last descendants of pagan believers. Some historians said that they were just incidental epidemic graveyards. In this not-well-studied hypothesis weeb of assumptions could be one true way to answer the question:

How much Christian, were commoners in the borderland of the Polish Crown and the Grand Duchy of Lithuania?

Since 2017 Podlaskie Museum in Białystok has had a running project focused on the recognition, interpretation, and description of Mogiłki sites in the interflaves of the Biebrza and Bug rivers. Based on project information, current thoughts and recent studies, there will be an attempt to find answers.

10 ANTHROPOLOGICAL COMPARATIVE ANALYSIS OF THE POPULATIONS FROM THE POST-MEDIEVAL STELAE CEMETERIES FROM PODLASIE REGION, POLAND

Dec, Olga (Adam Mickiewicz University) - Słodka, Angelika (Independent Researcher) - Lepionka, Hubert (Podlasie Museum in Białystok)

The phenomenon of post-medieval stelae cemeteries ('mogiłki') – characteristic for the archaeological landscape of north-eastern Poland and western Belarus – has been functioning in archaeology since the 20th century when first small-scale excavations were carried out at three different sites in Podlasie region, Poland. This made it possible to obtain first scientific information on Podlasie 'mogiłki'-type necropoleis. However, until 2018 research into this phenomenon was still based solely mostly on historical sources and scarce archaeological data from 20th century, despite the fact that research and recognition of the problem could be considered as opened.

Between 2018 and 2022, first truly interdisciplinary and broad research of the 'mogiłki' in Podlasie region was initiated, which allowed for a much better understanding of the issue – and the inclusion of much needed bio-anthropological data. Revisiting previously researched material and incorporating it into broader context allowed for a clarification of a trend, where despite the common denominator ('mogiłki'-type cemetery with clearly distinguished socio-cultural standing) each of the cemeteries retained individual character. This character varied: from different distribution of pathological conditions, intensity and number of infectious lesions to suggestive low intra-population genetic variability. The in-depth and cross-sectional summary of the data obtained so far allowed for a comparative anthropological analysis of the rural populations of post-medieval borderlands of Eastern Europe.

11 TALES FROM BEYOND THE GRAVE – WHAT BURIALS FROM VALENÇA FORTRESS CAN TELL US

Alves, Alexandrina (Lab2PT; CIAS)

For the past 20 years, Valença, a fortress located on top of a hill, south of the river Minho, and a relevant localization of the Portuguese northwest border, has been excavated. The archaeological interventions comprised the surrounding area of two churches, located inside the fort, Santa Maria dos Anjos and Santo Estêvão.

The excavations exposed part of both churchyards, where a total of 160 graves were identified, and 57 individuals (27 from Santa Maria dos Anjos; 29 from Santo Estêvão) were excavated and totally or partially exhumed.

Despite the chronological and physical proximity of the two churches several differences between burial rituals were observed, namely diverse grave techniques, and separate corpse management.

The medium state of preservation of the human remains partially compromised the palaeodemographic data, although from the 40 adults, sex was estimated for 26 (26/40; 65%) individuals, with a wide age at death range. For the 17 non-adults recovered, age at death varies between 6 months to 12-year-old.

Multiple paleopathological lesions were observed, thereby enabling us to attempt to delineate the health status of this population sample. Degenerative joint disease and trauma are the most frequent conditions observed, but infectious, benign tumors conditions are also present.

The study of the remains from both cemeteries expanded our knowledge of Valença population during the 16th to mid-19th centuries.

12 A TALE OF TWO CLOISTERS, A TALE OF TWO CITIES – A FUNERARY BIOARCHAEOLOGICAL COMPARISON OF TWO POST-MEDIEVAL BURIAL SITES

Lema Seabra, Ana (CIAS)

Urban Archaeology in Portugal, especially in commercial rescue archaeology, is often chronologically focused on post-medieval sites, sometimes with human remains. This presentation aims to compare two post-medieval burials sites from two different major cities in Portugal, the Convent of Saint Eloi in Porto and the Convent of Corpus Christi in Lisboa. The convent of St Eloi, also known as the convent of St Maria da Consolação, was located in the city of Porto, built in the end of the XV century and closed down in 1836 – like all convents in Portugal due to the extinction of the Religious Orders, and run by the Order of Saint Eloi. The Convent of Corpus Christi, located in Lisbon, was built in 1648 and given to Order of the Carmelitas Descalços to run in 1661, it suffered great damage during the Earthquake of 1755 and plans for rebuilding were halted due to the Extinction of the Religious Orders.

On both sites, cloister like structures were identified with the presence of human remains in primary burial position (as well as ossuary and reductions). We aim to compare and characterize both burial sites from a funerary bioarchaeological standpoint in regards to the buried population type, the use of lime and type of materials present with the human remains.

13 THE INFORMATIVE ROLE OF POST-MEDIEVAL OSSUARIES: THE EXAMPLE OF THE CRYPT OF SANT'AGOSTINO IN SASSARI (XVII-XIX CENTURIES)

Milanese, Marco (University of Sassari - Department of History, Human Sciences and Education) - Moshfegh Monazah, Leila (Institutt for historiske og klassiske studier - NTNU - Trondheim (NO)) - Roggio, Cinzia (University of Sassari - Department of History, Human Sciences and Education)

In postmedieval cemeteries and churches is commonly reported the presence of ossuaries and burial crypts, which are usually excluded from the anthropological analysis due to the high cost of these studies and to the wrong convention of the uselessness of this kind of secondary deposition to the reconstruction of the bioarchaeological context.

The proliferation of confraternities, often linked to corporations, favored the creation of burial places dedicated to them, identifiable by crypts or chapels built in cemeteries or churches that were the headquarters of the confraternity.

The crypt of the Church of St. Augustine, Sassari, excavated under the chapel of the Gremio dei Viandanti, contains hundreds of remains of the brothers of the Gremio, dated back between 1633 and 1810.

The crypt is the subject of a multidisciplinary project aimed at reconstructing the history of the members of the Gremio dei Viandanti, a post-medieval corporation that is still alive. All bones will be analysed to assess the biological profile and reconstruct the health status of this limited social group. In addition, the presence of tissues, through genomic analysis, can supply useful data to complement the information obtained from bioarchaeological and paleopathological studies.

Bibliography

Milanese M., Azzalin G., Moshfegh Monazah L., Magnini L., 2024. La cripta sepolcrale del Gremio dei Viandanti nella chiesa di Sant'Agostino in Sassari, in "Archeologia Postmedievale", 28.

14 PALAEOPATHOLOGICAL ANALYSIS OF INDIVIDUALS FROM A POST-MEDIEVAL SITE IN SLOVENIA

Lisic Fox, Nidia (University of Ljubljana) - Leskovar, Tamara (University of Ljubljana)

Researching post-medieval cemeteries can provide significant insights into past events and overall population by forming biological profiles of individuals and creating demographic structure of a specific population. This can often be supported by other resources and documented events offering a wider picture of a certain location and period. Moreover, palaeopathological studies are an integral addition to skeletal remains analysis in order to learn about health conditions, diseases and even population changes.

However, post-medieval cemeteries are often neglected due to being so close to the present as well as raising possible ethical questions. The aim of our research is to show how studying post-medieval cemeteries can contribute to overall research development of different time periods, better population understanding and specific past-present connections.

The basic analyses were performed on the skeletons discovered in 196 graves at site Vrazov trg, Slovenia. It was noted that numerous individuals were with various pathological changes. For this study, 10 most interesting individuals were chosen in order to highlight the potential of more in detail palaeopathological study.

15 PATHOLOGICAL CHANGES IN HUMAN BONES FROM THE MODERN PARISH CEMETERY AT ST. BARBARA CHURCH IN WROCLAW

Galdyn, Natalia (Wroclaw University of Environmental and Life Sciences) - Bernacka, Natalia (Wroclaw University of Environmental and Life Sciences) - Kwiatkowska, Barbara (Wroclaw University of Environmental and Life Sciences) - Dąbrowski, Paweł (Wroclaw Medical University)

The study aimed to characterize pathological changes in the bones of Wroclaw residents buried at St. Barbara's Church, a modern parish cemetery dating back to the 17th-18th centuries. The study involved analyzing 58 specimens from 12 sites, including 19 male, 16 female, and 23 specimens of indeterminate sex, including 13 juveniles and children. The conditions were characterized using Gladykowska-Rzeczycka's division in 1976.

Lesions of the masticatory apparatus were observed in the greatest numbers, with injuries being equally frequent in each age category and slightly more frequent in men. Degenerative changes were more common in adults and mature individuals, while inflammatory changes occurred only in the adultus and maturus age categories. Developmental dis-

orders were comparably frequent in both sexes, while endocrine disorders, metabolic disorders, and neoplasms were least frequently observed.

The population from St. Barbara's Church was compared to the populations from St. Paul's and St. Peter's churches and the Salvatore cemetery. Most remains belonged to adults, while the most pathology was present in the populations from St. Barbara's church and the Salvator cemetery. However, lesions characteristic of diseases like tuberculosis were rarely present in all three populations.

The bone remains used in the research came from: Grant number: NCN 2017/25/B/HS3/02006. Grant title: "On the threshold of industrialization – interdisciplinary evaluation of prosperity and quality of life of early modern inhabitants of Wrocław".

736 INTERDISCIPLINARY TRAJECTORIES IN MORTAR ANALYSIS OF HISTORICAL BUILDINGS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Bellato, Giulia (Trinity College, University of Cambridge) - Bianchi, Giovanna (Department of History and Cultural Heritage, University of Siena) - Lubritto, Carmine (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, MARE Centre, University of Campania "Luigi Vanvitelli") - Arighetti, Andrea (École normale supérieure, Université PSL)

Session format: Regular session

The relationship between archaeology, history, and archaeometry is a long-debated topic that has become increasingly prominent in recent years, thanks to the constant evolution of research procedures, as well as the increasing sophistication of the tools of analysis at our disposal. As such, the creation of new frameworks of research and the continuous updating of skills and technical knowledge are essential to keep up with these developments.

To enhance current models and pave the way for new research directions, a collaborative approach is crucial. This hinges on a close dialogue between scientists and social science researchers, underpinned by a shared understanding of the procedures defining the various archaeometric specialisations.

The proposed session makes a case for this interdisciplinary approach by focusing on the processes of production of the mortars used in the construction of historical buildings. Within this field of research, the analytical archaeometric procedures adopted in recent years have become increasingly more precise in defining both the characteristics and the dating of samples. In most studies, however, the work of the scientists remains isolated from the overall data produced by historical and archaeological research.

This session draws from the experience acquired within an ongoing research project studying a series of Italian medieval castles through the archaeometric analysis of their mortars. Its objective is to initiate a dialogue with other interdisciplinary projects where mortar analysis plays a pivotal role in shaping historical models.

Taking a wide diachronic perspective, it presents a set of case studies examined through field- and lab-based procedures, comparing both different methods and their results. Ultimately, it intends to offer a valuable model of a research process that elaborates a unified and seamless interpretive framework based on different kinds of data and on the integration of different specialisations.

ABSTRACTS

1 APPLICATION OF THE RADIOCARBON METHOD TO MORTARS IN ARCHAEOLOGICAL CONTEXTS

Vecchiattini, Rita (Dipartimento Architettura e Design (DAD) - Università di Genova; Istituto di Storia della Cultura Materiale (ISCUM)) - Pesce, Giovanni (Department of Mechanical and Construction Engineering - Northumbria University; Istituto di Storia della Cultura Materiale (ISCUM))

Among all the archaeometric dating methods, the dating of organic material using the Radiocarbon method has been one of the most commonly used since the 1960s, especially in the archaeological and anthropological fields. Since early 2000s, however, the Radiocarbon method has also been applied with some success to "lumps of pure lime" contained in historic mortars, within archaeological or architectural contexts.

The possibility of extending the application of the Radiocarbon dating method from the organic material deliberately or accidentally included in the mixtures, to the inorganic material (i.e., lime) is changing the research perspectives and its application. Dating the carbonation of lime in a mortar means, in fact, directly dating its setting time and therefore, the actual construction time of a building.

The experience, accumulated by the authors and by ISCum since 2008, in selecting, preparing and radiocarbon dating over 70 lumps of lime extracted from mortars of 28 different contexts allows now some reflections on this particular application of the Radiocarbon method.

This paper summarises the main critical limitations and potentials related to the application of the radiocarbon method to lime mortars samples in archaeological contexts with examples derived from specific case studies.

2 LIFE AFTER 14 YEARS OF EXPERIENCE WITH MORTAR DATING BY CRYO(2)SONIC PROCEDURE: CURRENT STATE OF THE ART AND FUTURE PERSPECTIVES

Marzaioli, Fabio (Università degli studi della Campania, Dipartimento di Matematica e Fisica) - Passariello, Isabella (Università degli studi della Campania, Dipartimento di Matematica e Fisica) - Terrasi, Filippo (Università degli studi della Campania, Dipartimento di Matematica e Fisica) - Nonni, Sara (The University of Manchester at Harwell) - Secco, Michele (Università degli Studi di Padova-Dipartimento dei Beni Culturali: archeologia, storia dell'arte, del cinema e della musica (DBC)) - Ricci, Giulia (Università degli Studi di Padova- Dipartimento di Geoscienze) - Artioli, Gilberto (Università degli Studi di Padova- Dipartimento di Geoscienze) - Lubritto, Carmine (Università degli studi della Campania, DiSTABiF)

This contribution aims to describe the history of Mortar Radiocarbon Dating by CryoSonic method since its first developments and testing in 2010. CryoSonic (CRYO-Breaking, SONication and Centrifugation) was firstly developed and applied @ CIRCE (Centre for Isotope Research on Cultural and Environmental heritage) Laboratory- Università degli Studi della Campania "Luigi Vanvitelli" (formerly Seconda Università degli Studi di Napoli) - Department of Mathematics and Physics based on a development of a procedure defined by Nawrocka, et al. (2011). Over about 1.5 decade initial procedure was developed and adapted in order to respond accurately to the great heterogeneity of real field mortars including low degree hydraulic ones (i.e. cocciopesto and pozzolanico). This procedure aims at the physical isolation of a real fraction from mortars differently from a widely spread family of procedures based onto stepped digestion.

Several study cases with well constrained chronological boundaries have been tested in order to verify procedure accuracy. Based onto experienced intensive testing of Cyo(2)Sonic, current state of the art (including efficiency %) and future perspectives of the applied procedure will also be described.

3 TECHNOLOGICAL CHANGES AND CONTINUITIES IN MORTAR PRODUCTION: A VALUABLE TOOL FOR THE CHRONOLOGICAL INTERPRETATION OF COMPLEX HERITAGE CONTEXTS

Razzante, Valeria (Dipartimento dei Beni Culturali, Università di Padova) - Secco, Michele (Dipartimento dei Beni Culturali, Università di Padova) - Dilaria, Simone (Dipartimento dei Beni Culturali, Università di Padova) - Ricci, Giulia (Dipartimento di Geoscienze, Università di Padova) - Previato, Caterina (Dipartimento dei Beni Culturali, Università di Padova) - Bonetto, Jacopo (Dipartimento dei Beni Culturali, Università di Padova) - Chavarría Arnau, Alexandra (Dipartimento dei Beni Culturali, Università di Padova) - Brogiolo, Gian Pietro (Dipartimento dei Beni Culturali, Università di Padova) - Marzaioli, Fabio (Dipartimento di Matematica e Fisica, Università degli Studi della Campania Luigi Vanvitelli)

In the last decades, archaeometric analysis of historic mortars has provided promising responses to improve knowledge on the technical evolution of construction practices. In this contribution, an interdisciplinary and multi-analytical approach is presented, combining historical research, archaeology, and archaeometry, to highlight noticeable variations and continuities in mortar production practices throughout different historical periods in two paradigmatic sites: the city of Padua and the site of Castelseprio-Torba (Varese).

Due to the presence of differentiated geological resources from the Euganean Hills, the city of Padua offers a peculiar context of great variability in mortar recipes. The multi-analytical study applied to mortars sampled from different Roman public structures of the city and its surroundings indicated a systematic utilization of Euganean volcanic aggregates as activators of the pozzolanico reaction; in post-classical periods the adoption of pozzolanico binders was replaced by a consistent production of natural hydraulic lime. The regular use of the Euganean marl – a clayey limestone – as raw material for lime production, has been identified both in the sections of the medieval and Carrarese walls, as well as in the latest Renaissance defensive structures.

A different perspective, linked to a continuing standardization over time, is offered by the late antique and medieval site of Castelseprio-Torba. Recent research highlighted a traditional way of producing mortars linked to the exploitation of local natural deposits (clay-rich sediments), to promote articulated pozzolanico reaction processes based on both calcium and magnesium systems, with formation of calcium and magnesium aluminum silicate hydrates (C-A-S-H and M-A-S-H, respectively). In this context, radiocarbon dating was applied to mortar samples collected from the masonry structures of the Torba monastery, providing an absolute chronological reference, and overcoming intrinsic limitations of relative chronology subjected to the diachronic continuity of mortar production technologies.

4 BINDER SELECTION PROCEDURE OF FLORENTINE HISTORICAL BUILDINGS FOR RADIOCARBON DATING

Calandra, Sara (Department of Earth Sciences, University of Florence, Italy; Department of Chemistry Ugo Schiff, University of Florence, Italy) - Cantisani, Emma (Institute of Heritage Science - National Research Council of Italy, Sesto Fiorentino (Florence), Italy) - Fratini, Fabio (Institute of Heritage Science - National Research Council of Italy, Sesto Fiorentino (Florence), Italy) - Salvadori, Barbara (Institute of Heritage Science - National Research Council of Italy, Sesto Fiorentino (Florence), Italy) - Conti, Claudia (Institute of Heritage Science - National Research Council of Italy, Milano, Italy) - Arrighetti, Andrea (École normale supérieure, Université PSL, France) - Barone, Serena (National Institute for Nuclear Physics, Unit of Florence, Italy; Department of Physics, University of Florence, Italy) - Liccioli, Lucia (National Institute for Nuclear Physics, Unit of Florence, Italy) - Fedi, Mariaelena (National Institute for Nuclear Physics, Unit of Florence, Italy) - Garzonio, Carlo (Department of Earth Sciences, University of Florence, Italy)

Mortar of historical building reveal details about raw materials, ancient technology, original recipes, and supply areas. These details let us identify the phases of construction. Since the pioneering studies of Labeyrie and Delibrias, (1964), mortar binder can be dated by absolute dating using radiocarbon. In principle, the datable carbon fraction is represented by the so-called anthropogenic calcite (CaCO₃), i.e. the carbonate binder resulting from the hardening of slaked lime [Ca(OH)₂] reacting with CO₂ from the atmosphere. The possibility of dating an aerial mortar has by radiocarbon depends on the complete separation of the binder from source of contaminations (components in the mortar mixture). Standard and approved experimental strategies for removing the sources of contamination have not yet been established.

The purpose of our research is to design a binder selection procedure for radiocarbon dating of historical mortars and apply it to mortars from the Florentine area (Cantisani et al., 2021).

Our procedure for selecting binder includes: 1) chemical, mineralo-petrographic characterization of mortar samples to identify the nature of binder, aggregates, the presence of lumps and hydraulic behavior; 2) mechanical separation of lumps or/and bulk samples and their characterization using non-destructive methods: cathodoluminescence, spectroscopic methods (ATR-FTIR and micro-Raman) (Calandra et al., 2022; Calandra et al., 2023) to evaluate the origin of calcite; and also, X-ray powder diffraction (XRPD) to identify mineralogical phases. And then proceeded to select samples consisting mainly of anthropogenic calcite; 3) carbonate micro-sample preparation (acid dissolution combined with Lilliput graphitization reactors (Fedi et al., 2020)) and ¹⁴C measurement by accelerator mass spectrometry (AMS).

This workflow has been applied on mortars from Trebbio castle, an important architectural Cultural Heritage in the surroundings of Florence (Italy). The procedure has allowed us to select suitable mortar samples, obtaining reliable dating results, comparable with the historical construction phases of the castle.

5 CHARACTERIZATION AND PREPARATION OF ARCHAEOLOGICAL MORTARS FOR AN EFFECTIVE RADIOCARBON DATING: THE CASE-STUDY OF SAMPLES FROM MEDITERRANEAN AREA

Di Cicco, Maria (University of Campania Luigi Vanvitelli) - Germinario, Chiara (Department of Sciences and Technology, University of Sannio, Benevento) - Grifa, Celestino (Department of Sciences and Technology, University of Sannio, Benevento) - Spagnuolo, Antonio (Energreenup srl, Via Acquaviva Caserta) - Altieri, Simona (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, University of Campania "Luigi Vanvitelli" and MAREa Centre, Via Vivaldi 43 Caserta) - Mantile, Noemi (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, University of Campania "Luigi Vanvitelli" and MAREa Centre, Via Vivaldi 43 Caserta) - Sabatella, Arianna (Department of Sciences and Technology, University of Sannio, Benevento) - Lubritto, Carmine (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, University of Campania "Luigi Vanvitelli" and MAREa Centre, Via Vivaldi 43 Caserta)

The dating of historical buildings is a crucial aspect of their study and evolution. Lime-based mortars are a highly effective building material for providing dating clues. This is because the carbon dioxide absorbed during the setting of the mortar on archaeological structures reflects the content of ¹⁴C that existed in the atmosphere at that time. However, it is important to note that some factors may influence the reliability and accuracy of radiocarbon measurements.

Due to the complexity of the problem, a number of chemical and mechanical procedures have been used in recent decades to prepare lime mortars for radiocarbon dating, including the Cryo2Sonic preparation protocol. However, these procedures may not completely eliminate contamination agents such as carbonate in aggregate, calcination relics, or secondary calcite from the carbon in the original binder, which can result in inaccurate dating of samples.

To minimise the impact of contaminants on dating procedures, the selection of the material must be accurate, and an appropriate characterization of mortar is fundamental.

The following research focuses on preparing, characterising and dating samples from various archaeological Mediterranean contexts. It highlights the importance of conducting a preliminary mineral-petrographic characterisation using Polarised Light Microscopy, Fourier Transform Infrared Spectroscopy and simultaneous thermal analyses to identify potential sources of dating contamination. The presentation will cover:

- the case-study of decorated plasters from an archaeological site Pollena Trocchia (Campania region, Italy), representing the “ideal” materials for reliable dating procedure, because of their nature (lime-based mortars containing volcanic aggregate) and their strict chrono-stratigraphic constraints, marked by the deposits of 79 CE and 472 CE Vesuvius’ eruptions;
- the case-study of mortars collected by Medieval Andalusian Castles, studied with the aim of highlighting how contamination effects can affect radiocarbon dating.

6 THE LIMEKILN OF THE MEDIEVAL SETTLEMENT OF MONTECORVINO (FOGGIA, APULIA): A MULTIDISCIPLINARY RESEARCH

Cardone, Angelo (Università degli Studi di Bari - DiRIUM) - Cataneo, Carlo (UniSalento - Dip. Beni Culturali) - Della Penna, Valeria (Università di Foggia - DISTUM) - Eramo, Giacomo (Università degli studi di Bari A. Moro - Dip. Scienze della terra e geoambientali) - Favia, Pasquale (Università di Foggia - DISTUM) - Fiorentino, Girolamo (UniSalento - Dip. Beni Culturali; LAP- Laboratorio di Archeobotanica e Paleocologia) - Giuliani, Roberta (Università degli Studi di Bari A. Moro - DIRIUM; Prin MY-FORTLANDS) - Stella, Matilde (UniSalento - Dip. Beni Culturali; LAP- Laboratorio di Archeobotanica e Paleocologia)

Montecorvino (Vulturino-FG) is an abandoned medieval site in the north-western Apulia; it was a *kastron*, founded by the Byzantines in the first half of the 11th century. The arrival of the Normans, after a few decades, involved the reorganization of the town: at the western end, an artificial embankment was built, surrounded by a moat; at the top a *castrum* was planted, dominated by a high quadrangular tower; it was articulated over time, with the construction of a wall and a second tower, up to transform, in the 2nd half of 13th century, into a fortress, densely occupied. Below the hill, towards the east, in the direction of the town, in recent excavations a limekiln (diam. about 3 m) has been discovered; given its size, it would seem to refer to one of the main building phases of the *castrum*. The structure was found with its last load of stone and full fuel.

The peculiarity of the discovery provided opportunity studying the context with a multidisciplinary approach: archaeological examination, archaeometric analyses and archaeobotanical study.

Archaeometric analyses have been set, aimed at acquiring information both on the nature and origin of the materials used to build the kiln and to make lime, and on the operation of the kiln. Samples underwent to petrographical analysis in thin section, X-ray powder diffraction (XRPD) and scanning electron microscopy coupled with energy-dispersive spectroscopy (SEM-EDS). Blocks of local siliceous limestones are the prevalent lithotype used for both the kiln and the lime production. Moreover, it was developed an experimental protocol to map the temperature distribution in the kiln.

Anthracological analysis of the charcoals remains allows us to determine the composition of the fuel, the formation way of the anthracological assemblage and the choices adopted for the functioning of the limekiln.

7 COMBINING MORTAR, WOOD, CARTOGRAPHIC AND DOCUMENTARY EVIDENCE TO UNDERSTAND THE MEDIEVAL TOWERS OF NEGROPONTE

Blackler, Andrew (Hellenic Society for Near-Eastern Studies) - Panagopoulou, Adamantia (Institute of Nanoscience and Nanotechnology “Demokritos” National Center for Scientific Research, Athens)

More than a hundred towers once dotted the medieval landscape of the Greek island of Euboea (Negroponte). They have traditionally been seen in a colonial context as constructed by Frankish and Venetian feudal landowners to display their power and control the local population immediately following the annexation of central Greece in 1204 by forces of the Fourth Crusade. In 2022/23, in a program supported by the Castle Studies Trust (UK), samples of mortar and wood were taken from within the walls of seven towers on the island.

The results of their analysis undertaken at the ‘NCSR’ Demokritos laboratory in Athens have enabled not only a revised build dating but also, through chemical study have identified different construction technology phases and raw material provenance sites. These results combined with GIS analysis, and contemporary documentary and cartographic evidence, have contributed to the development of a completely new understanding of their role during the nearly three centuries of Latin control (1204-1470).

This paper studies the process of sampling from the initial identification of target towers, given budget limitations, to the interaction between the various specialists and how this contributed to secondary analyses being undertaken. It then discusses how an understanding of the historical context coupled with the involvement of experts from multiple scientific disciplines was critical to the development of the final conclusions.

8 THE KEYS TO SUCCESS: INTERDISCIPLINARITY IN THE DATING OF MORTARS FROM SANTALLA DE BÓVEDA (LUGO, GALICIA, SPAIN)

Sanjurjo-Sanchez, Jorge (University of A Coruña) - Blanco-Rotea, Rebeca (Landscapes, Heritage and Territory Laboratory (Lab2PT), University of Minho (Portugal)) - Freire-Lista, David (Departamento de Geología, Universidade de Trás-os-Montes e Alto Douro (UTAD) and Centro de Geociencias da Universidade de Coimbra (Portugal).) - Benavides García, Rosa (Independent Researcher)

Since 2007, a team made up of geologists, archaeologists, art historians and restorers began to work collaboratively from different institutions in Galicia, University of A Coruña, University of Santiago, CSIC, and now in Portugal, University of Minho, we started to work with the mortars of different historical buildings with the aim of characterising and dating them, in the conviction that the mortars, being a material that must be made at the time of construction, were the key to answering some important historiographical debates about different architectures located in this region of the Iberian Peninsula, mainly for the Late Antiquity and Early Medieval Ages.

At that time, we began to work on Santalla de Bóveda, an important monument that preserves some mural paintings that have been identified as Roman, Early Christian or Early medieval, although researchers have not reached a consensus. The building was a very attractive case of study not only because it was a challenge to respond to this lack of consensus, but also because it preserves mortars of very different functionality and paintings that are an icon for the history of art, archaeology and architecture.

The continuous process carried out since then has been a methodological path that has accompanied the advances in dating techniques. Today, the monument has 40 dates, result of having combined three methods and that allow us to clearly date the stratigraphic sequence identified thanks to the archaeological study. Only the combination of different dating techniques applied to different materials and an interdisciplinary study, where archaeology and geology have collaborated closely with other disciplines to formulate the right questions, select the right samples and refine the methodology, have allowed us to reach solid conclusions that today open new interpretative hypotheses for early medieval architecture in Galicia.

9 THE CASTLES PROJECT

Bianchi, Giovanna (University of Siena) - Arrighetti, Andrea (École normale supérieure, Université PSL) - Bellato, Giulia (University of Cambridge) - Lubritto, Carmine (University of Campania “Luigi Vanvitelli”) - Garzonio, Carlo Alberto (University of Florence)

The study of medieval castles and of their transformations, in both structural and socio-political terms, is a long-standing key theme of Italian historiographical research. Though it has been tackled extensively through historical, archaeological, and archaeometric study, it still retains numerous open questions that carry significant historiographical implications. The precise chronology of the transformations of castles between the second half of the 11th century and the end of the 12th, for instance, remains unclear. One of the key elements of this transformation involves the shift to durable materials, accompanied by the increasing use of lime-based binders.

This paper presents the preliminary findings of an ambitious project developed by the universities of Siena, Florence, Turin, and Campania. It is based on a study of a set of Italian medieval castles from Tuscany, Piemonte, and Liguria, selected because of their historical and archaeological significance. It is aimed at refining our understanding of castles construction phases, specifically through the development of new protocol for the dating of historical lime-based mortars.

The field of archaeometry has seen great strides in recent years, especially in terms of the development of increasingly precise procedures for the dating of historical mortars. However, these types of analyses still retain significant challenges, not least that of successfully integrating the archaeometric data with that produced through historical-archaeological research. The paper presents an innovative framework of research which centres mortar dating in the creation of historical models. At the same time, it also explores the contribution that historical-archaeological analysis can bring to archaeometry, especially regarding the creation of new protocols of analysis. It aims at offering a valuable example of interdisciplinary research and at opening a fruitful discussion regarding the challenges and the advantages of creating research frameworks that can integrate data from different specialisations.

737 COMPUTATIONAL LANDSCAPES: DEBATING FUNDAMENTAL ISSUES OF ARCHAEOLOGICAL NARRATIVES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Herrera-Malatesta, Eduardo (Center for Urban Network Evolutions, Aarhus University) - Verhagen, Philip (Faculty of Humanities, Vrije Universiteit Amsterdam)

Session format: Regular session

Landscape research in archaeology has greatly benefited from the increasing application of computational methods over the last decades. Common examples come from spatial point patterns (Bevan 2020), Bayesian statistics (Crema and Shoda 2021), network analysis (e.g., Brughmans et al. 2024), 3D modelling (Campana et al. 2012), agent-based modelling (Romanowska et al. 2021), and Geographical Information Systems (Conolly 2016). While these and other methods have positively impacted archaeology and landscape studies, there have not been many studies assessing the impact of using advanced computational methods to create narratives about past landscapes. Some exceptions include Verhagen et al. (2021) who have discussed the challenges of comparing advanced spatio-temporal simulation models in archaeology. Bevan and Crema (2021) presented a review of the issues arising from the recent interest in constructing long-term proxies of human activity using simulation methods. Tenzer et al. (2023) have warned about the potential negative ethical implications of using AI and Machine Learning in archaeology without a full understanding of the inner workings of these complex computations. In addition, there is a growing trend of archaeologists working on quantifying uncertainties of archaeological data and models, as well as on best practices to deal with data incompleteness and imperfection (Lewis 2021).

With this session, we aim to bring together a group of specialists in computational and landscape archaeology to debate how computational approaches, methods and technologies contribute to enhancing landscape archaeological narratives. We invite presentations that explicitly apply and discuss any of the wide range of computational methods in landscape research in archaeology, with emphasis on critical considerations of, for example, how to avoid black box methodologies, potential ethical considerations, dealing with uncertainties in data, applicability of modelling concepts and archaeological theories, integration of different approaches, and issues of using legacy data for advanced modelling and simulations, among others.

ABSTRACTS

1 UNSHATTERED LANDSCAPES: A FRAMEWORK FOR DEALING WITH UNCERTAINTIES AND BIAS IN ARCHAEOLOGY

Herrera-Malatesta, Eduardo (Urbnet, Aarhus University)

The fragmentary nature of archaeological data is the key factor that affects past landscape reconstructions and loads archaeology and archaeological narratives with uncertainties. For decades, archaeologists have sought to reduce uncertainties by relying on stricter methodologies and advanced technologies. For example, to overcome survey uncertainty, the systematic total area survey was created. To overcome data and model uncertainty, advanced computational methods are used in the discipline. However, the use of these and other strategies does not reduce uncertainties if other aspects of the archaeological process are still within black-box methodologies and implicit reproductions of standardised steps. Furthermore, the application of advanced computational methods is not a solution by itself, as they need to be properly set up for each specific case study. All these uncertainties strongly affect the narratives we create about past peoples and their landscapes. This paper presents a framework for computational and landscape archaeologists seeking to have a systematic and transparent structure to deal with uncertainties in archaeology. The framework, which will be exemplified by different case studies, consists of three steps. First, the identification of uncertainties in spatial data and the creation of a robust procedure to deal with data and model uncertainties. Second, the exploration of how the relationship between spatial statistics and network methods can maximize their potential for enhancing our understanding of past events in space. Finally, a discussion of how implicit information in geovisualizations increases uncertainties and how this can affect narratives about the past. The analyses to be presented in this paper are part of a web application created to help colleagues, not specialized in computational archaeology, perform spatial analyses in a simple and straightforward manner and clearly understand the percentage of uncertainty embedded in their data and models.

2 GAMES OF HABITATION: UNRAVELING SETTLEMENT DYNAMICS IN SOUTHEAST ROMANIA'S CHALCOLITHIC. A MULTI-SCALE SPATIAL ANALYSIS

Covataru, Cristina (ArchaeoSciences Platform, Research Institute of the University of Bucharest (ICUB), Romania)

Over the last decades, the development and application of innovative computational methods in archaeology have broadened the research horizons for understanding (pre)historic societies. These methods have provided new insights into how people interacted with their environment and each other thousands of years ago.

This paper aims to explore the dynamics of prehistoric landscapes inhabited by the well-known Hamangia, Boian and Gumelnița communities (5200-3900 cal. BC) in southeastern Romania. This period synchronizes with the prosperous "golden 5th millennium" of Southeast Europe.

Point pattern analyses were employed to investigate settlement distribution patterns and the interaction between sites in a well-defined spatial-temporal frame. Kernel Density Estimation (KDE) was used to visualize the probability site of finding settlements in a specific area, considering several criteria like site cultural classification, different radii and observation windows, and the inclusion/exclusion of sites with unknown coordinates. The inter-community relationships from these focus areas were further explored by analyzing the distance between communities, using several geostatistical analyses such as the nearest neighbor test (NN), F-function, G-function, and K-function.

These analyses were conducted entirely through open-source software (QGIS and plugins), ensuring accessibility and reproducibility. Certain limitations still exist, including the accuracy and precision of site location, as well as the irregularities in the distribution and duration of these cultural phases, aspects which may influence the results. Despite these limitations, this methodology provides valuable insights and can potentially form narratives about settlement distribution, region landscape preferences, spatial and temporal dynamics, inter-community relationships, and implicitly about collective decision-making.

This research was supported by a grant from the Ministry of Research, Innovation and Digitization, contract number 41PFE/30.12.2021, within PNCDI III; and by financial support from the "Simion Mehedinți - Nature and Sustainable Development" Doctoral School, Faculty of Geography, University of Bucharest.

3 FROM NEAR-EMPTYSAPES TO HIGH DENSITY PAST: GAME-CHANGING IMPLICATIONS

Campana, Stefano (University of Siena)

In the last two decades we have seen a revolution in the archaeological density of the past showing in some circumstance the potential for a near-total recovery of past evidence. Methodologies used for study of the ancient landscape now offer a wide and seemingly ever-expanding variety of 'new' remote sensing methodologies, increasingly widely deployed for archaeological exploration and mapping purposes. In addition to improvements in technical capabilities massive evidence has been identified through decades of development related large excavations. Integrated, large-scale and continuous archaeological prospection and development-related fieldwork share responsibility for "the resulting flood of archaeological data". The outcomes of these studies find no parallel in the results of past surveys. It is a matter of resolution: the unprecedented high density of the information that such landscape investigations can now produce, as compared with the low-density results achieved in the past. This paper is aimed to discuss the implications of high-resolution representations of the past that have far-reaching archaeological consequences and have yet to be fully appreciated. In the first place, the archaeological outcomes show much more complicated landscapes dominated by labor, production, communication, and trade, and not just by settlements. Field boundaries and road systems, workshops and production sites, water features, dams and so forth, clearly predominate but obviously there are also settlements which, notwithstanding their remarkable sizes, are now somewhat in the background, clearly forming just part of a much broader picture. Methodologically, the implication of the results of landscape-scale geophysical survey and targeted minimalist excavation are nothing less than revolutionary.

4 RECONSTRUCTING REGIONAL GEOGRAPHIC VARIATIONS IN THE RATE OF THE SUB-SAHARAN EIA

Mes, Alexes (University of Cambridge)

Beginning around 4,000 BP, large-scale eastern and southern migrations expanded throughout sub-Saharan Africa resulting in major subsistence and cultural changes. The dispersal is associated with an early iron age (EIA) cultural package consisting -- wholly, or in part, at various times -- of a more sedentary lifestyle, thick-walled pottery, iron metallurgy, cattle-keeping and crop cultivation.

Behind all large-scale human dispersals lies a body of literature seeking to categorise this movement as demic migration vs. acculturation. The reality in any human migration is far more complex: the units of migration (individuals, families, communities), as well as the localised tempo and direction of dispersal shifted frequently.

It is the localised migration dynamics of sub-Saharan EIA communities that this paper aims to examine through the archaeological record: understanding the expansion of this cultural package as a series of regional and complex movements, focusing on variations in the tempo of dispersal and arrival times of these traits within smaller geographic areas.

The arrival times of these traits in geographic sub-regions are examined using a Bayesian phase model, where a hierarchical structure is introduced to account for the bias introduced by sample interdependence. This framework is then built on by considering if and how certain factors -- such as temperature, rainfall, geography and river-networks -- resulted in varied frictions to the dispersal and quantifying to what extent these potential drivers explain the observed differences in the dispersal process.

The results build a more detailed description of the localised dynamics of EIA communities in sub-Saharan Africa. Throughout, biases which influence the data -- such as uneven spatial and temporal sampling density -- are acknowledged and measurement uncertainty (calibration curve error and the sample's 14C age error) is accounted for. Computational intensity, and how this can restrict approaches to large archaeological datasets is briefly discussed.

5 A COMPUTATIONAL APPROACH TO THE STUDY OF CHULLPA ARCHITECTURE AND LANDSCAPE DYNAMICS

Gonzalez-Rodriguez, Cristian (University College London)

This presentation aims to bridge the connection between computational archaeology and landscape research within the Andean Plateau, focusing on the multidimensional chullpa phenomenon. Utilising a comprehensive multivariate approach, this study, conducted in the PhD research programme at the UCL Institute of Archaeology, explores the relationship between chullpa architecture, the animated Andean landscapes, and ecological dynamics. Chullpas, understood as aboveground sepulchres with origins around 900 CE, are examined not merely as burial sites but as key socio-political and ecological instruments that articulate royal power, ethical identity, and territorial demarcation.

The investigation employs computational methods, including logistic regression modelling, point pattern processing, and statistical permutation analysis, to explore the deliberate distribution and architectural variability of over 500 chullpa buildings across Perú, Bolivia and Chile. These methods allow for a multivariate understanding of the chullpas' interactions with diverse landscapes, highlighting how these structures adapt to and integrate with local ecological systems. This research emphasises the significance of chullpas beyond their physicality, positioning them as vital components within the Andean socio-ecological system, engaging with waterscapes, visualsapes, and mountainscapes.

By synthesising fieldwork data with computational modelling, the study offers approaches to the chullpas' roles as ritual technologies and their strategic orientations within the landscape. The inclusion of material recordings, ethno-historical data, and radiocarbon dating further complements the analysis, providing a deep temporal and contextual understanding of the chullpas' enduring resilience and adaptability over centuries.

Positioned within this session on "Computational Landscapes" this presentation seeks to contribute to the critical discussion on the application of computational methods in landscape archaeology. It highlights the importance of integrating socio-ecological contexts in computational analyses, thus contributing to the understanding of archaeological narratives through the animated Andean landscape.

6 ANCIENT PATHWAYS, THEORIES OF MOBILITY AND NETWORK ANALYSIS: REDEFINING THE NARRATIVES

Verhagen, Philip (Vrije Universiteit Amsterdam, Faculty of Humanities) - Groenhuijzen, Mark (Utrecht University, Department of History and Art History)

Modelling ancient pathways has become one of the most prolific areas of computational archaeology over the past decade. Compared to only ten years ago, the number of applications as well as the methodological sophistication of pathway modelling has increased substantially, now allowing us to address much more complex questions than just the reconstruction of ancient routes.

In papers by Nuninger et al. (2020a, 2020b) it was discussed how ontologies can be used as a starting point to debate and define the concepts related to ancient movement in a structured way, leading to the formalization of connections (routes) in a diachronic and multi-purpose 'track graph'. This track graph was set up as a conceptual structure, but can be easily implemented in computational analysis. So far, however, its application has been limited to a few unpublished pilot studies.

In this paper, we will explore how the application of the track graph concept can help to understand mobility and transport within the context of the Roman settlement and road system in the Dutch river area, at the frontier of the Empire. In particular, we will show how it can be used to define and explore various, sometimes competing hypotheses on the organisation of rural settlement, military infrastructure and mobility at multiple spatial and temporal scales.

738 RECLAIMING HERSTORY: WOMEN IN MEDITERRANEAN ARCHAEOLOGY FROM THE 18TH CENTURY TO TODAY

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Berlanga, María José (Universidad de Málaga) - Díaz-Andreu, Margarita (ICREA; Universitat de Barcelona) - Ferrara, Bianca (Universita degli Studi di Napoli Federico II) - Pizzato, Fedra (Universita degli Studi di Verona)

Session format: Regular session

The development of archeology in the more than twenty countries around the Mediterranean Sea has been distinct. However, all of them have a common factor: the role of women in it has been minimised or directly silenced. While not unique when compared to other regions in the world, the way women's contributions to the development of our study area have been perceived has been clouded by numerous assumptions. The aim of this session is to critically look at women's involvement in archaeology in the Mediterranean countries from the 18th century until today. The session ambition is to challenge traditional narratives by reassessing women's contributions to the discipline across a wide range of career opportunities. These include some key ones not usually included in traditional historical narratives of archaeology, such as the administration of archaeology in archaeological services, and the museums. Another topic to explore is intersectionality, examining how factors like gender, status, religion, or nationalism/imperialism may have influenced women archaeologists. The connection (or lack of) of these women with the women's movements is a further issue to consider. Moreover, papers looking at the possible interconnectedness between women of different countries are welcome. Papers can focus on a variety of different perspectives: biographies, periods, career paths, area of research. A reflection on the sources needed to bring women out of the history's silence is highly opportune. These may include not only publications, but also documentation stored in archives, photographs, personal narratives and oral history.

ABSTRACTS

1 FOUNDATION DEPOSITS: THE CAREERS OF EMILY PATERSON AND MARY C. JONAS OF THE EGYPT EXPLORATION SOCIETY

Sheppard, Kathleen (Missouri S&T)

Emily Paterson began work with Amelia Edwards of the Egypt Exploration Fund in London in 1888. She never went to Egypt, but her administrative and organizational work formed the foundation of the fledging Fund. For over 30 years, her steadfast influence and expertise made sure that the Great Men like Flinders Petrie and Alan Gardiner could work in Egypt. She organized meetings, corresponded with everyone, edited publications, dispersed money, set up excavation permissions, and so much more. She was the center of British Egyptology. When Paterson retired in 1919, Mary C. Jonas took over her role. Thrown into the deep end in 1922 with the uncovering of Tutankhamun's tomb, she had to organize quickly. She set up meeting rooms, sold tickets, entertained aristocrats and royalty, mediated arguments among Egyptologist from the Mediterranean and across the Atlantic in the United States. Jonas did go visit Egypt, in 1929, to help dispel tension at the Abydos site caused by a man working with Myrtle Broome and Amice Calverley. She retired before Second World War began. Despite the fact that, for over a half century, women sat at the helm of the biggest scholarly organization for Egyptology in Britain, they are hardly known to scholars.

Throughout the span of their careers antiquities laws changed, archaeological methods and theory changed dramatically, the field itself was reborn several times over. This paper will discuss the groundbreaking careers of Emily Paterson and Mary Jonas. In so doing, I will argue that their lives and careers deserve to be placed back where they belong: in a much more central place in the history of Egyptology and as touchpoints to the history of the discipline much more so than any Great Man.

2 A 'BENEFACTOR OF SCIENCE.' MARIA FIORONI, AN (AMATEUR) ARCHAEOLOGIST, MUSEOLOGIST, AND PHILANTHROPIST

Pizzato, Fedra (University of Verona)

Maria Fioroni (1887-1970) belonged to an affluent family of Florentine origin. Her father, a Garibaldi supporter, moved to Legnago, a small town in the province of Verona (Veneto). The family settled in an elegant residence known as Palazzo Fioroni, which still serves as the headquarters of a prestigious cultural foundation. While she is mainly recognized locally as a patron who donated collections that now form the core of civic collections, her role as an amateur archaeologist is often overlooked. Notably, Maria Fioroni continued her prehistory research even during the Fascist era, a remarkable feat in its own right. However, Maria Fioroni played an active role on multiple fronts, combining field research in archaeology with museology and even political and social activism. Her work ranged from establishing one

of the earliest colonial collections to field archaeology, encompassing social and patriotic engagement. Her philanthropic efforts earned her significant national recognitions and honors. Furthermore, a dense network of information exchange, archaeological materials, and iconographic materials revolved around Maria Fioroni, allowing her to fully integrate into the revival of prehistoric archaeology studies in Republican Italy. This paper delves into the case study of Maria Fioroni, shedding light on her uncelebrated role during the Fascist era, and her contributions to the resurgence of prehistoric archaeology during the initial decades of the Italian Republic (1950s-1960s). In doing so, it aims to reevaluate and highlight the agency of women in this complex historical context.

3 PIONEERING WOMEN AT CUICUL-DJEMILA: ROLE AND IMPACT IN XXTH CENTURY ARCHAEOLOGY IN ALGERIA

Sadaoui, Dahia (Archéologie; Université Aix-Marseille)

The aim of this paper is to reflect on the place and involvement of three women at the Cuicul-Djemila archaeological site in twentieth-century Algeria. It will be based on archives generated by archaeological research carried out on the site between 1909 and 1967. First, I will review the identity and career of these three women: Anne Marie Louise de Crésolles (1863-1941), wife and daughter of the site's previous directors, and director of research between 1920 and 1941; Yvonne Allais (1891-1981), historian and director of the site between 1942 and 1957; and Michèle Blanchard-Lemée (1936-2017), author of two thematic studies on Cuicul-Djemila. I will look in particular at what led them to take an active interest in this site, located in an isolated mountainous region with a harsh climate, during periods marked by war. I will then attempt to identify the precise role of each of these women in the field. What were their responsibilities on the site? What was the nature of their interactions with the workers, the institutions involved in the research and the local residents? I will then analyse their documentary output, their working methods, and their impact on the development of archaeological knowledge during this period. Finally, I will attempt to assess the visibility and place of these women within the learned societies of the period, which were predominantly male, and in contemporary academic circles.

4 ANOTHER HISTORY OF ANCIENT NEAR EASTERN ARCHAEOLOGY: THE ROLE OF WOMEN WORKING AT THE LOUVRE MUSEUM (LATE 19TH-20TH CENTURIES)

Rannou, Raphaëlle (Institut National d'Histoire de l'Art; Ecole du Louvre; Tours University)

Where are the women archaeologists? In traditional histories of Ancient Near Eastern archaeology and in biographical dictionaries of academics, the number of women mentioned is tiny by comparison with the number of men. However, when we study the lists of students and graduates in Ancient Near Eastern archaeology at the École du Louvre in Paris from 1881 to the present day, women are very clearly visible from the end of the nineteenth century. What happened to these women graduates? Their names can often be found on the lists of scientific personnel at the Louvre Museum from the 1930s as "chargées de mission".

The aim of my paper is to review the contribution of women to the archaeology of the Ancient Near East by focusing on female museum workers, using the case of the Louvre Museum in the twentieth century.

What tasks were assigned to these women in the museums and in the field? How much are they recognized as archaeologists? What are the factors that integrate and exclude women from the discipline? How does the gendered division of labor affect women's contribution to the discipline? What role do feminist networks and transnational women's networks play in women's careers?

Based on recent studies on the history of women archaeologists, I wish to map out a history of the archaeology of the Ancient Near East using a quantitative approach based on women's and men's careers.

Using museum administrative archives, the press, personal archives, and oral interviews, I wish to compare my quantitative studies with the careers of a few women who have left their mark on the history of Ancient Near Eastern archaeology at the Louvre: Marguerite Rutten, Agnès Spycket and Annie Caubet.

5 ARCHAEOLOGY AS A WORLD-VIEW: ANNAMARIE SCHWARZENBACH AND THE FEMALE ARCHAEOLOGISTS IN THE EARLY 20TH CENTURY

Ferrara, Bianca (Università degli studi di Napoli Federico II) - Giacco, Marialucia (Museo Archeologico Nazionale di Napoli)

In the first decades of the 20th century, in the Antiquities studies significant and radical transformations occurred. Innovative mindsets assert themselves following the results of the great archaeological campaigns in Greece, the East and Italy. The cultural debate, characterized by the comparison with the increasingly widespread positivist instances, materialized a renewal of the theories and methods of archaeological research in its relations with history, philology, linguistics and ethnology. However, common to all new research leanings is the subordinate role reserved for women. The first women who approached archaeological studies, even if in non-decision-making roles, belonged to the

aristocratic class and carried out independent studies, under the impulse of classicism and romanticism, in similar disciplinary fields, concerning the exploitation of ancient languages, cultures and art. In any case, when the scientific data allow us to reflect on the role of women, it must be admitted that some of them played a significant role in the development of the archaeological research.

In this paper a brief summary of the female scholars who, in the first decades of the 20th century, contributed to the progress of the archaeology's methods directly or indirectly; among these female scholars Annemarie Schwarzenbach and her tireless research activity in the rediscovery of Persia must be included. For Schwarzenbach the archaeology and "the recovery of the buried origins" are an excuse to escape, avoiding the lack of a "healthy" constructiveness that the cultural milieu of her time required. She tried to move forward on an unknown path and towards an uncertain knowledge, no longer accompanied by the awareness of the incomparable greatness of the past of which only the "misery of crumbling ruins" remained.

6 THE ARCHAEOLOGICAL ACTIVITIES OF ELEONORA BRACCO IN BASILICATA (1933-1961)

Donnici, Fabio (Università degli Studi della Basilicata)

Although still little known, Eleonora Bracco (Turin, 1905 - Rome, 1977) was a major figure in Italian female archaeology of the last century. After graduating from Turin in 1928, she completed a three-year postgraduate course in Greek and Roman Archaeology in Rome (1930-1932), during which she was also admitted to the Italian Archaeological School in Athens, where she conducted excavations and research from Constantinople to Mykonos, and from Delos to Samos. In 1933, she was appointed director of the 'Domenico Ridola' National Archaeological Museum in Matera, a role she held for 28 years, dedicating herself actively and, in many ways, 'pioneeringly' to the research, protection and enhancement of the archaeological heritage of the entire province of Matera.

The contribution proposed for this session intends to focus attention on the reconstruction of Eleonora Bracco's activities in Matera, with the aim of recovering the importance of her scientific legacy for knowledge of the Matera area from prehistoric times to the Middle Ages. To this end, an attempt will be made to highlight, on the one hand, the depth of her culture and the breadth of her interests, and on the other, the rigorous scientific approach of her archaeological research, which gave the Matera Museum a leading role among museum institutes in southern Italy.

7 SPANISH SCHOLARSHIP HOLDERS AT THE ISTITUTO INTERNAZIONALE DI STUDI LIGURI (BORDIGHERA)

Berlanga, María José (Universidad de Malaga)

There is no doubt that a fundamental research centre in the development of archaeological science in the 1950s was the Istituto Internazionale di Studi Liguri, founded in 1937 by Nino Lamboglia, of which he was director until 1977, the year of his death.

Using stratigraphic excavation methods and ceramic classification, he innovated and inspired archaeological practice and research in the Mediterranean basin.

In this context, it seems important to delve into the initial training stage as scholarship holders of a group of young Spanish archaeologists at this institute.

An important milestone, but not the only one, for the creation of this link with the future Spanish archaeologists was their participation, in the summer of 1951, in the course organised by the Faculty of Philosophy and Letters of the University of Zaragoza and the Institute of Oscense Studies. In this course, entitled Curso de Técnica Arqueológica, held between Canfranc and Jaca between 6 August and 5 September 1951, Nino Lamboglia gave a session on Roman ceramics and archaeology. Two of the twenty-four participants, María Ángeles Mezquíriz Irujo and Gloria Trías Rubiés, were awarded scholarships to train with the master for a few months after the end of the course.

But we know that they were not the only ones who trained with Nino Lamboglia. They were followed by Ana María Adroer, Matilde Font Sariols, Gabriela Martín Ávila, M. Ángeles Mezquíriz, M. Antonia Muñoz Amilibia, Rosario Navarro Sáenz, Mercedes Roca Roumens, Isabel Rodá and Encarnación Serrano.

Understanding the influence that these months of study and excavation outside their own country and at such a young age had on their future careers provides valuable information for understanding their academic and research careers.

8 FEMININE PRESENCE IN ARCHAEOLOGY AT THE CSIC: THE AUTHORS OF ARCHIVO ESPAÑOL DE ARQUEOLOGÍA DURING THE FRANCO DICTATORSHIP (1939-1975)

Fernández, Alba (Complutense University of Madrid)

The "Archivo Español de Arqueología" journal stood as a prominent journal that, operating under the Consejo Superior de Investigaciones Científicas (CSIC), the Spanish National Research Institute, played a crucial role in disseminating

research within the field of Archaeology. The CSIC housed a dedicated center for archaeology known as the Rodrigo Caro Institute of Archaeology. In the historical studies about the CSIC, women have often been overlooked. The internal structure of the organization exhibited a pronounced hierarchy and male dominance, relegating women, especially during the dictatorship era, to secondary roles such as scholarship holders or assistants. Nevertheless, within the institutes that focused on history and archaeology, the Rodrigo Caro Institute notably showed a higher percentage of women, with some sections surpassing the number of men—a phenomenon considered unthinkable at that time.

“Archivo Español de Arqueología” featured many articles authored by these women and other Spanish and foreign archaeologists. This paper explores the roles these women played as authors in the journal, providing context to their careers and examining the potential networks that may have emerged. Through this approach, we aim to bring to light voices that have been silenced, voices that significantly contributed to the advancement of the discipline during the pivotal decades of the twentieth century.

9 CHASING THE SUN - WOMEN ARCHAEOLOGIST IN POLISH RESEARCH IN THE MEDITERRANEAN BASIN

Wozny, Marzena (Archaeological Museum in Krakow) - Werra, Dagmara (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

In the 20th century, Polish archaeologists researched the Mediterranean basin, including Egypt, Greece and the Middle East. Those researches were mainly associated with Professor Kazimierz Michałowski. With that Professor, after which a research centre at the university, a gallery at the National Museum, several streets, and a school have names. However, other researchers, including women, also researched the area. In the ‘glare’ of such a prominent researcher, it was, and probably still is, challenging to ‘shine’. In this article, we want to focus primarily on those behind the acronym “et al.” or, more specifically, on women archaeologists.

Despite numerous and significant achievements in this field, these researchers have not received a deserved place in the history of Mediterranean archaeology. These women pursued their interest in the area of the ancient world’s great civilisations in science in various ways. In the paper, we will present the activities of selected female Polish researchers involved in Mediterranean archaeology differently. They were associated with universities and museums, excavated, developed collections of Mediterranean artefacts, and produced recognised publications. Those ancient historians represented different generations and had different experiences. They realised themselves as university teachers. We will pay special attention to two women: Mieczysława Ruxer and Maria Ludwika Bernhard. Ruxer studied archaeology in Cracow, was one of the first students of classical archaeology in Poland and later became a professor of classical archaeology in Poznan. Maria Ludwika Bernhard studied and became active as a researcher at the University of Warsaw. She collaborated with Kazimierz Michałowski. She led a Polish excavation expedition in Palmyra. For many years, she headed the chair of Mediterranean Archaeology at the Jagiellonian University in Krakow.

10 CONVERSATIONS BETWEEN SPAIN AND CHINA ON THE HISTORY OF WOMEN IN ARCHAEOLOGY: WHAT WE CAN LEARN FROM EACH OTHER

Dong, Tianyi (Departament d’Historia i Arqueologia, Universitat de Barcelona; Institut d’Arqueologia IAUB) - Díaz-Andreu, Margarita (ICREA; Departament d’Historia i Arqueologia, Universitat de Barcelona; Institut d’Arqueologia IAUB)

China and Spain are two countries characterized by very different locations and trajectories. The first is situated in Eastern Asia, ranking as the fourth largest country in the world, and it has had a communist regime for the past seven decades. In contrast, the second is located in the Mediterranean, considerably smaller, and has undergone a transition from a right-wing dictatorship to democracy during the same period. Given these geographical, political and even cultural differences between both countries, is a comparative exercise useful to analyse the history of women in archaeology? This paper will aim to answer this question by reflecting on a series of issues. Initially, we will examine whether concepts and theories applied in one country can be functional in the other, followed by considerations of methodology. We will then compare the political and social context of women in archaeology in both countries to identify commonalities and differences. We will finish the paper by discussing how useful comparative exercises are and what wider lessons we can learn from them.

11 WOMEN AND ARCHAEOLOGY IN SICILY BETWEEN THE MID-20TH AND 21ST CENTURIES

Congiu, Marina (Independent researcher)

The archaeological research conducted in Sicily in the years after the Second World War was strongly characterised by the figures of male archaeologists of great personality, such as Luigi Bernabò Brea, Pietro Griffò, Dinu Adamesteanu, Piero Orlandini, Ernesto De Miro and many others. In a field purely marked by male figures, few female archaeologists were able to make a significant name for themselves until the early 1990s, following the launch of studies on the integration processes of women not only in archaeology, but also in various public and social contexts.

This contribution is therefore intended to highlight the role played by Sicilian women archaeologists in the field of archaeological research and studies between the second half of the 20th century and the present century. At the same time, an attempt will be made to compare the situation of ‘female’ archaeology in Sicily with what was happening in Italy in the same years.

Women, professionals, scientists, contributed, through important excavation campaigns, to the dissemination of the results of their research, which still today constitute milestones in the history of archaeological studies. To give just a few examples, we will mention the excavation campaigns by Rosalba Panvini in Gela and the area around Caltanissetta, by Graziella Fiorentini in Agrigento, the important research work of Paola Pelagatti in Syracuse, the role played by Madelein Cavalier.

12 WRITING THE WOMEN ARCHAEOLOGIST IN ALGERIA: BETWEEN CONTEMPORARY CHALLENGES AND FUTURE ASPIRATIONS

Bourai, Donia (University Center Morsli Abdellah- Tipasa, Algeria)

The woman archaeologist in Algeria embodies much more than a simple researcher of the past’s remains; she is the reflection of a society in motion, defying social and cultural principles to claim her place in a field long dominated by her male counterparts. Its commitment to the preservation of Algeria’s archaeological heritage transcends the boundaries of time and space, offering unique insight into the history and cultural richness of this ancestral land.

In the increased movement of studies through the technological opening, Algeria is confronted with the obligation to assert itself in its research approach and to abolish long-anchored ideals erected under an archaeology shaped by targeted xenogenic reflection. Faced with this challenge, a question arises by itself. What are the chances for Algerian women archaeologists to claim national and international recognition and equal opportunities?

In our presentation, we will address the unique contribution of women in archaeological research in Algeria, the challenges that women in the field face in the face of an inherited, androcentric archeology and, more recently, an out of spite archeology, as well as strategies to promote their participation and recognition in this area. And finally, highlight their stories, their successes, and the perspectives of women archaeologists in Algeria.

739 ANALYSING THE CITY. ARCHAEOLOGICAL SCIENCE APPROACHES TO URBANISATION IN THE MEDITERRANEAN (1000-500 BCE)

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Amicone, Silvia (Archaeometry Research Group, Eberhard Karls Universität Tübingen) - Gleba, Margarita (Dipartimento dei Beni Culturali, Università degli Studi di Padova) - Riva, Corinna (University College London)

Session format: Regular session

The beginning of the Iron Age (12th to late 10th cent. BCE) ushered in a crucial period for the history of the ancient Mediterranean, which manifested in a series of transformative changes, among which was the beginnings of urbanism in the first half of the first millennium BCE (roughly the Iron Age). The development of urban states, spanning from the Aegean to Iberia and from northern Africa to the Alps, generated in turn complex economic system and exchange networks.

Aspects of urban state formation are fundamental for archaeologists, historians, as well as sociologists and economists globally. In archaeology, since Gordon Childe questions have focused on theoretical and methodological perspectives for understanding what cities were and did cross-culturally, and their trajectories.

Yet, despite the enormous potential of natural sciences for understanding the deep past, socio-political change connected to urban growth and its large-scale networks have been little explored in relation to advancements in archaeological science.

With this in mind, the session aims to bring together a broad range of expertise from archaeological science to theoretical perspectives in order to develop interdisciplinary conceptual and methodological approaches to the study of urbanism and its wider implications beyond current narratives.

Key themes will be craft specialization, connectivity, mobility, diet, and landscape change in relation to urbanisation. We welcome studies that make use of materials sciences, remote sensing, bioarchaeology, genetics to explore urbanisation in the Mediterranean.

1 THE MIDDLE POLESINE ON THE THRESHOLD OF PROTO-URBAN TRANSITION: NEW RESEARCH IN FRATTESINA AND VILLAMARZANA (ROVIGO)

Salzani, Paola (Soprintendenza Archeologia Belle Arti e Paesaggio di Verona, Rovigo e Vicenza) - Cardarelli, Andrea (Università Roma la Sapienza) - Cupitò, Michele (Università di Padova) - Bellintani, Paolo (CPSSAE) - de Neef, Wieke (University of Bamberg) - Angelini, Ivana (Università di Padova) - Nicosia, Cristiano (Università di Padova) - Pulcini, Maria Letizia (Direzione Regionale Musei Veneto) - Vicenzutto, David (Università di Padova)

The Middle Polesine region (Rovigo – Veneto – Italy) gains exceptional significance between the 12th and the beginning of the 9th century BCE due to the density of settlements, extraordinary growth of crafts, and exchanges between Europe and the Mediterranean. The “Prima Europa” project, supported by the Cariparo Foundation and coordinated by the Abap Superintendence of Vr-Ro-Vi, involves the University of Padua, Sapienza University of Rome, and CPSSAE of Rovigo in research in Frattesina, Villamarzana, and Campestrin. At Frattesina in Fratta Polesine, known for significant discoveries and excavations carried out in the second half of the twentieth century, recent research and excavations conducted by Sapienza and CPSSAE have yielded important findings. Geophysical and remote sensing investigations have helped define the extent of the settlement on the banks of the Po di Adria and the organization of the settlement according to a regular pattern, originally delimited by orthogonal artificial canals. Excavations have revealed structures delimiting the large village, as well as residential and artisanal structures, confirming the settlement’s role as an important center for production and exchange on an international scale. Between 2022 and 2023, magnetic surveys, intra and near-site coring investigations were carried out in Villamarzana, following which two excavation sectors were established. A section of the settlement’s perimeter and an internal portion of the settlement were identified, revealing a large drainage canal and square structures, both productive and likely residential, confirming the orthogonal housing layout detected by magnetic analyses. The findings so far are attributable to an advanced stage of Late Bronze Age 3 (HaB1). From the residential area excavation, four fragments of Protogeometric pottery have been found, showing comparisons with southeastern Italy. This is an exceptionally significant finding, as it demonstrates for the first time the persistence of relations between the Polesine region and the southern Adriatic.

2 ARCHAEOGEOPHYSICS AND ANCIENT MOTYA'S ARRIVALS, ADMINISTRATION, AND ANCESTORS

Herrmann, Jason (University of Pennsylvania) - Sconzo, Paola (University of Palermo)

It can be argued that ancient urban contexts are where geophysical prospection has made the largest impact in archaeology, as the organization of structures and urban plan can be revealed and linked to socio-spatial phenomena rapidly and without destructive excavation. At ancient Motya (modern Isola San Pantaleo, Sicily, Italy), a major Punic city in the Central Mediterranean, data from extensive magnetic gradiometry, electrical soil resistance, and ground-penetrating radar surveys have allowed us to expand archaeological investigations into yet unexplored sectors of the island site and create a near-complete map of Motya’s urban plan. Analysis of historic records, observations from past excavations, and the results from concurrent controlled surface collection and test excavations have allowed us to discern the timing and nature of many of the architectural and urban elements visible in the results of our multi-sensor survey data, as well as recognize particular construction practices and component materials. With this rich and integrated dataset, we can identify some of the inherited urban traditions upon which the ancient city was founded, as well as trace transformations in the urban plan as the inhabitants of Motya responded to social and political changes over its history. As one of the very few Phoenicio-Punic urban sites that is not covered or destroyed by later phases of occupation, our interpretations are a significant contribution toward broader questions of Punic urban traditions, material identity, and social organization.

3 THE “DIVISION LINES” OF METAPONTO: DECODING TOPOGRAPHICAL ANOMALIES USING LEAST COST PATH

Davidson, Christine (Trent University)

A survey of ancient scholarship and epigraphic evidence regarding the parceling of land in Greek colonial and rural contexts suggests precedent for extensive land division as early as the 8th century BCE. Evidence of an ‘urban grid’ appears in colonial contexts at Megara Hyblaia, Selinous, and Syracuse, with rural applications of similar infrastructure witnessed at sites such as Chersonesos. At these sites roads were established as multifunctional infrastructure, providing both delineation of space and routes of access within the countryside.

Surface survey and excavation in the countryside of the Greek settlement of Metaponto (Basilicata, Italy) reveal a busy extra-urban collection of necropoleis, sanctuaries, and farmsteads. Linear topographical anomalies identified in aerial photography of this region and spanning, at times, dozens of kilometers in length suggest ancient manipulation

of the landscape for a purpose not yet identified with certainty. This paper proposes that a number of these lines represent evidence of land division and travel. Using least cost path (a spatial analysis tool within GIS) to visualize connectivity between farmsteads and rural sanctuaries, this paper identifies locations most likely used for travel and which overlap the anomalous “division lines. These routes would have served as connections between farmsteads and rural sanctuaries of Metaponto in the 5th-3rd centuries BCE and suggest regular use of non-urban sacred spaces by rural inhabitants of the polity. The results of this study suggest that a number of “division lines” represent an extension of the urbanization evident in the city-center. Using a system of roads and canals, the inhabitants of Metaponto applied a standardized delineation of space in the countryside, something which also served to connect farmsteads to nearby sacred spaces.

4 THE RELIGIOUS TOPOGRAPHY OF ARCHAIC THASOS THROUGH GEOINFORMATIC APPROACH

Trippé, Natacha (Université Bordeaux Montaigne-Ausonius; Ecole française d’Athènes) - Kiosak, Dmytro (Université Bordeaux)

The sanctuaries and other sacred places of Thasos are quite well known. From the installation of the colony by Parians in the beginning of the 7th century B. C., the city was dotted with sanctuaries in strategic locations, forming a “religious framework” of the young city around which the public space and residential areas developed. However, there is still a lack of a complete picture of the sanctuaries’ location in the landscape of the island. A systematic study of sources and mapping of available information allowed us to recreate the picture of the emergence and functioning of the temples in their georeferenced position and in a diachronic perspective.

To consider the spatial parameters of landscape-sites interaction and the relation between the particular sites in their chronological context with their surroundings, the least cost path and viewshed analysis were performed using tools of QGIS geospatial software. The sanctuaries of Thasos are ranked according to their viewshed and visibility and clusters of mutual visibility are compared by chronological periods.

5 TRACING HUMAN IMPACT AND LAND-COVER CHANGES IN CENTRAL ITALY THROUGHOUT THE IRON AGE

Antler, Chen (University of Glasgow) - Whitehouse, Nicki (University of Glasgow) - Barratt, Phil (University of Nottingham)

This paper explores how human and environment relationship have developed over the course of the late Holocene on a regional scale, and how this relationship manifested in the transformation of land cover and land use. Focusing on the environmental transformation of Central Italy, we present preliminary results of our investigation into interaction between the local populations and nature through the study of lacustrine sequences. This is part of a broader project exploring the connection between landscape modification and identity, aimed at estimating how the process of shaping new anthropogenic landscapes creates a sense of shared identity among the new local communities, developing and expanding during the Iron Age. The project is based on two models built to evaluate human-environment interactions, first, on a local scale (using a GIS model) and secondly on a regional scale (using a REVEALS mode). This paper will focus on the latter.

Results from the re-analysis of pollen sequences will be presented, from lakes within 100 km from the city of Rome, including Lago di Mezzano, Lago di Vico, Lago Matiganano etc. Using age-depth modeling and the Regional Estimates of Vegetation Abundance from Large Sites model, the paper sheds light on land use practices within the region and presents information on how vegetation responded to interactions and helped to shape the anthropogenic landscape. The issues associated with age modelling and re-use of existing data to study land cover changes and linking these with the archaeological record will also be highlighted, including the challenges and limitations of evaluating landscape transformation and reconstructing chronologies that based on the characteristics of lake sediments and basin systems. Finally, we briefly discuss the significance of this work with respect to the development of Roman local identities, as the landscape was transformed.

6 URBANISM ON THE SUNNY SIDE OF THE ALPS

Gruškovnjak, Luka (University of Ljubljana) - Vojaković, Petra (University of Ljubljana; Arhej d.o.o.) - Prijatelj, Agni (University of Ljubljana) - Grčman, Helena (University of Ljubljana) - Mušič, Branko (University of Ljubljana) - Črešnar, Matija (University of Ljubljana)

Iron Age urbanism is a crucial archaeological research topic dealing with the emergence and characteristics of the earliest cities and processes of centralisation, urbanisation, and even early state formation. Traditionally, Iron Age research in Slovenia has not been concerned with urbanism as data on the internal organisation of central settlements was almost completely lacking. In the wider region, much research on early urbanisation has already been conducted in Etruria, northern Italy and areas north of the Alps, while territories south of the Alps are under-researched and, therefore, represent a significant gap in this narrative.

In this paper, we wish to start filling this gap by presenting research at two extensively excavated prehistoric central settlements in Slovenia, Ljubljana-Tribuna and Pungrt above Ig, located some 10 km apart in central Slovenia. While the lowland Tribuna was established already in the 11th century BC, the Pungrt hillfort seems to have somewhat later beginnings in the 8th century BC.

We will explore the urban attributes of both sites and discuss how they can contribute to the understanding of early urbanism in the wider region. Furthermore, we will explore the importance of micro-geoarchaeological research at early urban sites. Namely, the excavation at Pungrt was accompanied by extensive micro-geoarchaeological sampling, while that at Tribuna was not. By comparing the data gathered at both sites, the paper will demonstrate how micro-geoarchaeological research can significantly improve the understanding of the built environment and the way of life in such settlements.

7 URBAN ECOLOGY AND TERRITORIAL EXPLOITATION IN ARCHAIC ITALY THROUGH MULTI-ISOTOPE RECONSTRUCTION OF PASTORAL STRATEGIES

Trentacoste, Angela (The British School at Rome) - Makarewicz, Cheryl (University of Kiel)

By the middle of the first millennium BC, major Etruscan centres in central Italy possessed the physical attributes classically ascribed to a city, from monumental buildings to organised urban space. Archaeological investigations provide ample testament for the form of these settlements, but how did they function? Settlement hierarchies suggest control over surplus production in an agricultural hinterland and centralised resource extraction, but there is little direct evidence for how and where staple crops and livestock were produced and how their movement to the urban centre was organised: did people and animals flow seasonally across and beyond territories? Were resources drawn preferentially from productive zones or supplied indiscriminately?

This talk presents results from UrbanHerds, a collaborative research project investigating animal management and environmental exploitation in archaic Italy (c. 600–400 BC). Isotopic results ($\delta^{13}C$, $\delta^{15}N$, $\delta^{18}O$, $87Sr/86Sr$) from animal remains from three contemporary Etruscan urban centres offer insight into pastoral strategies and mobility patterns (e.g. transhumance). Study sites represent a range of ecologies and urban trajectories (long/short lived) and thus offer evidence for environmental exploitation and differing strategies of city-landscape interaction across the urban spectrum. Conclusions have implications for urban foodways, the movement of resources, and the nature of territoriality in early urban states.

8 DRESSING THE CITY: TEXTILES AND URBANISATION IN MEDITERRANEAN EUROPE 1000-500 BCE

Gleba, Margarita (University of Padua) - Dimova, Bela (University of Padua)

Textiles are a useful source of information for economic history, because they have often been at the heart of its making. In processes like urbanisation and the Industrial Revolution, textiles have been important means for creating and accumulating wealth, shaping power relations and labour regimes. Thanks to the recent developments in research, archaeology offers a *longue durée* perspective of the textile economy grounded in ever more quantifiable evidence. For the Mediterranean Europe, during the first millennium BC, this evidence comprises hundreds of textile remains and thousands of production tools, as well as images and texts, faunal and botanical data. Scientific analysis and correlation of these diverse sources inform us about regional variation and change over time, supply and demand, economic relations and infrastructure, the mobility of craftspeople, as well as more subtle but salient issues which structured supply and demand, such as what textiles were valued, how textiles were used to materialise identity and difference, and social hierarchies. The paper will summarise the evidence for the role of textiles in the urbanisation of Mediterranean Europe collected by the ERC PROCON project.

9 CRAFTS AND THE CITY: UNVEILING POTTERS' TECHNOLOGICAL TRADITIONS OF ETRURIA AT THE DAWN OF URBANISATION

Amicone, Silvia (Archaeometry Research Group, Eberhard Karls Universität Tübingen; Institute of Archaeology, University College London) - Morandi, Lionello (Department of Civilisations and Forms of Knowledge, University of Pisa; Archaeometry Research Group, Eberhard Karls Universität Tübingen)

During the early Iron Age (late 10th – late 8th cent. BCE), the Mediterranean basin became home to a complex network of seafaring peoples from different parts of the Mediterranean. Dramatic changes in sociocultural complexity occurred around the central Tyrrhenian Sea, particularly in Etruria (central Italy). This area, at the crossroads between the eastern and western Mediterranean, witnessed many important innovations leading to economic and socio-political developments that triggered the transition from villages to the renowned city-states of the Orientalising period (late 8th – early 6th cent. BCE).

Focusing on ceramic production, this presentation aims to shed new light on the technological and related social changes that accompany the transition to urban societies in Etruria and the first development of the Etruscan city-states. To achieve this, our research adopted a comprehensive approach which includes a vast range of scientific analyses to study ceramic technology from a selection of key early 1st Millennium BCE settlements of Etruria. Archaeometric investigations were coupled with systematic geological surveys of the sites' territories, in order to locate and characterise raw material sources that were available to ancient potters.

In our study emphasis has been placed on the technological changes introduced between the end of the early Iron Age and the beginning of the Orientalising period (last quarter of the 8th – first quarter of the 7th cent. BCE), such as the adoption of fast wheel throwing and new pyro-technologies to produce red ceramic coatings, as well as the black ware known as *bucchero*. The adoption of these innovations is traditionally seen as a sign of the emergence of craft specialisation resulting from the deep socioeconomic changes occurring in Etruria at the dawn of urbanisation and cross-cultural contacts with Nuragic, Phoenician and Greek artisan traditions.

10 A 1ST-MILLENNIUM-BC BOOMING ECONOMY? PROVENANCE STUDIES OF TRANSPORT AMPHORAE AT ETRUSCAN VULCI, ITALY

Riva, Corinna (Institute of Archaeology, University College London) - Mise, Maja (Institute of Archaeology, University College London)

The central Mediterranean region experienced a profound transformation in economic dynamics during the middle of the 1st millennium BC, with this trend gaining momentum as Rome expanded towards the second half of the millennium. The city-states of southern Etruria such as Vulci played a pivotal role in shaping the economic landscape of this period. However, despite their undeniable significance, our comprehension of the precise nature and extent of their economic contributions remains obscured. This knowledge gap persists due to the predominant scholarly emphasis on monumental Etruscan sites, from sanctuaries to necropoleis, and the study of fine ware, overlooking the crucial insights coarse ware containers could provide.

To address this imbalance, our study focuses on an ongoing research program centered on Etruscan transport amphorae from Vulci. Through the application of advanced analytical techniques such as microstructural analysis, ceramic petrography, and bulk geochemical analysis, our research aims to shed light on the intricacies of the Etruscan economy. By directing attention to the often-neglected coarse ware containers utilized for transporting agricultural products, we seek to enrich our understanding of the economic dynamics that characterized this pivotal period. This project not only uncovers insights into local amphorae production but also lays the groundwork for implementing long-term strategies to comprehensively study the complexities of the Etruscan economy.

11 PROCESSING THE CITY. DIET, TECHNOLOGY AND INTERACTION IN THE ADRIATIC HUB OF SPINA (NE ITALY)

Mistireki, Aleksandra (University of Berne, Institute of Archaeological Sciences, Mediterranean Archaeology) - Notarstefano, Florinda (Università del Salento, Dipartimento di Beni Culturali, Archeologia Classica) - Zamboni, Lorenzo (Università degli studi di Milano, Department of Cultural and Environmental Heritage, Classical Archaeology)

Recent theoretical advancements and field evidence have contributed to a new understanding of the early urbanisation process in the regions between the Alps and the Mediterranean. The international trade hub of Spina played a crucial role in this framework as a case study of a new foundation in a complex wetland environment, and for its ephemeral, short-lived success.

In addition to field evidence and material studies, archaeological science provides unprecedented data for reassessing crafting traditions, trade networks and daily habits within the multicultural population of Spina.

For example, an international collaborative project analysed dietary trends by applying chemical analyses to organic residues found on pottery vessels. Based on a large sample of 4th century BCE ceramic containers, cooking ware and tableware, the study aimed to investigate their function and use through the application of gas chromatography-mass spectrometry (GC-MS). The preliminary results suggest that most cooking vessels were used to process animal fats or vegetables, while fish consumption did not play a significant role in the diet, as only a few samples contained marine fats. Tableware was primarily used for consuming meat. In addition to wine trade and consumption, some containers appear to be related to the usage of pitch. Pitch was used to coat containers and, as we argue, in relation to building activities such as restoring and maintaining wooden housing structures.

Our objective is to compare these archaeometrical results with other recent natural science and environmental data to investigate the singularity of Spina in the context of cross-cultural and adaptive forms of ancient urbanism.

12 PRODUCING FOR THE CITY? THE INTENSIFICATION OF CERAMIC PRODUCTION IN IRON AGE SW EUROPE

de Groot, Beatrijs (The University of Edinburgh)

The Iron Age saw the emergence of a new mode of ceramic production across different regions of the western Mediterranean. Pottery workshops, marked by the presence of double chambered updraught kilns and the use of the potter's wheel, spread across the Iberian Peninsula and similar innovations took place across Gaul and the area north of the Alps. The shift to producing pottery in dedicated workshops suggest that more specialised and intensified forms of ceramic production were on the rise and such processes are traditionally seen as a key feature of urbanisation. In SW Europe, however, the characteristics of early urbanism are variable and perhaps better captured by the term 'low density urbanism'. Furthermore, in several cases pottery workshops are found in association with relatively small hill-fort settlements instead of larger centres.

In this presentation I will compare and contrast examples from my work on the first wheel-made pottery from across the Iberian Peninsula and southern Germany to address the varying characteristics of craft production, urbanism and production intensification across SW Europe. This work draws upon archaeometric analyses to consider the identity and motivations of people adopting the potter's wheel across the region and find out if and how they might have been 'producing for the city'.

13 THERE ARE SPECIALISTS NOT ONLY IN THE CITIES: CERAMIC PRODUCTIONS FROM THE FIRST IRON AGE IN THE INTERIOR OF IBERIA

Padilla Fernández, Juan Jesús (Universidad de Salamanca)

In Archaeology, studies on cities have always had a particular interest. Above all, they have served to justify the social, economic, and political model that laid the foundations of our Western world after the Enlightenment. In this sense, the concept of civilisation is directly related to creating complex cities and states. The Iron Age of the Mediterranean area is configured as a critical period to understand the past in terms of progress. In this time frame, distances become increasingly smaller, social and economic differences accentuate, and large urban centres emerge responsible for articulating and capitalising on these realities. The generation of this type of discourse in the Iberian Peninsula has traditionally motivated the vision of two contrasting worlds. On the one hand, cosmopolitan societies connected commercially with the Phoenician and Greek spheres flourished around the Mediterranean coastal area, capable of creating the first cities in the West, such as Gadir. On the other hand, inland communities live in small, isolated villages and only have occasional contact with the cultural splendour of the Mediterranean. However, studying the ceramic production processes typical of these inland towns refutes this assumption. Real specialists would live and develop technical gestures linked to kinetic energy control and specific surface treatments identical to those carried out in more southern and coastal areas. The evidence of the power of these technical guidelines serves, firstly, to associate the processes of ceramic specialisation with environments that are not necessarily urban and, secondly, to demonstrate that the ties of cultural reciprocity in Iberia would be more intense than previously imagined.

14 BETWEEN MEDITERRANEAN AND CENTRAL EUROPE: CONNECTIVITY AND TRADE ASSOCIATED WITH BIOLOGICAL PRODUCTS IN THE MIDDLE OF THE 1ST MILLENNIUM BCE

Rageot, Maxime (University of Tübingen) - Sacchetti, Federica (UMR 7299-CCJ (Aix-Marseille University - CNRS - Ministry of Culture))

Around the middle of the 1st millennium BC, the urban phenomenon took hold in the north-western Mediterranean. Stimulated in northern Italy by the Etruscans and in southern France by the Greeks, it led to the development of complex trade networks that spread to central Europe, characterized at this time (6th-5th BC) by the princely phenomenon theorized by W. Kimmig.

Based on the study of the spread of transport amphorae from all over the Mediterranean basin between Marseilles and central-western Europe, this paper will: (i) propose a theoretical model for the exchange of biological and perishable products transported in amphorae; and (ii) present the results of analyses of organic residues from these amphorae.

Our research focuses on biological resources transported and stored in amphorae which were associated with craft, diet and trade activities.

Based on molecular markers, we identified various plant by-products as tars, resins, oils and fruit products and provided new insights into the role of Marseille in trade and possibly redistribution of biological resources between Mediterranean and central Europe.

15 SCENT AND THE CITY: URBAN SMELLSCAPES AT THE OASIS OF TAYMA, NORTHWEST ARABIA

Huber, Barbara (Max Planck Institute of Geoanthropology, Department of Archaeology; University of Tübingen, Institute of Archaeological Science; Centre Européen de Recherche et d'Enseignement des Géosciences de l'Environnement (CEREGE)) - Weigel, Friedrich (German Archaeological Institute, Orient Department) - Hausleiter, Arnulf (German Archaeological Institute, Orient Department)

Throughout history, urban centers have been places, where culture, economy, technology and everyday life converge to shape society. While much attention has been paid to the visible facets of ancient cities, one aspect that often remains overlooked is the olfactory landscape that defined urban life. In antiquity, as in the modern world, cities were not only centers of visual and auditory stimuli, but also repositories of a rich tapestry of scents and smells. They have historically influenced the spatial arrangement of cities and settlements, often relegating malodorous sectors and industrial areas to the outskirts or downwind from populated areas. Moreover, aromatic substances, including incense, spices, and other aromatic materials, have been deeply embedded in the socio-cultural practices of societies during the 1st millennium BCE.

This paper investigates the olfactory dimension of urban life, with a particular focus on the ancient oasis city of Tayma, Northwest Arabia. Positioned strategically along the Incense Road, Tayma played a pivotal role in the transportation of aromatic materials to the Mediterranean, offering a compelling case study for understanding the relationship between scent, urban life and aromatics trade. Employing metabolic profiling techniques such as GC-MS and LC-MS/MS, we analyzed organic residues recovered from incense burners across various locations within Tayma. Our study encompassed different contexts, such as temple complexes, residential areas, and burial sites, revealing the deliberate selection of specific aromatic materials embedded in a multilayered urban smellscape of its own. Additionally, temporal trends in incense material usage are identified, indicating a shift from locally sourced aromatics to a prevalence of frankincense during the mid to late 1st millennium BCE. This biomolecular approach offers a comprehensive understanding of the olfactory aspects of urban life, shedding light on the sensory dimensions that influences the lives of urban inhabitants.

16 HOW TO BE BOTH: INTEGRATING METHODOLOGIES, DISCIPLINES AND SCALES IN THE STUDY OF IRON AGE MEDITERRANEAN URBANISM

Pollard, Dominic (New York University)

This paper offers a theoretical reflection on how to maximise the contributions of archaeological science approaches to the study of Iron Age Mediterranean urbanism. A recurrent issue in studying urban communities is their implicitly multi-scalar nature. Such settlements operate over multiple scales not only spatially (integrating local and more distant landscapes and resources), but also socially (housing diverse populations, organised in intricate economic, cultural, and political networks) and chronologically (comprising an ever-changing built environment, evolving at differing tempos to smaller, less complex habitations). Theorising how ancient urban communities in the Mediterranean developed and evolved across these multiple nested scales, whilst maintaining their unity as an analytical category, remains a thorny and stimulating area of study (one which notably led Horden and Purcell to reject the urban category outright). Ongoing advances in archaeological science have much to offer the study of urban and urbanising communities, which in the Iron Age came to exist on all shores of the Mediterranean Sea. But the results of these methods (be they aDNA or skeletal isotope studies, material science, or spatial analysis utilising remote sensing) themselves typically correspond to only certain temporal, spatial or social scales of past human activity. A key question, therefore, is how the resolution of these various methods can be brought most meaningfully into dialogue with more traditional archaeological methodologies, and current, multi-scalar theorisations of past urban systems. In this paper, I suggest that an alignment should be sought between the analytical scales of archaeological scientific techniques, and the spatial, temporal and social scales at which we theorise urban phenomena, such that each may structure and inform the other, leading to the application of methods best tailored to addressing the key questions of Iron Age Mediterranean Urbanism.

743 ISOTOPIC BASELINES AND BEYOND: EXPANDING ARCHAEOLOGICAL NARRATIVES AND REEVALUATING THE USE OF BASELINES IN ISOTOPE BIOARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Salesse, Kévin (Department of Anthropology, Masaryk University) - James, Hannah F. (Archaeology, Environmental changes & Geo-Chemistry, Vrije Universiteit Brussel) - Kootker, Lisette (Department of Earth Sciences, Vrije Universiteit Amsterdam) - Cheung, Christina (Department of Anthropology, Chinese University of Hong Kong)

Session format: Regular session

Isotopic analysis is now a common tool in archaeological studies, being applied to answer diverse questions about diet, mobility, trade, and landscape use. A fundamental aspect of enabling meaningful comparisons of individual measurements within the broader context of bio- and zoo-archaeological research lies in the construction of comprehensive baseline datasets from modern and archaeological samples (environmental data, faunal or human remains) for a variety of isotope systems (carbon, nitrogen, oxygen, strontium, sulphur). These baselines allow researchers to address different, more complex, and broader research questions, such as the development of isoscapes for elements like strontium, oxygen, and more recently, sulphur, which facilitates the assessment of mobility in ancient populations or the use of faunal data for modelling of past diets. The construction of isotopic baselines is often difficult, time-consuming and expensive, and sometimes samples are just not available, which given their applicability and usefulness, underlines the paramount importance of increased availability of the data for research.

In this session, supported by IsoArch (www.isoarch.eu) a community-driven, open and collaborative database of georeferenced isotopic measures of samples from all time periods and all around the world, we extend a warm invitation to researchers both building and using baseline isotopic data. We seek contributions to further expand the interpretations and narratives achievable through isotope analysis on human, faunal, or material remains from any place or time period. It is crucial to acknowledge that baselines are dynamic and are continuously evolving over time, which allows for the reinterpretation of legacy data. Accordingly, we encourage presentations revisiting past interpretations from isotopic data in light of new baselines. Lastly, we especially welcome presentations that delve into misapplications of isotopic baselines, and presentations that highlight the integration of archaeological information alongside isotopic measurements.

ABSTRACTS

1 BACK TO BASELINES

Snoeck, Christophe (AMGC, Vrije Universiteit Brussel)

Isotope analyses have become standard in bioarchaeological studies, offering invaluable insights into various aspects such as diet, mobility, food sourcing, landscape utilisation, and beyond. A prerequisite for interpreting bioarchaeological isotope data accurately is the establishment of a baseline dataset tailored to each isotopic system (H, C, N, O, S, Sr, Pb, etc.).

These baselines require adequate samples. For carbon and nitrogen isotopes, for example, analyses on zooarchaeological and archaeobotanical remains can provide a base for the potential dietary inputs, and can indicate diet or landscape use. For strontium isotope results, measurements on modern plants or (archaeological) rodents provide a baseline for the local environment for the study of palaeomobility.

Drawing on examples from diverse regions across Europe, this paper will highlight the benefits of using relevant baseline data, while examining the common challenges encountered by researchers using isotopic analyses. Lastly, the presentation will discuss where the field is moving forward, including the application of novel isotopic systems, and the integration of additional details to strengthen the robustness of bioarchaeological predictions.

2 COPING WITH LOESS: ENDEAVORS TO ESTABLISH AN 87SR/86SR BASELINE IN THE LOWER DANUBE RIVER VALLEY

Tafari, Aurélien (Research Institute of the University of Bucharest, ArchaeoSciences Division, University of Bucharest) - Tykot, Robert (Department of Anthropology, University of South Florida) - Lazăr, Cătălin (Research Institute of the University of Bucharest, ArchaeoSciences Division, University of Bucharest) - Salesse, Kévin (Department of anthropology, faculty of Science, Masaryk University) - James, Hannah (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel)

Soils formed on loess sediments are among the most fertile agricultural lands in Europe. Consequently, they have attracted ancient communities since the onset of the Neolithic. However, it is often assumed that their homogeneity and the vast surfaces they occupy constitute an obstacle to rely on strontium isotopic ratios to study ancient mobility. In addition, while considerable efforts have been deployed to characterize the strontium isotopic signature of the Transdanubian area, only a few studies have used strontium ratios to study past mobility in the Lower Danube River Valley. Thus, it remains uncertain which bioavailable strontium isotopic values should be expected there, which makes it difficult to interpret the results of strontium isotopic analyses on human or animal tooth enamel in this region of the world. This contribution presents our endeavors to remediate to this situation by developing a bioavailable strontium isotopic baseline, based on 60 plant samples collected at 20 different locations in Romania and Bulgaria, as well as the challenges to interpret these results at the light of previous strontium isotopic studies in the area.

3 TOWARDS A STRONTIUM ISOSCAPE FOR POLAND: DATA COLLECTION, CHALLENGES AND POTENTIAL

Dudek, Paulina (University of Gdansk) - Tarasow, Natalia (University of Gdansk) - Michalak, Oliwia (University of Gdansk) - Regina, Kamil (University of Gdansk) - Pospieszny, Łukasz (University of Gdansk; University of Bristol)

The first strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) measurements on Polish environmental samples were made in the 1980s. However, the systematic analysis of human remains using this system only gained traction in the last decade. While these studies offered initial insights into human mobility and provenance, they also gave rise to unanswered questions. Additionally, issues related to sample selection, collection, preparation, data publication, and interpretation have become apparent.

Therefore, establishing local Sr ranges and a national isoscape requires careful evaluation of existing human and baseline sample data. It is crucial to combine Sr values with geological, environmental, and archaeological contexts, along with results from other scientific analysis.

This paper introduces a project that compiles all published strontium isotope results for Holocene human remains in Poland. Our focus is particularly on addressing challenges and limitations related to data cleaning and standardization. Additionally, we aim to discuss the potential of large human remain datasets for calculating local Sr baselines, especially for periods/sites lacking faunal remains or areas too polluted for contemporary environmental samples.

Re-analysing existing data can lead to the creation of new interpretations and narratives. In extreme cases, revisions to previous findings might be necessary, such as concerning community mobility or the origin of identified immigrants. We will showcase how the quantity, quality, and methods of modelling/visualization of data can significantly alter perspectives.

4 EXPLORING DIFFERENT APPROACHES TO ISOTOPE MAPPING AND MODELLING FOR A DYNAMIC STRONTIUM ISOSCAPE – A CASE STUDY OF BELGIUM

Sengeløv, Amanda (Research Unit Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles, CP192, Avenue F.D. Roosevelt 50, 1050 Brussels, Belgium; G-Time Laboratory, Université Libre de Bruxelles, ULB, CP160/02, Avenue F.D. Roosevelt 50, 1050 Brussels, Belgium; Department of Archaeology, Ghent University, Sint-Pietersnieuwstraat 35, 9000 Ghent, Belgium) - Capuzzo, Giacomo (Bagolini Laboratory: Archaeology, Archaeometry, Photography (LaBAAF), Department of Humanities, University of Trento, via T. Gar 14, 38122 Trento, Italy) - Dalle, Sarah (Department of Archaeology, Ghent University, Sint-Pietersnieuwstraat 35, 9000 Ghent, Belgium; Research Unit Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050, Brussels, Belgium) - James, Hannah (Research Unit Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050, Brussels, Belgium.) - Sabaux, Charlotte (Research Unit Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles, CP192, Avenue F.D. Roosevelt 50, 1050 Brussels, Belgium; Department of Archaeology, Ghent University, Sint-Pietersnieuwstraat 35, 9000 Ghent, Belgium; Research Unit Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050, Brussels, Belgium) - Legrand, Emma (Research Unit Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050, Brussels, Belgium) - de Mulder, Guy (Department of Archaeology, Ghent University, Sint-Pietersnieuwstraat 35, 9000 Ghent, Belgium.) - Mattielli, Nadine (G-Time Laboratory, Université Libre de Bruxelles, ULB, CP160/02, Avenue F.D. Roosevelt 50, 1050 Brussels, Belgium) - Snoeck, Christophe (Research Unit Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050, Brussels, Belgium) - Vercauteren, Martine (Research Unit Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles, CP192, Avenue F.D. Roosevelt 50, 1050 Brussels, Belgium)

In recent years it has become evident that there is a growing need for a Belgian biologically available strontium (BASr) isoscape, and it has also become clear that one isoscape does not fit all archaeological and forensic questions. This study therefore focuses on exploring various approaches to strontium (Sr) isotope mapping and modelling in order to create a dynamic isoscape for Belgium, with a specific emphasis on its implications for archaeological studies. Belgium serves as a compelling case study, as it allows navigation through diverse landscapes and an examination of the intricate strontium isotopic signatures embedded in and between geological, ecological, and anthropogenic samples.

By employing high-resolution spatial sampling of modern various plants (grass, shrubs, and trees; $N > 600$), detailed strontium isoscapes are created, which capture the spatial strontium isotope heterogeneity of Belgium in different ways. Various modelling techniques, such as Empirical Bayesian Kriging (EBK), domain mapping based on lithologies, and voronoi tessellations, are employed, compared and merged, to obtain a dynamic BASr, which can be tailored to specific archaeological research questions. By comparing these approaches, their respective strengths and limitations are not only highlighted but also the importance of methodological choices in interpreting isotopic patterns are underscored.

The insights gained from this study provide a nuanced understanding of the local and regional variations in Sr isotopes, enhancing the accuracy of archaeological interpretations, where precise reconstructions of past human movements and dietary habits are paramount. In addition, by navigating through the BASr's of Belgium, this research provides insights into the applicability and adaptability of different techniques, offering a roadmap for researchers in various fields of archaeology, who seek to explore and interpret their data of diverse geographic and temporal settings using isoscapes.

5 A NEW BIOAVAILABLE STRONTIUM BASELINE FOR THE BAIKAL REGION

Werens, Karolina (School of Archaeology, University of Oxford; Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel) - Pouncett, John (School of Archaeology, University of Oxford) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel) - Schulting, Rick (School of Archaeology, University of Oxford) - Weber, Andrzej (Department of Anthropology, University of Alberta)

A new bioavailable strontium isotope ($87\text{Sr}/86\text{Sr}$) baseline was created for the Baikal region of East Siberia. With an ongoing, extensive archaeological investigation of c. 200 prehistoric cemetery sites in this vast area, there is a need for a reliable isotopic model of environmental strontium variation to contextualise human and faunal data. The new isoscape is based on 349 plant samples, including legacy data and 174 new measurements. The distinct geological variability and biodiversity in the Baikal region which translate into high isotopic variability in the environment provide favourable conditions for isotopic studies and method development. This paper compares and evaluates two approaches to modelling isoscapes: spatial aggregation and machine learning, each used to produce and compare effectiveness of geographic assignments based on strontium isotope ratios measured in dental enamel samples. This study showcases how expanding sampling strategy can improve sample distribution and baseline quality. The new baseline and spatial

assignments scripts can also be applied in other fields: forensics, environmental sciences or ecology, to support studies of provenance and mobility in both the past and present.

6 CREATION OF ESTONIAN STRONTIUM ISOSCAPES: CHALLENGES AND SOLUTIONS

Suni, Raivo (Institute of History and Archaeology, University of Tartu (Estonia)) - Oras, Ester (Institute of History and Archaeology, University of Tartu (Estonia); Institute of Chemistry, University of Tartu (Estonia)) - Tõrv, Mari (Institute of History and Archaeology, University of Tartu (Estonia)) - Kriiska, Aivar (Institute of History and Archaeology, University of Tartu (Estonia))

The use of strontium isotopes in archaeological provenance studies, migration and mobility research is a field that has received much attention worldwide in recent decades. Strontium isoscapes have been created for many countries and regions, based on the spread of bioavailable strontium. These have been particularly wide-spread in Scandinavia and SE Baltics, but Estonia with its area of 45,000 km², has so far been a minor player in this game, with coverage from limited areas and single case-studies.

Our paper represent the preliminary results of creating a bioavailable strontium baseline map for Estonia. We build on a more comprehensive approach of combining geological bedrock data with strontium values measured from animal remains, complemented by further statistical and GIS-based analysis. The results are promising and show that despite the small size of the territory, clear isotope lines correlating with geological formations emerge.

We present the challenges encountered during the creation of the strontium isoscapes in Estonia and propose solutions on how to overcome these. We will reflect on the potential impact of post-glacial coastal elevation and glacier-transported crystalline rock fragments from Fennoscandian shield on strontium isotope values, but also the issue of large variability of Sr values from limited geographical regions, discuss the potential influences from agricultural activities, but also impacts due to dietary peculiarities.

7 MOBILITY OR DIET? THE IMPORTANCE OF INTERPRETING BIOARCHAEOLOGICAL STRONTIUM DATA ALONGSIDE ENVIRONMENTAL BASELINES AND ARCHAEOLOGICAL INFORMATION

James, Hannah (Archaeology, Environmental changes & Geo-Chemistry research group, Vrije Universiteit Brussel) - Cortesão Silva, Filipa (Department of Prehistory and Archaeology, University of Seville, Spain; Research Centre for Anthropology and Health, University of Coimbra, Portugal) - Lima, Antonio (Direção Regional de Cultura do Norte, Rua da Igreja de Ramalde, 1, 4148-011 Porto, Portugal) - Cheung, Christina (Department of Anthropology, Chinese University of Hong Kong, Shatin, Hong Kong; Archaeology, Environmental changes & Geo-Chemistry research group, Vrije Universiteit Brussel) - Gerritzen, Carina (Archaeology, Environmental changes & Geo-Chemistry research group, Vrije Universiteit Brussel) - Griffith, Jacob (Archaeology, Environmental changes & Geo-Chemistry research group, Vrije Universiteit Brussel) - Snoeck, Christophe (Archaeology, Environmental changes & Geo-Chemistry research group, Vrije Universiteit Brussel)

Strontium isotope analysis is a common tool in archaeological studies, providing invaluable information on past human mobility and diet. The interpretation of these strontium data requires additional sources of information, such as an environmental baseline built from modern plants to confirm the local strontium signature or archaeological evidence to identify or restrict potential origins and food sources.

This presentation will discuss the combination of strontium isotope analysis ($87\text{Sr}/86\text{Sr}$ and $\delta 88\text{Sr}$) and concentration ($[\text{Sr}]$) on bioarchaeological samples and highlight the necessity of these avenues of additional information, using a Roman case study from the site of Tongobriga in northern Portugal. A modern plant baseline, consisting of 30 sampling sites within 50km of the site and 78 sampling sites across northern Portugal, has been constructed which identifies the local $87\text{Sr}/86\text{Sr}$, $\delta 88\text{Sr}$ and $[\text{Sr}]$ signatures. Strontium analysis on cremated human remains from Tongobriga necropolis (1st century CE) all returned values not consistent with a local origin suggesting either all individuals were non-local or perhaps the consumption of non-local food resources. In this presentation, these two possibilities will be explored. Using the local plant $87\text{Sr}/86\text{Sr}$, $\delta 88\text{Sr}$ and $[\text{Sr}]$, and archaeological evidence for food sourcing from the site, the potential sources of Sr in the diet will be modelled. Lastly, implications for interpreting strontium data without these two avenues of information will be explored.

8 HIGH-RESOLUTION OXYGEN ISOTOPE ANALYSES OF HUMAN TEETH REVEAL CONSIDERABLE INTRA- AND INTER-INDIVIDUAL VARIATION WITHIN AND AMONG GEOGRAPHIC LOCATIONS

Avila, Janaina (School of the Environment, University of Queensland, Queensland, Australia; Griffith Centre for Social and Cultural Research, Griffith University, Queensland, Australia) - Eerkens, Jelmer (Department of Anthropology, University of California Davis, California, USA) - Soficaru, Andrei (Francisc I. Rainer Institute of Anthropology, Romanian Academy, Romania) - Soltysiak, Arakadiusz (Faculty of Archaeology, University of Warsaw, Poland) - Williams, Ian (Research School of Earth Sciences, The Australian National University, Australian Capital Territory, Australia) - Smith, Tanya (Griffith Centre for Social and Cultural Research, Griffith University, Queensland, Australia; Australian Research Centre for Human Evolution, Griffith University, Queensland, Australia)

Scholars endeavour to reconstruct the histories of past peoples using isotopic signatures in bones and teeth, although such approaches have been limited by lifetime and post-burial (diagenetic) changes. Tooth enamel records dietary inputs throughout formation, does not remodel during life, and resists diagenesis, yielding the natural environmental variation of ingested water via isotopic analysis. Sensitive High Resolution Ion Microprobe (SHRIMP) measurements of oxygen isotope compositions ($\delta^{18}\text{O}$) can be related to daily enamel increments to facilitate sequential weekly sampling over years of growth. Studies of wild primates demonstrate that enamel $\delta^{18}\text{O}$ values track concurrent rainfall amounts with good fidelity [1], and recent humans from Southeast Asia revealed strong similarities to modern annual precipitation trends [2]. Here we present > 9000 $\delta^{18}\text{O}$ measurements from 55 human teeth from 13 archaeological sites and 7 unburied human teeth. Weekly samples taken over ~3 years/tooth revealed ~5 ‰ variation (range ~3 – 8 ‰), with more variation in pre-Industrial individuals. The lowest $\delta^{18}\text{O}$ values (11.6-19.8 ‰) were found in sedentary hunter gatherers from Con Co Ngua, Vietnam (6200-6800 YBP). The highest $\delta^{18}\text{O}$ values (17.9-24.8 ‰) occurred in early agriculturalists from Ali Kosh, Iran (9150-9450 YBP). Overlapping $\delta^{18}\text{O}$ values were evident among prehistoric populations in Southeast Asia and in the Near East, as well as modern individuals from Australia, Canada, Hungary, New Zealand and Romania. We caution against the sole use of oxygen isotope compositions for geolocation—particularly bulk samples, as our fine-scaled measurements show large intra- and inter-individual $\delta^{18}\text{O}$ variation, mainly due to seasonal hydrology.

[2] Vaiglova P. et al (2024) Past rainfall patterns in Southeast Asia revealed by microanalysis of $\delta^{18}\text{O}$ values in human teeth. *J. Arch. Sci.* 162:105922.

9 SHIFTING SANDS: BUILDING A BASELINE FOR SWANDRO, AN IRON AGE COASTAL SITE ON THE VERGE OF DISAPPEARING INTO THE SEA

Koon, Hannah (Department of Archaeological and Forensic Sciences, University of Bradford) - Spindler, Luke (Department of Archaeological and Forensic Sciences, University of Bradford) - Dockrill, Stephen (Department of Archaeological and Forensic Sciences, University of Bradford) - Bond, Julie (Department of Archaeological and Forensic Sciences, University of Bradford)

The Knowe of Swandro is situated on the shore of the small Orkney Island of Rousay. The site has a long chronology dominated by an Iron Age settlement. Due to ongoing severe coastal erosion, the archaeological features at the site have become truncated. However, careful excavation and sampling of these deposits means it is possible to explore the sequential changing subsistence strategies at the site. Initial findings suggested that a greater and more varied range of animals had been exploited to ensure the long-term survival of the inhabitants. Through the latest faunal and isotopic analyses this paper will discuss animal husbandry practices and the exploitation of marine resources as well as wild mammal and bird species. We will discuss sampling strategies, comparisons with the limited faunal isotope data available for this region, and consider the best approach to creating an isotopic faunal baseline that truly reflects the diet at a site with such varied exploitation of animal protein.

10 THE VALUE OF A WELL-DOCUMENTED ISOTOPIC BASELINE FOR MODELLING HUMAN DIETARY PRACTICES: A HIGH-RESOLUTION CASE STUDY FROM THE EARLY NEOLITHIC

Herrscher, Estelle (CNRS, LAMPEA UMR 7269, Aix-en-Provence) - Tacail, Théo (California Institute of Technology, Pasadena, California, US) - André, Guy (CNRS, LAMPEA UMR 7269, Aix-en-Provence) - Hachem, Lamys (Inrap; CNRS, Trajectoires UMR 8215, Paris) - Hamon, Caroline (CNRS, Trajectoires UMR 8215, Paris)

Thanks to the great quality and abundance of archaeological data on the LBK in the Aisne Valley (Paris Basin, France, 5100-4900 BC) a study of isotopic (C, N, S) dietary biomarkers was designed to characterize the relationship between humans and their surrounding natural and anthropogenic environments and understand how the socio-cultural structure can be reflected by dietary choices, at the individual and family levels. The corpus is based on more c. 300

samples of domestic and wild animals and 49 human subjects (20 immatures, 29 adults) from 9 archaeological sites located along the Aisne valley along a west-east gradient, over a distance of around 70 km.

Incorporating a detailed isotopic baseline frame representative of the natural environment and herd management over 200 years, a high-resolution analysis, specific to each site, was carried out to model human dietary practices according to archaeological criteria (sites, types of structures) and biological criteria (age, sex). Traditional isotopes (C, N, S) suggest varied dietary practices between sites/villages, indicating preferential choices in relation to their location close to the Aisne valley and their economic development. Regardless of sex, the adult dietary behaviors were homogeneous across the region and the sites. Immature individuals, differed from adults, with distinct trends depending on the site, suggesting that their diet was also linked to the social status of the deceased and the economic status of the villages. Finally, we critically discuss the outputs of a first Bayesian inference of the contributions of the dietary sources.

This research is funded by the HOMES project directed by Caroline Hamon (ANR-18-CE27-0011-01).

11 FISH(Y) BASELINES. EXPLORING CHALLENGES OF DIETARY RECONSTRUCTIONS IN ANCIENT ROME THROUGH STABLE ISOTOPE ANALYSIS

Salesse, Kévin (Department of Anthropology, Faculty of Science, Masaryk University)

During the 1st and 2nd centuries AD, Rome supported a population of a million with a meticulously managed food supply. While inhabitants enjoyed a diverse selection of foodstuffs from across the Roman Empire and beyond, the majority of staple foods originated from the city's immediate hinterland or regions with convenient access to the capital. At the very least, this is what historians inform us. But what insights do isotope bioarchaeologists provide us with? During this presentation, we aim to synthesize our understanding of isotopic evidence regarding dietary behaviors in the imperial capital, with a particular focus on the consumption of aquatic resources. We will address the challenges and limitations associated with the existing, albeit relatively limited, data, including issues related to the reliability of baselines and modeling. We will explore these aspects in the context of newly acquired data from individuals buried in Region X of the Catacombs of Saints Peter and Marcellinus in Rome.

745 REMOTE SENSING OF THE CHANGING MEDITERRANEAN, MIDDLE EAST AND NORTH AFRICA REGION

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Rayne, Louise (Newcastle University) - Cigna, Francesca (CNR (National Research Council)) - Tapete, Deodato (ASI (Italian Space Agency))

Session format: Regular session

Landscapes of the Mediterranean, Middle East and North Africa (MedMENA) region are characterised by both long-term processes and transformative events, often across large scales. The bird's eye view offered by remote sensing as well as increasingly powerful computing options and algorithms are now allowing these landscapes to be digitally modelled and investigated. Spaceborne and aerial data including optical imagery, SAR and Lidar are used by many studies to locate previously unknown sites, characterise landscapes and model past land use. Due to the wide global and temporal coverage offered by some of these datasets, monitoring and mapping for heritage management purposes is also increasingly undertaken. Open-source software (e.g. QGIS, Google Earth Engine) and datasets such as Copernicus facilitate comprehensive and democratic uptake of remote sensing applications in archaeology, while high resolution sensors allow detailed and focused analyses. Integration of historical datasets such as declassified imagery stretches back possibilities with time series and can often lead to capture of now-destroyed features.

The MedMENA region now faces significant challenges including climate change, pressures on resources and conflict. These threaten both the survival of archaeological sites and the traditional productive landscapes which have developed over long periods of time. Remote sensing technologies offer some degree of mitigation through preservation by recording as well as demonstration of the functioning and complexities of long-term land use which could inform future adaptation strategies.

This session therefore welcomes papers showcasing the contribution that remote sensing, machine learning, historical imagery and maps currently provide to unveil the impacts of such environmental and anthropogenic changes and challenges. Presentation of outcomes from regional to local scale archaeological studies is also encouraged.

1 HUMANITARIAN MAPPING SERVICE: CULTURAL HERITAGE DURING HUMANITARIAN CRISES

de Gruchy, Michelle (United Nations Satellite Centre (UNOSAT))

The world faces significant challenges including climate change, natural hazards, and conflict, resulting in humanitarian emergencies. When humanitarian emergencies occur, nation states and UN agencies can request assistance from the United Nations Satellite Centre (UNOSAT) to obtain a rapid map of the situation produced by remote sensing or image analysis of satellite imagery, typically within 24 hours, in order to facilitate the prioritization of resources and distribution of aid to the affected region(s). This can, and increasingly does, include rapid mapping of cultural heritage. For longer term humanitarian emergencies, such as an ongoing conflict, nation states may request regular monitoring, including monitoring of cultural heritage. This presentation provides an introduction to UNOSAT's humanitarian mapping service and the International Charter Space and Major Disasters that supports the service, as well as an overview of recent humanitarian emergency case studies involving cultural heritage across the Mediterranean, Middle East and North Africa (MedMENA) region.

2 ASSESSMENT OF THE IMPACT OF THE RECENT STORM DANIEL ON DERNA, EAST LIBYA, USING REMOTE SENSING

Mahmoud, Ahmed (University of Leicester) - Buzaian, Ahmed (University of Leicester) - Al-Kawash, Abduslam (Retired Archaeologist)

Derna is a coastal city located on the north-eastern part of Libya, at the end of a narrow wadi named after the city, c. 70 km east of Cyrene. It is situated in a fertile region with ample water resources. Derna suffered significant devastation as a result of the powerful impact of Storm Daniel, which struck the city early in the morning on the 10th of September 2023. The city's vulnerable geographical location made it especially susceptible. At the height of the rainstorm, a substantial volume of water accumulated behind two already weakened earthen dams constructed along the wadi in the early 1970s. As the storm raged, the two dams eventually collapsed, leading to the release of a torrent of floodwaters causing profound and extensive destruction. This influenced not only the present-day urban area, resulting in severe human loss, but also made a lasting impact on the archaeological heritage.

This paper uses a novel remote sensing technique, EAMENA Machine Learning Automated Change Detection (EAMENA MLACD), that uses cloud computing services i.e., Google Earth Engine, to assess the impact of flash floods on urban areas and heritage sites in Derna. Additionally, high-resolution satellite images, such as MAXAR, have been utilized to accurately evaluate the scale of destruction caused by the storm.

The floods, while causing destruction to modern buildings along the wadi, unveiled remains of fortifications associated with ancient Darnis, which can be observed from the high-resolution satellite images. Evidence of waterproof concrete blocks indicates the implementation of measures to protect the city from floods dating back to the Roman and Byzantine periods. Remains of a pottery kiln were also detected. Furthermore, a partially preserved marble statue reportedly recovered from the debris. All these discoveries serve as a testament to the rich history and archaeology of the city.

3 THE ALCEO PROJECT: DEEP LEARNING MEETS REMOTE SENSING FOR HERITAGE PROTECTION IN THE MENA REGION

Chiricallo, Elena (Istituto Italiano di Tecnologia; Università Ca' Foscari) - Sech, Gregory (Istituto Italiano di Tecnologia) - Salvi, Maria Cristina (Istituto Italiano di Tecnologia) - Giovanelli, Riccardo (Istituto Italiano di Tecnologia) - Poggi, Giulio (Istituto Italiano di Tecnologia) - Traviglia, Arianna (Istituto Italiano di Tecnologia)

Illicit undocumented excavations (looting) present a significant threat to archaeological sites, leading to irreversible damages that have a detrimental impact on archaeology and local communities. Remote sensing surveillance has emerged as the most efficient method for monitoring instances of looting, overcoming the challenges of inspecting inaccessible or hazardous locations. However, analysis of the data is still often conducted through visual inspection of the imagery, leading to potential loss of information and preventing the development of time-effective monitoring systems.

Within the Automatic Looting Classification from Earth Observation Activity (ALCEO) project, we developed a deep learning-based Change Detection method to automatically monitor endangered cultural heritage sites. Through this method, ALCEO automatically detects and segments appearing looting pits between two subsequent image acquisitions. In this way, a time series of very high-resolution satellite optical imagery can be used for monitoring and analysing changes in looting intensity. Three geographic areas of the MENA region, known for being severely affected by the looting phenomenon, have been selected and studied using archived remote sensing data spanning the last two decades. These areas are Ebla and Dura Europos in Syria and Aswan in Egypt.

The results of ALCEO were assessed in a ground truth campaign conducted in Aswan in 2023 and refined through a "human in the loop" approach, which served to improve the reliability of the model and of newly detected features. Model inferences by ALCEO can be used to create risk maps and study the evolution of the number and patterning of looting activities. This can help local and international law enforcement agencies understand the behaviour of looters and, therefore, prevent and anticipate their illicit activities. Moreover, it is a significant step toward a near-real-time monitoring system for cultural heritage preservation in the MENA region.

4 ARCHAEOLOGICAL PROSPECTION AND CULTURAL HERITAGE MONITORING WITH SATELLITE SAR IMAGERY IN ROME (ITALY)

Tapete, Deodato (Italian Space Agency (ASI), Rome, Italy) - Cigna, Francesca (National Research Council (CNR), Institute of Atmospheric Sciences and Climate (ISAC), Rome, Italy)

Space-borne remote sensing has increasingly supported archaeological and cultural heritage applications over the past century, and Synthetic Aperture Radar (SAR) imaging has played a key role in advancing this application field. In this work, SAR data capabilities for archaeological prospection and cultural heritage site monitoring are investigated and demonstrated through two case studies from the wider Province of Rome (Italy). Medium to very high resolution SAR scenes acquired by the RADARSAT-2 and Copernicus Sentinel-1 missions using the C-band, ALOS-1 using the L-band and COSMO-SkyMed using the X-band are exploited to trial the detection of crop marks at (semi-) buried and sub-surface archaeological features in the archaeological landscape of Ostia-Portus. The analysis highlights a progressive increase in the detectability of smaller archaeological features when moving from L to X band, from co- to cross-polarizations, and toward finer spatial resolutions. Big data stacks of Sentinel-1 imagery are also processed with the parallelized Small Baseline Subset (SBAS) multi-temporal Interferometric SAR (InSAR) method to extract ground displacement time series and monitor the stability of cultural heritage assets within the UNESCO World Heritage Site (WHS) of Rome. Several hotspots showing significant land deformation (mainly indicating the occurrence of subsidence) can be identified, such as in the area of Fiumicino International Airport and along the Tiber River alluvium, involving monuments and heritage assets. Land subsidence patterns distributed along the Tiber River course are spatially confined due to subsurface geology and interactions with urban development. In addition to the well-known subsidence patterns within the UNESCO WHS, at Basilica Saint Paul Outside the Walls and Grotta Perfetta valley, Sentinel-1 InSAR results highlight a clear subsidence pattern with rates up to -0.9 cm/year affecting the residential quarter of Valco San Paolo. This work is carried out in the framework of ESA and Chinese MOST Dragon-5 SARChaeology project.

5 UTILISING HEXAGON (KH-9) DECLASSIFIED SPY SATELLITE IMAGERY TO DETECT HISTORIC WATER MANAGEMENT FEATURES IN NORTH AFRICA

Makovics, Jen (Newcastle University)

Since the declassification of the CORONA Program in 1996, US Cold War Era satellite program imagery has become an indispensable tool for remote sensing. The final Cold War satellite program, HEXAGON (KH-9, 1971-1986), was declassified in 2002 with imagery recently released in 2020. HEXAGON Program imagery presents several advantages over CORONA. It offers the highest spatial resolution combined with the most expansive geographic footprint of any Cold War satellite and is of especially high quality in the MedMENA region. In this respect, HEXAGON rivals much of the modern open source and commercial imagery available, in particular because it also provides a snapshot in time that is unattainable through any other means. HEXAGON's high temporal resolution also offers advantages such as the establishment of TAQ and TPM dates. Accurate orthorectification is problematic due to the camera parameters remaining classified, but despite this, the imagery's archaeological research potential is immense.

This presentation will offer a brief overview of recent efforts to orthorectify and utilise HEXAGON imagery in tandem with modern satellite imagery to conduct remote sensing of two North African oases to identify historic water management features. Skoura Oasis in Southern Morocco and Kharga Oasis in the Western Desert of Egypt have both relied upon traditional networks of underground draining galleries (khattara/qanât) to abstract water. Though qanat use in Kharga has nearly disappeared, several khattara still feed and help to maintain Skoura Oasis. These and related features show up particularly well on the HEXAGON imagery. Data gleaned from remote sensing may assist in the understanding of how these oasis communities adapted their hydrologic systems to environmental stressors over the past two millennia, may provide data on the abandonment of water management systems and the oasis, and may also inform future approaches to creating more resilient, water-secure communities in arid locales.

6 MAPPING DESERTIFICATION IN THE MEDMENA REGION

Rayne, Louise (Newcastle University) - Makovics, Jen (Newcastle University) - Irvine, Hope (Newcastle University) - Assi, Lima (Newcastle University) - Hayes-Rich, Emily (University of New Mexico) - Levy, Jackson (Independent) - Bokbot, Youssef (INSAP)

Long-term and complex histories of desertification have led to abandonment of croplands in the MedMENA (Mediterranean, Middle East and North Africa) region. Desertification is now a particularly pressing issue due to the impact of climate change and demands on water resources. In some cases traditional cultivation systems have persisted for long periods and the value of these for informing for future adaptation strategies is increasingly recognised. However, the accurate extent of the ebb and flow of cultivation over time is poorly quantified. This paper will review existing global landcover products. These depict modern or historical croplands or even land degradation but they do not accurately represent the extent of desertification of traditional cultivation systems.

For case studies in southern Morocco, we used open-source satellite data to automatically detect and quantify areas of past desertification, relying on the distinctive reflectance and texture of these abandoned fields to train a machine-learning workflow. In this paper, we will present our methods using Google Earth Engine and the random forest algorithm to classify desertified fields, applied to a data stack comprising a 12-band Sentinel-2 composite and derived tasseled cap components, and a Sentinel-1 VV-polarisation composite. Sentinel-1 and 2 provide resolutions up to 10m, which is sufficient for detecting field surfaces.

Pre-1970s desertification was detected with an accuracy of 74-76% at the case study locations, revealing areas of degraded land abandoned potentially due to a breakdown of irrigation systems. An interdisciplinary approach drawing on archaeological and historical information showed that some of these irrigation and field systems were established in the medieval period and persisted for centuries, before abandonment due to factors including environmental challenges and political and social changes.

7 INVESTIGATING ANTHROPOGENIC AND CLIMATE CHANGE THREATS TO IRAQI ARCHAEOLOGICAL LANDSCAPES WITH SATELLITE IMAGERY

Cigna, Francesca (National Research Council (CNR), Italy) - Tapete, Deodato (Italian Space Agency (ASI), Italy) - Rayne, Louise (Newcastle University, UK) - Makovics, Jen (Newcastle University, UK) - Irvine, Hope (Newcastle University, UK) - de Gruchy, Michelle (United Nations Satellite Centre (UNOSAT), Switzerland) - Jotheri, Jaafar (University of Al-Qadisiyah, Iraq)

Iraq is among the five world countries most vulnerable to climate change impacts. Its cultural landscapes and heritage are exposed to erosion, weathering, abandonment and, eventually, disappearance. An approach combining satellite and on-the-ground observations to investigate anthropogenic and climate change-related processes is being developed in the framework of the Italian National Research Council – UK Royal Society bilateral cooperation programme. The analysis focuses on a wide region spanning between the capital city of Baghdad and the south-eastern sector of the country, encompassing the Ahwar of Southern Iraq UNESCO World Heritage Site, and the Wasit governorate. The analysis workflow capitalises on decades of satellite imagery, including declassified panchromatic data from the United States Cold War Era HEXAGON (KH-9) programme, Copernicus Sentinel-1 Synthetic Aperture Radar (SAR), Sentinel-2 and Sentinel-3 multispectral data, Planet Dove multispectral imagery, plus very high resolution scenes over selected priority sites acquired by commercial optical missions and the COSMO-SkyMed SAR constellation. A standardised image interpretation strategy is adopted to record features representing components of the ancient and traditional landscape of all periods, including tells, forts, canals, water bodies and wells. This includes long-standing landscapes used up until very recently. Landscape changes are captured via Interferometric SAR (InSAR) processing of yearly and monthly pairs of Sentinel-1 and COSMO-SkyMed scenes, and by computing time variations in surface reflectance and vegetation indices (e.g. Normalised Difference Vegetation Index, NDVI) across yearly pairs of Sentinel-2 composites. Country-wide snapshots of sectors impacted by recent dust storms are provided by Sentinel-3 data. The integrated methodology enables generation of satellite-derived products depicting occurred transformations, regional susceptibility and endangered heritage sites. Among the latter, this work showcases 2014-2023 yearly and 2023-2024 monthly change detection maps based on InSAR coherence, spectral and vegetation indices variation, and a regional scale zonation of areas impacted by dust storms occurred in 2022.

8 SPATIO-TEMPORAL CHANGES OF IRAQI WATER BODIES AND MARSHLANDS AND IMPACTS ON CULTURAL LANDSCAPES IN THE CONTEXT OF CLIMATE CHANGE

Azzarone, Eleonora (Italian Space Agency (ASI), Rome, Italy; University of Rome Tor Vergata, Rome, Italy; Telespazio S.p.A, Rome, Italy) - Tapete, Deodato (Italian Space Agency (ASI), Rome, Italy) - Cigna, Francesca (National Research Council (CNR), Institute of Atmospheric Sciences and Climate (ISAC), Rome, Italy)

Recent studies converge on warning about climate change impacts on Iraq's natural resources, including a water shortage crisis. With surface waters projected to dry up within the next 20 years, environmental consequences are

also likely to affect local cultural landscapes and heritage. Indeed, Iraqi archaeological sites and historic settlements, canals and palaeo-landscapes, are often located in proximity to water bodies and marshlands, thus shrink-swell cycles due to drought and flooding caused by extreme events, and consequent surface water run-off and accumulation, may accelerate cultural heritage deterioration, up to severe damage and disappearance. In order to assess the scale of recent impacts, a multi-temporal back-analysis was performed across a 8.000 km² area, spanning from south of Baghdad to Basra. Multispectral Sentinel-2 images were processed to estimate annual changes in water level and marshland surface extent of both permanent and ephemeral lakes (Hammar Lake, Najaf Sea, Hor Al-Shuwaija), artificial reservoirs (Razzaza, El Delmej) and the Ahwar of Southern Iraq UNESCO World Heritage Site. Normalized Difference Vegetation (NDVI), Normalized Difference Water (NDWI) and Moisture Indexes enabled automatic per-pixel image classification, followed by thresholding and, when needed, manual refinement, to assess surface extent changes and spatio-temporal trends of water bodies and marshlands in 2015-2023. The observed divergent behaviour between the analysed bodies highlights a diverse range of situations, and thus different risk levels for heritage assets conservation. The integration with environmental and contextual data, and information from UNESCO reports, confirms the current challenges in preserving historical marshlands and the relationships with anthropogenic activities. This work is carried out during an internship at the Italian Space Agency (ASI) and in the framework of ESA and Chinese MOST Dragon-5 SAR archaeology and the CNR – UK Royal Society “Vanishing archaeological landscapes under anthropogenic and climate change threats” projects.

9 HYMES - THE HYDROGRAPHY OF MESOPOTAMIA. RIVERS AND CHANNELS IN BABYLONIA FROM THE LATE 4TH TO THE 1ST MILLENNIUM BCE

Rutishauser, Susanne (University of Bern) - Novák, Mirko (University of Bern) - Gautschy, Rita (Swiss National Data and Service Center for the Humanities (DaSCH)) - Schrakamp, Ingo (Free University of Berlin; University of Münster) - Zischg, Andreas (University of Bern) - Aloda, Muntadher (University of Bern) - Borkowski, Sebastian (University of Bern) - Červík, Tadeáš (University of Bern) - Dvorak, Sven (University of Bern) - Zbinden, Eveline (University of Bern)

In the late 4th millennium BCE, southern Mesopotamia gave birth to mankind's first urban civilization. This was made possible by favourable environmental, socio-ecological and economic conditions. Given the aridity of the climate in the region, the agricultural set-up depended on irrigation. The interaction between natural processes and human activities led to a hydraulic landscape characterized by a dense network of natural and artificially created canals constituting complex irrigation systems with a variety of hydraulic devices and a corresponding administrative structure. Late 4th to 1st millennium BCE cuneiform texts in Sumerian and Akkadian reflect many aspects of water systems. The data-driven approach of the HyMes project (2024–2027) relies on data mining and formal network analysis to link toponyms and hydronyms mentioned in texts with archaeological data on settlements and remote sensing-based hydrographical network reconstructions. The implementation of data provenance and uniform resource identifiers (URIs) establish external links to existing databases. The outcome is a multi-temporal network of rivers and canals, covering several key periods of Mesopotamian history from the late 4th to the 1st millennium BCE. Each disciplinary dataset will complement the others and help to fill eventual gaps and inaccuracies. Based on this multi-temporal hydrographic network, it will be possible to analyse changes in hydrography and link them with societal evolutions as derived from existing historical and archaeological knowledge and findings. The multi-temporal hydrographic network will then be used to develop a simplified hydraulic model. The model will allow a closer investigation of specific environmental changes such as the increasing aridity on water circulation through the network and foster thereby further analyses on the impact of these environmental changes on civilizations.

10 UNDERTHESANDS: INVESTIGATING ANCIENT IRRIGATION LANDSCAPES IN ARID CLIMATES THROUGH REMOTE SENSING AND DEEP LEARNING METHODS

Bulawka, Nazarij (Institut Català d'Arqueologia Clàssica) - Orenge, Hector (Institut Català d'Arqueologia Clàssica)

The study of ancient irrigation plays a pivotal role in the archaeological investigation of arid landscapes. It covers various topics, including irrigation's role in empires or complex societies, agricultural intensification, communal irrigation practices, and water harvesting techniques. Moreover, each irrigation landscape is unique and requires a particularly adapted set of methods.

This paper outlines the results of UnderTheSands, a project aiming to investigate the application of remote sensing and machine learning methods to the analysis of ancient irrigated landscapes in selected case studies in Iraq, northern Iran, and Turkmenistan. The research integrates HEXAGON imagery, TanDEM-X digital elevation models, and LANDSAT, Sentinel-1, and Sentinel-2 multitemporal multispectral datasets in different parts of the workflow. Levees and paleochannels have been mapped by integrating the result of multitemporal vegetation indices (SMTVI) with Multi-Scale Relief Models (MSRM) calculated within the Google Earth Engine platform. Qanats, a type of underground water distribution system, have been mapped using the YOLOv8 qanat detection model we trained on the black-and-white HEXAGON high-resolution spy satellite images (1971-1986).

The applied methodology allows for a comprehensive understanding of irrigated landscapes. The research investigates the influence of environmental conditions and satellite imagery parameters on the visibility of features such as levees, paleochannels and qanats. Optimal results are achieved by combining several methods, adjusting seasonal parameters, and conducting a comparative analysis of visible features.

11 POST-CONFLICT LANDSCAPES IN EASTERN MEDITERRANEAN: GEOARCHAEOLOGICAL AND AUTOMATED REMOTE SENSING MAPPING OF VULNERABLE ARCHAEOLOGICAL SOILSCAPES IN THE LEBANESE BEKKA VALLEY

Neogi, Sayantani (Institut Català D'arqueologia Clàssica) - Conesa, Francesc (Institut Català d'Arqueologia Clàssica Plaça d'en Rovellat, s/n, 43003 Tarragona, Spain) - Orenge, Hector (Institut Català d'Arqueologia Clàssica Plaça d'en Rovellat, s/n, 43003 Tarragona, Spain)

This paper presents the scopes of the project SIGNATURE working in the Bekaa Valley of Lebanon. This ongoing Marie Skłodowska-Curie research intends to integrate geospatial legacy data coupled with multispectral and radar imagery in a two-fold remote approach to identify and map: 1) historical morphodynamics, to reveal past hydro-geomorphological landforms and short to long-term land use and land cover trends and 2) vulnerable archaeological soils, such as eroded and non-visible mounds, using automated site detection methods. The Bekaa Valley in Lebanon, with its fertile alluvial plains within the Litani and Orontes rivers, has been an attractive land to the populations through millennia. The settlers benefited from the valley orography, the alternate of pasture and agricultural lands and the availability of water sources. As an aftermath of the Lebanese Civil War and the instability resulting from military conflicts, the traditional agronomic landscapes of the Bekaa Valley were severely transformed. Our work will highlight the results from our desk-based assessment on how the Bekaa now offers an optimal scenario to investigate endangered cultural soils through accurate detection, mapping, and prediction of the location of vulnerable archaeological sites and landforms. To do so, we started with the recompilation of legacy data in the form of grey archaeological literature, as well as historical photographic datasets such as CORONA and HEXAGON imagery. The work has continued with the testing and implementation in cloud-computing Earth Observation platforms of automated site detection approaches using long-term satellite constellations, such as the Landsat and Sentinel archival missions.

12 MULTITEMPORAL AND MULTISPECTRAL SENTINEL-2 DATA FOR LANDSCAPE AND PREVENTIVE ARCHAEOLOGY IN THE LOWER VALLEY OF THE CALORE RIVER (BENEVENTO)

Corbo, Antonio (Sapienza University)

In landscapes that have significantly and still continue changing due to urban and infrastructural development, archaeological potential maps and predictive models are essential to unveil surviving archaeology. The availability of high to medium-resolution open-source satellite data offers new opportunities in this respect that are yet to be fully exploited.

The present study is conducted in the district north of Benevento city, southern Italy, and along the lower course of the Calore River in the Telesina Valley. Demonstrative case studies are presented (including excavated archaeological site and others still buried, such as villas, vici, and mansiones) via category of features related to the Roman, Late Antique, and Medieval periods that are characterized based on the spectral behavior as extracted from multi-temporal Sentinel-2 images collected in the period 2015-2023.

Spectral anomalies facilitate the identification and interpretation of new sites of potential archaeological interest, enable a comprehensive study of the area in various ancient epochs, and a better understanding of the human role in the past and current landscape transformation, settlement patterns, and the exploitation of resources and materials offered by the surrounding environment. Our results show how this study can also inform the evaluation and planning of the Municipality Urbanistic Plan (PUC) that the municipalities in the valley are requested to implement.

The chosen context is ideal for the application of this new topographical analysis, because only the eastern part of the area has been studied with traditional methodologies and systematic surveys. Thus the present research is in continuity with previous works, and allows the advancement of archaeological knowledge in the areas of internal Campania.

13 ARCHAEOINFORMATICS: HYBRID APPROACHES AND APPLIED ARCHAEOLOGY

Chroni, Athina (Hellenic Ministry of Education, Religious Affairs and Sports; National Technical University of Athens)

Focusing on the scientific field of archaeology, it is now clear that new technologies claim more and more "space" in matters of geospatial identification and digital georeferencing of archaeological sites, documentation and management in matters of large volumes of multiple types of data, detection and highlighting of relationships, sketching of hypothetical scenarios for the interpretation of archaeological relics, as well as dissemination of scientific-cultural information.

The combination of the sciences of applied archaeology combined with photointerpretation-remote sensing, geoinformatics and archaeoinformatics is proposed as the most fruitful one in the case-study of an area of archaeological interest in southern Greece: excavation data already published (applied archaeology), after photointerpretation-remote sensing laboratory work, can be further studied in a GIS environment, (geoinformatics) in order to digitally reveal their correlation diachronically in various periods of antiquity, thus extracting qualitative and quantitative data (archaeoinformatics) under the perspective of ground control implementation in the area of interest as well as test excavation (applied archaeology).

771 HERITAGE BEYOND CONSUMPTION: A CALL FOR A COLLECTIVE DISCUSSION

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Fiano, Francesca Romana (Università degli Studi di Ferrara) - Di Biase, Federica (Heidelberg University) - Porta, Francesca (Università degli Studi di Bologna)

Session format: Round table (without formal abstracts)

Recently, a series of actions targeting cultural heritage has been promoted by young activists for climate justice. Choosing the symbols of the 'heritage industry' to attract global attention, the activists have posed provocative questions such as: "Are you more concerned about the protection of a painting or the protection of our planet and people?"

No matter our own positioning, the youngest generation is engaging society in a critical discussion about the scale of priorities, including the role of Cultural Heritage. In this context, it is worth pursuing the opportunity of discussing the links between heritage practices and practitioners, and capitalist societies, together with notions of extreme consumerism, heritage commodification and perceptions on these relationalities.

In this sense, a critical collective introspective inquiry might start by evaluating communicative and promotional tools employed within heritage practice. Increased trends in heritage communication have fallen under major marketing trends, encouraging therefore phenomena such as Disneyfication and consumerism. These concepts have already been addressed within the field, yet what this discussion proposes is the exploration of the risks for heritage experts and professionals posed by the society of advanced capitalism, where exploitation is increasingly dramatic.

How do we conceive of a cultural offer avoiding consumerism and the commodification of heritage? Would countering these phenomena prompt the heritage field in becoming an asset for tackling global challenges?

We invite scholars to join a round table discussion on these subjects. Starting with a critical examination on the current state of the cultural offer, we aim to enlighten the boundary between the communication and commodification of cultural heritage and to outline alternative approaches that would allow for heritage to attain an active role in the contemporary society.

772 EMBRACING TRANSDISCIPLINARITY: MULTIPLE WAYS OF SEEING THE PAST THROUGH DIFFERENT ONTOLOGIES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Kristiansen, Kristian (University of Gothenburg and Copenhagen) - Frieman, Catherine (Australian National University)

Session format: Regular session

As researchers of histories of the past, we need ontologies and theoretical frameworks to situate our interpretations. However, these very same ontologies (sometimes viewed as scientific paradigms) also serve as conceptual traps that exclude certain parts of the world from consideration.

Thus, it may be suggested that the past is too complex to be comprehended by (and compressed into) a single ontology/paradigm. We need both cartesian and non-cartesian, binary and non-binary, empirical and interpretative thinking, because all are vital ingredients in past (and present) societies and their wider environmental entanglements. This raises some follow up questions:

1. How should we do this? Can we really reconcile different ontologies, which of course also represent different world views?
2. More mundanely, are we slaves of our terminologies and concepts? All terminologies (from classification to theoretical models) empower and imprison thinking. Their scientific 'raison d'être' is to bring order into chaos to allow comparison and analysis.
3. Does this prevent an integration of the different mindsets? Can our different analytical frameworks be brought into dialogue, given their divergent initial assumptions without violating their meaning?
4. Is it more productive to consider different ontologies as bringing different worldviews to interpretation that need not become integrated?

5. How do we then create an interpretative, transdisciplinary dialogue?

ABSTRACTS

1 WHO GETS TO DRIVE? TRANSDISCIPLINARITY AND THE CHALLENGES OF INTEGRATED APPROACHES IN BIOMOLECULAR ARCHAEOLOGY

O'Connell, Tamsin (Department of Archaeology, University of Cambridge)

Advances in analytical methodologies, particularly in biomolecular analysis, have transformed the information that we can retrieve from archaeological materials. The data yielded is multidimensional, complex and often vast. It typically requires substantial expertise to produce the raw data, then to wrangle it into something manageable. And then it requires interpretation, because the data we produce (genomic, proteomic, isotopic, lipid) are but proxies for the aspects of the past that interest us (origins, kinship, diet, migration, disease).

We can choose to work in silos – each researcher interpreting the data only from their area. Yet that does not leverage the breadth of information we have, nor make for realistic or likely representations.

Questions then arise about how and when and where to integrate our approaches. Such questions are both practical and philosophical. How can we derive interpretations which are consistent with all the observations? Do we combine data or interpretations? What are the implications for our data science approaches? How can we participate in scientific or academic endeavour where our own interests are not paramount? Where one approach may be seen as subservient to others, even if integrated?

Transdisciplinarity is a wonderful aspiration. But it is difficult. I shall reflect on the challenges inherent in biomolecular archaeology as we try to weave the evidence together to produce viable interpretations of the past that are satisfactory and satisfying to all involved.

2 BRIDGING ARCHAEOLOGY AND HUMAN PALEOGENETICS: PROBLEMS WITH EXISTING PRACTICES AND PROSPECTS FOR OVERCOMING THEM

Staniuk, Robert (IoA UCL) - Lee, Victor (Globe Institute, University of Copenhagen) - Timpson, Adrian (GEE UCL) - Kristiansen, Kristian (University of Gothenburg) - Racimo, Fernando (Globe Institute, University of Copenhagen) - Shennan, Stephen (IoA UCL) - Thomas, Mark G. (GEE UCL)

The aDNA revolution in archaeology has often been met with a critical response focusing on the persistent use of simple analytical models, the equating of clusters of genetic similarity with archaeological cultures, and over-simplified interpretations. The postulated panacea for these issues is increasingly collaborative, interdisciplinary and transdisciplinary research, where archaeologists provide more input on the underlying assumptions, data collection, as well as interpretative work. However, this remedy explicitly ignores the already existing network of collaborations between archaeology and paleogenetics. Since archaeology is the discipline that provides the main input in terms of research questions and samples for these investigations, it is worth examining how much archaeological input geneticists incentivize, how the collaboration is reflected in terms of authors participating in different studies, what kind of information is provided by archaeologists, and what limitations these factors imposes on the use of more complex models incorporating both cultural and genetic data.

In this paper we report our results on the statistical analysis of 18 peer-reviewed paleogenetics research papers on European prehistory published between 2013-2023 to discuss the possible drivers of gaps in interdisciplinary research. The investigation is based on the type of research input made by the different disciplines and the quality of reported archaeological metadata. The factors included in the study are: contributions of individual researchers, the ratio of geneticists to archaeologists, the use of separate supplementary files, and the presence/absence of different types of archaeological data associated with the sampled individuals. Based on the results of the analysis, we present tangible solutions for better interdisciplinary research and data publishing protocols.

3 ANCESTRY AND THE GENOME: MOVING BEYOND GROUP-THINKING

Skoglund, Pontus (Francis Crick Institute)

What is ancestry, and what is a genome? Concepts and terminology such as ancestry, population, and migration, have seen increased cross-disciplinary understanding in genetics and archaeology due to continuous dialogue over the past few years, but are still cause for misunderstanding. I will discuss modern concepts of genetic ancestry, and how scientific limitations, such as statistical boosts offered by grouping individuals, can limit an understanding of ancestry that is robust and useful across fields. I will discuss how we can move to an understanding of ancestry that is individual focused, and spatiotemporal, with little need for grouping of individuals by context. I will also discuss how the difficulty of making technical terminology in ancient genomics understandable to archaeologists and curators can impact

arguably the most important mission of ancient genomics: to create future-proof DNA sequence quality data when conducting destructive sampling, allowing future researchers to test older ideas and models.

4 CULTURAL TRANSITIONS AS DRIVERS OF NATURAL SELECTION

Nielsen, Rasmus (University of Copenhagen)

In this talk I will discuss recent advances in methods for detecting natural selection from genomic data and illustrate how these methods can be used to understand how past cultural processes have shaped the current human genetic landscape. Inference of past natural selection provides opportunities for connecting changes in cultural practices with the resulting effects on human biology. For example, the distribution of disease causing genetic variants can often best be understood as a product of past cultural practices and a complex interaction between genetics, culture, and the environment. Recent research on ancient DNA has uncovered a number of examples of this, particularly associated with the Neolithization and the resulting changes in diet and exposure to pathogens, that left a profound footprint on the genomes of modern Europeans. I will also discuss how narratives of past natural selection are shaped by modern biases and at times have contributed to reinforcing racial and gender stereotypes.

5 THE SIGNIFICANT TRANSDISCIPLINARY POTENTIAL OF DESIGN THINKING OF ARCHITECTURE IN ARCHAEOLOGY

Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg) - Toulouse, Catherine (Lengyel Toulouse Architects)

There are numerous reasons for interdisciplinary collaboration, but a different perspective, a different mindset, is a constant given, so that the probability of a benefit for both sides is highly likely. However, the collaboration between two disciplines that initially take fundamentally different paths, as is the case with archaeology and architecture, requires special consideration. It is not about the usual collaboration in which architecture uses its expertise to illustrate archaeological themes in an atmospheric way, but instead about genuine scientific collaboration in which both sides benefit immediately. In particular, the ontology of both disciplines initially provides little overlap. Yet there are definite parallels. Probably the most important is the interpretation, which is empirically generated in different ways on both sides. In many renowned research projects, the authors have translated the initial assumptions of archaeology into images in the closest dialogue with archaeology in such a way that, with a minimum of additions, new insights have been brought to light solely through this translation of media in the thinking of archaeology. This procedure is very familiar in architecture in the general design process and is based solely on capturing assumptions in drawings, regardless of their complexity, in order to lead them back to the original thought process via visual perception. However, the translation of vague assumptions and uncertain knowledge is the particular expertise of architecture, no matter how vague the design ideas and intentions are. The uncertainty is the same, as is the mindset, and on this basis this lecture aims to present and explain the potential of an extraordinary culture of cooperation on the basis of various projects.

6 STONE TOOLS UNDER A DIFFERENT LIGHT: CONSTRUCTING THE TRANSDISCIPLINARY METATOOL ONTOLOGY AND REFLECTING ON ITS POTENTIAL FOR ARCHAEOLOGY

Peixe, Alexandre (Delft University of Technology) - Hernandez Corbato, Carlos (Delft University of Technology) - Şişman, Burak (Delft University of Technology) - Langejans, Geeske (Delft University of Technology)

Ontologies represent and organise knowledge in many fields, including archaeology. In this contribution, we explore the potential of a multi-disciplinary ontology for stone tool production. Its primary function is enhancing data interoperability, facilitating knowledge sharing, and enabling effective information retrieval. However, during ontology development, one is forced to review and rethink assumptions, and this change in perspective can lead to new questions and insights. Our ontology is being built as part of the Metatool project, which aims to provide a computational model of synthetic awareness to facilitate the invention of tools for artificial agents. The Metatool ontology uses early human tool behaviour as a framework to be enriched with computational neuroscience and robotics models. It layered archaeological concepts as a foundation using literature on the earlier toolmakers and toolmaking. The archaeological evidence had to be reframed from a decision-making perspective that mounts up to a tool instead of departing from its final form. The ontology may also place the raw material at the centre, giving it agency, as it were. The ontology would represent the raw material's properties, such as hardness, durability, and availability, as descriptors and relate them with the techniques employed and the shapes produced. This could provide insights into the reasoning behind functional choices and hint at cultural considerations as drivers of the tool-making practices in the absence of those. A unified knowledge structure can streamline the examination of multiple assemblages, identifying patterns and contextualising them within socio-cultural and technological frameworks. Considering the Metatool ontology, we aim that computational neuroscience and robotics models can simulate scenarios to test the ideas raised by ontology analysis. It could validate insights into how functional properties and adaptive advantages relate to specific tool designs.

7 EVERYTHING ALL AT ONCE – REFLECTIONS ON NON-LINEAR DYNAMICS, MODELLING, AND TRANSDISCIPLINARITY IN SOCIAL ARCHAEOLOGY

Giroto, Chiara (Ludwig-Maximilians-Universität München)

Social interaction and structure is a pivotal field of archaeological behavioural modelling and reconstruction. It is also the field in which the researcher's own perception, worldview, and choices impact the result most considerably. Generally, research is based on traces acquired through material remains, settlement patterns, the environment, and human remains. Whilst having fully embraced approaches of "eclectic theory" many associated questions remain – in their very nature – post-processual. Social interactions and structures are cognitive features of society, subjective, and often symbolic. In pre- and protohistory direct and objectively interpretable evidence is missing. Whilst the use of environmental and spatial data might seem more objective than those derived from material culture it faces the same critique as a processual approach. Any factor chosen to reconstruct society is therefore an interpretation – may it be our own view, that of our community of practice or another field of science. Often ontologies differ and transdisciplinary applications of complex models are difficult.

This paper aims to investigate the potential of eclectic ontologies projected on prehistoric data. Employing non-linear algorithms and embracing chaotic system behaviour as a central part of humanity allows for an "everything all at once" approach that far transcends more traditional holistic approaches. It presents a plan of action to bind osteological analysis, material culture, regional material and spatial data databases – all assessed or generated by a single researcher. The application of classical methodologies in the reconstruction of social structures in combination with non-linear statistics as well as machine learning will be used in order to gain a better understanding if the 'hierarchisation' observed in the Central European Urnfield culture is comparable to the process of autocatalytic cycles – a commonly observed behaviour of complex systems.

8 "SPECIALIST" CAN ALSO MEAN "LOCAL": TRANSDISCIPLINARY ONTOLOGIES INTEGRATING LOCALISED KNOWLEDGE AS A KEY TO ARCHAEOLOGICAL PRAXIS

Frieman, Catherine (Australian National University) - Flexner, James (University of Sydney)

Archaeological methodologies rely on flexible epistemologies and the simultaneous embrace of multiple ontological frameworks. The archaeological record – a landscape, a site, an assemblage, an artefact – is and has always been a natural meeting point for diverse experts and narrators of an intrinsically imperfect and incomplete past. To compile meaning from fragments we work across disciplines in teams of specialists ranging from diggers and artefact experts to lab scientists, linguists, historians, and many others. Moreover, although rarely fully credited, local community members, paid diggers, and Indigenous or local interlocutors have shaped the understanding and interpretation of the archaeological past to an enormous extent. This sort of intense collaboration creates archaeology's characteristic kaleidoscopic knowledge patterns that shift as we shift analyses and collaborators and change form as we change audiences and scales of analysis. Here, we focus on the ways that particular localised ways of knowing contribute to archaeological knowledge, drawing on fieldwork experience in Northern Europe and the Pacific region. We consider the permeability of our communities of practice; we reflect on the sorts of craft pedagogies that build a discipline uniquely able to integrate diverse ways of understanding and reconstructing the past; and, recognising that archaeological knowledge has power in the present and can help us face and reshape an uncertain future, we ask how we can compose teams to study the past so that we can use it to create a better future, including on the ground in the places where we do our research.

9 POLITICS, PARADIGMS, AND POSTHUMANISM: DEFENDING PLURAL REALITIES IN AN UNEQUAL ARCHAEOLOGICAL LANDSCAPE

Schreiber, Tanja (Institut fuer Ur- und Fruehgeschichte Kiel; Institut für Prähistorische Archäologie, Freie Universität Berlin)

In this essay, I challenge the push for reconciling diverse ontologies to foster an "interpretative, transdisciplinary" dialogue, cautioning against subjugating alternative ontologies to scientific paradigms. These paradigms, supposedly objective and apolitical, perpetuate a power imbalance evident in the marginalization and exclusion of certain groups from equal participation in Western academic discourse, highlighting the interconnectedness of "truth" and "power". Attempting to unify different ontologies under systems that discredit most of them in the first place is thus futile.

Contrary to this, certain Western theoretical and philosophical approaches, such as Posthumanism and other relational ontological frameworks, view different positionalities actually as strengths, dismissing the need for a division or fusion. Rejecting dualistic thinking, such as "paradigm vs. ontology" or "binary vs. non-binary," I propose recognizing that science-based and alternative knowledge systems are products of Western scientific worldviews, and not inherently opposed. Hence, the necessity to reconcile seemingly opposed worldviews, which are not actually in opposition, diminishes.

Advocating for the embrace of diversity within archaeological theory and practices, I emphasize the coexistence of science-based and alternative ontologies. This approach highlights our capacity to engage in scientific methodologies while interpreting data through non-Cartesian frameworks. To illustrate, a case study on fortified hunter-gatherer settlements in Siberia, employing a relational framework to interpret quantitative data from a comprehensive big-data study, showcases the compatibility and strength derived from embracing multiple positionalities in archaeology.

10 ARCHAEOLOGY IN THE AGE OF ASSUMPTIONS: RECOGNIZING THE LIMITS OF ARCHAEOLOGICAL PRACTICE AND HOW TO BREAK THEM

Ribeiro, Artur (Christian-Albrechts-Universität)

For decades archaeology has tried to bridge the "gaps" and "fragmentation" within the discipline, such as the gaps between theories and data, the gaps separating the archaeological sciences from the humanities, or the gaps between the more heavily funded and well-researched areas of the world and those regions that lack funding and research in archaeology. In this it has been largely unsuccessful.

These gaps are here to stay and cannot be bridged, and the several attempts to bridge them fail because they are rooted in problems of our own creation. The issue is not that the past is too complex nor that we need multiple paradigms; the issue at hand is more straightforward than appears at face value; we have simply not put enough effort and thought into our interpretations of past phenomena.

A brief conceptual case-study will be employed to illustrate this. Research on demographic decline has been quite popular in archaeology in recent years. Assumptions abound in this research, many of which are still based on outdated Malthusian premises. In archaeology, research on demographic decline relies primarily on narratives of collapse involving food scarcity, spread of diseases, and warfare. However, more often than not, data shows that demographic decline happens without evidence of food scarcity, disease, or war. As the anthropologist Alexei Yurchak has argued, some societies undergo periods of political and economic hypernormalization, where a society refuses to grow and adapt. The idea that past societies normalized ways of living, sometimes leading to demographic decline, is something that has not yet found proper discussion in archaeology, but it is an important discussion, as it has repercussions on our assumptions of how people behaved in the past, over the long-term and as communities.

775 EXPLORING DATES-AS-DATA APPROACHES: THEORETICAL PROMISES AND METHODOLOGICAL PROBLEMS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Van Maldegem, Elliot (Ghent University) - Hoebe, Pir (University of Groningen) - Heaton, Tim (University of Leeds)

Session format: Regular session

The exponential growth in available radiocarbon data and accessible methodology have caused a veritable boom in research which use dates-as-data approaches. Such approaches hinge on the fundamental line of assumptions that the number of radiocarbon dates in a period is proportional to or indicative of the intensity of human activity or population. The most common method of summarizing these radiocarbon dates is through model tested summed probability distributions (SPDs). However there are several limitations inherent to large radiocarbon datasets, such as region- and period specific research focus and taphonomy, as well as methodological issues such as difficulties separating patterns caused by human activity and those caused by the shape of the calibration curve. To address these limitations, researchers have made efforts to enhance the quality of databases by employing chronometric hygiene, binning dates within specific archaeological sites, and to develop more advanced methods, including composite kernel density estimates (KDE) and non-parametric calibration and summation.

Nevertheless, questions persist regarding the way dates-as-data results can be interpreted. Are they able to reflect population dynamics or do they merely mirror availability and research focus? Can we reliably compare different time periods with each other or contrast different regions? What are the scales, both chronologically and geographically, that can offer useful results? Our aim is to look at the nature of radiocarbon dates as a proxy, and to explore complementary methods from archaeology and other disciplines (palaeoecology, geoarchaeology, climate studies, etc.) that could mitigate flaws in dates-as-data approaches.

This session invites papers that go beyond utilizing the principle of dates-as-data and explore the nature of assumptions, explore strategies for identifying and mitigating biases in datasets and the methods employed, incorporate various and complementary proxies, address different temporal and geographical scales, or theorize how results can and cannot be interpreted.

1 SUBMERGED, COVERED OR EXPOSED; ACCESSIBILITY AND REPRESENTATIVITY OF ARCHAEOLOGICAL DATA IN AND AROUND DOGGERLAND (12-7KA CALBP)

Hoebe, Pir (University of Groningen)

Dates-as-data approaches take large datasets of archaeological radiocarbon dates as a proxy for past changes in human activity. Such approaches have huge potential for gaining insight into large spatiotemporal patterns of changes in human activity in relation to external pressures, such as sea level rise, climate change and ecological hazards. Several limitations and methodological issues impede our ability to infer past human activity with these approaches. In the past decades, considerable progress has been made in the improvement of methods and the identification and correction of biases.

Landscape taphonomy is one key issue that requires careful consideration, as it can explain how patterns of archaeological data were influenced by sedimentation, erosion and preservation conditions. Taphonomic corrections have focused on general over-time changes in preservation potential, and the proportionality of landscape types and their preservation potential for archaeological data of a certain age. However, landscape taphonomy is very complex and case-study specific. It is essential that this is further explored, especially in the context of research areas with complex sedimentary histories such as those affected by Holocene sea level rise.

Doggerland, an area roughly the size of England and Wales combined (150000 km²) was submerged beneath the North Sea (12-7ka calBP). Inundation involved erosion and sedimentation, leading to spatiotemporally differential conditions in terms of the accessibility and preservation of deposits, as well as the archaeology associated with these prehistoric landscapes. Inundation modelling greatly improves our understanding of landscape taphonomy by making explicit when landscapes were submerged, with how much sediment they were covered, and which areas were eroded. Such results can provide valuable input for landscape taphonomy corrections or model testing in dates-as-data approaches. This strengthens our ability to parse patterns caused by biases in the dataset from patterns caused by changes in past human activity.

2 MODELING RADIOCARBON DATES AND HUMAN DYNAMICS IN THE VALENCIAN MEDITERRANEAN REGION

Extrem Membrado, Vanessa (Universitat de València) - Pardo-Gordó, Salvador (Universidad de La Laguna) - Aura Tortosa, J. Emili (Universitat de València)

The Iberian Mediterranean region was occupied by different hunter-gatherer-fisher groups throughout the Upper Palaeolithic and Mesolithic. There are around 400 radiocarbon dates for this region and chronologies, more than 200 dates from sites located in the middle of the current Valencian territory, bounded by the rivers Xúquer and Vinalopó. Many of these sites represent a long sequence of human occupation, for which there is a high diversity of archaeological remains and radiometric data, with considerable differences between the cultural phases. Some authors have observed the accumulation of dates around certain cultural phases as evidence of population dynamics and human activities. However, several factors may condition the existence of valid radiometric data for certain cultural phases.

This conference proposes to explore the radiocarbon dates as demography proxy and its comparison with the intra-site activity of les Coves de Santa Maira (Castell de Castells, Alicante). To this end we select several variables such as lithic and bone densities taking account the excavation extension. Thus, the aim is to observe whether the radiocarbon dates reflect the reality of the presence, activity and functionality of the site from the Palaeolithic to the Mesolithic. Finally, we will compare the data provided by the Santa Maira cave with the results of regional dynamics to assess whether they reflect human activity and the eco-dynamics of the Valencian.

3 SIMULATING FREQUENCY DISTRIBUTIONS FOR INDIRECTLY DATED HUMAN BURIALS IN SOUTH AFRICA

Loftus, Emma (Institut für Vor- und Frühgeschichtliche Archäologie, Ludwig-Maximilians-Universität München; Palaeo-Research Institute, University of Johannesburg) - Chase, Brian (Institut des Sciences de l'Évolution-Montpellier (ISEM), University of Montpellier, Centre National de la Recherche Scientifique (CNRS); Department of Environmental and Geographical Science, University of Cape Town) - Lombard, Marlize (Palaeo-Research Institute, University of Johannesburg) - Steyn, Maryna (Human Variation and Identification Research Unit, School of Anatomical Sciences, University of the Witwatersrand)

Changes in human burial behaviours may reflect broad cultural responses to wider archaeological or environmental events. Radiocarbon date aggregation methods, such as kernel density estimation, allow for an assessment of burial frequency through time, for correlation with archaeological and palaeoenvironmental records. However, datasets of directly dated burials are biased in many parts of the world due to ethical concerns over destructive sampling of human

remains. In South Africa, direct dating of human remains of Holocene foraging people (hunter-gatherers) has been more routine and widespread than the dating of human remains from early farming (or Iron Age) contexts, where extant descendent communities may request reburial. Additionally, farming sites can often be closely dated using material culture chronological frameworks from associated finds (e.g., ceramics), rendering direct dates unnecessary. Thus, we find modelled radiocarbon distributions for directly dated farmer burials do not reflect the actual distribution of burials through time. Importantly, this bias is unlikely to be resolved through additional dating efforts, given the ethical prohibitions. We attempt to redress the bias in the human burial dataset using simulated dates based on associated age ranges, and interpret the modelled distributions in light of regional archaeological and palaeoenvironmental events.

4 A NEW APPROACH TO SUMMARISATION: RIGOROUS IDENTIFICATION OF VARIATIONS/ CHANGEPOINTS IN THE OCCURRENCE RATE OF RADIOCARBON SAMPLES USING A POISSON PROCESS

Heaton, Tim (University of Leeds) - Al-assam, Sara (University of Leeds) - Bard, Edouard (CEREGE, Aix-Marseille University; Collège de France)

The reliability of a “dates-as-data” approaches is highly dependent upon our ability to estimate the calendar ages of the discoveries. This is particularly challenging in the case of radiocarbon (¹⁴C) due to the need to calibrate the set of samples you wish to summarise. This calibration introduces considerable uncertainties in the resultant calendar ages which most current approaches to summarisation (e.g., SPDs, KDEs, ...) do not rigorously incorporate.

In this talk, we provide a new, and statistically-underpinned, Bayesian approach to overcome these challenges. We model the occurrence of events (each assumed to leave a ¹⁴C sample in the archaeological/environmental record) as an inhomogeneous Poisson process, estimating the varying rate of samples using reversible-jump Markov Chain Monte Carlo. Given a set of radiocarbon samples, we aim to reconstruct how their occurrence rate varies over calendar time and identify if there are statistically-significant changepoints in this occurrence rate (i.e., specific times at which the rate of events abruptly changes). The resultant posterior estimate of the occurrence rate can be viewed analogously to a “dates-as-data” approach; while the ability to identify specific changepoints might suggest key times corresponding to changes in important external environmental factors.

We will demonstrate our approach on data exploring the expansion of humans, and the parallel disappearance of megafauna, in the Yukon and Alaska in the late Pleistocene and early Holocene: investigating both the timings of such migrations in comparison with the climatic changes known to have occurred during this period, and the potential interactions between humans and the various species in the region.

5 CALCULATING RATES OF CHANGE AND OBSERVING LATENT PROCESSES IN ARCHAEOLOGICAL 'BIG DATA'

McLaughlin, Rowan (Maynooth University)

Detecting past fluctuations in population and economic output by modelling the density of archaeological data is complicated by the issue of bias. This contribution explores this issue using simulation experiments and empirical data from Ireland, and presents some practical solutions to the problem. Firstly, dynamic growth models are expounded as a powerful alternative to ‘absolute’ density (i.e. SPD or KDE) models. Simulations demonstrate how these are less affected by biases. Because such models potentially amplify various forms of noise from the archaeological record, we also explore the limits of this technique. Secondly, we will see how such models can be usefully compared with palaeodietary evidence from stable isotopes palaeoenvironmental proxies. Thirdly, archaeological ‘grey’ literature is mined for qualitative information about bias in the minds of the archaeologists themselves. We then attempt to develop this into a mathematical description of a latent variable that may be present in density estimate models based on archaeological data.

6 BOSERUP OR MALTHUS? DID DEMOGRAPHIC CHANGES CAUSE ECONOMIC INNOVATIONS IN PREHISTORIC SOCIETIES IN THE BALKANS? OR THE OTHER WAY AROUND?

Kolar, Jan (University College London) - Bulatović, Jelena (Gothenburg University) - Riabogina, Natalia (Gothenburg University) - Speciale, Claudia (Institut Catala de Paleoeologia Humana i Evolució Social) - Staniuk, Robert (University College London) - Canteri, Elisabetta (University of Copenhagen) - Agerskov Rose, Helene (Gothenburg University) - Timpson, Adrian (University College London) - Shennan, Stephen (University College London)

The Balkan peninsula was among the first parts of Europe where the novel subsistence strategies – farming and animal herding – spread to from Southwest Asia. Neolithic farmers with Anatolian ancestry and new ways of life spread and their populations increased due to a set of innovations related to the Neolithic lifeways. Although farming and animal herding was a successful strategy for sustaining larger communities concentrated in villages and first urban-like settlements (tells), it also faced several problems (e.g., diseases from zoonosis, soil depletion, lower nutritional value of

food). Neolithic communities continued with further amendments in subsistence strategies - modification of crop spectra, changes in livestock management, higher importance of hunting, land use changes, higher mobility of fields etc.

This paper aims to explore the feedback between population growth or decrease and innovations in subsistence strategies during the Neolithic, Copper Age and Early Bronze Age (7,500-2,000 BCE) in the Balkan peninsula. We will investigate whether the population growth outpaced the agricultural production and innovations, or whether the higher population densities put the subsistence strategies under innovative pressure early enough to sustain the growing populations. This will be possible by using modeling procedures, multivariate statistics and large curated datasets of radiocarbon dates, archaeobotany and archaeozoology coming from hundreds of archaeological sites across the Balkans. Our paper will demonstrate the necessity of complementary data (archaeobotany, archaeozoology) for investigating population dynamics and will shed light on the usability of the dates-as-data approach for demographic research.

7 PREDATOR-PREY DYNAMICS IN RADIOCARBON DATASETS

Marom, Nimrod (University of Haifa) - Wolkowski, Uri (University of Haifa)

Predator-prey interactions have been a central theme in population ecology for the past century, but real-world data sets only exist for recent, relatively short (<100 years) time spans. This limits our ability to study centennial/millennial-scale predator-prey dynamics. We propose that regional radiocarbon databases can be used to reconstruct a signal of predator-prey population dynamics in deep time, overcoming this limitation. We test our argument by comparing the Kullback-Leibler divergence between top predator and prey summed probability distribution curves (SPDs) and randomly-generated SPDs in regional databases of predator and prey radiocarbon data from Pleistocene Beringia (published by Leonard et al. 2007) and the Holocene Judean Desert (published by Lazagabaster et al 2022). Our results suggest that the relation between predator and prey SPDs are not random, and, in the case of the Judean Desert, suggest a historical explanation supported by archaeological evidences. If our conclusions are correct, they could potentially extend the temporal depth of investigation of an important ecological phenomenon.

8 AUTOMATED CHRONOLOGICAL MODELLING OF LARGE QUANTITIES OF 14C DATES WITHIN A BAYESIAN FRAMEWORK

Canteri, Elisabetta (University of Copenhagen) - Rose, Helene (University of Gothenburg) - Kolar, Jan (University College London) - Ryabogina, Natalia (University of Gothenburg) - Timpson, Adrian (University College London) - Thomas, Mark (University College London) - Shennan, Stephen (University College London) - Kristiansen, Kristian (University of Gothenburg) - Racimo, Fernando (University of Copenhagen)

Archaeology is now entering an age of “Big Data”, where archaeological datasets across multiple studies are being combined into larger databases, covering broad geographic regions, and long periods of time. The increasing complexity of agglomerated data is broadening the spectrum of research opportunities, inviting the use of interdisciplinary approaches to help us better explore human (pre-)history. In turn, this calls for methodological approaches that can process large quantities of data in an automated way. Here, we present a pipeline for producing Bayesian chronological models, exemplified using ~700 14C dates collected across ~100 sites with ~125 phases in Western Eurasia, accessed from the Big Interdisciplinary Archaeological Database (BIAD). We automatically calibrate hundreds of 14C dates using the R software. We show how to process the data, run an OxCal model specifically tailored for it, and extract the calibration results in bulk. We use this as a case-study to ultimately understand the expansion of different crops in Western Eurasia during the Neolithic and Bronze Age periods. The use of statistical softwares like R and code that automatically processes data is now becoming a pressing need in archaeology, allowing us to ultimately identify the patterns and processes behind changes in cultural, genetic and social processes of the past.

9 DATING OCCUPATION GAPS IN SOUTH CAUCASUS: SCALE ISSUES AND DATA BIAS

Heit, Ilia (German Archaeological Institute, Eurasia Department)

Around 5000 cal BCE, there is a noticeable decline in archaeological evidence in the South Caucasus compared to the preceding Neolithic period. This cannot be attributed solely to the insufficient state of research on the Post-Neolithic period in this region. In diachronic macroscale studies, such data troughs are often associated with crises and depopulation. Radiocarbon dates are used as proxies to trace demographic processes, and the South Caucasus is a favourable region for such studies, as the volume of AMS dates has grown considerably in recent decades.

But what kind of data set is responsible for such large trends? As we move across different scales and examine settlement declines and disruptions at sub-regional or micro scales, questions arise about how to deal with data gaps, discontinuities, or ‘overdated’ contexts – elements that generate ‘noise’ at the higher level of consideration. How significant is the impact of simultaneous or temporally offset breaks in individual settlements on the broader picture of regional settlement? I will address these issues of scale and data bias by looking at the available Late Neolithic and

Chalcolithic 14C data from sites in the South Caucasus. My current project aims at the Bayesian modelling of the 14C data to temporally anchor phases of settlement and abandonment in the region. In this talk I will investigate whether zooming in and out between regions, subregions and settlements can be used to better understand settlement dynamics and data biases during the 6th and 5th millennia cal BCE.

776 PLASTER A MULTIPURPOSE MATERIAL FOR BINDING KNOWLEDGE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Nilhamn, Bonnie (Helsinki University) - Barouda, Archontoula (UCL Institute of Archaeology)

Session format: Regular session

Plasters have played an important role from the palaeolithic until recent history. The choice of raw materials and applications depended on many factors: traditions, know-how, and resources offered by the environment of the respective era. Their study can give insight into the technology used during different chronological periods. This session explores how new interpretive frameworks and emerging techniques on architectural plasters, plaster objects and plaster ware have increased our knowledge. The session seeks to improve awareness of how plaster technology developed and how plaster was used in various periods and regions. Plaster has been studied using a wide range of technologies, including petrographic analysis (optical microscopy), mineralogical analysis with X-ray Diffraction analysis (XRD), Thermal Analysis (DTA-TG), pXRF, ED-XRF, Raman Spectroscopy, SEM/EDS, GC-MS, FTIR-ATR. Using these archaeometric techniques, we can identify the characteristics of different materials and recipes (binders, aggregates, additives). Plaster production has also been studied experimentally and by studying ethnographic sources and ancient texts. There are many sources for plaster. Not all comprehensible for all. Therefore, it is essential when we study plasters to look for multi-disciplinary approaches, share knowledge with peers, and create cross-links between studied periods, regions, and disciplines. Hence, we invite archaeologists, historians, engineers and researchers of other disciplines to present and compare their studies from all prehistoric and historic periods. We welcome contributions considering all aspects of technology, cultural traditions, raw materials and applications surrounding plaster. Papers may include, but are not restricted to:

Materials science methodologies and new approaches

Experimental archaeology

When and where plaster emerged in different areas.

Raw materials and provenance studies

Plaster recipes and identification of plasters

The role of plaster and mortar within architecture (roof, floor, and wall plasters, cisterns/reservoirs/bins)

Plaster for producing portable objects and plaster ware;

The socio-economic role of plaster technology;

Development of Pyrotechnology.

ABSTRACTS

1 PLASTER - IS MY DEFINITION THE SAME AS YOURS?

Nilhamn, Bonnie (Helsinki University)

In this short introduction paper of our session, I would like to start addressing some problematic issues when discussing “plaster”. Many of us struggle to explain what we mean by “plaster,” especially when talking to people outside our field. We often understand each other within our research group, but the term can be misleading to others. In this paper, I’ll share some challenges and (sometimes hilarious) misunderstandings I encountered while studying Neolithic plaster ware, fka White Ware. These PW-containers may look confusingly similar to early pottery, but they are made from limestone or gypsum, not clay. These portable objects also relate to architectural features like stationary bins, using similar plaster materials, connecting them to other research fields such as building and construction history and wall art. Through this research, I have learned the importance of collaboration and clear communication across different disciplines, as the terminology and analysis methods are diverse. Plaster’s diverse uses and applications make it endlessly fascinating, with much left to explore and share.

2 PLASTER AS AN AID IN DATING CONTEXTS?

Hons, David (Department of Archaeology and Museology Masaryk University at Brno; Department of Archaeology Moravian Museum at Brno) - Golec, Martin (Department of History Palacký University Olomouc) - Mírová, Zuzana (Department of Archaeology Faculty of Arts Charles University) - Bartík, Jaroslav (Institute of Archaeology Czech Academy of Sciences Brno)

Introducing the potential of plaster as a material that can aid in the identification and dating of archaeological situations. Using several examples from different sites and contexts, I will present the different possibilities of using plaster as a deterministic material using portable/table XRF. The measured samples are always powdered. These examples are from several open settlements, cave sites and upland sites from the South Moravia region from the Bronze Age to the earlier Iron Age. Plaster material from one site can be distinguished from material from the same site but from a different period, at least in the lower hundreds of years, according to the data so far. This concept is gradually being verified at other sites, while looking for further possibilities of using the plaster, for more advanced analyses. The aim is to test the possibility of using the grease waste as a determinant for the contemporaneity of archaeological structures, which are often difficult to date accurately.

3 UNCOVERING STORIES HIDDEN IN THE WALLS OF THE BUDEČ ROTUNDA

Tomanova, Pavla (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Valek, Jan (Institute of Theoretical and Applied Mechanics of the Czech Academy of Sciences) - Kozlovce, Petr (Institute of Theoretical and Applied Mechanics of the Czech Academy of Sciences)

Rotunda at Budeč is the oldest fully preserved medieval church in the territory of the Czech Republic. Due to the long history of archaeological research, there has been many hypotheses built up on historical and archaeological evidence about the age, origin, and construction history of the building. Interdisciplinary research of the building materials has been carried out to verify archaeological and historical interpretations, and also to bring new insights into otherwise unrecognised aspects of construction. Recent advancements in radiocarbon dating of mortars provided an opportunity to apply this method on samples from various parts of the structure. The resulting chronological ranges successfully contributed to understanding of the individual construction phases of the church. However, for some locations, the results did not provide sufficiently accurate time ranges. In order to establish a further insight into the data obtained, polished thin-sections of mortar samples were prepared and studied by means of optical microscopy using petrography and cathodoluminescence. These methods were used to characterize the mortars and evaluate the similarities that may be associated with the different construction phases of the masonry. An important aspect was also the assessment of binder related particles which provided hints about the mortar production and processing technologies. The study of the mortar samples also contributed to the identification of the presence of contaminants containing geogenic carbon, and thus helped to refine the interpretation of radiocarbon dating, or conversely, to increase the confidence in some of the dating.

Using the case study of mortars from the rotunda at Budeč, this paper presents the possibilities and limits of traditional archaeological and construction history research, ¹⁴C dating of lime binders and of material analyses, and finally, how all the methods can verify and contribute to each other.

4 HIGHLIGHTS FROM PHYSICOCHEMICAL CHARACTERIZATION OF SOME PLASTERS AND MORTARS FROM THE STAVANGER CATHEDRAL, NORWAY

Gebremariam, Kidane (Museum of Archaeology, University of Stavanger)

Stavanger Cathedral is one of the oldest standing cathedrals in Norway. It distinctively maintains most of its original architecture and is unique being continuously used from its construction in medieval period till today. The Cathedral's official 900th anniversary is scheduled to be celebrated next year. In connection with a restoration and conservation work, some mortar and plaster samples from different periods have been investigated to shed light on the materials and techniques employed. Diverse complementary techniques, optical microscopy (OM), scanning electron microscopy-energy dispersive X-ray spectroscopy (SEM-EDS), X-ray fluorescence spectroscopy (XRF), Fourier transform infrared spectroscopy (FTIR), Raman spectroscopy (RS), thermogravimetry (TG) and X-ray diffraction (XRD) were utilized for the characterization of the binding media, aggregates, and their transformations. Indicators of the impacts of previous environments such as air pollutants are acquired from some of the alteration products. Salt formations associated with interior plasters are also investigated. Physicochemical characterizations using multiple archaeometric techniques, covering compositional, mineralogical, morphological, and microstructural aspects of building materials, have multifaceted benefits. The results of such investigations beyond supporting well-informed conservation interventions, can facilitate archaeological and art historical studies.

5 MINERAL SUBSTRATES FOR WALL PAINTINGS ACROSS THE LATE ANTIQUE LEVANT

Burdajewicz, Julia (Academy of Fine Arts in Warsaw)

This paper presents the results of a research project that was aimed at investigating the execution techniques of Late Antique wall paintings found at archaeological sites of the Levant. The project was prompted by an observation that very few paintings from the period in question survive in good condition, as opposed to their Roman-period predecessors, which often present remarkable durability. It could be assumed that this difference in preservation resulted from the different execution techniques applied; these, however, are rarely investigated in the case of Late Antique wall paintings. Since the preservation of a wall painting greatly depends on the durability of its support, the research focused on the mineral substrates – mortars and plasters. Features such as the thickness of the layers, the type of binder, the type and characteristics of the aggregate/additive, and the binder/aggregate ratio were examined. The results showed that the approaches to the execution of the wall painting substrates in Late Antiquity were very diverse and, thus, far from being as universal as the procedures applied in the Roman period. Nevertheless, a certain consistency in their execution was noted on a local scale. The quality of the Late Antique mineral supports was clearly inferior in relation to those from the Roman period, which certainly explains the typically poor state of preservation of the former. The reasons behind the decline of the technical quality of the wall painting substrates in Late Antiquity should be explored further.

6 GYPSUM PLASTERS AND THEIR PROPERTIES: PRELIMINARY RESULTS OF THE STUDY ON THE PAPHIAN SAMPLES (CYPRUS)

Pizzo, Paola (Institute of Theoretical and Applied Mechanics, Czech Academy of Science; Institute of Classical Archaeology, Faculty of Arts, Charles University) - Válek, Jan (Institute of Theoretical and Applied Mechanics, Czech Academy of Science)

Cyprus is naturally rich in limestone and gypsiferous stones. This plentiful availability of raw materials prompted an equally prolific production of both lime and gypsum plasters. Our project focuses on the plaster industry in the Paphian region in a wide time frame running from the Late Bronze Age to the Early Roman times. This presentation will particularly shed light on the understudied category of gypsum plasters, with particular attention to their production process, raw materials sourcing and functionalities.

We characterized the gypsum binders by using a variety of multiscale approaches, including optical microscopy, x-ray diffraction, thermal analysis, and SEM-EDS. Preliminary results display a high degree of similarity between samples of different sites; the raw materials employed are locally sourced, and they are processed following the same procedure. The resulting mortars produced are employed to respond to similar functionalities, specifically to serve as masonry mortars in the construction phase. Some exceptional samples are also employed as wall plasters, although this functional diversity is not mirrored by any difference in terms of production and characteristics.

7 EXPLORING PLASTER TECHNOLOGIES IN NEOLITHIC MAKRI, NORTHERN GREECE: AN INSIGHTFUL PERSPECTIVE

Barouda, Archontoula (University College London (UCL)) - Quinn, Patrick (University College London (UCL)) - Efstratiou, Nikos (Aristotle University of Thessaloniki)

This presentation reveals the intricate craftsmanship of the Neolithic period through an exploration of plaster technologies at Makri, situated in Northern Greece. As part of the Marie Skłodowska-Curie Innovative Training Network (PlaCe), our research focuses on deciphering the sophisticated techniques employed in plaster production and application at this prehistoric site. Makri stands out as a significant archaeological site in the Greek Thrace region, yielding well-preserved artifacts and structures that provide valuable insights into ancient societies. By analyzing plaster materials and techniques, our study sheds light on the ingenuity and skill of Neolithic craftsmen in this region. Drawing on an interdisciplinary approach, combining macroscopic, microscopic, and chemical analytical methods, our research aims to reconstruct the intricate processes involved in plaster production. Through experimental data and comparative analysis, we seek to understand the cultural, technological, and socio-economic factors that influenced plaster craftsmanship at Makri. This presentation provides a detailed overview of our research, sharing preliminary findings on plaster materials and outlining the broader implications of our ongoing project. By shedding light on Neolithic craftsmanship, intercultural exchanges, and the socio-economic dynamics of early European communities, our study contributes significantly to the understanding of prehistoric cultural development in the wider region.

784 DEMAND FOR SALT: FROM PREHISTORY TO THE EARLY MODERN PERIOD

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Attema, Peter (Groningen Institute of Archaeology) - Sotgia, Agostino (Groningen Institute of Archaeology) - Alessandri, Luca (Sapienza University Rome)

Session format: Regular session

The Archaeology of Salt has a long tradition in Northwestern Europe and the Mediterranean in both the (ethno)archaeological, ethnographic and historical disciplines. As far as the early periods (Neolithic to the postclassical period) are concerned, studies show an emphasis on the changing production modes and trade mechanisms in light of the growing demand for salt caused by population growth. This is the case in the Roman period where in coastal contexts large scale salinae replaced more elaborate modes of marine salt production. Archaeologists lack however a robust insight in the size and nature of salt demand of prehistoric, classical and early medieval societies. Knowledge about these two aspects as well as about the many purposes for which salt was used, might help us interpret the organization and scales of salt production in more detail and to understand what was needed where. This in turn may inform us better on trade mechanisms. For this session we solicit papers that model salt demand in various periods and contexts, deal with types of salt demand in urban and rural contexts or study salt demand in the context of animal husbandry and pastoralist strategies (transhumance). We also invite those who have experience with salt demand in the medieval to Early Modern Period to contribute to this session in order to bridge the archaeological – historical divide in the study of salt demand.

ABSTRACTS

1 SALT ON DEMAND : THE IMPORTANCE OF SALT EXPLOITATION DURING THE IRON AGES IN EUROPE

Millot-Richard, Clara (Paris 1 Panthéon-Sorbonne, UMR 8215 Trajectoires) - Weller, Olivier (Paris 1 Panthéon-Sorbonne, UMR 8215 Trajectoires)

There is no doubt that salt is a crucial raw material in many economic systems. This is especially true of Iron Age economies, where salt was used to make cured meats, animal feed and handicrafts, but also as a store of value and perhaps also as an exchange standard.

The aim of this paper is to study salt production and exchange systems during the Iron Ages (Hallstatt and La Tène) in north-east France and south-west Germany. In these regions, the economic dynamics associated with the exploitation of mineral raw materials are particularly rich in information, due to the concentration of producing and consuming agents. The salt production sites, both in the Seille valley (Moselle) and at Schwäbisch Hall (Baden-Württemberg), are among the best known in a continental context. One of the specificity of salt production during the Iron Ages is the technique of briquetage. It is a very complex and demanding “chaîne-opératoire” with implications on both production and demand of salt. The aim here is to look at salt production on a regional and macro-regional scale, both proven and suspected, highlighting the agents and scales of production and consumption depending on the context. We will adopt both a technical approach as well as perspectives inspired from economic sciences. Comparisons with other production circuits, such as that for iron, will enrich our thinking. Archaeological data on salt production and consumption during the Iron Ages provide wider insights into the economic system.

2 SALT MINING IN CENTRAL ANATOLIA THROUGH AGES

Üncü, Hakki (Settlement Archaeology Department, Middle East Technical University)

Central Anatolia is renowned for its rich salt mines. A three-season survey has been conducted by me to investigate the relationship between archaeological settlements and the salt mines in northern central Anatolia. Those mines are recorded to have been operated during the Ottoman Empire and the Republican period. The results indicate that certain settlements may be directly related to salt production. These settlements, which are located very close to and sometimes within the salt production areas, are generally mounds and sometimes flat settlements. The related archaeological settlements, which yielded dense finds from the Early Bronze Age onwards, generally continued to yield uninterrupted finds until the Iron Age. The salt deposits that make up the survey region, which rest on the southern slopes of the northern Anatolian Mountains are also the core settlement areas of Hatti and Hittite civilizations. Some of the settlements mentioned in various Hittite documents are directly related to salt production. Now all the possible options are clear for the location of those settlements. During the survey, traditional salt production techniques were investigated with an ethnoarchaeological approach, and it was observed that these traditional methods may well have been used in ancient times.

3 SODIUM CHRONICLES... GRAIN BY GRAIN. QUANTIFYING SALT'S DEMAND IN ANTIQUITY

Sotgia, Agostino (University of Groningen)

Salt is one of the most versatile elements available. Its usage spans a multitude of applications, which expanded over time in tandem with advancements in understanding the specific properties of sodium chloride. Primarily, salt serves as a fundamental resource: it directly functions as a sustenance capable of replenishing the mineral salts lost by humans and animals during their daily activities. Moreover, it serves as a crucial medium for preserving perishable foods such as meat or fish, through brining, vegetables like olives become edible. Finally, by adding salt to milk, it can be transformed into hard cheese, facilitating preservation and transportation, notably during the transhumance of herds. The utilization of salt also extends into the sphere of craftsmanship. When added to clay, salt allows for the creation of vessels with superior insulating qualities. Its application is also fundamental in manufacturing processes such as leather tanning, weaving, and metallurgy. Furthermore, the use of salt in fields such as medicine or symbolic activities is documented.

This contribution aims to provide a model for estimating salt demand. Starting from an examination of ethno-archaeological research related to salt utilization, the paper will proceed to quantify salt demand for the cities of Tarquinia and Rome (Central Italy) from the Iron Age to the Archaic period (9th – 5th c. BCE). The selection of case studies, as well as the chronological period, is closely tied to the objectives of the Salt and Power project (<https://saltandpower.gia-mediterranean.nl/>), which investigates salt production, demand and control in Italy during the first millennium BCE. In addition to offering a mathematical model applicable to diverse contexts, this contribution seeks to analyse deeper how the development of urban entities influenced salt demand, potentially leading to a shift from production via briquetage (fire induced salt making in ceramic containers) to salinae (evaporation in salt ponds).

4 UNEARTHING SALT: EXPLORING CERAMIC EVIDENCE FOR SALT PRODUCTION IN A CENTRAL ITALIAN COPPER AGE COMMUNITY

Conati Barbaro, Cecilia (Dipartimento di Scienze dell'Antichità, Sapienza University of Rome) - Marconi, Nadia (Dipartimento di Scienze dell'Antichità, Sapienza University of Rome) - Manfredini, Alessandra (Dipartimento di Scienze dell'Antichità, Sapienza University of Rome)

Salt, essential for human and animal sustenance, has seen increased demand with the rise of herding economies, notably since the Neolithic. Identifying salt usage, production, and distribution markers in the archaeological record is challenging due to its soluble nature, leaving few traces in extraction or containment artefacts. Thus, reliance on indirect indicators is essential. This presentation aims to discuss the hypothesis of salt production within a Central Italian Copper Age community based on pottery evidence.

The archaeological site of Maddalena di Muccia (Marche - Italy) is located at the foot of the Apennine mountains, strategically positioned at a crossroads between the main natural routes linking the Adriatic and Tyrrhenian regions. Occupied during the third millennium BCE, the settlement was inhabited by herders communities. Noteworthy finds include numerous standardized truncated cone-shaped vessels discovered in large fragments within pits, often accompanied by abundant charcoal and cooking slab remains.

These vessels, highly standardized in fabric, shape, size, and manufacturing technique, indicate a non-curated production for specific purposes, followed by intentional breakage. Comparisons with contemporaneous sites in Romania and Bulgaria, where salt production through briquetage is confirmed, support hypothesizing a similar function for Maddalena di Muccia. Ethnographic evidence of domestic salt production in the area, along with toponyms referring to salty waters, further encourages us to continue working around the hypothesis of salt production.

5 CHARACTERISTIC AND MEANING OF 8TH CENTURY UYGHUR SALT MINERS AT THE DAVST UUL SALT MINING SITES IN MONGOLIA

Han, Jinseong (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea.) - Hong, Jong Ha (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea.) - Ganbold, Ankhsanaa (National Center for Cultural Heritage, Ulaanbaatar, Mongolia.) - Mendbazar, Oyuntulga (National Center for Cultural Heritage, Ulaanbaatar, Mongolia.) - Kang, In Uk (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea.)

The Davst ul Salt Mine in Uvs aimag, Mongolia, is a traditional rock salt site that continues to be actively mined today. In 2017, a local resident discovered mummies and wooden-working tools while excavating for salt, prompting a rescue excavation. This excavation yielded a collection of wooden-working tools used in salt mining, bags of salt rocks, and a mummy that had been crushed to death during mining operations. In this presentation, it analyzes the archaeological context of the Davst Salt Mining site in several ways. Firstly, it examines the wooden-working tools utilized in salt mining, categorizing them by type and function. Secondly, it delves into the societal status and role of salt miners during that period. Thirdly, it provides a preliminary assessment of the organization and distribution of salt production

during the Uyghur period. Unraveling the complexities of salt supply and demand in archaeology is challenging. It is hoped that this study will contribute to a deeper understanding of salt production, distribution, and trade during the medieval Mongolian period, as well as within the steppe nomadic societies of eastern Eurasia. Collaboration on scientific analysis is eagerly anticipated to enrich the ongoing discussion. This study is supported by the National Research Foundation of Korea (NRF) grant (NRF-2023R1A2C1006785)

6 MODES OF EXPLOITATION AND TRADE MECHANISMS OF SALT IN MEDIEVAL AND MODERN EASTERN ROMANIA

Asandulesei, Mihaela (Alexandru Ioan Cuza University of Iasi)

The potential of Romania's salt resources within its territory is undeniable, and this has been consistently affirmed in academic circles through numerous national and international events over time.

In the eastern Carpathian region of Romania, the area under study, the presence of salt in both liquid and solid forms is well-documented across various historical periods, tracing back to prehistoric times with the earliest exploitation activities.

The approach to harnessing the natural mineral to meet daily needs or for economic endeavours stems from the efforts involved in the execution of spring catchment systems or from the diverse range of installations dedicated to the intensive extraction of solid salt. These methods are unique to each distinct era and undergo continual development.

The documentation of the presence of the natural mineral in various written or cartographic sources (such as maps, travel diaries, letters, descriptions, public or private documents) from different periods, particularly during the medieval and modern eras, highlights the significant importance attributed to saline substances in the development of human communities from social, economic, and ethno-cultural perspectives.

Our intervention seeks to conduct a retrospective analysis of documentary sources from the medieval and modern periods concerning pre-industrial and industrial exploitations, along with associated legal regulations. Additionally, we aim to explore methods of capitalization within the economic circuit, including trade and exchanges, both within the studied area and in the broader context of Southeast Europe.

Our documentation confirms a significant level of salt exploitation activity in the area under examination during the specified periods, and it also delineates methods of economic capitalization associated with this activity.

7 PREHISTORIC LARGE-SCALE SALT PRODUCTION, TRADE, POWER AND WEALTH IN SOUTH-EASTERN EUROPE

Kavruk, Valerii (The National Museum of Eastern Carpathians)

Prehistoric large salt production in southeast Europe is attested in two sites: Provadia-Solnitsata in north-eastern Bulgaria (inland brine evaporation, Chalcolithic) and Băile Figa (shallow rock salt mining and brine processing, Late Bronze Age) in Transylvania (central-northern Romania). To better understand the nature of this salt production, the paper integrates it into holistic pictures of the Balkan-Pontic-Anatolian Chalcolithic and Bronze Age of the Carpathian Basin.

Salt production in Provadia-Solnitsata during the Chalcolithic was part of a complex and vast system of power, economy and trade that included Eastern Balkans and possibly Anatolia. Salt obtained from this site was supplied mainly to the Balkan Peninsula. In addition, it must have been used for salting food products, including sturgeon and caviar, which were perhaps traded even to Anatolia. The fabulous richness of the Varna necropolis and some other site sites in north-eastern Bulgaria strongly suggest that salt was an essential trigger of the economic, social and political advance of this region during the Chalcolithic period.

During the Bronze Age, Transylvania became the most advanced salt production region of south-eastern Europe. In prehistoric times, the Tisza-Danube Interfluve was home to many lakes and swamps rich in food. To benefit from this resource, local people needed to trade it. This would not have been possible without salt, which they received from Transylvania and the Alpine region. Trade in salt and salted food explains the region's high socio-economic level during the Bronze Age, including the period between c. 1500 and 800 BC when large-scale salt production was carried out in Transylvania.

787 ARTISTS AND CRAFTSMEN. MULTIDISCIPLINARY APPROACHES IN THE ANALYSIS OF THE PRODUCTION OF EARLY MEDIEVAL WALL PAINTINGS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Cassitti, Patrick (Foundation pro Monastery of St. John, Müstair; Albert-Ludwigs-Universität Freiburg, Abteilung für Frühgeschichte und Archäologie des Mittelalters; Otto-Friedrich-Universität Bamberg, Lehrstuhl für Archäologie des Mittelalters und der Neuzeit) - Bordi, Giulia (Università degli Studi Roma Tre, Dipartimento di Studi Umanistici) - Cavallo, Giovanni (Scuola universitaria professionale della Svizzera italiana, Dipartimento ambiente costruzioni e design)

Session format: Regular session

Wall paintings provide valuable information on the culture and history of past societies. Because they are inextricably linked to the buildings on which they have been applied, their study happens at the intersection between Archaeology, Art History, the history of Architecture, and the natural sciences. In recent years, the field has advanced to the forefront of interdisciplinary studies. A wide, international exchange and an integration of knowledge and methods has however not yet taken place.

This session aims to promote collaboration and knowledge exchange between archaeologists, conservators, art historians and scientists working in the field of mural painting research, to present innovative methodologies and technologies used in the analysis and conservation of wall paintings and to encourage a deeper understanding of the cultural, artistic and historical significance of wall paintings through multidisciplinary approaches.

It will achieve this by bringing together researchers and experts from different backgrounds to present different views and approaches to the study of wall paintings as works of art, linked to different figurative cultures, and as products of technical and craft knowledge. A wide range of topics will be addressed, including, but not limited to:

- Analysis of painting techniques.
- Techniques of non-destructive analysis of wall paintings.
- Advances in methods of dating wall paintings.
- Characterisation of materials and provenance studies of pigments and binders.
- Documentation and conservation of wall paintings.
- Comparative analyses of wall paintings in different regions and periods.
- Interdisciplinary collaborations in research on wall painting.

ABSTRACTS

1 MERGING PERSPECTIVES: OPPORTUNITIES AND CHALLENGES IN INTERDISCIPLINARY WALL PAINTING RESEARCH

Cassitti, Patrick (Foundation pro Monastery of St. John) - Villa, Luca (Foundation pro Monastery of St. John) - Cavallo, Giovanni (Scuola universitaria professionale della Svizzera italiana, Dipartimento ambiente costruzioni e design) - D'Erme, Chiara (Scuola universitaria professionale della Svizzera italiana, Dipartimento ambiente costruzioni e design)

In 2022, the research initiative "Forgotten Colors - Rediscovering the Original Polychromy of Early Medieval Wall Paintings in the Raetia Curiensis Region" was initiated with support from the Swiss National Science Foundation. This ambitious project engages nine collaborative partners spanning diverse scientific fields, including archaeology, art history, heritage studies, science communication, digital humanities, material sciences, mineralogy, and physics.

The broad interdisciplinary collaboration not only offers fresh insights into the past but also presents significant challenges in harmonizing methods and synthesizing data across various disciplines. To address these challenges, the project employs a comprehensive approach, integrating microarchaeology alongside concepts and methods derived from Actor Network Theory and Symmetrical Archaeology. This bottom-up methodology entails meticulous examination of evidence and data from individual sites, culminating in the development of theories and descriptive networks through the synthesis and comparison of generated information. Furthermore, visualizations, including physical and augmented reality reconstructions of polychromies from selected sections of paintings, are being crafted.

This paper delves into a detailed exploration of this approach, providing an evaluation of the practical application of the theoretical concepts employed in the research project.

2 UNDERSTANDING THE CAROLINGIAN ARTIST THROUGH A NOVEL WORKFLOW INVOLVING MULTIMODAL REMOTE AND IN-SITU SPECTRAL IMAGING AND SPECTROSCOPIC TECHNIQUES

Liggins, Florence (Nottingham Trent University) - Detalle, Vincent (Centre National de la Recherche Scientifique (CNRS), Paris, France) - Romano, Francesco (CNR, Istituto di Scienze del Patrimonio Culturale (ISPC-CNR), Catania, Italy) - Cassetti, Patrick (Foundation pro Monastery of St. John, Müstair) - Liang, Haida (Nottingham Trent University)

F. Liggins, S. Kogou, C.S. Cheung, A. Vichi, A. Suzuki, V. Detalle, X Bai, M. Botticelli, C. Caliri, E. Ravan, F.P. Romano, C. Tennenini, P. Cassitti, H. Liang

The analysis of historical wall paintings can invite several obstacles, such as scale, complexity, diversity of materials, in substrate, pigment and binder. Locating restorative work can further add complication, especially where the work has been applied in a heterogenous manner. The Benedictine convent of St. John, a UNESCO world heritage site in Müstair, is host to both original Carolingian paintings (8th – 9th Century), and 20th Century restorative work and is therefore a prime example of where multiple methods are needed for large-scale analysis.

We demonstrate a novel workflow for thorough analysis of large-scale wall paintings which starts with a survey using a ground-based high spatial resolution remote spectral imaging system (PRISMS), which can scan entire building interiors at distances of order ~10m, providing 10-band reflectance spectra in the visible to near infrared (VNIR) (450-850nm)[1]. Hyperspectral imaging is also carried out with higher spectral resolution (~nm) covering the VNIR and shortwave infrared (SWIR) (1000-2500nm)[2]. These datasets are processed using in-house developed machine learning methods to provide material distribution maps based on reflectance spectra[2,3] such that further analysis only needs to be performed in targeted areas. Point-based analyses provide necessary complementary information in material identification, in this case ground-based remote Raman spectroscopy[4], close-range Laser-induced Breakdown Spectroscopy (LIBS), X-ray Diffraction (XRD), X-ray Fluorescence (XRF) and Fourier Transform Infrared (FTIR) spectroscopy.

Whilst demonstrating this workflow on the murals in Müstair through an IPERION HS MOLAB campaign[5], we're able to identify pigments from the original Carolingian artist's palette and define to what extent these materials are still distributed across the wall paintings.

3 INSIDE AND THROUGH PALIMPSEST WALLS. SANTA MARIA ANTIQUA AND EARLY MEDIEVAL PAINTING IN ROME

Bordi, Giulia (Roma Tre University) - Pogliani, Paola (Tuscia University) - Pelosi, Claudia (Tuscia University) - Lanteri, Luca (Tuscia University) - Valentini, Valeria (Tuscia University)

The multi and interdisciplinary research group consisting of art historians, restorers and chemists wants to present the research conducted within the European project Enhancement of Heritage Experiences: The Middle Ages. Digital Layered Models of Architecture and Mural Paintings over Time (EHEM), funded by Horizon 2020 - JPICH Conservation, Protection and Use. Case study is the church of S. Maria Antiqua and its extraordinary heritage of stratified murals from the 2nd to the 11th century.

For years, the team has been working on the development of an integrated system for the identification and characterisation of individual painting phases in order to date them.

Starting from the autoptic analysis of the plasters and their mapping on a digital basis, the study of materials and techniques was tackled to support the identification of the distinct pictorial layers using scientific analyses for the characterisation of materials combined with multispectral imaging surveys. The data is being fed into a database and annotation system linked to the 3D model of the monument.

The results of the research conducted on the paintings of S. Maria Antiqua are being compared with artistic production in Rome in the early Middle Ages thanks to the project: Rome and the Others (300-1300). Foreigners in the city between conflicts and integration, funded by Prin 2022-PNRR, started in January 2024.

4 FROM ROCK ART TO MEDIEVAL CHURCHES: THE CONTRIBUTION OF DIGITAL IMAGE ENHANCEMENT SYSTEMS

Croci, Chiara (University of Lausanne)

Developed for the study of rock paintings, the digital image enhancement system DStretch reveals great potential in support of archaeological and art historical research, especially for the study of stratified pictorial surfaces or those in precarious state of preservation.

Within the SNSF project "Rome aux siècles 'obscur'. Les lumières de la communication visuelle, Ve-XIe siècles", directed by Chiara Croci and Irene Quadri at the University of Lausanne, this tool was used to deepen the knowledge of pictorial works of early medieval Rome.

Digital enhancement through DStretch brought to light traces of pictorial scenes now invisible to the naked eye, 'pentimenti' and stratifications, which guided further investigations conducted using multispectral photographic techniques in collaboration with Prof. Eng. Rita Deiana of the University of Padua.

Through a selection of case studies from churches such as San Martino ai Monti, Sant'Adriano al Foro and San Clemente (8th-9th century), this paper aims to illustrate the contribution of digital enhancement as a preliminary tool to identify elements worthy of further investigation to shed light on the technical and conceptual mechanisms of medieval artistic production.

5 LET'S TRY TO MAKE THE FRAGMENT SPEAK - THE WALL PAINTING CYCLE IN THE CLOISTER OF BRANDENBURG CATHEDRAL

Schaedler-Saub, Ursula (HAWK University of Applied Sciences and Arts Hildesheim) - Krause-Riemer, Sabine (HAWK University of Applied Sciences and Arts Hildesheim) - Pursche, Jürgen (HAWK University of Applied Sciences and Arts Hildesheim)

How can we understand, visualize and mediate fragmentary medieval wall paintings? With a still on-going research study on extremely damaged wall paintings funded by Deutsche Forschungsgemeinschaft, we present interdisciplinary collaboration and innovative methods and techniques of digital documentation, visualisation and partial reconstruction, avoiding any harmful physical intervention.

One of our case studies is the wall painting cycle dedicated to the Liberal Arts and the Mechanical Arts, created in the 1440ies in the former Premonstratensian Library in the cloister of Brandenburg Cathedral. After the secularisation of the cloister in 1507, the wall paintings were forgotten. Various changes of use and a succession of renovations led to heavy damages and losses of the paintings. Re-discovered and uncovered in the early 21st Century during an urgent structural conservation, the wall paintings were preserved unretouched. However, the fragments without any restoration require visualisation and mediation.

Our project started with a comprehensive interdisciplinary investigation aimed at understanding the extremely reduced painting cycle in its architectonic, cultural and artistic context. We studied the historical materials and techniques of the paintings and their actual state of preservation with mostly non-invasive techniques. For the visualisation of all painting traces not observable in the visible light, we developed the methodology of the so-called spectral photo-piles which are composed of different rectified spectral images, including UV-luminescence imaging, hyperspectral and multispectral imaging and digital image processing with decorrelation stretch and Principal Component Analysis (PCA). A critical interdisciplinary evaluation and interpretation of the results enabled us to create a scientifically based digital visualisation with simplified partial reconstruction of the painting cycle – a very important contribution for a better understanding of the historical, cultural and aesthetic values of fragmentary preserved wall paintings.

6 TOKALI PROJECT IN CAPPADOCIA. INTEGRATED AND INTERDISCIPLINARY SYSTEM FOR THE KNOWLEDGE AND CONSERVATION OF MURALS

Pogliani, Paola Luisa (University of Tuscia) - Andaloro, Maria (University of Tuscia) - Alberti, Livia (University of Tuscia) - Pelosi, Claudia (University of Tuscia) - TEMUR YILDIZ, Hatice (Nevşehir Restorasyon ve Konservasyon Bölge Laboratuvarı Müdürlüğü) - Kantoğlu, Ömer (Tenmak)

The speech stems from the project, "Rupesrian painting in Cappadocia: knowledge, conservation and enhancement", which the University of Tuscia has been conducting in Cappadocia (Turkey) since 2006.

The work focuses on the knowledge of the numerous murals of Cappadocia (6th-13th century), based on research carried out during the survey in the region, and then from the experience acquired from conservation projects undertaken at two rock-cut churches: the Forty Martyrs in Şahinefendi and the New Tokali in the Göreme Open Air Museum.

The paper aims to present, in particular, the Tokali project that is a collaborative project with the Archaeological Museum and the Regional Restoration Laboratory of Nevşehir.

The project focuses on the knowledge and conservation of the extraordinary painting complex of the New Tokali Church dating from the mid-10th century. As far as knowledge is concerned, the main line of research is to study the pictorial process from conception to realisation. Central to the topic of conservation is the complicated restoration of the paintings, which has been ongoing since 2011.

Knowledge and restoration are the topics that in the Tokali project are organically connected with the characterising aspect of the monument that is the intimate relationship exists between art-historical features of their wall paintings in the context of the rock-cut. This approach is based on an integrated and interdisciplinary system of research and investigation and necessarily demands the collaboration of the historical, humanistic and techniques disciplines together with the hard science (chemistry, physics, geology, agronomy).

In the Tokali project, one important line of our work focuses on the techniques and materials of painting in the context of Cappadocia painting production (database <http://bancadati.museovirtualecappadocia.it/>). The peculiarities of the secco technique and the complex methods of execution will be emphasised through the approaches of autopsy analysis and scientific investigations carried out so far.

7 INTERDISCIPLINARY APPROACHES TO IMPLEMENT ON SITE WALL PAINTINGS CONSERVATION - A CASE STUDY FROM THE CHURCH OF MÜSTAIR

Leandri, Caterina (Stiftung Pro Kloster St. Johann Müstair) - Martinucci, Camilla (Stiftung Pro Kloster St. Johann Müstair) - Emmenegger, Rufino (Stiftung Pro Kloster St. Johann Müstair)

The Convent of Müstair (Switzerland) is a UNESCO site renowned for its wall paintings dating back to the 8th - 13th century, preserved in its main church. Starting in the late 20th century the painted surfaces underwent extensive art historical, technical, and diagnostic research, addressing topics like original technology, conservation history and state of conservation. The outcoming data led to gradual treatment applications, up to the current restoration campaign interesting the east wall of the church, since 2018 concentrated on the central apse.

The paintings characteristics, both original and later added materials, along with complex conservation issues have made the support of scientific systematic methodologies necessary in outlining intervention strategies and formulate their implementation over time.

As usual for medieval paintings, also the Müstair cycle can be seen as an outcome of different cultural heritage management practices performed over time. Some portions were covered and are today barely visible, others were strongly overpainted due to its fragmentary state.

The conservator's challenge lays in ensuring accessibility to various stakeholders while maintaining the objects physical integrity and guarantee long-term preservation. This often requires striking a balance between conservation of the material evidence together with considering monuments significance and context. A multidisciplinary approach with outstanding applications of scientific procedures is therefore crucial in providing support on the sitework, particularly in overcoming limitations of human perception by revealing aspects that otherwise cannot systematically and objectively be formulate.

The long in situ applied research allows for an overview of the evolution of analytical techniques, with particular emphasis on the increasing potential both in terms of reduced invasiveness and precision in addressing the starting questions. The Müstair case study exemplifies the delicate interplay between historical approaches and modern treatment methodologies, highlighting the indispensable contribution of interdisciplinary research to develop informed and effective conservation practices.

8 THE PALIMPSEST OF THE MAGDALEN CHAPEL OF ST. EMMERAM, REGENSBURG - AN ANALYTICAL CHALLENGE

Thalguter, Nadia (Technical University of Munich) - Angelin, Eva (Technical University of Munich) - Mindermann, Simon (Technical University of Munich) - Sessa, Clarimma (Technical University of Munich)

The Magdalen Chapel is part of the monumental church of St. Emmeram in Regensburg (Germany). It shows a unique palimpsest of wall paintings from four simultaneously visible different painting phases.

The oldest wall paintings originate from the middle of the 12th century and depict the life of a penitent, probably Saint Maria Aegyptiaca. The fragments of the second phase, dating from around 1400, show a Man of Sorrows and Christ on the Mount of Olives. At the end of the 15th century, in the third painting phase, standing saints and an angel were painted. The fourth painting, which was probably created in the first half of the 17th century, is a decorative painting with putti and garlands of fruit on a white background.

Nowadays, the fragmentary status of the wall paintings hinders their readability and poses queries about their conservation. A multimodal in situ approach was used to characterize the materials, understand the art techniques, and explore the aging phenomena, thereby ensuring the understanding of this complex artwork.

The paintings were systematically investigated by an interdisciplinary team of conservator-restorers and scientists. They were documented through photogrammetry, technical photography (VIS and UVL) as well as visual observation mapping using metigo@MAP software. Hyperspectral imaging (spectral range 400 - 2500 nm) and macro-X-ray fluorescence were combined with punctual Raman and Mid-infrared measurements for material characterization purposes. Terahertz imaging was tested for the investigation of the stratigraphy of selected areas.

The combination of the investigation done by the conservator-restorer, mapping, technical photography, and analytical results, allowed the assignments of the individual painting phases and relative palette, identification of later interventions, and visualization of hidden layers.

The information gathered using the multi-modal, non-invasive approach will serve to develop a conservation strategy and a new concept for the access and readability of the Magdalen Chapel palimpsest.

9 SURROUNDED BY SAINTS. CONSERVATION AND PREVENTION WORK IN OLD DONGOLA, SUDAN

Skarzynska, Magdalena (Polish Centre of Mediterranean Archaeology UW)

The role of an art conservator has long exceeded the practical aspect of this profession. Preserving the material side of a monument is only one of the conservator's tasks. He became not only a "doctor" but also an "advocate" of works of art, participating in heritage science, developing documentation, appropriate prevention and cooperating with other scientists. These ideas guide conservation work at the archaeological site of Old Dongola in Sudan. Dongola served as the capital of Makuria, one of the most prominent medieval African states. Archaeological research began in 1964 as part of the mission of the Center for Mediterranean Archeology at the University of Warsaw. The institution continues to work on this site under the supervision of Professor Artur Obluski. The research area encompasses the citadel situated on the eastern bank of the Nile and the Monastery of St. Anthony the Great. The Old Dongola site's most significant discoveries include polychrome churches. These interiors feature representations of saints, archangels, the Virgin Mary, and Christ, which are typical of Eastern Christian iconography. Additionally, images of Nubian dignitaries and hierarchs decorate these interiors. The unique local elements woven into traditional Christian iconography make these interiors particularly noteworthy. In addition, the paintings showcase different styles and technologies.

The presentation aims to showcase the conservation care and documentation system implemented at the archaeological site. It will also cover recent conservation work on wall paintings in the NB2 church, the Church of the Archangel Raphael, and the „Throne Hall“. Additionally, it will discuss conservation of current archaeological discoveries, such as the apse of the Great Church of Jesus and the room with king Dawid painting.

10 THE COLOURS OF THE MEDIEVAL WALLS: THE CASE OF SANT QUIRZE DE PEDRET

Cayuela, Begoña (Ars Picta (Universitat de Barcelona))

The international project EHEM (Enhancement of Heritage Experiences: The Middle Ages. Digital Layered Models of Architecture and Mural Paintings over Time) has been an opportunity to delve into an area of study little frequented by historians of medieval art: the colour of medieval walls. EHEM has been developed by a multidisciplinary team with researchers from Italy, Cyprus, and Catalonia.

One of the aims has been to create digital layered models of medieval architecture and mural paintings to provide an improved perception to the public of the original wall paintings and a tool for researchers, restorers, and heritage curators. The goal was to solve certain chromatic issues that medieval mural currently present, but immediately we realized that one major challenge was to establish the most reliable representation system in digital environments of medieval wall paintings.

The hermitage of Sant Quirze de Pedret (Spain) was decorated at two different times by superimposing two layers of wall decoration. After their discovery, the paintings were removed and transferred to the Museum of Barcelona and the Museum of Solsona and were subjected to different conservational procedures. The restoration criteria applied have resulted in notable differences in the current chromatic perception.

In this paper we will discuss the issues faced by the team in the process of recovering the colours of Pedret. It will also review the experience of determining the material characteristics of the frescoes, their chromatic palette from the digital images and grouping them in the digital model to offer a unique opportunity to see the paintings on the virtual walls and to regroup pieces originally of the same fresco that nowadays are disperse. Lastly, but not least, we will reflect on the relevance of this approach to understand the techniques used by the medieval painters of Pedret.

11 THE 11TH-13TH CENTURY WALL PAINTINGS IN CANTON TICINO, SWITZERLAND: A SYSTEMATIC STUDY

Luppichini, Stefania (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC)) - Piqué, Francesca (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC)) - Moretti, Patrizia (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC)) - Caroselli, Marta (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC)) - Lumia, Chiara (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC)) - Schädler-Saub, Ursula (University of Applied Sciences and Arts, Faculty Architecture, Engineering and Conservation, Hildesheim, Germany (HAWK)) - Jean, Giacinta (University of Applied Sciences and Arts of Southern Switzerland (SUPSI_IMC))

Since 2022, the Conservation and Restoration unit of SUPSI-IMC is studying of a series of 11th and 13th C. wall paintings located in churches in Canton Ticino, Switzerland. Among these are S. Maria Assunta in Sorengo, S. Vittore in Muralto, SS. Gervasio e Protasio in Cadempino and the Baptistry of Riva San Vitale. The aim of the study is to characterize the painting technique (materials and methods) and the history of the buildings' construction. The study is supported by grant from the Beate und Hans Peter Autenrieth Foundation.

Through visual examination combined with scientific investigations, the team has identified and documented aspects of the painting technique such as "giornate", incisions and snapped cord, lime-based paint and the use of traditional pigments such as ochres but also precious ones like Lapis Lazuli (Sorengo and Muralto), Azurite (Sorengo and Riva San Vitale), Egyptian Blue (Cadempino), Minio, Biacca and Cinnabar (Sorengo) applied with organic binders (no longer identifiable).

At Sorengo, the combination of archival research with on-site observations, stratigraphic analysis of the elevations of the Romanesque church, the dating of mortars and wood provided in-depth knowledge on the phases of construction.

The study faced the multiple challenges presented by the impact of previous restoration interventions. The churches have undergone architectural modification and, from the 1920s to the 1980s, attempts at recovering the Romanic wall painting schemes.

For each site, the results (graphic documentation and investigations) are organized and managed on a GIS platform.

The presentation will illustrate the extent and the result of the study of the paintings, showing technological and stylistic similarities which give important insights into the cultural and commercial exchanges of this historical period in Canton Ticino.

12 THE DATING OF PYRENEAN ROMANESQUE PAINTING

Guardia, Milagros (Universitat de Barcelona)

The research group ArsPicta of the Universitat de Barcelona, which has been involved in the study of Romanesque mural painting in the Pyrenees region, presents the following proposal:

Under the topic: Advances in methods of dating wall paintings.

The dating of Pyrenean Romanesque painting

Milagros Guardia

Ars Picta

Research Institute for Medieval Cultures (IRCVM)- Universitat de Barcelona

The historical-artistic discourse developed in relation to Pyrenean and Hispanic painting in general has been established based on chronological reference points and the establishment of formal relations between the various pictorial groups. For the latter, in turn, using a figure, that of the "master" who would be the material author of a work and to whom, precisely because of formal relationships, others have been attributed, ultimately inventing a supposed catalog. The formalist method in relation to the work of Romanesque muralists has been repeatedly questioned, though perhaps with little success or, at any rate, with little significance in general studies, and the appropriateness of the term master and the possibility of conserving more than one work by the same team has also been debated.

However, chronological marks have been scarcely discussed, and it is precisely on them that the possibility of establishing a coherent historiographical discourse is based. This is the intention of the communication presented here, precisely to subject to criticism, and to dismantle some of these references of dating of our paintings.

13 MEDIEVAL WALL PAINTINGS STUDIES VERSUS NEW METHODS OF DATATION

Boisseau, Claire (CNRS) - Marzais, Amaëlle (Université Lyon 2)

Over the past decades, technologies involved in medieval wall painting studies had transformed our way of considering it. Now we all use chemical analysis of the murals and their components to specify their dating and their context of production. Since the invention of radiocarbon or dendrochronology, new analysis can now be more accurate based on white lime or whitelead. In the meantime, Art history try to think about new methods to use stylistic details of

the paintings to appreciate their datation. Some of these methods are inspired by archeology, like typo-chronology. All these collaborations bring many benefits to the understanding of murals, but it's still a challenge for everyone. Humanities and new technologies focused on distinct preoccupations. The real benefit in the past was to refocus art history on the materiality, that was not taken in consideration at that days. But, it is clear that the chronological ranges given by carbone 14 are so large (over two or three centuries) that sometimes it is not a help at all to precise the context of creation of a mural. Thanks to examples from mainly French area, the aim of this contribution is to recap the challenge implied by an interdisciplinarity collaboration. It will recap methods and problematic cases exposed on April 2024 at the INHA (Paris) during the Workshop titled "Dater les peintures murales médiévales : approches interdisciplinaires".

789 SHARING, MERGING AND ANALYSIS OF NONINVASIVE ARCHAEOLOGICAL DATA: TOWARDS A MCSA DOCTORAL NETWORK

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: van Leusen, Martijn (Groningen Institute of Archaeology; International Mediterranean Survey workshop) - Campana, Stefano (University of Siena) - Verhegge, Jeroen (University of Ghent; PROSPECT)

Session format: Round table (without formal abstracts)

In the past half century, a massive but underused archaeological data resource has been building up, composed of different kinds of noninvasive observation. From the 1950s onward, fieldwalking surveys and aerial photography have been used to map surface archaeological remains and features over millions of square kilometers; more recently, near-surface geophysics and various types of remote sensing methods including lidar have begun to contribute more 'hidden' archaeological data. Each of these noninvasive approaches contributes valuable and complementary information about the presence, character, and degree of preservation of archaeological remains in the soil, but so far they have been the preserve of mostly separate groups of academic and commercial actors – subdisciplines that have attempted, but mostly failed, to collaborate. The challenge now is to break down the disciplinary and institutional walls between the different research communities, so that different noninvasive data can be shared and integrated for analysis, and can thus have a much greater impact on heritage management across Europe.

This roundtable session aims to bring together prospective partners to develop a proposal for a MCSA doctoral network, aiming to train up a new generation of scholars and heritage managers, not hampered by tradition, for data sharing, merging and analysis. A broad range of academic, professional, and HM partners will be needed, so students not only learn to understand the ins and outs of each noninvasive approach, but also to understand how these are conditioned by geoscientific circumstances and how current obstacles to data sharing and merging can be overcome.

790 THE (COPPER) AGE OF TRANSFORMATION: RESEARCH DEVELOPMENTS ON C. 4500-3500 BC FROM AROUND THE CARPATHIAN BASIN

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Ridge, William (University of Illinois at Chicago) - Tomazič, Iride (University of Michigan) - Čataj, Lea (Croatian Conservation Institute)

Session format: Regular session

For decades, the archaeological record of the Copper Age (including the name) was comparably vague. Primarily known from the introduction of copper metallurgy, formalized cemeteries, and a generally small record of settlements, the Copper Age presents a fundamentally transformative period. The late-5th millennium marks a major shift in sociocultural and demographic trajectories, especially across the Carpathian Basin.

Recent research, with absolute chronology, has greatly advanced the understanding of the Copper Age "package" and has suggested the emergence of macro-regional trends along with a notable amount of regional variation. However, a general lack of interregional synthesis, comparison, and communication, particularly between research traditions from different countries, restricted a fuller understanding of the period.

We invite participants to share their work from all stages of research, including reports from fieldwork from throughout the Carpathian Basin (Hungary, Slovakia, southwestern Ukraine, western Romania, northern Serbia, northeast Bosnia and Herzegovina, northern Croatia, eastern Slovenia, southeastern Austria). A question we would like the participants to address within their paper is "What makes the Copper Age? Some of the topics that we hope to address during this session include, but are not limited to:

-Inquiries of landscape change use.

-Changes in regional settlement and mortuary patterns.

-Variation in material culture across the Carpathian basin and within particular cultural traditions.

-Shifts in economic and subsistence strategies.

By bringing together scholars from various regions and national research traditions, we aim to create a more holistic picture of the Copper Age within the Carpathian Basin. By exemplifying the similarities and differences across the Carpathian Basin between 4500-3500 BC, we aim to explain the changes that distinguish the period from the preceding two millennia.

ABSTRACTS

1 LASINJA CULTURE: REGIONAL DIFFERENCES AND MACROREGIONAL SIMILARITIES

Cataj, Lea (Hrvatski Restauratorski Zavod / Croatian Conservation Institute)

Lasinja is a copper age culture widespread between the Alps, the Dinarides and the Danube River. Because it occupied a large area, several regional types are recognized, such as Balaton-Lasinja, Kanzianiberg-Lasinja and (Bisamberg)-Oberpullendorf. At the same time, similarities in the way pottery was shaped and ornamented can be seen across central and south-eastern Europe.

While investigating Lasinja culture in northwestern/central Croatia, a large sum of data was gathered enabling both micro- and macro-regional analysis of the finds and sites dated to the last centuries of the 5th millennium. Comparing the results of archaeological investigations from more than 80 sites in central Croatia with the published data from continental Slovenia, eastern Austria, Transdanubia, northern Bosnia and eastern Croatia, new insights into Lasinja culture were brought to light.

The paper aims to propose answers to several questions: what are the elements that connect different sites and attribute them to Lasinja culture, why do some regions show more resemblance in their "Lasinja package", in which concurrent cultures can analogies in the archaeological material be traced, how important are the predecessors in the formation of Lasinja culture.

2 NEW RESEARCH ON THE ENEOLITHIC LAKESCAPE OF CARINTHIA (AUSTRIA)

Ries, Marie-Claire (University of Innsbruck, Microarchaeological Laboratory, Department for Archaeologies)

Archaeological studies in Austria's province of Carinthia have been notably underrepresented in the international research discourse. The Alpe-Adria region boasts rich natural (metallurgical) resources and is characterized by bodies of water, including numerous large lakes, peat bogs and the fluvial main axis of the Drava River flowing eastwards to Southeastern Europe. Within this environment, movement of people as well as exchange of objects, ideas and technologies have occurred in the past.

The onset of sedentary life and farming is documented for the 5th and 4th Millennia BCE. Neolithic and Chalcolithic communities associated with the Kanzianiberg-Lasinja culture, as well as groups with pottery exhibiting furrowed incisions, have shaped the local archaeological record. However, our cultural knowledge is limited due to the lack of modern investigations and stratified contexts.

One of the very few pieces of evidence for local settlement activity is the submerged pile-dwelling site in Lake Keutschachersee (a UNESCO heritage site). Exceptionally well-preserved house structures at this site are among Austria's oldest wooden architectural remains. A newly launched project has now taken on the task of answering the question: Where are the other pile-dwelling sites?

The project aims to contribute to this discussion by updating the current site inventories. Evidence is systematically recorded through scientific diving, fieldwork campaigns in wetlands and archival research. Preliminary results, including the analysis of artefacts from a newly discovered case-study site in Lake Wörthersee (Kapuzinerinsel) are presented. The local material culture exhibits strong similarities to well-investigated records from the south and southeast, allowing for a better contextualisation of this crucial key region in pan-European archaeology.

3 VIEW FROM THE EDGE: FORMATION OF COPPER AGE SETTLEMENT SYSTEMS IN THE SE ALPS

Mlekuz Vrhovnik, Dimitrij (University of Ljubljana)

The settlement system of tells and large agglomerated flat settlements collapsed after 4500 BC in the Carpathian basin. Directly preceding this change, we observe the fast expansion of the Neolithic settlement systems into the SE Alps. I argue that this Late Neolithic expansion in the periphery is the shape of things to come in the core area of the Carpathian basin. The historical development of the SE Alps in the fifth millennium BP is related to the broader social, demographic and cultural changes in the Carpathian basin; it is an active response. While this process is traditionally explained as a succession of Neolithic Lengyel and Copper Age Lasinja cultures, I argue it is a single process that reflects the dynamics in the core areas. In the aftermath of these changes, a different lifestyle emerged, characterised by a more dispersed settlement system and generally smaller settlements. Last but not least, if developments during

the fifth millennium in the SE Alps and the Carpathian basin are part of the same historical unfolding, the perspective from the periphery also gives us a fresh view of the core area.

4 ENEOLITHIC POPULATION OF THE LASINJA CULTURE IN EASTERN CROATIA - SETTLEMENT, MORTUARY PRACTICE AND UTILIZATION OF SPACE

Rajkovic, Dragana (Archaeological museum Osijek) - Balen, Jacqueline (Archaeological Museum in Zagreb)

The lecture will discuss recent research on Lasinja culture in the area of the Croatian part of the Baranja region. Authors would like to present recent investigation in the area, conducted in a last five years. Baranja is a region located in a favourable geographical position bordered by two important communication routes that in the past both connected and separated it from the surrounding area of the Pannonian Plain, namely the Drava and Danube rivers, to which it owes its specificity. Thanks to the abundance of water, diverse animal life, fertile soil and natural shelters in its hilly part around Banovo Brdo, Baranja has been an attractive place for permanent residence and settlement by almost all archaeological populations throughout the past, which is best evidenced by the number of recorded sites, of which there are over a hundred.

In the Eneolithic period, some general changes happened in the economy and the way of life, compared to the previous Neolithic period. Although agriculture is still very dominant, increasing of the cattle breeding leads to the construction of a new short-term seasonal settlements. The time of the middle Eneolithic was marked by the Lasinja Culture (4300-3950 BC) and the sites of this culture were investigated at the several locations in the area of Croatian part of Baranja, especially in vicinity of Beli Manastir (Branjin Vrh, Sudaraž, Širine, Šumarina, Staro Selo).

Interesting data about the appearance of the Lasinja culture settlement stand out in particular at the Branjin Vrh site while sporadic graves of the Lasinja culture were discovered at the sites Staro Selo and Branjin Vrh.

5 PICKING UP THE PIECES: ZOOARCHAEOLOGICAL AND ARCHAOMETRIC ANALYSES OF FRAGMENTED BONE FROM THE FIRST LASINJA-CULTURE SITE IN LIKA, CROATIA

Zavodny, Emily (University of Central Florida)

To date the site of Stari Grad (4235-4050 cal BC) in Otočac, Croatia is the only known Lasinja culture site south of the Kapela mountain range. Faunal remains from ongoing excavations, then, provide a singular opportunity to identify and characterize Copper Age husbandry practices in the Lika region for the first time. However, only 50 pieces of bone and teeth have been recovered so far and, given the highly fragmented state of the material, visual identification methods alone are difficult if not impossible. This presentation reports results from both traditional zooarchaeological and newer archaeometric studies aimed at maximizing the information possible from this small but important assemblage. For example, Zooarchaeology by Mass Spectrometry (ZooMS) was used to double the total number of identifications and additional light isotope (carbon, oxygen, nitrogen) analyses were conducted to recreate human-animal interactions. Together these results are the first step towards understanding not only the lifeways of this particular Copper Age community, but also how the Lika region itself might be integrated into the larger archaeological narrative of this period.

6 BOLERÁZ, BADEN OR STARE GMAJNE? FIRST SETTLEMENTS FROM THE SECOND HALF OF THE 4TH MILLENNIUM BC IN NORTH-EASTERN SLOVENIA

Kramberger, Bine (Institute for the protection of cultural heritage of Slovenia)

Northeastern Slovenia comprises the regions of the western Pannonian Plain, therefore the development in prehistory here was always closely connected with the contemporaneous development in the Carpathian Basin. So far, we have succeeded to define the settlement from the middle of the 5th millennium BC, which we find to be close to the Late Lengyel Culture, and numerous settlements from the last third of the 5th millennium BC (Lasinja Culture) and the first half of the 4th and mid-4th millennium BC (Furchenstich horizon and the Protoboleráz phase or Retz-Gajary Culture), which show that the area was settled dense during these chronological horizons. In this paper, however, we present first evidence on the settlements from the following chronological horizon. It could be defined based on the results of rescue excavations, the revision of the discovered material culture and the results of ¹⁴C AMS analysis. We can conclude that the finds and settlement features with ceramics from the second half of the 4th millennium BC are similar to that of Boleráz phase and Baden culture, as well as from the settlements of so-called Stare gmajne group in the Ljubljansko barje (Ljubljana moor). So far, four archaeological sites have been identified, all located on the edge of the Drava plain (Slivnica 1B, Zgornje Radvanje - Habakuk, Lavše near Šikole and Borl Castle). It can be also noted that at individual sites - even those that were investigated on a larger scale - only few pits from this time horizon have been discovered, which indicates a less intensive settlement activity or less dense settlement in the second half of the 4th millennium BC in comparison to other periods, both within individual multi-period sites, as well as in northeastern Slovenia as a whole.

7 THE TIME HAS COME TO BE GONE: SETTLEMENT PATTERNS AND DEPOPULATION DURING THE COPPER AGE IN EASTERN HUNGARY

Ridge, William (University of Illinois at Chicago)

The centuries after c. 4500 BC were a time of significant social and cultural transformation on the Great Hungarian Plain. Metal technology spread widely during this period and the first large, extramural cemeteries in the region were established. Moreover, the tells and large settlements that had characterized the Late Neolithic were abandoned, and the landscape was instead populated by hundreds of small, often short-lived settlements. The vibrant and regionally discrete Late Neolithic traditions (Tisza, Herpály, and Csőszhalom) were replaced by the materially homogenous traditions of the Early Copper Age (Tiszapolgár and Bodrogkeresztúr) that extended across the Plain and surrounding areas. However, after c. 4000 BC, the activity on the Plain appears to have significantly declined, with very few sites belonging to the Middle Copper Age (Hunyadihalom and Proto-Boleráz).

In this paper, I examine the settlement patterns associated with this cultural trajectory in the well-studied region of the Körös River Basin in southeastern Hungary. The settlement patterns in the Körös region demonstrate a massive decline in the number of sites through the Early and Middle Copper Age that suggests a process of depopulation. Incorporating survey, excavation, radiocarbon dates, and environmental data collected over the last two decades, I examine the changes in settlement dynamics to explain possible shifts in sociocultural organization and demography. These patterns are compared and contextualized with other surrounding regions in order to draw broader conclusions across the Carpathian Basin during 4500-3500 BC.

8 THE GREAT HUNGARIAN PLAIN IN THE MIDDLE COPPER AGE: NEW RESULTS OF THE RESEARCH ON THE HUNYADIHALOM CULTURE

Hegedus, Zsuzsa (Hungarian National Museum National Institute of Archaeology; Eötvös Loránd University Institute of Archaeological Sciences)

The Middle Copper Age of the Great Hungarian Plain between 3900 and 3700 calBC is associated with the Hunyadihalom culture, which unfortunately still remains relatively under-researched. The main reason for this may be the fact that although it was recognised as a separate social entity with unique pottery style in the 1960s, only a few of its sites are known. Furthermore, these sites are not large cemeteries with spectacular artefacts or affluent burials, as in the preceding Early Copper Age, but rather settlements, generally comprising only a few pits. The most prominent exception is the Tiszalúc–Sarkadpuszta settlement, excavated by Pál Patay between 1974 and 1990. The 2005 publication of this complex, palisade-surrounded settlement of timber-framed houses still fundamentally shapes our understanding of the culture. However, given the new research results and the advance of methodological possibilities of the past two decades, it is imperative to summarise and revise our knowledge.

In this research, I mainly focus on the study of individual communities from different sites, deducing their traditions, their way of life, and the way they organised their social relations, through the discernible tendencies in their pottery use. Exploring the patterns and subsistence strategy observed in settlements of varying intensities and structures is essential for interpreting the dynamics of social groups expressing a shared identity through the use of distinct pottery. With this approach focusing on everyday life, we have the opportunity to fit the piece of Hunyadihalom culture into the metaphorical puzzle that is the Copper Age of the Carpathian Basin.

9 THE ERA OF CHANGES - STUDIES ON THE MIDDLE AND LATE COPPER AGE TRANSITION IN THE CARPATHIAN BASIN

Fábián, Szilvia (Hungarian National Museum) - Marton, Tibor (HUN-REN Research Centre for the Humanities, Institute of Archaeology) - Csippán, Péter (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest Hungary) - Priskin, Anna (Déri Museum, Debrecen) - Daróczi-Szabó, Márta (Budapest History Museum) - Rajna, András (Ferenczy Museum Centre, Szentendre)

The end of the 5th millennium brought several sociocultural and demographic changes, followed by the formation of an extensive network of social interactions among communities in the 4th millennium, and these stable-like periods led to the spread of several technologies and wealth, which best represent the appearance of metal objects such as heavy copper tools and gold ornaments. This epoch is exceptional and well-known for innovations during the 4th millennium. A part of a currently ongoing National Research, Development and Innovation Office Fund project (NKFIH K129332) focuses on the change at the end of the Middle and the beginning of the Late Copper Age, in which several fundamental transformations can be detected. The environment surrounding human societies and its living and non-living elements constantly changes. Natural scientists have developed several models, such as the adaptive cycle model, based on the similarity of these processes. In recent years, archaeological studies have used this latter method to understand the long-term changes and transformations in the human past, described as specific processes like collapse and resilience. In our presentation, we would like to give an overview of the period mentioned above using this

approach to try to reconstruct changes in the usages of the natural sources, the exchange network, the settlement pattern in-site and regional levels, as well as the material culture and the ideology.

10 LIVE AND LET DIE - BURIALS AND STRUCTURED DEPOSITS AT THE BEGINNING OF THE LATE COPPER AGE (3800-3500BC)

Rajna, András (Ferenczy Museum Center) - Fábián, Szilvia (Hungarian National Museum)

In general, we can say in prehistory, that finds from burials can be interpreted as reflections of the image of contemporary society. The late Copper Age of the Central Carpathian basin, especially the northern part of the region between the Danube and the Tisza rivers has become better known through research in recent years.

Cemeteries with a large number of graves, burials within settlements have been widely published from the Middle Copper Age cultural units as well as the Late Copper Age Baden complex. However, the ritual life of the cultural unit defined as “Protoboleráz”, the initial phase of the Late Copper Age connecting these periods has been little researched.

In our presentation, we would like to present the changes in the role of the structure of burials and their relationship to the settlements. Through these features discovered here, we try to interpret the transformation of the social system at the end of the Middle Copper Age and the beginning of the Late Copper Age (3800-3500BC).

11 RE-EVALUATING THE TIME DOMAINS OF THE CARPATHIAN BASIN

Brummack, Sven (Freie Universität Berlin)

Direct radiometric dating has contributed to an ongoing and fundamental paradigm shift in the construction of chronological reference systems away from iso-phenomenological approaches towards iso-chronologies. Many established reference systems have been constructed with iso-phenomenological concepts, where the material was ordered based upon analogy and then illuminated by stratigraphic sequences (Schier 2014: 423–425). Analogies often failed to produce accurate results, particularly if attempted either over vast distances or directed towards material which was rare (Raczky 1995). Stratigraphic information was found to be suitable for sequential ordering of groups and have long since been employed in this function by archaeologists drawing on Steno’s law of superposition, original horizontality and original continuity (archaeologically defined by Harris 1979). Following research on Varna-I (Higham et al. 2007), archaeological groups are now arranged iso-chronologically instead, tying the material to the distribution of the absolute data retrieved from them. With the help of high-resolution radiometric data, it becomes clearer to what extent the established chronological systems need to be modified. To a considerable extent, the current discussion concerns the periodization of the Copper Age in the Carpathian Basin. It was noted that calibrated dating intervals of Bodrogkeresztúr graves from Rákóczi falva did not differ from the Tiszapolgár samples retrieved from Hajdúböszörmény-Ficsori-tó-dűlő, leading researchers to claim a contemporaneous relationship (Raczky, Siklósi 2013), and to question the periodization of the Copper Age. Overall, this interpretation has not remained without contradiction (Brummack, Diaconescu 2014) and has since been reviewed again (Siklósi, Szilágyi 2016; 2021). This research sums up the recent advantages in south-eastern Europe and expands upon the work from previous analysis through access to more dates, enhanced age models made possible by detailed understanding of archaeological deposition. Exemplifying data were drawn from burial and settlement sites to show the effect age modelling has in furthering our understanding of periodization.

793 LITHIC RAW MATERIALS LITHOTHEQUES: OPEN ACCESS AND INTEROPERABILITY INITIATIVES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Terradas, Xavier (Spanish National Research Council (CSIC-IMF)) - Delvigne, Vincent (Centre National de la Recherche Scientifique, UMR 8068 TEMPS) - Gómez de Soler, Bruno (University Rovira i Virgili; IPHES- CERCA) - Soto Quesada, María (Universidad Autónoma de Madrid) - Tuffery, Christophe (Ministère de la Culture)

Session format: Regular session

International research on lithic raw material provenance has led to the development of lithotheques or reference collections of rocks and minerals. Over time, a great diversity of institutions and studies has contributed to create these collections to document their own research and the specific regional lithological contexts. Its creation has allowed a better knowledge of possible supply areas, providing crucial data for a better understanding of mobility, exchanges and human behaviour throughout prehistory.

Today, these lithotheques should assist us in achieving new goals related to greater contextualization and representativeness of source areas exploited in the past. The management of collections and their associated data is a crucial

element for these purposes. In this sense, the recording, contextualization, description and analyses of lithic raw materials must be carried out using standardized methods, going beyond the scope of each lithotheque and allowing the exchange of this information to potential users anywhere. However, consensual workflows, common protocols, digital and open-access platforms and infrastructures facilitating unrestricted and immediate shared data management, and therefore scientific inter-operability, are still globally scarce. Different initiatives are now working in this direction but international cross-border cooperation still remains a challenge.

The creation of open-access tools on lithic raw materials availability enables effective international collaboration based on FAIR principles. They represent a key tool to encourage the sharing of scientific results, optimizing researches carried out and offering long-term data preservation spaces. Understanding open access platforms as a crucial tool in the future of archaeological sciences, the aim of this session is to create an international forum that fosters the knowledge of different tools, methods, data, and approaches developed globally to promote free accessibility, collaboration and transparency as main pillars of the research community and a wider target audience interested on our research.

The organizers would like to acknowledge the dedication of Xavier Mangado (University of Barcelona) and Solène Denis (CNRS-UMR 8068) to the organization of this session, as well as their generosity in refusing to be included among the 5 organizers, in accordance with EAA standards.

ABSTRACTS

1 THE GDR "SILEX", A FOUR-YEAR REVIEW OF OPEN ACCESS EXPERIENCE

Tuffery, Christophe (Ministère de la Culture et UMR 8068 TEMPS) - Beauvais, Pierre-Antoine (CNRS, UMR TEMPS 8068 University of Cape Tow et UMR TRACES 5608) - Binder, Didier (CNRS et Université Côte d'Azur, UMR CEPAM 7264) - Bostyn, Françoise (Université de Paris 1) - Collin, Jean-Philippe (Université Libre de Bruxelles CReA-Patrimoine) - Defranould, Elsa (CNRS et Université Côte d'Azur, UMR CEPAM 7264) - Fernandes, Paul (Paléotime et UMR TEMPS 8068) - Gibaud, Alix (Inrap et UMR LAMPEA 7269) - Guiavar'ch, Mikael (CNRS et UMR CReAAH 6566) - Delvigne, Vincent (CNRS et UMR TEMPS 8068)

Started in 2019, the Research Group (GDR) "Silex" is a consortium of about fifty researchers from various institutions interested in the diagnosis and transfer of siliceous raw materials during Prehistory. The research is structured around three complementary axes:

1. questioning the reliability of different analysis methods (axis 1);
2. enriching the data corpus through the use of harmonized tools (axis 2);
3. reflecting on the archaeological implications induced by methodological transformations over the last 15 years (axis 3).

A transversal axis concerns publication and communication strategies with the aim of making data as accessible as possible.

For these works, it was necessary to harmonize the vocabulary, build data recording tools, and develop exchange and visualization platforms. Inventory files of about fifteen lithotheques and the results of surveys conducted by GDR members since 2019 are now directly shared online under a free license specific for France (Etablab 2.0) compatible with the CC-BY license. This publication is based on a server and a mapping application (ArcGisOnline) and a data warehouse (Nakala). The whole system enables georeferenced and descriptive data and associated images at different scales to be shared. Today, the data chain from their production to their publication, is a structured process, which enables to answer to the questions and constraints of archaeologists. The whole system allows both the enhancement of old data and the implementation of new surveys and characterizations data. The handling of these tools is facilitated through initial training sessions organized annually and follow up by various GDR members in charge of data validation. As a true collaborative platform, the proposed tool allows for the pooling of work at each one's place, in a spirit of data sharing and protection and in compliance with FAIR principles.

Other co-authors: S.RENAULT, F.-X.LE BOURDONNEC, M.IMBEAUX, A.PASQUALINI, A.TOMASSO, C.LEANDRI.

2 IMPLEMENTATION OF A DIGITAL INFRASTRUCTURE FOR ARCHAEOLOGICAL LITHOTHEQUES IN SPAIN

Terradas, Xavier (Spanish National Research Council (CSIC-IMF, Barcelona)) - Soto-Quesada, Maria (Universidad Autónoma de Madrid (MIAS-UAM)) - Gómez-de-Soler, Bruno (IPHES-CERCA, URV (Tarragona)) - Tarrío, An-doni (UPV/EHU (Vitoria)) - Mangado, Xavier (Universitat de Barcelona (UB-SERP)) - Duarte, Elsa (Universidad de Oviedo) - Herrero-Alonso, Diego (Universidad de León) - Domínguez-Bella, Salvador (Universidad de Cádiz) - Domingo, Rafael (Universidad de Zaragoza) - Ortega, David (Spanish National Research Council (CSIC-IMF, Barcelona))

During last month's we have been developing a thematic network funded by the Spanish State Research Agency, focused on establishing the databases and digital infrastructure to gather, share and make available to the scientific community all the data and information related to Spanish archaeological lithotheques. These scientific collections of rocks are located in the institutions that host the 12 participating research groups, distributed throughout Spain. The proposal has been focused on the study of siliceous rocks since they were the raw materials most frequently used to produce tools in prehistoric times until the appearance and generalisation of metallurgy.

In a first phase, we have carried out an internal survey to obtain detailed knowledge of the current state of all the lithotheques included in the thematic network. This survey demanded information on their collections, territorial scope, recording of units, outcrops and samples, associated documentation, accessibility to the samples and related information, among many other aspects. We consider that the comparative study of all these aspects represents an updated state of the art in this field of research in Spain. In this contribution we will present the first conclusions on this issue, detecting our strengths as well as those points that require more attention from the network.

Undoubtedly, this approach will contribute to outline the immediate development work packages of the network, establishing the basic requirements to start building the databases that in the near future should constitute the core of the digital infrastructure that will allow the integration of the data from the different working groups. All these actions will guarantee the publication and free access of the network's data in accordance with international Open Science and FAIR Data requirements and standards.

3 CREATING ONLINE DATABASES OF LITHIC COLLECTIONS. TWO CASES FROM POLAND - VARIOUS CHALLENGES AND APPROACHES

Werra, Dagmara H. (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw, Poland) - Woźny, Marzena (Archaeological Museum in Krakow, Poland) - Sudoł-Procyk, Magdalena (Institute of Archaeology, Nicolaus Copernicus University, Toruń, Poland) - Bułwka, Sylwia (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw, Poland) - Sokólska-Majchrzak, Anna (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw, Poland)

Since the pandemic, digitalisation and free open access to different databases have become standard. First of all, it concerns publications, books and archive documents. And now it is time for archaeological artefacts! In this presentation, we would like to present and compare two virtual archaeological databases. The first is Atlas of Rocks, a part of Open Resources in the Digital Repository of Scientific Institutes. The second one is the Archaeological Atlas of Małopolska. Both were created in scientific institutions based on scientific materials.

Nevertheless, they present different approaches to data and archaeological materials. The first one, Atlas of Rocks, is strictly scientific and presents lithic materials from Poland and neighbouring countries. In creating this Atlas, we considered the generally prevailing trends and developed adequate universal terminology. The database contains basic information about the raw material, such as its name and place of origin, metric data, a description of macroscopic features or more detailed data on deposits. Every example is visible in detailed photographs and 3D models.

The main goal of the second Atlas is the popularisation of archaeological heritage. This database is the first popular science portal that is a knowledge repository of the archaeological heritage of Małopolska. It was created in the Archaeological Museum in Kraków. This portal is a compendium of knowledge on the region's archaeological heritage and unique discoveries at nearly 400 archaeological sites in the southern part of Poland. This repository is not strictly a lithotheque; however, the lithic materials create a considerable part of this database.

Creating an online lithotheque is a challenge, both in scientific, organizational, and technological approaches. We would like to present our observations and experience.

4 LITHIPHES: A NEW SPACE TO SAFEGUARD AND CONSULT GEOLOGICAL SAMPLES AT IPHES-CERCA (TARRAGONA, SPAIN)

Brià, Judit (Institut Català de Paleoecologia Humana i Evolució Social (IPHES)) - Gómez de Soler, Bruno (Institut Català de Paleoecologia Humana i Evolució Social (IPHES))

With the passage of time, collections expand with materials from outcrops and archaeological settlements thanks to researchers and institutions developing their research projects. This process implies an enormous quantity of information and materials that if are not processed and stored correctly run the risk of being lost forever. As a solution, at the IPHES-CERCA research Institute we present LithIPHES, our state of the art lithoteque designed to organize geological samples, currently focused on chert, and cater to the needs of IPHES-CERCA researchers following the FAIR principles.

LithIPHES consists of three main parts: the data base, the core of the lithoteque, where all information available is stored; the physical sample collection categorized according to the data base; and finally, a map collection with the geographical information of all registered samples. As a live project, we are working on improving the existing elements while developing new tools to expand LithIPHES and make it a reference for other lithoteques thanks to new technologies such as 3D printing, an online visor and open science projects.

With these tools at our disposal, our desire is to help researchers with an easy and fast way to access the materials, to facilitate interdisciplinary research with other institutions, and to guarantee the preservation of the geological samples from IPHES-CERCA projects for the future.

5 ARQUEOLIT - AN OPEN ACCESS LITHOTHEQUE IN PORTUGAL

Jordão, Patricia (UNIARQ-FLUL) - Soares, Sofia (LNEG) - Pena, Teresa (LNEG)

The establishment of a rock database used as raw material throughout human history is highly important in encouraging the systematic realization of provenance studies in archaeology. This will shorten the first stages of the Petroarchaeological Protocol – sample collection and description – speeding up the process of correlating archaeological and geological samples, and simplifying the provenance study itself.

In Portugal, as a result of the provenance studies of siliceous raw materials carried out since the last decade of the 20th century, many samples were collected. However, these remained attached to each research project, with partial publication of the petrographic, mineralogical, and geochemical characterization.

This paper intends to present the joint efforts of LNEG - Portuguese National Laboratory of Energy and Geology and UNIARQ – Centre for Archaeology of University of Lisbon to build an archeological lithotheque - ARQUEOLit.

LNEG, as a National Geological Service, already has a Litoteca that compiles core samples obtained during years of geological surveys and mineral exploration, although this collection is not focused on archaeological raw materials, particularly flint, which was a key resource in prehistoric times.

The LNEG's experience with the UNIARQ's specialization in the study of siliceous resources led to the creation of a raw materials lithotheque, beginning mainly with flint samples as an outcome of research projects carried out in the past years, to support archaeological research and to contribute to the understanding of how siliceous raw materials were obtained and managed in Prehistory.

The ARQUEOLit aims to adopt a harmonized protocol at different stages of the data treatment, from collection to online publication, in accordance with FAIR principles, arguing that open access platforms are a crucial tool in the future of archaeological sciences. Thus, the ARQUEOLit will be linked to the existing European Cartosilex database cartographic platform for consulting georeferenced data.

6 THE OPENLIT PROJECT: A FIRST STEP FOR AN OPEN ACCESS LITHOTHEQUE OF ITALIAN KNAPPABLE ROCKS

Lo Vetro, Domenico (Dipartimento SAGAS, Università di Firenze; Museo e Istituto Fiorentino di Preistoria) - Bertola, Stefano (Dipartimento SAGAS, Università di Firenze) - Carletti, Elena (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma) - Conforti, Jacopo (Dipartimento di Scienze della Terra e Geoambientali, Università di Bari Aldo Moro) - Ferrero, Arianna (Dipartimento SAGAS, Università di Firenze) - Moscone, Daniele (Institute of Pre- and Protohistoric Archaeology, Kiel University) - Pizziolo, Giovanna (Dipartimento di Scienze Storiche e dei beni culturali, Università di Siena) - Santo, Alba (Dipartimento di Scienze della Terra, Università di Firenze) - Sappaluto, Luigi (Dipartimento di Scienze della Terra e Geoambientali, Università di Bari Aldo Moro) - Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università di Bari Aldo Moro)

A few regional projects in various European countries have recently been launched for the characterization of lithic resources including the creation of geo-referenced lithoteques that have been designed according to shared scien-

tific protocols. Italy is still lacking such tools for systematizing research in the field and enhancing our knowledge of knappable materials.

OPENLIT research project aims to build up the core of the first Italian open access lithoteque, a reference collection of knappable rocks based on a multi-parametric GIS-based database. The goal of this project is to develop a standard analytical descriptive system for defining knappable rocks, based on laboratory testing, and to make it available to the scientific community through an open access repository aimed at data sharing and dissemination.

The first step in achieving this goal consists in organizing a large set of information on knappable rocks available to prehistoric communities in Italy. Various lithoteques of knappable rocks from different Italian regions are currently stored in Italian University labs. These lithoteques have been assembled over time by several researchers with different methodological approaches and are not always accessible to scholars and students.

Starting from cherts, OPENLIT will provide the scientific community with a powerful, open and implementable research tool aimed at depicting the availability of knappable rocks in some key-territories in Italy. The open access repository will host the shared lithoteque and the geo-samples mapping as part of a WebGIS platform. For the first time data will be analysed at a national level with a shared approach combining different methodologies. Macroscopic, petrographic and compositional characterization of selected geological chert will provide target values to establish reference groups for further comparisons with prehistoric collections from both the Italian peninsula and neighbouring territories.

7 SHARING CHERTS: THE LAEX-UAM PILOT EXCHANGING EXPERIENCE

Soto, Maria (Universidad Autónoma de Madrid) - Castañeda, Nuria (Universidad Autónoma de Madrid) - Torres Navas, Conchi (Instituto de Historia - CSIC) - Baena, Javier (Universidad Autónoma de Madrid)

Lithic raw materials analyses in Prehistory encompasses multidisciplinary approaches ranging from prospecting, sampling, petrographic and geochemical characterization requiring open, accessible, and transparent initiatives to avoid research duplicity and ensure reproducibility and replicability practices.

The Experimental Archaeology Laboratory (LAEX-UAM) is a teaching and research facility focused on promoting the knowledge of hunter-gatherer's technologies and lifeways. The involvement in different international projects, experimental networks, and transference programs boots our compromise with inter-operability initiatives and FAIR principles.

The LAEX-UAM also hosts a relevant collection of knappable materials from geological outcrops exploited since the Lower and Middle Palaeolithic in the central region of the Iberian Peninsula. Outcrops and chert petrographic characterization have been developed through different research projects (AEI and FEDER funding), and a pioneering national exchanging initiative has been launched to enhance the recognition of these lithologies within a regional and large-distance ranges.

This pilot exchanging program with 30 universities and research institutes is based on the shipment of: 1) centimetric cortical hand samples of different lithologies and provenances; 2) uncovered petrographic thin sections; 3) the corresponding petrographic characterization; and 4) an institutional letter explaining the scope of this novel initiative.

Our plan was to explore the recognition of these lithologies through macroscopic and mineralogical characterization, aiming at launching a collaborative procedure through enlarging institutional reference collections, and stablishing a collaborative network that facilitates the detection, classification and assignation of these materials and their possible exploitation exceeding traditional knowledge and geographic niches.

The program is presented as a successful tool, and the positive received responses exhibit the need of systematic recording, shared workflows, accessible data and exchanging programs of hand samples. With this aim, the team is involved in a recent national Research Network project to promote digital tools and effective collaboration that optimize efforts and resources on lithic raw materials research.

8 LITHIC RAW MATERIAL DEPOSITS IN ISTRIA, CROATIA - A LITHOTHEQUE IN THE MAKING

Šprem, Katarina (Independent researcher)

Istrian peninsula, the westernmost part of Croatia, is mostly made up of carbonate surface deposits with siliceous rocks cropping up in several places throughout the peninsula. For the purposes of the provenance analysis of lithic raw materials in prehistory of the Istrian peninsula, we surveyed known chert deposits and sampled them to create a micropetrographic database. The Istrian chert is diagenetic, meaning the limestone has been silicified into chert, which can be seen by ghosts of the primary structure observed during petrographic analyses. The problem with Istrian chert is that it appears along a line of Cretaceous (mostly Cenomanian) limestone and its visual characteristic are mostly the same, with a few exceptions. There are also secondary deposits of chert with unknown parent rock, but also diagenetic in nature. How to differentiate visually similar but geographically different cherts? Some geochemical analyses we conducted show interesting geochemical footprints of two deposits and the potential of this kind of analysis in differentiating between them. This presentation will explain the logistical steps behind the project to create the lithotheque,

as well as present some chert samples and deposits. We will also display some of our plans for the advancement of the project and eventual open access status.

9 LUSOLIT FROM THE SHELF TO THE WEB: AN ONLINE LITHOTHEQUE FROM SOUTH PORTUGAL
Belmiro, Joana (ICArEHB, Universidade do Algarve) - Bicho, Nuno (ICArEHB, Universidade do Algarve) - Cascalheira, João (ICArEHB, Universidade do Algarve)

Lithic raw materials played a critical role in the survival and cultural organization of past human groups, making them central elements in understanding mobility, raw material acquisition, and exchange networks. Identifying changes in these patterns over time is essential for comprehending how different groups adapted and reorganized their material culture. Southwestern Iberia is a key region for studying human behavior through time, as it served as a refuge for hunter-gatherer communities during the Upper Paleolithic climatic shifts and was continuously inhabited during recent Prehistory. This is evident in archaeological sites such as Vale Boi, an eco-cultural niche with one of the region's most complete Upper Paleolithic sequences (c. 32 ka to 15 ka cal BP).

Evidence also suggests that from the Upper Paleolithic to recent prehistory, lithic raw materials were exchanged by both hunter-gatherers and agricultural communities in the Iberian Peninsula, as cherts from southwestern Portugal have been identified in collections from other regions of Portugal.

To characterize lithic raw material procurement and usage in south Portugal and explore potential social networks between southwesternmost Iberia and other regions in the Peninsula, establishing a reference collection accessible to the scientific community is paramount. The LusoLit project, initiated in 2016, aims to achieve this goal.

This paper presents the results of previous and ongoing systematic prospection works in the Algarve region, along with the macroscopic, petrographic, and geochemical characterization of geological chert and chalcedony samples. This effort resulted in the creation of a regional online reference database, accompanied by a well-defined analysis methodology. The comprehensive database currently contains visual and descriptive information on regional cherts and chalcedony, allowing for their free online and offline accessibility, and fostering future collaborations and scientific transparency.

10 THE BEGINNING OF A LITHOTHEQUE IN SOUTHERN CHILEAN PATAGONIA?
Arecheta, Constanza (Universitat Rovira I Virgili) - Sierpe, Victor (CEHA)

Southern Patagonia is a macro region shared between Chile and Argentina, which has a great variability of lithic raw materials, with a large number of primary and secondary sources. To date there is no lithotheque available that can illustrate the lithic landscape of the region. The study of raw materials in the extreme south of Chile has not been widely investigated and less in an inter-site format. Sierra Baguales is located in the province of Última Esperanza in the region of Magallanes (Chile), which is a great place to start this research. It contains multiple procurement sources of all kinds and evidence of resource exchange from distant sources (250 km away). In this space we have human presence that allow us a unique study, not only because they remained as hunter-gatherer communities until contact with different European societies. It is also, because in that contact there were opportunities for ethnographic studies, which allow us to have one more method to understand the use of lithic resources. Adding the information from sources of lithic raw materials, ethnographic studies and archaeological evidence, we would like to answer, how did hunter-gatherer groups use lithic resources in the Sierra Baguales area during the late Holocene? Therefore, not only starting a regional lithotheque, but also deepening the knowledge we have of the resource procurement by human groups in Patagonia.

11 GEOLOGICAL AND GEOCHEMICAL RESEARCH IN THE CREATION OF AN OPEN-ACCESS DATABASE: A CASE STUDY FROM BULGARIA

Gurova, Maria (National Institute of Archaeology, Bulgarian Academy of Sciences) - Andreeva, Polina (Geological Institute, Bulgarian Academy of Sciences) - Stefanova, Elitsa (Geological Institute, Bulgarian Academy of Sciences) - Bonsall, Clive (University of Edinburgh)

Bulgaria has many primary and secondary flint outcrops that were, or could have been, exploited for toolmaking in prehistory. Previously, raw material provenances and distributions were inferred from visual and/or petrographic observations of flint. This and the abundant data on prehistoric chipped stone assemblages invited a re-assessment of two proxies: i) their significance for understanding human mobility, and cultural and economic transitions in prehistory and ii) the methods and techniques of research.

Over more than a decade there have been notable advances in Bulgaria in raw material studies using macro- and micropetrography combined with geochemical (LA-ICP-MS) analysis of raw material samples and flint artefacts. Based on four systematic field surveys to identify and record raw material outcrops, we selected 64 geological samples for comparison with 166 artefacts from archaeological sites. All stages of our analytical procedure – from fieldwork to

the combined analytical results and database creation were meticulously documented. The results of this research have been presented in open-access publications and constitute a coherent corpus of analytical data that could be integrated into future academic initiatives to create a more comprehensive digital lithotheque.

This paper outlines our achievements in raw material provenance studies and the correlation between geological samples and artefacts, revealing the potential vs actual use of each raw material outcrop. Our team is open and available for future collaborations with the wider raw material-oriented research community.

12 SMARTPHONE IMAGING AND SILICEOUS RAW MATERIAL CHARACTERISATION: CROSS-REFERENCING DATA TO BUILD A REFERENTIAL COLLECTION IN EASTERN IBERIAN PENINSULA

Ramacciotti, Mirco (PREMEDOC Research Group, Department of Prehistory, Archaeology and Ancient History, University of Valencia.) - Gallelo, Gianni (PREMEDOC Research Group, Department of Prehistory, Archaeology and Ancient History, University of Valencia.) - Diez Castillo, Agustín (GRAM Research Group, Department of Prehistory, Archaeology and Ancient History, University of Valencia) - García Puchol, Oretó (PREMEDOC Research Group, Department of Prehistory, Archaeology and Ancient History, University of Valencia.)

In the last decades, the application of analytical techniques for the characterisation of lithic materials has consistently supported provenance studies and raw materials identification. The new challenges in this area of research are linked to the development of effective methods based on non-invasive approaches which permit to obtain useful data on large assemblages by means of portable devices. However, the development of a standardised protocol to build referential databases is a real challenge due to different variables, involving available labs facilities and instrumentation, laboratory procedures and individual skills. Nevertheless, smartphones as analytical tools can consistently contribute in the standardisation of a protocol to build reliable and accessible libraries, being widespread, easily portable and user-friendly devices.

In this paper, we test a methodological proposal on a referential collection of siliceous rocks in the framework of the projects conducted by our team in the Eastern Iberian Peninsula, linked to the study of raw materials supply strategies of the last hunter-gatherer inhabitants of Cueva de la Cocina. Finally, we are exploring the potentials of smartphone imaging as an effective, cheap and fast method to characterise large lithic assemblage, and as part of a standardised protocol for the collection of shareable data, including the use of other techniques such as portable X-ray fluorescence spectroscopy.

794 OLD EXCAVATIONS AND FINDS, NEW DATA AND INTERPRETATIONS: THE USE OF ARCHIVES IN CURRENT ARCHAEOLOGICAL RESEARCH PROJECTS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Schlanger, Nathan (Ecole nationale des chartes, Paris; UMR Trajectoires - 8215) - Cataldi, Maddalena (Ecole française de Rome) - Hofmann, Kerstin (Romano-Germanic Commission of the German Archaeological Institute) - Plutniak, Sébastien (Citeres Lab, CNRS, Tours) - Rosner, Chloé (Institut national d'histoire de l'art; UMR TEMPS 8068)

Session format: Regular session

The history of archaeology is a growing field of investigations which provides a range of studies and insights based on rigorous historical methodologies, drawing on archival materials, and organised into a veritable community with its research programs and widespread publications.

Besides providing new knowledge on the practices and theories of archaeology worldwide, these empirical (archive-based) investigations have also focused attention on the production, conservation, dissemination and re-use of a range of documents produced by past archaeologists in the course of their excavation or collection activities. In turn, this has generated renewed interest in the archives of archaeology, be it in order to better understand the scientific, cultural and social implications of the discipline, or to make practical use of archival materials as a source of evidence and interpretations about the past.

This session aims to address both these conceptual and pragmatic dimensions of the archives-based history of archaeology. Contributors are invited to address issues such as:

- 1) the scientific use of archival information: how, in our age of open science and (digital) data-reuse, are the results of past research integrated in the current production of knowledge?
- 2) the organisation of archive-based research projects: who leads such projects, and what division of labour between archaeologists, historians or archivists are at stake?
- 3) publication policy: to which audiences (scientific, laypeople) and in what publications are presented the results of projects combining new and old archaeological data?

More generally, we welcome papers addressing broader methodological or theoretical issues concerning the use of archives for the history of archaeology.

ABSTRACTS

1 COMBINING THE OLD WITH THE NEW FOR A MORE REFLECTIVE FUTURE

Hofmann, Kerstin (RGK - Romano-Germanic Commission DAI) - Rösler, Katja (RGK - Romano-Germanic Commission DAI)

In recent decades, the history of science has shown that scientific knowledge can be dependent on socio-political conditions, personal networks, technical innovations, research practices and places etc. Due to these insights, research on the history of archaeology is thriving and archaeological research is becoming more reflexive. At the same time, the digital turn and the WWW encourage transdisciplinary research as well as new forms of access to and presentation of information.

In several collaborative projects, the RGK is accessing archives with different research questions and uses new digital technologies for this purpose. In addition to the traditional history of research, the research on knowledge production is becoming increasingly important. After a brief overview, we would like to illustrate this with the newly approved long-term academy project *disiecta membra*. It aims to identify, catalogue, link and evaluate a corpus of dislocated building elements of roman stone architecture in Germany as well as research related historical and praxeological topics. The long project duration of 24 years offers the rare opportunity to develop tools for the digital linking of newly collected object data with old archive information, but also to reflect on changing knowledge practices. A positive side effect will be the indexing and analysis of the content of selected holdings from the archives of the RGK and other institutions. This is of particular relevance, as the archives of archaeology are often scattered and difficult to access. Our research data on actors and practices will be published in the dynamic biographic information system *Propylaeum-VITAE* to promote further research in the history of archaeology. Using case studies, we will present our work with and on archival material. Furthermore, we would like to discuss whether the combined consideration of old and new data, practices and analyses can contribute to a more reflective future.

2 KNOWLEDGE CONSTRUCTION IN AND WITH THE ARCHAEOLOGICAL ARCHIVE

Ward, Chloë (Ludwig-Maximilians-Universität, University of Munich)

The aim of this paper is to consider the construction of archaeological knowledge within, and using, archives. Using case studies derived from fieldwork in Sudan and Egypt, and drawing upon archival theory and interdisciplinary approaches to archival research, this paper will consider how the processes of archival documentation produce, transform, and construct archaeological knowledge.

A major focus will be the ERC *DiverseNile* project in northern Sudan, where past research is being integrated with ongoing archaeological fieldwork; in particular, a survey conducted between 1970 and 1975 which was published as a series of reports. While invaluable, these reports hint at extensive additional information which remains unpublished. Unfortunately, for a variety of reasons, this material is not currently accessible; however, we can still consider its role in the production and publication of archaeological knowledge. This includes the way information was initially collected, which drew upon previous archaeological research while simultaneously developing a bespoke recording style and methodology. By attempting to apply methods developed as part of my previous experience of archival research – primarily archival records from a 1921–1922 excavation in Egypt – I explore the ways in which we can still engage with, and integrate, information from what is effectively an archival ghost but remains an important source of evidence and interpretation nonetheless.

By looking at the archive as a subject in its own right, rather than merely a source of information, it is possible to engage with fundamental aspects of both the production of archaeological knowledge and the history of archaeological research, thereby also facilitating a reflexive exercise on current practices. A crucial consideration is also how to effectively integrate the results of past archaeological research with new data while ensuring these are accessible to future researchers.

3 LILLA JORED A CHIEFTAIN BURIAL? - RECONSTRUCTION AN EARLY 19TH CENTURY EXCAVATION

Eboskog, Mikael (Bohusläns museum) - Nyqvist, Roger (Bohusläns museum)

The presence of gold almost always affects the narrative that we call history. One example is Lilla Jored's grave in Bohuslän from 4th century AD and which was excavated in 1816. Several gold objects were found that came to dominate the image of the tomb and its story, that of a burial of a prince influenced by the Roman Empire. The other findings

and the actual circumstances of the investigation in 1816 fell into oblivion. The official story conveyed today via an exhibition at the National Historical Museum and on national television is still focused on the same interpretation.

In our project, we want to understand both why and how the grave was dug, but also the connection between the different finds recorded at the site. Interestingly, despite the gold finds, the actual place become lost (rediscovered 1925). Our investigation shows that the official picture has major flaws. The archival material shows, for example, that the gold finds used in the main narratives were submitted two years after the investigation and cannot be linked with certainty to the grave. Around the excavated grave there are also several over-ploughed graves and possibly some of the gold may come from one of these.

The Lilla Jored project is both a history of archaeology and of knowledge that clearly shows how a passed down narrative and the dissemination of knowledge about a place can be changed by critically processing the various archived documents. Unfortunately, the tendency for our archives and repositories to be largely unused is within the current knowledge production in Sweden, regardless of the age of the archive material. Which affects how we can access the older documents in the future, but also how our contemporary archived material will be accessible and, above all, do we save sufficient documentation?

4 CREATING COMMON GROUND. SWEDISH ARCHIVE RESEARCH ON THE PAST FOR THE FUTURE

Wallensten, Jenny (Swedish Institute at Athens) - Hansson, Ulf (Swedish Institute in Rome) - Frejman, Axel (Uppsala University; Swedish Research Institute in Istanbul)

In 2019, the Swedish research institutes at Athens, Rome and Istanbul initiated a project to create a digital platform gathering archive material from over 100 years of Swedish archaeological research in the Mediterranean area. The platform, named *Common Ground*, initially aimed at being a powerful tool in an early research phase for scholars wishing to locate archaeological material in local museums and storerooms, has underway developed into a digital archive of great interest in itself. It provides not only information about where to find certain objects, and a smooth way of gathering quantitative information about material categories, but researchers can also access field diaries, plans, sketches letters and photographs, thus allowing studies in the history of archaeological research and ideas, for example. Non-official participants in fieldwork become visible, for example the wives of the main excavators, who also contributed to the success of a field campaign, but who were not necessarily mentioned in official documents. Furthermore, the archives of the institutes have become accessible in a way that assures the safety of original documentation.

In this paper, we address the importance of making legacy data otherwise kept at several places and in different countries coming together to enrich current research and the interesting perspective that opens when non-Swedish scholars study Swedish research in an historical perspective. Moreover, we discuss choices made as regards the intended audience (our platform will have different layers of access, going from detailed storage information for a few targeted specialists to information of interest on a general level), as well as the potentially difficult collaboration between archaeologists and IT-specialists and its potential backsets.

5 RAW MATERIALS CIRCULATION DURING THE EBA IN THE SANDOMIERZ UPLAND. DATA OF THE "PAR" PROGRAM IN THE NEW TECHNOLOGICAL REALITY

Budziszewski, Janusz (Institute of Archaeology UKSW) - Szubski, Michał (Institute of Archaeology University of Cardinal Stefan Wyszyński in Warsaw)

In the late 1970s, the Polish archaeological community launched a program for the comprehensive documentation of archaeological sites called the "Polish Archaeological Record" (PAR). The implementation was based on a standardized method carried out by small teams conducting field surveys within artificially designated spatial units (37x41 km²). The country's territory was divided into approximately 8,500 units, referred to as the PAR Areas. The recording of information was formalized on specially designed cards, which became a mandatory form of documentation. Fieldwork was conducted using maps at a 1:25,000 scale.

The culmination of the program occurred in the late 1980s and early 1990s. Over the course of two decades, work was conducted on nearly 90% of Poland, documenting around 500,000 archaeological sites. These results serve the heritage authorities well in their daily practice. From the beginning, attempts were made to use the obtained data in settlement research. However, after initial fascination, it became apparent that the huge amount of data and methodical problems during fieldwork significantly limited analytical possibilities.

Currently, PAR data is being digitized by the National Heritage Institute and partially made available to researchers. By focusing on selected, well-surveyed areas, one can ask specific research questions. The presented case study is limited to the loess-covered area of the Sandomierz Upland, covering an area of approximately 1140 km². This area includes 35 PAR sheets and was investigated in the years 1987-1999 mostly by one research team. With basic knowledge about the reliability of past work, we investigate the circulation of a Turonian flint, known as the "Ożarów flint" among the early Bronze Age communities. Settlement information and findings of loose artifacts allow GIS spatial

analyses regarding the likely paths of people's movement and distribution of specific flint in the specific microregion during the specific time frame.

6 ARCHIVAL RESEARCH ON SHIPWRECKS IN TAIWAN'S WATERS: ITS CONTRIBUTION TO UNDERWATER ARCHAEOLOGY SURVEYS

Chen, Pin-Wen (Texas A&M Univeristy) - Lee, Chi-Lin (Tamkang University)

This paper emphasizes the critical role of archival research in underwater archaeology. Using historical research methodologies, such as data collection, sorting, verification, and analysis, one of the project updates the database of shipwrecks in Taiwan's waters and generates hotspot maps for potential underwater cultural heritage. It incorporates historical materials related to the Sino-French War from the French National Library (Bibliothèque nationale de France), the French Naval Archives (Service historique de la défense), the Dutch East India Company, and other Taiwanese historical materials from the 16th to the 19th centuries. Taiwan's strategic maritime location and the treacherous waters near Penghu Island, which have many recorded shipwrecks, emphasize the importance of this research. So far, 101 underwater targets have been discovered near Taiwan, with twenty identified as underwater archaeological sites, and six recognized as significant shipwrecks. The study categorizes and analyzes shipwreck historical research results based on location, cause, and ship type. This method helps identify the shipwreck and its historical era, placing it within a broader historical context. The paper reflects on the challenges and opportunities of conducting most archival research online during the Covid pandemic. It also discusses the potential for open database access for academic researchers and the public, advocating for a more inclusive approach to sharing knowledge about underwater cultural heritage. Through a comparative review of various projects, the article contributes to the ongoing discussion about the importance of archival research in deepening our understanding of underwater cultural heritage.

7 THE BASILICA IULIA PROJECT AND THE ARCHIVE OF LAURA FABBRINI (1960-1964): QUESTIONS OF WORKFLOW, METHOD, AND DATA TRANSPARENCY

Bozza, Sara (CNR - Istituto di Scienze del Patrimonio Culturale) - Galli, Marco (Sapienza Università di Roma) - Ismaelli, Tommaso (CNR - Istituto di Scienze del Patrimonio Culturale)

The discovery of the Basilica Iulia in 1851-1852 was the starting point of the modern archaeological research in the Forum Romanum; however, after its complete excavation by P. Rosa (1870-1871), the monument remained aside from the main research interests, till the extensive investigations carried out by Laura Fabbri (1960-1964). Her significant archive, composed of plans, hundreds of photos, and many excavation diaries, is the object of a multidisciplinary project, aimed at enhancing the information potential of the old excavations, which had remained unpublished. The in-depth analysis of textual, graphic and photographic records together with new architectural and geophysical survey and the multidisciplinary study of archaeological materials allowed a significant improvement of our understanding of the context as well as a thorough reconstruction of its chronological phases.

First, the contribution focuses on the archive documentation as a primary source for the history of archaeology, in order to reconstruct the research interests and approach of Fabbri, a neglected figure of the Italian post World War II archaeology, whose method appears significantly aligned to the most up-to-date stratigraphic experience of that time. Secondly, the paper presents the workflow developed within the Basilica Iulia Project as a case study to reflect on the best practice in the re-use, actualization and dissemination of archaeological legacy data. The developed workflow aimed at connecting the 1960-1964 information on stratigraphic units, architectural structures, and archaeological materials to the current research method, based on multidisciplinary approach and digital techniques, such as the 3D model of the excavation areas. Finally, crucial methodological questions related to the recognizability of sources, the authorship of old and new data and interpretations, thus the transparency of the archaeological research, are discussed.

8 BROWSING LEGACY MATERIAL: THE CASE OF THE ARCHIVES OF THE FRENCH MISSION AT ENKOMI (CYPRUS)

Meneghetti, Francesca (Cyprus American Archaeological Research Institute)

Thanks to its archaeological riches, Cyprus has been the target of archaeological explorations since the end of the 19th century. The first half of the 20th century, in particular, saw an increase in the number of foreign archaeological missions working on the island. Dug by British, Swedish, French and Cypriot missions, the Late Bronze Age site of Enkomi is an example of this phenomenon. The archaeological discoveries of the four expeditions brought to light a key site for studying the Late Bronze Age Cypriot economy, society and material culture. Since Enkomi lies in the northern, occupied part of the island, it is inaccessible to further field investigations. Thus, scholars are left to work with legacy data from previous archaeological missions that are mainly poorly published or unedited.

The paper focuses on the work of the French mission initiated in 1934 by C.F.A. Schaeffer. The French worked at Enkomi until 1973, unearthing large parts of the site and large quantities of material. Despite the best efforts of the missions' members, the results of the French excavations at Enkomi remain largely unpublished. As part of a larger, long-term project aimed at investigating and publishing the material of the French mission at Enkomi, the paper presents the challenges and the preliminary results of the study of the archives of C.F.A. Schaeffer and related legacy material.

9 BACK TO THE SIXTIES ! NEW INVESTIGATIONS ON JEAN PERROT'S EXCAVATIONS AT THE NEOLITHIC SITE OF MUNHATA (8TH-6TH MILLENNIA BC)

Bessenay, Julie (UMR 5133 ArchéOrient) - Vieugué, Julien (UMR 8068 TEMPS)

Excavated from 1962 to 1967 under the supervision of Jean Perrot (1920-2012), Munhata is considered as a major settlement for better understanding the late stages of the Neolithisation process in the southern Levant. Despite its importance, this site remains largely unpublished. Since 2020, new investigations have been carried out on Jean Perrot's excavation archives as part of two successive projects respectively funded by the French National Agency for Research (<https://cerastone.cnrs.fr/>) and the Shelby White and Leon Levy foundation (<https://whitelevy.fas.harvard.edu/munhata-and-second-neolithic-revolution-near-east>). We first gathered, sorted and described the field documentation in close collaboration with the archivists of the Maison des Sciences de l'Homme Mondes (Nanterre, France) before digitalizing it in order to put it online. We then started to analyse the stratigraphic data from these documents (photographs, plans, notebooks, locus and catalogue files...) with the aim of reconstructing the long-term occupation sequence at the site of Munhata. This archives-based approach is combined with a re-examination of the artefacts discovered in the 1960's and an achievement of new radiocarbon dates. Such an integrated study will allow us to track the history of the Neolithic village of Munhata that will be published in a comprehensive monograph and, beyond, to contribute to various debates about the Neolithisation process in the Near East.

10 ANCIENT, ARCHIVAL, AND MODERN SOURCES COMBINED WITHIN THE PTOLEMAIC PATHYRIS PROJECT (EGYPT)

Skalec, Aneta (Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences) - Ejsmond, Wojciech (Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences)

Three kinds of data, that is ancient, 19th-20th century, and modern ones, form a unique case of complementary sources allowing a reconstruction of an Egyptian provincial town in the 2nd century BCE.

The town of Per-Hathor, known in Greek as Pathyris, was located 28 kilometres south of Luxor, in the Gebelein micro-region. The town is very important for papyrologists as it played the role of a district capital from approximately 186 BCE to 88 BCE. About 1300 Greek and Demotic documents were found in the ruins of the town in the 19th-20th centuries, making it a unique site to understand life in provincial Upper Egypt in Ptolemaic times (305-30 BCE). Despite significant visibility in the papyrological source material Pathyris is very little known from an archaeological perspective since the remains of the town mostly vanished during the 20th century. The town was explored in the late 19th and early 20th centuries by numerous scholars, but the results of their field activities were never published to a satisfying extent. The importance of Pathyris for understanding Ptolemaic Egypt became apparent much later when the texts were published. Current archival surveys revealed unpublished documentation from excavations in the form of sketches and photographs, which can be paired with the results of current field prospection to fill the gap in our knowledge.

The available sources allow for very-needed research on the urban layout and domestic architecture of Pathyris. During the presentation, we will discuss how archaeological and geospatial data from old and current fieldwork can be combined with topographical information contained in Greek and Demotic papyri, to reconstruct the appearance and functioning of the town. We will also present how we are planning to link all those sources within a 3D town visualisation which will be available both for a scientific and laypeople audience.

11 ARCHIVES TELL THE TRUTH - RECONSTRUCTING THE HISTORY OF ARCHAEOLOGICAL AND CONSERVATION WORK AT THE TEMPLE OF HATSHEPSUT IN EGYPT

Kasprzycka, Katarzyna (University of Warsaw, Faculty of Archaeology)

The temple of Queen Hatshepsut at Deir el-Bahari in Egypt is an object of constant interest of many scholars since 1893, when Édouard Naville on behalf of the Egypt Exploration Fund unearthed the northern part of the temple, which was under debris from ancient times. In the excavated part of the temple he first found the so-called Northern Chamber of Amun. In later years the temple was examined by various institution, including the Metropolitan Museum of Art in New York, Service des antiquités de l'Égypte, and Polish-Egyptian Archaeological and Conservation Mission. Despite of this uninterrupted period of research, many myths and questions have grown up around the temple,

especially around The Northern Chamber of Amun, which have not been solved until today. Archive documentation has helped to change this.

Some problems to be dealt with were: do all the blocks from the fully reconstructed entrance to this chamber truly come from it, who was responsible for building them into the wall and when, what was the original type of roof of this chamber - flat or barrel-vaulted? The archive material was extremely useful in finding answers to these questions. These included excavation journals kept in Archives of Édouard Naville in Société d'Égyptologie Genève, photographs stored in the archives of Musées d'art et d'histoire de Genève, or the archives of the Egypt Exploration Society. A careful examination of this whole material as well as additional various photographs allowed to find good answer to the above-mentioned questions, so this paper aims to share the results achieved through the analysis of archival material remaining from the former work at the temple of Queen Hatshepsut.

12 LE BLOT 40 YEARS LATER: AN EXAMPLE OF FUZZY LOGIC IN ARCHAEOLOGY

Vincent, Delvigne (CNRS, UMR 8068 TEMPS) - Bruno, Bosselin (no rattachement) - Jacques, Virmont (no rattachement) - Jean-Paul, Raynal (CNRS UMR 5199 PACEA)

Unearthed in 1934, the Blot site (Cerzat, Haute-Loire, France) stretches discontinuously over more than 100 meters at the foot of a tall basalt cliff. Informed of its existence by Prof. Mayet, J. Combié conducted a six-meter-deep survey from 1956 to 1958, before H. Delporte, J.-P. Dugas, and J. Virmont began extensive excavations in 1966 until 1982. They uncovered several deposits containing Upper Paleolithic artifacts, divided into about a hundred levels. The archaeological corpus includes an exceptional set attributed to the Protomagdalenian (cf. final Gravettian), divided into several phases and structured in such a way that the existence of a "hut" was proposed.

On the occasion of the monographic publication work on the site, more than 40 years after the end of the excavations (2020-2024), we digitized the entire collection of field notebooks, allowing for the visualization and spatial processing of objects (n = 48810 points) through a GIS (QGIS v3.14). Beyond its cartographic aspect - and in the tradition of the work carried out at the Blot in the 1970s - this tool enabled the automated construction of object profiles (sagittal and frontal) which, in turn, allowed for a reconsideration of the archaeological value of the level subdivisions.

Considering the geometry of the nappe de vestiges - understood as areas of object concentration - and their comparison with observations recorded in the excavation archives, shows that at the Blot 1) the recognition of levels is based on subjective characteristics forcing us to think through "fuzzy logic" and 2) that the interpretation of the deposits is fundamentally linked to the school of thought in which the excavators are enrolled. Following the presentation of the (re)construction work of the archaeo-stratigraphy, this communication will present the epistemological consequences of our approach by discussing the notion of "level" in archaeology.

13 DE STEFANI'S ARCHIVE AS A PORTRAIT OF THE EUROPEAN HISTORY OF ARCHAEOLOGY IN THE SECOND HALF OF THE XIX CENTURY

Gabrielli, Angelica (University of Verona)

Stefano De Stefani was a ministerial excavations inspector in the Verona area during the second half of the 19th century, and his private archive has been recently donated to the city's State Archive. De Stefani's archival documentation includes correspondences, notebooks, iconographic and topographic tables, and photographs related to significant archaeological discoveries of the era. The ongoing investigation employs a methodological approach encompassing archival, historical, and archaeological analyses. The research methodology commences with a comprehensive examination and transcription of archival material, contextualizing them within the scientific research milieu of the time and drawing parallels with contemporary investigations. This paper concentrates explicitly on the preliminary analysis of correspondences, exploring their connections to influential figures in historical archaeology and their relevance to major archaeological excavations during that period. In the first part, the methodology involves a geographical and chronological analysis of the extensive network of over 157 correspondents. The correspondence includes autograph letters from renowned authorities such as Evans, De Mortillet, Cartailhac, Wollaston Franks, Hirschfeld, Munro, De Nadaillac, Pauli, Schreiber, and Wilson. It also features letters from leading Italian archaeologists and palethnologists, including Pigorini, Castelfranco, Orsi, and Chierici. Instead, the second part explicitly focuses on reusing archival materials to supplement current excavations. Finally, the paper aims to exploit the archival sources in the history of archaeology by studying De Stefani's documentation as a reflective portrayal of the scientific and academic landscape in Italy and Europe during the second half of the 19th century and as a source for actual research projects.

14 INVESTIGATING ELAEUS, FROM THE TRENCHES TO PRESS

Lebée, Thomas (Louvre Museum) - Kardianou, Alexandra (Louvre Museum)

The necropolis of Elaeus, at the tip of the Thracian Chersonese, was fortuitously excavated by French troops under fire during the 1915 Gallipoli campaign. Despite these peculiar premises, qualified archaeologists were affected to the improvised dig, while operating along military actions and with the minimal amount of resource. Finds were sent by the

army to Paris and despite the publicity of the excavations, their subsequent thorough reports and a few campaigns in the following years, the Elaeus material draw little attention afterwards.

During the next stage of their life, as museum pieces, these artefacts were exposed to the risk of invisibilization inside a tremendous collection, but digital tools used for collections management contribute currently to their analysis and ultimately to their dissemination among both scholars and the general public. Moreover, the study of the unpublished excavation diary sheds new lights on this corpus excavated in extraordinary circumstances. A publication will soon make available these additional insights to the public, benefiting from the result of years of documentary work and previously unknown materials.

The intended communication aims to use this project in order to illustrate the variety of data that can be gathered from archives, but also the difficulties to identify a documentation scattered beyond ordinary sources for Antiquity scholarship. It will also address how such first-hand documentation, now objects of study in their own rights, may enhance further study on archaeological materials and their lost immediate context.

15 ADMINISTRATING AND SHAPING ARCHAEOLOGY IN BRITISH MANDATE PALESTINE IN LIGHT OF THE ARCHIVES OF THE DEPARTMENT OF ANTIQUITIES ARCHIVES

Rosner, Chloe (Institut national d'histoire de l'art)

Nowadays, archives play a key role in the work of archaeologists and historians of archaeology. This paper is less concerned with the content of the archives of archaeology but rather with their history from the production of documents to their archiving. This presentation aims to highlight the benefits of understanding archaeological archives as objects in their own right, and less as sources, for tracing the history of the discipline. It also seeks to emphasize that the archives of archaeology must be understood in their broadest sense, to initiate a renewed history of its practices and administration. To this end, this presentation will focus on the history of the archives of the British Mandate Department of Antiquities officially founded in British-ruled Palestine in 1920. We will look at the documents produced by this department, as well as the many stages and players involved in their production and archiving, and the issues at stake. This will enable us to examine how this department functioned, administered, and shaped archaeological practice and the heritage it unearths. The broader aim of unraveling these issues is to contribute to the history of archaeology in British-ruled Palestine, particularly its political and social facets.

16 WHOSE WORK? TELLING NEW STORIES WITH ARCHAEOLOGICAL ARCHIVES AT THE HARVARD ART MUSEUMS

Clerkin, Caitlin (Harvard Art Museums)

What role can archaeological archives play in the galleries of art museums? This paper offers a case study, presenting a recent temporary display at the Harvard Art Museums that brought archival material into the galleries in order to offer a new, humanized narrative about archaeological excavation and heritage to public audiences.

On view from December 2022 to June 2023 as part of the museums' regular program of rotating displays, "Whose Work? The Modern Workers of Ancient Samaria-Sebaste" presented the excavation of ancient Samaria-Sebaste (modern Sebastiyeh, occupied West Bank, Palestine) as the story of early 20th century Palestinian and Egyptian archaeological workers, who are typically uncredited in Western archaeological and art histories, through display of archival photographs, payroll records, and excavated finds. The installation drew on the excavated finds from the 1930s Joint Expedition to Samaria-Sebaste stewarded by the Harvard Art Museums and the Harvard Museum of the Ancient Near East (HMANE) and on the excavation archives from the 1908-1910 Harvard Expedition to Samaria held by the latter museum.

This installation was one of several recent gallery interventions that centered people, both ancient and modern, in interpreting ancient objects, in lieu of a primarily art historical message.

Excavation archives (and the research potential therein) allowed us to tell a story "peopled" by real, named individuals. We hoped this installation would prompt visitors to ask who (and whose work) lies behind other objects they see in museum galleries—whether ancient craftspeople, modern artists' workshops, or excavators—and in what context they played a role. As museums seek to tell more equitable stories about the inequitable past of both archaeological and museum practice, this case study suggests that archaeological archives have a role to play in "reframing" narratives for public audiences.

ARCHAEOLOGICAL ARCHIVES AND LOCAL COMMUNITIES: HOW CAN HISTORY OF ARCHAEOLOGY INFORM HERITAGE PRACTICES

Baran, Mustafa Kemal (Koç University)

While there has been a growing scholarly interest in the history of archaeology, this has typically been confined to understanding the socio-political history surrounding the discipline or addressing practical questions of archaeologists regarding their fieldwork. By aiming to open up new research directions for archival work in the history of archaeology, this paper will explore how research in archaeological archives can inform contemporary heritage management and public archaeology practices which often prioritize present and future planning without engaging in critical historical research. It will do so by investigating the role and contributions of local communities in the history of archaeology in Turkey drawing on archival documents authored specifically by these communities. These documents are currently housed in various archives in Germany, US, and Turkey.

This paper aims to shift the perspective and construct a narrative primarily based on documents authored by local communities, in contrast to the historiography of archaeology, where local communities are often contextualized through archaeologists' field notes and voices.

Furthermore, this paper will scrutinize the voices and personalities found in these archives within the context of historiography of archaeology in Turkey, and it will re-examine the politics of archives, archiving, and archival research in archaeology and heritage from a critical perspective. Additionally, it will evaluate the potential of a wide range of methodologies that can integrate the history of archaeology into contemporary heritage practices in Turkey. It will explore collaborative approaches to historical research and producing knowledge with local communities as part of a broader public engagement scheme in heritage sites.

BEST PRACTICES ON ARCHAEOLOGICAL 3D DATA MANAGEMENT: METHODS AND APPROACHES TO CAPTURE, GENERATE, AND DISSEMINATE 3D INFORMATION IN ARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Hollaender, Julian (State Office for Heritage Management Baden-Württemberg) - Dilena Quintana, Miguel Angel (Universidad Complutense de Madrid (UCM)) - Skole, John (Arkeologerna; The National Historical Museums of Sweden) - Papazoi, Elli (Institute of Classics / University of Graz) - Thiery, Florian (Leibniz-Zentrum für Archäologie - LEIZA)

Session format: Regular session

Over the last 15 years, digital methods have been well-established in all documentary stages of archaeological research. As is known, each excavation develops integrally in a three-dimensional setting, hence the relevance of digitally gathering each component of the whole volumetric information. This includes the 3D capturing and modelling of excavation sites and recovered artefacts or structures that emerge via different approaches like Light Detection and Ranging (LiDaR), 3D (laser), programmatically combined procedures, scanning or photogrammetrical techniques, e.g. Structure from Motion (SfM).

However, much of that spatial data is lost through the misapplication of documentation practices, the informatic guidelines and a missing Research Data Management (RDM). Crucial discussions around consistency and reproducibility in diverse software environments regarding these 3D methodologies, or their respective capacity for long-term storage and findability, accessibility, interoperability, and reusability (FAIR) faculties are ignored or left aside. In addition, the metadata modelling for these processes is still in its very early stages. Therefore, these discrepancies can impede different teams from comparing and disseminating the computerised results.

For this purpose, collaborative efforts, both in creating common documentation standards, free open source software (FOSS) and FAIRification tools and developing future-proof archiving instances have been made by various worldwide initiatives. However, they require a decidedly global perspective and acceptance.

We aim to bring together archaeologists and researchers concerned with the above-stated issues and work with all archaeological periods and digital technologies. We encourage them to present their views on this matter to debate about standardised methodologies capable of capturing, generating, archiving and disseminating archaeological 3D digital information.

1 3D DOCUMENTATION AND MODELLING IN ARCHAEOLOGICAL FIELDWORK - CURRENT APPROACHES, WORK-FLOWS AND DATA STANDARDS AND THE GOALS OF THE NFDI4OBJECTS-CONSORTIUM

Hollaender, Julian (Landesamt für Denkmalpflege / State Office for Heritage Baden-Württemberg) - Höke, Benjamin (Landesamt für Denkmalpflege / State Office for Heritage Baden-Württemberg) - Lang, Matthias (University of Bonn / Bonn Center for Digital Humanities) - Pallan Gayol, Carlos (University of Bonn / Bonn Center for Digital Humanities) - Berger, Steffen (Landesamt für Denkmalpflege / State Office for Heritage Baden-Württemberg) - Abele, Jonas (Landesamt für Denkmalpflege / State Office for Heritage Baden-Württemberg)

NFDI4Objects is a German multidisciplinary consortium within the federal National Research Data Infrastructure (NFDI). The consortium unites researchers and practitioners whose work focuses on the material heritage and is dedicated to the challenges of modern research data infrastructures. Within their daily work, the primary documentation of findings and observations during fieldwork, in excavations or surveying, generates and structures key data for further steps of scholarly investigations and heritage management. During the last 15 years 3D documentation methods of various kinds, e.g. image based modelling, structured light or laser scanning, have become integrated into these processes on various levels. They changed not only scholarly approaches and hermeneutics but led to a steep increase in generated and stored data and heightened awareness about the need of future-proof and sustainable digital data management. One of the first objectives of NFDI4Objects in the field of 3D primary documentation was to conduct a broad survey, including multilayered questionnaires, to catch the status quo across archaeological researches and practitioners. This paper therefore aims to present and discuss the results of this survey and its implications on planned further steps in addressing the aforementioned challenges. The international perspective will help the community to harmonize its efforts in the light of international FAIR data exchange and sustainable data standards and management.

2 3D MODELLING AND 3D COMPUTED TOMOGRAPHY SCANS IN POST EXCAVATION INVESTIGATION

Knoll, David (Landesamt für Denkmalpflege Baden-Württemberg) - Chen, Zhuoru (Landesamt für Denkmalpflege Baden-Württemberg)

In 2023 a new project named „Pilotprojekt Inwertsetzung Ausgrabungen“ (PIA) was established at the State Office for Cultural Heritage Baden-Württemberg and aims to publish the findings of preventive excavations in Baden-Württemberg in order to implement the Valletta Treaty. By doing so, PIA is currently working with various 3D data, e.g. the recordings of archaeological objects by structured-light 3D scanners or photogrammetry (SfM). In addition, the investigation of blocks by means of computed tomography scan is being established as a core capability within the project. This paper aims to deliver an interlinked overview of these different methods in use with a special focus on their usability and attached workflows in the archaeological investigations in order to issue traditional publications as well as new forms of digital dissemination. Our approaches and results will help to understand and improve the necessary workflows to achieve the implementation of the Valletta Treaty over the borders of Baden-Württemberg in order to make the findings as compliant as possible to FAIR-data principles.

3 3D-DIMENSIONS MATTER: HOW TO RECONSTRUCT, VISUALISE AND ANALYSE ARCHAEOLOGICAL CONTEXTS BY USING THREE-DIMENSIONAL APPROACHES AND DIGITAL STRATEGIES

Dilena Quintana, Miguel Angel (Universidad Complutense de Madrid) - Álvarez-Alonso, David (Universidad Complutense de Madrid) - Cerrillo-Cuenca, Enrique (Universidad Complutense de Madrid) - De Andrés-Herrero, María (Universidad Complutense de Madrid)

Archaeological excavations are destructive processes where few elements survive after the extractive tasks. These subtractions can hinder the exhaustive analysis of the entire volumetric context since distances, dimensions, positions, inclinations, and orientations disappear.

Such an obstacle becomes particularly evident where sedimentation buries human occupations chronologically close. These circumstances arose at the Spanish shelter Abrigo del Molino (Segovia), a late Mousterian site in the central part of the Iberian Peninsula.

Yet, innovative methodologies embracing three steps: restoring, visualising and analysing the 3D digital excavation, can settle this spatial challenge.

First, reconstructive techniques allow for spatial database generation. Such a dataset contains both components: the 3D model of each artefact found in the excavation and the entire spatial context (archaeological and stratigraphic surfaces). Photogrammetrical and programmatically combined procedures generate a 3D model database employing standard formats.

Second, techniques that create mixed-reality implementations for viewing the site. Such applications employ the aforementioned 3D models to display them interactively in situ through mobile devices. Therefore, on the excavation, we can associate the virtual finds with the tangible context from which they were extracted (digital and physical reality coexist, creating fusions).

Third, the exhaustive statistical analysis manages to group the archaeological 3D models using mathematical techniques -clustering methods-. This examination tries to encounter associations by using the discernible attributes of each artefact registered on the 3D database and their spatial distributions in the digital excavation, which allows for the classification of the buried elements.

The passage between these three distinct phases in different digital settings must consider critical issues about compatibility, transportability, consistency and reproducibility of data in such specific software environments.

The final result includes groups of finds, which statistically show a high level of correlation between the artefacts they contain. Such clusters could delineate single occupations or chronologically close occupations with similar characteristics.

4 HORDES OF 3D DATA: A FREE OPEN SOURCE SEMANTIC SYSTEM FOR DISSEMINATING A LIDAR LIBRARY OF THE MONGOLIAN ARCHAEOLOGICAL LANDSCAPE

Fisher, Michael (Max Planck Institute of Geoanthropology; Institute for the Study of Ancient Cultures, University of Chicago) - Hiatt, Cyrus (Farallon Geographics)

The Mongolian Archaeology Project: Surveying the Steppes (MAPSS) combines remote satellite sensing with ground truthing and drone survey in order to rapidly document and assess the conditions of, and risks to, the immovable cultural heritage of Mongolia, a nation whose rural populations and pastoral economies are quickly transitioning to urban growth and industrialization. Using LiDAR sensors on mobile phones and tablets, MAPSS and its local collaborating partners generate 3D models of the myriad archaeological features visible across the Mongolian landscape. These include ancient kurgans, petroglyphs, stelae, and statuary. Additionally, the project's drone mapping program produces 3D imagery of the landscape itself.

MAPSS deploys an instance of the Arches FOSS semantic graph database platform in order to store and disseminate archaeological business data, metadata, and paradata. With over a hundred 3D models and dozens of DEMs, the challenge has become how to integrate high-volume, high-velocity 3D data without succumbing to the pitfalls of unstructured Big Data storage. In collaboration with Farallon Geographics, MAPSS has designed and developed a widget for the Arches platform that enables in-app viewing of 3D models and capture of key metadata. Arches graph modelling allows semantic embedding of these data across different graphs for flexible integration of the 3D image library with site and feature information. This paper will describe the methods for 3D data capture and how they are integrated within the overall MAPSS methodology, as well as the semantic tools it uses to store and share these data over the web. It furthermore considers some of the continuing challenges in capturing and displaying 3D imagery, such as double-embedding, and proposes ways to use these datasets for research and the protection of the physical features themselves.

5 DIGITAL MINIATURES: PROSPECTS AND LIMITATIONS OF 3D DOCUMENTATION OF BRONZE AGE AEGEAN SEAL IMAGES

Andreovits, Tatiana (Institut für Klassische Archäologie, Universität Heidelberg)

Seals are miniature artefacts made of stone, metal, clay, bone, and ivory, equipped with means that allow them to be worn on the body. They display engraved motifs and produce relief images when pressed into soft materials, acting as communicative media. More than 10,000 seals and sealings from the Bronze Age period have been discovered in the Aegean Islands and Greek mainland. The Corpus der minoischen und mykenischen Siegel (CMS) at the University of Heidelberg houses modern impressions and casts of the vast majority of them. This presentation delves into the use of 3D digital and computational tools on Minoan and Mycenaean seals and sealings. A high-resolution portable light scanner was used to 3D scan a selected assemblage of 133 modern impressions from the CMS archive, as well as 47 original seals and sealings from the National Archaeological Museum in Athens, the Heraklion Archaeological Museum, and the Archaeological Museum of Messara. The selected assemblage included clay sealings, steatite, agate, jasper, and carnelian seals, as well as modern silicon and plasticine impressions and casts. The diverse materials had a significant impact on the scanning and post-processing procedures, thereby affecting the quality of the digital models. The proposed paper highlights the observed differences resulting from the implementation of digital technologies in various materials. Acknowledging the lack of standardised methodologies for the 3D documentation of

seals and sealings, the presentation aims to discuss the prospects and limitations of applying digital and computational methodologies to micrographic objects. Additionally, it aims to address the challenges faced in accurately capturing the intricate details and textures of miniature objects using digital technologies and explore potential solutions and advancements that can improve the overall quality and reliability of 3D documentation for seals and sealings.

6 RECONSTRUCTING THE PAST USING 3D METHODS. THE CASE OF THE CULT GROUP AT LYCOSURA

Dimopoulou, Sotiria (Archaeologist)

The aim of this paper is to demonstrate how modern digital technology can facilitate a direct connection between the past and the future for visitors to archaeological sites. It is based on my doctoral thesis at the University of Münster, which focused on the Hellenistic cult group at Lycosura in Arcadia, Peloponnese. It also explores a possible 3D project that aims to represent the colossal statues in the dark cella of the Temple of Despoina and contribute to a digital reunion of the fragments which are exhibited in the National Archaeological Museum of Athens and the Museum of Lycosura. A 3D visualization and a tour inside the temple make it possible to experience the mysterious atmosphere and observe the colossal group. An application allows you to enter the dark cella and view the group from different angles at the touch of a button. It will also be shown how modern technology can enable people with visual and hearing impairments to have direct contact with both the cult room and the statues of Lycosura, since it will be possible, to obtain information - also in sign language - about the group, the mythical tradition of Despoina, the symbolization of the attributes with the help of colors, light and optical sensors (example of the Deaf Space). For the visually impaired, a tactile programme could enable them to 'feel' the attributes, (torches, snakes, scepter), in their colossal size. The aim of this 3D reconstruction is to stimulate interest in the interpretation of ancient ritual traditions and to provide an opportunity for individuals to experience and participate in the mysterious and sacred.

7 STANDARDIZATION AND CHALLENGES IN POINT CLOUD ALIGNMENT: LASER SCANNING IN ROMAN OSTIA

Ogawa, Takuro (Kyushu University) - Hori, Yoshiki (Kyushu University)

Since 2012, measurement surveys using laser scanners in Ostia have been carried out by a Japanese research team, with particular emphasis on completing measurements of both the exteriors and interiors of 90% of the excavated buildings. The foundation of this city-scale big data is constructed from point cloud data generated by terrestrial laser scanners and GNSS geodetic points through RTK positioning, providing detailed measurements that cannot be obtained through aerial LiDAR or SLAM. Based on these measurements, 3D data information is supplemented as needed, tailored to the characteristics of the subject matter, using OPT scanners, SLAM-style LiDAR, and high-resolution photogrammetry with mirrorless SLR cameras.

The reproducibility of data from terrestrial laser measurements largely depends on the alignment process. The analysis of point cloud data obtained through laser scanning primarily focuses on the differences between point clouds or between point cloud data and mesh data. Particularly in analyses that use basic geometric shapes, the employment of RANSAC ensures the reliable reproducibility of stable research data. In recent years, the ability to handle point cloud data from various types of scanners has been extended not only to commercial software but also to free software, making it important in the construction of interdisciplinary research environments to archive unedited point cloud data (raw data) in a state that is always usable and sharable.

This paper aims to reveal the challenges in standardizing the documentation of point cloud data by verifying synthesis results with multiple terrestrial laser scanners (Z+F Imager 5016, Leica C10, FARO Focus 3D, Leica BLK360) and various commercial and free software, drawing on the extensive data and experience acquired during actual measurements in ancient Roman cities.

8 DIGITALIZING ARCHAEOLOGICAL MONUMENTS IN 3D - CAPTURING THE IMPERIAL ROMAN BATHS OF TRIER IN HIGH DETAIL

Bauer, Steffen (Heidelberg University; Interdisciplinary Center for Scientific Computing, Heidelberg University) - Prien, Roland (Heidelberg University; Heidelberg Center for Cultural Heritage)

Within the scope of the project "Transforming Cultural Heritage in 3D" a group of archaeologists, mathematicians and sociologists work on the potentials and implications of the digitization of Cultural Heritage. As example for best practice, the project aims to digitize the Imperial Roman Barbara Baths (Barbarathermen) in Trier, which were the second largest bathing complex in the Roman Empire in the second century AD and are now part of the UNESCO World Heritage Site "Roman Monuments, St. Peter's Cathedral and Church of Our Lady in Trier".

The currently accessible remains extend over 15000 square meters and are captured with a resolution of a point distance in the millimeter range over a period of two to three years. The effective combination of laser scanning, photogrammetry and structured light scanning requires the adaptation and further development of existing workflows.

Research data management takes into account this growing amount of data over time and attempts to use existing digital infrastructures according to FAIR principles. For raw data and digital reconstructions, suitable metadata schemas and ontologies are evaluated.

Due to the extent of the reconstruction, the number and extreme heterogeneity of the metadata, annotations are essential. The annotations and the visualization of the large reconstructions are based on the same abstract hierarchical model and allow both to be linked beyond individual points to entire areas. The technical implementation with common web viewers is carried out with the development of an extension of a widely used data format (glTF).

The overarching research is dedicated to a theoretical and practical analysis of the transformation processes associated with the digitization of Cultural Heritage in the form of 3D models. A central component is the implementation of a best-practice lighthouse project in the field of knowledge transfer, which includes the digitization and digital dissemination of the Barbara Baths.

9 TAKING THE LONG ROAD

Færch-Jensen, Jeppe (Museum Sydøstdanmark)

In 1976 the foundation for an iron age road leading to a crossing of Tryggevælde Å, near Varpelev, Eastern Zealand in Denmark was found and excavated. The roadbed was constructed of large oaken timbers, some rammed into the ground, and others placed horizontally and locked over the posts with mortises and tenons. Back then, it was concluded, that the timbers were originating from nearby longhouses. Most of the timbers were salvaged and brought home for conservation, although a substantial part ended up resting in a large waterfilled basin for almost fifty years.

In 2012 the basin was rediscovered, and the timbers taken out for examination and re-evaluation, but it was not until 2023 that actual actions were taken, and the waterlogged timbers surfaced again for 3D scanning with a structured light scanner.

Now we have excellent digital replicas of all the unconserved timbers (while we are still searching the magazines for the conserved ones). The timbers themselves hold numerous opportunities to further research in dendrochronology, and technologies such as isotope research and micro-DNA also might be available for tree-ring material in the future.

But the first step of this project, which I will present here is more basic and has a twofold aim. Firstly, examining the conclusions as to whether the timbers were in fact reused from condemned longhouses by digitally reconstructing the roadbed as it stood upon excavation. Secondly, by doing so, evaluating the strength of the virtual reconstruction as a method for the enhancement of archaeological epistemology.

The method involves digitization of old excavation plans using QGIS, 3D models of the single timbers made with an Artec EVA scanner, and a lot of manual labour to place the 3D models of the timbers according to the plan in a 3-dimensional virtual environment using Rhino 7.

10 RECONSTRUCTION OF HISTORICAL GOTHENBURG, THEORY AND DIGITAL PRACTICES

Ekholm, Niklas (Arkeologerna -SHM) - Ramirez, Teobaldo (Arkeologerna -SHM) - Lindahl, Mikael (Arkeologerna -SHM) - Erkell, Miriam (Arkeologerna -SHM) - Skredsvik, Andreas (Arkeologerna -SHM) - Edqvist, Johanna (Arkeologerna -SHM) - Nannmark, Ester (Arkeologerna -SHM)

One of the most important infrastructure projects in the city of Gothenburg Sweden started in 2018 with the construction of the "West-Link" (Västlänken). A new underway rail tunnel is planned to pass through the city affecting important archaeological remains from the first foundation of the city in 1621.

The fieldwork included documenting the archaeological remains in such a way that several objects and buildings would be possible to reconstruct virtually. The archaeological remains were real-time digital documented in the data program Intrasis, a combined database, GIS software and laser scanning. In addition, photogrammetry with SFM camera and drones were used to enable an accurate recreation. The method used in the creation of 3d-models and virtual environments has been done with the software Blender and Unreal Engine.

Our project is mainly to be used within public outreach, but it has also been helpful in visualise and analysing the archaeological data. We see great possibilities for the model to be used as an additional tool to be used side by side with traditional GIS software to create a more immersive spatial analysis. As the model recreates not just the architectural features, but also the landscape in form of hydrological and geomorphological characteristics, it opens the possibilities to be used in teaching and research by other disciplines in social and natural sciences alike.

As our goal is for our reconstruction to live on after we are finished with the project. It should be able to be revisited at a later stage and tweaked based on any new information available at the time. The data and models therefore need to

be available to access and integrate in new projects. Therefore, we have focused on accessibility with as few obstacles as possible. The data, regardless of the software, needs to be available for further investigations.

799 ELEVATING THE ELDERS: (RE)CENTERING OLDER ADULTS IN BIOARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Bethard, Jonathan (University of South Florida) - Buckberry, Jo (University of Bradford) - Silva Carvalho, Carlos (University of Bradford)

Session format: Regular session

Over the last several decades bioarchaeologists working in contexts around the world have made great strides in understanding the past through the contextualized study of human skeletal remains recovered from archaeological sites. Despite the numerous ways in which bioarchaeological studies have enhanced what we know about past communities, the identification and interpretation of older adults has been underrepresented in bioarchaeological scholarship. Among the reasons why this reality exists are because methodological shortcomings have been identified and bioarchaeological researchers have been stifled by an inability to confidently assign individual age estimates beyond the fifth decade. As a result of this trend, few studies have examined how and why the human lifespan has changed over time. Additionally, the inability to identify older adults in the archaeological record has left a void in the literature and numerous questions related to the role that elderly individuals played in their communities remain unanswered. Despite these limitations, numerous scholars have devoted considerable energy to changing the narrative about elderly individuals in past communities, through both their theoretical and methodological contributions. Drawing inspiration from this emerging body of literature, we invite scholars working on questions related to older adults across time and geography to share their perspectives in this symposium. We welcome contributions focused on social theory related to older adults, methodological contributions focused on improving the identification of older individuals in the archaeological record, or case studies from any temporal period or region where the identification of elder individuals helped improve the understanding of an archaeological context.

ABSTRACTS

1 ABSENT ELDERS? BIOARCHAEOLOGY AND THE IDENTIFICATION OF ADVANCED AGE

Bethard, Jonathan (University of South Florida)

Despite decades of progress through the development of sophisticated theoretical frameworks and rigorous methodological advances, bioarchaeologists still struggle to identify and interpret the ways in which elderly individuals were visible in the past. In part due to the complexities of human aging, coupled with myriad taphonomic realities, bioarchaeologists have struggled to identify the later stages of the human life course. These biases have hindered bioarchaeologists from answering important questions about human longevity, and most importantly, kept bioarchaeological scholars from understanding how older individuals participated in and were viewed by their communities. Despite these limitations, a variety of novel contributions have started to improve our ability to better understand old age in the past. The goals of this presentation are threefold: 1) review recent contributions calling for an (bio)archaeology of old age; 2) present a content analysis of published bioarchaeological studies that include age cohort data; and 3) present a case study highlighting the problems of age estimation and the identification elders drawn from an archaeological context in Transylvania.

2 AGE, ACTIVITY, AND ADAPTATION: BRIDGING MACROSCOPIC AND MICROSCOPIC INSIGHTS INTO ENTHESEAL CHANGES IN THE UPPER LIMBS OF THE ELDERLY POPULATION

Schendzielorz, Sofie-Kristin (Centre for Anatomy and Human Identification (CAHID), School of Science and Engineering, University of Dundee) - Gómez García-Donas, Julieta (Centre for Anatomy and Human Identification (CAHID), School of Science and Engineering, University of Dundee)

Enthesal changes are alterations in the attachment sites of ligaments and tendons to bone and have been traditionally linked to mechanical stress and activity levels. These changes have been observed in different skeletal elements and populations, and the variability and extent of these changes are still to be completely understood. This paper aims to explore the relationship between age, activity, and adaptation by investigating Enthesal Changes in the upper limbs of elderly individuals, integrating both macroscopic and microscopic approaches to unravel the complex interplay of factors potentially influencing enthesal changes.

This research will utilize a sample of adult human humeri obtained from the Centre for Anatomy and Human Identification, University of Dundee. Macroscopic assessment of muscle attachment sites will follow standardised protocols, while microscopic analysis will involve histomorphometric parameters related to cross-sectional geometry and

remodelling rates. Statistical analysis will be applied comparing the association between macroscopic and microscopic data testing for the interaction of any other potential confounding factors.

The present research aims to investigate activity-induced reorganization at fibrous entheses through a novel approach that combines the macroscopic and microscopic examination of the enthesal changes. Moreover, the investigation of the relationship between the changes and other factors such as sex and advanced age will provide further insights into the effect of hormonal changes and degenerative changes. Exploring connections between enthesal change and activity will validate the “muscle hypothesis,” analysing different traits of enthesal change to identify potential differential etiologies.

3 IDENTIFYING OLDER ADULTS IN COMMINGLED SKELETONS USING TRANSITION ANALYSIS 3

Bolster, Alyssa (Brown University) - Jeanlouis, Hannah (Independent Researcher) - Gregoricka, Lesley (University of South Alabama) - Ullinger, Jaime (Quinnipiac University)

In bioarchaeology, paleodemographic investigations are fraught with obstacles, particularly when attempting to estimate adult age. Arguably, this difficulty is only amplified when studying commingled and taphonomically damaged skeletal assemblages. In this paper, we present results of adult age estimation in commingled skeletons using both traditional and novel methods. We employed Suchey-Brooks (with Hartnett modification) and Transition Analysis 3 (TA3) to estimate adult age frequencies from Umm an-Nar tombs Unar 1 (2400-2200 BCE) and Unar 2 (2300-2100 BCE), located in the modern-day Emirate of Ras al-Khaimah, United Arab Emirates. Seeking to test how method choice impacted adult age estimates, we observed skeletal age indicators on pubic symphyses, proximal femora, and proximal and distal humeri.

Results indicated that traditional and novel methods differed significantly in the categorization of young, middle, and old-age adults. TA3 identified more middle and old adults in the same skeletal assemblage when compared to Suchey-Brooks, with some individuals surviving well into the oft-cited 50+ years of age category, and even as high as 70 or 80 years old. These new estimates influence our understanding of survivorship in Early Bronze Age Arabia, pushing back against preconceived notions of high young adult mortality based on previous adult age estimates. These results underscore how the often-implied absence of older-age individuals, due to the limitations of traditional methods, can have an impact on bioarchaeological interpretations more broadly. Older individuals were present in Early Bronze Age Arabia and lived to older ages than we previously understood. This will affect our understanding of the life course, including exposure to pathogens and skeletal degeneration from daily activities. It also asks us to expand our understanding of community membership and the ways in which older individuals functioned within the group.

4 “THE FINAL ACT IN THE PLAY OF LIFE:” INTERDISCIPLINARY PERSPECTIVES ON AGING IN THE ROMAN WORLD

Bews, Elizabeth (University of South Florida)

As the average age of almost every population around the globe steadily increases, we are confronted with universal concerns surrounding aging, including geriatric illness, senility, and the role of the elderly in society. As we seek to better understand the aging process and its consequences, it is only natural to reflect on the experience of age and aging in the past. While there is a plethora of evidence that many Romans lived well into old age, sometimes over the age of 100, there have been comparatively few bioarchaeological studies that engage with the concept of growing old in the Roman world. Bioarchaeological studies centered on aging in the Roman period concentrate on bone microstructure (Cho and Stout 2011; Beauchesne and Agarwal 2014, 2017), diachronic changes in longevity (Petry 2019; Redfern and DeWitte 2011), and age related aspects of social identity (Gowland 2007; Moore 2010). While some of these studies draw upon non-osteological evidence, like funerary data, they largely neglect the plethora of old age-related information derived from Roman textual, epigraphic, and visual evidence. Indeed, outside of bioarchaeology there are vibrant discussions regarding Roman demography, life expectancy, and what it meant to be elderly in the Roman world (Parkin 1992, 2003; Scheidel 2001; Cokayne 2003; Saller 1994; Harlow and Laurence 2002; Hopkins 1966). This paper seeks to address how these various lines of evidence help us to understand what it meant to be ‘old’ in the Roman world. It also endeavors to explore whether bioarchaeologists can incorporate this information into their techniques for identifying ‘old’ individuals in the Roman archaeological record.

5 INTERFACING WITH OUR ELDERS: AGING AND HEALTH AT PETRA, JORDAN

Perry, Megan (East Carolina University) - Propst, Akacia (McMaster University)

The evaluation of senescence in human skeletal remains has been hindered by the lack of clear age classes over 50 years of age. The use of new techniques has greatly increased our ability to identify the elderly in the archaeological record and better understand the senescent period in antiquity. The use of cementochronology, for instance, has extended skeletal age-at-death estimations into senescence. This method was used for age estimations of skeletal individuals from the largely commingled assemblages dating from the late 2nd century BC to the late 1st century

AD from the Nabataean capital city of Petra, Jordan. Twelve out of 66 of the individuals represented in the study were identified as being 60 years of age or older. These individuals were buried within 5 different tombs located on the North Ridge at Petra and represent a previously invisible portion city residents. The contexts that included these elderly individuals were reassessed to better understand their life history and treatment after death through observations of osteoarthritis, trauma, and LEH and evidence of mortuary behavior. In addition, future avenues of research to better understand their longevity within this ancient city will be discussed.

6 FRAILITY AND RESILIENCE IN THE METROPOLIS: EMBODYING OLD AGE IN MEDIEVAL LONDON

Yaussy, Samantha (Department of Sociology and Anthropology, James Madison University) - Marklein, Kathryn (Department of Anthropology, University of Louisville; Center for Archaeology and Cultural Heritage, University of Louisville) - DeWitte, Sharon (Department of Anthropology, University of Colorado Boulder; Institute of Behavioral Science, University of Colorado Boulder) - Crews, Douglas (Department of Anthropology, The Ohio State University; College of Public Health, The Ohio State University)

Although viewed as an evolutionary conundrum, post-reproductive human lifespans extending beyond the fifth decade represent important and productive periods for individuals and communities. With improved methods allowing estimates of age even for the oldest adults, bioarchaeologists are better equipped to explore experiences among geriatric individuals in historic populations. In addition to better understanding experiences during older age in specific contexts, examinations of pathological conditions in later years offer insight into survival (resilience) and mortality (frailty). Consequently, among older individuals in the same skeletal collection, we can uniquely explore: the osteological paradox (i.e., the frailest individuals potentially exhibiting fewer skeletal lesions appearing “healthy” because they died before a skeletal response to physiological insults); and the morbidity-mortality paradox (i.e., females experiencing more negative health issues during their lives yet outliving males).

Here we consider skeletal and dentoalveolar conditions in older (45+ years) individuals from medieval London, as evidence of frailty and resilience. Using a new methodology integrating cumulative phenotypic (e.g., skeletal frailty index) and hazards-based approaches, we constructed 5-biomarker (enamel hypoplasia, periosteal new bone formation, osteoarthritis, cribra orbitalia, femoral length) frailty and resilience indices for adult individuals from four medieval London cemeteries. Frailty indices reflect biomarker expressions (presence, absence, or severity) associated with elevated mortality/lower survivorship, whereas resilience indices include biomarker expressions associated with lower mortality/higher survivorship. In a subsample of 43 adults aged 45+ years (19 estimated females and 24 estimated males), we observed significant differences in frailty and resilience between sexes, despite no significant difference in age distributions. On average, older males exhibited higher frailty (2.33) and lower resilience (1.71) than females (1.68 and 2.32, respectively). Results suggest a female-male morbidity-mortality paradox, as observed in modern populations, occurring in this subsample of older individuals in medieval London. These indices also provide physical embodiments of old age in this urban setting.

7 “IT MATTERS NOT HOW LONG WE LIVE BUT HOW”: BECOMING OLD DURING THE INDUSTRIAL REVOLUTION IN ENGLAND AND WALES

Buckberry, Jo (University of Bradford) - Crane-Kramer, Gillian (State University of New York at Plattsburgh)

Identifying our elders in bioarchaeology remains a challenge. While new methodological developments are opening-up the potential of accurately identifying the age of the oldest members of archaeological communities, we continue to struggle with the catch-all ‘45+’ age category. Comparisons with demographic records highlight the discrepancies in our data, caused by methodological and preservation biases. Although there is hope for the future, what can be gleaned from extant osteological data? This paper will explore the documentary and skeletal evidence of health during the industrial revolution, highlighting the challenges and potential of this often-overlooked age group.

We collated data from the annual report of the Registrar General for 1837-8 (n=335055 deaths) and osteological data collated from 18 cemetery excavations (n=4157 skeletons). As expected, infants, young children and old adults are underrepresented in the skeletal assemblages: while 32.3% of documented deaths were individuals aged 45 or older, only 19.9% of skeletons were aged as 45+. These mature adults will have survived multiple acute illness and have markers of chronic disease on their skeletons. As expected, these individuals had higher prevalence rates of periosteal reactions, fractures, osteoarthritis, osteoporosis, DISH, gout and fractures, which are all cumulative over the life course, or clinically associated with increasing age. The decline in crude prevalence of caries, periapical lesions and enamel hypoplasia probably relates to high rates of antemortem tooth loss, whereas lower rates of treponemal disease, TB and visceral rib lesions probably suggest these conditions are associated with, or could lead to, a younger age-at-death. Interestingly, residual rickets was identified more commonly in older adults than younger or middle adults, suggesting childhood vitamin D deficiency was not associated increased frailty. It is harder to interpret the fall in prevalence of cribra orbitalia – is this due to lesions remodelling, increased frailty or a combination of the two?

8 BEYOND NUNS AND GRANDMOTHERS: INTERSECTIONAL AGING AND THE ROLE OF ELDER FEMALES IN MEDIEVAL PRUSSIA

Gaddis, Katherine (University of Nevada, Las Vegas) - Gruenthal-Rankin, Ariel (University of Hawai'i-West O'ahu)

As with so many groups before them, older adults have been historically underrepresented in bioarchaeological literature. Despite recent theoretical and methodological advancements, our understanding of the role that older adults played in past societies and the experience of aging in the past remains vague. From an intersectional perspective, age is part of the larger picture of lived experience, which includes proximity, or lack thereof, to structures of power and status. When discussing aging and old age in past societies, it is necessary to frame these concepts within the context of both individual identity and historical context. This task is particularly difficult when primary historical accounts are limited or nonexistent. Such is the case for the Old Prussian populations of the Baltic region (modern day Northeastern Poland, Lithuania, and Latvia). Written accounts of the Old Prussians, who had no formal written language, are limited to records left by the Teutonic Order. Virtually all of these records focus on the role of elder males and their sons due to the importance of land control and inheritance under colonialism. Virtually nothing is recorded about the lives and experiences of elder females in medieval Prussia.

Here we present osteobiographical accounts of elder females from the Medieval Prussian cemetery at Beżławki (Northeastern Poland), contextualized via archaeological data and feminist medievalist writings. In doing so, we aim to shed light on the embodied experiences of aging females and add intersectional nuance to our understanding of life during and after colonization and conversion to Christianity in medieval Prussia.

9 AGE ESTIMATION AMONG ELDERLY EUNUCHS: A CASE STUDY FROM LINGLONG LANE CEMETERY IN BEIJING, CHINA

Du, Dejing (University of South Florida)

A primary goal of bioarchaeology is to understand the past through the contextualized study of human skeletal remains recovered from archaeological contexts. Today bioarchaeologists are interested in questions focused on intersecting aspects of identity, especially those which are understudied or best known from nonarchaeological or historical sources. For example, bioarchaeologists have rarely had the opportunity to examine contexts where bodily transformations to living people directly impacted how those individuals moved through their societies during life.

Eunuchs, as significant figures in the ancient Chinese court serving the emperor and members of his family, were typically men who had been castrated and thus rendered infertile. However, despite being a large and spanning group over time, bioarchaeological studies face challenges in age estimation of eunuchs.

A key question revolves around whether this male demographic, deprived of testosterone, enjoyed longer lifespans compared to ordinary men. Yet, traditional age estimation methods fail to provide age ranges for individuals over 50 years old, and the delayed closure of epiphyses further complicates the estimation of eunuchs as a distinct group.

Therefore, this study focuses on 137 human skeletal remains from the eunuch cemetery in Linglong Lane, Beijing. Utilizing the TA2 for age estimation and integrating historical literature, this research aims to provide evidence for addressing age estimates of eunuchs as a group, particularly regarding elderly individuals among them.

10 THE ANOMALOUS INTERMENT OF AN ELDERLY, BAROQUE ERA (1700S) SZEKLER-HUNGARIAN NOBLEWOMAN

Zejdlik, Katie (Western Carolina University) - Bethard, Jonathan (University of South Florida) - Nyáradi, Zsolt (Archaeology Department, Haáz Rezso Múzeum, Odorheiu Secuiesc, Romania)

Bioarchaeological interpretations of elderly individuals have proven difficult given the physical ambiguity of identifying osteological features and their correlations with chronological age. Additionally, cultural constructions of age have not adequately considered how older adults functioned in their societies and few archaeological contexts have complementary historical sources that corroborate their findings. The case study presented here explores several of these questions by presenting the burial of an elderly female recovered from the Ferenczy family crypt at the Papdomb archaeological site in present-day Harghita County, Romania. The Ferenczy family were influential, Szekler-Hungarian nobles who helped maintain the church they were buried in. Three individuals were recovered from a clearly defined, crypt feature during the 2014 excavation. Two males had been placed side by side in an extended and supine position with their heads to the west and feet to the east. One of the males had a preserved coffin lid with a nail pattern that read "Fere" and "1743", which aligned with known regional history. An elderly female had been placed in flexed position with a north to south orientation at the heads of the two noblemen. Her cardinal orientation and body positioning are unusual within the broader context of the cemetery and have been observed in less than 1% of the 935 burials so far recovered. A biological profile was generated and the TA3 software package suggested that she possibly lived into her eighth or ninth decade. Though limited to a single osteobiographical case study, the interpretation of this elderly noblewoman enables us to better understand aspects of advanced age in this Szekler context.

802 FROM PREHISTORY TO POST-MEDIEVAL TIMES: PERSISTENCE AND CHANGE IN ARTISANAL PRODUCTION ACROSS THE MEDITERRANEAN

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Berrica, Silvia (Escuela Española de Historia y Arqueología de Roma EEHAR-CSIC, Italy) - Morgado-Roncal, Leyre (University of Granada) - Carrera, Francesco (Soprintendenze archeologia, belle arti e paesaggio)

Session format: Regular session

The Mediterranean region has played a pivotal role in the development of human civilization, witnessing the rise and fall of numerous ancient cultures and empires. Throughout history, artisanal production has been a significant driver of economic and cultural growth in this region, persisting with remarkable resilience despite the ever-evolving socio-political context. This session aims to explore the persistence and changes in artisanal production from Prehistory to Post-Medieval times, shedding light on the continuity and adaptation of traditional crafts and techniques.

By bringing together scholars and researchers specializing in archaeology, art history, anthropology, and material culture studies, we seek to foster interdisciplinary discussions. The goal is to generate a multi-proxy and diachronic understanding of the evolution of artisanal practices across the Mediterranean. In doing so, the role of artisans as cultural mediators, and agents of innovation will be highlighted.

We encourage papers and case studies that deal with any kind of craft (pottery, metal, glass, bone, jewellery, etc.) and its production processes from Prehistory to Post-Medieval times. Communications on methodological and theoretical approaches to the Archaeology of Production are also welcomed.

This holistic examination of artisanal production, ultimately, aims to contribute to a broader understanding of the enduring cultural heritage of the Mediterranean region. By recognizing the inherent value of traditional craftsmanship and its dynamic relationships with societal, political, and economic forces, we can better appreciate the significance of artisanal production. Not only as a vital component in shaping our collective past, but also as an informing tool to envision our future.

ABSTRACTS

1 TABLET-WEAVING IN THE 1ST MILLENNIUM BCE: CRAFTSMANSHIP, CASE STUDIES, AND INTERPRETATIONS

Saunderson, Kayleigh (University of Vienna; Natural History Museum Vienna)

While the textile technique of tablet weaving was also utilised for practical purposes, the unique patterning possibilities made them especially popular as a decorative element during the Iron Age, as can be seen with finds from e.g. Hallstatt, Dürrnberg, Hochdorf, and Verucchio. The technique might already have its origins in the Bronze Age, though it is difficult to identify the technique based on textile finds, and possible tools are often difficult to identify with complete certainty. This contribution aims to explore the theoretical formation of the techniques of tablet weaving, along with the chaîne opératoire of production, who produced these products and who they were produced for, and the various uses of tablet-woven ribbons during the first millennium BCE in Central and Southern Europe. Furthermore, some case studies shall be presented, such as a newly found (2022) tablet-woven ribbon from the salt mines of Hallstatt, Austria, as well as experimental archaeological approaches regarding this technique and the uses of the reconstructions in public communication.

2 WEAVING RELATIONSHIPS: EXPLORING CONNECTIONS IN THE MESSARÀ PLAIN BEYOND THE DARK AGES

Toscano, Flavia Maria Chiara (Universität Heidelberg)

The transitional period between the Bronze and early Iron Age Crete experienced significant cultural-social change and no single pre-existing system can have remained totally intact. Regionalism is one of the most evident aspects of this phase, and through studies conducted over the years, patterns of the archaeological record have been outlined, emphasizing this aspect across the island. The Messara Plain stands out as one of the most interesting areas, with its long history centered on sites such as Phaistos, Kommos, and Haghia Triada which are among the few that have yielded archaeological evidence for the phases of the Dark Ages. The new social dynamics affected domestic production and with this work, we intend to present the results obtained from the study of textile tools in the Messara. Sites like Phaistos offer an extraordinary opportunity to shed light on the evolution of a widely practiced craft from its earliest stages. Based on textile-related materials such as loomweights and spindlewhorls, it has been possible to establish a chronological-typological classification and trace a functional evolution attributable to the internal choices of domestic groups. Modern methodological tools, such as space syntax analysis and the perspective provided by Household

Archaeology, enable a comparison between settlements from Late Minoan III C (12th cent.B.C.) to Proto-Geometric period (9th cent.B.C.). The ultimate goal of this presentation is to highlight a relational system between different households characterized by labor differentiation with a special focus on Phaistos area. This approach facilitates understanding the labor economy, distinguishing activities based on the complexity of required knowledge for product realization. Furthermore, by comparing different sites, it helps discern the types of activities occurring within households or if provisioning was diversified in any way.

3 IN THE BEGINNING OF TEXTILE CRAFT: THE SIGNIFICANT CASE OF THE CHALCOLITHIC SETTLEMENT OF LOS MILLARES (SE, SPAIN)

Basso Rial, Ricardo (University of Alicante) - Dorado Alejos, Alberto (University of Granada) - Pau, Claudia (University of Granada) - Spanedda, Liliana (University of Granada) - Molina González, Fernando (University of Granada) - Cámara Serrano, Juan Antonio (University of Granada)

Textile production is one of the oldest artisanal processes of humanity. Its origin in many areas of Europe and the Mediterranean dates back to the early stages of Late Prehistoric times. However, the perishable nature of most of its tools and of the textiles themselves has made it difficult to record in archaeological excavations and has conditioned its study and interest in its research, especially in Spain. Although in recent years this has begun to change, with an increasing number of studies dedicated to textile production in prehistoric contexts, little interest has so far been shown in tracing the beginnings of this activity on the Iberian Peninsula.

The aim of this contribution is to begin to resolve this situation by evaluating the extensive body of evidence related to textile activity at the archaeological site of Los Millares, a settlement in the southeast of the Iberian Peninsula considered to be one of the most important Chalcolithic centres in the Western Mediterranean between 3200 and 2200 BCE. The different interventions carried out at this site since the end of the 19th century, but above all in the last decades of the 20th century, have made it possible to document a large number of textile tools that show the importance that this craft may have had from the end of the 4th millennium onwards. It is also one of the few archaeological sites where textile remains have been preserved with which to explore the raw materials and techniques used. All of this allows us to make a first approximation to the chaîne opératoire of this craft activity and its organisation in the settlement, as well as to begin to assess its significant role in the economy of the Copper Age communities.

4 CHALCOLITHIC CRAFT ON THE CLIFF? CERAMIC PROVENANCE AND TECHNOLOGY AT THE HIGH-ALTITUDE SETTLEMENT OF LES MORERES (ALICANTE, SPAIN)

Serna Martínez, Israel (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico (INAPH), Universidad de Alicante) - García Atiénzar, Gabriel (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico (INAPH), Universidad de Alicante) - Del Pino Curbelo, Miguel (Departamento de Ciencias Históricas, Universidad de Las Palmas de Gran Canaria) - Buxeda i Garrigós, Jaume (Departament d'Història i Arqueologia, Universitat de Barcelona)

Les Moreres (Alicante, Spain) is a fortified high-altitude settlement dating from the second half of the 3rd millennium BC. This context is representative of the social and material changes that took place in SE Iberia in this period, with an incipient social elite interested in the control of the territory and in the communication and exchange routes.

The pottery assemblage at Les Moreres exhibits a remarkable functional diversity, showcasing a meticulous technical prowess inherent in its production. This is evident in the deliberate technological choices made across the manufacturing process, which are undeniably intertwined with the various domestic functions served, including cooking, storage, and transportation needs. The configuration of the trousseau also reveals the role that factors such as growing social competition and certain forms of food consumption must have played in the design of these objects. It is within this context that the development of some more carefully crafted designs, such as symbolic ceramics or bell-beakers vessels, is framed. Additionally, possible imports from other peninsular and extrapeninsular sites would need to be considered, adding to the initial (and elusive) evidence of long-distance material exchange networks in the Mediterranean basin.

To enhance our understanding of the production processes, the influence of social and material factors in decision-making, and the inherent mobility in ceramic group assemblages like the one found at Les Moreres, this paper presents the results of the integrated analysis of 35 samples, comparing typological and archaeometric information. The techniques employed are XRD, XRF, SEM and thin section optical petrography.

5 THE QUARRYING OF GRANITE IN GALLURA IN THE NURAGIC ERA. THE CASE OF THE GIANTS' TOMB OF SU MONTE S'ABE

Carrera, Francesco (Soprintendenza Nazionale per il Patrimonio Culturale Subacqueo)

Gallura, a vast area of north-western Sardinia, is characterized by important granite outcrops which have influenced the populations settled here since the Neolithic.

But it is from the end of the Copper Age and even more so in the Bronze Age that granite working took on a fundamental role in the creation of the great monuments that still dot this region today, from the megalithic walls, to the allée couverte tombs up to the tombs of giants and monumental nuraghi.

It is right next to these monuments that the granite processing areas were identified, characterized by a system significantly different from those known from the Punic period to the present day. In particular, the quarry area relating to the giants' tomb of Su Monte S'Abbe in Olbia will be presented where, thanks to the signs left in the rock and some tools found, it was possible to reconstruct the entire system of quarrying and transport of the blocks, of the slabs and the large curved stele that made up the exedra. Finally, the techniques identified in Gallura will be compared in order to propose a first chrono-typology of the quarrying techniques of this particular rock on the basis of the traces identified in the territory.

6 ARTISANS AND ARTIFACTS: A POST-HUMANIST EXPLORATION OF ETRUSCAN POTTERY

McCabe, Michael (Leiden University)

This article examines artisanal practices in early Iron Age Italy, focusing on the production of pottery by the Etruscans and cross-craft production techniques. Using post-humanist and New Materialist perspectives, the article delves into how these artisanal practices evolved over time, highlighting artisans' critical role as cultural intermediaries and innovators while incorporating the non-human actor and ontological reality.

This study uses archaeological, historical, and anthropological approaches to explore how humans and non-human factors interacted to shape pottery production among the Etruscans. It highlights how Etruscan artists, positioned within a network of social and cultural connections, navigated material, environmental, and technological factors to create pottery that had both practical uses as well as symbolic and aesthetic meanings. Using a post-humanist approach, this analysis goes beyond the human-centred perspective and recognises the role of materials, tools, and the environment in shaping artisanal practices. It explains how the actions and intentions of humans interacted with these non-human elements, leading to innovative new constructions.

The abstract emphasises the importance of studying the evolution of artisanal practices over the longue-durée, which includes examining shifts in techniques, styles, and socio-cultural contexts especially regarding periods of change. This detailed analysis reveals Etruscan pottery production's dynamic and contingent nature and helps us understand the complex interactions between artisans, materials, and cultural landscapes. This research aims to contribute to a better understanding of Iron Age Mediterranean artisanal practices, highlighting the role of both human and non-human factors in shaping cultural evolution.

7 COINS AND CRAFT: TEXTILE VESTIGES AND THE CRAFTSMANSHIP BEHIND IN THE ROMAN PROVINCES OF HISPANIA, NORICUM, AND PANNONIA

Morgado-Roncal, Leyre (University of Granada (Spain)) - Grömer, Karina (Natural History Museum Vienna)

In Roman Archaeology, textile studies have been traditionally approached through written and iconographic sources. In the last decades, this has been changing and Roman period textiles are studied also with an interdisciplinary approach, including fibre or dyestuff analysis and many more. It is also important to study the contexts of the textiles found (the graves, settlements, and hoards) and such understanding of the archaeological textiles in situ.

We would like to provide an overview of a less known phenomenon: textiles attached to Roman coins with examples from different Roman provinces (Hispania, Noricum, and Pannonia). Therefore, we hope to draw the attention to a textile function that was less studied so far, with comparison findings from different regions of the Roman Empire. Moreover, the focus will also be in the craft behind: the production processes and its artisans. Consequently, the manufacture of textiles in the Roman World will be addressed, including some hints on known values and prices of certain textile products to return to the main case study: coins and textiles.

8 THE CONTRIBUTION OF ANCIENT REPRODUCTIONS IN ARCHAEOLOGY OF PRODUCTION: THE CASE STUDY OF TWO AMPHORAE FROM THE GRUPPO DI VANTH

Zubajová, Marina (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Paolini, Roberto (Independent researcher)

Two almost identical red-figure amphorae from the Gruppo di Vanth (inv. n. 2647 and 2645), dated to the last quarter of the 4th century BC, were discovered in a dismal state. Both amphorae were missing the entire foot and a large part of the neck. Of the original handles woven from three strips of clay, only one has survived, and even that only partially. The bodies of the vessels decorated with a red-figure frieze have been preserved almost completely. The frieze depicts a journey to the underworld: we see a deceased, two male demons, probably the rulers of the underworld, Persephone and Hades, the demon *vanth* and Kerberos. Amphorae are restored and exhibited in the Etruscan Museum "Claudio Faina" in Orvieto. They are known in terms of iconography, but no one has ever deeply studied their "materiality" and thus what their original overall form was, or how they were created and painted. A stylized reproduction of one of them was created in 2023 (inv. n. 2647). The author is the specialized craftsman Roberto Paolini, who is an expert in ancient techniques regarding the production and painting of ancient reproductions, collaborating with universities and museums internationally. The authors provide a reconstruction of the missing parts based on the study of similar objects. These findings were included in the created reproduction of the amphora in the form of decorative plastic elements and partly also parts of the figures on the painted frieze. The authors would like to present these new proposals for the reconstruction of the appearance of both amphorae. In addition, the technology of the production process and the painted decoration of the reproduction of the amphora will be reflected in the contribution.

9 EXPLORING SECONDARY GLASS PRODUCTION IN ROMAN AQUILEIA: AN EXTENSIVE ARCHAOMETRIC STUDY TOWARDS NEW EVIDENCE

Molinaro, Sabrina (Center for Cultural Heritage Technology - Istituto Italiano di Tecnologia; Università Ca' Foscari di Venezia) - Zanini, Roberta (Center for Cultural Heritage Technology - Istituto Italiano di Tecnologia) - Giummolè, Federica (Università Ca' Foscari di Venezia) - Traviglia, Arianna (Center for Cultural Heritage Technology - Istituto Italiano di Tecnologia)

An assemblage comprising 430 glass shards, selected from a larger group of shards recovered during field-walking survey near Roman Aquileia (NE Italy), has been subjected to thorough examination to elucidate the presence of indigenous glass production in this region during antiquity. Dating back to the period spanning the 1st century BC to the 4th century AD, these shards serve as crucial testimonies in establishing a still debated historical narrative. The primary aim of this investigation is to substantiate the conjecture that Aquileia held a significant role in the manufacturing of glass in antiquity, encompassing the crafting of original glass, recycling processes, and the production of artifacts distinguished by unique colorations.

The chemical composition analysis of glass samples was conducted through laser ablation inductively coupled plasma-mass spectrometry (LA-ICP-MS) and this endeavor represents the most extensive analysis ever undertaken on ancient glass fragments utilizing this technique. This technique facilitates the precise quantification of major, minor, and trace elements, providing essential data for exploring provenance, establishing compositional groups, and occasionally offering insights into the chronological context of the samples. The majority of the examined items (chunks, working residues, and artifact shards) displayed noteworthy compositional similarities, strongly indicating the prevalence of glassworking activities in the region. Comprehensive analyses revealed the coexistence of both recycled and primary glass. Notably, the compositional data for raw primary glass indicated both the Syro-Palestinian and Egyptian regions as sourcing areas, confirming the role of the Roman city of Aquileia as a central hub in the intricate network of trade of the past. Moreover, specific colored glass fragments exhibited compositions typical of glass produced during the 1st or 2nd century AD. This finding suggests the use of specific furnaces and manufacturing procedures, suggesting the possibility of a highly specialized local production in Aquileia during that period.

10 SURVIVAL OF ANCIENT CERAMIC FORMS IN MODERN TIMES

Zarco Martínez, Eva (Universidad Nacional de Educación a Distancia)

Certain industries, developed in the Iberian Peninsula since ancient times, can be and are studied from their ceramic containers. The packaging is, in the cases we present, representative of both a specific production and commercial routes that show a demand supplied from the peninsular territory.

Already in Roman times, there was a standardization of packaging, so that certain typologies could be directly related to the export of specific products. This premise is supported by the numerous studies related to amphora epigraphy that analyze the complex production and logistics process of the Hispanic product. In this historical stage, the typological standardization of containers dedicated to the transportation of oil tends towards the ovoid shape for the optimization of production and transportation of the product. The presence of these containers is widely known in the Testaccio of Rome, but also in the limes of central and western Europe.

The ovoid shape that prevailed in Roman times, surviving for approximately five centuries, can be observed again in the 15th century, in the Sevillian *botijuelas* or Spanish olive jars. These containers of food products have similar characteristics to Roman amphorae not only in their shape, but also in the production areas and starting point of trade routes that repeat patterns from antiquity.

11 METALLURGICAL PRACTICES IN LATE ANTIQUE ROME: BETWEEN CONTINUITY AND CHANGE

Bison, Giulia (University of Leicester)

The last decades of excavations and research have deepened and broadened our knowledge of the archaeology of production in Rome between Late Antiquity and the Renaissance, revealing a city which, despite the vicissitudes it underwent, remained a lively centre of production and trade.

In particular, the late antique period shows aspects of marked continuity with the imperial times, but also numerous profound changes that mark a break with the past, while preparing the transition to the early Middle Ages.

Three recently excavated metallurgical sites illustrate these aspects and shed new light on the metallurgy practised in Rome between the 5th and 7th centuries: these highlight a continuity in the way metals were worked, while the use of the sites where the workshops were established shows a marked difference from previous periods and a remarkable ability to adapt spaces to production needs. These discontinuities provide a useful starting point for exploring the political, economic and social factors that underpinned certain phenomena of Rome's life during this period.

At the same time, the artisans who were still active in the city played a fundamental role, guaranteeing the continuity of metalworking technologies and practices and maintaining dynamic relations with the social body the *Urbs*.

My paper will therefore focus on the analysis of the metallurgical evidence that is the subject of my research, combining the data that emerge with some reflections on the various actors and factors at play in this period of Roman history, trying to place them in a broader historical context.

12 CRAFT ACTIVITY IN THE EARLY MEDIEVAL PERIOD. BREAD MAKING IN RURAL AREAS IN IBERIAN CENTRAL PLATEAU

Berrica, Silvia (Escuela Española de Historia y Arqueología de Roma EEHAR-CSIC, Italy)

Bread making in rural areas of the Iberian Central Plateau is the focus of this study. The research delves into the distinct settlement hierarchies that were present in the Central Iberian Peninsula during the Early Middle Ages, specifically examining the categorization and organization of settlements in the region.

During the Early Middle Ages, distinct types of settlements existed in the Central Iberian Peninsula, each varying in size, function, and social structure. Craftsmanship played a significant role in distinguishing the differences between these settlements, particularly evident in the bakeries found in rural areas and large towns. These bakeries offer insight into new perspectives on productive activities during the early Middle Ages, shedding light on the social and economic dynamics of towns in the Central Iberian Plateau.

This research contributes a fresh perspective from the field of Archaeology of Production, with a focus on the economic aspects of peasant life in the region.

13 PRODUCTIVE ACTIVITIES AS INDICATORS OF POLITICAL AND ECONOMIC CHANGES IN THE AMITERNUM TERRITORY

Forgione, Alfonso (Università dell'Aquila)

The archaeological investigations of the episcopal complex in Amiternum, located near the city of L'Aquila, have revealed at least 3 structures interpreted as bread ovens located in two distinct and symmetrical areas of the ancient episcopal complex. These structures, consisting of three stove bases with a diameter of approximately 1 meter, were constructed with bricks and fragmented roof tiles placed directly on the flooring, which also showed evident signs of redness. One of these installations still preserved a fragment of the elevation of the stove made of compact clay soil.

In association with these floors, at least two large grain pits and a series of aligned post holes were found, which were functional to the wooden installations used for production and storage. After the discontinuation of the productive area, the structures were intentionally demolished, and the foundations were reused as flooring, supplemented by flat and compact layers of muddy soil that uniformly covered the entire area and leaned against the existing structures.

The particular morphology of the installations and the presence of grain pits and post holes confirm the hypothesis that these installations were bread ovens for the secular and religious community of the territory.

The ovens, found within the side aisles of the place of worship after the infill of the arches that separated them from the central nave and their subsequent defunctionalization, can be chronologically placed between the end of the 9th and the first half of the 10th century. This period coincided with significant planovolumetric transformations of the

entire complex as a consequence of one of the major earthquakes that struck the L'Aquila territory. It is also possible that during this period, the episcopal seat became a point of reference for nearby settlements.

14 EAST VERSUS WEST: THE ORIGINS OF THE Umayyad STYLE IN THE ART OF STUCCO TECHNIQUE

Georgieva, Siyana (Univesità di Padova; Università Popolare della Toscana)

By 750, the Umayyad dynasty had gained control of a vast territory stretching from Kyrgyzstan to Spain. The technique stucco was a distinctive feature of Sassanian architecture. The studies that form the basis of our understanding of the complex issues related to Early Muslim art have focused on the sources of architectural stucco details, the meaning of themes and forms in their new context, and the transition of motifs from East to West. The aim of this research is to explore the identity of the group or groups of artists who sculpted the stucco decoration in the Umayyad palaces. Additionally, it aims to investigate the interaction between various artistic traditions and the challenges faced by the sculptors, which resulted in the creation of a new style. The method used aims to isolate the purely stylistic aspect from the motifs and models of the compositions. The work assumes that artists borrow themes, motifs, models, and even entire compositions from one culture, while their basic style is rooted in another tradition, the one in which they were trained. Comparative analyses of the stylistic details of carving, as well as the alterations made in the compositions, could help distinguish between the sources of the motifs and models and the origins of the artists involved in the execution of the decoration. This work employs detailed analysis with a current approach to provide a more accurate and complex picture of the processes involved in the construction of the Umayyad palaces. The study focuses on four late Umayyad palaces: Khirbat al-Mafjar, Mshatta, Qasr al-Hayr West, and Madinat al-Zahra. These sites were chosen for their richness and the relatively developed style of decoration with the stucco technique across the Mediterranean. East versus west?

15 THE PRODUCTION OF LEATHER IN THE NASRID KINGDOM OF GRANADA: CHARACTERIZATION AND CHRISTIAN TRANSFORMATIONS POST-CONQUEST

Garrido López, Jorge (University of Granada)

Leather-working was one of the most important productive activities, in terms of division of labour, number of employees and commercial derivation from al-Andalus in general and the nasrid territory in particular. However, our knowledge of the production process of this material is very limited and always based on extrapolations from other spaces and chronologies. In this communication, I propose to present in a broad and general way the main aspects that characterize the production of nasrid leather, with the aim of delving into the elements of change that have been identified after the castilian conquest, such as the social organization of labour, reorganization of productive spaces with respect to the new conception of urban framework imposed by the christians, new tanning techniques and their commercial derivation.

To carry out this work, I will mainly rely on the information provided by the archaeological record generated in the various urban interventions in the territory occupied by the nasrid emirate of Granada, confronting and enriching them with the information from the textual sources available for this particular period, both chronicles and archival documentation.

16 TRADE AND CERAMIC EXCHANGE IN THE SOUTHEASTERN IBERIAN PENINSULA DURING THE 15TH AND 16TH CENTURIES

Sánchez Castillo, Carmen (University of the Basque Country) - García Porras, Alberto (Universidad de Granada) - Iñáñez, Javier (University of the Basque Country)

The southeastern region of the Iberian Peninsula, particularly the area of Almería (Spain), underwent numerous political, economic, and social transformations during the 15th-16th centuries. The conclusion of medieval Islamic presence on the Iberian Peninsula, marked by the disappearance of the Nasrid kingdom, represents a pivotal moment of change. It is characterized by the convergence of elements transitioning to the modern world and the replacement of one society with another based on entirely different social and economic parameters.

These changes had a direct impact on trade, as evidenced by preserved written documentation and the understudied material manifestation of ceramics. In this study, we will assess the current state of research and propose its exploration through archaeological and archaeometric methodologies. Our goal is to recognize consumption patterns, identify the production cycle, and reconstruct exchange and distribution routes. This approach aims to enhance our understanding, through material evidence, of the dynamics of transformation that this society underwent.

803 DYNAMICS OF OWNERSHIP AND TRANSFORMATION OF URBAN SPACES IN THE ROMAN ERA

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Sánchez de la Parra-Pérez, Santiago (Universidad de Valladolid) - Rodríguez Gutiérrez, Oliva (Universidad de Sevilla) - Boucard, Jordan (LUGDUNUM - Musée & Théâtres romains)

Session format: Regular session

Too often, the ancient city is approached as a "still photo", where the most monumental, homogeneous or best known phases of research are the most important. In this way, dynamics that are probably very frequent in everyday urban life, such as changes of ownership, annexations, boundaries, abuses by private individuals in the occupation of space, etc., go unnoticed. Some surviving legal sources show the concern for urban planning and order, while archaeology documents some of these processes.

In this way, the analysis of the urban framework of a Roman city can be approached from a structural point of view, tracing its configuration through multiple sources of information. Furthermore, the composition of the civic nuclei can be studied by analysing the elements that made them up, defining the spaces according to their ownership and purpose.

This session aims to bring together people who study the processes of change in Roman city spaces from the perspective of archaeological, legal, epigraphic and textual criticism studies. We want to share our experiences in different fields of research and sources of information, so we encourage the presentation of both case studies and reflections on the main issues intrinsic to this subject. We welcome papers that address topics such as land ownership, the transfer of property, the disaffection of real estate or the transformation of the use of plots of land in Roman urban contexts. Our intention is to create an interdisciplinary discussion environment in which to present, among other themes, the tools available to define the purpose of land, the structural transformations of a specific building or of multiple spatially related urban spaces. We are also interested in the analysis of textual, epigraphic and legal sources that contextualise and frame the evolution of a given urban framework.

ABSTRACTS

1 THE LEGAL AND ADMINISTRATIVE CONTEXT OF DONATIONS, PURCHASES, AND SALES OF URBAN LAND IN THE ROMAN WEST (1ST-3RD CENTURIES AD)

Sánchez de la Parra-Pérez, Santiago (University of Valladolid)

The choice of land was one of the main issues to be considered in any public construction project in Roman times. This phase took place at the beginning of process and was made public after the promulgation of the decurion decree, which established the administrative bases of the project. It had to conform to the various property rights existing in Roman times (publicum, sacrum and privatum), which regulated and limited the type of structures to be built according to the category of plot. In turn, the *ius superficiei* defined the right of ownership and possession of the parcels and the buildings located on them. In this contribution we will review the legal context of Roman public building through the epigraphic and literary documentation available in Hispania and North Africa during the 1st-3rd centuries AD, paying special attention to the euergetic donations of local benefactors. The elites commonly offered cities private land for the construction of public structures. In particular, we will reflect on the meaning of the formula "*solo empto ab republica*," which directly refers to the legal ownership of the land. Its specific meaning has led to the publication of several articles that have not offered a unanimously accepted solution by the scientific community, providing an ideal opportunity to contextualize the dynamics of property from a legal perspective in the Roman city.

2 BETWEEN PUBLIC AND PRIVATE: DEDICATIONS AND STATUARY HONOURS OF INDIVIDUALS IN PUBLIC SPACES OF ROMAN CITIES OF HISPANIA

Cases Mora, Noelia (Humboldt Fellow Universität Hamburg)

Within the Roman city, dedications and statuary honours placed in forums and other public spaces had to be authorised by the local *ordo*, a permission made explicit with epigraphic formulations such as *l(ocus) d(atus) d(ecreto) d(ecurionum)* or *accepto loco ab ordine*. The reasons for these homages were varied and could arise from the initiative of the local senate, civic groups or individuals, as well as being financed by any of them. According to Roman legislation, the donation by private individuals of monuments placed in a public space meant that they became public property, so any modification or restoration belonged to the city's jurisdiction (Dig. 42, 5, 29; 43, 24, 11, 1).

In this context, it is particularly interesting to note the possible location of pedestals with statues dedicated to divinities in forums and other relevant spaces of the city, although their main purpose was to remember or honour

individuals. They have often been misidentified as funerary monuments, since the use of formulas such as *in honorem et memoriam* have made it possible to discern that the individuals remembered had already passed away. The purpose of this paper is to explore how and what consideration was given to these spaces, that were publicly owned but ceded to private individuals for their “self-representation”. In this regard, one of the most suggestive hypotheses refers to the frequency with which many of these divinities were qualified with the epithet *Augustus*. This allusion to imperial power could have been used as a means to obtain the authorisation of the local senate to the use of public space by these private individuals.

3 THE CONSTRUCTION SITES FOR TRANSFORMING PRIVATE BUILDINGS INTO PUBLIC MONUMENTS: TRANSFORMATION SITES AND REUSE

Boucard, Jordan (Lugdunum. Theatre et musées romains de Lyon)

The archaeology of construction and its study themes now provide new keys to understanding archaeological sites. Among these, the stage of site preparation and the conversion of a building, as well as questions related to reuse, can be studied. During the High Empire, a frequent but understudied phenomenon is worth noting: the transformation of private buildings into public buildings. Urban space is a place in motion, and destruction / construction / reconstruction sites were omnipresent. We propose here to study the dynamics of transforming private buildings into public monuments through the lens of the construction site. An operational chain can be defined, taking into account the potential for reuse. There are numerous archaeological examples, and the in-depth study of some of them provides new answers regarding the progress of the construction site. This is notably the case with the *Mithraeum* at Ostia or the sector of the pseudo-sanctuary of *Cybele* in Lugdunum, etc.

4 ONE NARRATIVE FITS ALL? REVIEWING ROMAN URBAN DEVELOPMENTS IN MID-IMPERIAL ITALY

Goetz, Lisa (Classical Archaeology, University of Augsburg, Germany)

How did Roman urban centres change in Italy in the second century AD? Traditionally, positive images of growth, wealth, expansion, and prosperity are often drawn. And deviant developments that do not fit into the supposedly flourishing urban era of the Roman Empire quickly fall into negative categories. As discussed in recent studies, such a linear urban narrative, which remains within limited interpretations and binary, simplified concepts, does not do justice to the heterogeneous situation in archaeological and historical urban research. Considering the different urban developments at the local level and in micro-contexts, this paper will examine several case studies of Roman urban centres in mid-Imperial Italy. Conflicting developments ranging from new to ruinous scenarios raise the question of how urban changes are recognized, explained, and interpreted. For answers, the modern perception of urban culture and the impact of traditional research history on the conceptualization of urban image(s) are addressed. Alongside extensive research of urban geographical and economic parameters, recent debates on urbanity in cultural and ethnographic approaches highlight the diversity of change, by reviewing local challenges, individual solutions, and the city as locus. This paper will therefore explore archaeological remains of adaptations in material culture as well as in architectural and social spaces and reflect on ideas of continuity, functionality, and crisis in ‘minor’ urban centres on the Italian peninsula. Beyond an unchanging urban image, a variety of modifications and transformations are emphasized as integral processes that allow for a better understanding of the adapting urban developments and culture in mid-Imperial Italy. The paper aims to contribute to the discussion on the persisting narratives of Roman urban culture in second century Italy, opening up additional perspectives on old concepts and new approaches to the study of local urban changes.

5 OWNERSHIP, FINANCIAL INVESTMENT AND LANDSCAPE IMPACT OF TWO GREAT MONUMENTS: THE CLAUDIUM IN ROME AND THE PROVINCIAL FORUM IN TARRACO

Domingo, Javier (Pontifical University of the Holy Cross) - Pensabene, Patrizio (Sapienza Università di Roma)

We present two monuments that we have studied in the past - the *Claudianum* in Rome and the *Provincial Forum* in Tarraco - but now from a different perspective: taking into account the change of ownership of the plots on which they were built and their landscape impact.

It is true that the data we have about their ownership conditions are very limited. Even so, we know that in *Celio* there were several *domus* owned by the *Claudians*, which we can assume passed to the imperial patrimony. This would explain the construction here of a large cult enclosure dedicated to *Claudius*. In this case, we would be facing the transition from private ownership to imperial ownership.

In the whole of Tarraco, we only know that in the acropolis there was a military camp, a fact which suggests that the area was a state property: it is true that the numerous excavations carried out in the upper part of the city have not provided data about possible constructions preceding the provincial enclosure, but we do have a wall of the 2nd century BC that, due to its monumentality, could have been part of a public building. At the same time, on the slope of

the hill where the circus was later built, there was a workshop for the production of architectural terracottas, which was subsequently dismantled. We would therefore be facing the transition from private ownership to public ownership.

We present both buildings together because they share the commonality of a significant economic investment, but with different origins: in the case of Rome, state-funded, and in Tarraco, funded by provincial elites.

Regarding the landscape impact, although we have more data for the late period, this allows us to hypothesize how both complexes were perceived from their origins in the 1st century AD.

6 EXPLORING THE EVIDENCE FOR CHANGING PROPERTY OWNERSHIP: CASE STUDIES FROM THE EXCAVATIONS OF HOUSES AND SHOPS AT POMPEII AND THARROS

Ellis, Steven (University of Cincinnati)

The aim of this presentation is to consider the extent to which we can identify changes in the ownership of urban property - especially that of Roman houses and shops - via archaeological excavations into their phases of development. The case studies are drawn from the University of Cincinnati's excavations of a variety of properties at the *Porta Stabia* neighborhood in Pompeii, as well as from the excavations of various neighborhoods across the Punic-Roman city of Tharros, Sardinia. Whereas urban investment and ownership is often, and reasonably, attached to changes in the architectural configuration of singular and neighboring properties, the focus here is on exploring other indicators. The archaeological evidence from the excavations at Pompeii and Tharros points to a range of signifiers for changes to property ownership, with some commonalities across and between the different cities. The examples include: the terracing of the landscape associated with property investment; ritual activities, whether in the cultic material deposited into pits cut into the floor, or in the replacement of household shrines; and the reorganization of underground drainage infrastructure. Some of the examples do not just signify changes in ownership or new divisions between neighboring properties, but also demonstrate the sharing of infrastructure and resources between owners. Also, the rate of structural and spatial development of various properties, from one phase of occupation or activity to the next, is considered as a potential indicator for the transition of ownership.

7 OWNERSHIP DYNAMICS IN BAELO CLAUDIA (PROV. BAETICA) THROUGH ARCHAEOLOGICAL EVIDENCE

Rodriguez, Oliva (University of Seville)

The archaeological evidence allows us to identify dynamic changes in land use, with divisions of former buildings, annexations, invasion of public space, etc. Although we have no direct material information, it is more than likely that these modifications involved regulated administrative actions related to property or, failing that, illegal abusive uses. *Baelo Claudia*, in the south of *Baetica*, is today a depopulated area that has been uninhabited since the 6th century AD and has been excavated and investigated for more than a century. Much of its urban centre has therefore been exhumed and well-published. This makes it a particularly suitable case study for tracing these interesting dynamics of urban transformation. Of particular interest is what has been documented in recent excavations in the southeast angle of the forum, where a large building erected at the beginning of the Imperial period was partially demolished in order to construct a new one. The excavations carried out in the industrial salting quarter have also documented the closure of a gate of the city wall and the partial invasion of a road.

This contribution will therefore deal with different examples of urban transformation documented in the city which allow us to reflect on the effective existence of a dynamic real-estate life, in accordance with the rules established by the municipal authorities. This contrasts, once again in *Baelo*, with the Late Antique phase of occupation, from the 5th century AD onwards. At that time, new building initiatives were documented on ancient constructions, although they already seem to respond to a more spontaneous operation and not controlled by public authorities. In fact, it serves to reflect on the forms of collective organisation at this time, the existence of administrators with responsibilities in the community or the validity of the rules of application for the common running.

8 EXPLORING THE CHANGES OF THE URBAN SPACE OF LUCUS AUGUSTI. REVISITING SANTO DOMINGO SQUARE

Folgueira Rios, Francisco (Universidad de Santiago de Compostela) - Martins, Manuela (UAUM/Lab2pT) - Machado, Diego (UAUM/Lab2pT)

Lucus Augusti was one of the three cities founded by Augustus in the North-West of the Iberian Peninsula, with the aim of reorganizing the territory after its effective conquest in 19 B.C. Over it is at present the city of Lugo, where in 1986 archaeological activity began among multiple difficulties. To the problems of urban archaeology, we must add the peculiarities of Lugo, which lacks databases, in which the archaeological documentation generated by this activity is poured. This makes it difficult to investigate the available resources, which in turn complicates the revision of the historical discourse, generated after the first excavations carried out at the end of the twentieth century. Because of

this, the evolution of the Roman city is perceived in a schematic way, through these created models, which tend to emphasize the idea of a monumental and immobile city, without paying attention to the data that might contradict them. As a result, excavations are sometimes carried out in an attempt to confirm these models, forcing the interpretation of the remains to adapt to them.

By reviewing the available archaeological information, and through a methodology that emphasizes the analysis of changes in land use, construction, remodelling or abandonment of buildings, we will try to present a more complex idea of the urban evolution of Lucus Augusti. In this way, focusing on the specific case of the 1986 excavation of the Plaza de Santo Domingo, we intend to approach the daily dynamics that would take place in this area of the city, in addition to trying to certify whether with this methodology, we can reuse interventions that previously only offered us a still photo, to better understand the urban changes occurred in the Roman city.

9 **RESHAPING URBAN LANDSCAPES: INSIGHTS FROM AESO (ISONA I CONCA DELLÀ, CATALONIA, SPAIN)**

Garcés, Ignasi (Universitat de Barcelona) - Cau, Miguel Angel (Universitat de Barcelona; ICREA; Associate researcher, Center Camille Jullian, MMSH, CNRS/Université Aix-Marseille; Institute of Archeology of the University of Barcelona (IAUB)) - Mas, Catalina (Universitat de Barcelona; Institute of Archeology of the University of Barcelona (IAUB)) - Martín, Borja (Universitat de Barcelona) - Bermúdez, Xavier (IPAT-Serveis Culturals; Museu de la Conca Dellà) - Belmonte, Cristina (IPAT-Serveis Culturals; Museu de la Conca Dellà) - Arcos, Roser (IPAT-Serveis Culturals; Museu de la Conca Dellà) - Reyes, Teresa (Museu de la Conca Dellà)

The Roman city of Aeso, situated beneath the contemporary town of Isona in the Catalan Pre-Pyrenees (Lleida, Catalonia, Spain), underwent archaeological excavations towards the end of the previous century, with recent efforts by our research team rekindling this exploration.

Between the 2nd and 1st centuries B.C.E., the Iberian settlement was replaced by a new city spanning approximately 4 hectares, planned in accordance with Roman urban design principles, while retaining its Iberian name. This endeavour was not isolated but rather part of a broader series of legal, military, and administrative transformations undertaken by the Roman state in the northeastern region of Hispania Citerior. The most prominent remnants from that period include a robust walled enclosure, which served as the foundation for the initial urban layout and orientation.

A period of significant prosperity ensued during the reigns of the Flavian and Antonine emperors, as evidenced by the city's abundant epigraphy, before succumbing to a profound crisis—a fate common among smaller Roman cities in the area. From an urban planning perspective, archaeology has confirmed that this flourishing period led to an expansion of the urban landscape, particularly evident at the southern periphery. Remarkably, this expansion not only incorporated new areas but also introduced a novel urban layout, leading to the dismantling of sections of the city walls and to the destruction of some of the main streets.

Consequently, inquiries arise regarding the correlation between these transformations, the city's legal status, and its alignment with the tumultuous transition from the Republic to the Empire. This study aims to blend an examination of legal sources reflecting the disaffection of the public use of urban spaces with an archaeological analysis comparing Aeso to other cities across the Iberian Peninsula that expanded their enclosures, thereby facilitating a comparative exploration of the adopted solutions.

10 **ARCHITECTURAL TRANSFORMATIONS AND OWNERSHIP DYNAMICS OF COMMERCIAL BUILDINGS: THE SHOPS IN LUGDUNUM AND VIENNA (FR) AS A CASE STUDY**

Lepee, Marine (Laboratoire ArAr-UMR5138, Maison de l'Orient et de la Méditerranée, Lyon; Université de Lille, Laboratoire HALMA-8164)

Retail spaces played a significant role in shaping the urban landscapes of Roman cities, including their plots and street networks. Archaeological data from the colonies of Lugdunum and Vienna, which were important trade centres in the Rhône Valley and Roman Gaul, provide a rich corpus of shops dating from the 1st c. BC to the 3rd c. AD. These shops were either integrated into buildings and completed their facades, such as houses and public buildings, or formed the ground floor of multi-storey buildings and commercial squares.

As part of a PhD thesis completed in 2023, a diachronic and multi-level analysis of their remains was carried out, with particular attention given to the architectural and planimetric transformations that the buildings underwent over time. The aim of this paper is to analyse the rhythms of reorganisation and reconstruction, including expansion or contraction, division into neighboring units, encroachment and other related processes, as well as the processes of abandonment and change of use affecting both the shops as individual rooms and more widely the commercial buildings in which they are located. It is also important to consider the dynamics of the surrounding urban area, which may be the cause or consequence of these developments.

What do these structural changes reveal about the evolution of the ownership and the management of shops, apart from their impact on the organization of retail and urban traffic? How do these transformations reflect changes in investment strategies in commercial architecture in these two colonies over the centuries? To establish the link between architectural and ownership issues, archaeological sources from selected sites in the study area will be combined cautiously with legal and epigraphic sources from the Roman world, that could shed light on how shops were run.

11 **OWNERSHIP IN A ROMAN POLIS REAL ESTATE DYNAMICS AND URBAN LANDSCAPE TRANSFORMATIONS IN THE MID-IMPERIAL ATHENS**

Cecconi, Niccolò (Sapienza. Università di Roma; Scuola Archeologica Italiana di Atene)

After the Roman conquest of Greece, the identities of the Greek cities were transformed by the intervention of central power, civic institutions, and local families. Even Athens, as a *civitas libera et foederata* of the province of Achaia and from the Antonine age onwards as the capital of the Panhellenic federal league (Panhellenion), underwent significant interventions that modified the landscape and functions of civic spaces. Certain property and ownership dynamics can be linked to some of these transformations. Three significant contexts will be the focus of the paper to shed light on this.

1) Thanks to archaeological, epigraphic, and literary sources, we know that in the residential area south of the Acropolis there were some houses of the family of Herodes Atticus and that this district was enlarged by Herodes in the 2nd century CE.

2) An inscription found at the Agora (IG II2 2776), dating back to the 2nd century CE, mentions some private land around the Akademia. Some archaeological evidence can be connected to these properties.

3) Hadrian's Library and the so-called 'Pantheon' were built on a late Hellenistic residential area. To build these luxurious buildings, it was necessary to demolish the previous houses and relocate all the owners to other areas of the city. A similar operation can be referred to the southeastern part of the city, where the completion of the Olympieion and the construction of a new residential quarter required the destruction of some buildings and of classical city walls.

These events may also be related to the appointment of a *curatores rei publicae* by Antoninus Pius to supervise the completion of the constructions begun by Hadrian.

804 **MAKE DOLIA GREAT AGAIN - COMPARATIVE PERSPECTIVES ON ANCIENT CLAY-JAR WINEMAKING**

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Komar, Paulina (University of Warsaw) - Van Limbergen, Dimitri (Ghent University)

Session format: Regular session

In today's wine scene, clay-jar winemaking is a discrete phenomenon, mainly confined to the Caucasus (Georgia, Armenia) and a few artisan winemakers in Mediterranean Europe (Greece, France, Italy, Spain, Portugal) and South America (Peru, Chile). In Antiquity, however, such jars were standard equipment in winemaking facilities spreading from the Caucasus to the Iberian Peninsula. They were the 'karas' of the Armenian Urartu Kingdom, the 'pithoi' of the Greeks and the 'dolia' of the Romans. Surprisingly however, current research on ancient wine has largely ignored the role of these containers in ancient wine production and economy, and their influence on ancient wines' sensory properties remains poorly understood.

With this session, we aim to re-establish the role of clay jars in ancient wine studies by concentrating on aspects of their making and on their effects on wine fermentation and storage. To this purpose, we intend to bring together a holistic and comparative group of researchers working on ancient and contemporary clay jar winemaking in the Mediterranean, the Caucasus and beyond. We are particularly interested in talks dealing with clay jar typologies and forms, geographical and chronological distributions, and archaeometric studies of clay composition and vessel contents; especially if such work leads to insights into processes of wine fermentation and organoleptic evolution.

ABSTRACTS

1 **CALCULATING THE VOLUME OF DOLIA EMBEDDED IN COUNTERS OF TABERNA IN POMPEII** **Zhao, Xinyan (Kyushu University) - Hori, Yoshiki (Kyushu University) - Ogawa, Takuro (Kyushu University)**

In the context of archaeological excavations within the Roman Empire, in addition to the wine workshops and vessels dedicated to wine transport, a diverse array of dolia has been found in various contexts, including the examples embedded in counters of taberna. These dolia, suggested by existing literature, were likely instrumental in offering a diverse range of flavored beverages. Additionally, numbers of amphorae, traditionally used for wine distribution, were

found alongside these dolia. While there is an association between these dolia and wine reprocessing and distribution, the scarcity of archaeological evidence presents challenges in conclusively determining the specific types of dolia linked to wine. Furthermore, the use of traditional measurement methodologies for dolia that are embedded in architectural structures is difficult. Hence, the challenge in this study revolves around precisely evaluating the shapes and volumes of those immobile dolia. To determine the purpose and function of the embedded dolia, one needs first to measure the shape and to calculate the volume usually from detailed drawings of evidence, but often gave up on hand-measurement. This research utilizes 3D visual technology to scan the interiors of these dolia embedded in counters in Pompeii, resulting in high-precision 3D models, and restoring the original form of the dolia through fitting operations.

The volume could, especially, serve as a key metric for assessing the relationship between dolia and wine. This involves the first utilization of 3D model in measuring dolia volume embedded in counters in 14 houses in Pompeii, conducting comparative analyses with amphora volume. Combining these elements allows for a better understanding of the connections between various types of dolia used in taberna. Also, it provides new data regarding their shapes and volumes. The methodologies employed for data acquisition and visual archaeological analysis in this study can serve as valuable references for similar research pursuits.

2 DOLIA FROM LUSITANIA: EXPLORING CHRONO-TYOLOGIES AND CONTENTS

Bombico, Sonia (CIDEHUS - University of Évora) - **Andrade, Daniel** (CHAM - NOVA University Lisbon; CIDEHUS - University of Évora) - **Quaresma, José Carlos** (CHAM - NOVA University Lisbon) - **Abrunhosa Pereira, Pedro** (CITCEM - University of Porto) - **Oliveira, César** (HERCULES - University of Évora) - **Carneiro, André** (CHAIA - University of Évora)

In this paper, we will present the results of the research conducted within the framework of the VILUS project—an initiative aimed at characterizing and typifying the dolia of Lusitania through a systematic study of ceramic collections from various archaeological contexts. The 2023 fieldwork encompassed the scrutiny of dolia collections from the Roman cities of Mirobriga, Conimbriga, and Salacia, materials sourced from fish salting factories in Sines, and dolia from rural sites such as the villa of Horta da Torre (Fronteira), the villa of Santa Catarina de Sítimos (Alcácer do Sal), and agrarian and rural sites in the municipality of Ponte de Sor.

The analysis of different archaeological contexts—urban, rural, and coastal—coupled with a comprehensive literature review, enabling us to draw specific conclusions. Firstly, trends were observed towards the predominance of types with introverted thickened or introverted glans rims and inverted pyriform bodies (types 2 and 3), particularly in southern Lusitania. The chronologies of the contexts allow an attempt at defining a chrono-typology, although the data suggests a rather long-term use of the containers. On the other hand, an inventory of dolia production centers in the province was compiled, and distinct fabrics were identified by region. Epigraphy, especially numeral graffiti, provides data on the capacity of the containers. Finally, we will present the results of organic residue analysis in pottery, offering intriguing insights into the contents of the dolia, typically associated with the production and storage of wine and olive oil.

3 UNVEILING THE POTENTIAL OF PREHISTORIC WINEMAKING: THE EFFECT OF VESSEL SHAPE ON THE PERFORMANCE OF SPONTANEOUS FERMENTATION PHENOMENA

Harutyunyan, Mkrtych (Linking Landscape, Environment, Agriculture and Food (LEAF) Research Center, Associated Laboratory TERRA, Instituto Superior de Agronomia, Universidade de Lisboa) - **Granja-Soares, Joana** (Departamento de Ciências e Engenharia de Biosistemas (DCEB), Instituto Superior de Agronomia, Universidade de Lisboa) - **Chandra, Mahesh** (Linking Landscape, Environment, Agriculture and Food (LEAF) Research Center, Associated Laboratory TERRA, Instituto Superior de Agronomia, Universidade de Lisboa) - **Asryan, Arman** (College of Science and Engineering, American University of Armenia) - **Oliveira, Joana** (Faculdade de Ciências da Universidade do Porto (FCUP)) - **Freitas, Víctor** (Faculdade de Ciências da Universidade do Porto (FCUP)) - **Loira, Iris** (Departamento de Química y Tecnología de Alimentos de la Universidad Politécnica de Madrid (ETSIAAB-UPM)) - **Morata, Antonio** (Departamento de Química y Tecnología de Alimentos de la Universidad Politécnica de Madrid (ETSIAAB-UPM)) - **Cunha, Jorge** (Estação Vitivinícola Nacional (EVN)) - **Malfeito-Ferreira, Manuel** (Linking Landscape, Environment, Agriculture and Food (LEAF) Research Center, Associated Laboratory TERRA, Instituto Superior de Agronomia, Universidade de Lisboa)

The earliest archaeological evidence of wine comes from ceramic vessels of the Transcaucasian ‘Shulaveri-Shomutepe’ or ‘Aratashen-Shulaveri-Shomutepe culture’ (SSC/ASHSh: c. 6000–5200 BC). Western European bell beakers (BB: c. 2500–2000 BC) did not show residues consistent with wine. Knowing that wild grapes populated both habitats, the absence of wine during the Bell Beaker period remains to be explained. The main goal of this work is to test whether the vessel’s shape could influence the performance of spontaneous fermentation, specifically regarding the production of volatile acidity. In addition, wine yields and phenolic composition were determined for wild grapes in

comparison with six red varieties *Vitis vinifera* L. subsp. *sativa*, chosen as a function of their genetic relatedness with the wild counterpart (Vinhão, Marufo, Branjo, Melhorio, Castelão and Aragonez).

Two types of vessels were used: (i) borosilicate glass beakers (4–5 L) to imitate BB pottery style; and (ii) Erlenmeyer flasks (5 L) to imitate SSC/AshSh vessels. Fermentations occurred spontaneously and wines were analysed for their conventional physical-chemical parameters, spectrophotometric indexes, and yeast species at the end of fermentation.

V. sylvestris grapes showed the lowest berry weight and juice yields while wines showed high total acidity and colour intensity when compared to the cultivated varieties. *Saccharomyces cerevisiae* dominated at the end of all spontaneous fermentation, in all types of vessels and conditions. Most of the wines fermented in Erlenmeyers showed higher ethanol and lower volatile acidity than those fermented in beakers, either in red or white wine style fermentations. Therefore, the shape of the vessels influenced the performance of fermentations, probably due to the different exposure to air, leading to vinegary ferments more frequently in open-mouths than in conical-shaped flasks. These results provide a hypothesis based on fermentation performance, for the absence of wine produced in the Iberian Peninsula until the arrival of Phoenician settlers.

4 THE ROMAN ‘DOLIUM’ EXPERIMENT: FROM THE ORIGINAL ARCHAEOLOGICAL VESSELS TO THE MODERN REPLICAS

Martín i Oliveras, Antoni (Universitat de Barcelona) - **Parés Sansano, Bruno** (Cella Vinaria Project) - **Matés Porcel, Josep** (Cella Vinaria Project)

The ‘dolum’ is one of the most common pottery elements that appears in the excavations of Roman settlements, whether they were urban ‘domus’; ‘villae rusticae’; farms for intensive cereal crop cultivation; centres specialising in wine-growing and olive oil production; infrastructures for production, storage, distribution, and transport (‘horrea’, ‘cellae vinariae et oleariae’); Roman tanker-ships; or establishments for the sale and consumption of the contents of the ‘dolia’ (‘tabernae’, ‘cauponae’, ‘thermopolia’ etc.).

Despite this, the ‘dolum’ has been one of the vessels least studied by scholars, perhaps due to its “gross” structural manufacturing and its functional condition as a large pottery container for the collection and storage of agricultural products considered more as an integral part of production and processing facilities than as a container itself.

The main purpose of this paper is to present the whole documentation and manufacturing processes of replicas of Roman ‘dolia’ from the four originals located at the archaeological site of Veral de Vallmora. Today, these are presented in restored condition ‘in situ’ in the ‘Cella Vinaria’ Archaeological Park in Teià (Maresme, Barcelona, Spain). These containers have a similar body shape, differing mainly in their general dimensions and in the type of rims. They belong chronologically to Phase 1 of the site, corresponding to the first wine-growing estate whose full operational period is the 1st century AD.

The objective is show all the processes of documentation and manufacturing of these replicas, from the metrological and digital photogrammetric study of the original archaeological vessels enabling a 3D theoretical model of the ‘dolum’, which in turn has served as a sample for making the different elements of the replica container by the master potter, to the drying and firing processes, transport, and installation in the original archaeological context located at the site in the so-called northeastern ‘Cella Vinaria’.

5 MAKING, USING, AND REPAIRING DOLIA FOR WINE

Cheung, Caroline (Princeton University)

Dolia (singular dolium) were the largest type of pottery in the ancient world that could hold hundreds to as much as three thousand liters. They primarily stored wine during its production on agricultural estates, but also in shops and bars. Their shape and size facilitated wine fermentation, and they were legally considered architectural elements of a wine cellar. As expensive and valuable vessels, dolia were also prized for their utility and could be used for long periods of time. Well made dolia, with the proper upkeep, had the potential to be used for long periods of time. Although dolia could be robust vessels, the way they were produced also made them susceptible to damage such as cracking, which was often remedied in order to extend their utility. Many dolia repaired in antiquity shed light on different techniques and materials craftsmen used in order to mend the wine vessels. Agricultural texts also note the importance of regularly cleaning and coating the vessels before adding new batches of wine. This paper considers the impact of the long lives of dolia (including their production, upkeep, and repairs) on ancient wine, as well as the ways storing wine affected how dolia were made and maintained.

6 ON THE ORIGINS OF ROMAN WINEMAKING IN EARTHENWARE VESSELS

Van Limbergen, Dimitri (Ghent University; Università degli Studi di Verona)

Dolia defossa – earthenware vessels buried in the ground up to their rims to store and ferment wine – are perhaps the most characteristic and visual element of Roman winemaking estates. They have been found in wine cellars all over the western Roman world, especially in Italy, Portugal, Spain, and southern France, sometimes in very large quantities. The widespread use of these vessels attests to the existence of a skilled, specialized wine industry, aimed at making good wines by storing the must in purposely made clay jars, whose shape, size, and material properties all contributed to balanced fermentation and aging.

But where did the technique come from? While the Roman evidence certainly stands out in terms of quantity, the use of such vessels in winemaking was already a millennia-old practice at the time, going back at least 4000 years to the Caucasus region. In this talk, I will trace the origins and development of winemaking in earthenware vessels, from Georgia and Armenia, through Iran and Turkey and the time of the Urartian Kingdom (9th-7th century BC), and across the Archaic and Greek Classical world. Clay jars so reveal themselves as a highly specific, ingenious key component of ancient viniculture, and one perfected by the Romans in the first two centuries of our era.

7 CLAY-JAR WINE PRODUCTION NOW AND THEN – A COMPARATIVE PERSPECTIVE

Komar, Paulina (University of Warsaw)

Greek pithoi and Roman dolia were standard ceramic containers for wine fermentation. The practice of fermenting and/or maturing wines in big clay-jars usually buried in the ground that started from at least the Neolithic period (as evidenced by the Areni Cave, Armenia) has preserved until today, especially in the Caucasus area and the Iberian Peninsula. In recent years it has gained remarkable popularity and the experiments with the so-called “amphora wines” has been made in almost every wine-producing region (including Poland!).

Nevertheless, only traditions from Georgia, Armenia, Greece, Spain and Portugal can easily be traced back to antiquity. These traditions, however, differ in details from one another, for example with the use of resin (antiquity) or bees-wax (Georgia) for sealing fermentation jars, adding or not salt of seawater to wine (Greece and Rome) or with pouring olive oil on the surface of fermenting must (the Iberian Peninsula). Not to mention differences in wine terroirs, vine varieties and clay types of the fermentation jars. This presentation will use both classical sources as well as interviews with today’s wine producers. It will concentrate on differences in wine making processes in order to establish how they affected the fermentation and hence wine tastes.

8 THE PITHOI OF THE RURAL SETTLEMENT OF JAZZO FORNASIELLO (APULIA, VITH - IVTH CENTURY BCE): ARCHAEOMETRIC INSIGHTS INTO PRODUCTION PROCESSES

Muntoni, Italo (Soprintendenza ABAP BAT-FG, Ministry of Culture) - Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari “Aldo Moro”, Bari, Italy) - Lambrugo, Claudia (Dipartimento di Beni Culturali e Ambientali, Università degli studi di Milano) - Lojacono, Agnese (Dipartimento di Beni Culturali e Ambientali, Università degli studi di Milano)

This talk will focus on the archaeometrical analysis of the pithoi used to storage wine and produced in Peucetia between the VI and the IV century B.C. The study was carried out on the archaeological materials from the rural settlement of Jazzo Fornasiello near Gravina in Puglia (Bari), located in the inner Peucetia, in the Bradanic area, excavated by the University of Milan since 2009 under the supervision of the Soprintendenza Belle Arti e Paesaggio for the metropolitan city of Bari. The numerous pithoi fragments found in the site clearly indicate that these vessels play a key role in the economic growth and in the settlement systems in the rural economy environment. Chemical analyses performed at the University of Milan confirm their use for winemaking.

The archaeometrical studies, conducted in collaboration between the University of Milan and the University of Bari Aldo Moro, include optical microscope (POM) and scanning electron microscopy (SEM-EDS), petrography on thin section and mineralogical bulk analysis (XRPD) of sixty samples. This analysis has allowed to know the compositional, textural and microstructural features and to identify the raw materials and the technological choices employed in the different chronological phases and in the distinct types of pithoi attested.

A specific study has been carried out on a pithos, recovered in situ by the excavators, whose profile is entirely preserved. A section of the whole profile has been cut to fully understand the production process of the vase and the method of forming and firing.

The talk will show how for the first time this analysis clarifies the hard process of making pithoi, which had to involve a specialized know-how, from the collecting of raw material to the firing process, bringing a new light on the interpretation of the importance of huge storage jars in the Peucetian settlements.

811 BRIDGING THE WALL BETWEEN PREHISTORY AND THE PRESENT: COMMUNICATION AND INCLUSIVENESS IN THE REALMS OF SCIENCE, HERITAGE AND EDUCATION

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Silvestri, Letizia (Soprintendenza Capitolina ai Beni Culturali (Casal de’ Pazzi Museum); Università degli Studi di Roma; Durham University) - Cura, Sara (School of Communication and Media Studies)

Session format: Regular session

Prehistoric archaeological evidence is widespread throughout Europe and the Mediterranean region. Despite its prevalence, themes, sites, remains, and museums related to human prehistory are often perceived as distant not only chronologically but also conceptually by the general public.

Efforts by cultural heritage professionals, academia, the education sector, and science communicators aim to reconnect prehistory with society. Prehistory is at the crossroads of many scientific fields studying community transformations and adaptations throughout time and space, and can unveil many possibilities to bridge to the past with present dilemmas and challenges, such as climate change, loss of biodiversity, sustainability, cultural evolution and diversity over a long time, integration, migrations, as well as care and solidarity.

From the engagement in public archaeology events to the use of ever more refined communication and edutainment approaches in research centers, museums, and heritage sites; from the creation of dedicated educational programs on Prehistory for teachers and students to the development of prehistoric-themed science communication contents on mass and social media, the strategies to make Prehistory better known, attractive, and appreciated are countless.

Furthermore, by doing so, we not only uphold the value of our discipline and heritage but also contribute to scientific literacy, intellectual and cultural development, to face misinformation and pseudoscience, to a deeper understanding of the world and its challenges, and the involvement of citizens in decision-making processes concerning their heritage.

Throughout this communication process, it is crucial to prioritize inclusion and diversity, while having the capacity to reach all individuals, regardless of gender, age, physical and mental condition, social status, economic status, geographical location, or educational level.

This session seeks to explore the challenges and ways in which the world of human Prehistory successfully reconciles with the public through communication, with particular reference to projects focused on inclusiveness and engagement with diverse audiences.

This session is co-organised by Juan Gibaja, Berta Morell, Marta Portillo (Institució Milà i Fontanals (IMF-CSIC), Spain), Patrizia Gioia (Independent Researcher, Ex Soprintendenza Capitolina ai Beni Culturali (Casal de’ Pazzi Museum), Italy), Gerard Remolins (ReGiraRocs SLU, Recerca, Conservació i Difusió del Patrimoni Cultural i Natura dels Pirineus, Spain), Jordi Serangeli (University of Tübingen, Senckenberg Centre for Human Evolution and Palaeoecology, Germany), Andrea Serodio Dominguez (Grupo de Estudos de Arqueologia, Antiguidade e Território. Universidad de Vigo, Spain), Gian Luca Zanzi (Soprintendenza Capitolina ai Beni Culturali (Casal de’ Pazzi Museum), Italy).

ABSTRACTS

1 PALAEOOLITHIC ON DISPLAY: MUSEUMS FOCUSING ON PALAEOOLITHIC SITES IN THE IBERIAN PENINSULA AND THEIR OUTREACH STRATEGIES

Serodio, Andrea (Universidade de Vigo) - Méndez-Quintas, Eduardo (Universidade de Vigo)

The record of human presence during the Palaeolithic time in the Iberian Peninsula is known worldwide. Temporally it covers the whole range of development of this period, displaying even the earliest examples, on a continental scale, of the first human presence.

Following the importance and variety of known sites (cave or open-air sites or rock art stations), there is currently a relevant number of centres and/or museums focused on their dissemination. However, the thematic distribution of these centres, their scope and importance are asymmetrically distributed. Currently, most of the Iberian centres are focused on rock art sites, mostly in caves, and with a geographical distribution linked mainly to the Cantabrian coast. There are important exceptions, such as the Foz Côa-Siega Verde key-sites in the Duero basin, but their distribution is very uneven. Outside this age range and site of types, there are not many centres/museums existing today. Among them, the “Atapuerca System” stands out, which due to its size and scope is the best developed proposal for the dissemination of the most ancient stages.

The main objective of this communication is to analyse the dissemination strategies followed by these centres to raise awareness of the Palaeolithic among different types of publics.

2 ARCHAEOLOGICAL PARKS AND EDUCATION: THE EDUPARQ PROJECT

Lopez-Mondejar, Maria Leticia (University of Santiago de Compostela)

In recent decades, many studies and experiences have highlighted the enormous educational value of archaeological heritage, especially that of prehistoric times. Such heritage facilitates experiential learning and offers innovative opportunities to address transversal skills and content from the earliest stages of education. This presentation aims to present the EduPARq project currently being developed at the Faculty of Educational Sciences of the University of Santiago de Compostela (A Coruña, Spain). The project analyses, among others areas, the educational value of Prehistoric Archaeological Parks located in Galicia (Spain). These spaces represent contexts of great potential from the didactic point of view, as they include the presence of itineraries for visits, which foster connections with the environment and outdoor education, as well as education in landscape and for sustainability. The project aims to highlight the didactic interest of these parks, as well as to explore the extent to which the use of heritage education models that integrate content and context, linking archaeological heritage and landscape, can enhance the understanding and acquisition of new learning in elementary education students, such as citizenship skills or ecological awareness.

3 STRATEGIES OF DISSEMINATION IN MIDDLE PALEOLITHIC ARCHAEOLOGY: SITES, COMMUNITIES AND STRATEGIES IN RURAL CONTEXTS

García Basanta, Andrea (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid, Ciudad Universitaria de Cantoblanco, Madrid, Spain) - Morales, Juan Ignacio (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili, Tarragona, Spain; SERP, Departament d'Història i Arqueologia, Universitat de Barcelona, Spain) - Romagnoli, Francesca (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid, Ciudad Universitaria de Cantoblanco, Madrid, Spain)

It is often perceived that dissemination of archaeological studies holds less importance than the archaeological research itself. Furthermore, the exploration of methods for scientific dissemination is scarce. Despite the increasing prioritization of knowledge transfer, reflected in funding requirements that demands a plan for dissemination strategies, the real impact of dissemination is rarely the focus of research. Moreover, the analysis of the social impact of archaeological research is still difficult to be quantified and systematized. We are developing new strategies to (i) analyze social impact of Paleolithic archaeological research, and (ii) improve the direct relevance of archaeology, contributing to social, cultural, and economic positive impact in local communities. In Middle Paleolithic archaeology in Spain, new dissemination methods, beyond conferences and open days, have been hardly implemented. As a result, knowledge about the behavioral complexity of Neanderthal societies is mainly unknown to the public, making archaeological research mostly irrelevant in research policy.

In this paper, we present preliminary results and future lines in Neanderthal sites, located in the peripheral area of Barcelona (Spain), where we are developing novel strategies of knowledge transfer, based on Public Archaeology theory and methods, and the analysis of their impact. The sites selected have become a reference in Neanderthal studies, and present perfect contexts to develop and test new dissemination strategies for their location, the quality of the material record, and the multidisciplinary research developed. Most visitors to the sites are local residents, mainly belonging to two age groups: adults and schoolchildren. Our approach aims to (i) reinforce their links with the Paleolithic heritage through activities for the understanding and appreciation of the sites; (ii) bring Paleolithic archaeology to the classrooms with educational projects; and (iii) improve the value of Neanderthal archaeology creating analytical tools to test and enhance the social impact of research.

4 THE MEMORY OF THE HERD

Martín, Patricia (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili) - Alías, Andrea (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Berihuete, Marian (Universitat Autònoma de Barcelona) - Gabucio, Maria Joana (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili) - Gibaja, Juan F. (Institut Milà i Fontanals (IMF-CSIC)) - Marín, Patricia (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Messana, Chiara (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili) - Sopesens, Javier (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Vergès, Josep Maria (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili) - Vilardell, Roser (Museu Etnogràfic de Ripoll)

Mediterranean pastoralism has evolved, rooted in the territory, over millennia. Shepherds and shepherdesses have an extensive knowledge of traditional practices, currently they carry out their activity with few changes, with respect to how the first prehistoric farmers would have done it. For this reason, they provide important information for the interpretation of the analysis of livestock breeding in prehistoric times.

Our dissemination and citizen science project La memoria del rebaño (The memory of the herd) is structured around shepherding in the Iberian Peninsula and has three main objectives: 1) To gather information on the traditional practice of shepherding through the integration of shepherds and shepherdesses in the scientific process. 2) To highlight this traditional heritage among the youth. 3) To empower the forgotten sectors in scientific dissemination, specially those related to the rural world: the elderly and shepherds and shepherdesses.

To achieve these objectives, we have developed an ethnoarchaeological study with shepherds and shepherdesses, as well as educational workshops in primary and secondary schools and talks and workshops in rural senior centres.

The ethnoarchaeological study focuses on conducting open-ended interviews with shepherds and shepherdesses. While educational workshops are structured around a role-playing and collaborative card game in which children put themselves in the place of Neolithic shepherds and shepherdesses. The objective is for the children to reflect on the value of the shepherd's trade, the changes and continuities throughout history and the significance of archaeology as a source of information.

Finally, the workshops in senior centres have a more open structure and are based on an initial call asking them to bring objects or photographs from their past. From this, an environment of trust and exchange of knowledge and experiences is generated.

5 BREAKING BARRIERS: INCLUSIVE OUTREACH IN ARCHAEOLOGY FOR CHILDREN AND TEENAGERS UNDERGOING CANCER TREATMENT AND PEOPLE DEPRIVED OF LIBERTY

Quevedo-Semperena, Izaro (Institut Milà i Fontanals-CSIC; Aranzadi Zientzia Elkartea) - Remolins Zamora, Gerard (Regirarocs, SL) - Gibaja, Juan (Institut Milà i Fontanals-CSIC) - Mozota, Millan (Ministry of Agriculture, Fisheries and Food, Spain) - Morell, Berta (Institut Milà i Fontanals-CSIC) - Portillo, Marta (Institut Milà i Fontanals-CSIC) - Moreno, Jose (AFANOC)

This presentation aims to show innovative science outreach initiatives that deliberately target historically overlooked social groups. Specifically, we will share insights from two distinct outreach projects focusing on children undergoing cancer treatment and individuals incarcerated in penitentiary facilities. Our primary emphasis is on a pioneering archaeological science outreach endeavor, designed to amplify engagement within traditionally excluded communities from scientific dissemination.

We will delve into the outcomes of collaborative efforts with "Casa dels Xuklis" (AFANOC, Barcelona), a temporary residence supporting children, adolescents, and their families during cancer treatment, as well as three prisons in the Catalonia region. Our project introduces a range of interactive workshops uniquely tailored to meet the specific needs of these diverse audiences. Activities include simulated excavations and laboratories, educational games, and talks that have been carefully curated to measure interest in archaeology within these groups.

Preliminary findings indicate a distinctly positive influence on the comprehension and enthusiasm for archaeology among children, adolescents, and prisoners alike. Noteworthy observations encompass heightened motivation, enhanced quality of life, and improved emotional well-being. These outcomes have garnered praise from families, volunteers, and prison staff, recognizing their valuable contributions throughout the outreach initiatives. The importance of establishing a meaningful connection with the external world has proven pivotal in enriching the learning experience for all involved, underscoring the transformative impact on the interaction of participants with science with the aim of promoting reflection, self-awareness and critical thinking.

In summary, our archaeological science outreach project targeting traditionally overlooked communities has yielded inclusive and distinctive experiences. We remain steadfast in our commitment to champion accessible science for everyone, aspiring to inspire fellow professionals to undertake similar inclusive outreach projects in diverse communities, with a particular emphasis on reaching the most vulnerable population.

6 LANDCRAFT(ING) - PRACTICES OF INTERACTION AND SOCIALIZATION OF CULTURAL HERITAGE IN THE CÔA VALLEY REGION (PORTUGAL)

Comendador Rey, Beatriz Pilar (Group of studies in Archaeology, Antiquity, and Territory, University of Vigo) - Carvalho, Bárbara (Centre of studies in Archaeology, Arts and Heritage Sciences, University of Coimbra.) - Bacelar Alves, Lara (Centre of studies in Archaeology, Arts and Heritage Sciences, University of Coimbra.) - Sackett, Hannah (Independent researcher)

LandCRAFT- The socio-cultural contexts of Late Prehistoric art in the Côa valley is one of the most recent research projects being carried out in the Côa valley World Heritage site. 25 years after its classification by UNESCO and the battle to save the world's largest open-air Palaeolithic art site which, amongst strong political controversy, mobilised the country in favour of its preservation at the expense of building a dam, the Côa valley keeps challenging all those involved in cultural heritage studies to find innovative ways of establishing a dialogue between science and the public. This is particularly critical in low-density and rural territories, distant from political decision-making centres.

The practice of a community-oriented archaeology was at the foundations of the LandCRAFT project, following the concern to find the most favourable approaches to promote the involvement of local communities and visitors in Public Archaeology events related to the investigation of rock art.

A number of methodological proposals applied in practices of dissemination and socialization of cultural heritage were assessed and adapted to the specificities of the Côa valley region. Their implementation triggered a set of symbiotic processes that raised the awareness of the human and cultural values of this territory, to the processes of resistance and change but also to the imagining of future prospects. Above all, our work revealed a primordial and timeless reality: as in all genuine encounters, practices of socialization of cultural heritage are a continuous and mutually transformative process that requires, from the self and the other, dedication and everlasting care.

7 LET'S ROCK - A STONE AGE PODCAST PROJECT: COMMUNICATING PREHISTORY THROUGH PODCASTS

Cura, Sara (Escola Superior de Comunicação Social; ICArEHB, the Interdisciplinary Center for Archaeology and Evolution of Human Behaviour.)

Prehistory is a social and human science that seeks to understand the richness of human experiences – their uniqueness, similarities, achievements, and failures – over time and space. The discipline encompasses Physical and Natural Sciences, Social Sciences, and the Humanities in its techniques, methods, and interpretative narratives. We believe that its communication enriches people's lives. It was in this spirit that Let's Rock – a Stone Age podcast was created in 2022. At that time, there were no specific archaeology podcasts in Portugal, and the advantages of the podcast format made the project relevant and ensured its continuity. The chosen format was interviews with researchers whose careers were built from the beginning of the 21st century.

The podcast has 13 episodes, with an average duration of 1 hour, available on Spotify and Soundcloud, and has 3,000 full plays.

The topics are:

- Specific Prehistory research of each interviewee: Paleolithic Art, Geoarchaeology, Zooarchaeology, and Museology, among others.
- Development of scientific careers: successes, difficulties, and strategies.
- The relevance of science communication in Prehistory.

Promotion is done on social media: Facebook, LinkedIn, and Instagram. The podcast had a media presence with interviews with the podcast host and other news in the national press. It was the subject of a workshop in a Training School of the COST project Integrating Neandertal Legacy: From Past to Present (iNEAL).

The balance is quite positive; however, the podcast does not grow in audience, and the questions are:

- Lack of interest in the topic?
- Inaccessibility of the contents (too much science)?
- Are episodes too long?

Weak promotion strategy due to lack of time, skills, and resources?

This communication aims to present the podcast project and discuss its effectiveness and relevance within Prehistory science communication and best practices for divulgation and promotion.

8 PREHISTORY, PUBLIC PERCEPTION, AND PODCASTS

Siebrecht, Matilda (EXARC; Streichardt und Wedekind Archaeologie) - Boyle, Tristan (Archaeology Podcast Network)

The representation of prehistory in popular media is restricted by the limited data available to prehistoric archaeologists, in comparison to the relatively well-documented later time periods of history. While history shows, books, films, and podcasts are able to delve into a deep well of evidence and make resounding claims with definite conclusions within a relatively short timeframe, the more elusive realms of prehistory require a significantly more nuanced discussion, which can be restricted by the time allowances of the media form itself. For example, longer-form content such as popular non-fiction books allow the full extent of prehistoric discussions to be presented. However, such media can still be inaccessible for a modern audience, especially considering the focus in present society on engagement through digital media, and the emphasis on short-form content for a public with busy lives and a short attention span. Science communication channels such as social media have proved an extremely efficient and approachable platform for the dissemination of archaeological knowledge, but the short-form content of these platforms often do not allow prehistory researchers to portray the full breadth of their interpretations without resorting to simplified conclusions that are open to misunderstanding. One form of media that combines the best of both these worlds is that of podcasting, which allows researchers to engage in a discussion that can do justice to their topic, through a platform that is both

inclusive and accessible to all. Podcasts are freely available to everyone, can be accessed through multiple methods, and allow audiences to engage with the topic in a way that is convenient to them. In this presentation, we highlight the advantages and disadvantages of using podcasts to portray prehistory, using the case study of the Archaeology Podcast Network.

9 TRACING COMMUNICATION AND INCLUSIVENESS PATHWAYS IN CULTURAL HERITAGE: INSIGHTS FROM ITALIAN HUMAN PREHISTORY AND THE CASAL DE' PAZZI MUSEUM-SITE

Silvestri, Letizia (Sovrintendenza Capitolina ai Beni Culturali; Università di Roma - Tor Vergata; Durham University) - Zanzi, Gian Luca (Sovrintendenza Capitolina ai Beni Culturali) - Gioia, Patrizia (Independent Researcher (formerly Sovrintendenza Capitolina ai Beni Culturali))

Cultural heritage must be accessible and inclusive, and its communication should be scientifically accurate yet understandable and tailored to diverse audiences. The more distant the times, cultures and lifeways, the greater the difficulties in conveying and comprehending the value and meaning of a heritage site.

This is particularly true in the case of human prehistory, which, when communicated effectively, can offer numerous points for reflection on current issues due to its many thematic connections with the present.

The Casal de' Pazzi Museum, a Pleistocene deposit-museum on the outskirts of Rome and unique in its kind, aims to achieve these goals by experimenting with increasingly different and impactful inclusive and communicative strategies. The need for comparison, updating, dialogue, as well as the search for new ideas and stimuli has made it essential to carry out a comprehensive analysis of similar realities in the Italian panorama. This study started from the source of information most closely related to the concept of modern communication, i.e. the data reported on the websites of about 200 Italian prehistoric heritage sites and museums spanning between the Pleistocene and the Bronze Age.

This allowed for a critical analysis of information reported online, including aspects such as opening hours, initiatives with the territory and local/non local socio-cultural realities, the quality of the websites themselves, online and on-site accessibility, ticket costs, the attitude towards experimentation and new dissemination methods, etc. Heritage sites and museums with particularly informative websites were chosen as comparative case studies, also through interviews with curators/directors; the same was done with sites whose websites seemed particularly lacking in information, in order to compare the web/social appearance with the actual situation and understand the reasons for such discrepancies. The considerations generated from this critical analysis will be presented and discussed with other participants in the thematic session.

10 CONNECTING PREHISTORY TO CONTEMPORARY: SOME EXPERIENCES FROM FOUR TUSCAN MUSEUMS

Parisi, Marcella (Civico Museo Archeologico di Camaiore; Museo di Storia Naturale dell'Università di Pisa) - Bonato, Marzia (Civico Museo Archeologico di Camaiore) - Dini, Angela (Museo di Storia Naturale dell'Università di Pisa) - Bonaccorsi, Elena (Museo di Storia Naturale dell'Università di Pisa) - Chelini, Maddalena (Museo e Istituto fiorentino di Preistoria) - Cuda, Maria Teresa (Museo Civico per la Preistoria del Monte Cetona)

In the Italian context, Prehistory hardly enjoys a prominent position in the dissemination of archaeology to the general public. However, more than other periods, this is a particularly versatile tool for conveying content of various kinds, especially in the education context. The prehistory narrative offers, in fact, various views to deepen and develop many of the agenda 2030 themes.

To face these challenges, four Tuscan museums have developed innovative independent paths based on the same principles: the Civico Museo Archeologico di Camaiore, the Museo di Storia Naturale dell'Università di Pisa, the Museo e Istituto Fiorentino di Preistoria and the Museo Civico per la Preistoria del Monte Cetona.

Through their activities, each of these cultural institutions promotes a deeper knowledge of Prehistory, while trying to develop its themes within issues of contemporary relevance. Such efforts not only facilitate the dissemination of scientific knowledge but also encourage citizens' participation in education about sustainability, heritage and its conservation.

In this contribution, some examples of good practices with a strong social impact carried out by these four museums will be presented. Within these activities, the focus on the needs of different publics and the reference to issues that also affect our daily lives represent two key points. By focusing on both global themes and a more strictly territorial dimension, it is therefore possible to promote greater knowledge of prehistory and its importance.

There is no doubt that a participatory and in-depth narrative of this period of human history makes it possible to face the challenges of the present in a more conscious manner, orienting society towards a more sustainable future.

11 OLD SMYRNA EXCAVATION HOUSE AS A CONTEMPORARY ADDITION ON ARCHAEOLOGICAL SITE

Sönmez, Ahu (Dokuz Eylül University) - Tanaç Zeren, Mine (Dokuz Eylül University)

İzmir, which has hosted many civilizations throughout history with its fertile lands and natural harbor, has today many immovable cultural assets. One of the most important cultural asset is Old Smyrna, which gives its name to İzmir and is preserved within the modern urban fabric. The ancient city is included in the UNESCO WHL as a connection point in İzmir's 8500-year history within the scope of "The Historical Port City of İzmir". Today, Old Smyrna, which has a mission of raising qualified scientists and raising awareness of the local community in addition to the scientific studies that have been going on for nearly a century, needs comprehensive contemporary additions. Studies on cultural heritage carry missions such transferring them to future generations, and making them a part of their lives by establishing their connection with society. In this context, an excavation house complex has been designed for Old Smyrna, which includes work and laboratory spaces for scientific studies, accommodation and storage units, as well as experimental archaeology studies, a children's education area and a seminar hall.

Many modern cities host archaeological heritage sites. Although the contemporary additions have been implemented considering national or international policies, they often do not have a unity of ideas and design. This study aims to reveal the process of determining the criteria taken into consideration during the design phase of the new excavation house designed for Old Smyrna. To determine the criteria, cultural heritage sites that have been included in the UNESCO WHL and protected within the modern urban fabric, such as the ancient city of Old Smyrna, and host similar activities were examined. The examples within the archaeological sites were evaluated, and design criteria were established, considering their architectural characteristics and technical features as well as their social facilities and relations with the society.

12 SHAPING STRATIGRAPHY: DEMYSTIFYING ARCHAEOLOGICAL CONTEXTS THROUGH DISPLAY AT VÉSZTŐ-MÁGOR

Lingle, Ashley (University of York) - Seifert, Jerrod (University of Oslo) - Gyucha, Attila (The University of Georgia) - Riebe, Danielle (The University of Georgia) - Duffy, Paul (Christian-Albrecht University of Kiel) - Ridge, William (University of Illinois Chicago) - Parkinson, William (The Field Museum)

This paper presents the unique preservation and engagement strategy for the archaeological site of Vésztő-Mágor, Hungary, addressing the challenges of bridging the gap between human prehistory and the public. The prehistoric site, covering over 3500 years of human activity, utilises a display-in-context approach to engage people with the past. This involves a holistic blend of scientific research, traditional earth building, and robust public engagement efforts, guided by principles of inclusivity and community benefit.

Heritage practitioner agency drives the inclusive practice, emphasizing the site as a conduit for fostering community connections and redeveloping site significance to ensure sustainable engagement. Contextual displays ground the archaeological remains in their historical and cultural context, transcending the chronological and conceptual distances perceived by the general public. A dynamic program works to draw in a range of visitor types from regional, national, and international contexts. Through co-created display efforts, the community becomes an active participant in the preservation and presentation processes. This collaborative approach ensures that the archaeological site becomes a shared space, with the community deriving cultural and educational benefits, fostering a deeper understanding of historical narratives.

Scientific research, informed by real-time environmental monitoring data, provides a dynamic and adaptive conservation strategy. This evidence-based approach ensures the sustainable conservation of Vésztő-Mágor while incorporating contemporary scientific methodologies. The preservation strategy incorporates traditional earth building techniques, contributing to the authenticity and contextual display of the archaeological site. By recreating the architectural ambiance of the prehistoric era, this approach fosters a deeper connection between the public and the site, making it more accessible and relatable.

The success of the strategies developed for the site lie in their holistic and inclusive nature, where environmental monitoring, traditional earth building, and public engagement efforts intertwine. This blended approach not only ensures the physical preservation of Vésztő-Mágor but actively engages audiences.

13 THE REFLECTION OF PREHISTORY IN THE FINE ARTS, WITH PARTICULAR REGARD TO PUBLIC SCULPTURE IN HUNGARY

Ernyey, Katalin (Government Office of the Capital City Budapest, Heritage Department)

The purpose of the paper is to present as complete a database as possible, and to analyze one or two examples in detail, which reflect the motivation, purpose and effect of the fine art work. At the EAA Conference in 2022, Budapest with the title 'Archaeology on the street' I already raised the importance of the role of public statues (building decorations)

in the socialization of archeology and in bringing archeology and archaeological results to as many people as possible. Now, knowing the general background, I am focusing on the works related to prehistoric times, through one or two interesting examples I would like to show the motivation for such works, how authentic they are from a professional point of view, and what role they play in the local community. The paper is based on different sources: community-based on-line database of public works of art, own collection and on-site examination.

14 SCHÖNINGEN AND THE PATH TO THE UNESCO WORLD HERITAGE TITLE

Serangeli, Jordi (Universität Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment) - Haßmann, Henning (Niedersächsisches Landesamt für Denkmalpflege) - Conard, Nicholas (Universität Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment)

The exceptionally well-preserved archaeological site complex of Schöningen in Lower Saxony has preserved 300,000-year-old stone, wood and osseous finds, as well as indicators of climate and environment. Among the most important finds are the Schöningen spears, which count among the oldest long-distance weapons known. Schöningen offers a unique insight into the cultural evolution of humans and the ecology of an untouched natural environment.

A visit to the Schöningen Research Museum and the ongoing excavations provides visitors with all kinds of information. These include a focus on early human lifeways and the cultural evolution, as well as how the climate developed between the ice sheet and the warm periods. The museum activities around these Lower Paleolithic sites consciously pursue the goal of leading visitors to reflect about the Prehistory and the Present. Exhibits focus is on the issues of how we live, move and eat, as well as responsibility for the use of natural resources.

Schöningen offers numerous topics for bridging the wall between prehistory and the present and can contribute to the debate about current and complex issues such as climate change, the decline in biodiversity, the increase in waste and the use of weapons. The exhibits examine unifying aspects of our shared human history and contextualize observations about the past in the discourse of the challenges humanity faces today.

The uniqueness of this site has persuaded the state of Lower Saxony to nominate Schöningen for the status of a UNESCO World Heritage Site.

A comparison with other similar museums and projects in Germany should contribute to the ongoing discussion of the relevance of our Paleolithic past when examining the challenges we face in the present.

15 EXPERIENCING LOCALITY, IDENTITY, AND HERITAGE WHILE INVESTIGATING A PREHISTORIC SITE IN NORTHERN FINLAND

Modarress Julin, Mirette (University of Oulu, Finland)

Ancient heritage can be an emotional and quite personal notion. How it is understood depends on many variables including social and economic background, and even age of the viewer. Commonly, heritage process that people can take part in, define, use, and enjoy the heritage of their ancestors is an ideal to be strived for. Ways to engage with the past remains and in archaeology are numerous, among others: site-visits, lectures, and museum tours. For some it can be metal detecting for ancient objects. Though metal detecting can be considered as dubious, it has gained some popularity in Finland. One inclusive and interactive way to participate is by volunteering in archaeological fieldwork.

In this paper, I discuss people's attitudes towards archaeological heritage, research, and expectations for results through a case study of the excavations in the prehistoric site of Kiurunkangas, located in Sievi, Northern Finland. Under examination is how people perceive the archaeological sites of their locality, and how do they convey it. Results suggest a keen interest of locals in archaeological heritage and its examination. An educative approach, while keeping an open vision by engaging in dialogue with interested stakeholders has been tried and tested.

16 CHANGING OUR PERCEPTIONS. HOW CAN WE RETHINK OUR WAY OF DOING ARCHAEOLOGY?

Foresi, Federica (Museum Vestsjælland; University of Siena)

It is often difficult for archaeologists to think outside the box. We are rarely encouraged to do so and we are often hesitant to play with creativity because we perceive a risk of losing our credibility within academia. It generally seems easier, and safer, to follow paths already paved, instead of risking failure and potential ridicule.

However, it could be argued that creativity is a fundamental part of the archaeologist's role in the dissemination of information. "Creativity is not a talent, it is a way of operating," famous English actor John Cleese once said. As we move further into the twenty-first century, it should become our way of operating. We must try to find creative ways to communicate with the public, to stimulate curiosity or provoke reactions. In order to do this, we must start to look at things differently ourselves.

For instance, we could think about how people who understand concepts better when they are expressed visually could be shown information, perhaps in the form of a comic strip. Alternatively, we could consider how our perception of exhibition design would change if we had to experience the exhibition without the use of sight.

I will illustrate my argument through a project that I am currently working on - a comic book about the prehistoric bog body known as the Tollund man and I will discuss the use of the hands-on approach in prehistoric archaeology exhibition design context.

These examples will show the importance of the archaeologist's emotional awareness in taking decisions that change the course of a project's direction. The outcome of a given project will always be influenced by not only the emotional impact it is expected to have on the public, but also by the impact it has on the archaeologist who is designing it.

814 MATERIALISING MEANING. CENTERING THE ROLE OF SOCIAL INTERACTIONS IN ARCHAEOLOGICAL STUDIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Benzonelli, Agnese (University of Cambridge) - Klesner, Catherine (University of Cambridge) - Orfanou, Vana (Ludwig-Maximilians-Universität München) - Franjic, Ana (KU Leuven) - Brysbaert, Ann (Leiden University; Netherlands Institute at Athens)

Session format: Regular session

With this session we seek to stimulate discussions on the broader implications of materials research in archaeology, and share diverse methodological and theoretical approaches and perspectives exercised across the discipline. Even though investigation of the smallest fragment can produce new knowledge about the past, material studies become more impactful when they incorporate archaeological narratives. Here, we take upon the increasing integration of science and archaeology over the last decades to create a platform for discussing enquiry-driven archaeologically contextualised research in order to contribute to a more nuanced, rounded view of past people's lives. The study of materials is conducive to understanding details of social differentiation and transformation, labour organisation, and the mechanisms and implications of long-distance exchange of both materials and knowledge, all of which unravels important worldviews of past societies. Recent transformative research in the field has resulted precisely from multi-disciplinary and multi-material studies that investigate technological development, innovation, cross-craft and cross-cultural interactions.

We welcome contributions that explore, but are not limited to: 1) cross-craft interactions; 2) innovation; and 3) knowledge transmission in material culture investigations. We encourage the integration of methodological and theoretical frameworks that are applicable in multiple case studies and hence more prone to cross-cultural application and comparison.

We wish to highlight the role that materials played in the weaving of the social fabric and the importance of comprehensive material studies that stem from social inquiry in archaeology. We hope that this session will provide ideas for impactful enquiry-driven archaeomaterials research, through examples of collaborative efforts or innovative approaches, which will foster the development of a more comprehensive investigation of material culture.

ABSTRACTS

1 TOWARDS A SKILL-BASED ANALYSIS OF CRAFT ORGANISATION AND CROSS-CRAFT INTERACTION: A CASE STUDY FROM NARIÑO, COLOMBIA

Benzonelli, Agnese (University of Cambridge) - Klesner, Catherine (University of Cambridge) - Martinon-Torres, Marcos (University of Cambridge)

The material culture from Nariño, Colombia, (ca 400-1600 CE) is distinctive for its flat, strongly geometric designs with radial symmetry, negative decoration, and highly polished surfaces. These attributes are most recognisable in decorative pottery vessels, textiles, and enigmatic metal discs recovered from burial tombs in the altiplano region. Cross-material transfers are obvious in the shared decorative motifs featuring prominently in different media. However, we lack focused research on the extent to which techniques, textures, and know-how may have been shared too. These are important dimensions that may provide insight into the organisation of production.

By examining object decorations, morphology, composition and technology for both ceramic vessels and metal disks recovered from Nariño, Colombia, we aim to holistically reconstruct the chaînes opératoires of these intricate technologies and identify instances of shared skills, technology, and knowledge.

We investigated complete vessels (n=114), ceramic sherds (n=93) and metal fragments (n=51), we characterised object morphology (3D GMM), composition (pXRF, LA-ICP-MS, and Raman spectroscopy), and identified technological attributes (high resolution digital microscopy and SEM-EDS), reconstructing production pathways for the ceramic and gold objects independently. Through comparisons of the objects' chaînes opératoires, we highlight steps and traits that provide insights into the variable skill sets, individual makers, and communities of practice. By identify-

ing elements of the technological systems that are shared between media we explore the co-evolution and resilience of craft production in heterarchical systems.

2 CROSSING PATHS. PEOPLE-CRAFT INTERACTION IN GREEK AND ROMAN STONE WORKING. INSIGHTS FROM MARBLE AND DECORATIVE STONE VASES

Perna, Simona (Institut Català d'Arqueologia Clàssica (ICAC))

This presentation examines the dynamics of people-craft interaction in ancient Greek and Roman stone working, focusing on the production of stone vases during the 5th - 4th centuries BC and 1st century BC to 1st century AD. Through a closer analysis of these artifacts, it is possible to uncover a convergence of techniques, highlighting instances of innovation and knowledge transmission within the craft.

Despite the richness of these objects as potential sources of insight, classical stone vases have often been overlooked in discussions regarding ancient stone carving and cross-craft interaction. The paper's starting hypothesis proposes that these vases represent the epitome of material culture and human agency, providing a unique lens through which to examine the cognitive processes underlying transformative technology and conceptual ideologies in Classical antiquity.

By scrutinizing classical stone vases, this paper aims to shed light on various aspects of ancient society, including social differentiation, craft organization, and mechanisms of long-distance exchange of materials and knowledge. Through an interdisciplinary approach encompassing archaeological evidence, material analysis, and historical context, it seeks to elucidate the multifaceted nature of people-craft interaction in the ancient Mediterranean societies.

This research contributes to a broader understanding of the role of material culture in shaping ancient societies, emphasizing the significance of classical stone vases as tangible manifestations of cultural exchange and socio-economic dynamics. Reevaluating the importance of these artifacts is set to enrich current discussions on ancient craftsmanship, cross-craft interaction, and the socio-cultural factors driving technological innovation in antiquity. Moreover, by contextualizing these artifacts within their broader social and historical contexts, we gain a deeper understanding of the interconnectedness of craft production, consumption patterns, and identity formation in the ancient Mediterranean landscape.

3 RECONSTRUCTING CROSS-CRAFT INTERACTIONS BETWEEN LATE ROMAN GLASS CARVING WORKSITES

Meredith, Hallie (Washington State University)

Late Antique archaeometric data is key to the reconstruction of social interactions between industries (cross-craft) in glass. Archaeological and economic evidence has confirmed that a number of late Roman (fourth-seventh century CE) industries incorporating glass production each had separate work sites. Glass makers produced raw materials independently from glass blowers shaping objects and engravers carving/finishing glass. Representing three industries, they were all interdependent. At Kom el-Dikka, Alexandria, for instance, a finishing worksite for glassware was identified in the same complex as a shop, while a furnace for shaping glass was found across the road. There is also archaeological evidence of recycling as an independent retail trade, such as at Sardis, Turkey, potentially representing a fourth glass industry. A very significant archaeometric study (Brill and Whitehouse 1988) demonstrates that two-colour (dichroic) vessel glass was strategically reused in the production of flesh tones for architectural glass panels. What has not been adequately explored as of yet is how such practices have significant implications concerning cross-craft interactions between glass engravers likely representing complementary specialities. Focusing on the related engraving techniques of diatreta (also known today as "cage" cups or openwork vessels) and opus sectile glass carving as evidence, this paper demonstrates that glass production in the late Antique Eastern Mediterranean was an example of cross-craft involving aspects of specialised collaboration among interdependent glass producers. Importantly, inter-industry relations existed not only in terms of resources but fundamentally of skills. Cold-worked carving in various media suggests that relatively large-scale late Roman urban production was more likely defined by the transferrable skill set of carving itself as opposed to any particular material. This paper's contribution lies in incorporating vital archaeometric evidence that enables the reconstruction of social interactions between late Roman engravers with greater nuance and differentiation thereby deepening our understanding of specialisation in this period.

4 JEWELS CREATED FROM DIRT: AN INVESTIGATION INTO THE SOCIAL CONTEXT BEHIND GLASS MANUFACTURING IN LATE BRONZE AGE EGYPT

Mitchell, Sarah (Newcastle University; Archaeological Research Services Ltd.)

Glassmaking in Late Bronze Age Egypt has been a generally neglected area of study until recently. This study aims to understand the manufacturing process of Late Bronze Age glass ingots, particularly blue glass, through the experimental reproduction of Egyptian glass. Alongside the reproduction of Egyptian glass, experimental investigation into

the replication and use of different furnace types was also conducted. Modern electrical and wood-fired furnaces are utilised in varying locations to perform experimental glassmaking. The study also investigates the use of a separator in the manufacturing process, which would allow for the glass ingots to be easily separated from the crucibles. Various materials such as oil, pure lime, and crushed oyster shells are used as a parting layer in the glass crucibles; both the lime and oyster shell layers are successful in separating the ingots from the crucibles after firing. This study also aims to further understanding of cross-craft interaction between glassmaking and other pyrotechnologies such as metallurgy. Metallurgical crucibles are examined and comparisons are drawn between them and crucibles that were used for glass manufacturing. Desk-based research of glass workshops excavated at sites such as Amarna, Qantir and Lisht has also been conducted to understand the skills that may have been needed in order to produce glass on an industrial scale. The experiments in this study suggest new avenues for research focussing on the manufacture of coloured glass ingots and the interactions between glassmaking and other technologies in Late Bronze Age Egypt.

5 FROM THE 'NITTY-GRITTY' OF CERAMIC ANALYSIS TO A COMMUNITY OF PRACTICE PERSPECTIVE: A VIEW FROM THE BRONZE AGE AEGEAN

Hilditch, Jill (University of Amsterdam)

In a recent paper by Pollard and Liu discussing provenance studies, the importance of recognising and reconstructing “the sequence of human activities” (2023, 97) applied to raw materials was underlined. Indeed, for the past twenty years or more, this concept has formed the core of much archaeomaterials research using the *chaîne opératoire* concept. Pollard and Liu’s paper also emphasised that ‘repetitive and consistent human actions’ (2023, 103) during production are the key for successfully integrating social and material approaches to material culture. One way to investigate these repeated human actions with materials is the community of practice theoretical framework, which centres the social dynamics that drive the learning and (repeated) performance of such actions. This framework offers a valuable means for archaeologists to move from tangible archaeological remains to intangible social interactions, providing a way to integrate increasingly complex archaeomaterials datasets with broader archaeological narratives.

This paper will explore a ceramic perspective on social interactions, in particular how specific knowledge on material provenance and *chaînes opératoires* or production sequences can be given wider meaning through considering potting communities of practice. Using examples of Bronze Age ceramic artefacts from multiple projects within the Aegean, this paper will discuss integrating the ‘nitty-gritty’ of ceramic analysis within a broader methodological approach to considering interaction and exchange from the archaeological record.

6 MATERIAL IDENTITIES OF THE INDUS TERRACOTTA-MAKING COMMUNITIES

Lahiri, Sutapa (University of Calgary)

The present paper examines the Indus terracotta industry from the Mature phase of the Indus period (2600-1900 BCE), known for its diverse material culture. Despite the rich material culture of this era, there has been limited research on the manufacturing techniques, cross-craft technology, and knowledge transmission involved in producing Indus terracottas.

In this presentation, I will examine the terracotta assemblages from two Indus settlements in the Ghaggar basin in Northwestern India dating to the Mature Indus period (2600-1900 BCE). The study provides the first comparative study of terracotta technological styles using the *chaîne opératoire* approach to determine the technical choices made by the Indus terracotta-making community. The findings of this study suggest that there was a range of technological choices made across various terracotta artifacts, such as figurines, toys, personal adornments, and terracotta cakes. Furthermore, it also implies the possibility of different groups involved in the production of terracotta, as well as the presence of cross-craft techniques during the mature or urban phase of the Indus civilization. These findings provide valuable insights into the technological knowledge transmission processes and the diversity of terracotta production during the Mature Indus period.

7 POTS = POTTERS. COMMUNITIES OF PRACTICE VIA MINUTE VARIATION APPROACH

Harush, Ortal (The Hebrew University)

The concept embodied in “Pots equal People,” which explores the correlation between pottery and human societies, has sparked lively debates among researchers over an extended period, primarily associating this expression with the presumed relationship between ethnic groups and pottery. Despite facing robust criticism, the connection between pottery and ancient societies remains a pivotal theme in archaeological ceramic studies. A suggested transformation of the equation from “Pots equal People” to “Pots equal Potters” aims to offer a more nuanced understanding of the cultural and anthropological aspects of ancient societies, with a specific one on the role of potters within their communities. In this context, the current paper adopts this modified equation, with a specific focus on micro-morphology—a detailed methodology designed to thoroughly explore variations within a single ceramic type. The underlying premise is that a meticulous examination of sub-typological variations, employing a minute variation approach through

a three-phase analysis, will enable the identification of production units, assessment of production intensity, and establishment of connections with distinct communities of practice.

8 CERAMIC PRODUCTION AND COMMUNITY AT ARCHAIC AND CLASSICAL ELEON IN CENTRAL GREECE

Sadarananda, Janelle (Skidmore College; University of Pennsylvania) - Bertram, Haley (University of Cincinnati)

While archaeomaterials research can provide insight into specific details of individual objects, like the provenance of raw materials and the techniques of production, the power of this research lies in answering broader social questions about people’s lives and interactions in the past. In this paper, a votive assemblage from the site of Eleon in Boeotia, Greece, provides a case study for community involvement in production and dedication of pottery and figurines at a local sanctuary during the Archaic and Classical periods (600-450 BCE). Our holistic study employs ceramic petrography to investigate changes in production practices over time, in combination with archaeological evidence for changing dedicatory and ritual practices. We explore the relationship between producers of the religiously significant and regionally unique Boeotian Kylix Ware vessels (BKW) and the producers of terracotta figurines found dedicated at Eleon’s sanctuary. Based on petrographic and macroscopic analysis, we propose that in many cases the producers of BKW and those of figurines were one and the same. In weaving together the material stories of these locally-specific objects, we are able to delve into the idea that producers of ceramic dedications were members of the same community as the dedicators, and were likely dedicators themselves. Our study is grounded in theories of the *chaîne opératoire* and technological style, as well as ritual modes of production in small-scale societies. By considering the entanglement of producers and consumers in the ritual landscape at Eleon, we aim to provide a model for scientific analytical investigations of community production and use of religious objects.

9 A COMMUNITIES-OF-PRACTICE APPROACH TO TRACE THE SOCIAL CHANGE DURING THE EARLY CHALCOLITHIC IN EASTERN ROMANIA

Matau, Florica (ARHEOINVEST Center, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi, Romania)

This paper aims to examine the skills and expertise developed by the Early Chalcolithic potters located in eastern Romania from 5050-4600 cal BC. The objective is to assess their abilities to produce standardized and elaborate objects and identify the transmission mechanisms that led to social complexity. The study considers ceramics as the result of a wide range of conscious choices made by the potters regarding the materials they select and process in various ways. These choices are a result of a learning process acquired and passed on via social relationships. The various sequential choices made by the potters are determined by their enrolment in a community of practice that represents a group of participants acting in a similar learning environment and shared practice.

The study will use the *chaîne opératoire* methodology to investigate the learning and cultural transmission system developed within the Early Chalcolithic communities. To determine how communities of practice acted within the pottery production chain, the theory of artefact design will be applied to target the high and low-visibility attributes revealed by macroscopic observations and petrographic investigations.

10 PARTY OR THERAPY? POSSIBLE FUNCTIONS OF ANATOLIAN EBA RITUAL PITS ACCORDING TO GC-MS ANALYSIS OF ORGANIC RESIDUES OF SOME POTTERY

Türkteki, Murat (Bilecik Şeyh Edebali University) - Tarhan, İsmail (Konya Selçuk University) - Türkteki, Sinem (Bilecik Şeyh Edebali University)

In the last quarter of the 3rd millennium BC, inter-regional interaction intensifies in the Anatolian peninsula due to organised trade networks. An “elite” class dominating the trade and administrative management of settlements becomes apparent. Luxury goods and their imitations, mostly attributed to this class, become widespread among the societies of the period throughout the Mediterranean basin from east to west. The most important of these are the depas, which is a very characteristic form and is usually described as a double-handled drinking vessel, and the so-called “Syrian bottle”. Parallel to this, some rituals also become widespread in this period. Ritual pits containing complete vessels, figurines and precious artefacts are represented by a large number of examples in many sites where the period is recorded. In addition to contextual assessments to understand their function, analysis of the organic remains inside the pots provide evidence for possible predictions. This study, which includes the first analysis of organic remains on depas and bottles to date, allows us to make some suggestions about the intended use of these forms and why the pit ritual was performed.

11 EXPLORING ALTERNATIVE STRATEGIES FOR EUROPEAN BRONZE AGE METALWORK CHEMICAL ANALYSIS AND INTERPRETATION: TRENDS IN COPPER AND ARTEFACT SPACE

Matthews, Steven (Groningen Institute of Archaeology, University of Groningen; Deutsches Archäologisches Institut (DAI)) - Bray, Peter (Department of Archaeology, University of Reading)

The 'Chemical-Space' approach to copper-alloy artefact analysis aims to provide an open, multi-variate system for visualising trends and patterns in chemical data. As well as production and source, emphasis is also placed on metal circulation, down-the-line transmission, and recycling. Due to its open nature, it can be widely applied to chemical analyses assemblages from any period or place. Within the European Bronze Age the authors and their collaborators have traced patterns within chemical classes across chronological time-space frameworks. This has provided a renewed focus upon a wider range of technological processes and intra-regional variation, and offers an alternative to models which posit centralised control of production, and prestige goods exchange.

Hindering progress, however, is a lack of similar development in the classification of the artefact-base upon which metallurgical studies draw. Classification continues to be viewed as a niche methodological activity, rather than a vital field of theoretically-informed research, producing important analytical data. As a result, the traditional output of these activities, 'types', are taken as immutable, unchanging categorisations, encouraging an essentialist belief that they comprise real historical phenomenon. Consequently, compositional groups are simply compared with the typologies for various metalwork kinds, with no selection for relevance of traits or trends within them. At worse, comparisons are reduced to the simplest level of artefact categorisation ('dagger', 'sword', etc.) reducing the visibility of regional variation.

If the potential of the Chemical-Space approach is to be fully exploited, we require a shift from taxonomic to analytical classification, focusing on question-based classes which embrace the study of variation rather than homogeneity. Here we explore alternative narratives for transmission and change in Atlantic metalworking during the Later Bronze Age, based on a new analysis of the history of grip-tang sword evolution in Western Europe, combining new approaches in analytical archaeology.

12 METAL PRODUCTION IN THE 2ND MILLENNIUM BC EURASIAN STEPPE: CASE STUDIES FROM THE CENTRAL AND EASTERN KAZAKHSTAN

Calgaro, Ilaria (Institute of Archaeology UCL) - Radivojević, Miljana (Institute of Archaeology UCL) - Altaweel, Mark (Institute of Archaeology UCL) - Doumani-Dupuy, Paula (School of Sciences and Humanities, Nazarbayev University, Nur-Sultan, Kazakhstan) - Yermolayeva, Antonina (A.Kh. Institute of Archaeology, Almaty 050010, Kazakhstan)

The 2nd millennium BC Eurasian Steppe witnesses a surge in metal circulation, still paired by few data on recipes and technology behind metal production. Hence, local-scale analysis of metal debris emerges as a powerful tool for interpreting the role of metalmaking among Bronze Age communities of the Steppe. We present new data on metal production technology from three 2nd millennium BC sites of Kazakhstan, which span the regional Middle to Final Bronze Age: Taldysai and Myrzhyk (Central Kazakhstan), two workshops, and Koken (East Kazakhstan), workshop and burial site. The analysed collection includes ores, archaeological and experimental smelting debris, crucibles and metal artefacts.

We identified two metal production lines transmitted over 400 years at Taldysai (MBA-LBA): copper and arsenical copper. Copper metal was obtained by co-smelting local copper oxides and sulfides in a single step. Experimental smelting in a replica of the archaeological pit furnaces by using local copper oxides with low sulfur supports this interpretation. Arsenical copper production is exhibited through co-smelting of copper and arsenic-rich ores in two steps: (i) desulfurisation, (ii) iron removal. Myrzhyk (LBA-FBA) provided evidence for local production of arsenical copper. Copper oxides with moderate arsenic content were documented alongside slags, although their origin is still contentious. Most interestingly, Myrzhyk yielded pit furnaces comparable to those in Taldysai. Materials from Koken (LBA) showed in-situ production of copper metal again from copper oxides. Here, local copper production is paired by numerous tin bronze grave goods, which suggest contacts with the Altai mountains.

Local-scale analyses of metal production debris allow to distinguish centres that shared and transmitted technological models and traditions (Taldysai and Myrzhyk) and connector sites at the crossroad between the steppes and their margins (Koken). By and large, this will contribute to a better understanding of Bronze Age technological and economic developments across the Eurasian Steppe.

13 POTTERY PRODUCTION AS INDICATOR FOR KNOWLEDGE TRANSMISSION AND SOCIAL INTERACTIONS DURING THE SO-CALLED GREEK 'COLONIZATION' IN ITALY (8TH-6TH CENTURIES BC)

Charalambidou, Polyxeni (Xenia) (Vrije Universiteit Amsterdam)

The "Pots and Pans" research (coordinated by the undersigned; full title "Pottery production and consumption as indicators for the contributions of Greek migrants and local inhabitants to the so-called Greek 'colonization' in Italy") explores artisanal mobility, interplay and knowledge transmission in pottery production and consumption at the time of the Greek migration and diaspora phenomena to southern Italy and Sicily (8th-6th centuries BC). The focus of the investigation is on ceramics that were used during the early stages of the Greek colonization movement; pottery played a crucial role in the early subsistence economy, in the newly created funerary and cultic domain, in the economic and cultural exchanges with the indigenous populations of Italy.

This paper first introduces the "Pots and Pans" methodological framework, with the aim to contribute to the discussion for an increased and more comprehensive investigation of material culture. The presentation highpoints some of the project's results, to confer the value of archaeomaterials research in achieving and understanding of the formation of new realities when communities come into contact. By combining a range of science-based methods (macroscopic, petrographic, chemical and SEM analyses), we gain insights into the wide-ranging routes of knowledge transfer as well as the multiple production/technology practices which can also enable us to achieve a deeper understanding of social and economic relations between mother-cities, colonies and native communities. Both the incomers' and the indigenous traditions of manufacture are highlighted, as these aid the understanding of cultural practices in both the migrant and local populations, cross-cultural borrowings and interactions, changes that may have occurred with the arrival of the Greek migrants within the domains of material culture.

14 METALS IN A CHANGING WORLD: MATERIAL INSIGHTS INTO SOCIAL TRANSFORMATIONS AT THE END OF THE BRONZE AGE IN GREECE

Orfanou, Vana (Ludwig-Maximilians-Universität) - Aktipi, Konstantina (Ephorate of Antiquities of Achaia) - Batziou, Anthi (Ephorate of Antiquities of Magnesia) - Borgna, Elisabetta (University of Udine) - Jones, Olivia (West Virginia University) - Kleitsas, Christos (Ephorate of Antiquities of Ioannina) - Konstanti, Katerina (National Archaeological Museum in Athens) - Lemos, Irene (University of Oxford) - Degryse, Patrick (KU Leuven) - Stockhammer, Philipp (LMU Munich; MPI for Evolutionary Anthropology Leipzig)

When the established Mycenaean palatial systems collapsed around the 12th century BC socio-political crises in the eastern Mediterranean, they brought with them irreversible transformations that defined the end of the European Bronze Age. Fundamental questions about the social impact of these transformations remain with implications for fully understanding diachronic human responses to significant environmental and cultural stressors. This study examines metallurgical materials (objects, by-products, and technical ceramics) from the Greek peninsula dating to before and immediately after the crisis years to evaluate how social collapse interfered with cultural processes as expressed in metallurgy. Elemental, isotopic, and microscopic analyses provide new data on the nature and provenance indication of raw materials, as well as the processing of metal resources following primary smelting such as during metalworking, reuse / recycling, circulation, and deposition. Materials from key sites covering much of mainland Greece provide new insights into technological choices of communities with links to the north, east and west of the peninsula. Results directly inform ongoing academic debates about the nature of the Mycenaean collapse and will open new pathways for future research on materials and humans, and for the study of societies in crisis.

15 FINDING MEANING ALONG THE WAY: WHAT NETWORK PERSPECTIVES ON RAW MATERIALS HAVE TO OFFER

Kerig, Tim (ROOTS CAU Kiel) - Hilpert, Johanna (University of Cologne) - Serbe, Benjamin (CAU ROOTS Kiel)

Within a network science approach, we investigate large-scale exchange systems in Eurasia and Africa (8000–1 BC). We concentrate on raw materials. Raw material connects the source to demand in a distant location, regardless of whether this demand is for the supply of abundant goods, such as small tools, or for a few highly valued diplomatic gifts.

We will show, how network related assumptions and imputations are necessary for an understanding of the meaning of materials and how the network perspective can change the meaning of those objects.

With Network Alignment, we aim to identify overlapping subnetworks of different raw materials ("communities") and evaluate the global alignment of multiple exchange networks to explore interactions between different actors. Consequential, material-specific bridges and gaps between different regions can become apparent, highlighting the social interaction between different actors. As network alignment is so far used in context of biological interaction networks, this paper investigates the potential for archaeological applications.

Exploring the combination of hundred-thousands, even millions of different finds of sourced raw material helps to a deeper understanding of prehistoric exchange systems.

The Big Exchange project is funded by the federal state of Schleswig-Holstein. The project receives funding by the German Research Foundation (DFG) under Germany's Excellence Strategy – EXC 2150 – 390870439.

16 POTTERY STYLE AS AN INDICATOR OF INNOVATIVENESS IN CENTRAL EUROPE IN THE 5TH-4TH MILLENNIUM CAL BC

Szilágyi, Márton (Eötvös Loránd University, MTA-ELTE “Lendület” Momentum Innovation Research Group) - Solnay, Eszter (Eötvös Loránd University, MTA-ELTE “Lendület” Momentum Innovation Research Group; Paris 1 Panthéon-Sorbonne University, Doctoral School of Archaeology; UMR 8215 Trajectoires) - Siklósi, Zsuzsanna (Eötvös Loránd University, MTA-ELTE “Lendület” Momentum Innovation Research Group)

The fact that clay is a material that is easy to shape and is accessible to almost all prehistoric communities makes pottery not only the most abundant find type but also the most variable one in the archaeological record. Stylistic variations of pottery are commonly seen as a projection of identities such as social groups or individual self-expression. The geographical boundaries of styles are commonly understood as social boundaries. However, stylistic variations and boundaries can also be evidence of innovativeness and/or access to novelties. Innovation and pottery often come up together in the context of pottery-making technologies, but the changes in pottery styles are rarely understood as an indicator of accepting, refusing, or simply accessing new stylistic ideas. As pottery and the know-how of pottery making is accessible to almost every prehistoric community, it can also be an arena for creativity. However, one can only be creative and open-minded as much as their community and its rules allow it.

We can see in the archaeological record in Central Europe, more precisely in the Danube Basin from Bavaria to the Carpathian Basin, that the pottery styles in 4500-3600 cal BC are very variable on the one hand, and similar to each other on the other hand. Some characteristics are present in almost all areas while others are exclusive to a certain geographical zone. Many stylistic elements, such as certain pot forms, are inherited from earlier times and others, such as decoration technics and motifs, are creative innovations that spread (sometimes alongside technological knowledge) from one place to another. Our contribution will give a brief insight into our methods of how we try to reconstruct past communities' attitudes towards stylistic innovations using a large GIS-based comparative stylistic database combined with multivariate statistics.

17 TRACKING BRONZE PRODUCTION IN THE CARPATHIAN BASIN THROUGH THE MIDDLE/LATE BRONZE AGE TRANSITION THROUGH TECHNICAL CERAMICS: CURRENT RESULTS

Brown, Lauren (University College Dublin, School of Archaeology) - Amicone, Silvia (Archaeometry Research Group, Eberhard Karls University of Tübingen; Institute of Archaeology, University College London)

The circulation of craft knowledge and its function as a social actor have long been major themes of archeological study. However, it is only recently that the effect of “significant” social change on the transmission of knowledge has been explored beyond ideas of loss and decreased complexity. These more nuanced discussions incorporate themes of choice, resilience, and transformation within cultural practices.

This work aims to understand the effect of significant social change on the transmission of knowledge through the lens of bronze craft. Changes in the technology and organization of production are tracked through the comparison of technical ceramic, technical properties, spatial layout, and social setting of bronze production pre- and post- 16th c BC in the Carpathian Basin.

To examine this topic, a catalogue of all settlements in the study region with evidence of bronze craft is compiled. These sites are identified through the presence of , technical ceramics used for metal production (i.e. crucibles, moulds, cores, and pyrotechnical installations) is compiled. . Material analysis is to be carried out on ceramic samples come from the case study sites of Pecica (Romania), Feudvar (Serbia), Rabe (Serbia), and Şagu (Romania). Samples of domestic and architectural ceramics are included in the analysis investigate cross-craft interaction.

All ceramic samples are to be analysed using ceramic petrography, X-ray fluorescence, X-ray diffraction, and scanning electron microscopy. These methods are used to identify the paste recipes and production processes of each ceramic type. The data gained will be used to address themes of knowledge transfer, accumulation, loss, invention, innovation, and cultural and technical choice between. This information will then be discussed in sensory and cognitive contexts with the implementation of modern studies of teaching and learning.

18 EVERYTHING OLD IS NEW AGAIN: EARLY MEDIEVAL GLASS RECYCLING: TECHNOLOGY, MUTABILITY, AND RESOURCEFULNESS

Lucas, Vic (Institute of Archaeology, University College London)

In the last decade, recycling has become a ubiquitous presence in papers published on the chemical analyses of glass of the first millennium CE. It is becoming increasingly clear that recycling to greater or lesser degrees played a key role in the production of glass objects, and was a firmly embedded part of glassworkers' practice.

However, there has been a tendency to approach recycling as a monolithic practice, with many papers simply noting evidence for recycling without any great consideration of the complexity or nuance of the specific human actions and decisions that led to the chemical signatures we lump together as “recycling”, nor the specific social and economic contexts in which such recycling practices were taking place.

The early medieval period offers an excellent opportunity to attempt to untangle some of this complexity, as analyses have indicated a glassworking system that was heavily reliant on recycled material.

This paper will present analyses of early medieval (7th - 10th century CE) window and vessel glass from five key sites in Britain. It attempts to identify a variety of recycling practices across different types and colours of glass, and to contextualise these practices as part of the wider landscape of trade and exchange, and the roles of secular and ecclesiastical power in the 7th - 10th centuries. As well as considering wider implications for how we discuss recycling across materials more generally.

818 CURRENT STATUS AND THE FUTURE OF DIGITAL ARCHAEOLOGY IN THE EASTERN MEDITERRANEAN

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Moullou, Dorina (Hellenic Ministry of Culture; Hellenic Open University) - Farinetti, Emeri (Roma Tre University; Italian Archaeological School at Athens) - Moutsiou, Theodora (University of Cyprus) - Ozguner Gulhan, Nimet Pinar (University of Zielona Gora, Institute of Architecture and Urbanism) - Babucic, Nikola (University of Hamburg)

Session format: Regular session

The Greek Chapter of the Computer Applications & Quantitative Methods in Archaeology (CAA-GR), which involves a wider research community from the Eastern Mediterranean area, invites scholars, researchers, academics, and professionals to explore the current and future state of digital archaeology in the Eastern Mediterranean.

Speakers and participants will have the opportunity to exchange knowledge and experiences on digital archaeology in the Eastern Mediterranean and will envision future directions. A strong focal point in the discussion will be on how the digital practice can cross boundaries and facilitate international collaboration. The intention is to establish a cross-border collegial environment where scholars share their experiences, highlight problems and offer potential solutions, knowledge transfer and know-how.

Participants from Greece, Cyprus, Turkey, and neighboring regions will share experiences and discuss digital scholarship levels in educational institutes, challenges in adopting curricula, managerial issues, and resource allocation strategies.

Colleagues from foreign archaeological missions will highlight their experiences managing digital projects in the Eastern Mediterranean, addressing integration challenges and unforeseen issues.

Presentations by scholars from the state sector will delve into the impact of digital transformation on archaeological projects, focusing on national policies, project evaluation, and the adoption/rejection of digital tools by archaeological services.

Ethical and legal concerns, surrounding digital archaeology in the Eastern Mediterranean including data creation and ownership, cultural heritage preservation, and responsible data-sharing practices, will be addressed.

The discussion extends to how digital archaeology projects engage the public, and promote cultural heritage preservation, by means of virtual exhibits, interactive educational resources, and community involvement in digital initiatives.

Please submit your proposals for presentations, papers, or case studies that align with the themes outlined above. Your insights and experiences will contribute to a robust discussion and the advancement of digital archaeology in this culturally rich and historically significant region.

1 ERIMI-PITHARKA ARCHAEOLOGICAL PROJECT: APPLICATION OF DIGITAL TECHNOLOGIES

Zeman-Wisniewska, Katarzyna (Uniwersytet Kardynała Stefana Wyszyńskiego w Warszawie) - Recht, Laerke (University of Graz) - Wiśniewski, Mariusz (Ministry of Culture and National Heritage, Poland)

Erimi-Pitharka is an archaeological site, located in the Kouris Valley of south-central Cyprus and dated to Late Cypriot IIC-III A (ca. 1300-1150 BCE). The current research project started in 2022 and is focused on exploring the character of Pitharka in terms of economy, subsistence and societal development, and to investigate its role in the settlement and mortuary landscape of the Kouris Valley, both spatially and chronologically. From the beginning of the project, both in the field and afterwards, a range of digital technologies are employed, and this paper will present their application. The project started with non-invasive prospection, using LiDAR data and Ground Penetrating Radar (GPR); the preliminary results of this were already taken into consideration during the first field season. It was followed by employing drone photos to create a Digital Terrain Model (DTM) of the site. The project employs immediate digital recording in the field and in the post-excavation process. Using a form-built and custom-made database in the Epicollect5 system, all data concerning archaeological contexts are captured directly during excavation with tablets and smartphones; similarly, special finds and ceramics are entered with their context in the field, and additional information added after washing, processing and drawings and photographic documentation. Photogrammetry (SfM) is employed as a primary high resolution method of single context recording, used daily and applied immediately in the field, during every stage of the excavation process. These modern technologies are a vital part of the Erimi-Pitharka project, not only facilitating workflow and making data more available, but also helping to create a deeper understanding of the archaeological site.

2 APPLICATIONS OF DIGITAL ARCHAEOLOGY IN DOCUMENTING AND UNDERSTANDING OF GERÇİN HÖYÜK, GAZIANTEP

Özgüner Gülhan, Nimet Pinar (University of Zielona Góra) - Demir, Timur (Gaziantep University)

Gerçin Höyük, located within the borders of Gaziantep province, has been the focus of earlier short-time visits and investigations. The recent systematical archaeological work has begun at the site in 2022. This new phase of studies focuses on digital archaeological applications that took place at various scales at the site to put the site in its context. Thus, part of the current research focuses on past and recent formation processes that took place at the site with the aid of traditional and modern remote sensing and GIS studies.

Especially within the early 20th century, the landscape surrounding the site has changed tremendously. Former wetlands at and around the site were dried as part of governmental programs. This drastically altered the surrounding landscape, as they turned into agricultural fields, gradually modifying the borders of the mound, and erasing other nearby mounds. This also led some parts of the site to be buried with earth dug out from the drainage canals. Strong wind erosion and looting activities also have an impact on the site. Unfortunately, the site also got affected by the 7.7 magnitude earthquake disaster that took place on February 6, 2023, as it is located only 32 km West of Sofalaca, the epicenter of the earthquake. Thus, we employ digital image processing of high and moderate-resolution satellite data to investigate changes in the landscape as well as to measure the impact of the earthquake at the site. As part of this research, we discuss the advantages of modern digital techniques and how they can be supported by traditional methods in documenting site formation processes.

3 ADVANCING EXCAVATION MAPPING: INTEGRATING TERRESTRIAL PHOTOGRAMMETRY, LIDAR, AND UAV DATA FOR THE ROMAN BATH COMPLEX IN RAFINA, ATTICA, GREECE

Ragia, Lemonia (Hellenic Open University, Patras, Greece) - Moulou, Dorina (Ephorate of Antiquities of East Attica, Athens, Greece; Hellenic Open University)

The utilization of Unmanned Aerial Vehicles (UAVs) has surged in recent years, demonstrating versatile capabilities across various domains including mapping, object detection, urban planning, archaeology, and geology. However, due to the quick data acquisition and development of algorithms for fast and real-time data processing, UAV-generated data often culminates in producing two-dimensional models. Concurrently, Lidar (Light Detection and Ranging) technology, with its established reputation for generating precise three-dimensional models, continues to be extensively employed for data acquisition. Additionally, terrestrial photogrammetry has emerged as a valuable tool, providing detailed imaging of objects within excavation sites that are not visible from aerial perspectives.

This study proposes an inclusive approach that merges UAV, terrestrial Laser scanning, and photogrammetry technologies. Focused on the excavation site of the Roman Bath Complex in Rafina, Attica, Greece, this methodology aims to create a comprehensive three-dimensional point cloud capturing both surface and subsurface features. Terrestrial photogrammetry enhances this approach by providing detailed imaging of objects within the excavation

that are not visible from aerial perspectives, while UAVs offer top-down data acquisition capabilities. Laser scanning further enriches the approach by providing highly accurate and precise measurements of surface features and structures. Integration of these datasets, alongside precise georeferencing through ground control points measured with total station and GNSS systems, facilitates the creation of reliable, high-fidelity three-dimensional photogrammetric models.

Furthermore, leveraging these integrated technologies allows for the identification of critical features within the excavation, including areas obscured by shadows or affected by other light phenomena. This comprehensive approach enables enhanced archaeological interpretation by providing intricate details in both horizontal and vertical dimensions, thus aiding in the identification and interpretation of spatial objects crucial to understanding the site's cultural and architectural context.

4 A VIRTUAL JOURNEY TO ANCIENT EPHEBUS USING XR AND AI

Denker, Ahmet (Professor) - Demirtas, Deniz (Researcher) - Ulas, Ecem (Researcher) - Gungordu, Selen (Researcher)

The core motivation for this work arises from the significant challenges brought about by the pandemic and subsequent lockdowns. These circumstances have underscored the imperative of virtual access to cultural heritage sites. The integration of Artificial Intelligence (AI) and Extended Reality (XR) with 3D digital reconstruction provided a unique opportunity to rebuild and experience Ephesus that is the home to many noteworthy landmark structures, including the Temple of Artemis – one of the Seven Wonders of the World.

In the fateful and convincing reconstruction of ancient Ephesus, extensive research encompassing a comprehensive data analysis and detailed examination and comparison of historical datasets played a pivotal role. Subsequently, the technologies to assist in reaching the objective were explored. Our research trajectories on Cultural Heritage (CH), Extended Reality (XR) and Artificial Intelligence (AI) have been fused. While XR has opened avenues for transporting visitors through time and creating the sense of being there, AI provided innovative tools that enhance visitor engagement with the ancient city, and allowing them to experience the site as it existed in its heydays. User experience was extended even by facilitating interaction with the city's historical inhabitants. Avatars were inserted into scenes, serving with the help of AI as guides to accompany visitors and providing them with an interactive experience, thereby enriching the overall visitor engagement.

The outcome of this project is a grabbing reconstruction, a captivating animation and an educational, immersive virtual journey to Ephesus, providing a sense of presence and immersion previously unattainable. This time journey to the past was made possible by harnessing the power of 3D reconstruction, AI, and XR technologies.

5 GAMETABLE NETWORK: UNVEILING THE PAST, EMBRACING THE FUTURE THROUGH AI-DRIVEN ARCHAEOLOGICAL RESEARCH

Moullou, Dorina (Hellenic Ministry of Culture; Hellenic Open University) - Crist, Walter (Leiden University) - Penn, Timothy (University of Reading) - Piette, Éric (Université Catholique de Louvain – UCLouvain)

Games, as a subject of study, span diverse disciplines, often in isolation. In computer science and mathematics, games stand as testbeds for pioneering methodologies, shaping state-of-the-art techniques in economics, engineering, and AI. Simultaneously, archaeologists, historians, and anthropologists explore the motivations underlying human play, dissecting its social implications on both individual and societal levels. Games have not only been instrumental in pedagogical development but are gaining recognition as integral components of humanity's intangible cultural heritage. However, this recognition is tinged with a poignant realization: much of the world's game heritage has been lost, overshadowed by colonialism, imperialism, and commercialization.

Against this backdrop, the paper introduces the GameTable Network, an EU-funded COST Action overcoming disciplinary divides. The network's research integrates AI techniques, archaeology, and gaming research, into a cohesive framework. In doing so, the network aspires to rekindle the essence of games not only as mere entertainment but also as repositories of cultural richness and historical narratives. The aim is not only to uncover the mysteries of the past but to acknowledge and rectify the gaps hindering a holistic understanding of games.

Our objectives span from reconstructing historical games to advancing AI methodologies, from fostering educational programs to embracing community involvement in digital initiatives. Key challenges include innovative approaches for studying, reconstructing, and preserving heritage games, reconstructing missing rules in incomplete games, simulating play at a human level, applying AI to study historical games, developing novel methods to identify unrecognized games measuring their evolution across space and time, developing pedagogical tools, and leveraging GameAI in a culturally diverse way, all crucially contributing to the study of heritage games.

Through this interdisciplinary lens, our aspiration is to enrich scholarly dialogue within the Eastern Mediterranean, Europe and beyond, advancing our collective understanding of the historical and cultural dimensions embedded in games through AI-driven research.

HANDS-ON CLASSROOM AND FIELD APPROACHES TO DIGITAL ARCHAEOLOGY: FROM A SPECIAL TOPICS COURSE TO TECHNOLOGY-FOCUSED FIELDWORK

Bishop, Savannah (Koç University)

At this point in time, Digital Archaeology is a mature and constantly evolving part of the field of Archaeology. From GIS to digital repositories, 3D scanning to virtual reality, and numerous other digital tools and technologies, Digital Archaeology is an interdisciplinary approach to studying and understanding the past. Given this prominence, the question arises, how are students learning to use these technologies? Further, how can we envision the future of digital archaeology together with the students who will be its architects? This paper examines these questions within the context of the Eastern Mediterranean through two hands-on applications: the "Digitizing the Past" course (ARHA 350) I teach at Koç University in Istanbul, Türkiye, and the Southern Phokis Regional Project (SPRP) fieldwork I coordinate with students in Antikyra, Greece.

ARHA 350 focuses on hands-on learning through different laboratory facilities: Archaeology (ARHA & KUDAR), Mixed Reality (KARMA), and Manufacturing and Automation (MARC). In this first iteration of the course, I aim to provide a history of digital scholarship while fostering critical thinking through its application. These applications include 3D scanning, photogrammetry, AR & VR, and 3D printing. Similarly, SPRP combines traditional and cutting-edge technologies through a partnership between the Yale University Peabody Museum and the Boeian Ephorate of Antiquities. The project defines its presence in Greece as international, inclusive, and interdisciplinary. This is the first year a small group of undergraduate students will join the project. They will engage with numerous digital tools, among them 3D scanning, photogrammetry, drone survey, GIS mapping, and AI.

Both contexts illustrate students' reflexive engagement with digital archaeology, informing future digital pedagogy based on their experiences, and providing novel insight into entry-level learning of digital tools and techniques. This discussion is intended to address the outcomes, challenges, and impact of current digital learning within the Eastern Mediterranean.

819 NETWORK OF EUROPEAN IDENTITIES ? THE IRON AGE BETWEEN ALPS, PANNONIA AND BALKANS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Dept. of Archaeology; Center for Prehistoric Research) - Grömer, Karina (Natural History Museum Vienna)

Session format: Regular session

The area between Alps, Balkans and Pannonia seems to be a key area for the understanding of the communication network that emerged in the Iron Age connecting Central Europe and the Mediterranean. Intensity of constant cultural mediation between the Central Europe and Mediterranean concentrated in this area, where three cultural areas interact, making it crucial for the understanding much wider processes of creation and change of identities on European scale.

Applying interdisciplinary research to material culture and organic remains from this period and area allows insight in behaviour and social dynamics of Iron Age communities with much higher resolution than conventional archaeological methods. We will here focus on the interdisciplinary study of three basic categories: food, textiles and metals. Identifying specific choices related to food sources and processing techniques can shed light on different identities within a same community or inside different local communities sharing the same landscape or geographical area. Textile traditions define large-scale cultural zones. The study of the distribution of metal objects, combining typology as well as compositional data, may provide the definition of networks between local centres, matching general cultural traits and local identities. By combining the results of interdisciplinary methodology and traditional research, we will test and perhaps modify current paradigms on the identity of Iron Age communities. We hope to go beyond and challenge standard definitions of Iron Age identities based on traditional notions such as "cultural groups" and (later) "ethnicities".

We invite all contributions based on a scientific approach to the Iron Age in the area between Alps, Pannonia and Mediterranean, especially those related to food, metals and textiles. We will also welcome papers discussing definitions of the Iron Age identities based on differences and similarities in processes of production, use, and distribution of food, metals and textiles.

ABSTRACTS

1 CONTRASTING GENETIC IMPACTS OF EASTERN MIGRANTS ON EARLY IRON AGE COMMUNITIES IN HUNGARY AND TRANSYLVANIA

Papac, Luka (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany.) - Egri, Mariana (Institute of Archaeology and Art History, Cluj-Napoca, Romania.) - Mötsch, Angela (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany.) - Lamnidis, Thiseas (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany.) - Gál, Szilárd (Mureş County Museum, Târgu Mureş, Romania.) - Rustoiu, Aurel (Institute of Archaeology and Art History, Cluj-Napoca, Romania.) - Schiffels, Stephan (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany.)

Ancient DNA from Iron Age nomads across the Eurasian steppe, including individuals from "Scythian" contexts, has revealed their varied genetic origins and high genetic diversity. However, little is known about their genetic impact and legacy on European communities. By analysing genomes of "Scythian" Age individuals from Transylvania (n=67, unpublished) and Hungary (n=7, previously published), we find ~40% eastern admixture in Transylvania but 0% in Hungary. In contrast to the trans-Eurasian migrations to the Pannonian Basin in the Avar period, the eastern ancestry in Transylvanian "Scythians" largely came from "Scythian" communities in neighbouring Moldova and Ukraine, which admixed into the pre-existing Balkan genetic substratum. In addition to eastern ancestry, we find multiple genetic outlier individuals from central/northern Europe and southern Balkans buried in "Scythian" contexts, implying a dynamic admixture process associated with the formation of these "Scythian" communities. From Transylvania, we reconstruct several families from "Scythian" burial contexts up to three generations deep, most consisting of members with and without eastern ancestry, documenting real-time admixture between locals and eastern migrants. Among these is also a case of siblings buried 11km apart. However, this eastern ancestry did not persist after the "Scythian" period, with subsequent "Celtic" Age associated individuals (n=6) carrying primarily the pre-existing local ancestry with limited evidence of additional central European or eastern gene flow.

2 BEYOND DEFENSE: EXPLORING THE ROLE OF IRON AGE RAMPARTS IN NORTHERN CROATIA

Ovcaric, Franka (University of Zagreb, Department of Archaeology, Zagreb) - Drahotusky-Bruketa, Luka (University of Zagreb, Department of Archaeology, Zagreb) - Potrebica, Hrvoje (University of Zagreb, Department of Archaeology, Zagreb)

The Iron Age witnessed a resurgence of urbanization characterized by the construction of extensive earthworks, particularly ramparts. Traditional interpretations have focused on their defensive function, but recent scholarly discussions propose alternative social explanations. This paper presents an integrative interpretation, arguing that while these structures were indeed built for defense, their social symbolism is equally significant. We contend that the symbolism of ramparts extends beyond defense to the profound impact they had on the landscape, creating a lasting impression of control. Unlike other monumental architecture, the symbolic importance of ramparts lies in their recreation of the natural landscape. This study differentiates Iron Age earthworks from other structures in continental Croatia, emphasizing the enduring symbolic influence they exert on the landscape even after two millennia. While acknowledging the established notion of "social" construction in the Iron Age, our approach aligns with and expands upon previous discussions. We posit that the defensive aspect of ramparts is integral to their symbolism, intricately connected to the transformative changes they brought to the landscape.

Landscapes serve as tangible anchors for the priorities and assumptions of those who shape and utilize them. Our paper adopts a prehistoric cultural geography approach to examine the transition from late Bronze to Iron Age landscapes in two regions. Through analyzing construction processes, functionality, and the significance of landscape features from cultural, economic, and symbolic perspectives, we explore how prehistoric societies structured daily activities, transformed the appearance of the landscape, and invested it with cultural meaning. In this prehistoric system, the ideological landscape intersects with both social and symbolic landscapes, utilizing the symbolic to justify and enforce social positions. The landscape, essentially, becomes a dynamic arena for the expression of social narratives, revealing intricate connections between ideology, society, and the physical environment.

3 ÁRTÁND BETWEEN REGIONAL UPHEAVAL AND INTERREGIONAL IDENTITY

Soós, Bence (Hungarian National Museum)

The ostentatious assemblage discovered near Ártánd (eastern Hungary) is one of the most important and most perplexing finds of the Early Iron Age in the Carpathian Basin. The sheer amount and the outstanding quality of the items plainly suggest that the assemblage is closely associated with a prominent elite group. Due mostly to the bronze hydria of Greek origin, the prominence and uniqueness of the assemblage have already been discussed several times. This paper endeavours to explore the wide-ranging contacts of the Ártánd find and evaluate how these links could have shaped as well as displayed the identity of the owner of the items. The deposited artefacts seemingly originate from

a wide range of geographic regions and cultural backgrounds. Similarities and differences between how and in what kind of contexts these items were used and deposited in their native setting and in the case of the Ártánd assemblage might allude to the extent to which owners of the ostentatious items were ready to adopt not just the objects but the ideas and customs attached to them and identities in general. In addition, the paper discusses how these non-local elements could have led to confusion, bewilderment or even tension in a local setting, especially, in an age of social and cultural shifts. The proposed paper discusses what unique assemblages tell us about identities in archaeological settings and how the Ártánd assemblage might be interpreted in on a local and interregional scale.

4 EARLY IRON AGE FOODWAYS IN THE MIDDLE DANUBE REGION: AN ARCHAEOBOTANICAL ANALYSIS OF PLANT REMAINS FROM KALENDERBERG AND VEKERZUG SETTLEMENTS

Ranum, Caleb (University of Alabama; Constantine the Philosopher University in Nitra)

A foodways approach to the archaeological record seeks to understand past cultures by examining the daily activities associated with all dimensions of food production, processing, preparation and consumption. The quotidian practices associated with creating and consuming food function to teach and reinforce both individual and group identities related to ethnicity, gender, and social status. The rules about what is considered edible, what constitutes a meal, how it should be prepared, and how it should be served delineate roles within a community and exclude those who have different culinary practices.

This paper will provide early results from my dissertation research on plant foodways in the Middle Danube Region during the Early Iron Age, with a focus on uncovering Eastern Hallstatt identity via local culinary practices. As one of the first major archaeobotanical studies in the region, the primary goal is to identify the ingredients used in local Kalenderberg cuisine by analyzing archaeobotanical remains from four settlement sites. Additional research at two Vekerzug culture settlement sites provides an insight into the foodways of the archaeological cultures east of the Danube that are often assumed to have been more nomadic. By researching the foodways of these two archaeological cultures I aim to provide a basic understanding of local cuisines during the Early Iron Age and allow for a comparison to identify culinary markers of identity that differ between Kalenderberg and Vekerzug settlements.

5 TUMULUS GOMILA - A NEW CONTRIBUTION TO THE KNOWLEDGE OF HALLSTATT BURIAL CUSTOMS IN CENTRAL EUROPE

Šoštaric, Renata (University of Zagreb, Faculty of Science) - Kožul, Mirjam (University of Zagreb, Faculty of Science)

The Gomila tumulus at the Jalžabet site (near Varaždin), from which the analyzed archaeobotanical samples come, has a diameter of about 65 m and a preserved height of about 8 m, and is one of the largest prehistoric burial mounds in Central Europe. It belongs to the first half or middle of the 6th century BC, the last stage of development of the Martijanec-Kaptol cultural group, that is, the eastern Hallstatt cultural complex. Some of the most famous princely graves of the eastern Hallstatt cultural complex originate from that time, such as the tumuli in Strettweg (Austria) and Kaptol (Croatia), and the Kröllkogel tumulus in Kleinklein (Austria).

From 75 samples of sediments from the Gomila tumulus, a total of 5234 plant remains were separated and determined, of which 91% were carbonized, while the rest (noncarbonized) were interpreted as recent contamination. The most numerous finds are large-grain cereals, which make up almost 90% of the determined taxa. Unfortunately, due to the poor condition in which they were preserved, a very high proportion of findings belongs to the Cerealia group. In addition to cereals, very small amounts of lentils (*Lens culinaris*), hazelnuts (*Corylus avellana*), acorns (*Quercus* sp.) and weed admixtures were found. A comparison of the archaeobotanical results of the Gomila tumulus with other previously published findings of plant remains from Iron Age tumuli, primarily in Croatia, shows great similarities, as cereals are mostly the most common grave goods, with few additions of nuts and/or fruits.

6 FORGE IRON WHEN IT'S HOT

Vojakovic, Petra (Centre for Interdisciplinary Research in Archaeology (CIRA), Department of Archaeology, Faculty of Arts, University of Ljubljana; Arhej d. o. o.) - Gruškovnjak, Luka (Centre for Interdisciplinary Research in Archaeology (CIRA), Department of Archaeology, Faculty of Arts, University of Ljubljana) - Prijatelj, Agni (Department of Soil and Environmental Science, Biotechnical Faculty, University of Ljubljana; Centre for Interdisciplinary Research in Archaeology (CIRA), Department of Archaeology, Faculty of Arts, University of Ljubljana) - Burja, Jaka (Institute of Metals and Technology) - Šetina Batič, Barbara (Institute of Metals and Technology) - Toškan, Borut (Institute of Archaeology, Research Centre of the Slovenian Academy of Sciences and Arts) - Tolar, Tjaša (Institute of Archaeology, Research Centre of the Slovenian Academy of Sciences and Arts) - Brajkovič, Rok (Geological Survey of Slovenia) - Črešnar, Matija (Centre for Interdisciplinary Research in Archaeology (CIRA), Department of Archaeology, Faculty of Arts, University of Ljubljana)

The spread of iron and iron metallurgy throughout Europe caused one of the major technological changes that characterised the Iron Age and has importantly affected many other spheres of life. Despite this widespread phenomenon, archaeologists rarely discover primary iron ore processing sites, and even less frequently blacksmiths' workshops, while slag is present at almost every Early Iron Age site in the south-eastern Alpine region (i.e. present-day Slovenia). The iron ore rich region made iron production not only an important source of prosperity, but also a source of trade with the neighbouring regions.

For the purposes of this presentation, we would like to discuss one of the Late Hallstatt period buildings from Pungrt hillfort in Central Slovenia. The Building 24 was located on the lowest terrace of the settlement next to a 2m-wide gravel road that runs along the inner face of the monumental 3m-wide stone rampart. It was timber-framed with stone foundations and consisted of three rooms. Micro-refuse analysis of the building revealed that the south-western room, which would have been interpreted as a purely domestic setting based on macro-observations during excavations, was a blacksmith's workshop. Distribution patterns of hammerscale – micro-debris produced during the forging of iron – indicate the locations of the smithing hearth and anvil, while other micro-refuse provides insights into the materials, foods, fuel and possibly even the location of furniture used by the blacksmith.

7 METALLURGY AND RITUALS INTERTWINED: EXPLORING THE LATE HALLSTATT IN SVETI KRIŽ, CROATIA

Mavrovic Mokos, Janja (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology) - Šejić, Laura (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology, PhD student) - Drahotusky Bruketa, Luka (University of Zagreb Faculty of Humanities and Social Sciences Department of Archaeology, PhD student)

In 2023, the first discovery and excavation of the potential ritual structure from the Late Hallstatt era unfolded at Sveti Križ in Croatia. This 2x1 m rectangular building, fortified by stone walls and supported by four pillars at the corners, strongly implied the existence of a roof. A rich assortment of archaeological artifacts graced the interior, encompassing animal bones, stone tools, spindle whorls, and an array of metal objects. Notably, the unearthing of a substantial number of fibulae hinted at connections reaching into northern Italy and along the eastern coast of the Adriatic. Moreover, a bone artifact adorned with intricate decorations, featuring opposing zoomorphic sides, and a shark's tooth sourced from the Pannonian Sea, were also among the retrieved items. Building upon the fibulae discoveries, the structure's dating extends from the 6th to the 5th centuries BC. Of particular interest, the eastern wall of the building seamlessly abuts the plausible western wall of a smithy, which itself aligns with the same historical timeframe. Inside the smithy, several important indicators of iron ore processing were found for the first time on the site. The evidence of ore processing is the large amount of slag, along with a semi-finished product of an iron socketed axe, suitable for further processing. These findings found in one place, within a closed context, represent irrefutable evidence of metallurgical activity. Within the Late Hallstatt settlement, in close proximity to both the potential ritual edifice and plausible smithy, an unusual deposit of limonite was uncovered. This discovery stands out as metallurgical activities traditionally occurred beyond the settlement boundaries. The comprehensive analysis of organic residue and zooarchaeological data will try to offer profound insights into this extraordinary and exceedingly rare Late Hallstatt context.

8 IRON AGE METAL PROCUREMENT AND ALLOYING PRACTICES : ARCHAOMETALLURGICAL ANALYSES ON COPPER-BASED OBJECTS FROM SLOVENIA, CROATIA AND BOSNIA-HERCEGOVINA

Mehofer, Mathias (Vienna Institute for Archaeological Science, University Vienna; Human Evolution and Archaeological Sciences, University Vienna) - Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

In this paper we will present the first results of a recently funded CSF project with the title "Creation of European Identities – Food, Textiles and Metals in the Iron Age Between Alps, Pannonia and Balkans (project no.: IP-2020-02-2371). It focuses on use of metals, textiles and food as indicators of prehistoric identities in the Iron Age. The first systematical archeometallurgical analyses aimed to examine the wide-ranging exchange pattern of communities located at contact zone between Alps, Pannonia and Balkans. It included prestigious sets of weapons (helmets, axes and swords) and specific types of costume elements (multiheaded pins).

A set of 98 copper-based objects covering the time span of the 8th to the 4th century BC, was sampled. The chemical composition was analysed by energy dispersive X-ray fluorescence analyses (ED-XRF) and the stable lead isotope ratios of the copper metals by a High resolution -Multicollector-Inductively Coupled Plasma Mass Spectrometry (HR-MC-ICP-MS) at the Curt Engelhorn Centre of Archaeometry, Mannheim.

Within this lecture the analytical results will compared to previously published results of copper ores, slags, ingots and artefacts from the European region to examine the copper exchange systems. The preliminary results show, that tin bronzes and leaded bronzes are present. The element patterns indicate that in the metal objects fahlore-dominated copper is prevailing with chalcopyrite-based metal still present in low quantities. This in good accordance with previous research results for Central Europe, which describe a noticeable increase in fahlore dominated copper from Ha B onwards. While the tin concentration decreases since the Late Bronze Age, lead becomes an important alloying agent in the younger periods. The generated archaeometallurgical database will allow for in-depth analyses of the Iron Age copper exchange and to examine the metal procurement of these metal using societies over a long period.

9 MULTIHEADED PINS IN THE IRON AGE - COSTUME AND STATUS

Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology) - Mavrović Mokos, Janja (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

In the Eastern Hallstatt area multiheaded pins were perceived as prominent part of male costume. However, distribution of this type shows that they were present in large area of Central and South-eastern Europe from Este Culture in northern Italy to the Danube with very few examples found north of that river. In most of the cases they were part of grave inventories of the 8th and 7th century BC. However, closer insight suggests that these objects were not just functional part of male costume but rather insignia of special status, at least in some groups. That would explain their distribution across boundaries of different cultural groups and presumably costumes. Based on that and on the fact that not all male graves included these objects, this paper will argue that multiheaded pins were distinctive and universally recognizable markers of identity. However, the identity they reflected was not of specific cultural group or individual community related to specific kind of costume, but of special class of people, probably warrior elite. In the area south of the eastern Hallstatt there were two types of similar objects. In necropolis of Sanski Most whole series of bronze pins usually with two spherical heads were discovered exclusively in female graves around head. Although similar in shape they differed ifrom Central European multiheaded pins in everything else (chronology: at least two centuries later, position on the body: hairpins vs. costume ornaments, gender attribution: female vs. male). Interestingly in Donja Dolina which should be site of the same cultural group very specific type of multiheaded pins (Donja Dolina type) had probably same position on the body and gender attribution as Hallstatt ones, with somewhat later chronology but still earlier than Sanski Most. These pins were probably also markers of the same identity as their Hallstatt counterparts.

10 AUSTRIAN-SLOVENIAN CONNECTIONS: CASE STUDIES FOR IRON AGE TEXTILES FROM SLOVENIAN AND AUSTRIAN SITES

Groemer, Karina (Natural History Museum Vienna) - Saunderson, Kayleigh (University of Vienna) - Lau, Ronja (Ruhr University Bochum)

In the last decades, textile archaeology was among the fields of research in archaeology, that was fostered in the course of large international, interdisciplinary and innovative research projects. Lately, the Digital Atlas from the COST Action EuroWeb visualised how far we have gone with collecting basic data, and the abundance of publications on archaeological textiles from Europe also demonstrates the high level of standardisation of methods, innovative approaches and integration of the latest interdisciplinary methodologies.

Also within the project "Creation of European Identities – Food, Textiles and Metals in the Iron Age Between Alps, Pannonia and Balkans" and the activities at the Textile Research Group at the Natural History Museum, new data was gained during research on Austrian and Slovenian collections.

New Case studies will be presented, such as Hallstatt period textiles from Slovenia (Vace, Magdalenska Gora), and the textiles from Latène period cemeteries Walpersdorf, Leithaprodersdorf, Göttlesbrunn, Kuchl and Ratzersdorf. Those finds will be set into context in comparison with statistical data from archaeological textiles from Austria and Slovenia and their implication on our understanding of organic materials from Iron Age grave finds.

11 LEATHERWORKING ARTIFACTS IN FUNERARY CONTEXTS OF EARLY IRON AGE EUROPE. A CASE STUDY FROM SOUTHERN NECROPOLIS OF PADOVA (NORTH-EASTERN ITALY)

Pollon, Nicola (Alma Mater Studiorum - Università di Bologna)

The recent analysis of a burial group from the Iron Age necropolis of Palazzo Emo Capodilista-Tabacchi in Padova has uncovered a cremation burial (grave 336), dated to the late-7th century BCE, standing out for its unique artisanal set. These tools are likely associated with leatherworking, as indicated by parallels in the archaeological record and in traditional crafts. The assemblage comprises an iron knife, a whetstone, a bronze needle, an iron awl, two additional bone needles, and two bone artifacts possibly identified as a folder and stitch markers. This toolkit might have been employed for braiding and sewing leather strips. The bone needles can also be used in crafting wool and thick vegetal fibers. Leather braiding has connections to the manufacturing of various objects, including belts, implements for furniture/carts, and elements of horse harnesses. The latter possibility gains significance from the presence of a distinctive decorative motif on a single-handled cup within grave 336, featuring two opposing horses surrounding a disk realized with attached bronze nails. This motif is quite rare in Venetic necropolises, and it typically occurs both in Padova and Este in graves with knives, awls, or needles. This association prompts inquiry into how and why leatherworking was symbolized in funerary contexts and whether, in certain instances, it could be linked to the production of horse harnesses or other items associated with elite consumption. To explore this hypothesis, an investigation into the recurrence of comparable artisanal indicators and their potential association with horse motif decorations or elements of horse harnesses has been undertaken. This investigation primarily encompasses Early Iron Age Veneto, extending to the central-eastern and south-eastern Hallstatt Alpine regions. The purpose of this paper is to stimulate reflection on the role of leatherworking in the funerary representation of both elite and non-elite groups in Early Iron Age Europe.

12 IMMIGRANTS OR INFLUENCERS? CHANGES IN THE IRON AGE COMMUNITIES IN BELA KRAJINA, SE SLOVENIA

Grahek, Lucija (Institute of Archaeology, ZRC SAZU) - Nemeček, Nataša (National Museum of Slovenia) - Gleba, Margarita (Dipartimento dei Beni Culturali / Università degli Studi di Padova)

Archaeological research from the 19th and 20th centuries shows that the Dolenjska and Bela krajina region in south-eastern Slovenia flourished in the Early Iron Age (Hallstatt period) due to its geostrategic position - situated between the Alps, Pannonia, the Balkans and the Adriatic - and the abundance of easily accessible iron ore. The societies living around the Kolpa River in Bela krajina, played a significant role in the formation of the Dolenjska cultural group. During the Late Hallstatt period, local societies began to expand beyond their core centres, and this is traditionally attributed to the northward expansion of the lapodic tribes. The lapodic culture is believed to have significantly influenced Bela krajina during the Late Iron Age. Simultaneously, and during the same period, local societies adopted the attire and material culture associated with the Celtic Taurisci tribe. New research, however, challenges the validity of traditional definitions of individual societies based solely on typo-chronological analyses of finds and proposes a re-evaluation of the old data.

The presentation will cover the interdisciplinary approaches used to gain insights into prehistoric communities using new data and findings from two of the largest Iron Age centres in Bela krajina, namely Podzemelj and Vinica. We will present and discuss the initial results of archaeometric analyses of non-ceramic finds, especially bronzes, and of mineralised textile remains, and other organic materials. This research aims to provide a deeper understanding of the prehistoric communities in the region and their way of life.

833 ADRIATIC BRIDGE - UNRAVELLING POLITICAL, SOCIAL, AND CULTURAL TRANSFORMATIONS IN THE ADRIATIC?IONIAN, AND BALKAN REGION IN THE LAST MILLENNIUM BC

Session theme: 6. The Mediterranean from Within

Session organisers: Perkic, Domagoj (Dubrovnik Museums, Archaeological Museum) - Miše, Maja (UCL Institute of Archaeology) - Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences) - James, Sarah (Department of Classics, University of Colorado Boulder) - Meo, Francesco (University of Salento, Department of Cultural Heritage)

Session format: Regular session

Over the last millennia BCE, the Adriatic – Ionian region experienced a series of profound transformations. This transitional period witnessed the evolution of local communities along the eastern and western coasts to the emergence of integrated societies characterized by the coexistence of Greeks, indigenous communities, and newly arrived Romans. Amidst these changes, the region exhibited expanding economic complexities, the development of distinct local identities through enhanced mobility and network connectivity, and a flourishing trade and exchange network. These developments played a key role in unifying diverse social organizations and material culture, ultimately resulting in a unified culture at the end of the last millennium BC. However, scholarly discussions often fall short of examining the Adriatic region, leading to fragmented representations of the area and its historical significance within the broader context of ancient Mediterranean connectivity and communities.

This session aims to address several pertinent questions concerning the historical trajectories of Adriatic communities:

- How did Adriatic communities develop from the Late Bronze Age, and what influence did the collapse of the Bronze Age in the Mediterranean have on this region?
- Can we trace the catalysts behind Adriatic – Ionian trade and their impact on local communities?
- What were the consequences of the arrival of external actors, the Greeks and Romans, on the transformation of the Adriatic region?

The primary objective of this session is to offer valuable insights into these inquiries, stimulate meaningful discussions among scholars, and potentially provoke the exploration of new research avenues within the study of the Adriatic – Ionian region during this transformative period. By delving into these questions, we anticipate a more nuanced comprehension of the connections that linked Adriatic communities and a clearer understanding of the related social and cultural developments that shaped the region during this pivotal era.

ABSTRACTS

1 HILLFORTS AND MOUNDS - EMERGENCE OF CULTURAL LANDSCAPE IN THE 1ST MILLENNIUM BC IN SOUTH OF THE EASTERN ADRIATIC COAST

Perkic, Domagoj (Dubrovnik Museums, Archaeological Museum) - Dizdar, Marko (Institute of Archaeology, Zagreb) - Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

The settlement of Grad near Nakovana on a prominent stone rise, dominates over complex cultural landscapes defined by prominent hillfort settlements and dozens of stone mounds in their surroundings as well as an Illyrian cave sanctuary. Archaeological material recovered from Grad suggests a long period of occupation that was particularly intensive in the 1st millennium BC, evidenced also by dozens of stone mounds of various forms and sizes. Large, conical mounds probably date from the late Copper Age and the early Bronze Age (the Cetina culture), while explored necropolis of Zmijno consists of stepped mounds with a central burial chamber and two or three stone rings. They contained remains of a number of deceased as well as many metal, glass and pottery objects from the late 5th and 4th c. BC. Flat graves have also been found between mounds, dating from the late Bronze Age and the early Iron Age. In contrast, the Gradina hillfort at Zakotorac does not appear to have been fortified by a rampart. In the valley to the south of it there is a number of mounds that are similar to those attributed to the Cetina culture. Directly below the settlement, there is a group of mounds with one or more peripheral rings and a flattened stone fill that is sometimes step-like. So far we excavated three mounds and dry-stone tombs located next to them. The mounds contained several graves each, with a number of deceased, and the material dating from the 6th to the 4th century BC. Next to them, there were dry-stone tombs, also containing several deceased each with variety of finds from 4th-3rd/2nd century BC. This research conducted by consortium of several institutions will continue to explore complex cultural landscapes with large potential for future interdisciplinary research.

2 STINE - MISSING LINK IN THE IRON AGE OF THE ISLAND OF KORČULA

Borzić, Igor (University of Zadar, Department of Archaeology) - Potrebica, Hrvoje (Faculty of Humanities and Social Science, Department of archaeology) - Kalebota, Marta (Korčula City Museum) - Radić, Dinko (Centre of culture, Vela Luka) - Vuković, Miroslav (Faculty of Humanities and Social Science, Department of archaeology)

The Iron Age settlement of Stine is located on north-western edge of the fertile field behind the village of Žrnovo in the eastern part of the Island of Korčula. Unlike other recognized and confirmed settlements of that period it does not look like classic hillfort. In this case it is “hidden” behind ridge of the hill overlooking Pelješac Channel which probably served as natural fortification and monitoring point while settlement itself was placed on series of terraces sliding down towards the field on the southern side of the hill. Although systematic research just began it is clear that it will have large impact on understanding Iron Age dynamics on the island itself but also on the whole area of the southern Adriatic as well for several reasons:

1. It is the only settlement of significant size on the eastern part of Korčula. Therefore, if we accept hypothesis that Lumbarda's Psephysma mentions dynasts of local community that were benevolent to founding Isseian colony on Koludrt this is so far the best location for their settlement and ideal site for understand relationship between Greeks and indigenous population and perhaps shed more light to reasons of its founding and its disappearance.
2. It is the only Iron Age settlement of this type known so far. Although it could be reflection of adaptation to specific landscape, it definitely suggests that in research of the Iron Age landscapes of the southern Adriatic we have to move past traditional paradigm hillfort-field-communication-mounds.
3. The chronology of finds suggest that it lived deeply into the 1st century BC. It could give us additional insight in what actually happened during the Octavian campaign that allegedly wiped-out population of Mljet and Korčula and traces of which we discovered in Nakovana, just across the Pelješac Chanell.

3 THE EVOLUTION OF ARCHAEOLOGICAL LANDSCAPE IN THE TERRITORY OF KAVAJA AND RROGOZHINA (ALBANIA) FROM PREHISTORY TO THE IMPERIAL ROMAN PERIOD

Shehi, Eduard (Albanian Institute of Archaeology)

This presentation explores the evolution of territorial utilization in the region south of Epidamnus-Dyrrachium, the largest ancient city on the eastern Adriatic coast. The terrain is characterized by low hills, fields, and several rivers coursing through it, all facing the Adriatic Sea. Human presence traces back to the Neolithic period, gradually increasing with slow momentum until the Iron Age. Notably, settlements were primarily positioned on hill slopes, rarely in the plains, leaving interpretive clues.

Furthermore, a sudden expansion occurs from the Archaic period, particularly in the Classical era. Coastal positions, hillsides, and descent into the plains characterize this period. Territory usage significantly expands while strategically selecting positions to control valleys, fields, natural routes, or hillside slopes.

The highest level of settlement presence belongs to the Hellenistic period, with a notable increase in the number of settlements spreading across the territory, predominantly on hill slopes. Settlement types primarily consist of villages and farms, with fewer fortified settlements.

The Roman period witnesses a nearly drastic shift in territorial usage patterns. Firstly, there is a massive shift towards the plains, abandoning most hillside settlements. Those remaining on hillsides hold crucial positions for territorial control. Settlement types mainly comprise villages and rural villas, followed by roadside stations.

This presentation aims to detail the evolution of territorial usage in this area and attempts to explain the reasons behind residents' choices during different historical periods.

4 ECONOMY OF IRON AGE COMMUNITIES IN EASTERN ADRIATIC: INSIGHTS FROM LARGE STORAGE JARS FROM NADIN AND RAT VIČJA LUKA (DALMATIA)

Miše, Maja (UCL - Institute of Archaeology, UK) - Barbarić, Vedran (Faculty of Humanities and Social Sciences, University of Split, Croatia) - Čelhar, Martina (Department of Archaeology, University of Zadar, Croatia)

In the last millennium BCE, the Dalmatian region harboured diverse communities, each with unique social structures, cultural affiliations, and trading networks. The similarities and differences among these communities, discernible through hillforts, material culture, and burial customs, present a complex narrative. This complexity deepens when we consider their interactions and potential mutual economic strategies. Until now, these questions have remained unanswered, mainly due to a fragmented approach to each community. To address the complex issues surrounding production and trade, this study explores two Iron Age communities—one along the northern Dalmatian coast and hinterland and the other on the Central Dalmatian islands, focusing on the hillforts of Nadin and Rat Vičja Luka. Situated in different landscapes, with Nadin on the largest fertile field in Dalmatia and Rat on the island of Brač, these locations provide a unique perspective for investigation.

Material evidence from the 9th century BCE onwards indicates that both communities engaged in trade with the western Adriatic coast. These cross-Adriatic trade connections often signify economic surplus, indicative of communities with resources beyond immediate needs. To comprehend the economic dynamics of prehistoric communities, particularly Eastern Adriatic Iron Age societies, a holistic approach is imperative, incorporating archaeological evidence such as valuable items, trade routes, and settlement patterns. Notably, large storage jars serve as crucial archaeological finds shedding light on these dynamics.

This paper presents a detailed analysis of large storage jars from Nadin and Rat Vičja Luka, utilizing them as proxies to characterize local production and, consequently, local strategies of food storage. Through an integrated examination encompassing typological, microstructural, and geochemical analyses, the aim is to delineate local production and re-construct the technological aspects of large storage jar manufacturing. The evidence of local production, coupled with trading contracts, provides valuable insights for reconstructing Iron Age economies along the eastern Adriatic coast.

5 TRANSMISSION AND TRANSFORMATION IN THE ADRIATIC IRON AGE: A STUDY OF IMPORTED DRINKING WARES FROM GRADINA RAT, BRAČ

James, Sarah (University of Colorado Boulder)

After the Bronze Age, the earliest fragments of non-local pottery at Gradina Rat appear in the mid-9th century. At first, Italian matt-painted wares were imported from central or southeastern Italy comprised primarily of cups, pitchers, and large bowls/kraters that were used at the hillfort. These newly introduced wares had no parallels among local shapes. While it is possible that Italic imports took the place of metal vessels or ones made of perishable materials, I propose that these objects were adopted for their uniqueness and would have been understood as valuable exotica. In this way, who possessed them may be the more important point. Those with access to these matt-painted wares perhaps displayed (or used) them in communal settings in order to enhance their own social status. Access to Greek-style products produced in Mainland Greece and Magna Graecia began at the site in the 6th c. BCE and presumably had to compete with well-established Italic wares. The imported shapes are again drinking vessels and large, open shapes (kraters/bowls) and these are followed within a century by Greek-style transport amphorae typically used for wine. This evidence for imported wine suggests on-site consumption probably using Greek-style and Italic table wares, although the frequency of such events is uncertain. Given that wine production started with the arrival of Greek settlers to the Adriatic islands in the 4th c. BCE, the previous adoption of and subsequent adaptations to this new product by local inhabitants may help explain the rapid spread of viticulture in the region.

6 NORTHERN EPIRUS BETWEEN THE CLASSICAL AND THE HELLENISTIC PERIOD: THE CASE OF ÇUKA E AJTOIT, BUTRINT AND THEIR REGIONAL CONTEXT

Aleotti, Nadia (Sapienza University of Rome)

The ancient Northern Epirus, now southern Albania, provides an interesting point of view to observe the developments of interactions between different realities during the second half of the 1st millennium BC. It is a geographically marginal territory of Greece, but closely connected with the Corinthian and Corinthian-Corciran colonies in the Adriatic-Ionian area, as well as with the different local realities of this region. In this frame, the passage from the Classical to the Hellenistic period represents a crucial moment in defining the new Epirus realities and their new relations and connections with the rest of the Adriatic and Ionian regions.

The few pottery fragments of the 5th-4th cent. BC among the finds recovered by the recent surveys of the new Italian-Albanian research project in Çuka e Ajtoit (Albania), and the pottery of the same period from Butrint, are particularly interesting for the comprehension of this period in Northern Epirus from the particular point of view of the material culture. This period is archaeologically quite elusive, yet it brings fundamental changes, of which we only catch the final results in the early-mid Hellenistic period with the full adherence to the Hellenistic koine. By analyzing in detail the material culture of Çuka e Ajtoit and Butrint, the paper aims to help better delineate this transition, crucial for the region and its role in the Adriatic-Ionian area.

7 UNDER THE BRIDGE? CENTRAL DALMATIAN ISLANDS AND THE TRANS - ADRIATIC CONTACTS (2ND AND 1ST MILLENIUM BCE)

Barbaric, Vedran (University of Split, Faculty of Humanities and Social Sciences)

The contacts between two sides of the Adriatic in its central part rely on the maritime route that connects two shores via islands that are positioned between Gargano and Kaštela bay (in proximity of the main route inland through Dinarics). Known in the literature as the Adriatic Island Bridge, this route has been in use by prehistoric seafarers and sailors since the Neolithic. From that time on, the trans-Adriatic route connects two shores with different intensities, depending on the circumstances of the period. This paper examines the available archaeological evidence from the Central Dalmatian islands on this route and its potential for our understanding of the trans-Adriatic communication

dynamics during the last two millennia BCE. Mostly, we are dealing with settlement and burial evidence that rarely comes from the excavations. Still, islands have been surveyed in detail (through Adriatic Islands Project activities), so data on hillfort settlements and ritual mounds proves to be very helpful, especially when combined with the excavation data. The position of individual islands on the route, although seemingly similar, i.e., relatively close to the mainland, together with their morphology, seem to have greatly influenced cultural dynamics on the local level. The available archaeological record will be examined in order to identify key indicators that can help us understand the role of the islands and, possibly, up to some extent, the nature and scope of trans-Adriatic contacts as observed from its eastern shores.

8 RELATIONS BETWEEN KOSOVO AND THE GREEK COLONIES OF DURRACHION AND APOLLONIA DURING THE IRON AGE

Baraliu, Sedat (University of Prishtina, Faculty of Philosophy) - Premtim, Alaj (Archeological Institut of Kosovo)

This study will deal with the trade relations between Durrachion and Apollonia within the current territory of Kosovo during the Iron Age. After the establishment of two colonies, Dyrrachion in 627 B.C., and that of Apollonia around 600 B.C., before our era in the territory of Illyria, the relations between the Greeks and the Dardanians underwent a new flourishing, because these colonies served as a bridge to facilitate exchanges between the merchants of the two provinces. Through the White Drin, Kosovo could communicate with the Greek colonies in the Adriatic, and through them, with the rest of Greece. Many finds in the territory of Kosovo are considered as imported from these Greek colonies, or from their metropolis Corinth.

It appears that the colonies were primarily interested in silver mining. Between the 4th and 1st centuries B.C., Apollonia as well as Dyrrachion produced coins from silver metal which could have been taken from Dardania or from the city of Damastion. Strabo places this place in the hinterland of Dyrrachion and Apollonia. Proof of these exchanges are the coins from Apollonia and Dyrrachion found in the territory of Kosovo. The discoveries of the village of Qollopek in Peja reveal a treasure of coins from Apollonia, 475 drachmas and 2 imitations. But discoveries of such coins have also occurred in other places in Kosovo, such as in Janjevë and around Pristina. Evans claims that coins of Apollonia and Dyrrachion have been discovered in Dukagjin (Kosovo).

9 THE STRAIT OF OTRANTO: A GATE FOR ADRIATIC CONNECTIONS

Meo, Francesco (Department of Cultural Heritage, University of Salento (Italy))

This paper will focus on the role of the Strait of Otranto as a gate for the connections among populations in the first millennium BCE through a series of examples aimed at highlighting the links between southern Puglia Region and the eastern coast of the Adriatic sea.

Since before the creation of the Corinthian trade routes through the Adriatic sea and the foundation of the Greek colonies along its coasts, local populations on the two shores of the Strait of Otranto (the so-called Iapigian in southern Puglia and the Devollians in the nearby Albania) make pottery whose shapes and matt-painted decorations are similar each other.

The connection between the two coasts, far just 70 km, is also attested by a particular shape of mug made in Corinth or in its colonies, so-called boccaletto, never found in other areas except the South of Puglia and Albania.

On the other hand, the recent discovery of a ship wrecked not far from Otranto with an early 7th century BCE cargo of Corinthian vases in its hold (skyphoi, anphoras, hydriai) confirms the importance of Adriatic routes for the trade of goods which are purchased by the elites of local populations when they adopt customs typical of other cultures, which lead to a gradual change of their societies.

Even in the Hellenistic period the Adriatic sea is the scenario of changes. In 334 BCE, Alexander I of Epirus, also known as Alexander Molossus, came to southern Italy at the request of the Greek colony of Taras to aid them in battle against several Italic population. That episode is just the beginning of serious changes, for example in the architecture of the Messapians, the population who lived in Southern Puglia Region, with a strong influence by the Macedonians.

10 ANIMAL MANAGEMENT AT GREEK AND ROMAN PHAROS (STARI GRAD, HVAR ISLAND): PRELIMINARY RESULTS FROM FAUNAL STABLE ISOTOPE ANALYSES

Alagich, Rudolph (University of Sydney) - Barbir, Antonela (Institute of Archaeology, Zagreb) - Ugarković, Marina (Institute of Archaeology, Zagreb) - Smith, Colin (Universidad de Burgos; La Trobe University)

The settlement of Pharos was founded by Parian Greek colonists in 385/4 BCE. After the Illyrian wars and consolidation of Roman rule in the region, Pharos was incorporated into a broader homogeneous cultural sphere. It is unknown to what extent Roman administration impacted agricultural production at Pharos, and whether food continued to be

sourced from the same agricultural systems as under the Greeks. For example, land redistribution or a prioritisation of different agricultural commodities might have impacted the provenance of the food consumed within the city.

Analysis of the stable isotopic composition of faunal remains has become an increasingly popular way to elicit details of past agropastoral production. The advantage of using stable isotopes is that they provide direct evidence of animal diet and crop management, allowing the reconstruction of aspects of agriculture that are invisible to traditional archaeological analyses. This paper establishes the animal management strategies practiced at Greek and Roman period Pharos through the analysis of the carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotopic composition of faunal bone collagen, the first such study from a Greek settlement in Dalmatia.

Our results reveal that the animals consumed at Pharos were reared utilising a variety of management strategies. Roman rule over the settlement did not appear to make a difference in the way the cattle and pigs consumed here were managed, however subtle changes are visible in the sheep and goat diets suggesting Greek farmers tended to manage these animals under a more intensive regime.

11 CHALLENGES OF ANTHROPOLOGICAL ANALYSIS OF HUMAN OSTEOLOGICAL MATERIAL FROM PREHISTORIC SITES ON PELJEŠAC, CROATIA

Bedic, Željka (Institute for Anthropological Research, Centre for Applied Bioanthropology) - Vodanović, Marin (University of Zagreb, School of Dental Medicine) - Perkić, Domagoj (Dubrovnik Museums, Archaeological Museum) - Dizdar, Marko (Institute of Archaeology) - Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences)

Since 2020, archaeological research has been ongoing in the Nakovana and Zakotorac area on the Pelješac peninsula. Many stone mounds were recorded, which according to their construction method can be divided into those with a “classic” domed appearance; those that have an extremely regular circular plan, and consist of two or three concentric rings, with the flattened center where a square tomb can usually be seen; and the flat graves next to the mounds. Two graves in Nakovana, and seven graves from three mounds in Zakotorac dating back to the Bronze and Iron ages were investigated. The objects found in the graves include fragments of ceramic vessels, metal finds such as bronze jewelry and parts of clothing. Also, extremely fragmented human remains were found in the graves at both sites, which were anthropologically analyzed. In all but one of the graves, many deceased were buried. The teeth were the best-preserved elements of the human skeleton, so the determination of the minimum number of individuals (MNI) in the grave was determined according to the tooth that appears the most times. For example, in grave 1 from mound 1 there are 206 teeth, 18 of which are deciduous teeth. The upper left first premolar appears most often – 13 times, of which 7 belong to subadults. The second tooth that appears most often is the upper right canine (10), of which only one tooth belongs to a subadult, so it can be concluded that the MNI in this grave is 16 – nine adults and seven subadults. Detailed analyzes are still in progress and will also include indicators of dental health (caries, tooth enamel hypoplasia, calculus, and wear) and thus help in the reconstruction of the diet of the prehistoric populations that inhabited Pelješac during the Bronze and Iron Ages.

12 ARCHAEOGENOMIC RESEARCH OF KAMENICE, A PREHISTORIC ALBANIAN TUMULUS (1600-500 BCE)

Jia, Xiaowen (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM), Leipzig, Germany; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University of Munich, Munich, Germany) - Skourtanioti, Eirini (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM), Leipzig, Germany) - Heilmann, Daniela (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University of Munich, Munich, Germany) - Bejko, Lorenc (Department of Archaeology and Heritage Studies, University of Tirana, Tirana, Albania) - Amore, Maria (Department of Archaeology and Heritage Studies, University of Tirana, Tirana, Albania) - Aliu, Skender (Department of Archaeology and Heritage Studies, University of Tirana, Tirana, Albania) - Pojani, Iris (Department of Archaeology and Heritage Studies, University of Tirana, Tirana, Albania) - Ringbauer, Harald (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM), Leipzig, Germany) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM), Leipzig, Germany) - Stockhammer, Philipp (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM), Leipzig, Germany; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University of Munich, Munich, Germany)

Situated in southeastern Albania at the interface of the Aegean and the Adriatic, the Tumulus of Kamenice was used for inhumations from 1600 to 500 BCE. In order to understand societal transformations in Kamenice and its regional context, we generated genome-wide SNP data for 204 individuals from Kamenice that span the full-time transect, 24 individuals from Iron Age North Macedonia, and 2 individuals from Late Bronze Age southwestern Bulgaria. Our comprehensive dataset provides first insights into genetic continuities and changes of Late Bronze Age and Iron Age Albania as well as biological relatedness and demography of a single tumulus. Furthermore, we could compare the spread of cultural elements from central Europe and southern Aegean with genetic pattern and kinship practice.

We identified a genetically homogeneous population throughout the respective time in contrast to all societal transformations in the wider region. Our results indicate that populations from Albania, the northern Aegean and Dalmatia form a joint cluster along Adriatic east coast, which could be differentiated from both the southern Aegean and further inland Balkan. We also reconstruct a regional kinship network of Kamenice extending more than 250 kilometers by identifying biological relatedness up to 10th degree. By comparing the genetic profile and kinship network we could learn more about the mobility and connectivity on both supra-regional and micro-regional scales.

Moreover, we found evidence for not only a patrilineal society, but also a local population bottleneck event around 750 BCE for the first time in this region, adding another layer regarding human mobility.

13 GREEK EXPLORATION AND PHANTOM SETTLEMENTS IN THE ADRIATIC – A COLLISION BETWEEN ARCHAEOLOGICAL EVIDENCE AND HISTORICAL NARRATIVE

Budic, Filip (The Faculty of Humanities and Social Sciences in Zagreb University of Zagreb; Chair of Ancient History Department of History)

The earliest Greek navigation in the Adriatic is an intriguing and open question that has been much debated in the scholarly literature. The ancient written sources of historical and mythological provenance inspired several exploration concepts allegedly led by Mycenaean, Euboean, Phocaeans, Rhodians, Corinthians, Corcyraeans and others. Furthermore, there are also narratives about the Greek settlement foundations that might have occurred in the Adriatic during the Archaic and Classical periods. The so-called phantom settlements include the Rhodian/Coan Elpia in Daunia, Thessalian settlements in Umbria, as well as numerous locations on the Eastern Adriatic coast such as the Cnidian settlement of Corcyra Melaina, Parian Anchiale, or Herakleia.

This paper focuses on the early Greek influence in the Adriatic through the echo of potential prospection and the foundation of short-lasting settlements. The emphasis is on the interpretative framework of such concepts that are in archaeological and historical literature often observed contrastingly. One tends to reject the possibility of an ephemeral Greek presence in the Adriatic due to the lack of archaeological evidence, while the other attempts to construct coherent historical narratives, primarily by using the principle *ex mythologia - historia*.

The main aim is to offer a critical approach and propose a framework of valid arguments that could support or reject some of the concepts regarding Greek prospection, temporary settlements and their possible impact on the local and regional socio-cultural environment. The aforementioned phenomena are also considered in the context of indigenously trans-Adriatic connections that can be followed throughout the Early Iron Age.

834 WOMEN THROUGH THE AGES: ROLES, RITUALS, AND RESEARCH THROUGH THE LENSES OF ARCHAEOLOGICAL SCIENCES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Zeppilli, Carlotta (University of Cagliari (Italy)) - Farese, Martina (Department of Environmental Biology, Sapienza University of Rome (Italy)); Mediterranean bioArchaeological Research Advances (MAREA) Centre (Italy)) - Bernardini, Sara (University of Bologna (Italy)); LAMPEA, UMR 7269, Université d'Aix-Marseille (France); Mediterranean bioArchaeological Research Advances (MAREA) Centre (Italy)) - Bonucci, Biancamaria (Institute of Genomics, University of Tartu (Estonia))

Session format: Regular session

The 1980s represented a turning point in the rediscovery of the woman figure in past societies and the deconstruction of stereotypes based on modern standards. In gender archaeology, this ongoing process of change is characterised by a constant debate, also due to the various roles played by women across time and space. Researchers continue to challenge traditional views and question preconceptions, aided by the introduction of new fields of research in both Archaeology and Anthropology.

This session focuses on a comprehensive and interdisciplinary approach to exploring women, from prehistory to protohistory, from history to the present day. We aim to highlight new research regarding: i) aspects of daily life, such as group organisation, ii) burial rituals dedicated to women, iii) the health condition that characterised their lives, specifically during critical moments like pregnancy, childbirth and breastfeeding, iv) palaeopathologies, including traumas, v) evidence of exogamy, and vi) artistic production associated with women.

Of particular interest are cases involving the re-evaluation of burial contexts through the application of interdisciplinary approaches and new technologies (e.g. aDNA, proteomics).

We also invite works that question the presence of a gender-based division of labour, in any, using osteological and virtual imaging assessment. Studies on intra-life changes characterising women's lives, from puberty to menopause are also welcomed, as well as all the possible dietary, health and associated socio-cultural variations related to these events.

We encourage oral and poster presentations delving into the multi-faceted role of women in the past, discussing their life history while re-thinking past assumptions, through various approaches and methodologies. We welcome broad studies as well as works focusing on specific and local (pre-)historical contexts.

Lastly, we would also like to discuss the current roles of women in (bio)archaeological disciplines and the female researchers who are still leading feminist movements today.

ABSTRACTS

1 POWER TO THE 3RD MILLENNIUM WOMEN!

Olerud, Louise (Faculty of Archaeology, Leiden University)

The third millennium BCE is considered a period of much cultural and social change in European Prehistory. Recent results from ancient DNA studies have led to the revival of the traditional Kurgan hypothesis explaining these changes: mass migrations of militant, nomadic pastoralists from the Pontic Caspian steppe brought Indo-European languages and culture to Europe, as well as a 'male-dominant', patriarchal society. However, such an interpretation of this period is largely rooted in andro- and ethnocentric, Western assumptions, in which biological sex is equated with gender, and weapons are associated with masculinity. It also begs the question: what about the women?

Recent network analysis of burials from the Corded Ware culture (c. 2900-2500 BCE) has shown that, throughout Europe, men were typically buried in a supra-regional burial style, similar to other men buried up to 600 km away, while women were buried in a local burial style. Yet, stable isotope analyses reveal that women were actually more mobile than men. This finding has been interpreted as evidence for a system of female exogamy, by which is typically meant that women were passively exchanged as marriage partners to uphold alliances between communities. The sheer variability in patrilocal kinship structures known from ethnography, let alone the agency of the women themselves in these systems, is not taken into account in these narratives.

In this paper, I argue that women in the third millennium BCE would have had more agency than they are credited with and may have even played an important role in the cultural changes seen in this period.

2 FINNIC FEMALES: TRACING THE ORIGIN OF THE LIKELY EARLY FINNIC-SPEAKING WOMEN IN THE EASTERN BALTIC

Saag, Lehti (University of Tartu) - Salmela, Elina (University of Helsinki) - Konsa, Marge (University of Tartu) - Suni, Raivo (University of Tartu) - Moilanen, Ulla (University of Helsinki) - Tõrv, Mari (University of Tartu) - Tambets, Kristiina (University of Tartu; University of Helsinki) - Honkola, Terhi (University of Helsinki)

Previous studies have suggested that the ancestors of Finnic-speaking people reached the Eastern Baltic region during the 1st millennium BC. However, so far the focus in terms of studying the genetic background of these people has been on men because of the distinct male lineages connecting Finnic- and other European Uralic-speakers to Siberia. Here, we set out to study the genetic ancestry and strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) based mobility of the women living in the Eastern Baltic at this time.

The basis of this study is the fragmentary human remains from the Kunda Hiiemägi tarand cemetery – an above-ground stone structure in Northeast Estonia from early Pre-Roman Iron Age (around 800–400 cal BCE). Previously, two male individuals have been analysed and shown to be non-local based on $^{87}\text{Sr}/^{86}\text{Sr}$ analysis. These two individuals also have the highest proportions of genome-wide Siberian (modern Nganasan-like) ancestry among published Estonian Iron Age individuals (6% and 8%). Now, we have included 12 additional individuals from Kunda Hiiemägi into ancient DNA extraction and sequencing as well as $^{87}\text{Sr}/^{86}\text{Sr}$ isotope analysis. The aim of the current study is to reveal whether women from an early tarand cemetery, coinciding in time with the hypothesised arrival of Finnic languages in the Eastern Baltic, are local or show signs of mobility, similarly to men from the same cemetery.

Our study contributes to the comprehension of the Finnic languages' arrival in the Eastern Baltic region. We broaden the scope beyond Finnic-speaking men to encompass the role of females in potential migration events related to the arrival of the Finnic language in the region.

3 BIOMECHANICAL ADAPTATIONS AND THEIR IMPLICATIONS ON WOMEN'S ACTIVITIES IN EARLY AGRO-PASTORAL SOCIETIES IN FRANCE - WOMENSO FAR ANR PROGRAM

Bédécarrats, Samuel (UMR 5199 PACEA; Université de Bordeaux) - Lambert, Aurore (Eveha International; UMR 7268 ADES) - Goude, Gwenaëlle (UMR 7269 LAMPEA) - Leduc, Guillaume (UMR 7330 CEREGE) - Rottier, Stéphane (UMR 5199 PACEA) - WomenSOFar, Consortium WomenSOFar (WomenSOFar)

The WomenSOFar (2022-2026; ANR-21-CE03-0008; Individual life histories and WOMEN Status at the Onset of FARming) ANR research program explores the status of women in early Neolithic societies. Employing a multidisciplinary approach encompassing isotopic and genetic data alongside osteological characterizations, the project aims to investigate the intricate interplay between biology, environment and social behaviours, in order to make inferences on the lives of women in first agro-pastoral societies.

A main focus of the project is on bone adaptations to activity. Six funerary sites from the south-east and north of France, dating from the 5th millennium BC, are being studied using palaeopathological characterization and imaging methods. Cross-sectional geometry of long bones and bony changes that may reflect responses to mechanical stresses are examined conjointly in order to deduce activity-related biomechanical adaptations and infer social organizations. The study is additionally relying on an innovative data recording, in which observations are linked to their anatomical location, and spatial statistics tools are used to analyse them.

Preliminary findings suggest that there is no difference in the intensity of bone changes between women and men. Spatial analyses reveal different distributions of bone changes depending on the individual's sex. Cross-sectional geometry data indicate greater variability for women, overlapping with the male distribution. The latter is narrower and statistically different for the right humerus, potentially indicating specific adaptations in men to activities involving the upper limb. These results suggest different life histories according to sex, showcasing a greater variety of activities in women and a potential tendency towards specialisation in men. The results will be further explored in conjunction with archaeological, isotopic and genetic data to provide a comprehensive assessment of the biological, environmental and cultural factors influencing these findings.

4 SOCIAL IDENTITY AND MICRO-NARRATIVES OF LIFE TRAJECTORY FROM BIOARCHAEOLOGY: WOMEN FROM THE CHALCOLITHIC BURIAL SITE OF CAMINO DEL MOLINO (SE-SPAIN)

Díaz-Navarro, Sonia (Universidad de Valladolid) - Haber Uriarte, María (Universidad de Murcia)

Humans are complex beings who change and evolve throughout their lives. These changes occur during the different stages of childhood, adolescence, adulthood, and old age. They may also manifest in aspects like gender identity, health conditions, or transitions from being a native to becoming a foreigner. Furthermore, our identity or role as individuals within a group evolves and we are influenced by our interaction with other humans on issues such as learning, care or social relationships. Tracing specific cultural elements that can help characterise social features in past societies is a challenge. This paper offers an approach to the different identities of the women of a unique Mediterranean Chalco-

lithic community. The results come from an exhaustive bioarchaeological analysis of the skeletal remains of the 1,348 individuals recovered from the largest collective burial site known to date, the Camino del Molino archaeological site (Murcia, SE Spain) (2971-2251 years cal. BC, 2σ). The combination of archaeological, isotopic, palaeodemographic, palaeopathological, dental and osteometric analysis has allowed us to trace elements that can help us to characterise and hypothesise social factors such as the sexual division of labour, the specialisation of women in artisan tasks, and to identify gender/age biases in aspects such as diet, training/learning or even access to the tomb; and, in short, to shed light on the social identity of this community. This same analysis has allowed us to generate osteobiographies or micro-narratives of the life trajectory of specific individuals, framing them in the performance of different social roles.

5 "OF DUBIOUS CHARACTER": THE GENDERED RECEPTION OF WOMEN WITH BODY MODIFICATIONS IN THE ANCIENT MEDITERRANEAN

O'Keeffe, Amy (Trinity College Dublin)

There is an abiding impression that the people of the ancient world did not modify their bodies, and that those who did were social deviants. The archaeological evidence would indicate that a number of different modification types were carried out in the ancient Mediterranean, including artificial cranial modification, tattooing, and scarification. The incidence of modified bodies appears to be far higher among female individuals than male. In scholarly writings, the interpretation of these practices of a female majority repeatedly devolves into negative stereotypes. Women with altered crania are dismissed where their male counterparts are interpreted as being members of elite classes. Women with tattoos are almost unerringly labelled as concubines and as having low moral worth. Those with scarification markings on their faces are depicted as hysterical, and as ruining their aesthetic worth.

This paper will present a collection of case studies that demonstrate different body modification practices in the ancient eastern Mediterranean, and explore the significance of gender in these cultural practices. Particular areas of interest are the Cyclades in the Bronze Age (3200-2300 BCE), Cyprus in the Bronze Age (2600-1050 BCE), and Egypt in Dynasty XI (2150-1991). The significance and nuanced interpretations of this evidence has been stymied by biases within the discipline of archaeology. The purpose of this paper is to reassess the evidence for body modifications, and approach them through a multidisciplinary lens. Part of this reassessment is to critique the past scholarship of these modifications, and deconstruct these deeply rooted disciplinary biases, which affect numerous areas of archaeological interpretation, which is evidenced in this dynamic, yet intersecting, range of cultural practices being explored.

6 INTEGRATION THROUGH SEPARATION: THE DEVELOPMENT OF THE WOMEN'S SECTION IN THE MEDIEVAL SYNAGOGUE

Schöpf, Friederike (University of Münster)

Many traditions in today's Jewish religious practice are considered old-fashioned and an integral part of religion. However, behind certain traditions lies a long history of development. This is particularly striking when it comes to practices regarding issues of gendered religious traditions. The synagogue is part of this development. For a long time, modern scholars attributed the separation of women and men to the early synagogues of antiquity. However, the separation was only implemented during the Middle Ages. The new spatial concept of a separate women's section prevented a direct view of the prayer room. The exclusion of women was often referred to a male strategy, to keep the religious space clear from female influence.

However, rabbinic sources of the eleventh to the thirteenth centuries deliver a different view on this subject. The segregation of women is portrayed as a female concept to preserve tradition and piety. Did the establishment of women's synagogue therefore happen on the women's behalf?

This new research aims to change our perception of the character of women's synagogue and the reason for their development. By combining the archaeological and architectural evidence with the literal sources, a female approach to the subject is contemplated.

7 DETECTING WOMEN'S PRESENCE IN CASTLE ENVIRONMENTS THROUGH ARCHAEOLOGICAL AND HISTORICAL SOURCES

Vanecková, Daniela (Masaryk university)

The paper will discuss the presence of women in the castle environment, with a new progressive approach. Critically re-evaluated archaeological findings are linked with historical sources, allowing new conclusions to be drawn in the study of the role of women. The reconstruction of women's lives in the Middle Ages has so far only been investigated from historical sources, and archaeological evidence is often only interpreted in general terms without any connection to the presence of women. Women in the Middle Ages used various objects that we have recorded in written sources or period iconography. This large number of different objects, however, is not entirely preserved in the archaeological

evidence. With these objects (whether complete or in the form of fragments) there is a generalized interpretation of small objects, objects made of non-ferrous metals, jewelry, unspecified, etc., without gender determination. So, the woman is theoretically recognizable in material culture, but the objects she used are made of poorly preserved materials, unisex, or are poorly or not identified at all.

In a case study of known women (from historical sources) who lived at Rokštejn Castle, we will show what the possibilities of archaeology with a combination of historical sources are in detecting women in the castle environment. At Rokštejn Castle, there could be members of the noble family, their ladies-in-waiting, maids, and nurses for their children. Rokštejn Castle presents unique opportunities for exploring medieval society, and that's thanks to ongoing systematic archaeological research, which has lasted continuously since the eighties of the last century. An extensive file of data, which includes documents of material culture, and written and iconographic sources, allows, based on a review of already obtained data, the reconstruction of the quality of life of a woman in a castle environment during the High and Late Middle Ages.

8 HIP AT WHAT COST? HOW THE HUMAN FEMALE PELVIS HAS ADAPTED TO BIPEDALISM AND CHILDBIRTH: AN ONTOGENETIC PERSPECTIVE

Figus, Carla (Department of Cultural Heritage, Ravenna Campus, University of Bologna, Italy.) - Colombo, Antony (Department of Life and Earth Sciences, Ecole Pratique des Hautes Etudes (EPHE), Paris, France; Unite Mixte de Recherche (UMR) 6034 Archéosciences Bordeaux, Centre national de la recherche scientifique (CNRS) - Université Bordeaux-Montaigne, Pessac, France) - Bortolini, Eugenio (Department of Cultural Heritage, Ravenna Campus, University of Bologna, Italy.) - Ascanelli, Simona (University Hospital Ferrara, Italy.) - Bernardini, Federico (Department of Humanistic Studies, Università Ca'Foscari, Venezia, Italy; Multidisciplinary Laboratory, Abdus Salam International Centre for Theoretical Physics, Trieste, Italy) - Belcastro, Maria Giovanna (Department of Biological, Geological and Environmental Sciences, University of Bologna) - Carlson, Kristian (Department of Integrative Anatomical Sciences, Keck School of Medicine, University of Southern California, Los Angeles, CA, United States; Evolutionary Studies Institute, University of the Witwatersrand, Johannesburg, South Africa) - Ryan, Timothy (Department of Anthropology, Pennsylvania State University, University Park, PA, United States) - Benazzi, Stefano (Department of Cultural Heritage, Ravenna Campus, University of Bologna, Italy.)

The pelvis has undergone significant modifications throughout evolution towards efficient bipedal locomotion and the need to accommodate the birth of large-headed newborns. However, these modifications have led to consequences, and obstructed labor is now a significant global health challenge, contributing to 8% of maternal mortality worldwide. Many studies have explored the mechanics of the bony pelvis during bipedal locomotion and the role of the pelvic floor in facilitating the birth of large-headed newborns while maintaining efficiency in walking and running. Recent reviews have shown that high-risk labor is a multifactorial issue that includes gender inequality, poverty, malnutrition, infectious diseases, and short stature. However, there is a lack of understanding of the developmental perspective on the pelvis, which considers the biosocial context during growth. This perspective is crucial for a comprehensive understanding of pelvic anatomy. To address this gap, this new project, RISEN, a new MSCA-funded project, aims to explore the ontogenetic mechanisms that underlie pelvic development. RISEN seeks to unravel how external influences such as bipedalism and health status impact adult pelvic bony morphology. This project adopts an innovative and multidisciplinary methodology that leverages cutting-edge technologies and integrates biological and cultural data, such as economic and cultural background. The primary objective of RISEN is to present a compelling reinterpretation of pelvic morphology. By examining pelvic development through a biosocial lens, the project provides insights into the interplay between morphological features and biosocial dynamics. Ultimately, the project aims to offer society fresh tools for assessing the role that pelvic morphology plays in fetal delivery, igniting social and scientific debates about these issues.

This work is funded by the European Union under the Horizon Europe research and innovation program - Marie Skłodowska-Curie Actions, HORIZON-TMA-MSCA-PF-GF - n.101108385 - RISEN.

9 MATERNAL AND NEONATAL DEATHS IN 3RD-17TH CENTURY LITHUANIA: A STUDY BASED ON ARCHAEOLOGICAL, HISTORICAL, AND ETHNOGRAPHIC DATA

Valotkiene, Šarune (National Museum of Lithuania)

The aim of the presentation is to reconstruct the risks faced by pregnant women and mothers after childbirth during prehistoric and long historical periods in the territory of present-day Lithuania, utilizing an interdisciplinary research approach. The presentation will analyze archaeological, ethnographic, linguistic, and historical data.

So far, only 10 possible graves of dead pregnant women and mothers have been found among the abundant archaeological materials dating from the 3rd to the 17th centuries. This allows only cautious generalizations to be made, such as the inference that the deceased women were of childbearing age, and that almost all the newborn babies in these

graves were placed at the head of the deceased. The extremely fragmentary anthropological and archaeological material also hinders a more detailed study.

In order to reconstruct the various risks that could have led to the deaths of pregnant women and mothers and to better understand the fragmentary archaeological material, it was decided to analyse data from other disciplines, both contemporaneous and more recent, side by side.

Although it must be admitted that most of the data comes from later times, specifically from the 15th until the 17th centuries. Historical sources from this period abound on the plight of pregnant noble women. For example, a surviving will exist in which a woman in labour, anticipating her death during childbirth, documented her last requests. Less data is available on the life of peasant women, which is reflected in several beliefs and superstitions recorded during the Christian missions. A considerably larger amount of data comes from ethnography, folklore, and the Lithuanian language. While these sources provide a better picture of the situation of pregnant women and women in labour, unfortunately, they lack specific dates. On the other hand, the information encoded in these sources typically dates back to ancient times.

10 FOETAL AND FEMALE BODIES IN 4TH MIL. EGYPT: A COMBINED APPROACH ON PREGNANCY LOSS AND EARLY PERSONHOOD ACQUISITION

Barba Garcia, Pablo (Institute of Archaeology - UCL)

Feminist theories have recently highlighted the increasing individualisation and personification of the foetus in Western cultures. While the provision of personhood to foetuses might not be unique of modernity, archaeologists should be careful of individualising the foetus a priori in their studies, as this might incur in an unwanted imposition of western mentalities.

Drawing from these sources, this paper claims the necessity of studying foetal and neonatal remains in conjunction with the women's bodies. Resorting to the funerary record of Egypt during the 4th millennium BC, I analyse both the individual burial of foetuses and newborns, and of women who died during pregnancy, labour, and/or who were buried with the remains of foetuses and newborns. Paying attention to burial types and distribution of graves in the landscape, I argue that we can apprehend local understandings of personhood construction through the first moments of life.

My analysis shows an evident underrepresentation of foetal and infant remains under 6 months of age in burial spaces through the region, which cannot be exclusively adduced to post-depositional processes. These individuals are found in two different contexts. When in communal cemeteries, they always occur with women remains, either in utero or in the pelvic area—dystocia. Outside communal cemeteries, foetal and neonatal remains have been unearthed in individual burials in necropolises dedicated exclusively to children. Exceptionally, they are also found on their own in pot burials.

I conclude that, in these communities, foetuses and infants below 6 months might have not been considered as persons or individuals, but as part of the woman's body. It is argued that pot burials and child-only cemeteries could indeed embody female bodies. The paper highlights the possibilities for studying motherhood, foetal (non-)personhood, and emotional reactions to pregnancy loss in prehistoric communities behind this approach.

11 BORN IN A BROTHEL: NEW PERSPECTIVES ON CHILDCARE WITH MEDIEVAL SEX WORKERS

Poulain, Maxime (Ghent University) - Bon, Céline (Musée de l'Homme, Paris; UMR 7206 - Éco-anthropologie) - Palmer, Jessica (Ghent University)

Prostitution was omnipresent in medieval Europe. In the study of past sex work, historical studies have thus far mainly focussed on institutions and brothel keepers, which often pop up in the records (issuing rules or being fined for not paying taxes). The women who served in these houses, however, usually remain in obscurity. Archaeological sciences offer the potential to invert this perspective and get a better grip on the living and working conditions of female prostitutes in medieval society.

In this paper, we target a 14th-century brothel in the city of Aalst (Belgium). Excavations in 1998 revealed a three-month-old infant, buried in a corner of the building. This infant burial is being re-evaluated through combined isotopic and aDNA analyses. The results not only inform us about the care afforded to this child in a socially deviant environment, but equally provide new insights about its mother. For example, isotopes indicate that the Aalst infant was breastfed, nuancing dominant narratives of abortion and infanticide with prostitutes. Ancient pathogens, preserved in dental calculus or associated sediments, moreover show which diseases lingered in their living spaces and could possibly be passed on from mother to baby.

12 THE PERCEPTION OF MENOPAUSE IN THE PAST: COMBINING PALEOPATHOLOGICAL, ANTHROPOLOGICAL AND FUNERARY DATA

De Luca, Federica (University of Ferrara) - Zaccagni, Luciana (University of Ferrara) - Rinaldo, Natascia (University of Ferrara)

The term menopause refers to the point of time when the menstrual periods stop due to lower hormone levels. When studying past populations, menopause is considered a measure of "population health", and it gives us information on the social structure and beliefs of past societies, especially when anthropological, paleopathological, and funerary data are combined. In this study, we analyzed the skeletons of 52 adult females from the St. Biagio Cemetery (Ravenna, 17th-19th Century, Italy): 38 premenopausal and perimenopausal women (<50 years) (73.07%), and 14 post-menopausal women (50+ years) (26.93%). This study aims to: i) give an overview of the health status of these women and to highlight possible different roles between pre- and postmenopausal women in society; ii) gather information on the perception of menopause of this period. Concerning the index of frailty (BIF), the two categories fall into the medium frail category with an increasing trend with increasing age (40.01 vs 45.77, respectively). A high percentage of joint diseases and antemortem traumas (e.g. fractures of sternum and scapula) were reported both in pre and postmenopausal women. These results confirmed that women probably worked at all ages (just like men), as confirmed by historical sources. The perception of menopause by this past society could be reflected by the analysis of funerary treatment; in our skeletal assemblage, we found both normative and non-normative treatments in both pre- and postmenopausal women (e.g. marginalization in the cemetery). On the other hand, evidence of care and compassion by society has been shown for women of all ages. In conclusion, we can assume that generally women of all ages were well integrated in this society and no differences emerged in the comparison between peri- and postmenopausal women.

13 GENDER INEQUALITIES IN NORTHERN IBERIA: THE WOMEN BURIED IN THE CATHEDRAL OF SANTA MARÍA (VITORIA-GASTEIZ; 12TH-18TH CENTURIES)

Garcia, Nerea (Department of Genetics, Physical Anthropology and Animal Physiology, Faculty of Science and Technology, University of the Basque Country (UPV/EHU), Barrio Sarriena s/n 48940, Leioa, Bizkaia, Spain.) - Hervella, Montserrat (Department of Genetics, Physical Anthropology and Animal Physiology, Faculty of Science and Technology, University of the Basque Country (UPV/EHU), Barrio Sarriena s/n 48940, Leioa, Bizkaia, Spain.) - De-la-Rúa, Concepción (Department of Genetics, Physical Anthropology and Animal Physiology, Faculty of Science and Technology, University of the Basque Country (UPV/EHU), Barrio Sarriena s/n 48940, Leioa, Bizkaia, Spain.)

The archaeological intervention carried out in the Cathedral of Santa María (Vitoria-Gasteiz, Spain) revealed an extensive and complex funerary use of the temple, resulting in one of the largest skeletal collections in the Iberian Peninsula (N≈2200 burials). The study of a sub-sample of individuals randomly selected from all the burial areas of the temple (N=472) has provided insights into the biological and social structure of this human group. Specifically, we focused on the analysis of women in the population of Vitoria-Gasteiz between the 12th and 18th centuries, using a multidisciplinary approach that includes anthropology, palaeodemography and palaeopathology.

The higher proportion of women in this population represents an unusual finding compared to other similar parish cemeteries. This result could be partly explained by a differential migration of women from rural to urban areas in search of better living conditions; however, the preference of men to be buried in other convents and/or monasteries of Vitoria-Gasteiz instead of in the Cathedral because of their higher spirituality could also have contributed.

The palaeodemographic analysis reveals sex differences in mortality profile (χ^2 ; $p=0.01$), with women dying earlier, especially between the ages of 25 and 35. This difference, traditionally attributed to reproductive risks, may have been accentuated by possible differences in social status, which increase women's vulnerability to health problems at a younger age than men. However, a lower prevalence of arthropathies in women is observed in this population, which in this case may be related to their earlier mortality, as detectable joint lesions in skeletal material require some time to develop and evolve.

In conclusion, the differences between men and women in the migration and burial patterns, the mortality profile, or the health status, may be interpreted in terms of gender inequalities in the medieval population from Vitoria-Gasteiz buried in the Cathedral of Santa María.

14 SEX-RELATED VARIABILITY IN THE ANCIENT ORAL MICROBIOME

Ham, Allison (Pennsylvania State University) - Weyrich, Laura (Pennsylvania State University)

The human oral microbiome influences the manifestation of several chronic diseases that disproportionately impact females (e.g., dental caries, rheumatoid arthritis), and its reconstruction through aDNA technology represents a novel approach for understanding sex-specific patterns of health in the past. While several genetic, environmental, and

behavioral factors are known to influence the oral microbiome, a lack of consensus exists on the effect of sex on the composition of these microbial communities within archaeological contexts. This study reexamines sex-specific variability in beta diversity (differences in taxonomic composition) in the ancient oral microbiome using sequenced dental calculus samples from nine London cemeteries (~1000-1900 CE). Sex estimates were taken from the Wellcome Osteological Research Database, and all statistical analyses were performed using QIIME2. An ADONIS test was used to examine the effect of sex on taxonomic composition with several variables incorporated into the model that are known drivers of beta diversity within the sample, including dominant taxa (*Methanobrevibacter*, *Streptococcus*), time period, and tooth type. Dominant taxa, tooth type, and sex had an effect on beta diversity, and the sample was separated into subsets using dominant taxa and sex to further explore these results. ADONIS tests were performed for each dominant taxa with sex and tooth type included in the model. Tooth type had a significant effect on beta diversity in both taxonomic communities, but not sex. When only females were analyzed both dominant taxa and tooth type affected beta diversity, and no interaction was observed between the two variables. These preliminary results demonstrate that a higher proportion of females had *Streptococcus*-associated oral communities, which are linked to high-carbohydrate and dairy consumption. Overall, these findings suggest that gender differences in diet may have driven taxonomic composition within the sample, but further analysis is needed to understand how these differences impacted past patterns of female health.

15 **TWO ARMED FEMALE BURIALS FROM THE ENEOLITHIC NECROPOLIS OF CELLETTA DEI PASSERI (FORLÌ, NORTHERN ITALY): ARCHAEOLOGICAL, ANTHROPOLOGICAL AND PROTEOMIC ANALYSES**

Nicolosi, Teresa (Department of Cultural Heritage, Alma Mater Studiorum University of Bologna, Bologna, Italy) - Miari, Monica (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara, Bologna, Italy) - Silvestrini, Sara (Department of Cultural Heritage, Alma Mater Studiorum University of Bologna, Bologna, Italy) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität, Frankfurt am Main, Germany) - Vazzana, Antonino (Department of Cultural Heritage, Alma Mater Studiorum University of Bologna, Bologna, Italy) - Sorrentino, Rita (Department of Biological, Geological and Environmental Sciences, Alma Mater Studiorum University of Bologna, Bologna, Italy) - Belcastro, Maria Giovanna (Department of Biological, Geological and Environmental Sciences, Alma Mater Studiorum University of Bologna, Bologna, Italy) - Benazzi, Stefano (Department of Cultural Heritage, Alma Mater Studiorum University of Bologna, Bologna, Italy)

This contribution focuses on the prehistoric necropolis of Celletta dei Passeri (Forlì, northern Italy), excavated between 2009 and 2010 and dated to the Eneolithic period (3.350-2.580 cal BC). It includes 75 graves, among which only 51 contain human remains, along with the burial of a dog. Most of the burials are single primary depositions, even if many of them show traces of manipulation practices related to displacement and removal of skeletal elements. Unexpected and significant data emerged concerning the typology of the grave goods and the sex of the individuals. All individuals are generally provided with a jug placed at their feet, without any apparent gender or age distinction. Flint artefacts and arrow-heads are common among males and young individuals. On the other hand, seven burials are distinguished by the presence of copper axes and/or daggers within their funerary goods. Osteological analyses, firstly performed by the University of Venice, immediately suggested that two of these could be attributable to female individuals. Consequently, following the re-assessment of the biological profile by means of traditional anthropological analyses, we run enamel peptide analyses, aiming at detecting the presence of sexually dimorphic variants of the protein amelogenin (AMELX and AMELY) and reinforcing the sex estimation. Results confirm that five individuals are males, while individuals buried in tombs 27 and 75 are females. Significantly, these latter were buried in proximity to armed male burials (tombs 25 and 74, respectively). Moreover, individuals 25 and 27 were 14C dated to the same period, suggesting potential social or familiar ties during life. These findings represent the first documented cases of armed female burials in Italy during the Eneolithic period, likely linked to a distinctive social status or rank held by these individuals within their community, providing insights into the prominent role played by women in increasingly complex societies.

16 **WARRIOR BURIALS AND OTHER MYTHS FROM THE LATE BRONZE AGE IN GREECE**

Albanese, John (University of Windsor)

The interpretation of the “Griffin Warrior” burial at Pylos and other similar burials are derived from and have served to reinforce gendered biases of our understanding of the Late Bronze Age. The focus on preconceived modern biases about masculinity projected into the past has contributed to the invisibility of women, children, and non-binary people during this and other periods in Greece and elsewhere. The systematic assessment of the fragmentary and commingled remains from a Late Helladic tholos tomb and ossuary at Tzannata on the Greek Island of Kefalonia is revealing that individuals of all sexes and ages were included in these monumental tombs. Following a review of the overall pattern of burials and mortuary practices in each tomb, the focus of this paper is on a case study involving one individual whose biological sex was almost certainly female and who was buried with a large amount of bronze. The goal of the

paper is to demonstrate that a more inclusive approach where maleness and masculinity are not the focus of research can lead to a better understanding of the lives and deaths of all people during the late Bronze Age.

17 **BEDLAM, BAGS, AND BURIAL RITES: FEMALE HIP ASSEMBLAGES IN EARLY MEDIEVAL BRITAIN**

Fry, Megan (University of Florida)

Before the wide-scale adoption of Christianity in Britain, burials included a wide variety of grave goods, often signaling status, ethnicity, and varied by demography. This study explores objects included in female graves which have been interpreted as bags worn about the hip. Although sometimes worn, some were often placed in the grave during the funerary ritual after the body was already placed. The function of the objects included within the bags is not always obvious (e.g., a pottery fragment, or a broken wrist clasp). This indicates that these items had a great personal, social, or cultural meaning than what is evident now. They are generally associated with burials that are of ‘high status’, or with burials that have previously been described as ‘deviant’. The latter often being interpreted as possibly representing a witch or sacrificial victim. These interpretations are far too simplistic, and generalizations remove any nuance and agency within this behavior. These hip assemblages are explored through the lens of materiality to ascertain the social and ritual significance behind this complex burial practice.

18 **RECONSTRUCTING WOMEN'S IDENTITIES IN ROMAN SALONA (DALMATIA) THROUGH FEMALE BURIALS AND GRAVE GOODS IN THE WESTERN NECROPOLIS**

Banovac, Ivana (Archaeological museum Split) - Jadrić-Kučan, Ivana (University of Zadar)

Due to its relatively good preservation, Salona, once the capital of the Roman province of Dalmatia, offers an extraordinary insight for learning about and understanding ancient Roman society. Systematic archaeological research in the city of Salona began as early as the 1820s and was first carried out on the city's Western necropolis. It has since been continuously explored and studied. Two centuries of research resulted in the discovery of an exceptional amount of rich archaeological material that will, for this purpose, serve as a source for interpreting the lives of Roman women within that city community. In this contribution, we will discuss the findings from an excavation campaign that took place in 1986 and 1987 during which a total of 615 graves dating from the 1st to the 5th century AD were found. Research will be based, primarily, on analysing artefacts found in the context as grave goods, specifically gendered and age related materials that could indicate female burials. In cases where skeletal remains don't offer sufficient information due to poor preservation, these analyses will be supported by osteological reports from excavations and, if possible, by analyses of skeletal remains conducted using methods of forensic anthropology. This material, which is still in the early process of being analysed and published, helps shed light on the characteristics and diversity of the city's population, especially women whose extremely important role in that society has been a somewhat neglected topic in the discussions of local scholars. This research aims to try to identify female burials based on preserved grave goods and grave architecture and to analyse the funerary rituals to reconstruct the identity and social status of women in Salona for a better understanding of the role of women as the important members of that community, as well as the entire Roman society.

19 **SCULPTING THE SKULL. PATTERNS OF SEX-BIASED TREATMENT OF THE DEAD IN THE EARLY IRON AGE ROMANIA**

Constantinescu, Mihai (Faculty of History, University of Bucharest)

The Early Iron Age Babadag culture (10th-9th century BCE), is known for its large number of settlements and the absence of cemeteries. However, numerous “deviant” burials have been excavated in every settlement archaeologically investigated in various habitat structures. The skeletons recovered are in different states of preservation and completeness, either in anatomical position or with parts of the skeletons and scattered bones found in partial or with no anatomical connection. Adult individuals represent the majority, with children being less represented in the available sample.

After analyzing the cause of death and the pattern of dismemberment of some individuals, a distinct treatment pattern for males and females emerged. Some of the males showed lesions on the skulls associated with deliberate perimortem deadly violent actions. In contrast, several female skulls found in different sites had their skulls intentionally processed post-mortem, using similar tools and techniques. These skulls were intentionally cut and chipped out, using similar blunt and sharp tools and similar techniques in order to remove them from the rest of the corpse and possibly prepare them for exposure and further manipulation within the settlement. These similar patterns of fragmentation lead us to the deduction that “specialists” might have existed in the Babadag settlements to perform such procedures and that some female skulls remained within the community of the living for longer periods.

This study highlights sex-differentiated patterns in the treatment of the dead, based on individual-level causes of death in the Lower Danube region during the EIA, which might arise as a result of the identity or character of the individuals. These treatments are discussed in the wider contemporary south-east European context regarding macabre funerary practices, using bioarchaeological and historical information to understand the socio-cultural aspects related to this unique practice of female skull processing and post-mortem manipulation.

20 **RETHINKING GENDER MODELS: A PRELIMINARY ANALYSIS TO RECONSIDER WOMEN'S FUNERARY IDENTITY IN BURIALS FROM THE MIDDLE NEOLITHIC NORTHERN ITALY**

Colli, Laura (Università degli Studi di Siena) - Pizziolo, Giovanna (Università degli Studi di Siena) - Mariani, Pier Paolo (Università degli Studi di Siena)

This work, still in progress, is focusing on assessing the variations of gender identities in funerary records from the Square Mouthed Pottery Culture of Northern Italy.

Methodologically, it draws inspiration from the most recent theories of feminism and gender studies, such as Judith Butler's ideas on the performativity of gender, and their reflection on archaeological interpretations of sex, identities, and roles. Considering gender as a continuum of variations and not a fixed paradigm was the starting point to rethink some of the previously proposed gender models for the SMP culture: such models were based on dichotomous and presentist ideas that connected men with symbols of power, hunting and violence, while relegating women to an ancillary role, strictly associated with maieutic and domestic activities.

Thus, after collecting all the legacy data available, the information has been organized in a database, then, the 398 burials were analysed through descriptive statistical analysis, with a focus on the association between the sex of the individual and the grave features, that would point out the presence of preferential links and connections between certain rituals or objects and the sex of the buried. This method underlined the existence of a richness in the funerary culture, which might be representative of a more fluid concept of identity. Specifically, the funerary record for women shows a great variability of connections depending on the differences in age and, possibly, status, with individuals buried with complex and diverse features, that oftentimes diverge from the role proposed in previous models.

21 **WOMEN OF POWER? EXPRESSIONS OF GENDER, POWER AND IDEOLOGY IN THE NORDIC BRONZE AGE C. 1300 - 900 BC**

Felding, Louise (Vejlemuseerne)

With a focus on gender, power, and ideology, the aim is to investigate expressions of gender from the transitional period around 1300 - 900 BCE in the Nordic Bronze Age. This period marks the shift from the early to the late Bronze Age in the Nordic region and is characterised by a significant ideological change, as well as marked by disruptions in extensive import networks. The ideological shift is observed in the material culture as a change from inhumations to cremations and a rise of votive depositional practices.

Through network analyses of burials and deposits from the early and late Nordic Bronze Age expressions of identity are analysed with the overall aim to examine a potential change in the gendered material expressions. Objects related to the female sphere appears to dominate the depositional assemblages and therefore the role of women and their visibility in the public sphere and in Bronze Age religion is noted. These observations seem to contrast statements from older historical sources dating back to Homer that describe a structural exclusion of women from the public and political sphere. Such exclusion is not clear based on the material evidence from the Nordic Bronze Age suggesting that powerful women of the past have been overlooked.

835 **THE HORSE IN ARCHAEOLOGY: AN INTERDISCIPLINARY APPROACH FOR UNCOVERING RELATIONS BETWEEN HORSE AND HUMANS IN THE PAST**

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Coimbra, Fernando (Polytechnic Institute of Tomar, CGeo, Coimbra University) - Gheorghiu, Dragos (Doctoral School, National University of Arts, Bucharest) - Golec Mirová, Zuzana (Charles University Prague; Institute of Archaeology of the Czech Academy of Sciences, Prague) - Schifter Bagge, Merethe (Museum Skanderborg) - Sundkvist, Anneli (Societas Archaeologica Upsaliensis; Equine History Collective)

Session format: Regular session

The horse has been part of human history for thousands of years, having multiple roles: prey, source of raw materials and food, mount, "war machine", co-worker, and companion are just a few examples of the outcome of horse and human relations through the millennia. This large diversity can be analyzed through e.g. economic, social, artistic and mythological aspects. The horse-human interactions are visible in many different types of sources: archaeological, historic, iconographic, symbolic and technological, just to mention a few.

We invite speakers to explore this grand area of different aspects of this long history and relationship in a session with two main focuses:

1) The archaeological, historical, cultural and artistic study of horses in its different contexts. Iconography available on several archaeological and historical remains such as prehistoric art, sculptures, numismatics, mosaics, and frescoes, among other artistic manifestations of very different chronologies allows us to understand better the importance of the horse in the History of Humankind and development of civilization, mainly after the domestication process.

2) Equestrian archaeology in the 21st century with the starting point in the horse as an animal. This highlights the need to bring horses, horse-related artefacts and 'horse people' within archaeology into a disciplinary field of research. Topics such as horse breeding, the evolution of horsemanship, and the art of riding, just to mention a few examples, cannot be studied based on archaeological artifacts only. In the growing field of equestrian studies, all types of sources and methods that help us to understand past relations between horse and man are welcome and needed.

ABSTRACTS

1 **CONTRIBUTING TO THE HISTORY OF EQUIDS: THE PORTUGUESE ARCHAEOZOOLOGICAL RECORD FROM THE PALAEOLITHIC TO THE BRONZE AGE**

Guinot, Catarina (Universidade de Évora, PT) - Almeida, Nelson (CHAIA, Universidade de Évora, PT; UNIAHQ, Universidade de Lisboa, PT)

Equids have had an important and changing role throughout history and human-equid relations can be discussed from different perspectives. Several colleagues try to understand human-equid relations under a broader socio-cultural and ideological framework, while their characterisation under a more "traditional" framework can still be highly informative albeit mostly from an economic point-of-view. Focusing on Western Iberia, the archaeozoological record shows a fluctuating frequency of equid species through time, with variables such as changing palaeoenvironment, different geographies, or even socio-cultural and ideological aspects having had varying influences on their representativeness or body part presence in faunal profiles. Even if the prehistoric and protohistoric records of equids might not be the most abundant in comparison to other species, they nonetheless provide important information if one is to try and discuss their paleoeconomic relevance under a longue durée perspective. We provide a state-of-the-art archaeozoological record of equids' presence in current Portuguese territory, aiming to discuss their importance, mostly focusing on their "prey status", and how it changed from the Palaeolithic to the Bronze Age.

2 **ON TECHNOLOGY TRANSFER, ICONOGRAPHY, AND HORSES IN THE CUCUTENI-TRIPOLYE AND STEPPIC TRADITIONS**

Gheorghiu, Dragos (National University of Arts - Bucharest)

In the 5th millennium BC, in the western and northern Pontic area, the Cucuteni - Tripolye tradition begins a slow diffusion towards the east, exporting to the steppe populations a series of cultural elements.

In the Cucuteni - Tripolye tradition among domestic animals, cattle are present both in the osteological record and in ceramic miniatures. The painting of some of the miniatures suggests that cattle were used for yoke traction.

Of the wild animals, the horse is rare in the diet in the western part of the tradition until late but is present in the eastern part of the tradition, closer to the steppe populations. However, the horse is absent in all artistic representations.

In contrast, for steppe peoples the horse represented an important animal, both as a food source, as an image of prestige in the form of amulets or 'sceptres', as ritual deposition in fragmentary - rhetorical form in funerary contexts, or as a riding animal and emerging means of transport.

Towards the end of the Cucuteni - Tripolye tradition a change in diet is observed, with osteological remains of horses present in greater quantities, denoting a change in mentality and economics.

The iconography of ceramic painting from the same period begins to contain iconic images of dogs and people with dogs, probably evoking hunting scenes.

The present paper examines the differences and similarities in the perception of cattle and horses, as well as possible technological transfers between the two cultural blocks.

A case study is the analysis of a rare image of a horse, from a complex narrative scene painted on a Cucuteni Phase B vessel, which suggests the emergence of a use of the horse different from that of a simple food source.

3 THE HORSE IN THE ART OF THE KOBAN CULTURE

Makhortykh, Sergey (Institute of Archaeology Ukrainian Academy of Sciences, Kyiv) - Kotova, Nadia (Institute of Archaeology Ukrainian Academy of Sciences, Kyiv)

One of the recurring artistic motifs in Koban Culture imagery of the Late Bronze - Early Iron Age is the horse which occupies an important part of its visual framework. It is worth noting that the main centre of their distribution is not in the plains, but in the high mountains of the Central Caucasus (Koban and Tli cemeteries). Horses are represented here as the volumetric cast bronze figures or their parts (protomes), as well as in the form of engraved images on metal artefacts (axes, belts, etc.). Not all horse images are the same and it is possible to distinguish them stylistically. There is also a distinct gender specificity, as evidenced by the fact that horse figurines and pins ending in two symmetrical horse heads facing in opposite directions are associated with female burials, while axes, daggers and cheek pieces decorated with various horse images/compositions (rider on horseback, horse led by neck yoke, etc.) are characteristic of male burials. What these people have in common is that they were both holders of sacred and/or military power, while the horse would have been an emblem of status. An innovative artistic tradition associated with the depiction of the horse and its elements spread in the Koban Culture in the 9th - 8th centuries BC. This was the time when the cult of the horse and its associated deities developed in the North and Central Caucasus, an important manifestation of which was also the discovery of bridles in tombs and the presence of horse burials themselves. The appearance of horse images in the art of the Koban Culture can be seen as a local response to particular impulses triggered by intensive intercultural contacts with the horse-breeding centres of Eastern Europe and Western Asia.

4 ROCK ART ENGRAVED HORSES AND NARRATIVES FROM THE MINHO REGION (NORTHWEST OF PORTUGAL): SOME ARCHAEOLOGICAL EVIDENCE FROM A PREVAILING "HORSESCAPE."

Sampaio, Hugo Aluai (Laboratorio de Paisagens, Património e Território (Lab2PT); Centro de Investigação, Desenvolvimento e Inovação em Turismo (CiTUR); Laboratório Associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território (IN2PAST); Departamento de História do Instituto de Ciências Sociais da Universidade do Minho; Escola Superior de Hotelaria e Turismo do Instituto Politécnico do Cávado e do Ave) - Coutinho, Luís (Unidade de Arqueologia da Universidade do Minho) - Ana, Bettencourt (Laboratório de Paisagens, Património e Território (Lab2PT); Departamento de História do Instituto de Ciências Sociais da Universidade do Minho) - Cardoso, Daniela (Centro de Geociências da Universidade de Coimbra (CGEO); Laboratorio de Paisagens, Património e Território (Lab2PT))

Archaeological records attest the figurative (naturalistic or schematic) engraving of equines sparsely between the South of Galicia (Rias Baixas, Spain) and river Ave (North of Portugal). Roughly considered from between the end of the 3rd and the end of the 1st millennium BCE, they may share its presence with circular motifs (solar symbols?), weapons, or vessels, or can appear isolated, in herds, mounted or "accompanied" by anthropomorphs.

Considering the known set of horses depictions in the Northwest of Portugal, this work will address, among other, issues related to their proximity to distinct rock art manifestations, their orientation, alignment, relation, and positioning to other motifs, or even its interlinking with other horses and (sometimes armed) horseman. Denouncing processes of addition perpetrated over time, to maintain or change the significance of the sites, reflecting cults to the solar horse or metaphorizing mythical or daily narratives, horse engravings also reflect the socio-ontological transformations occurred from the regional Late Bronze Age onwards and during the Iron Age.

Nevertheless, the horse was always seen as communally crucial. Its socioeconomic, ideological, ritual-symbolic meaning can be inferred by the role assumed in some narratives: functioning as a "tool" or a "power device", among other meanings, its significance endured more than 2000 years. Being part of the local imaginary until the XX century, the presence of legends and beliefs, toponymy, and even some local habits directly and indirectly related to horses, shows its perseverance over time until global progress gradually replaced traditional lifestyles.

Curiously, its local significance prevails in the landscape due to the presence of Garranos. Elements of this breed, domesticated and used for different purposes, still living in semi-wild or wild states in herds, interlink past and present, leading us to propose the concept of "horsescape" and horses as referentials in the landscape of Minho.

5 REFLECTION OF THE HORSE IN MATERIAL CULTURE IN MORAVIA (CZECH REPUBLIC) IN THE URNFIELDS AND HALLSTATT PERIOD

Golec Mírová, Zuzana (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic; Charles University Prague)

The horse, a majestic and noble animal. During prehistoric times and especially during the Bronze and Iron Ages, a unique relationship between man and horse was formed. From a hunted, consumable animal, to a luxury "item" of the highest social classes, to a companion in battles and duels, and even a friend. The issue of horses and the sources associated with them has long been neglected in the Late and Final Bronze Ages and Hallstatt Period (1300-450

BC) research in Moravia (Czech Republic), although it offers considerable potential for research into typological and chronological issues, and subsequently also socio-economic, religious, communication and many other topics. Comprehensive research on the horse not only aids in understanding its specific role in prehistoric societies but also provides insights into prehistoric society as a whole. The association of horses with the elites of these periods is crucial – chiefs, magnates and princes and princesses manifested their power through the possession of horse, which was a luxurious article. The paper explores various categories of materials from the studied periods, including wagons, chariots, yokes, horse harnesses, riding equipment, depictions, and remains. The contribution focuses particularly on the relevance to chronology, long-distance travel and social disperse of the horse.

6 HORSES DURING THE EUROPEAN BRONZE AGE AND IRON AGE

Coimbra, Fernando (Polytechnic Institute of Tomar, CGEO, Coimbra University)

During the Palaeolithic horses were only useful for their meat for nourishment, skin for clothing and bones for making tools. After the domestication process, in the Neolithic, the milk of mares is included in nourishment, as for example in Central Asia.

With the Metal Ages and the development of complex societies this animal acquires a larger importance regarding simultaneously a social, economic, military and mythological level, with several roles that were not seen before.

This paper analyses some of these roles among European societies of the two last millennia BCE, focusing on data available through archaeological excavations, iconography and written sources. In what concerns iconography, there are examples taken from rock art, pottery, sculpture, funerary tombstones, among other cases, which allow to understand better the importance of the horse as a "war machine", a help in hunting, mean of transport, status symbol and a psychopomp animal. This last characteristic can be seen for example in Ancient Greek texts such as Iliad (XXIII, 171-2), where Achilles ordered a sacrifice of four horses over the funerary pyre of his friend Patroklos, killed in Trojan war, in order that they could lead his soul to Hades' kingdom, the Otherworld, being the horse considered to be a guide of souls in the afterlife.

In the Bronze Age and Iron Age of Southern Europe the horse appears associated with elites of an equestrian character, which constitute a true aristocracy seen through rock art examples from Greece, Italy, Spain and Portugal.

Also archaeological excavations in several different countries sometimes contribute with findings of artefacts related to a horse culture, which allow a better understanding of the importance that this animal had in the development of civilization.

7 HORSES AND HORSE EQUIPMENT IN THE LATE HALLSTATT SOUTH-EASTERN PANNONIA

Dizdar, Marko (Institute of Archaeology, Zagreb, Croatia)

The Late Hallstatt period in the south-eastern Pannonian plain is mostly defined by a group of finds from women graves attributed to the Sarmatian group. The number of investigated cemeteries is not large, and separate horse burials with or without horse equipment were also found in some of them. These burials, as well as the graves of the deceased, have been dated to the 5th and 4th centuries BC. A phenomena of horse burials in the Late Hallstatt cemeteries has been documented over a wide area from northern Italy to the Lower Danube and the northern parts of the Carpathian Basin. Zooarchaeological analyses were carried out on some remains of horses from cemeteries of the Sarmatian group, which indicate the possibility of trade and exchange of horses, and probably their equipment, between different communities. Horse equipment were found in some horse burials of the Sarmatian group, while in some it is missing. Also, horse equipment was found on other sites of the Sarmatian group, and probably originate from destroyed graves. Different forms of horse equipment are recognized, most often different shapes of iron bits. The decorative bronze fittings stand out, which indicate contacts with the Lower Danube region. In the last research in Croatian Danube region were recorded bronze phalerae of the Magdalenska Gora type, indicating cultural connectivity with the south-eastern Alpine area, and/or with the northern parts of the Carpathian Basin where the Vekezug culture spread. Finds of horse equipment of the Sarmatian group indicate existing of cultural connectivity between different Late Hallstatt communities, which is also shown by the items of women's costumes and jewellery. These communities used the same objects of horse equipment, with inclusion of new forms through different kinds of transfers and exchange, and which may have been used for display of complex social identities.

8 HORSE AS A HISTORICAL AND ARCHAEOLOGICAL SOURCE, AND AS A CULTURAL MONUMENT. CASE STUDY: CRETAN HORSE

Klontza-Jaklova, Vera (MUNI - Ústav archeologie a muzeologie)

The Cretan (or Messara, Giorgalidiko) horse or pony was mentioned for the first time in 1895 by the Ottomans as a distinct and specific breed of horse. This horse has a much longer history dating back to prehistoric times. The paper presents archaeofaunal, iconographic, and historiographical information supporting its roots in the Bronze Age and

the development of horse culture on the island. The Cretan horse is considered to be part of local tradition, a historical source, and an integral part of Cretan cultural heritage. The specific geographical, climatic, historical, and cultural conditions of the island, as well as the needs of the island's population, have shaped its characteristics. However, the Cretan horse remains poorly documented and is threatened with extinction. We also try to answer the question of why this is so.

The paper argues that even a living culture (in this case horses) can serve as a fully-fledged archaeological and historical source and that a great deal of information can be obtained by studying the living horse population and the current equestrian culture. It also argues that specific breeds need to be protected as inorganic monuments.

9 HOLD YOUR HORSES! NEW INSIGHTS INTO THE EARLY IRON AGE EQUID BURIALS IN SLOVENIA

Škvor Jernejc, Brina (Research Centre SAZU, Institute of Archaeology) - Toškan, Borut (Research Centre SAZU, Institute of Archaeology) - Turk, Peter (National Museum of Slovenia)

In the eastern Hallstatt culture, horses were considered as an expression of the social status and identity of the Early Iron Age elites. Their sacrifice and burial are connected with socially privileged individuals, commonly men, who could be regarded as leaders of local communities with the highest political, military, economic and possibly religious power. In this paradigm, the ritually offered horses served as companions on the last journey of the deceased and at the same time as a symbol of the highest social rank. The custom has its roots in the Late Bronze Age, where it is traditionally associated with the emerging warrior elite.

Of the several dozen horse graves known from the East Alpine Hallstatt region, almost half come from the Dolenjska Hallstatt group in the south-eastern Alpine region. A further fifteen burials have been reported for other Hallstatt cultural groups from the area of present-day Slovenia, with four independent horse burials, not directly associated with human graves, from the Most na Soči site in the west of the country demonstrating prevalent influences from the neighboring Venetians. We present here part of the results of the first comprehensive archaeozoological study of horse remains from the Late Bronze Age and Early Iron Age cemeteries of the south-eastern Alpine region, combined with a detailed analysis of selected associated contexts and several newly obtained ¹⁴C dates. The list of topics addressed includes the timing and form of the earliest deposition of equine remains in human graves, the main cross-group differences in horse-related burial rituals, and the justification of the traditional association of horse depositions with exclusively male individuals of higher social status.

10 HORSE SACRIFICES IN THE ROYAL HELLENISTIC NECROPOLIS OF THE GETAE IN SBORYANOVO NATIONAL RESERVE, NE BULGARIA. OVERVIEW OF STUDIES.

Gergova, Diana (National Academy of Arts) - Gergova, Diana (Academy of Art, Sofia,; BNC - ICOMOS Bulgaria)

The large-scale interdisciplinary research of the Hellenistic royal necropolis of the capital of the Getae in Sbornovo from 1982 to now reveal the important place of the horse in the specific beliefs and funeral practices of immortalization of the Getic elite and of the two Getic rulers Kotela and Dromichaites, whose burials have been identified in the Southern and in the Northern group of tumuli of the necropolis.

Horses of different age and use in life are found in the tumuli in a wide variety of contexts, some of them raising the question of their ethnical peculiarities and phases of the realization of these burial rites. Diversity in the poses of the sacrificed horses, including the unique for the Getae „levade” pose, suggests not only chronological differences, but also some ideological nuances.

The scope of the traditionally applied interdisciplinary approaches in the interpretation of palaeozoological materials in Sbornovo has been broadened in the frame of the Bulgarian-Swiss collaboration in the last years. The strontium analyses of the remains of some of the sacrificed horses, which will be reported in a separate paper, is a new step towards deepening our knowledge about the relations between horse and humans in the world of the Getae.

11 THE ROLE OF HORSES AND HORSE FIGURINES IN THE SANCTUARY OF OLYMPIA

Patay-Horváth, András (Eötvös Loránd University, Budapest; Magyar Régészeti és Művészettörténeti Társulat)

During the Early Iron Age (10th-8th c.), small bronze animal figurines were dedicated at Olympia in exceptionally large numbers. I have already discussed the bovines in detail, in the present paper I focus on the horse figurines and extend the inquiry on the entire period of pagan Antiquity.

It is usually assumed that horse figurines were somehow related to (local?) horsebreeding and were dedicated by local or external owners of these animals. In general, horses were certainly bred and were clearly regarded as prestige goods representing wealth and status during later centuries as well, but the dedication of horse figurines was mainly restricted to the Geometric period. The communis opinio, however, does not offer any explanation for this change, i.e. for the

disappearance of these votives after ca. 700 BCE. The basic reason for dedicating the animal figurines and for their conspicuous accumulation in the sanctuary of Olympia is not satisfactorily explained either.

As an alternative theory, I argue therefore that the figurines did not represent domesticates but wild or feral animals hunted and/or captured around the sanctuary. This idea can be corroborated by comparing other votive assemblages of similar animal figurines from Geometric Greece and from other regions dating from prehistory to modern times. Some confirmation also comes from ancient written sources dealing with relevant, i.e. horse-related cult phenomena at Olympia and elsewhere. The scattered pieces of evidence suggest a reconstruction of ritual practices based on capturing feral horses living around the sanctuary and thus explaining the large numbers of dedicated figurines as well as their disappearance approximately at the same time as the equestrian contests were introduced at the Olympic Games.

12 HORSES AND HUMANS: AN INTERDISCIPLINARY STUDY OF THE SECOND IRON AGE NECROPOLIS IN SBORYANOVO (BULGARIA)

Desideri, Jocelyne (Archaeology of Africa & Anthropology Laboratory (ARCAN) University of Geneva) - Gergova, Diana (Bulgarian Academy of Sciences, Sofia, Bulgaria) - Rosselet-Christ, Deborah (Archaeology of Africa & Anthropology Laboratory (ARCAN) University of Geneva) - Kottas, Georgios (Archaeology of Africa & Anthropology Laboratory (ARCAN) University of Geneva) - Gios, Matteo (Department F.-A. Forel for Environmental and Aquatic Sciences, University of Geneva, Switzerland) - Anastassov, Jordan (Institute of Archaeology and Classical Studies, University of Neuchâtel, Switzerland)

The Sbornovo archaeological reserve in northeastern Bulgaria covers an exceptionally rich area of almost 800 hectares and testifies to the existence of an important political, economic and religious center - probably a capital - associated with the Getic kingdom during the Second Iron Age. The excavated complex includes an urban centre, sanctuaries and necropolises with more than a hundred burial mounds, two of them containing royal burials.

Since 2014, a Bulgarian-Swiss mission has been conducting interdisciplinary archaeological research in the necropolises of the archaeological reserve. The data collected since the beginning of the systematic investigations in 1982 represent the most important series of remains from an aristocratic funerary context of the 4th-3rd centuries BC on the scale of Bulgaria - and the Balkans in general. The aim of the project is to characterize, in the broadest sense, the funerary occupation of this area. To date, nine survey and excavation campaigns have been carried out, and research is still ongoing. They involve an international team of about thirty researchers and students, mainly from Switzerland, Bulgaria, France and Belgium.

Far from being simple necropolises, they have turned out to be privileged spaces with monumental structures in which the animal has a privileged place alongside the human. This presentation deals with the study of mobility by strontium isotope analysis of animals (horses and dog) buried in two Second Iron Age burial mounds discovered in the Sbornovo archaeological reserve. The results obtained reveal a very interesting story about the lifestyle and treatment of the animals deposited in these funerary structures.

This study - the first of this kind on animal bones in Sbornovo - is part of a broader ongoing program focusing on all human and animal remains found in the Archaeological Reserve.

13 ABOUT HEROES AND HORSES. THE COMMON ICONOGRAPHY OF HORSEMAN DEPICTIONS IN THE CONTEXT OF SUMPTUOUS TOMBS (4TH-3RD CENTURIES BC.)

Sorin, Clesiu (Bucharest Municipality Museum)

The presentation will focus on the relationship between the horse and the rider during the 4th-3rd centuries BC, within the Thracian-Getic political structure when the horse has a privileged status transferred to the horseman, who becomes not only a formidable fighter, but also a figure whose role among the elite is to legitimately administer territory.

As a result, the horse ownership has turned from a close relationship, into a community endeavor when the management of the relationship with the horse, acquired a social dimension.

In fact, from the 4th century BC, riding horses that are specially bred, become the object of symbolic gifts, and harnesses adorned with silver pieces will be the object of tomb deposits.

The peoples whose universe developed around the horse, illustrated and integrated its image into what has been historiographical called the „animal style”, which also includes North Thracian artistic manifestations, whose anthropo- or zoomorphic representations were created as a result of convergent Scythian or Greco-Macedonian influences.

Starting from two artefacts belonging to a private collection, in which the horse and the horseman are in the foreground of their symbolic iconography, we will try to reach on a more general background, putting them in context with other discoveries found in sumptuous tombs, such as those at Agighiol, Peretu in Romania or Vratsa and Letnitsa in Bulgaria.

A number of artefacts were also analyzed by X-ray Fluorescence (XRF), and the results help emphasize their symbolic value.

14 **THE ART OF HORSEMANSHIP RIDING IN GEOMETRIC GREECE: THE RELATIONSHIP BETWEEN HORSE AND RIDER IN ICONOGRAPHY AND BIOARCHAEOLOGY**

De Souza, Camila (Fluminense Federal University)

This presentation aims to discuss the meanings of the art of horsemanship in some societies during the Geometric Period of the History of Ancient Greece (between 900 and 700 BC). The analysis of the iconographic record of the geometric pottery of the burials is associated with the bioanthropological study of the human remains that show the bodily experience of this activity in individuals in life, allowing us to understand the characteristics of the relations between horse and rider in different societies of the period. The research also aims to gather, organize, catalogue, analyze and compare the iconography of the horse and rider and the available osteological data from the sites of Argos (Peloponnese), Athens (Attica) and Eretria (Euboea), in order to understand the role of art of horsemanship in relation to the historical context of the process of rise and origins of the polis during the Geometric Period, especially the 8th century BC.

The art of horsemanship emphasizes the importance of multidisciplinarity for understanding a period of transformation and structuring of what we call the Hellenic world, marked by human practices and actions that result in multidimensional material expressions of sociocultural domains. Whether iconographic or funerary in nature, the recording of social inequalities is conceived as a political, ideological and symbolic violence resource with the aim of legitimizing local and regional identities.

15 **HORSES IN THE FUNERAL CULTURE OF THE WEST BALTIC CIRCLE: A CASE STUDY OF THE CEMETERY IN RÓWNINA DOLNA (POLAND)**

Szubska, Magdalena (Cardinal Stefan Wyszyński University in Warsaw; Ministry of Culture and National Heritage)

Horse burials constitute a distinctive element of the funeral culture within the West Baltic circle. The oldest ones come from Masuria region. During the Roman Period, they are present in Sambia, Masuria, Suwałki Region, western Lithuania, and northwestern Latvia. During the Migration Period, they also appear in the central and eastern regions of Lithuania and Latvia. The cemetery discovered in the 1990s in Równina Dolna (Warmian-Masurian voivodeship, north-east Poland), site III, dating back to the Roman Period and the Migration Period, is exceptionally valuable due to a significant number of skeletal horse graves (over 70) that accompanied human graves (over 350). These horse burials were equipped with equestrian gear. Among the horse pits, various items were discovered, including two parade bridles, snaffle bits (over 60), bridle buckles, large iron buckles, leather strap ferrules, and nosebands.

The presentation will discuss the layout of the cemetery and the relationships between horse and human graves. In many cases, a direct connection between them has been observed. The extremely challenging question of the method of burying horses will also be addressed – whether the animals were placed in the graves alive or dead.

16 **HORSE HUSBANDRY IN LITHUANIA FROM THE LATE ROMAN TO THE EARLY MODERN PERIOD: 1500 YEARS LASTING TRADITIONS?**

Piliciauskienė, Giedre (Vilnius University)

The first horse remains in Lithuania date back to the early 4th millennium BC. During the Subneolithic and Neolithic, horse remains in the settlement sites were still very scarce. The situation has changed considerably since the Late Bronze Age, 800-600 cal BC, when horse bones are among the most commonly found in the zooarchaeological material in western Lithuania. Moreover, around 200 cal BC, horses began to be buried. The tradition of horse burials in Lithuania lasted to the 14th C AD, leaving about 2000 horse burials are still known today. During the Late Roman and Migration Periods, exceptionally large horses are found in Lithuania, and $^{87}\text{Sr}/^{86}\text{Sr}$ analysis revealed that some of them are of non-local origin. In addition, stable isotope analysis of $^{87}\text{Sr}/^{86}\text{Sr}$, $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ stable isotopes have provided insights into horse husbandry during the 2nd to 14th C AD. However very detailed historical records on horse husbandry in the 16-17th C AD contributed to the interpretation of stable isotope data of Late Roman and Migration Period horses and shed light on the husbandry practises of horses bred during the first millennium AD. Early Modern period historical written and iconographical records provide very valuable data on the horse equipment, and care, breeding, training the horses in the Grand Duchy of Lithuania. In this presentation, I will talk about the peculiarities of horse husbandry in the territory of present-day Lithuania from the Late Roman Iron Age to the 20th century AD, based on stable isotope data and historical records.

17 **DAUGHTERS OF THE VALKYRIES: THE EQUESTRIANISM OF WOMEN IN VIKING AGE SCANDINAVIA**

Sundkvist, Anneli (Independent researcher)

Horses in the Viking world have long been considered a male affair. However, there are numerous examples of connections between horses and women, expressed in the written sources, the art, and the archaeological material.

In the Old Norse written sources, the only group with clear connections to horses as well as war in myths and literature is the Valkyries. These servants of Óðinn, and possibly goddess Freyja, rode to the battlefield to bring home the worthiest of the fallen. The Valkyries were semi-divine, violent and blood thirsty. And they were all women.

The story of the Valkyries tells us that it was not unthinkable to connect women and horses in the Viking Age. Still, the Valkyries are women of myth. However, the archaeological material reveals that many women in the Viking world were buried in a way that stresses their equestrianism. What parts did they play in the Viking equestrian world? This paper explores some of these women and the way they were buried, depicted, and written about. As riders, drivers, owners, or providers. As – to use a modern word – horsewomen. “

18 **FEEDING HORSES IN THE AFTERLIFE**

Bagge, Merethe Schifter (Museum Skanderborg) - Out, Welmoed (Moesgaard Museum, Department of Archaeological Science and Conservation)

Horses have played an important role in human societies throughout the past. At a certain point horses became a crucial part of their owners' identities, and sometimes, such as times of war, even the essential part. Therefore, the well-being of horses was probably one of the most important issues for prehistoric people. An ill or debilitated horse was useless in warfare or as a means of transportation.

This contribution presents a recent find of an equestrian grave from Fregerslev dating to the Viking Age. A small group of similarly richly equipped burials are known from Viking-Age Denmark (including present day Denmark, Scania and northern Germany). At Fregerslev, an impressive array of horse equipment with gold and silver fittings was placed in one corner of the grave, and the horse (detected by geochemistry) was placed next to the harness. The bridle and saddle gear lay in two different piles and a pile of horse fodder, evidenced by phytoliths, was placed in between them. Remnants of leather close to the phytoliths suggest the presence of a food bag as well. The phytoliths proved the presence of well-sorted chaff, primarily from oats.

Food offerings accompanying deceased humans are well known from many regions and periods in the past, but food offerings in animals' graves are almost unknown. The primary reason for this is probably the rapid decomposition of the organic elements, leaving remains that in many cases would not be visible to the naked eye. The finds from Fregerslev shed new light on burial rituals and thereby also elucidate human-horse relations, even in death and the afterlife.

19 **ARCHAEOETHOLOGY: A NEW FRAMEWORK TO INTERPRET PAST HORSE-HUMAN RELATIONS**

Larsen, Renate (University of Leicester)

How can we explore the lived experiences of horses in the Viking Age? That is one question at the core of my multi-disciplinary research, which aims to provide a deeper understanding of how animals experienced life in Iron and Viking Age Scandinavia c. 400-1100 C.E. Classically, interpretations of past animal-human relationships tended to focus on the agency of the human: what humans did to animals and how humans felt about them. Recently, archaeological and interdisciplinary research has been disrupting this approach by de-centring the human in the animal-human relationship and exploring the nuances and complexities of animal-human interactions.

By drawing on multidisciplinary knowledge of horses from the field of ethology, I believe we can explore the range of experiences past horses might have had and gain a deeper understanding of past horse-human interactions. In this paper, I want to present a theoretical framework I've framed as 'archaeoethology', which combines zooarchaeological methods with modern research into animal behaviour, cognition, and emotions, and demonstrate how such an approach can be applied to the archaeological material from Iron and Viking Age Scandinavia. Ultimately, I am interested in exploring the range of horse-human interactions in the past by giving attention to the relational aspect – how did horses negotiate their place in Viking Age society, and how might they have felt about us?

20 **HORSE RIDING STYLE AND MOUNTED COMBAT TECHNIQUES IN THE AVAR PERIOD (6TH- 9TH CENTURY AD) – A TRANSDISCIPLINARY APPROACH**

Bühler, Birgit (Vienna Institute for Archaeological Science (VIAS), University of Vienna)

The Avars, a nomadic tribal confederation originating in Central and Inner Asia, were present in the Carpathian Basin from the late 6th to the early 9th century AD. Horses were an important aspect of life in the Avar realm: According to the historical sources, the Avars were accomplished mounted warriors. Avar warriors' outstanding skills in mounted

archery, but also in fighting with a range of different weapons on horseback, appear to have been a major reason for their military success, especially when they first arrived in Europe in the late sixth and early seventh century AD. Archaeological evidence also suggests that horses were essential within the Avar realm, both from a practical and from a symbolic point of view. Although the exact details of horse-riding style in the Avar period are no longer accessible to us, some basic principles of the communication between rider and horse have remained the same throughout the history of equestrianism – past or present. Also, much can be inferred about Avar horse-riding style due to the necessities of mounted combat. For example, the ability to direct the horse without using the reins is a major pre-requisite, both for using any type of weapon on horseback and for many tasks in the everyday work of equestrian pastoralists. Experimental ethnoarchaeology, on the basis of a comparative study of horse-riding styles within modern “schools” of horseback archery could be helpful for understanding the riding style of early medieval populations of mounted archers. On the basis of a review of previous research on Avar horsemanship, this paper presents an innovative, trans-disciplinary approach to Avar-period horse-riding style and mounted combat technique, including biomechanical research, for example using a horse-riding simulator.

21 THE WHOLE HORSE: RESULTS FROM THE MEDIEVAL WARHORSE PROJECT

Outram, Alan (Department of Archaeology and History, University of Exeter) - Creighton, Oliver (Department of Archaeology and History, University of Exeter) - Kanne, Katherine (University College Dublin)

Based at the Universities of Exeter and East Anglia, and Funded by the Arts and Humanities Research Council, the research project ‘Warhorse: A Medieval Revolution?’ conducted the first ever systematic study of warhorses, and horses generally, in England in the Middle Ages. In this paper, we present the results of the Warhorse project as a case study of genuinely interdisciplinary research, integrating zooarchaeology, genetic and isotopic analyses, material culture, and landscape-wide datasets, dating between the late Saxon and Tudor period (c. AD 800–1600), all contextualised by new historical research. Our whole horse, multiproxy approach was undertaken at a variety of different scales, from individual equestrian artefacts and scientific samples of bones and teeth from a single horse, through to landscape analysis of equine environments, and nationwide datasets of horse bones and material culture. This allowed us to interrogate the medieval horse in its social context, including military, economic, political, and ideological importance, leading to the most comprehensive image to date of the most iconic animal of the Middle Ages.

22 EQUID-HUMAN INTERACTIONS IN MEDIEVAL ROME: EXPLORING THE ROLE AND MANAGEMENT OF EQUIDS THROUGH AN INTERDISCIPLINARY APPROACH

Minniti, Claudia (Sapienza University of Rome) - Corbino, Chiara (CNR - ISPC - Istituto di Scienze del Patrimonio Culturale) - Modi, Alessandra (Università di Firenze, Dipartimento di Biologia) - Caramelli, David (Università di Firenze, Dipartimento di Biologia)

Equids have exerted a notable influence on the history of humanity. Thanks to the use of horses, people’s mobility, cultural exchanges and commercial activities have increased. The success of horses in war is also widely documented in the history of each conquest and expansion. One of the aspects of greatest interest is related to the diffusion of different varieties selected for different functions. Ancient sources attest to the presence of some varieties of horses that should have been widespread from Roman period onwards, linking them to the geographical areas from which they came. More than a simple geographical catalogue, some physical distinctions are also described. Archaeozoological studies are also contributing to defining the history of the evolution of horses, however the difficulty of discriminating between the various equids (horses, donkeys and hybrids) represents a strong bias factor. Rome represents an ideal case study as the excavations and studies carried out for several decades provide a large quantity of remains that can be correlated to a very broad chronological period, allowing to investigate ancient horse husbandry strategies to highlight changes and resilience through time and functions. This paper aims to present the first results of an interdisciplinary study that compares recent aDNA analysis of some equid remains, morphological and biometrical studies and written and ichnographic sources in order to deepen our knowledge on the use of horse in Rome in the medieval and post-medieval periods.

23 THE HORSE IN MEDIEVAL POLAND. AN INTERDISCIPLINARY OVERVIEW

Makowiecki, Daniel (Institute of Archaeology, Nicolaus Copernicus University, Torun)

In archaeology, horse bones excavated in strongholds, settlements, castles, towns and commentaries are the most frequent evidence of the importance of this species in the tribal and early state of Poland. Elements of riding equipment are much less frequently discovered. Short historical accounts supplement the records by reporting only some aspects of the human relationship with this animal.

The history of the horse and its importance among the medieval Slavs inhabiting Poland in the 8th and 14th centuries were the subject of a project implemented in 2018-2023*. Data was collected and analysed from the source categories mentioned above. Additionally, biomolecular methods – aDNA and isotope – were used to study horse bones

and teeth. The paper presents the most important results of the project. It indicates the principles of interpretation of horse bone remains based on zoological, biological and taphonomic data. Thanks to them and the 14C dating, it turned out that treating the skeletons and skulls of horses, recorded in archaeological contexts, as offerings and sacrifices was an overinterpretation. Attention was drawn to the widespread consumption of horse meat and utilisation of horse bony waste, e.g., in prestigious places without care. Various rules for treating horses in religious and magical ceremonies among individual groups of Slavs have been recorded. Information was obtained about what types of horses were bred in different regions, what coat colours were preferred and how long the horses were used. The types of diseases and their frequency were determined thanks to paleopathological research, which let us consider how horses were treated by their owners. It was also an excellent chance to confront historical records on horses with archaeological data.

*) The research is the result of the project “Horse in Poland among the early Piasts and internal fragmentation” (2017/25/B/HS3/01248) financed by the National Science Center.

24 HEIGHT AND WEIGHT OF HORSES IN PORTUGAL (LATE MIDDLE AGES AND EARLY MODERN ERA): AN APPROACH BASED ON WRITTEN SOURCES

Soares de Sousa, Afonso (Instituto de Estudos Medievais; Faculdade de Letras da Universidade de Coimbra) - Nisa, João (Centro de História da Sociedade e da Cultura; Faculdade de Letras da Universidade de Coimbra)

Seen as a sturdy companion since its domestication, the horse was first seen as a workforce, but it quickly became an important weapon of war. Several technological advances carried out throughout the Middle Ages, such as the stirrup and the improvement of the saddle for military purposes, further highlighted its worth and made it one of the symbols of the age itself, embodied in the figure of the Medieval knight. In Portugal, particularly in the Late Middle Ages, the Crown tried to encourage and enforce the acquisition of mounts destined for war, focusing on their breed, use and maintenance. However, the study of horses’ height and weight in Portugal between the Medieval and the Early Modern periods has not aroused much interest in Portuguese historiography. Nonetheless, in other geographies significant contributions have already been made, mainly from studies in the field of zooarchaeology. We therefore propose to provide a new view, based on a newly discovered and unpublished written source, of equine morphology in Portugal, with the aim of establishing a starting point that will stimulate new developments in the knowledge of the different types of equids. The results we intend to present aim, at the same time, to establish a starting point that could in future benefit from a dialogue with zooarchaeology – a science with which the estimates presented here could be compared.

838 COMMUNITY ENGAGEMENT IN ARCHAEOLOGICAL HERITAGE: BEST PRACTICES, OBJECTIVES, CONFLICTS, AND PLANS FOR THE FUTURE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Stefanou, Eleni (The Heritage Management Organization; Hellenic Open University, MSc Cultural Organizations Management) - Anagnostopoulos, Aris (University of Kent; The Heritage Management Organization)

Session format: Workshop

In this workshop on community engagement in archaeological heritage management individual colleagues and/or initiatives that do community engagement from all over Europe meet to discuss methods, limitations, prospects, and plan for the future. Participants will be divided into different working groups and will engage in an organised discussion about methods that are put into practice, the selection of audiences,

the non-participants and the reasons for not getting involved, the power dynamics and the issues of conflict, the common values that can emerge from community engagement archaeological heritage projects, as well as the potential future steps to be taken. The purpose of this closed interactive workshop is to formulate a series of proposals for the development of a manual of best practices and methodologies for organizing actions to engage and activate local communities in archaeology and cultural heritage. The participants will be divided into groups that will work in round tables, and with the guidance of the moderators will be focused on the following topics: best practices that they have implemented so far, indicating the specific characteristics of the communities to which they were targeted, problems and / or conflicts they face in organizing their actions, goals and objectives for future actions and synergies. In the end of the workshop the topics from each group will be presented to all participants.

842 CONTINUITY IN CHANGE: ENVIRONMENTAL, CULTURAL, SOCIAL AND MATERIAL EVOLUTION IN ANCIENT ARABIA

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Maini, Elena (Sapienza University of Rome) - Fernández Rodríguez, Carlos (Universidad Autónoma de Madrid) - Maiorano, Maria Pia (Goethe University Frankfurt) - Gómez Sanz, Paula (Universidad Autónoma de Madrid)

Session format: Regular session

The archaeological record of the Arabian Peninsula is marked by a convoluted interplay of continuity and change. This session seeks to delve into the intricate narratives of the region's prehistory and early history. As we reflect on the persistence and endurance of ancient human communities populating the Peninsula and how they have contributed to ongoing transformations, we will examine the profound effects of climate and environmental changes (including those caused by humans), shifts in population density, interactions, mobility and migrations. We will also examine the evolving relationships between human groups and the material culture they conceptualized, produced and exchanged, and the fluctuating dynamics of settlement patterns and resources exploitation, from mobile to sedentary and conversely, exploring instances of collapse, resilience, persistence and evolution.

Archaeological evidence will also make it possible to go beyond the material expressions of human cultures and explore the evolution of the religious, spiritual and ritual spheres that were created and lived by the different communities. Our discussion will consider insights from archaeological projects and research spanning different time periods and regions, evidencing medium- to long-term transformations in subsistence strategies, settlement patterns, exchange modes, and ritualistic behavior.

We, therefore, encourage communications from a wide range of subjects adopting a variety of methodological/theoretical approaches, including landscape archaeology and paleoenvironment, bioarchaeology, material culture and ancient technologies, architectural and building techniques, behavioral evolution, cultural transmission, ancient written sources, etc. Helpful proxies will eventually emerge to enable refinement of our comprehension of the subtle interface between continuity and change in the cultural evolution of the Arabian Peninsula and the transformative forces that have shaped the region's history.

ABSTRACTS

1 TRACKING THE EVOLUTION OF PEOPLE-PLANT RELATIONSHIPS IN THE SOUTHERN HAJAR PIEDMONT (CENTRAL OMAN) THROUGH THE MIDDLE-LATE HOLOCENE

Proctor, Lucas (Goethe University Frankfurt)

The mutually co-determining relationship between plants and people has an important role to play in the resilience and transformation of societies over the longue durée. Understanding this relationship is especially important in southeastern Arabia, where low rates of annual precipitation place significant ecological constraints on both humans and plants. During the Middle Holocene, conditions in southeastern Arabia are thought to have been moister than present, owing to a northward shift in the ITCZ. Following the onset of aridity in the 5th–4th millennia BCE, evidence suggests there are marked changes in human occupational and subsistence patterns in the region, culminating with a transition to crop production during the 3rd millennium BCE. However, the precise timing of this development and the broader nature of human-plant relationships during these millennia remain poorly understood.

This study uses the southern Hajar piedmont of central Oman as a case study for understanding continuity and change in human-plant relationships over millennial timescales in hyperarid environments. Through an analysis of macrobotanical remains from the Middle/Late Neolithic (5500–3200 BCE), Hafit (3200–2700 BCE), Umm an-Nar (2700–2000 BCE), and Late Islamic (1700–1900 CE) sites, we will examine potential changes in vegetation and resource management related to 1) the end of the Holocene Humid Period and 2) the development of local oasis agroforestry. Wood charcoal recovered from these sites provide insight into fuel harvesting and woodland management, and, when considered over long timescales, can provide information on changing vegetation patterns. In particular, this study will consider whether the flourishing of local copper production in the Hafit and Umm an-Nar contributed to wood scarcity in an already non-forested landscape. Meanwhile, carpological remains allow us to examine changing patterns of subsistence, especially surrounding the timing of early date palm cultivation and emergence of the unique Arabian oasis agroforestry system.

2 LAYERS OF TIME: UNEARTHING THE DYNAMIC HISTORY OF RAS AL JINZ RJ-3 FROM NEOLITHIC TO EARLY BRONZE AGE OMAN

Azzara, Valentina (Netherlands eScience Center; Leiden University, Faculty of Archaeology; Time of Magan Field School) - De Rorre, Alexandre (Time of Magan Field School)

This paper delves into the cultural transformations and the adaptation strategies of local populations to changing environmental conditions at the site of Ras Al Jinz RJ-3 in Oman, across the Late Neolithic (c. 4300–3200 BCE) and the Early Bronze Age (Hafit Period, c. 3200–2600 BCE; Umm an-Nar Period, c. 2600–2000 BCE). Occupied from the Late Neolithic through to the end of the EBA, RJ-3 presents a unique opportunity to study the evolution of complexity in a single location, which is rare in the area. It also allows us to focus on “regular” settlement remains, while most projects have focused on the excavation of tombs and monumental towers.

Extensive excavations and deep test-trenches at the site have revealed a wealth of data, including remnants of a Late Neolithic occupation, which yielded a lithic industry that has no comparison so far in the region; a settlement of the Hafit period, exceptional as very few Hafit settlements are known across the region, despite thousands of documented cairns; specialized workshop areas dating to the Umm an-Nar period, and contemporary to the residential area of RJ-2, c. 300 m to the south, marking the apogee of the occupation.

This paper presents the evidence unearthed at the site, offering a comprehensive view of the settlement's long-term development and provides a remarkable narrative of the continuity and evolution of occupations in coastal Omani Sharqiyah, redefining our understanding of settlement dynamics in prehistoric Oman.

3 THE OTHER SIDE OF AL-KHUTM: CONTINUITY IN CHANGE IN A SOUTHEAST ARABIAN BRONZE AND IRON AGE PALIMPSEST

Swerida, Jennifer (Leiden University) - Bryant, Robert (University of Pennsylvania) - Dollarhide, Eli (New York University Abu Dhabi) - Smith, Stefan (Wissenschaftlicher Mitarbeiter at Staatliche Schlösser und Gärten Hessen) - Casana, Jesse (Dartmouth College) - Creamer, Petra (Emory University) - Nugent, Selin (Oxford Brookes University)

The archaeological site of al-Khutm, similar to the neighboring site of Bat in northwest Oman, is known for its Early Bronze Age monuments, particularly the third millennium BCE tower constructed on the northwestern end of the site's long hillside. Contexts on the other side of the Khutm hill, however, exist in a dense palimpsest of domestic, monumental, and mortuary remains preserved at surface level. Rather than a continual occupation, the architecture and material culture found at al-Khutm Settlement reflect an intermittent presence and repeated reoccupation of the hillside from the late fourth through the first millennium BCE. Such complex sets of multi-period surface remains are common at archaeological sites throughout southeast Arabia, but are rarely addressed through an explicit methodological or theoretical framework.

Engaging with results of recent fieldwork by the Bat Archaeological Project, this paper presents the Khutm Settlement in terms of an Early Bronze and Iron Age persistent place and cultural palimpsest. Methodological review will consider the challenges posed by such archaeological landscapes for site documentation and characterization. Theoretical discussion will address the impact of palimpsest, where each occupational phase is superimposed on and interacts with the remains of previous phases, on the formation and experience of the site as a cultural space over time. Results of this study will provide a framework for evaluating questions of continuity and change in light of these characteristically Arabian persistent, if intermittent, places and landscapes.

4 CHANGE AND DOMESTIC ARCHITECTURE IN ANCIENT HILI

Morgan, Colleen (University of York) - Eddisford, Daniel (Heritage International) - Araar, Leila (University of York) - Fowler, Louise (Museum of London Archaeology) - Roberts, Xavier (Durham University) - De Vreeze, Michel (Self-Employed) - Al Meqbali, Ali Abdu Rahman (Department of Culture and Tourism, Abu Dhabi) - Valente, Tatiana (Department of Culture and Tourism, Abu Dhabi)

A team from the University of York in collaboration with the Department of Culture and Tourism of Abu Dhabi has just completed its second season of fieldwork in Hili Archaeological Park, part of the UNESCO Cultural Sites of Al Ain. This project is exploring the poorly understood Bronze Age (c. 2500 BCE) domestic architecture and remains in the Park. In this paper we describe our results from these two seasons, which include trial excavations exploring the landscape and the intensive excavation of multiple architectural forms at a single site, Hili-16, including a large mud-brick structure. This structure contrasts with the large stone-built tombs and towers commonly associated with Umm an Nar architecture, and could be seen as domestic in function. Using theory and methods derived from household archaeology, we describe some potential uses of this structure, and present a 3D reconstruction to compare to other similar, contemporaneous buildings in the Gulf. Finally, during the investigation of this structure we found extensive evidence of both earlier and later phases of occupation of the area, and a potential new form of Iron Age structure

that contrasts with other contemporaneous occupations at Hili. Importantly, the material recovered from the site also evidences wider interactions with the Arabian world, as well as further afield with locations like the Indus Valley. Thus we present the change of use of the site and landscape over time, reflecting the adaptive use of architectural materials and technology.

5 UMM AN-NAR RITUAL BUILDINGS FROM AL BATINAH PLAIN IN OMAN, UNITY OF CONCEPT AND DESIGN

Douglas, Khaled (Sultan Qaboos University) - Pizzimenti, Sara (Pisa University) - Al Jahwari, Nasser (Sultan Qaboos University) - Hesein, Mohamad (Sultan Qaboos University)

Despite the scarcity of ritual buildings discovered in the Omani Peninsula from the Umm al-Nar period, recent excavations in al Batinah Plain region in northern Oman revealed three distinctive buildings that their function related to ritual. These buildings found in three different archaeological settlements all belong to Umm an-Nar culture (2700-2000 BC), these sites are: Dahwa 1 (DH1) and Dahwa 7 (DH7), both sites located ca. 24 km southwest of the coastal city of Saham, the third site is al-Tikha located at the northern periphery Al-Rustaq, ca. 42 km southwest of the coastline. All these settlements situated at the east foothills of Al-Hajar mountains. The buildings showed great similarity in term of size, architectural layout, and nature of archaeological finds, which presumably indicates the presence of unity in term of concept and perhaps belief. Was this kind of ritual buildings exclusive to the coastal region of Oman or could it be extended throughout the Omani Peninsula?

6 THE SAMAD LATE IRON AGE (SLIA) IN EASTERN OMAN, 2024 UPDATE

Yule, Paul (University Heidelberg)

The archaeology of Oman focusses largely on archaeological survey and the Bronze Age, as in other ANE subfields. Samad Late Iron Age (SLIA) sources are often fragmented, mortuary, necessitating considerable fieldwork to achieve minimal results. Beginning and end dates are hardly fixed by contexted absolute datings. SLIA sites are far fewer than of the Early Iron Age (EIA) in South-eastern Arabia, indicating a less sustainable environment: 364 vs. 274 sites, as of 24.01.2024. The c. 500-year lifespan of the SLIA (>300 BCE to 300 CE) shows little tangible artefactual development. Few sites can be more finely dated.

The methods used to list and date sites in our gazetteer require explanation. Since 1998 the author attempted different site lists. The site gazetteer, 'ent' went through builds in 1998, 2014 and 2023, each with different goals. The current iteration of 'ent' lists suspected EIA and SLIA sites in two Excel databases which are continuously updated. As of 24.01.2024 the EIA version is online: <https://uniheidelberg.academia.edu/paulyule/Drafts>, 2024a Yule ent eia oman+uae.

Its publication in print media is limited in that it cannot be updated continuously and is too large to fit onto a print-page and in this format is impractical. The discussion of a smooth or abrupt transition from the EIA to the SLIA is re-opened. This year fifteen 14C dated contexts are intended to support a more differentiated chronology.

7 REASSESSING EARLY BRONZE AGE TOWERS IN CENTRAL OMAN THROUGH ARCHITECTURE, STRATIGRAPHY, AND LANDSCAPE INTERACTION

Antinori, Guido (Sapienza Università di Roma)

This study investigates the circular monumental structures, known as "early bronze age towers", associated with the Hafit (3200-2700 BC) and Umm an-Nar (2700-2000 BC) cultural contexts in central Oman. Without the hallmarks of bureaucratic and urban centres, these mobile, kin-based and tribal communities achieved monumental architectural feats, sophisticated water management systems, and advanced metallurgical practices. The study proposes a reevaluation of these monumental structures' architecture and stratigraphy, placing a significant emphasis on their relationship with the surrounding landscape. This connection is critically analysed to infer potential agricultural and metallurgical practices of the time, i.e. development of palm groves oasis and the exploitation of copper and its associated chaîne opératoire from ore extraction to the production of artifacts and ingots. By mapping the geographical distribution of the structures and assessing their proximity to key water and mineral resources, the research aims to highlight the strategic selection of settlement sites influenced by the landscape's potential to support oasis agriculture and copper metallurgy. This approach offers new insights into socio-economic strategies for resource management and adaptation, and illuminates broader socio-environmental dynamics. These structures' locations were not arbitrary but were instead integral to a complex network of human-environment interactions, reflecting a deep understanding of, and adaptation to, the arid landscapes of ancient Arabia.

8 CONTINUITY IN CHANGING SETTLEMENT PATTERNS IN BRONZE AND IRON AGE CENTRAL OMAN

Döpfer, Stephanie (HCCH, Heidelberg University)

From the Early Bronze Age, circa 3,100 BCE, to the end of the (Early) Iron Age, around 300 BCE, the communities in Eastern Arabia were significantly affected by environmental and social changes. This paper will concentrate on the diachronic developments in settlement patterns on a local scale in a selected area of the Wilayat Al-Mudhaybi in central Oman. From 2018 to 2022, the Al-Mudhaybi Regional Survey, funded by the German Research Foundation (DFG), was conducted in the region, using a variety of methods including remote sensing, ground truthing and systematic field-walking of transects. This paper presents past adaptation strategies to an arid environment based on the survey results, which go beyond the traditional dichotomy of sedentary and mobile, temporary and permanent. The paper utilises Bernbeck's (2008) concept of multisited communities as a basis for developing a new understanding of settlement patterns in the region. According to Bernbeck's model, sites are permanent features of a landscape that, however, do not necessarily require the year-round presence of sedentary inhabitants. Several places were used by the same group at different times and on different occasions, where diverse resources could be exploited and different activities could be carried out. The communities in central Oman from the Bronze to Iron Age are thus characterised by the various forms and practices of mobility and sedentism as well as subsistence.

9 WATER MANAGEMENT THROUGH TIME SEEN FROM THE AL MADAM FALAJ

Fernández Rodríguez, Carlos (Universidad Autónoma de Madrid) - del Cerro Linares, Carmen (Universidad Autónoma de Madrid)

Falaj (pl. aflaj) meant extraordinary progress in terms of Water Management in the Southeast of Arabia during the Iron Age. In fact, it marked a milestone in the History of the region: a revolution in the way of managing the Water of an ancient population.

Previously, people of the Bronze Age could only get water thanks to the wells available in the natural oasis. Settlements of that period were located mainly in the mountains, near the natural oases, or close to the sea. However, this hydrological system allowed the first permanent occupation of the interior of the Oman peninsula and the appearance of new oases, thanks to the water provided by aflaj. The population grew remarkably in these centuries. It is supposed that the water of the falaj only served for agricultural purposes, considering that wells have also been found in connection with the settlements.

To understand this phenom, we propose to take the Al Madam Falaj (Sharjah, UAE) as an example. It is one of the best excavated aflaj in the Peninsula, considering that we know all the parts of the whole structure (the underground gallery, the first meters of the opencast channel, the first secondary channels, and the main irrigation network area). In addition, we will reflect on the last part of every falaj: its end, and its archaeological search. It will provide a global perspective of the structure and culminate long research.

10 HAPPY TROPICS IN THE LAND OF MAGAN. A NEW MULTIMILLENNIAL ARCHAEOLOGICAL LANDSCAPE NORTH-WEST OF MUSCAT IN SOUTH BATINAH

Ramazzotti, Marco (Sapienza University of Rome - Sciences of Antiquity) - Kzzo, Ahmed (Sapienza University of Rome) - Di Ludovico, Alessandro (Sapienza University of Rome - Sovrintendenza Capitolina)

Sapienza Archaeological Mission in Arabian Peninsula and the Gulf (MASPAG) surveys in the Omani southern Batinah, northwest of Muscat, near the Muslimat oasis, has recently revealed a new hitherto unknown multi-millennial archaeological landscape crossed by the Tropic of Cancer. In this vast area, two enormous cemeteries with hundreds of collective tombs have been identified. The oldest graves typologically and morphologically date from the end of the 4th millennium, but both the cemeteries appear to be associated with long-lasting settlements continuously inhabited up to the Islamic period. The two cemeteries next to a settlement that was fortified in the Iron Age offer the possibility of investigating the social complexity of those nomadic groups interposed between south-eastern Arabia and the Persian Gulf on a broad spectrum. Powerful nomadic coalitions capable of governing large portions of the piedmont territory interposed between the rocky Hajar mountains and the spectacular western coasts of the Arabian Sea, a nomadic and half-nomadic territorial state in the south-eastern frontier of the ancient Near East which Mesopotamian texts identify as the Land of Magan.

11 **MODELING ACCESSIBILITY TO INTERPRET SETTLEMENT PATTERN: A CASE STUDY FROM IRON AGE SOUTHEAST ARABIA**

Paulsen, Paige (Johns Hopkins University)

Settlement pattern analysis seeks to describe the regional-scale organization of societies and the spatial dimensions of small-scale decision-making. Settlement patterns can speak to questions ranging from subsistence strategy to political organization, while changes in these patterns both reflect and reproduce changes in a society itself. The accessibility of settlements is a component of arguments about their role in the settlement pattern, as settlement locations and the social interactions between sites are necessarily mediated by people moving over the landscape. Sites might be located to oversee or control trade routes, be built in inaccessible locations to provide defense, or take advantage of specific resources. Assessing these possible interpretations requires methods for describing the landscape in terms of how people might move across it. In Iron Age Southeast Arabia, settlement patterns are notable for their expansion from preceding periods: there appears to be an increase in the number of settlements and in the variety of environmental zones that host them, participating in a broadly shared material culture horizon. What drives this shift? And what interactions link these settlements together to produce the cohesive material culture of the 1st millennium BCE?

This paper uses GIS methods to approach the spatial dimensions of Iron Age Southeast Arabia by considering affordances and constraints of movement across the landscape. By modeling human movement, the physical location is connected to the movement used to access it and the social context this interaction generates. By comparing the locations of known Iron Age sites to the outputs of movement potential, we provide another line of evidence for arguing about reasons for and implications of changing settlement pattern.

12 **VISIBILITY, TOPOGRAPHY AND DISTRIBUTION OF THE EARLY BRONZE AGE HAFIT TOMBS IN THE AL-HAJAR MOUNTAINS IN SOUTHEAST ARABIA**

Kuronuma, Taichi (Research Institute for Languages and Cultures of Asia and Africa, Tokyo University of Foreign Studies) - Miki, Takehiro (The University of Tokyo) - Tanabe, Kantaro (The University of Tokyo) - Kondo, Yasuhisa (Research Institute for Humanity and Nature; The Graduate University for Advanced Studies, SOKENDAI)

Visibility is the key to considering the distributional pattern of tombs during the Early Bronze Age Hafit period in Southeast Arabia. Hafit tombs on hills along the broader wadi floodplains are typical landscapes that are often related to territoriality. However, the Hafit tombs are also distributed in the mountain region, such as on the highly visible cliff ridges or wadi slopes, indicating different landscapes in the cases of wide and open topographical conditions. Such a distribution is not likely related to territoriality but to other factors. This paper discusses the relationships between the distribution of Hafit tombs, local topography, and visibility in the Southeast Arabian mountain region based on the results of archaeological investigations in the Tanuf District, North-Central Oman. We have recorded more than 90 Hafit tombs distributed in and on narrow canyons, high plateaus, wide floodplains, and isolated hills. Their distributions differ according to local topographical conditions. Around the small basin and wide floodplains, tombs were built in highly visible areas, such as slopes and very shallow hills. At the junction between the mountain and the floodplains, the tombs are seamlessly distributed along the slopes, which are gentle enough to climb to the high plateaus of Jabal Al-Akhdar. Inside the canyon, we confirmed tombs on steep slopes and gentler slopes. Such distributional characteristics indicate the nexus of typical Hafit mortuary landscapes in open topographic conditions and mountain-specific landscapes, and the visibility of tombs functioned to guide the approach to the high plateaus of the Al-Hajar Mountains at the junction and inside the canyon. The distributional pattern of the Hafit tombs in the mountains relied on local topography and high visibility capability, possibly containing the concept of pass indicators.

13 **PERSISTENCE AND CHANGE IN SINGLE-CHAMBERED CAIRNS DURING THE SECOND HALF OF 3RD MILLENNIUM BCE IN THE OMAN PENINSULA**

Bortolini, Eugenio (Dept. of Cultural Heritage, University of Bologna, Italy) - Williams, Kimberly (Dept. of Anthropology, Temple University, Philadelphia, USA)

Tomb architecture and mortuary ritual in the Early Bronze Age of southeastern Arabia has long been thought about as a shift between single and smaller scale multiple interments in Hafit-Type cairns (3200-2700 BCE), and large scale communal interment in Umm an-Nar tombs (2700-2000 BCE). The fundamentals of interment in either of these structures stand in stark contrast to one another. The first involves the placement of a body and some mortuary goods in a cairn at a high place. The tomb is often used successively and the bod(ies) were disturbed during later reuse events (typically post Bronze Age, i.e. 1500 BCE through the late Pre-Islamic period, < CE 600). Umm an-Nar tombs, on the other hand, are true communal tombs where up to hundreds of individuals are interred and deliberately broken and commingled as part of the mortuary ritual. The authors have each considered the transition between these conditions and have identified intermediate forms and practices in both empirical and modeled data. In this paper, we go

further and consider cases of Umm an-Nar period groups who had either elaborate transitional cairns built for their interment or who were placed in more conservative (Hafit-Type?) cairns even when an appropriate communal tomb might have been available. Why did these tomb designs differentially persist? Can we glean any information about what life circumstances may have led to their exceptional interment situations? Are they exceptional at all? Are they all expression of reuse, or do they rather entail a portion of variability in funerary practices that defy current models of development in Early Bronze Age mortuary rituals of the Oman Peninsula?

14 **THE FIRST CAMPAIGN OF EXCAVATIONS AT MANAQI (AL-BATINAH SOUTH): DISCOVERING AN EARLY IRON AGE FUNERARY BUILDING**

Hesein, Mohamed Abdulhamed (Sultan Qaboos University) - Gernez, Guillaume (, Université Paris 1 Panthéon-Sorbonne) - Douglas, Khaled (Sultan Qaboos University) - Al-Jahwari, Nasser (Sultan Qaboos University)

Manaqi archaeological site is located in Rustaq (al-Batinah South) on the banks of the Wadi al-Ghashab. The banks of this wadi, surveyed in 2010 by the joint Omani-British team from the Department of Archaeology at Sultan Qaboos University (SQU) in Muscat and the Department of Archaeology at Durham University in the UK, revealed dense Iron Age occupation, with the notable presence of several settlements and at least one possible ritual site.

In January 2024, the SQU team conducted its first season of excavations to understand the organisation of one of these sites and determine its chronology and function. The excavation was undertaken in Area 1 of Manaqi, located at the top of an 8-metre-high alluvial terrace overlooking the whole wadi. Two large buildings were excavated: the largest and highest, building 1, was disturbed by several later tombs built on top of it but is promising based on its surface area, its architecture and the artefacts discovered on the surface, typically of the Early Iron Age II. It has only been superficially cleaned. Although partially excavated, building 2 is very enigmatic: its T-shape has yet to be known as the Iron Age equivalent in the region. While only foundation layers were found, it is above all the presence, inside and outside the building, of at least thirty infant and perinatal burials, most of them arranged along the walls, that raises the most questions: this atypical funerary complex, entirely devoted to burials of young children, is unique in Southeastern Arabia.

The construction, stratigraphy, chronology and function of these two buildings will be discussed based on the initial results of absolute dating, the preliminary study of the archaeological material and physical anthropology results, and the possible known parallels, the originality of the site, and the prospects for further research will be discussed.

15 **CORRIDOR-SHAPED TOMBS IN OMAN IN THE LATE 2ND MILLENNIUM BC: CONTINUITY OF COLLECTIVE PRACTICE AND THE EFFECT OF SOCIETAL EVOLUTION**

Genchi, Francesco (Sapienza University of Rome)

The talk aims to characterize the spread of an original type of collective monumental tomb, showing on the one hand the continuity of a very common practice in southeastern Arabia, and on the other hand the introduction of distinctive and innovative characters. Among the main and most striking features of the social complexity of the prehistoric communities of eastern Arabia is the funerary aspect characterized since the end of the fourth millennium by the construction of collective tombs. This trend increased during the Umm an-Nar phase and reaches its peak between Late Bronze Age and Early Iron Age with the introduction of the long and wide corridor-shaped tombs. From Bronze Age oases and contemporary coastal settlements surrounded, surmounted, and marked by hundreds of collective burials comes the construction of cemetery areas often composed of numerous collective underground tombs that were large, structurally complex, and had a strong identity value. They seem to represent a reflection of the tribal-based society that is fully delineated by the end of the second millennium BCE and leads to the construction of burial monuments capable of housing hundreds of individuals. The continuity of collective funerary practice alongside the variability of architecture thus offers us a unique and privileged perspective on social changes in the local population structure.

16 **A PROPOSED METHODOLOGY FOR THE REINTEGRATION OF CAIRN TOMBS: THE AL KHUDAIRAH NECROPOLIS**

Gómez Sanz, Paula (Universidad Autónoma de Madrid) - Alonso García, Alicia (Universidad Autónoma de Madrid) - Fernández Rodríguez, Carlos (Universidad Autónoma de Madrid) - Guerra García, Pablo (Universidad de Castilla-La Mancha) - del Cerro Linares, Carmen (Universidad Autónoma de Madrid)

Through this communication we seek to develop and propose an approach for the reintegration of cairn structures made of stone in the frame of the funerary world of the Oman peninsula (the Sultanate of Oman and the United Arab Emirates).

First of all, we will study and compare the different conservation and restoration interventions carried out in various funerary structures throughout the different peninsular necropolises. We will mainly focus in the architectonic reinte-

gration of funerary monuments and in the importance of the digital documentation of the original preservation status for the conservation of cultural heritage, which has gradually gained relevance due to the development of techniques such as photogrammetry.

Various archaeological teams in the Oman peninsula have already carried out different interventions focused on the restoration and reintegration of tombs. This is the case of Jabal Salut (C. Condoluci and M. Degli Esposti, 2015, *High Places in Oman: The Imto Excavations of Bronze and Iron Age Remains on Jabal Salut: 3*, *Quaderni Di Arabia Antica*, 3).

The main section of our communication will focus on the development of an approach for the calculation of architectural volumes and reintegration of funerary structures in stone. Tombs T18, T19 and T20 from the al Khudairah necropolis (emirate of Sharjah, UAE) will serve as an example. These tombs were excavated during the field seasons of 2020 and 2023 and will be the subject of a future intervention.

843 THE ?DATA RUSH? - ADAPTING TO THE CONSEQUENCES OF INCREASED QUANTITIES OF HIGH-QUALITY DATA IN ARCHAEOLOGICAL RESEARCH

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Ialongo, Nicola (University of Göttingen, Department of Pre- and Protohistory) - Cereda, Susanna (University of Innsbruck, Institute of Archaeologies) - Lago, Giancarlo (University of Bologna) - Johnson, Paul (University of Nottingham; Magnitude Surveys Ltd) - Mlekuz Vrhovnik, Dimitrij (University of Ljubljana; Institute for the Protection of Cultural Heritage of Slovenia)

Session format: Regular session

Over the course of several decades, archaeology has exhibited a growing reliance on an expanding corpus of data generated through the continuous evolution of techniques and methodologies. The integration of technological innovations and novel methodologies in archaeological research has not only led to an era of data accumulation but has also fundamentally reshaped models and theories.

Rather than simply providing straightforward answers to original questions, the wealth of information now at our disposal has undertaken a subtler, yet more profound role: it has shown that some of the previously held assumptions were either plain wrong, or more often considerably more nuanced than expected. The consequences of this data-winning frenzy invite a critical re-evaluation of long-standing paradigms.

This session aims to explore the transformative impact of data-driven approaches on the field of archaeology, and how they have reshaped our understanding of the past. Specifically, it will examine how the proliferation of data has profoundly affected the way archaeologists conceive and investigate key archaeological themes such as “migration”, “trade”, “adaptation”, “technological transfer”, “cultural change”, “human behaviour”, and more.

To stress the profound interdisciplinary nature of the topic and of the themes debated in archaeology, we welcome contributions from archaeologists, anthropologists, geoscientists, geneticists, and other related disciplines. The session will offer a platform for researchers to share their experiences, methodologies, and case studies that illustrate the impact of increasing data in transforming the way we conceive and tackle distinctive human phenomena. By bringing together experts in different fields, our aim is to foster discussions that will advance our collective understanding of a (big)data-driven archaeology.

Moving on from the words of philosopher Alison Wylie, who observes “how inquiry succeeds when evidence is sparse and uncertain”, and aim to explore how inquiry itself shapeshifts when the evidence is abundant and detailed.

ABSTRACTS

1 REFLECTIONS ON SCALE AND RESOLUTION IN ARCHAEOLOGICAL SURVEY DATASETS (REDUX): FROM HECTARES TO SQUARE-KILOMETERS (AND BACK)

Johnson, Paul (Magnitude Surveys Ltd; University of Nottingham)

It can be argued that developments in the equipment and methodologies used for archaeological prospection have resulted in “a technologically-driven tendency towards hyper-empiricism, and the collection of more data in the belief that enlarged datasets will inevitably lead to the revelation of answers to all of our questions”. In the UK, geophysical surveys for development-led projects encompassing over 1,000ha are now regularly commissioned, with expectations that the data will be collected and interpreted within relatively short timescales. While there is extensive discussion about the archiving and accessibility of such data, progress on moving the interrogation of these datasets beyond a simple assessment of “archaeological potential” is lagging. We are now at a point where geophysical survey datasets are no longer only suitable for locating individual sites, or their boundaries. It is increasingly feasible to ap-

proach whole poly-focal landscapes using these techniques. Previously research aiming to move beyond “the Site” has addressed concepts of “emptyscapes”, or deliberately targeted the gaps between known sites in order to try to understand what, in the terminology of traditional field survey would be referred to as the “off-site”. As the unit of study shifts and extends to encompass these useful – but perhaps now obsolescent – concepts as a matter of course, we return to a landscape that can be mapped and interrogated extensively, and also intensively. I have previously argued that self-reflection, and a recursive reappraisal of research questions and methodologies, is essential if we are to avoid falling into a hyper-empiricist paradigm which privileges the quantity of information collected over its quality, or its value for understanding the past. In this context, the challenge for Archaeological Prospection as a discipline is not “how do we collect more data”, but “how do we value the data we collect, and make it meaningful”.

2 LARGE-SCALE META-ANALYSIS AS A NEW FRONTIER FOR UNDERSTANDING PAST MOBILITY AND MIGRATION WITH ANCIENT DNA

Schmid, Clemens (Max Planck Institute for Evolutionary Anthropology; Max Planck Institute of Geoanthropology) - Schiffels, Stephan (Max Planck Institute for Evolutionary Anthropology)

Human archaeogenetics is a quickly accelerating field, now producing new data faster than individual researchers can keep track of and co-analyze. Recently, the threshold of genome-wide data for 10,000 ancient human individuals has been surpassed [1], with many of these samples featuring rich context information ranging from archaeological field observations to radiocarbon dating. This wealth of data poses both challenges and chances, first regarding data handling, storage and distribution, but then also concerning analysis, visualisation and the conceptualisation of research questions now coming within reach.

In this talk we will (i) give a brief overview over the data generated and available in human archaeogenetics and then (ii) introduce the genotype data management system Poseidon [2] as a potential solution for some of the key technical challenges emerging from the new abundance of data points between genetics and archaeology.

Finally and most importantly we will (iii) present our ongoing work on quantitative mobility estimation through spatiotemporal interpolation. Each archaeogenetic sample can be considered an informative observation for the reconstruction of a spatiotemporal ancestry field, which in turn enables a probabilistic similarity and “origin” search to obtain a derived mobility proxy [3]. This meta-analysis is only truly viable with large amounts of data and opens up a novel macro-perspective on past human mobility as measurable ancestry relocation. At the same time it paves the way towards methods that empower individual researchers to make use of the growing amount of reference data without getting overwhelmed.

3 GENDER VISIBILITY IN BURIAL PRACTICES OF PRE- AND PROTOHISTORIC EUROPE

Pape, Eleonore (Max Planck Institute for Evolutionary Anthropology, Department of Archaeogenetic)

Burials provide dual insights into two interconnected aspects of society: they reveal burial practices influenced by ideologies and illuminate the social and biological makeup of burial communities. Ideological practices can spread and shape societies over time, yet they may also obscure crucial information. For instance, collective burials with commingled remains and artifacts pose particular challenges for archaeologists in determining the social roles of the deceased, while cremation practices hinder biological structure analysis.

The transition from collective to single inhumation burial in much of Europe between the 4th and 3rd millennia BC has sparked prolonged debate. This shift is commonly associated with population movement, and with the ubiquitous development of increasingly hierarchical societies, where gender roles become clearer and (male) warriors gain significant stature. However, this transition in burial rites may also reveal previously obscured social structures. Determining gender and status in collective burials is particularly challenging, and patterns in Bronze and Iron Age single burials may perhaps not differ significantly from Neolithic practices preceding the collective burials.

Building on this premise, my research aims to assess the visibility of gender in selected single inhumation burial sites across Neolithic, Bronze Age, and Iron Age Central and Southern Europe. In the scope of my contribution, I will analyze and compare the gender and sex determinacy rates achieved by archaeologists, osteologists and geneticists in different regions and eras. I will explore the correlation between the spread of burial ideologies and shifts in societal structures concerning gendered practices and investigate whether the apparent increase in gender visibility in single burials during the 3rd millennium BC and thereafter could be rather attributed to methodological factors.

4 MEASURING UP? EXPLORING THE RELATIONSHIP BETWEEN THE 'DATA RUSH' AND ARCHAEOLOGICAL PROXIES FOR DEMOGRAPHY AND INEQUALITY

Lawrence, Dan (Durham University)

Archaeologists study unobservable past human behaviours through the observable material remains they leave behind. In order to bridge this gap, we use proxies – variables which we can measure in the present and which we assume correlate with the values and properties of variables we want to understand in the past. For example, past population levels can be reconstructed using data such as site counts or occupation areas. An under-discussed result of the 'data rush' described in the session abstract is that aggregated archaeological datasets can be used to create proxies which were not previously available. For example, summed probability distributions of radiocarbon dates, generated through the collection of vast databases of individual dates manipulated using a range of computational and statistical techniques, have provided an additional proxy for population. While this has allowed us to expand our capacity to extract meaning from the archaeological record, integrating new proxies into our archaeological toolkit presents theoretical and methodological challenges. This paper will consider how novel scales of data collection and integration have introduced new proxies in two major research areas in archaeology, demography and inequality, and reflect on how far the challenges which resulted have been resolved. In doing so, it will demonstrate how careful consideration of the meanings of proxies, and explicit discussion of their implications, limitations and biases, is critical to future work in archaeological data science.

5 DATA SELLS... BUT WHO'S BUYING? EXPLORING PROXIES OF ECONOMIC GROWTH IN BRONZE AGE EUROPE

Ialongo, Nicola (University of Göttingen)

There is a widespread perception that the European Bronze Age experienced steady economic growth. People, things, and ideas seem to circulate more frequently, in greater quantities, and farther away than ever before. At the same time, terms like globalisation, long-distance trade, market integration, and even money are becoming commonplace. Such a perception largely derives from the substantial investments of the last decades in partnerships between archaeology and the natural sciences.

Interestingly, a large portion of the ever-growing data-pool produced by these partnerships is qualitative in nature, and does not easily lend itself to quantification: We know that raw materials moved long distances, but we cannot pinpoint the provenance of single objects; we know that people moved long distances, but we cannot tell how many and where from; we see increasing inequality, but we cannot really put a number on it; we assume demographic growth, but we cannot obtain reliable figures.

This raises several questions: Did the economy really grow during the Bronze Age? And if it did, by what margin? And if growth cannot be quantified, how can we be sure that previous economies did not grow as well? Are existing data enough to answer these questions, or do we need new ones?

In this paper, I will illustrate ongoing research on pre-coinage money, and explore how quantitative approaches can reveal patterns of economic growth¹. Results suggest that the mass values of metal fragments are reliable proxies of consumption, opening unexplored scenarios for the quantification of prehistoric economies.

Metal objects are one of the most widely available form of data for the Bronze Age, and preliminary results encourage exploring new ways to extract information from common, yet perhaps underestimated sources.

6 NEW PERSPECTIVES IN QUANTITATIVE ARCHAEOLOGY: DATA DRIVEN APPROACHES IN POTTERY ANALYSIS

Cardarelli, Lorenzo (University of Roma La Sapienza; CNR - Istituto di Scienze del Patrimonio Culturale)

The analysis and study of ceramics plays a central role in archaeology, providing insights into technology, cultural exchange, and chronological indicators. Traditionally, ceramic analysis has relied on empirical methods involving the definition of classifications or typologies as a prelude to further investigation. This paper explores the transformative impact of the integration of new technologies, in particular machine learning and broader computer science concepts such as big data, on archaeological ceramic studies. Indeed, the integration of these technologies spans several stages, from the creation and management of datasets (object detection, information retrieval) to analysis (exploratory and predictive analyses) and dissemination of results (replicable processes, shared repositories, software libraries). This shift leads to significant simplifications and improvements in ceramic studies, including accelerated dataset creation through computer vision pipelines, automatic classification algorithms, statistical analysis for images and text, and the sharing of datasets and analysis functionality through repositories and software libraries. This paradigm shift implies a

change in perspective and approach to archaeological ceramic studies. The automation of large-scale data processing, together with automated analysis and classification, marks a clear departure from traditional qualitative approaches, often based on a limited number of artefacts. This paper aims to illustrate the potential benefits, limitations, and future prospects of a data-driven approach to archaeological ceramic studies. By reflecting on these issues, this paper not only assesses the impact and prospects of these methods, but also encourages consideration of existing empirical tools and methodologies used in ceramic studies. Such an approach facilitates a comprehensive understanding of the implications, challenges, and opportunities of data-driven archaeological ceramic research.

7 SUBJECTIVITY AND REFLEXIVITY AS FOUNDATION FOR AN EXTRAORDINARILY FERTILE COLLABORATION BETWEEN ARCHITECTURE AND ARCHAEOLOGY

Toulouse, Catherine (Lengyel Toulouse Architects) - Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg)

Reflexivity is a process that can not only challenge one's own actions, but also directly enriches them as an agency, namely when the medium is transcended. A very common procedure in every design discipline consists of transferring thoughts, primarily design thoughts of course, but essentially still vague ideas about a complex issue, by translating them into a drawing, a reflexive observation, as it were from the outside. No less subjective than the initial concept, the observation of the same takes on an illusory objectivity, which particularly encourages reflection. However, this design thinking also works in archaeology, only it works differently at first. Here, too, drawings encourage reflection. In architecture, however, the special expertise lies in giving concrete form to even extraordinarily vague ideas. The step by step progression from a rough volumetric cubature to the final design version is comparable to the gradual process of discovery in archaeology. Faithfulness to facts thus becomes faithfulness to hypotheses, literally, when the aim is to create a meaningful architectural vision with as little added as possible, just as it is for a building contractor. Seeing one's own design, or hypothesis, in a different light also influences one's view of the outside world. Above all, however, it stimulates self-reflection. A series of practical examples, all of which were developed in close collaboration between architecture and archaeology, shall be used to present and explain the potential of this combination of subjectivity and reflexivity.

845 TRANS-ADRIATIC DYNAMICS: LATE BRONZE TO EARLY IRON AGE MATT-PAINTED POTTERY IN THE SOUTHWESTERN BALKANS AND SOUTHERN ITALY

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Pavuk, Peter (Institute of Classical Archaeology, Charles University, Prague) - Krapf, Tobias (Swiss School of Archaeology in Greece) - Bernardo-Ciddio, Leah (Interdepartmental Program in Ancient Mediterranean Art and Archaeology, University of Michigan) - Iacono, Francesco (Dipartimento di Storie Cultura e Civiltà)

Session format: Regular session

The topic of LBA/EIA Matt-painted pottery on both sides of the Adriatic Sea has intermittently sparked discussions for some time now, resulting in several comprehensive studies examining the material from both regions. However, the subject has rarely been approached as a cohesive unit and it has been over 15 years since the last significant survey of material on the Eastern side of the Adriatic (Horejs 2007). While not all regions have provided substantial new evidence, notable discoveries have been made, particularly on the Western side of the Adriatic.

The session aims to bring together experts currently researching matt-painted pottery in the broader region encompassing Southern Italy, Albania, the Republic of North Macedonia, and Greece. The goal is to discuss both old and new evidence, highlighting the continuity from approximately the 15th to 7th century BC, while also examining distinct regional variations. Additionally, the session seeks to explore potential connections between the two Adriatic coasts concerning the transfer of style, knowledge, and materials. We welcome input on new developments in technology, provenance analyses, radiocarbon dating, and contextual analysis.

ABSTRACTS

1 ON THE WAY NORTH, WEST, AND EAST: AEGEAN MATT-PAINTED WARES IN THE EARLY LATE BRONZE AGE

Pavuk, Peter (Institute of Classical Archaeology, Charles University, Prague) - Krapf, Tobias (Swiss School of Archaeology in Greece) - Iacono, Francesco (Dipartimento di Storia Culture Civiltà, Università di Bologna) - Bernardo Ciddio, Leah (Department of Classical Studies, University of Michigan)

Matt-painted wares (MPW) have traditionally been associated with the Middle Bronze Age on the Greek mainland, particularly with the island of Aegina. However, it is now understood that there is not one unified version of MPW;

rather, there exists a whole variety, likely stemming from several larger exporting workshops and numerous smaller, more locally focused ones. Additionally, it has become clear that Central Greece played an important role, being home to many of these workshops. Furthermore, there is evident development over time, both within individual workshops and among them. Particularly noteworthy is the spread of MPWs towards the end of the Aegean Middle Bronze Age, extending not only to the North but also to the East and West, as both imports and locally produced items. This paper aims to provide insight into the factors preceding these later developments and the origins from which they emerge, setting the stage for further exploration in other papers within this session. It will also sketch the different terminologies used between Aegean, Italy and the Balkans.

2 MOVING AROUND THE TELL SETTLEMENTS OF CENTRAL MACEDONIA, GREECE: THE CASE OF LATE BRONZE AGE MATT PAINTED POTTERY

Vliora, Evagelia (Aristotle University of Thessaloniki) - Kiriati, Evangelia (Fitch Laboratory, British School at Athens)

The introduction of Matt Painted pottery among the LBA prehistoric societies in Central Macedonia, Greece, has often attracted the interest of researchers during the last decades. The elaborate painted decoration of the matt painted vessels was often attributed to the presence of skilled potters who were receptive to stimuli from neighbouring areas, mostly to the South. The published material from excavations conducted during the second half of the 20th century such as those of Kastanas, Ayios Mamas, Assiros Toumba and Thessaloniki Toumba have significantly enriched our understanding of Bronze Age in the region. However, a cohesive comparative study of pottery from the tell settlements of the region was until recently missing. Our study aimed to fill this gap by applying a comprehensive, interdisciplinary approach in the study of table wares from this area. The study combined the detailed macroscopic typological and technological examination with the use of ceramic petrology. The pottery assemblages involved derived primarily from Thessaloniki Toumba and from several other sites located in neighbouring parts of Central Macedonia. The technological characterization of the pottery and the reconstruction of the manufacturing process indicated that the matt painted ware stood apart from the undecorated tableware for their relative standardization, suggesting a consistent range of potter's choices and a limited number of production locations. The results of this interdisciplinary analysis revealed some interesting patterns concerning intra- and inter- regional mobility dynamics in Central Macedonia as well as some new evidence on issues of cohesion and identity among the communities at least towards the very end of the LBA. In the presentation, the social implications of these observations will be discussed both in the intra-community and in a regional level.

3 THE MATT-PAINTED POTTERY OF THE LATE BRONZE AGE ULANCI CULTURAL GROUP SHAPES, DECORATIVE MOTIFS AND CHRONOLOGY

Videski, Zlatko (Archaeological museum of the Republic of North Macedonia)

With the new researches, the amount of matt-painted pottery discovered in the territory of the UlanCI cultural group is increasing, which highlights the need for its definition and systematization. Matt-painted pottery represent the most characteristic category of findings through which the strong Aegean influence present in the Late Bronze Age in R. N. Macedonia. In addition to the new way of making, with the use of quality clay and with the new way of decoration, with the choice of new decorative motifs, is also characteristic the appearance of new pottery forms, which represent local copies of the Helladic ceramic production. According to the pottery forms present, matt-painted pottery can be divided into two subgroups: local matt-painted and local Mycenaeanized pottery.

The local matt-painted pottery is represented by the kantharos form, which is an expression of the nurturing of the local pottery tradition that takes on a new look under the influence of the pottery from the south. When performing the decoration, there is a lack of decorative motifs, so the motif of a full and hatched zig-zag line is typical and is found only in this pottery form. Local Mycenaean pottery consists of the new forms of the alabastron and amphoriskoi, which represent local handmade copies of Mycenaean pottery. In the decoration, this southern influence is most pronounced through the Late Helladic way of dividing the surface of the vessel with horizontal lines and the choice of the main motifs. The motifs of hatched and solid colored triangles, a running spiral and hatched stripes are present, and the combination of two motifs on one vessel is also characteristic.

4 BETWEEN REGIONAL CONFINEMENT AND CULTURAL TRANSMISSION: STYLISTIC ATTRIBUTES OF MATT-PAINTED POTTERY IN SOUTHERN ALBANIA AND ADJACENT AREAS

Krapf, Tobias (Swiss School of Archaeology in Greece; University of Lausanne) - Agolli, Esmeralda (Department of Archaeology and Culture Heritage, University of Tirana)

There is hardly any type of pottery in the late prehistoric southwestern Balkans that has received comparable scholarly attention to the matt-painted. Widely encountered in four modern countries (Greece, the Republic of North Mace-

donia, Albania, and southern Italy), matt-painted pottery has been perceived as a key material for the understanding of the Late Bronze and Early Iron Age. Furthermore, major attention has been given to issues regarding its origin or even its motherland, queries vigorously implied by nationalistic agendas aiming to align modern nation borders with prehistoric ones.

Recent research on late prehistoric pottery around the area has increasingly expanded its focus, addressing various questions about technology, modes of production, models of cultural transmission, and, of course, forms of regional and interregional networks. The properties of matt-painted pottery especially when different attributes such as the composition of motifs, fabric, shaping technique, vessel shape and size are combined, maintain great potential to explore routes of interaction as well as the nature of exchange within and between the communities that chose to adopt this stylistic feature into their local pottery production.

Against this backdrop, in the present paper, we focus on the stylistic properties of the matt-painted pottery encountered in southern Albania and adjacent areas, and analyse the quantitative profile of its regional and intraregional distribution. An important aspect is to clarify issues concerning the chronology and internal evolution of these productions. We argue that despite its extensive distribution around the southwestern Balkans and southern Italy, the matt-painted pottery developed within the socio-economic confines of the communities that produced it. In this context, we will briefly examine the scarce evidence from the Albanian coast, before posing the question about the region's involvement in presumed trans-Adriatic dynamics.

5 A PXRF STUDY OF BRONZE- AND EARLY IRON AGE MATT-PAINTED POTTERY FROM ALBANIA, EPIRUS AND CENTRAL GREECE

Aslaksen, Ole Christian (Independent)

The aim of this paper is to present the results of a collaborative pXRF survey of pottery from the Southeastern Albania (Sovjan, Barç, Maliq and Staro Selo), Epirus (Krya, Liatovouni, Dodona, Vitsa and Kastritsa) and Central Greece (Agia Paraskevi and Lianokladi) dating to the Bronze Age and Early Iron Age. With an emphasis on the Albanian and Epirote material, this paper is focused on the regional traits of the matt-painted pottery, but also compares it to other pottery types and wares found at the key sites of this study. The paints themselves are also included in the framework of the study presented here, with a regional focus. The material from Agia Paraskevi and Lianokladi is added as it may inform on the relation between communities producing matt painted pottery located within the same valley, but also as Central Greece is part of the discourse concerning the spread of matt painted pottery between regions. The matt painted pottery from Albania and Epirus shows localism not only in style but also chemistry. The study was conducted as a collaboration between the French Albanian Archaeological Mission in the Korçë Basin, Ephorate of Antiquities of Ioannina, Ephorate of Antiquities of Phtiotis and Evrytania and the University of Gothenburg, with funding from the Bank of Sweden Tercentenary Foundation.

6 MATT PAINTED POTTERY FROM THE REGION AROUND GREAT LAKES: NEW CHRONOLOGICAL EVIDENCE

Ardjanliev, Pero (National Archaeological museum of North Macedonia)

The subject of research in this study will be Matt painted pottery from the region around the Great Lakes. This name for the region was first established in archaeological science by Bouzek in his capital work „Graeco-Macedonian Bronzes. Analysis and chronology“. The main geographical characteristic of the region subject to this study are the lake systems of Lake Ohrid, both Prespa lakes and the recently dried Lake Maliq. This lake region, later historically attributed to the Dassaretai, has a very favourable geographic position, providing the best direct connection between the Aegean and the Adriatic coast. Considering the geography of the region and taking into account the importance of river valleys as main communications in the past, we come to the conclusion that it represents an important cross-road in this part of the Balkan peninsula. This can be concluded from the discovered archaeological remains and the discovered settlements and necropolises that cover the entire period of human activity in the past in the region.

The main feature of the material culture in the region in this so-called transition period from the Late Bronze Age to the Early Iron Age is the appearance of the local Matt painted pottery.

There are various debates in archaeological science about Matt painted pottery, such as the reasons for the distribution of the pottery, its origin and of course its chronological determination. Here, with the help of the results of the latest research, we will try to determine the chronological framework of this phenomenon in the Great Lakes region.

7 THE BLACK AND THE WHITE: THE EMERGENCE OF SOUTHERN ITALIAN PROTOGEOMETRIC POTTERY THROUGH THE PRISM OF ROCA VECCHIA

Iacono, Francesco (Dipartimento di Storie Cultura e Civiltà) - Guglielmino, Riccardo (University of Salento) - Coluccia, Luigi (Università del Salento / Università di Foggia)

Southern Italian Protogeometric wares, a peculiar class of dark-on-light painted pottery, emerged at some point toward the very end of the second millennium BC in southern Italy, in a context which was dominated by connections with the Aegean world on the one side, and a range of diverse areas, including both the northern Adriatic and the Balkans on the other. In this paper we will try to explore, through the lens of the archaeological record of the important Bronze Age hub of Roca Vecchia, the role played by this pottery in southern Italian societies of the late 2nd millennium BC. At Roca the Protogeometric repertoire is abundant and dated to a non-final phase of the Final Bronze Age/Protovillanovan, roughly contemporary to the early material of this class recorded elsewhere in the Central Mediterranean (e.g. at Lipari). Through a stylistic and contextual examination of Southern Italian Protogeometric finds we will try to explore the significance of this pottery at crucial junction of the development of society of peninsular Italy at the end of the Bronze Age.

8 EXPLORING PRODUCTION PROFILES AND COMMUNITY DYNAMICS: SALENTO'S MATT-PAINTED POTTERY REVISITED

Bernardo-Ciddio, Leah (University of Michigan)

Building on the important early work of De Juliis and Yntema on the matt-painted pottery of southern Italy, a new generation of scholars has continued to address regional matt-painted productions through new methodologies and theoretical perspectives.

The expansion of theoretical discourse on transmission of technical knowledge and habits, the phenomenon of innovation, and the social contexts of learning has allowed scholars to deploy the chaîne opératoire approach, originally rooted in French ethnography and then applied to the description of manufacture of lithics. Roux and Courty, whose application of this approach to identify the technical signatures of potting communities of practice in the archaeological record, have produced a model and body of work that has been enormously influential. The archaeologists of today are thus able to approach ceramic production evidence from a producer-focused approach, examining new finds with a close eye for the traces left behind by the actual production sequences in an attempt to discern intra- and inter-site social realities.

This approach has been applied to address the production of south Italian matt-painted pottery, most recently by Fasanella Masci, Barresi, and Kleibrink in Calabria. The results of their work have highlighted the potential for this approach to use material excavated in the past to shed new light on social realities in other regions.

In this paper, I will present the preliminary results arising from my close study of previously excavated matt-painted pottery from the Borgo Nuovo deposit at Taranto, excavated settlement contexts at Otranto, and limited survey and excavations at other sites in Salento. Comparison of these datasets allows for examination of production practices through an important period that includes the emergence of distinct regional style in this part of Apulia and the adjustment by local potters to a period of increased exchange and human mobility within the South Adriatic.

9 THE MATT-PAINTED POTTERY FROM INCORONATA (ITALY). CONTEXTS, PRODUCTIONS AND ICONOGRAPHIES

Vita, Cesare (Université Rennes 2)

This communication aims to discuss craft issues related to the matt-painted pottery and their function and consumption in the contexts put in light at Incoronata in Southern Italy. This Oenotrian site, subject of archaeological investigations since 1971, and situated only 7 km from the Ionian coast of today's Basilicata region, has been occupied from the 9th century BCE. While the initial phase was characterised only by indigenous frequentation, from the beginning of 7th BCE this was also the place of encounter with Aegean communities, thus making Incoronata a key site for the understanding of the dynamics of Greek-Indigenous interactions before the foundation of the Greek colony of Metaponto. Starting from the presentation of the indigenous contexts, and then passing to the mixed Greek-Indigenous ones, the paper will highlight the use of the matt-painted pottery as prestigious objects in the ritual activities. It will also address the subject of decoration styles and the meaning of some iconographies, through the comparisons of regional similarities and differences; finally, it will present the results of recent archaeometric analyses.

10 DYNAMICS OF INTERACTION AND COMMENSALITY THROUGH THE INVESTIGATION OF TECHNOLOGY AND FUNCTION OF THE MATT-PAINTED POTTERY OF SALENTO (SOUTHEAST ITALY)

Notarstefano, Florinda (University of Salento) - Semeraro, Grazia (University of Salento) - D'Alfonso, Serena (University of Salento) - Sabetta, Gaia (University of Salento)

In the last decades, multidisciplinary scientific research and projects have been applied to the study of the settlement system, landscapes and internal organization of ancient sites in southern Puglia. These investigations allowed recognizing a complex settlement system, characterized by a general process of expansion in the second half of the 8th century BC, a period marked by intense demographic growth, mobility and exchanges between populations, documented by an increasing number of hut villages indicating the presence of organized communities in the Salento peninsula. In these villages, the archaeological research revealed aspects of daily life as well as significant evidence of ceremonial practices, evidenced by the particular incidence of lapygian Late Geometric matt-painted vessels, sometimes associated with Corinthian geometric ceramics. In the lapygian villages of Salento, some of the individual dwellings seem to play a dominant role with respect to the surrounding structures as shown by the presence of imported Greek vessels, linked to wine consumption and commensal practices. On the other hand, the matt-painted pottery of Salento has many signs of regional stylistic coherence in the 8th century BC along with the adoption of new shapes, a growing complexity of the decorative motifs and the reoccurring set of drinking vessels. Furthermore, the pottery shapes and the use alteration traces on the interior of vessels show comparisons with those observed in containers used for alcohol fermentation reported in many ethnoarchaeological studies. The contextual and functional analysis carried out through the study of vessel technology, use-wear and organic residue analysis provided insights into the development of commensal practices that possibly could have involved the production and consumption of fermented beverages in the Iron Age settlements. This work is part of the PRIN PNRR 2022 project "POTOR. People, Pots and Drinks. An interdisciplinary approach to drinking and commensal practices in pre-Roman southern Italy".

11 THE EARLY IRON AGE MATT-PAINTED POTTERY OF THE IONIAN ISLANDS: SOME PRELIMINARY REMARKS

Haywood, Christina (University College Dublin)

This paper will discuss some finds of handmade pottery from the Ionian Islands that fit in the category of Iron Age matt-painted pottery. These pieces come from caves and settlement sites in Ithaca, Kefalonia and Lefkas. Some of the material is new and some comes from old excavations, but was unrecognised, poorly published or remains unpublished. Stylistically it is not a uniform lot. Various questions arise from the preliminary study of this material and will be raised in this paper: firstly, how can it be recognized as Early Iron Age and how can it be distinguished from the local Middle Bronze Age Matt-painted ware; secondly, how is it related to the latter if at all; thirdly, what is its relationship with the local fineware pottery from Late Bronze Age to the Protogeometric periods. Last, but not least, what are its stylistic and chronological connections with the matt-painted pottery of Greek mainland regions, mainly neighbouring Aitolakarnania and Achaia but also beyond, and what do these mean in terms of potters' choices, connectivity and the mobility of people.

12 DAUNIAN MATT-PAINTED POTTERY FROM NORTHERN DALMATIA: NEW PERSPECTIVES FROM THE NADIN-GRADINA SITE

Celhar, Martina (University of Zadar) - Zaro, Gregory (University of Maine)

Matt-painted pottery of southern Italy is one of the region's most recognizable and distinctive artifact classes, and its distribution around the Adriatic reflects tight exchange networks among different communities. In the eastern Adriatic, it was widely distributed from the 9th century BC, with the oldest type (South-Italian Early Geometric) thus far concentrated in middle Dalmatia only. However, the most abundant quantity to date is found in Istria, the Kvarner region, and in northern Dalmatia. In Northern Dalmatia, Daunian matt-painted pottery has been documented at 16 different sites, including the archaeological site of Nadin-Gradina, the focus of this study. Nadin-Gradina lies in the Ravni Kotari region along Croatia's Adriatic coast and has long been recognized as one of the largest and most distinctive Liburnian Iron Age and Roman settlements in Dalmatia. In 2015, the Nadin-Gradina Archaeological Project began systematic excavation on the hillfort settlement. Daunian matt-painted pottery was recovered from nearly every settlement layer, from the late 9th/8th to 5th century BC, suggesting that it was a fairly common commodity within the Nadin community. These objects have been frequently discussed as foreign prestige goods, clearly distinguished from locally produced coarse ware by their fine paste and painted ornamentation. However, one Daunian Middle Geometric olla was filled with cereals and recovered from a storage feature. This unique context raises questions about how these foreign "luxury" items were actually perceived and what meaning it may have held within the Nadin-Gradina community.

848 THE ARCHAEOGENETICS OF ANCIENT ITALY: SOCIO-CULTURAL CHANGES, INTERACTION AND MOBILITY FROM PREHISTORY TO THE MIDDLE AGES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Fontani, Francesco (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Cultural Heritage, University of Bologna) - Sabatini, Serena (University of Gothenburg) - Vai, Stefania (Department of Biology, University of Florence) - Scorrano, Gabriele (University of Copenhagen)

Session format: Regular session

Italy's unique position in the Mediterranean and its diverse geographical features, including the Alps and the Apennine range, have shaped its complex history and demography. In recent decades, archaeogenetics has revolutionized our understanding of population dynamics, social structures, and kinship networks in ancient Italy, revealing patterns of ancestry and social organization that traditional archaeology alone could not uncover. This interdisciplinary approach has also prompted critical discussions regarding interpretative models and the association between genetics and culture. This session aims to explore how the integration of archaeogenetics with traditional archaeological methods can deepen our understanding of Italy's past, from prehistory to the Middle Ages. We focus on the intricate relationship between genetic and cultural variations across the Italian peninsula and the broader Mediterranean region. Seeking to foster dialogue among researchers working on different aspects of Italy's archaeological and genetic heritage, we invite papers that leverage multidisciplinary methods, integrating archaeogenetics with studies on diet, mobility, demographics, and anthropology. Contributions should provide new perspectives on population genomics in ancient Italy, exploring themes such as continuity and change in social organization, kinship, social stratification, gender, and ethnicity. We encourage submissions that present fine-tuned case studies, innovative models of past population patterns, and critical analyses of big data modeling's impact on our perception of past population genomics. By integrating diverse approaches and datasets, we aim to offer fresh insights into the archaeological discipline and the role of the Italian peninsula in the ancient Mediterranean world, addressing questions of cultural and genetic interplay at various scales, from site-specific to interregional analyses. In addition to the primary proponents, this session will benefit from the co-organizational expertise and support of Dr. Serena Aneli (University of Turin) and Dr. Alissa Mittnik (Max Planck Institute for Evolutionary Anthropology and Harvard University).

ABSTRACTS

1 THE BIOMOLECULAR PROFILE OF 17,000-YEAR-OLD HUMAN REMAINS FROM RIPARO TAGLIENTE

Posth, Cosimo (University of Tübingen) - Efe Yavuz, Orhan (University of Tübingen) - Oxilia, Gregorio (University of Bologna) - Silvestrini, Sara (University of Bologna) - Tassoni, Laura (University of Bologna) - Drucker, Dorothée (Senckenberg Centre for Human Evolution and Palaeoenvironment at the University of Tübingen) - Talamo, Sahra (University of Bologna) - Fontana, Federica (University of Ferrara) - Benazzi, Stefano (University of Bologna)

The Epigravettian human remains from the Tagliente rockshelter in northern Italy represent some of the earliest evidence of human occupation in the southern Alpine slope after the Last Glacial Maximum. However, the biological relationships between the Tagliente 1 postcranial skeleton and the Tagliente 2 mandible remain unknown. Here, we apply state-of-the-art paleogenomic, isotopic and radiocarbon dating techniques on a femur fragment of Tagliente 1 and compare the results to previously published data from Tagliente 2. Despite showing different isotopic signatures and non-overlapping radiocarbon dates, we reveal close genetic relatedness between the two human remains. We demonstrate that the distinct isotopic values can be explained by different dietary practices, whereas the discrepancy in dating can be caused by a minor ^{14}C contamination, possibly stemming from post-excavation conservation treatments. These findings highlight the importance of interdisciplinary biomolecular studies in offering new perspectives on the Upper Palaeolithic fossil record and addressing long-standing bioarchaeological questions.

2 UNCOVERING THE GENOMIC STRUCTURE OF PREHISTORIC INDIVIDUALS FROM THE ICEMAN'S TERRITORY IN THE EASTERN ITALIAN ALPS

Coia, Valentina (EURAC Research, Institute for Mummy Studies) - Croze, Myriam (EURAC Research, Institute for Mummy Studies) - Paladin, Alice (EURAC Research, Institute for Mummy Studies) - Zingale, Stefania (EURAC Research, Institute for Mummy Studies) - Maixner, Frank (EURAC Research, Institute for Mummy Studies) - Günther, Torsten (Department of Organismal Biology, Evolutionary Biology Centre, Uppsala University) - Zink, Albert (EURAC Research, Institute for Mummy Studies) - Pedrotti, Annaluisa (Department of Humanities, University of Trento)

The Eastern Italian Alps played a crucial role as a bridge between the Mediterranean and the Northern Alps, and several cultural contacts are documented in this area since prehistory. However, thus far, genomically analysed prehistoric samples from this strategic area have consisted of only one Upper Palaeolithic (Villabruna) and a few Copper Age individuals, including the Tyrolean Iceman. Therefore, to define the genetic structure of alpine prehistoric groups and investigate whether cultural contacts were accompanied by genetic exchanges, we extended the genomic analyses (shotgun and capture data) to other 47 individuals from 17 archaeological sites radiocarbon dated from the Mesolithic (6380-6107 cal. BCE) to the Middle Bronze Age (1601-1295 cal. BCE).

The Mesolithic sample shows high genomic affinity with Western Hunter-Gatherers (WHGs), also with genomic contribution (~16%) from Eastern HGs, indicating genetic admixture between these two HG groups dating back at least from ~6400 cal. BCE. The alpine Neolithic genomes indicate a genetic shift associated with the arrival of the first farmers from Anatolia, showing a high Early-farmer-related ancestry (average ~87%) with limited contribution from HGs (~13%). The same ancestral model persists in most alpine individuals from the Neolithic onwards, with few changes, also evident at the Y-chromosomal level. Limited genetic impact was observed from groups carrying steppe-related ancestry, although this ancestry reached the Eastern Italian Alps, possibly through trans-alpine migrations, at least from ~2400 cal. BCE, earlier than it has been observed in northern Italy (~2200 cal. BCE). Another genetic component related to Neolithic Iranians was detected in the Eastern Italian Alps, possibly introduced through migrations of groups from southern areas. In summary, although our study highlights some gene flow from groups of different origins, it suggests also a certain genetic continuity over time in the Eastern Italian Alps compared to other European areas.

3 PALEOGENOMIC ANALYSIS IN A MULTIDISCIPLINARY FRAMEWORK FOR A FINE DESCRIPTION OF A COPPER AGE SITE: CORNA NIBBIA DI BIONE (BRESCIA)

Savarino, Francesco (Department of Biology, University of Florence) - Vanni, Margherita (Department of Biology, University of Florence) - Modi, Alessandra (Department of Biology, University of Florence) - Pizzolo, Giovanna (Department of Historical Sciences and Cultural Heritage University of Siena) - Dori, Irene (Department of Biology, University of Florence) - Moggi Cecchi, Jacopo (Department of Biology, University of Florence) - Baioni, Marco (Valle Sabbia Archaeological Museum - Gavardo (BS)) - Caramelli, David (Department of Biology, University of Florence) - Lo Vetto, Domenico (Department of History, Archaeology, Geography, Art and Entertainment (SAGAS); Florentine Museum and Institute of Prehistory Paolo Graziosi) - Vai, Stefania (Department of Biology, University of Florence)

Corna Nibbia is a rock shelter in the municipality of Bione (Brescia, Northern Italy), investigated by the Superintendence of Archaeological Heritage of Lombardy and the Archaeological Museum of Valle Sabbia di Gavardo from 2000 to 2010. The first evidence of human frequentation of the site dates back at around 3400 BCE (Copper Age) and continues (with phases of abandonment) intensively until around 900 BCE (Recent/Final Bronze Age). A funerary area delimited by two enclosures, associated to the "Culture of Civitate", was characterized by a secondary burial of scattered human remains with signs of crushing and sometimes semi-combustion, from which at least 29 individuals were estimated. A multidisciplinary study was set up and it involves archaeology, anthropology, paleogenomic and landscape archaeology: the aim is to provide a detailed picture of the community who frequented the site. We started from the whole genome analysis of all the petrous bones available, corresponding to 9 individuals. The biological portrait (sex, phenotypic traits, state of health, diet, mobility, and kinship relations) together with a fine analysis of the settlement characteristics and of the cultural dynamics will be provided and compared at a local and multi-regional level. The data obtained from each discipline are constantly integrated and managed through a GIS, allowing the creation of interpretative models. The results will lead us to evaluate the timing of use of the necropolis and the ritual patterns, suggested by the criteria of selection of the individuals, their position in the burial area and the relationships between them. In addition to this fine-scale description of the site, these data will provide novel information about the genetic variability in the Mediterranean area during the Copper Age.

4 GENOMIC ANALYSIS OF HUMAN SKELETAL REMAINS FROM THE ANCIENT BRONZE AGE NECROPOLIS OF VIGGIANO (PZ, BASILICATA, ITALY)

Lucci, Michaela (Sapienza University of Rome) - Antonelli, Lorenzo (Department of Environmental Biology, Sapienza University of Rome, Italy) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome, Italy; Department of Evolutionary Anthropology, University of Vienna, Austria; Department of Genetics, Harvard Medical School, Boston (MA), USA) - La Pastina, Francesco (Department of Environmental Biology, Sapienza University of Rome, Italy) - Mittnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Natali, Elana (Freelance researcher, via Firenze 36 - 17100 Savona, Italy.) - Rohland, Nadin (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna, Austria) - Reich, David (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Fernandes, Daniel (Institute of Geosciences, Goethe University Frankfurt, Frankfurt, Germany; Research Centre for Anthropology and Health (CIAS), Department of Life Sciences, University of Coimbra, Coimbra, Portugal; Department of Evolutionary Anthropology, University of Vienna, Austria)

The Viggiano necropolis is located in the Upper Agri Valley (647 meters above sea level), in the province of Potenza (Basilicata, Italy). Excavations, conducted in 2003 as part of the works for the construction of the Eni Viggiano-Taranto oil pipeline, brought to light, above the Neolithic levels, the remains of a funerary structure chronologically relevant to the Early Bronze Age, dated 2035-1900 calBCE (3620±20 BP, PSUAMS-12701).

The necropolis uncovered 11 burials, including two with two skeletons, with a total of 13 individuals, 11 of which had skeletal remains that could be studied, relating to eight adults and three children. Of these individuals, eight yielded positive results for genomic analysis. Almost all the individuals analyzed are male, 7 out of 8, including children, and 6 are related to relatives up to the fourth degree, all male. Of these three are brothers, one is the son of one of the brothers, and the remainder are two first cousins.

The Y Chromosome haplogroups are all subclades of R-M269 (R1b1a1b) heavily introduced to Europe through the large steppe migrations of the Late Neolithic.

The haplogroups of the mitochondrial genome are T2, found throughout Europe, North Africa, and Central Asia as far as Siberia, and haplogroup H, which is the most common and most diverse maternal lineage in Europe, most of the Middle East, and the Caucasus region.

The PCA of the Viggiano individuals shows that the occupied area is shared with other Early Bronze Age and Middle Bronze Age individuals from Sicily and also with Early Bronze Age populations from Spain, just as, although more distant than the Neolithic of Sardinia.

This study begins to shed light on a still little-known period of peninsular Italy.

5 GENETIC ANCESTRY AND KINSHIP PRACTICES IN MIDDLE BRONZE AGE CALABRIA

Fontani, Francesco (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Cultural Heritage, University of Bologna) - Larocca, Felice (Speleo-archaeological Research Centre "Enzo dei Medici") - Cilli, Elisabetta (Department of Cultural Heritage, University of Bologna) - Luiselli, Donata (Department of Cultural Heritage, University of Bologna) - Stockhammer, Philipp (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Mittnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Located at the center of the Mediterranean Basin, at the "tip" of the Italian boot, the territory of present-day Calabria is characterized by a richness in natural resources and an extremely inhomogeneous landscape. Its strategic position as a bridge to Sicily and its wealth in minerals spurred several waves of migrations and colonization of the region since the Early Neolithic up to the modern era, both on coastal and inner mountain areas. Moreover, coastal sites experienced millennia of maritime contacts. While more recent events, such as the Hellenic colonization, are well documented on the archaeological record, the demography of prehistoric native populations remains a topic of debate, mostly due to chronological discordance of the findings and a general lack of integrated archaeological research. As such, nearly no genetic information exists today for ancient Calabrian populations. Here, we present genome-wide data for 13 ancient humans found buried in the Middle Bronze Age cave site of Grotta della Monaca. Supported by archaeological evidence, we use paleogenomic data to decipher funerary customs, social organization, family ties, and gender-related burial practices of a Proto-Apennine community dated 1700-1380 cal BCE. We also contextualize the biogeographical origin and ancestry of prehistoric people of Calabria within the broad landscape of existing data from Mediterranean populations. We investigate the persistence of distinct genomic components, such

as Near Eastern-related ancestry, for which we provide the earliest appearance in mainland southern Italy. We also highlight the first evidence for prehistoric Italy of close-kin incestuous mating, which we address in light of the existing archaeological, anthropological, sociological and historical knowledge.

6 ANCIENT GENOMES FROM A ROCA VECCHIA, APULIA, SHED LIGHT ON MINOAN MODES OF COLONISATION

Nicolini, Valeria (Department of Biology and Biotechnology "L. Spallanzani", University of Pavia) - Montinaro, Francesco (Department of Biology, University of Bari; Institute of Genomics, University of Tartu) - Aneli, Serena (Department of Public Health and Pediatrics, University of Turin) - Sasso, Stefania (Institute of Genomics, University of Tartu) - Saupe, Tina (Institute of Organismal Biology, Evolutionary Biology Centre, University of Uppsala) - Guglielmino, Riccardo (Department of Cultural Heritage, University of Salento) - Vincenti, Giorgia (Department of Cultural Heritage, University of Salento) - Fabbri, Pier Francesco (Museo Fiorentino di Preistoria) - Pagani, Luca (Department of Biology, University of Padova; Institute of Genomics, University of Tartu)

Roca Vecchia, an iconic bronze age stronghold in Apulia, southern Italy, was completely destroyed during a siege between the end of the 15th and the beginning of the 14th century BCE. During the siege, part of the local people hid within the stronghold walls, where their remains were found during the excavation that took place in the 1990s.

Material culture found at Roca Vecchia and associated with the period of the siege includes Minoan-type pottery produced from local clay, imported Aegean pottery and an Aegean type dagger, pointing to an established relationship between the site and the Minoan civilization. Therefore, the site offers an unprecedented opportunity to characterise the genetic components of the population inhabiting an indigenous settlement with traces of a Minoan minority, to shed light on the demic or cultural modes of the Minoan presence in the central Mediterranean.

With our work we sampled all the available individuals excavated at the siege and obtained genome-wide information for two individuals. When compared with available Minoan, Apulian and broadly Mediterranean genomes, the individuals showed a characteristic Bronze/Iron Age Italian peninsula genetic signature, with limited contribution from Minoans. We conclude that the local population of Roca Vecchia, at the moment of the siege, was predominantly autochthonous, with a minoritarian Minoan component. Archaeological data suggest that the Roca Vecchia Aegean population component probably increased in the following centuries.

7 NEW INSIGHTS IN THE POPULATION DYNAMICS OF THE ITALIC IRON AGE: ARCHAEOGENETIC ANALYSIS OF THE MIDDLE-ADRIATIC CULTURES

Ravasini, Francesco (Sapienza University of Rome, Italy) - Solnik, Anu (University of Tartu, Estonia) - Delpino, Chiara (Superintendence Archaeology, Fine Arts and Landscape for the Provinces of Frosinone, Latina and Rieti, Ministry of Cultural Heritage, Italy) - Finocchi, Stefano (Superintendence Archaeology, Fine Arts and Landscape of the Marche Region, Ministry of Cultural Heritage, Italy) - Giroladini, Pierluigi (Superintendence Archaeology, Fine Arts and Landscape for the metropolitan city of Florence and the provinces of Pistoia and Prato, Ministry of Cultural Heritage, Italy) - Scheib, Christiana (Department of Zoology, University of Cambridge and St John's College, University of Cambridge, UK) - Tambets, Kristiina (University of Tartu, Estonia) - Cruciani, Fulvio (Sapienza University of Rome, Italy; Institute of Molecular Biology and Pathology (IBPM), CNR, Italy) - D'Atanasio, Eugenia (Institute of Molecular Biology and Pathology (IBPM), CNR, Italy) - Trombetta, Beniamino (Sapienza University of Rome, Italy)

The Italic Iron Age (approximately 10th-3rd century BCE) was characterized by a mosaic of different cultural groups, thoroughly characterized by an archaeological perspective. While some of these ethnicities have been partially investigated from a genomic point of view (providing new insights into population dynamics) a comprehensive genetic portrait remains elusive, particularly for those populations residing along the mid-Adriatic coast. To better understand the evolution and history of Iron Age Italic populations, we focused our attention on the Picenes, a civilization that flourished along the Adriatic coasts of Central Italy from the 9th to the 3rd century BCE, until Roman colonization. The Picenes were composed of many local groups not necessarily related from a genetic perspective. We analyzed the genome of 81 ancient individuals buried in three different Iron Age necropolises located in Central Italy, two associated to the Picene culture (Novilara and Sirolo-Numana, 8th-5th century BCE) and one Etruscan necropolis (Monteriggioni/Colle di Val D'Elsa, 8th-6th century BCE). Our investigation unveiled genetic homogeneity not only among the two Picene sites, indicating extensive gene flow, but also between the Picenes and other contemporary populations, pointing to a common genetic origin of the Italic Iron Age ethnic groups. Despite this homogeneity, relevant genetic distinctions emerged between coeval Adriatic and Tyrrhenian populations, pointing to genetic contacts between the Adriatic coast of Italy and the Balkans and/or Northern Europe. Furthermore, the identification of genetic outliers (indicating foreign ancestries) within the cultures here analyzed suggests that the Italic Iron Age was characterized by a multicultural society where individuals with diverse genetic origins from across Europe coexisted.

8 ALFEDENA (AQ, ABRUZZO, ITALY), A 6TH-5TH CENTURY BCE SAMNITE COMMUNITY: ANALYSIS OF KINSHIP AND SOCIAL STRUCTURE THROUGH ARCHAEOGENETIC DATA

Coppa, Alfredo (Sapienza University of Rome; Department of Evolutionary Anthropology, University of Vienna, Austria; Department of Genetics, Harvard Medical School, Boston (MA), USA) - Bondioli, Luca (Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music, University of Padua, Italy) - D'Anastasio, Ruggero (Department of Medicine and Aging Sciences, University "G. D'Annunzio" Chieti-Pescara, Italy) - D'Ercole, Vincenzo (Department of Humanities, Arts and Social Sciences (DiLASS) University "G. D'Annunzio Chieti-Pescara, Italy) - Lugli, Federico (Institute of Geosciences, Goethe University Frankfurt, Frankfurt, Germany; Department of Chemical and Geological Science, University of Modena and Reggio Emilia, Italy) - Lucci, Michaela (Department of Environmental Biology, Sapienza University of Rome, Italy) - Nava, Alessia (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome, Rome, Italy) - Mittnik, Alissa (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna, Austria) - Reich, David (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA)

The Samnite necropolis of Alfedena (6th-5th century BCE, L'Aquila, Abruzzo, Italy) underwent systematic excavations in the late 19th and early 20th century, revealing around 1,500 burials, of which only 38 cranial remains are preserved. Subsequent systematic excavations of the site between 1974 and 1979 were the first in Italy to involve a biological anthropologist on the ground. These excavations uncovered 132 burials with a total of 140 individuals. Over the years, this collection has been the subject of numerous analyses, leading to the publication of many articles on various aspects of bioarchaeology.

Of these latter 140 individuals, 109 were analyzed for aDNA, with 77 (70.1 %) yielding positive results. We reconstruct several large pedigrees that span up to six generations. With only a few exceptions, all 1st degree relationships were found between pairs of male individuals or a mother and son, indicating a patrilineal social organization. Instances of consanguineous offspring suggested the practice of cousin marriage. Notable for the reconstruction of the social structure and marriage patterns is that in the 9 cases detected, the parents' graves were next to each other and the children were placed in the immediate vicinity, testifying to a clear planning in the topographical development of the cemetery. Strontium radiogenic isotope analysis suggested that some individuals appeared to be non-local, likely originating from neighboring areas of Abruzzo and Molise. The Alfedena samples were analyzed in the context of the four neighboring coeval necropolises from Abruzzo (Barrea 2.3 km, and Opi 15.7 km) and Molise (San Pietro Avellana 9.5 km, and Abbazia Nuova 11.2 km), and that of Alfedena Alboreto, slightly later (3rd century BCE), which is 2-300 meters away from the oldest group of tombs.

9 ARCHAEOGENETIC CHARACTERIZATION REVEALS SOCIAL ENDOGAMY AMONG SAMNITE GROUPS IN ANCIENT PRE-ROMAN ITALY (PONTECAGNANO, CAMPANIA, 5TH-4TH CENTURY BCE)

Riccomi, Giulia (Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy.; Department of Archaeology, Max Planck Institute of Geoanthropology, Jena, Germany) - Petta, Valeria (Università degli Studi di Salerno, Italy.) - Giuffra, Valentina (Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy.) - Pellegrino, Carmine (Università degli Studi di Salerno, Italy.) - Sirak, Kendra (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA 02138, USA.) - Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA 02138, USA.; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany.) - Reich, David Emil (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA 02138, USA.)

The Samnites, prominent competitors of the Romans prior their dominance over the Italian peninsula in the 3rd century BCE, underwent a transformative cultural period known as the 'Samnitization process' between the 5th and 4th centuries BCE. This marked a shift in the political structure of Italic populations, involving mobility of groups from inland central Italy to the Campania region in the south. While the analysis of topography, spatial organization, and material culture has shed light on these migrations, biosocial and biocultural aspects of this process remain largely unexplored. In this study, we integrated osteological and archaeological data with new genomic data obtained from the disarticulated petrous bones of 26 individuals inhumated in the funerary sector of Di Renna (5th-4th centuries BCE) within the eastern necropolis of the Etruscan-Campanian site of Pontecagnano (Salerno, southern Italy). The archaeological interpretation based on the grave goods allowed us to identify individuals belonging to Samnite groups; 'aeroplano' fibula was usually found in female and non-adult burials while males were adorned with bronze belt and spear. As for topography of Di Renna funerary sector, several family clusters were identified. Biocultural relatedness

was supported by characterization of genetic kinship and detection of runs of homozygosity providing direct evidence of consanguineous marriage practices among cousins at high frequencies during 425-375 BCE, the later phase of the Samnitization. Genomic data also revealed that the ancestry of these individuals mainly arose from the Italian mainland, with some showing additional ancestry from the eastern Mediterranean. Our results shed light on the social organization of this ancient group and highlight the potential of archaeogenetic approaches for unravelling the interplay of genetic admixture, mating patterns, and marital practices associated to mobility in pre-Roman Italy.

10 KINSHIP PATTERNS AND GENETIC PROFILE IN THE LATE IRON AGE SEMINARIO VESCOVILE NECROPOLIS (NORTHEASTERN ITALY; 3RD - 1ST CENTURIES BCE)

Zingale, Stefania (Institute for Mummy Studies, Eurac Research) - Laffranchi, Zita (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Paladin, Alice (Institute for Mummy Studies, Eurac Research) - Goffredo, Giulia (Institute for Mummy Studies, Eurac Research) - Salzani, Luciano (Soprintendenza per i Beni Archeologici del Veneto, Settore territorio, Sede di Padova-Nucleo di Verona) - Dori, Irene (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Verona, Rovigo e Vicenza; Department of Biology, University of Florence) - Zink, Albert (Institute for Mummy Studies, Eurac Research; Faculty of Biology, Ludwig Maximilian University of Munich) - Milella, Marco (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Coia, Valentina (Institute for Mummy Studies, Eurac Research)

The European Late Iron Age (4th-1st centuries BCE) is characterized by cultural exchanges favored by trade networks and human movements, including the southward movement of transalpine groups to the Italian Peninsula. Here, we investigate 92 individuals from the Northeastern Italian necropolis of Seminario Vescoville (SV, 3rd - 1st centuries BCE) through paleogenomic analyses (genetic sex determination and kinship analyses) to contribute to the understanding of their social organization and obtain a first insight into the genetic profile of the individuals from this funerary context.

We successfully analyzed the ancient genomes (via shotgun plus nuclear and mtDNA enrichment data) of 90 individuals from SV, including 42 non-adults. Genetic sex assignment revealed 50 females (XX) and 40 males (XY), with a higher frequency of female non-adults (~43%). While male Y-Chromosomal haplogroups are primarily represented by the main haplogroup R1b* (~73%), mtDNA haplogroups assignment showed high genetic variation in the maternal lineages, including besides typical European lineages (e.g., H* and U*), an African haplogroup (L1). This was found in a non-adult female whose funerary treatment does not deviate from that observed in the rest of the burial site. Additionally, kinship analyses identified 20 cases of close biological relationships (up to the 3rd degree). However, kinships do not follow any specific spatial patterning, as burials of closely related individuals are located in distant necropolis areas. Comparative analyses confirm genetic diversity among individuals from SV and no genomic affinity with present-day populations from the same geographic area.

Overall, our findings indicate higher mobility of females compared to males, suggesting possibly patrilocality. Furthermore, the absence of specific kinship patterns emphasizes the complexity of social structures of ancient Iron Age groups from Northern Italy. Moreover, we reveal that the Iron Age individuals have contributed little to the gene pool of today's North-Eastern Italians.

11 REINTERPRETING POMPEII'S PLASTER CASTS USING ANCIENT DNA

Mittnik, Alissa (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Human Evolutionary Biology, Harvard University, Cambridge, MA, USA; Department of Genetics, Harvard Medical School, Boston, MA, USA) - Pilli, Elena (Department of Biology, University of Florence, Italy) - Vai, Stefania (Department of Biology, University of Florence, Italy) - Moses, Victoria (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA, USA; Department of History, Harvard University, Cambridge, MA, USA) - Modi, Alessandra (Department of Biology, University of Florence, Italy) - Morelli, Stefania (Department of Biology, University of Florence, Italy) - Amoretti, Valeria (Parco Archeologico di Pompei, Naples, Italy) - Osanna, Massimo (Ministry of Cultural Heritage and Activities and Tourism, Rome, Italy) - Caramelli, David (Department of Biology, University of Florence, Italy) - Reich, David (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA, USA; Department of Genetics, Harvard Medical School, Boston, MA, USA; Howard Hughes Medical Institute (HHMI), Harvard Medical School, Boston, MA, USA; Broad Institute of MIT and Harvard, Cambridge, MA, USA)

The 79 CE volcanic eruption buried several Roman towns on the Gulf of Naples, preserving civil and private structures, sculptures, paintings, and mosaics in ash, offering an unparalleled glimpse into ancient Roman life. Excavations in Pompeii from 1748 on revealed over 1,000 human victims. Developed in the 19th century, archaeologist Giuseppe Fiorelli's plaster cast method captured the shapes of over 100 of their bodies. Their interpretations, shaped by initial archaeologists and restorers, reflect the worldview of their time.

We generated genome-wide ancient DNA data to characterize the genetic relationships, sex and ancestry of five individuals from the casts sampled during the 2015 restoration efforts. Genetic analysis of several individuals previ-

ously assumed to be women revealed them as genetically male. Additionally, members of a presumed family unit were found to be genetically unrelated. Our findings challenge longstanding interpretations about gender roles and familial relationships such as associating jewelry with femininity or interpreting physical closeness as indicators of biological relationships and underscore the unreliability of the commonly repeated narratives.

All individuals from Pompeii consistently trace their ancestry largely to recent immigrants from the eastern Mediterranean, echoing findings from contemporaneous ancient genomes in the city of Rome. This underscores the cosmopolitan nature of the Roman Empire during this period, revealing a mosaic of diverse cultural influences shaping the demographic landscape of both Roman urban centers.

Integrating genetic data with archaeological and historical information proves essential, even in historically rich sites like Pompeii to significantly enhance our understanding of past lives and behaviors.

12 HERCULANEUM, 79 CE: ARCHAEOGENETIC INSIGHTS INTO ROMAN SOCIETY FROM A CATASTROPHIC DEATH ASSEMBLAGE

Petrone, Pier Paolo (Department of Advanced Biomedical Sciences, Unit of forensic Medicine, University of Naples Federico II, Naples, Italy) - Mitnik, Alissa (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA; Department of Genetics, Harvard Medical School, Boston (MA), USA) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Reich, David (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA; Department of Genetics, Harvard Medical School, Boston (MA), USA; Howard Hughes Medical Institute, Harvard Medical School, Boston, Massachusetts, USA; Broad Institute of Harvard and MIT, Cambridge, Massachusetts, USA)

The eruption of Mount Vesuvius in 79 CE captured a unique snapshot of Roman Imperial society, burying nearby settlements along with their architecture, writing, art, household objects and thousands of lives lost in the catastrophe. Our genetic study focused on the remains of 94 of the volcano's victims excavated at Herculaneum, 80 of whom perished in the boat chambers on the shore while awaiting rescue—a group that encapsulates a frozen cross-section of Roman society.

We identified 13 families through genetic relationships, predominantly consisting of mothers and their young children, but also adult men and their elderly parents. The group displayed remarkable genetic heterogeneity, even within families, with ancestral roots extending across the Central and Eastern Mediterranean, Central Europe, and North Africa, and indications of immediate Levantine origins for some. This finding underscores the diversity and mobility within the Roman Empire, also described for the population of the city of Rome—a phenomenon intricately woven into territorial expansion, trade, slavery, and cultural exchange.

By integrating the genetic insights with a comprehensive reassessment of the archaeological and anthropological evidence we examine the individuals' demographics, pathologies, and personal items associated with their socio-economic status to illuminate the diverse background of Herculaneum's inhabitants, unraveling their identities, social roles and behaviors amidst the catastrophic eruption.

13 POPULATION CHANGES IN NORTHERN ITALY FROM THE IRON AGE TO MODERN TIMES

Yavuz, Orhan Efe (Archaeo- and Palaeogenetics Group, Institute for Archaeological Sciences, University of Tübingen, Tübingen, Germany; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen, Tübingen, Germany) - Zaro, Valentina (Dipartimento di Biologia, Università degli Studi di Firenze, Florence, Italy) - Laffranchi, Zita (Institute of Forensic Medicine, Department of Physical Anthropology, University of Bern, Bern, Switzerland) - Dori, Irene (Dipartimento di Biologia, Università degli Studi di Firenze, Florence, Italy; Soprintendenza archeologia belle arti e paesaggio per le province di Verona, Rovigo e Vicenza, Italy) - Bruno, Brunella (Soprintendenza archeologia belle arti e paesaggio per le province di Verona, Rovigo e Vicenza, Italy) - Belcastro, Maria (Dipartimento di Scienze Biologiche, Geologiche e Ambientali, Alma Mater Studiorum Università di Bologna, Bologna, Italy) - Milella, Marco (Institute of Forensic Medicine, Department of Physical Anthropology, University of Bern, Bern, Switzerland) - Lari, Martina (Dipartimento di Biologia, Università degli Studi di Firenze, Florence, Italy) - Caramelli, David (Dipartimento di Biologia, Università degli Studi di Firenze, Florence, Italy) - Posth, Cosimo (Archaeo- and Palaeogenetics Group, Institute for Archaeological Sciences, University of Tübingen, Tübingen, Germany; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen, Tübingen, Germany; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

Archaeological investigations and historical accounts consistently indicate a diverse and highly localized cultural landscape throughout the Italian peninsula during the pre-Roman period. The Iron Age in northern Italy can be defined as a dynamic and cultural mosaic, including the presence of groups associated with the northernmost expansion of the Etruscan culture. Through the establishment of the Republican period, Rome extended its control to this territory (2nd-1st century BCE), resulting in an increased cultural homogeneity with other areas of Italy. The Roman Empire

then strengthened its cultural, political, and economic hegemony also on provinces surrounding the Italian peninsula. However, it is unclear if these geopolitical processes led to demographic changes in northern Italy.

Here, we generated genome-wide data of 66 individuals from eleven sites in northern Italy associated with Etruscan and Imperial-period groups. We integrated them into the published relevant archaeogenetic dataset, including Medieval and present-day genomes, with the aim of gaining insights into population changes in northern Italy during the last 3,000 years while filling this geographical and temporal gap in the record.

Our results revealed that most northern Etruscan individuals cluster genetically with coeval genomes from Etruria. This seemingly homogenous genetic profile among the Etruscan groups experienced a strong demographic shift during the Imperial period. As a result, most northern Italian individuals derive three-quarters of their genetic profile from the local Iron Age substratum and one-quarter from contemporaneous groups in the Near East. This Eastern Mediterranean signal persists in the genetic record of Medieval and modern-day northern Italian populations albeit in diluted form due to significant genetic admixture with central and northern European groups. In conclusion, our findings suggest that northern Italy, in terms of population dynamics during the Imperial rule, adheres to a pattern akin to that observed in the city of Rome and central Italy.

14 THE LATE ANTIQUE/EARLY MEDIEVAL NECROPOLIS OF CASTEL SOZZIO (CIVITELLA D'AGLIANO, VT, ITALY): A MULTIDISCIPLINARY RESEARCH APPROACH

Candilio, Francesca (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy; Department of Environmental Biology, Sapienza University of Rome, Italy) - Antonelli, Lorenzo (Department of Environmental Biology, Sapienza University of Rome, Italy) - Borgia, Emanuela (Department of Antiquities, Sapienza University of Rome, Italy) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome, Italy; Department of Evolutionary Anthropology, University of Vienna, Austria; Department of Genetics, Harvard Medical School, Boston (MA), USA) - La Pastina, Francesco (Department of Environmental Biology, Sapienza University of Rome, Italy) - Lugli, Federico (Institute of Geosciences, Goethe University Frankfurt, Frankfurt, Germany; Department of Chemical and Geological Science, University of Modena and Reggio Emilia, Italy) - Lucci, Michaela (Department of Environmental Biology, Sapienza University of Rome, Italy) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna, Austria) - Reich, David (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Fernandes, Daniel (Department of Evolutionary Anthropology, University of Vienna, Austria; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Research Centre for Anthropology and Health (CIAS), Department of Life Sciences, University of Coimbra, Coimbra, Portugal)

In the territory of Civitella d'Agliano (VT, Lazio), at the site today called Castel Sozzio, excavation campaigns from 1997-1998 and 2020-2023 brought to light a funerary complex of great importance, as it is the only one investigated in the Tiber Valley for this period. The burials, many of which were reused several times, show different funerary typologies, and very few grave goods were found in the tombs. However, preliminary chronological interpretation suggests a date between the 5th and 7th century CE - a crucial period when Italy was affected by the Gothic invasion, by the war between Byzantines and Goths, and then by the advent of the Lombards.

To date, 148 skeletons have been recovered, of which 76 have been analyzed for ancient DNA, with 70 giving positive results. An initial PCA analysis shows substantial heterogeneity, in line with the findings on the population structure of Rome highlighted in previous research (Antonio et al., 2019). Six family groups, consisting of 2-4 members, were identified, to which 15 individuals belonged. In addition to genomic analyses, and in order to study mobility, strontium radiogenic isotope analyses were carried out for 55 samples, of which 35 were also analyzed for oxygen isotopes. Of great interest is Family D where a father and son are genetic outliers, with the former being non-local. About 20% of the sample individuals are of non-local origin, and preliminary data indicate at least two different areas of origin. This preliminary study shows how the integration of molecular and isotopic data is of fundamental importance in the study of the human population of specific geographical areas.

15 AN ARCHAEOGENETIC STUDY OF THE RISE OF THE MARITIME REPUBLIC OF NOLI, ITALY

Moots, Hannah (Centre for Palaeogenetics) - Gordon, Imani (University of Chicago) - Gold, Claire L. (University of Massachusetts Amherst) - Fuente, Constanza (University of Chicago) - Bandyopadhyay, Esha (University of Chicago) - Koch, Emily (University of Michigan) - Witonsky, David (University of Chicago) - Lupiáñez-Corpa, Natividad (University of Chicago) - Raghavan, Maanasa (University of Chicago) - Holt, Brigitte (University of Massachusetts Amherst)

In the 12th century CE, the small coastal Ligurian town of Noli grew into a maritime republic, with territorial holding and a trading network distributed across the Mediterranean, the Black Sea, and beyond. While steep mountains isolate Noli from many neighboring cities by land, its wide maritime trade network and sailing prowess meant that it was highly interconnected with other communities by sea. As competition with other Italian city-states grew, Noli allied

itself with the Republic of Genoa, sharing military support and mutually increasing their overseas connections. In this study, we sequenced and studied archaeogenomic data from 23 inhabitants of medieval Noli, spanning the 10th - 13th centuries, to better understand the rise of this maritime republic. We find that the population is genetically highly diverse, reflecting the far-reaching networks of the allied republics, which included territories on nearby Corsica and Sardinia, as well as further away in North Africa, the Aegean, and the Black Sea. We examine patterns in biological relatedness across the site and investigate genomic evidence for infectious diseases impacting this population. We present an archaeogenomic glimpse into the population of this maritime republic and contextualize our findings within the rich historical and archaeological documentation of medieval Italy.

16 **ARCHAEOGENETIC INSIGHTS INTO THE ANCIENT CITY OF BLANDA: A MILLENNIA-LONG PERSPECTIVE FROM THE NECROPOLIS OF TORTORA (CS, CALABRIA, ITALY)**

Mollo, Fabrizio (University of Messina) - Barbato, Mariangela (Superintendency of Archaeology, Fine Arts and Landscape for the province of Cosenza, Italy) - Coppa, Afredo (Department of Environmental Biology, Sapienza University of Rome, Italy; Department of Evolutionary Anthropology, University of Vienna, Austria; Department of Genetics, Harvard Medical School, Boston (MA), USA) - La Pastina, Francesco (Department of Environmental Biology, Sapienza University of Rome, Italy) - Lucci, Michaela (Department of Environmental Biology, Sapienza University of Rome, Italy) - Mallick, Swapan (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Sperduti, Alessandra (Servizio di Bioarcheologia, Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy; Università degli Studi "L'Orientale" di Napoli, Naples, Italy) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna, Austria) - Reich, David (Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA) - Mittnik, Alissa (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Genetics, Harvard Medical School, Boston (MA), USA; Department of Human Evolutionary Biology, Harvard University, Cambridge (MA), USA)

The necropolis of Tortora comprises two main burial nuclei: the first dating to the Archaic and Pre-Roman period, features two culturally distinct chronological periods, the older Oenotrian (6th and 5th century BCE) and later Lucanian phase (4th century BCE). The second pertains to the Early Medieval period (7th to 9th century CE).

In our ongoing archaeogenetic study, genome-wide data from 44 individuals across all phases, reveal five pedigrees, two from the Oenotrian, two from the Lucanian, and one from the Early Medieval phase. Population genetic analyses delineate two main genetic clusters aligning with the cultural and chronological groups. Most individuals from the 6th to 4th century BCE genetically resemble contemporaneous populations from Lazio and Etruria, while the Early Medieval individuals are shifted more toward Aegean and Near Eastern populations. Notable, genetic outliers from the first period suggest potential Greek gene flow or incorporation of Greeks into the local Oenotrian population.

A series of absolute dates largely confirms the archaeological chronology, albeit with low resolution for the earlier phases due to the Hallstatt Plateau. Unexpectedly, two individuals from Tomb 61 were dated to the Roman Imperial period, a phase during which there is no archaeological documentation of the use of the necropolis. This Lucanian tomb had been violated in ancient times; it was devoid of grave goods, but the structure (chamber tomb of large blocks of limestone with red-coloured walls) signifies very high rank. These individuals are also outliers in terms of their genetics: the adult male (2nd-4th century CE) shares genetic affinity with ancient Eastern Baltic populations, while the adult female (1st century BCE-2nd century CE), clusters with contemporaneous population of Rome.

This research illuminates the population and social dynamics of the city of Blanda, spanning over a millennium and offering nuanced insights into the use of its necropolis.

17 **1000 ANCIENT ITALIAN GENOMES: EVIDENCE FROM ANCIENT BIOMOLECULES FOR UNRAVELLING PAST HUMAN POPULATION DYNAMICS**

Vai, Stefania (Department of Biology, University of Florence, Italy) - Boscolo Agostini, Rajiv (Department of Life Sciences and Biotechnologies, University of Ferrara, Italy) - Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA 02138, USA; Department of Genetics, Harvard Medical School, Boston, MA 02115, USA; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean, 04103 Leipzig, Germany; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean, Cambridge, MA 02138, USA; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103 Leipzig, Germany) - Luiselli, Donata (Department of Cultural Heritage, Ravenna, University of Bologna, Italy) - Rickards, Olga (Department of Biology, University of Rome, Tor Vergata, Italy) - Sineo, Luca (Department of Biological, Chemical and Pharmaceutical Sciences and Technologies, University of Palermo, Italy) - Volante, Nicoletta (Department of History and Cultural Heritage, University of Siena, Italy) - Ghirotto, Silvia (Department of Life Sciences and Biotechnologies, University of Ferrara, Italy) - Reich, David (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA 02138, USA; Department of Genetics, Harvard Medical School, Boston, MA 02115, USA; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean, 04103 Leipzig, Germany; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean, Cambridge, MA 02138, USA; Howard Hughes Medical Institute (HHMI), Harvard Medical School, Boston, MA 02115, USA; Broad Institute of MIT and Harvard, Cambridge, MA 02142, USA) - Caramelli, David (Department of Biology, University of Florence, Italy)

Italy occupies a strategic geographical position in the center of the Mediterranean Sea, while affected by the influence of continental Europe. Since its prehistory, Italy has been characterized by a variety of groups defined by different material culture and traditions. Among the possible reasons for this peculiarity there are different levels of cultural and biological contributions from outside the country, different levels of genetic exchanges between local groups occurred both in prehistoric and historical times, as well as the presence of different environments, climates and resources that could have led to cultural and/or biological differentiation and even isolation. A multidisciplinary approach is needed to reconstruct the past population dynamics of the Italian country, and the contribution of paleogenomics is fundamental to investigate biological variation through time and space. To infer the details of the peopling of the country from the Paleolithic to the Middle Age we analyzed about 1,000 ancient human remains through a combination of target enrichment of nuclear informative SNPs and whole genome sequencing. Both explorative analyses of the genomic variation and model-based methods have been used to infer explicit demographic scenarios to be tested through an Approximate Bayesian Computation (ABC) framework specifically optimized for low-coverage data. Thanks to this approach, the colonization dynamics and the genealogical relationships through time and space will be explored at an unprecedented level. Radiocarbon dating and Strontium Isotopes analysis will also be used to refine the reconstructions obtained through the paleogenomic analysis.

849 **ZOOARCHAEOLOGY IN TRANSITION(S): SUBSISTENCE PATTERNS, CULTURAL CHANGES AND CONTINUITY IN EUROPEAN PREHISTORY THROUGH OLD AND NEW TOOLS**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Marchán-Fernández, Alberto (Universidad de Salamanca) - Gabucio, Maria Joana (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Pineda, Antonio (UMR 7194 HNHP (MNHN-CNRS-UPVD), Département Homme et Environnement, Muséum National d'Histoire Naturelle; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA)) - Rufà, Anna (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour – ICArEHB, Universidade do Algarve; Université de Bordeaux) - Téllez, Edgar (Centro Nacional de Investigación sobre la Evolución Humana (CENIEH))

Session format: Regular session

Throughout the Pleistocene, numerous cold and temperate climatic phases alternate, culminating around 11,800 cal BP with the onset of the Holocene, characterized by warm climatic conditions. This sequence of environmental changes had an impact on the technology, economy and internal dynamics of Pleistocene and early Holocene hunter-gatherer groups, as well as the first food producers of the Neolithic. Research on human-animal interactions provides a great amount of information about aspects such as the socio-economic organization of human groups, their territorial distribution or their symbolic world, among others.

Zooarchaeology involves the study of faunal remains (bones, teeth, shells, etc.) recovered from archaeological sites, paying special attention to the phenomena of change and continuity in order to infer the existence of cultural patterns. It is also characterized by the incorporation of new tools, as well as the permanence of others. Thus, in the last

two decades, this discipline is undergoing its own transition, in which traditional methods (taxonomic identification, taphonomic analysis, etc.) are combined with new techniques (e.g. ZooMS, genomic studies, Artificial Intelligence) through transdisciplinary and multiproxy approaches.

This session aims to create an open forum to explore in depth the subsistence patterns, the procurement of animal resources and their subsequent management by Pleistocene hunter-gatherers and early prehistoric farmers, as well as their implications for the organization and cosmology of these human groups. Our objective is to provide a space for sharing and integrating new and old methodological approaches, contributing to a better understanding of the phenomena of change and continuity in human-animal relationships during Prehistory. Communications and posters related to these associated aspects are welcome:

- Archaeofaunal and archaeomalacological analyses.
- Isotopic and proteomic analyses.
- Genomic studies.
- Osteometry and specific variability.
- Experimental protocols.
- Bone industry and operational chain.
- Taphonomic and biometric analyses.
- Geostatistics and territorial occupation strategies
- Palaeoclimatic and palaeoenvironmental analyses
- Other new methodological and technological approaches in Zooarchaeology.

ABSTRACTS

1 A TAPHONOMIC REVIEW OF THE SEQUENCE OF THE MIDDLE PLEISTOCENE SITE OF NOTARCHIRICO (MIS 17-MIS 16)

Alcalá, Antonio (Museum National d'Histoire Naturelle; Institut Català de Paleoeologia Humana i Evolució Social) - Iannucci, Alessio (Eberhard-Karls-University Tübingen) - Mecozzi, Beniamino (Sapienza University of Rome) - Carpentieri, Marco (Università degli Studi di Ferrara) - Sardella, Raffaele (Sapienza University of Rome) - Moncel, Marie-Hélène (Museum National d'Histoire Naturelle)

The Middle Pleistocene site of Notarchirico plays a crucial role to study the arrival and evolution of the Acheulean technology in Western Europe and its relationship with human behavior. First excavations (1979 to 1995), coordinated by Marcello Piperno, led to the discovery of 11 archaeological levels (from alpha (α), to G) in a seven-meter-deep sequence. Since 2016, a new project started, directed of Marie-Hélène Moncel and older levels have been unearthed (up to level J). The site has been dated between 610 and 695 ka (MIS 17-MIS 16) by $^{40}\text{Ar}/^{39}\text{Ar}$ and ESR.

The first taphonomic studies were only on the upper levels of the sequence: alpha and A. In this work we present the preliminary data of the taphonomic study of the rest of the whole sequence (levels B to I2). The total number of faunal remains analyzed amounts to 3389, although the distribution of the material in the sequence is unevenly. Levels D and E of the old excavation and levels F, G, I1 and I2 of the new one yielded the majority of the faunal material.

The faunal record is almost totally composed by elephants and ungulates, being *Palaeoloxodon antiquus*, *Bison* sp., *Praemegaceros* sp., *Cervus* sp., Dama-like deer the most represented taxa. Other taxa, like *Macaca* sp., *Castor* sp. and carnivorans (*Canis* sp. and *Martes* sp.) are scarcely represented. No evidence of anthropic modification was identified in the whole sequence, whereas carnivore activity is only proved by some tooth-marked specimens. Although the poor preservation of the bone surfaces makes difficult to infer the role of hominins and carnivorans, this taphonomic review can help to elucidate the formation process of the site of Notarchirico and to discuss hypotheses on the reasons of the regular presence of hominins on this place and along the lake/water channels.

2 BONE TOOLS AT THE NEANDERTHAL SITE OF ABRI SUARD (CHARENTE, FRANCE) DURING MIS 6-5

Téllez Peñaranda, Edgar (Consortio Centro Nacional de Investigación sobre la Evolución Humana (CENIEH)) - Doyon, Luc (PACEA UMR 5199, Université de Bordeaux, CNRS, Ministère de la Culture et de la Communication. Bâtiment B8, Allée Geoffroy Saint Hilaire F-33600 Pessac, France) - Genuite, Kim (PACEA UMR 5199, Université de Bordeaux, CNRS, Ministère de la Culture et de la Communication. Bâtiment B8, Allée Geoffroy Saint Hilaire F-33600 Pessac, France) - Gómez-Olivencia, Asier (Dept. Geología, Facultad de Ciencia y Tecnología, Universidad del País Vasco/Euskal Herriko Unibertsitatea (UPV/EHU). Barrio Sarriena s/n, 48940 Leioa, Spain; Aranzadi Zientzia Elkartea/Sociedad de Ciencias Aranzadi, Zorroagaina 11, 20014 Donostia-San Sebastián, Spain.; Centro UCM-ISCI de Investigación sobre Evolución y Comportamiento Humanos, Avda. Monforte de Lemos 5 (Pabellón 14), 28029 Madrid, Spain.; Departamento de Geodinámica, Estratigrafía y Paleontología, Facultad de Ciencias Geológicas, Universidad Complutense de Madrid, c/ José Antonio Novais, 12. Ciudad Universitaria, 28040 Madrid, Spain) - Sala, Nohemi (Consortio Centro Nacional de Investigación sobre la Evolución Humana (CENIEH)) - Rodríguez-Hidalgo, Antonio (Consejo Superior de Investigaciones Científicas, Instituto de Arqueología (CSIC-Junta de Extremadura), Plaza de España 15, 06800, Mérida, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4 (Edifici W3), Campus Sescelades URV, 43007, Tarragona, Spain.) - López-Onaindia, Diego (PACEA UMR 5199, Université de Bordeaux, CNRS, Ministère de la Culture et de la Communication. Bâtiment B8, Allée Geoffroy Saint Hilaire F-33600 Pessac, France; Aranzadi Zientzia Elkartea/Sociedad de Ciencias Aranzadi, Zorroagaina 11, 20014 Donostia-San Sebastián, Spain.)

The use of animal bones for the manufacture and modification of stone tools is documented in the archaeological record since the Lower Palaeolithic. These elements combine features of lithic and bone technology, and their identification and characterization is of interest from the perspective of faunal resource management and the dynamics of site occupation by human groups. The site of Abri Suard (Charente, France) was excavated intermittently between the 1930s and 1980s by P. David and A. Debénath and preserve a stratigraphic sequence deposited from the end of the Middle Pleistocene to the beginning of the Late Pleistocene (Debénath, 1974; Blackwell et al., 1983). A recent review of the faunal material from the levels containing human remains (250-120 Ky) allows the documentation of eight knapping bone tools used as retouchers and for organic soft hammer percussion.

The taxonomic list was described by David and Prat (1965) and Griggo (1996). Retouchers occur on reindeer (*Rangifer tarandus*) bones, including a proximal phalanx, a metacarpal and a calcaneus and on horse (*Equus ferus*) bones, i.e., a proximal phalanx, a calcaneus, as well as on unidentified long bone diaphyseal fragment. A rhinoceros radius (*Coelodonta antiquitatis*) and a radius/ulna belonging to a very large animal show stigmas and cortical extractions that suggest their use as organic soft hammers. Some of the retouchers show cut marks and cortical extractions, which is consistent with the pattern found in the rest of the analysed assemblage and indicates an intensive exploitation of faunal resources. They bear between one and three active areas. The morphology of the pits (ovoid vs. triangular) and scores (rectilinear vs. sinuous) on these areas entails the retouching of different raw materials, including quartzite and flint (Mallye et al., 2012). Our findings contribute to elucidate behavioural aspects of ancient Neanderthals in southwestern France.

3 WOLVES OR LARGE CATS? GIS IMAGE ANALYSIS FOR THE IDENTIFICATION OF UNGULATE MODIFICATION AND ACCUMULATION IN PLEISTOCENE CONTEXTS

Terrón, Gerard (Grup de Recerca del Quaternari, GRQ-SERP. Department of History and Archaeology, University of Barcelona, Barcelona, Spain) - Daura, Joan (Grup de Recerca del Quaternari, GRQ-SERP. Department of History and Archaeology, University of Barcelona, Barcelona, Spain) - Parkinson, Jennifer (Department of Anthropology, University of San Diego, San Diego, CA, USA.; Human Origins Program, National Museum of Natural History, Smithsonian Institution, Washington, DC, USA.) - Sanz, Montserrat (Grup de Recerca del Quaternari, GRQ-SERP. Department of History and Archaeology, University of Barcelona, Barcelona, Spain)

Various biological agents are involved in the processes of accumulation and alteration of faunal remains from Pleistocene sites. Among these agents, carnivores are an important consideration. Multiple zooarchaeological and taphonomic techniques and methodologies have been developed to identify carnivore involvement in archaeofauna assemblages. This research proposes the use of a methodology based on image processing in Geographical Information Systems (GIS), developed over the last decade, which maps surface modifications and breakage patterns onto bone images that serve as composite "maps" of bone surface damage and preservation. Different types of analyses can then be applied, such as calculating the bone portion survivorship, which allows evaluation of the level of destruction and damage to bones across an assemblage, or Kernel Density Estimation (KDE), which analyses the patterns and density of marks on bone surfaces. We apply this method to examine Layers I-II at the Late Pleistocene Cova del Rinoceront site (Castelldefels, Spain), which has more than 2000 well-preserved vertebrate remains associated with the use of the cave as a carnivore den. Previous taphonomic work proposed two carnivore taxa (canids or large felids) as presumed producers. The aim of the present work is to determine which agent is involved using GIS methods to

compare the Pleistocene assemblage with data from two experiments carried out with modern wolves and felids. In conclusion, it was observed that the pattern noted in the Pleistocene sample matches that modified by wolves. The results obtained confirm the potential of this method, highlighting the possibilities of digital methods for the study of faunal remains.

4 **PALAEOECOLOGY AT RECLAU CAVES (SERINYÀ, IBERIA): FAUNAL ASSEMBLAGES FROM MIDDLE PALAEOLITHIC TO LAST GLACIAL MAXIMUM AT ARBREDA AND MOLLET III**

Fernández García, Mónica (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA)) - Rufi, Isaac (Institut de Recerca Històrica - Universitat de Girona; Departament d'Història i Arqueologia, Universitat de Barcelona) - López-García, Juan Manuel (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Lécuyer, Christophe (Laboratoire de Géologie de Lyon: Terre, Planètes, Environnement (LGL-TPE, CNRS-UMR5276, ENSL)) - Soler, Joaquim (Institut Català de Recerca en Patrimoni Cultural (ICRPC-CERCA); Institut de Recerca Històrica - Universitat de Girona)

There are only few archaeological sequences in Iberia that provide evidence of Neanderthals and Anatomically Modern Humans (AMH) occupying the same geographic location. Reclau Caves in northeastern Iberia host evidence of human presence spanning from the Upper Palaeolithic to the Middle Palaeolithic across distinct caves within the same karstic system. Arbreda cave presents an extensive archaeological sequence encompassing Mousterian, Aurignacian, Gravettian, Solutrean, and Magdalenian periods (from level N to level A), while Mollet III reveals episodes associated with Gravettian and Solutrean. Human remains were recovered at both sites, with findings of Neanderthals in Arbreda and AMH in Mollet III.

This study aims to synthesize environmental data obtained through several proxies in these sites, with a primary focus on large and small mammal assemblages. This research provides novel insights from the older Mousterian levels at Arbreda (N to L) and the Upper Palaeolithic assemblage from Mollet III. Additionally, stable isotope analysis ($\delta^{18}O$) of microvertebrate remains along the Arbreda sequence serves as a valuable proxy for quantifying climatic shifts. By combining traditional taxonomy-based methods for studying faunal remains with modern biochemical approaches, this work provides a comprehensive landscape and environmental reconstruction.

This interdisciplinary approach sheds light on the human population dynamics associated with climate during two crucial episodes: the Middle-to-Upper Palaeolithic transition and the Last Glacial Maximum. During this period, the region experienced notably colder conditions (-5 to -1°C) compared to present-day temperatures, yet a mosaic-like vegetation landscape appears to have been maintained. The environmental impact is more pronounced during the Upper Palaeolithic, characterized by abrupt climatic alterations, particularly during the Aurignacian. These findings highlight that Anatomically Modern Humans were well-adapted upon their arrival to Iberia.

5 **NEANDERTALS AND MODERN HUMAN: INVESTIGATION OF THE FATTY ACID METABOLISM COMBINING ZOOARCHAEOLOGICAL ANALYSIS AND GENOMIC STUDIES**

Crezzini, Jacopo (Department of Biology - University of Florence, Laboratory of Anthropology Molecular Anthropology/Paleogenetics Unit, via del Proconsolo 12 50122, Firenze, Italy; Department of Physical Science, Earth and Environment - University of Siena, Research Unit of Prehistory and Anthropology, Strada Laterina 8 53100, Siena, Italy; Centro Studi sul Quaternario ODV, Sansepolcro, Italy) - Modi, Alessandra (Department of Biology - University of Florence, Laboratory of Anthropology Molecular Anthropology/Paleogenetics Unit, via del Proconsolo 12 50122, Firenze, Italy) - Cannariaro, Costanza (Department of Biology - University of Florence, Laboratory of Anthropology Molecular Anthropology/Paleogenetics Unit, via del Proconsolo 12 50122, Firenze, Italy) - Caramelli, David (Department of Biology - University of Florence, Laboratory of Anthropology Molecular Anthropology/Paleogenetics Unit, via del Proconsolo 12 50122, Firenze, Italy) - Boschini, Francesco (Department of Physical Science, Earth and Environment - University of Siena, Research Unit of Prehistory and Anthropology, Strada Laterina 8 53100, Siena, Italy)

Zooarchaeological analyses of MIS4/MIS3 faunal assemblages from Apulia (southern Italy) have shown the lack or scarcity of spongy elements in macromammal samples, together with the evidence of fresh-bone breakage and the focusing of the hunting activities on adult and old preys. This peculiar exploitation of ungulates is attested in other European Middle Palaeolithic deposits. We interpreted our

zooarchaeological data as an intense exploitation of bone marrow and grease by Neandertals. During the Late Mousterian period Apulia was characterised by frequent and prolonged drought climate conditions that could have caused the scarcity of vegetable foods and, as a consequence, the availability of important nutritional compounds. Apulian Neandertals may have responded to this crisis by increasing the intake/absorption of nutrients from animal resources by activating an intensive extraction/consumption of

bone grease. Through the consideration of ethnographical data, the preparation of 'fermented bone-grease base food' was also considered. Recent genetic studies have evidenced the selection of different haplotype (defined by 28 SNPs) that associate with very distinct measurements of long chain PUFA product-to-substrate ratios among great apes, extinct human groups and modern humans. We tried to identify other polymorphisms related to the expression of enzymes involved in fatty acid metabolism in Neanderthal and modern human. This was carried out through the analyses of the genomes related to Homo neanderthalensis and extant human groups characterized by a peculiar dietary fat consumption.

6 **BEYOND THE SHORELINE: EXPLORING EARLY UPPER PALAEOLITHIC MARINE MOLLUSC EXPLOITATION AT RIPARO BOMBRINI (VENTIMIGLIA, ITALY)**

Gazzo, Silvia (Department of Antiquities, Philosophy, History, University of Genoa, Via Balbi, 2 - 16126 Genoa, Italy) - Cristiani, Emanuela (DANTE - Diet and Ancient Technology Laboratory, Department of Oral and Maxillo-Facial Sciences, Sapienza University of Rome, 00161, Rome, Italy) - Negrino, Fabio (Department of Antiquities, Philosophy, History, University of Genoa, Via Balbi, 2 - 16126 Genoa, Italy) - Riel-Salvatore, Julien (Département d'Anthropologie, Université de Montréal, Montréal, Canada)

This research explores the modes of exploitation of marine molluscs at Riparo Bombrini (Ventimiglia, north-west Italy) during the Protoaurignacian and the Early Aurignacian.

Although marine shell remains have been found in some Palaeolithic sites along the Tyrrhenian coast, a comprehensive study of these collections has never been carried out, leaving the question of the exploitation of marine resources by the hunter-gatherer groups in this geographical area unresolved.

Riparo Bombrini has proven to be a significant starting point for investigating the exploitation of marine malacofauna in Liguria during the Early Upper Palaeolithic. It has yielded not only remains of shellfishes consumed for dietary purposes but also a considerable quantity of small marine shells used for the fabrication of personal ornaments.

As integral components in more complex decorative combinations and symbolically charged objects that outwardly express cultural value, shell beads have been analysed in relation to both site function and on-site human activities, with the aim of understanding the relationship between craftsmen and raw materials. In particular, this study contributes to a better characterization of the technological and social organisation of Early Upper Palaeolithic hunter-gatherers who inhabited the rockshelter.

The analysis of the assemblage highlights the presence of trends in the selection of shell species for beads production. Specifically, at Riparo Bombrini there appears to have been a preference toward small and spherical gastropods - especially *Homalopoma sanguineum* and *Tritia pellucida* - possibly reflecting the influence of intra- and inter-regional traditions.

Nonetheless, beyond behavioural factors and human preferences, local variations in raw material availability must be taken into account when examining trends in the production of shell ornaments.

7 **MARINE RESOURCES EXPLOITATION AT COVA ROSA (ASTURIAS, SPAIN) DURING THE LATE PLEISTOCENE (CA. 22,500 - 15,300 CAL BP)**

Marchán-Fernández, Alberto (Universidad de Salamanca) - Aguirre-Uribesalgo, Amaia (Universitat Autònoma de Barcelona) - Álvarez-Fernández, Esteban (Universidad de Salamanca)

This paper presents the results of the analysis of archaeomalacological remains from five consecutive archaeological interventions carried out in Cova Rosa (Layers A1 to B11), located in the Sella valley (Asturias, Spain) during the 1970s (1975-1979). Specifically, we have studied the remains of molluscs and crustaceans collected by hunter-gatherer groups. This analysis has been carried out from a quantitative, taxonomic, taphonomic and biometric point of view. The sample analysed is dominated by species collected for their bromatological interest (mainly *Patella vulgata* and *Littorina littorea*), although taxa with no food value have also been documented. A selection of large limpets and periwinkles has been observed. In addition, different anthropogenic (e.g. burning, trampling) and natural alterations on the shells (annelids, calcium carbonate precipitation) have been documented. The study of this type of evidence can provide information on the patterns of coastal exploitation that took place in the past, particularly during the Magdalenian period, as well as on the types of beaches chosen by hunter-gatherer groups to collect resources. The results obtained in the analysis of the remains of marine origin are compared with existing information from other sites from the end of the Late Pleistocene, both in the Sella Valley and in Cantabrian Spain.

8 UNRAVELLING THE SUBSISTENCE STRATEGIES IN A MAGDALENIAN DWELLING STRUCTURE OF THE LOWER GALLERY OF LA GARMA (OMOÑO, CANTABRIA, SPAIN)

Portero Hernández, Rodrigo (Universidad de Salamanca; Instituto Internacional de Investigaciones Prehistóricas de Cantabria (Universidad de Cantabria)) - García-Noriega, Carlos (Instituto Internacional de Investigaciones Prehistóricas de Cantabria (Universidad de Cantabria)) - Ontañón, Roberto (Museo de Prehistoria y Arqueología de Cantabria; Instituto Internacional de Investigaciones Prehistóricas de Cantabria (Universidad de Cantabria)) - Arias, Pablo (Instituto Internacional de Investigaciones Prehistóricas de Cantabria (Universidad de Cantabria))

La Garma is a hill which contains a group of archaeological sites that have yielded evidence of human activity from the Lower Palaeolithic to the Middle Ages. Notably, the Lower Gallery within this complex, dated ca. 14,800 cal BC, is distinguished by exceptionally well-preserved floors and structures. This preservation results from the entrance's collapse at the Palaeolithic's end, leading to extraordinarily well-preserved evidence of human activities. In this paper we present the results of the archaeozoological and taphonomic analysis carried out inside the dwelling structure I-A of the Zone I of the Lower Gallery. Our objective is to determine subsistence strategies carried out by the human groups that inhabited this structure during the Middle Magdalenian. To this aim, the anatomical and taxonomic identification of the species represented has been carried out and the processing and consumption patterns of these animals have been documented. Although the information that it provides on the lifestyles of the Magdalenian groups is exceptional, the study of the Palaeolithic faunal remains has been a challenge, as conventional recording processes are inapplicable, due to potential conservation damage. For this purpose, each faunal remain has been analysed on the surface of the structure in situ, moving the laboratory to the cave and returning each remain to its original position.

The faunal remains documented have revealed the importance of the consumption of ungulates, mainly red deer and horses, in the subsistence of the human groups that inhabited the Lower Gallery, while other resources such as molluscs, birds and fish would have been a complementary resource in the diet. The taphonomic study has shown the presence of all the tasks in the operational chain of animal processing, including butchery marks, the intentional breakages of the bone to access the marrow content and the thermoalteration of the remains.

9 SMALL GAME PROCUREMENT DURING THE LATE GLACIAL IN NORTHEASTERN IBERIA: A CASE STUDY FROM COVA GRAN DE SANTA LINYA (SPAIN)

Rufà, Anna (ICArEHB, Universidade do Algarve; PACEA UMR-5199) - Sánchez-Martínez, Javier (Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona; ICArEHB, Universidade do Algarve; IPHES-CERCA) - Martínez-Moreno, Jorge (Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona) - Mora Torcal, Rafael (Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona)

The Upper Palaeolithic period in the Iberian Peninsula witnessed a notable ecological shift, as seen in the archaeobotanical and archaeofaunal record. This change was especially perceived on subsistence strategies, particularly in the Mediterranean basin, as an increased procurement of small game was documented in many archaeological sequences. This region provided optimal conditions for the proliferation of small animals like rabbits, which are abundant and easy-procured prey.

Cova Gran de Santa Linya (northeastern Iberia) is one of the most complete sequences for the Late Pleistocene - Early Holocene period in Iberia, standing out as a key archaeological site to explore this topic. This site has been subject to meticulous fieldwork aimed at understanding site formation processes and identifying its archaeological potential across different sectors. Since 2015, archaeological works are focused on Sector V a new excavation area that has unearthed over 10 archaeological units, dating from the Late Upper Palaeolithic (c.14.3-13.6 ky cal BP). This sector has revealed human remains attributed to *Homo sapiens* between the layer V20 and V22, which has instigated a detailed analysis of the faunal record from these units to better understand the subsistence strategies employed by Late Glacial. The majority of faunal remains associated with these archaeological layers comprise small animals, mainly leporids and birds.

The taphonomic analysis of more than 1600 small animal bones unveiled specimens exhibiting human-induced damage such as cut and chewing marks. Other surface modifications related to burning processes were observed too, stressing the significance of these taxa for human feeding. The result of this research contributes with novel data to comprehend the taphonomical processes that affected the formation of Sector V. In addition, it provides new data to broaden our understanding of subsistence strategies during the Late Upper Palaeolithic period in the region.

10 EXPLORING THE AHRENSBURGIAN PRESENCE IN BELGIUM FROM A ZOOARCHAEOLOGICAL AND ISOTOPIC PERSPECTIVE: THE CASE OF REMOUCHAMPS (AYWAILLE)

Pironneau, Camille (Ghent University) - Robert, Prudence (Ghent University) - Vandendriessche, Hans (Ghent University) - Abrams, Grégory (Ghent University; Scientific Department, Espace muséal d'Andenne) - Crombé, Philippe (Ghent University) - De Groote, Isabelle (Ghent University)

The Ahrensburgian complex emerged during the Younger Dryas in northwestern Europe, during the last glacial period before the onset of the Holocene's global warming. This techno-complex of the Final Palaeolithic is characterised by a lamino-lamellar lithic industry: tanged points and obliquely truncated points called Zonhoven. In Belgium, Ahrensburgian sites that yielded faunal remains are mainly located in caves and highlighted massive exploitation of reindeers. Remouchamps, located near the municipality of Aywaille in the Belgian Ardennes, is the most important of these sites.

The faunal collection, coming from excavations conducted in the 20th Century, has been re-visited considering advances in zooarchaeological methods. Studying those animal remains provides new insight into specialised hunting strategies, including transport, exploitation, and more generally new information regarding the site occupation and its function(s).

Besides this zooarchaeological research, the implementation of strontium, oxygen, and carbon isotope analysis on the reindeer tooth enamel provides additional information regarding reindeer herds' mobility and seasonality of the occupation(s) in Belgium. This study therefore provides new insight into Ahrensburgian settlement dynamics and how they took shape in response to reindeer herd migrations during the last cold episode of the Pleistocene.

11 EXPLOITING THE ALPINE MOUNTAINS IN THE MESOLITHIC: THE CONTRIBUTION OF ARCHAEOZOOLOGY TO UNDERSTANDING THE DYNAMICS OF MOUNTAIN LAND USE

Derbord, Louise (TRACES UMR 5608, Université Toulouse Jean Jaurès, France) - Angelin, Alexandre (Archéorient UMR 5133, Université Lumière Lyon II, France) - Costamagno, Sandrine (TRACES UMR 5608, Université Toulouse Jean Jaurès, France)

Since the early 1960s-1970s, archaeological research in the Alps has highlighted the increased frequency of mountainous environments during the Mesolithic era (10th-6th millennium cal. BCE in Europe). Indeed, during this period of climatic change, the post-Würmian glacier retreat allowed occupation of mountain territories at most altitudinal levels. Occupations dynamics and their evolutions thus became a main focus for investigation, the latter turning particularly towards the exploitation of wildlife resources.

It has long been accepted that the population adopted a vertical mobility, moving up in altitude in summer to exploit specific resources and in particular, hunt ibex (*Capra hircus*). When winter arrives, these populations would then retreat to the valleys and foothills. This model was based on incomplete data at the time, with few sites containing faunal remains and little to no zooarchaeological analysis. It has since been questioned, but a more precise model has not yet been proposed.

New zooarchaeological studies (e.g. France, Italy) have recently resumed, after being at a standstill for a long period, bringing this issue to the forefront of scientific research. Located in the northern French Alps, the Grande Rivoire rockshelter (Sassenage, Isère, France), serves as a reference site for studying the utilization and occupation of mountainous territories. The one meter's high stratigraphic sequence spanning the First and Second Mesolithic has proven rich in faunal remains and thus allows a complete study of the territorial occupation strategies and their evolutions during this period. By comparison with data from several alpine ranges (from France, Switzerland and Italy, for instance) it allows us to better understand the human-animal and environmental relationships during Prehistory. In addition, for more in-depth results and interpretations, it now seems more necessary to use new methods, to overcome the limitations of classic archaeozoological studies (e.g. highly fragmentary artifacts, osteological similarities between species).

12 TRAVELLING CATTLE OR HERD MANAGERS? BULK AND COMPOUND-SPECIFIC ISOTOPE EVIDENCE FOR THE NEOLITHIC INTRODUCTION OF AGRO-PASTORALISM AT GROTTA DELL'UZZO (SICILY)

Mannino, Marcello (Aarhus University, Department of Archaeology, Aarhus, Denmark; Former Department of Human Evolution, Max Planck for Evolutionary Anthropology, Leipzig, Germany) - Van Biesen, Geert (Core Research Equipment & Instrument Training (CREAIT) Network, Stable Isotope Laboratory, Memorial University of Newfoundland, St. John's, Canada) - Fuller, Benjamin (Aarhus University, Department of Archaeology, Aarhus, Denmark; Géosciences Environnement Toulouse, CNRS, Observatoire Midi Pyrénées, Toulouse, France) - Talamo, Sahra (Department of Chemistry "Giacomo Ciamician", Alma Mater Studiorum, Bologna University, Bologna, Italy; Former Department of Human Evolution, Max Planck for Evolutionary Anthropology, Leipzig, Germany) - Tagliacozzo, Antonio (Formerly at Service of Bioarchaeology, Museo delle Civiltà, Museo Preistorico Etnografico "Luigi Pigorini", Rome, Italy) - Collina, Carmine (Museo Civico "Biagio Greco", Mondragone (Caserta), Italy) - Richards, Michael (Department of Archeology, Simon Fraser University, Burnaby, British Columbia, Canada; Former Department of Human Evolution, Max Planck for Evolutionary Anthropology, Leipzig, Germany) - Grimes, Vaughan (Department of Archaeology, Memorial University of Newfoundland, Queen's College, St. John's, Canada; Department of Earth Sciences, Memorial University of Newfoundland, St. John's, Canada)

Zooarchaeological and isotopic investigations on assemblages from Grotta dell'Uzzo have demonstrated that significant subsistence changes took place in NW Sicily during the early Holocene. Animal protein was the dominant component in human diets for most of the prehistoric occupation of the cave, hunting being the key activity in the Mesolithic, whilst a combination of hunting, fishing and herding dominated the transition into the Neolithic. Here we show how, by undertaking more substantial sampling than is often the case for isotopic investigations aimed at reconstructing human diets, useful life history data can be accrued on mammals exploited by prehistoric humans. We focus on the results of our isotopic analyses on bone collagen extracted from Neolithic domesticates. In fact, a few ovicaprids and numerous cattle (*Bos taurus*) specimens from Grotta dell'Uzzo have very high carbon isotope values, unlike earlier and later terrestrial mammals. Bulk isotope analyses (C, N, S) suggest that early Neolithic cattle fed heavily on C4 plants, which is confirmed by compound-specific carbon isotope analyses on the amino acids of the same bone collagen samples. Different interpretations of these data are evaluated in this talk, with a view to: (i) obtain a clearer understanding on the spread of agro-pastoralism by Neolithic peoples voyaging across the Mediterranean Sea and (ii) develop new approaches for the study and interpretation of faunal assemblages contemporary to major prehistoric transitions.

13 TOOTH ENAMEL CARBON AND OXYGEN ISOTOPE RATIOS REVEAL DIVERSE OVICAPRID HUSBANDRY STRATEGIES DURING THE NEOLITHIC ON THE DALMATIAN COAST, CROATIA

Triozzi, Nicholas (UC Santa Barbara) - McClure, Sarah (UC Santa Barbara) - Horvat-Oštrić, Kristina (University of Zadar) - George, Richard (UC Santa Barbara) - Ebert, Claire (University of Pittsburgh) - Podrug, Emil (Muzej grada Šibenika) - Kennett, Douglas (UC Santa Barbara)

This paper presents stable isotope results from sequentially sampled archaeological sheep and goat teeth recovered at Early, Middle, and Late Neolithic sites in Dalmatia. The use of intra-tooth sequences of oxygen isotope ratios is a reliable and effective method for determining birthing seasonality and elucidating migration patterns of herbivores in zooarchaeological assemblages. Sequential sampling of enamel bioapatite for stable carbon and oxygen isotope analysis produces direct evidence of an animal's diet as a time-series spanning that period of tooth growth. A series of enamel $\delta^{18}\text{O}$ values captures variation in the ^{18}O -enrichment of precipitation which is largely influenced by seasonal changes in temperature. Variation in $\delta^{13}\text{C}$ values may signal changes to the animal's diet arising from switching between C3 and C4 plants and movements between different grazing and foraging environments. The stable isotope data presented in this study offers a diachronic perspective animal husbandry spanning the Neolithic in the Eastern Adriatic. The results from our study lends support to recent traditional zooarchaeological analyses of the source assemblages, which evinces a greater emphasis on dairying and that a shift in the seasonal allocation of alternative subsistence activities (e.g., hunting) occurred during the Middle Neolithic. The stable isotope data point to multiple or extended lambing seasons in addition to increased mobility, potentially taking the form of vertical transhumance. The implications of these revelations are discussed in consideration of key developments to food production that coincide with the arrival of Danilo ceramics to northern Dalmatia.

14 AT HOME IN THE NEOLITHIC: ZOOMS ANALYSIS OF FAUNA FROM A POTENTIAL STARČEVO HOUSE IN THE SOUTH MORAVA VALLEY, SERBIA

Wernado, Shana (Institute for Archaeological Sciences, Department of Geoscience, University of Tübingen) - Bulatovic, Jelena (Department of Historical Studies University of Gothenburg, Sweden) - Brown, Samantha (Institute for Archaeological Sciences, Department of Geoscience, University of Tübingen) - Horejs, Barbara (Austrian Archaeological Institute, Austrian Academy of Sciences; HEAS & UHA, University of Vienna)

Extensive excavations at the Neolithic site Svinjarička Čuka in the South Morava Valley of Serbia have been ongoing since 2019 (<https://www.oeaw.ac.at/oeai/forschung/praehistorie-wana-archaeologie/prehistoric-phenomena/pus-ta-reka-research-neotech-project>) and aim to deepen our understanding of the Neolithization process of the central Balkans. These excavations revealed domestic features associated with phases of occupation on the river terrace, dating between 5700/5600 and 5500 BC. Especially interesting is a domestic structure measuring 7.50 × 4.30 m, indicative of a potential Starčevo house (Horejs et al. 2022). Repeated occupation phases had previously been unknown for the Starčevo culture, allowing for novel insights into social dynamics and possible cultural trends over time.

We examined the faunal assemblage to detect differences between these occupation horizons in the interior and exterior of the house. While previous zooarchaeological analysis yielded successful results, a considerable number of bones lacked diagnostic features. To address this, high-throughput ZooMS (Zooarchaeology by Mass Spectrometry) was conducted. This method allows for taxonomic identification of collagen through the known differences in amino acid sequences between fauna. 376 bone specimens were collected and analysed, including 43 that were previously identified by morphology to compare methodologies.

This comprehensive study encompasses a thorough analysis of faunal remains from various occupation horizons within a domestic building dating to early phases of the first agricultural communities of the Balkans, associated with the Starčevo horizon. It involved a comparative assessment of results derived from morphologically based and proteomics-based zooarchaeological analyses, marking a significant advancement of proteomics in Neolithic research methodologies.

Our results give insight into the animal management and subsistence strategies of Svinjarička Čuka occupants across multiple occupation horizons, demonstrating the utility of ZooMS analysis to other Neolithic assemblages.

852 MANUFACTURING MEMORY. PAST MNEMOTOPOI AND PRESENT MAP-MAKING IN THE QUEST OF COLLECTIVE MEMORIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Da Vela, Raffaella (SFB1070 RessourcenKulturen University of Tübingen) - Ballmer, Ariane (Independent Researcher) - Irvin, Aaron (Murray State University) - Schumann, Robert (University of Hamburg) - Giovannetti, Chiara (Sapienza University of Rome)

Session format: Session with keynote presentation and discussion

This session investigates the relation of mnemotopes and collective memories within a diachronical and global framework, analyzing processes and practices occurring in the spatialization of memories, as well as the expression of that space through mapping. Drawing from multiple fields and experiences, we seek to explore theoretical models as well as practical methodologies that concur in the construction, deconstruction, and manufacturing of collective memories. What is the conceptual relationship between spatial materiality and memory? By what physical means is memory embedded in the landscape? What role can and do narrated topographies play in the construction and transformation of cultural memory? How can practices such as participatory mapping, counter-mapping, or feminist mapping alter the way physical spaces are interpreted? What effect might cartographical narratives have had in reinforcing political structures, or bringing about political changes?

This session explores diverse approaches to topographical mnemotechniques and memoryscapes, as well as symbolic mapping. We seek to identify points of agreement as well as key differences in order to critically debate dimensions of both physical, spatial memory, and its expression in the methodologies involved in the craft of map-making. Our goal is to examine the conceptualization of space itself, both physical and in abstraction, and its use to develop and manufacture communal purpose, identity, memory, and meaning. Our focus is in the past in general, beyond the boundaries of individual fields, in order to further develop innovative research tools of value to the field of archaeology at large, rather than confined within particular approaches or material types.

1 THE INVENTION OF CULTURAL HERITAGE AND MEMORY. ANTHROPOLOGICAL PERSPECTIVES ON A CONTESTED CONCEPT AND THE STORY OF AN (UN)POPULAR MONUMENT

Klocke-Daffa, Sabine (University of Tuebingen)

Ever since the UN World Heritage Convention of 1972, which was expanded several times in later years, tangible and intangible objects, archaeological sites, monuments, architectural ensembles and landscapes, as well as oral traditions, music and craft techniques, have been considered assets worthy of protection. They are said to be points of reference in space and time, links between past and present and the “cement of identity”. Regardless of how historical it is, cultural heritage has become a much sought-after resource which, in addition to its symbolic and identity-forming significance, shows undeniable financial benefits. Heritage sites promise to attract streams of visitors, income-generating employment and (sometimes dubious) fame. However, the fact that a society’s memory is time-bound and rarely shared equally by all members, its heritage may constantly be re-defined, negotiated, and disputed. The case study of a much-contested monument in Southern Africa illustrates the ambivalence of invented heritage and constructed memory: once described as a symbol of German power and Germanness in Africa, it later turned into a thriving tourist attraction, then site of contested memory, heated debates and hallmark of oppression. Today, it stands where invented cultural heritage ends up at best: in a museum.

2 METSEMEGOGOLO: OF FRAGMENTED ARCHIVES AND STORY-MAPPING FOR THE EXPLORATION OF ANCIENT AFRICAN URBANISM

Merlo, Stefania (University of Cambridge) - Wintjes, Justine (Kwa-Zulu Natal Museum, South Africa) - Coetzee, Anton (School of Arts, University of the Witwatersrand)

Story-mapping is a compelling form of presentation of curated narratives or pathways along which archaeological, historical and various other archives of the past can be explored and presented to various publics. As other forms of digital storytelling, it potentially enables users to share personal stories, produce novel, multiple, complementary and, at times, conflicting knowledges and to raise awareness of marginalized and contested histories through the co-creation of heritage. Yet, the premise of digital storytelling through maps is the existence of digital archives and a digital platform that facilitates the creative process as well as accessibility by both producers and consumers. The lack of one or all is a hindrance to its implementation and the reason for its almost complete absence as a narrative tool for the exploration of the African past.

Metsemegogolo means ‘ancient towns’ or ‘old cities/places’ in Setswana. It is the name chosen for a project, developed by a collective of researchers since 2019, aimed at both redressing the lack of digital materials that speak to the theme of pre-colonial African urbanism (with a particular focus, for now, onto Tswana settlements c.1600 into historical times in Southern Africa) and experimenting with varied forms of curations of this rich but rarely represented past, outside the bounds of scholarly research. The multimodal platform at the core of the project uses spatio-temporal principles to do so. This allows, at the same time the re-aggregation of archival materials that have been refracted into different spaces over time and can therefore be reconnected and re-enlivened to subvert traditional hierarchies (most of which colonial in lineage) and the use of place and landscape as dynamic structural principles of creative mapping.

3 MARKING THE PAST, ORGANIZING THE PRESENT, SHAPING THE FUTURE: THE TREES OF THE KAABU KINGDOM (SENEGAMBIA, 13TH-19TH C)

Canós-Donnay, Sirio (INICIPIT (Instituto de ciencias del patrimonio), CSIC (Consejo superior de invest))

From the 13th century until its collapse six centuries later, the Kaabu Kingdom dominated politically, economically and culturally most of the Senegambia (current Senegal, Gambia, and Guinea-Bissau). Initially as part of the Mali Empire, later as an independent kingdom, Kaabu flourished and expanded its commercial networks across West Africa and the Atlantic world. Over the past decade, and through various projects, I have studied the archaeology of Kaabu and its landscape organisation; this has involved recognising and understanding the key role that some trees play in the articulation of its political landscapes. As places of memory, political institutions (assembly points, courts, markers of political office), and/or shrines, these ‘political’ trees defined the kingdom’s power geographies. The combination of a materially ephemeral nature with a deep-time social life, however, makes their study methodologically challenging. In this paper I review the nature of these trees and the challenges posed by their archaeological study.

4 HEROES, ANCESTORS, AND TREES: WRITING MANDLAKAZE’S HISTORY INTO THE LANDSCAPE

Cruz, M Dores (University of Cologne)

In Southern Mozambique, as in other sub-Saharan regions, trees can be loci of spiritual power, of local and regional identity. They mark places of reverence and establish links between ancestors and present generations. They are, at once, material and symbolical marks engaged in mediating social relations between past and present, memorializing events and individuals. But they also map local events and individuals, sometimes relevant for national narratives, but unfailingly inscribed in local concepts of history, time, and landscape. In this paper, I discuss briefly the significance of trees and tree groves in local narratives of past events that took place in the Mandlakaze’s district, that highlight local lineages and the power of the deceased. While trees materialize the memory of ancestors, they are also used to write national heroes into local views of landscape and history. Sacred trees and tree groves related to counter-narratives of local lineages are often associated with archaeological and/or ritual sites, while others located in national heritage sites, particularly related to the liberation struggle are used to integrate national heroes into local narratives. This case study broadens our understanding of archaeological evidence, contributing to decolonize archaeological practice by considering non-western epistemologies and local memories.

5 PLANTING HOME GROUND: TREES IN SPECIAL BLACK AMERICAN YARDS

Gundaker, Grey (Teachers College Columbia University)

Many peoples around the world see trees as mediators between earth and sky and this and the other world. In the African Diaspora to North America, trees also mediate between past and present, and between the places where Africans enslaved in the Americas began their journeys and where their descendants took root. Based on ethnographic research in the southeastern United States, this paper will show a variety of ways that Black homeowners used trees in memorials for ancestors and more recent family members. These memorials serve as anchors for the home places of extended families and assert that members hold rights to land, contribute to their communities, and uphold principles of right living against the grain of racism, disenfranchisement, and other injustices. By taking literally the phrase “family tree,” planting miniature “sacred forests,” and adorning trees with bottles and light reflecting materials, the elders I met during fieldwork in the 1980s and 90s looked back through their family histories and forward toward healing the ruptures of the Middle Passage. Although home ownership allowed larger scale, the arrangements of plants and objects around and in trees may help archaeologists to identify commemorative and communicative activities at smaller scales and in earlier contexts as well.

6 ARCHITECTURAL RITUAL AS MNEMONIC ACT: GUDEA’S TEMPLE BUILDING SEEN THROUGH THE DEDICATIONS AND THE WORKFORCE

Sen, Kutay (Columbia University)

The topic, which is the integral theme of the dissertation that I am presently working on, investigates foundations of the temples of the middle and late 3rd millennium B.C. in southern Mesopotamia, and the foundation deposits laid therein, as topographical memoryscapes which this session convenes to address and discuss. I question whether both the foundations and their deposits can be studied as vessels of composing and preserving a collective consciousness of the material worldview of the Mesopotamians. I argue that an approach which integrates life-stories of objects, archaeological context-analysis and epigraphic evidence would allow us to construct an alternative reading of historical consciousness in Mesopotamia through material and architectural record, rather than a predominantly scribal/linguistics-oriented tradition of studying the subject in the archaeology of ancient West Asia.

Within the confines of this session, I propose to present on the Cylinders of Gudea, which narrate the most detailed account of a temple foundation ceremony, as well as the remains of the temple of Ningirsu in ancient Tello, and some of the foundation deposits of Gudea and his father Ur-Bau in the 22nd century B.C. The materiality of this ritual is manifest in the dedications and tools used in the ceremony as well as the participation of the workforce in the making of the whole structure. This paper presents an account of the foundation ceremony based on the spatial continuity and temporal diachronicity of both foundation deposits and experience of the workforce, extending the subject beyond the person of the ruler and royal ideology which dominate the field. I argue that the preservation of temple foundations was a mnemotechnical act, and their deposits are pertinent to architecture as much as to ideology; and these two phenomena come into effect intertwined in the collective memory of all the participants.

7 MONUMENTAL ‘MEMORYSCAPES’ OF SARDINIA: NURAGIC RE-USE THROUGH SPACE, TIME, AND MEMORY

Gustafson, Julia (University of Cambridge)

Once a monument has been built in a landscape, it forever changes the way in which humans perceive and interact with that space. The re-use of monuments demonstrates how meaning was attached to these places and how this

shifts over time, becoming ‘memoryscapes’ or palimpsests of human-monument interaction. Questions such as why societies that are separated both temporally and culturally have re-used and even re-constructed older monuments remain to be answered.

In Sardinia, these questions are of particular relevance because of its cross-continental and cross-cultural connections in the Mediterranean. The Sardinian Bronze Age (1800-1100 BC) saw the emergence of the Nuragic civilisation, which is characterised by the construction of impressive megalithic architecture, in the form of the eponymous nuraghi. Today, nuraghi are an important symbol of Sardinian national identity, and their continued re-use throughout the classical, medieval and modern periods stands as a record of their important place in the imagination, memory, and identity of Sardinians. While it is not unusual for prehistoric monuments to have a continuous impact on the landscape and popular imagination, the case of monument re-use in Sardinia seems to be unique in that it is both almost universal (i.e. most monuments show signs of re-use) and persistent (i.e. most time periods in Sardinia have some re-use). Previous research on Sardinia relating to archaeological ‘memoryscapes’ has only begun to address the phenomenon of Nuragic reuse in Sardinian society throughout the Roman, Byzantine, and modern-historic periods.

This study investigates how Nuragic monuments are used/re-used, built/re-built, encultured/re-encultured through the *longue durée*, considering whether they act as mnemonic devices within the broader Sardinian landscape in relation to the preservation, creation, and transformation of memory and identity, and how this impact, if any, manifests in the physical, metaphysical, and sensorial spaces around them.

8 ANCIENT ASIAN ECHOES: TRACING CULTURAL MEMORIES THROUGH ARTISTIC REPRESENTATIONS OF HUMAN-HEADED BIRD

Sun, Yu (Durham University)

Memory is an abstract concept, and for archaeologists studying the cultural memory of ancient societies, some of the most crucial carriers of memory are material culture and visual arts, serving as the embodiment and concretization of cultural memory. This study explores cultural exchanges in different ancient Asian regions, focusing on a supernatural creature often depicted in ancient Asian art, the human-headed bird, similar to the creature known in the West as the “Siren”.

By comparing the varied applications and transformations of this theme by different cultural groups, we are able to investigate social exchanges and map the cultural exchange networks of ancient Asia during specific periods. In this presentation, a specific case study will illustrate this research approach by tracing the origin and dissemination of a particular image type, priest with a human head and a bird’s body, along with the altar image in Zoroastrianism. Originating in the Achaemenid Empire, inherited by Chorasmia, and transformed with Hellenistic elements, this motif spread in Central Asia and gained popularity among the Sogdians. Through the migration of the Sogdians, it reached ancient China, where cultural memories of the same image differed between those who migrated and those who stayed in the Sogdian cultural area. This phenomenon is reflected in the treatment and processing of the priest with a human head and a bird’s body image.

In summary, this project aims to reinterpret archaeological materials from the perspective of cultural memory and exchange through visual culture, exploring communication and interaction among ancient Asian civilizations.

9 SPATIAL MODES OF CULTURAL MEMORY AS SEEN IN THE ALPINE BRONZE AGE

Ballmer, Ariane (Independent Researcher)

In the Central Alps, the second half of the 1st millennium BC is characterised by increased human presence and activity. Among the archaeological remains (including settlements, burials as well as sites associated with agricultural and resource production practices), ritual depositions and emerging ceremonial sites are typical. Based on these two source categories, both of which are clearly related to topography, the paper proposes two spatial modes of cultural memory, one of which refers to a flexible, meta-geographical reference points within ‘scapes’, essentially determined by the natural environment, and the other one featuring fixed locations of territorial significance. A trend towards a detachment of the cultural memory from the unaltered, natural terrain in favour of an increased collective use of ceremonial sites controlled by elites, is identified. This development can be explained against the background of the economic and social change in the Central Alpine region at the transition from the 2nd to the 1st millennium BC.

10 MEMORY INFRASTRUCTURES IN THE IRON AGE NORTHERN APENNINES (ITALY) AS RESOURCES FOR THE CONSTRUCTION OF MEMORYSCAPES

Da Vela, Raffaella (Post-Doc Researcher at the SFB1070 RessourcenKulturen University of Tübingen)

What were the infrastructures of collective cultural memory in the northern Apennines between the 8th and 5th centuries BC and what was their role in the construction of memoryscapes? This mountainous region connected central and northern Italy and thus the Etruscan core and the Po Valley. Memory infrastructures are defined here as

the socio-natural systems that constitute the necessary and contingent condition for the construction, manipulation and transmission of cultural memory within local communities. These infrastructures are located at the intersection of social, cultural and personal identities and enable the formation of shared memories between communities settled on both sides of the mountains. The focus will be on the spatial infrastructures of memory, and in particular on the impact of vertical resource landscapes on memory construction. Social infrastructures, such as gender roles and social functions, as well as semantic infrastructures, such as value systems, will also be considered in their interaction with spatial infrastructures. Particular attention will be paid to the invention of mythological topographies and to the role played by the mobility of people and ideas in the construction, transmission and manipulation of cultural memory across generations.

11 NECROPOLEIS AS MNEMONIC PALIMPSEST: TOMB VIOLATION, TOUCH, AND REMEMBRANCE IN PRE-ROMAN ITALY

Peruzzi, Bice (Rutgers State University of New Jersey)

Tombs are physical embodiments of memory. Even when they lack an epitaph, funerary monuments act as reminders of individuals who have passed away and their conspicuous presence in the landscape affects generations of onlookers over the years.

Yet, collective memory – very much like that of an individual – is not static, but rather it is a continuous active process of creation where memories compete, change, or are eradicated depending on the contemporary social context.

This paper analyzes the relationship between burials and collective memory, focusing on the widespread custom in Southeastern Italy of violating, reusing, and removing tombs (sometimes even to build residences). I argue that this practice was the expression of complex strategies used by specific social groups, to create a narrative about their past. By repeatedly engaging with the physical remains of pre-deceased members of their communities, they were able to blur the boundaries between past generations and their present, alternately rejecting, incorporating, and reinventing shared memories.

The archaeological evidence shows that this phenomenon was particularly prevalent towards the end of the 4th century BCE, a period of profound reshaping of the sociocultural structures of the communities that populated Apulia and Basilicata. In such times of social restructuring, when competition for authority must have been the rule, being able to own a piece of the shared past must have been particularly appealing, as it allowed the new elites to legitimize their newfound power.

12 MANUFACTURED MEMORY AND THE URBANIZATION OF ROMAN GAUL

Irvin, Aaron (Murray State University)

As a result of the Roman conquests, Gallic communities suddenly found themselves fractured, resettled, relocated, and assigned wholly new identities and functions by not only their conquerors, but by a new Gallo-Roman elite that emerged within the Gallic provinces. This elite was tasked with governing the existing Gallic population, while also maintaining amiable relations with the new Roman imperial power.

The range of different settlement types and proto-urban centers in Gaul, coupled with the period of Roman conquest and domination, present what has become a confused and unclear narrative. It is the argument of this presentation that theories and paradigms arising out of current glocalization models allow us to instead view the process of Gallic urbanization as a process of negotiation over shared identity, memory, and memorialization; an attempt to crystallize group experience and therefore manifest identities into shared social spaces. What have thus far been viewed as attempts at aping Roman culture, or imprecise efforts at Romanization, were instead smaller pieces of a larger cultural discussion taking place throughout the Three Gauls on what Gallic society would look like post-conquest, and how it would relate to itself and Roman society both in a manufactured past and future.

13 HEADDRESS, COMBAT HEADDRESS, THE POWER OF INSIGNIA

Fleury, Béatrice (Freelance)

This presentation attempts to re-assess violence in ancient societies through items of military equipment and related insignia, and link their impact on memory and role in our “imaginary”.

The portrait of the “Good Savage” (Rousseau), as taken up in its “essence” in “L’archéologie de la violence”, reflects the nineteen-sixties pacifist outlook.

The Ancients would not have perpetrated acts of violence, or not at the same level of savagery as modern societies.

In Soudsky’s neo-Marxist model, in neolithic societies, accumulation of economic surpluses causes differences in wealth, leads to intensification of competitiveness, and ultimately to territorial and cultural expansionism, consecrated in the enshrinement of unparalleled power.

Mauss, Sahlins, Godelier described “primitive” systems on Marxist lines.

Chesneaux analysed the collapse of political/economical systems of African and Asian societies in the nineteenth century as part of the imposition of European hegemony.

The impact of one culture on another, the accompanying changes and inevitable acts of resistance, end in uncertain acculturation. Consider Caesar’s Gallic Wars ...

Findings supporting an escalation of violence are few. Recent discoveries of enclosed neolithic sites in Europe which unveil indices of violence, suggest the reverse. For the end of the Iron Age, discoveries at Gallic sites testify intense savage practices of putting to death.

Comparison of items of iron age defensive equipment with modern ones, fortuitously uncovers the impact insignias have on behaviour; they carry messages contradictory to their aim, as their semiotics induce the impulse for power.

Consciousness provide us with the arms to combat the “syndrome violence”. Whether it is attested by rituals of sacrifice, mortuary practices, warfare, even murder.

Helmets painted in romantic mode by Rochard reflect our “imaginaire”.

Resilience, resistance, repression, are vectors of aggressivity. “Nothing has changed”, other than in form, and in the shift from ostentatious symbol to functionality.

A PLAYFUL MAPPING APPROACH TO ARCHAEOLOGICAL LANDSCAPES

Giovannetti, Chiara (Sapienza University of Rome) - Anichini, Francesca (Università di Pisa) - Basile, Salvatore (Università di Pisa) - Gattiglia, Gabriele (Università di Pisa) - Paperini, Elisa (Università di Pisa) - Sciuto, Claudia (Università di Pisa) - Voccia, Raffaele (Università di Pisa)

The archaeological landscapes we survey are a living and lively reality in the daily lives of many. People shape the landscape and are also shaped by it, engaging in a daily exchange that often goes uncharted. This study addresses the challenge of capturing this dynamic, with a specific focus on the non-dominant voices of children.

The presented case study, conducted during an archaeo-anthropological investigation of the Apuan Alps led by Map-paLab (Pisa University), suggests that employing playful mapping techniques provides children with a valuable avenue to freely express their perspectives on archaeological sites, thereby challenging established power structures within the field. Methods such as accompanied archaeological surveys, simplified Topographic Unit models, GPS apps, and participating walks were utilized to engage children, with a hybrid digital and analogue approach. Results indicate a positive reception of the approach, providing a pleasant and educational experience. Conducting activities in familiar places for children was a facilitating element and a privileged moment to observe the unfolding relationship between the landscape and the children. It allowed seeing how these spaces, for us ‘archaeological sites,’ were living and present elements in the ongoing narrative of their everyday lives.

The implications of this study will extend to the creation of a meta-data schema linking experiential data from children with archaeological datasets, paving the way for a more inclusive and collaborative understanding of archaeological landscapes, and reuse of archaeological data. The cases for reuse are particularly geared towards formal educational contexts, with the aim of facilitating a discussion on the epistemological potential of material sources, often excluded from school curricula after the advent of written sources.

ARCHAEOLOGY, CRAFTING MAPS, AND POLITICAL CHANGE: PLAYFULLY MAPPING THE CONTESTED URBAN LANDSCAPES AND MEMORIES OF SURIÇI IN DIYARBAKIR

Hacigüzeller, Piraye (University of Antwerp)

In this talk, I aim to situate maps and mappings (i.e., the practices involved in map-making and map-using) within the field of archaeology. I characterise archaeological mapping as a craft that necessitates a distinct set of skills. Like all crafts, it requires attentiveness, improvisation, and an openness to affect. I present the impact that the digital transition has had on archaeological mappings, particularly since the 1990s. Further, I elucidate how, from the 2000s onwards, mappings began to serve as a focal practice for advocating, demanding, and effecting political change in archaeology—a process I name mapping archaeology for change. Despite inherent challenges, archaeological mapping can prove to be a powerful ally for nondominant individuals and communities striving to make their voices heard. For instance, such mappings can serve as important aids in exploring contested landscapes through unique performances. These performances can highlight attempts to erase collective memories woven into urban materialities as I will illustrate with a playful mapping activity I carried out in Diyarbakir, southwest Turkey, in February 2024.

16

TO MAP A COUNTRY’S ANCIENT REMAINS AND CULTURAL HERITAGE WITHIN THE FRAMEWORK OF SYSTEMATIC PROTECTION AND INTERACTIVE PRESERVATION

Thunberg, Carl L. (Västernorrland County Museum; ICOM)

The endeavor to map a country’s ancient remains and cultural heritage within the framework of systematic preservation and with an ambition to also capture the relationship between people, cultural heritage and their surrounding environment necessitates a transformative shift in perspective. Beyond the conventional focus on inventory and documentation, this multidisciplinary approach places a paramount emphasis on the intricate interplay between human interaction and the landscape, seamlessly intertwining preservation and community engagement. The selection process for preservation evolves into a nuanced endeavor, where differing narratives and memory preservation shape the criteria. Based on cultural and historical significance, the interpretation of sites becomes a pivotal factor in the selection process. Diverse perspectives must be considered to ensure a comprehensive representation of the country’s rich cultural tapestry. The need to address memory preservation, and weaving the collective memory, i.e. memories, and contested memories, into the fabric of heritage preservation should be underscored. The complexities of memory preservation must be addressed in such a process, not least the intricacies of archiving and safeguarding narratives. The studies that form the basis for this lecture propose an inclusive preservation strategy that not only catalogues ancient sites but also incorporates the stories embedded within them, acknowledging the diverse cultural memories associated with each locale. Furthermore, the implementation of systematic cultural heritage protection extends beyond legal frameworks. It underscores the necessity of integrating public awareness and education initiatives, fostering a collective responsibility for preservation. Integrating GIS technology becomes a tool not just for spatial documentation but a dynamic medium for capturing the evolving relationship between people, heritage sites, and their surrounding environment. This tech-enabled approach allows for real-time monitoring of changes, identifying potential threats, and ensuring a responsive preservation strategy.

Internationally, the abstract advocates for collaborative efforts, urging countries to engage in information sharing and cooperative initiatives. Recognizing the universal significance of cultural heritage, this collaborative approach seeks to benefit from diverse perspectives and expertise, creating a global network committed to preserving the world’s ancient treasures. In essence, this framework envisions a collaborative, community-driven effort where government agencies, local communities, researchers, and international organizations converge to safeguard and celebrate a country’s antiquities. An intertwining preservation of physical ancient remains with narratives and memories, could be an approach to enable enduring protection of our ancient remains in a more holistic manner. This is of course also something that would be most beneficial within a framework of international cooperation.

BUILDING BRIDGES: AN OPEN FORUM FOR ARCHAEOLOGY AND METAGENOMICS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Bonucci, Biancamaria (Institute of Genomics, University of Tartu) - Borry, Maxime (Max Planck Institute for Evolutionary Anthropology; Leibniz Institute for Natural Product Research and Infection Biology Hans Knöll Institute) - Lopopolo, Maria (Institut Pasteur, Université Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Pach, Aleksandra Laura (Globe Institute, University of Copenhagen) - Quagliariello, Andrea (Dept. Comparative Biomedicine and Food Science, University of Padua)

Session format: We propose a dynamic session format that encourages diverse contributions, emphasising both “tandem presentations” and traditional ones from “regular session”, in order to foster an interdisciplinary exchange of ideas. In this innovative session type, participants are invited to submit presentations in pairs, where one presenter focuses on the archeological angle of the project, and the other on the ancient metagenomics one, each offering their fresh perspectives and insights. These “tandem presentations” will be followed by open discussions that explore the synergies between disciplines. Additionally, we welcome standard presentations that showcase research from the individual disciplines of expertise. This mixed approach not only accommodates the varied expertise of our attendees but also promotes an enriching dialogue across interdisciplinary boundaries, making our session a hub for cutting-edge collaboration.

Humans and microbes have always maintained an enduring coexistence, directly and indirectly shaping each other’s biology and evolution.

Ancient metagenomics is an emerging field at the crossroads of archaeology, biology and computational sciences. It interrogates our shared past by analysing preserved ancient microbial DNA from a variety of archaeological matrices, ranging from dental calculus to preserved biological material in ancient vessels. This innovative approach has introduced a paradigm shift in our comprehension of historical human lifestyles, dietary customs, and health.

Seizing the rare opportunity of bringing experts in archaeology, molecular and computational biology together, we aim to promote an open and collaborative atmosphere to stimulate exchanges between disciplines and enrich our collective grasp of the past.

In this session, we encourage the presentation of projects that are at the intersection of the above disciplines. For instance, the study of ancient pottery (e.g. a wine amphora), can provide new insights into historical context, international trade, ancient diet, as well as the identification of ancient microorganisms associated with wine fermentation.

Embracing this dynamic format, the session will endorse “tandem presentations”, with an expert from each field, alongside conventional talks and posters, that showcase research from the individual disciplines of expertise. As an example, a study based on birch tar could be presented by a biologist, delving into the oral microbiome and dietary signals extracted from the substrate, together with an archaeologist who investigates the uses of this material and its cultural context.

The presentations will be followed by discussions designed to mend the gap between disciplines. Through this integrative approach, our session aspires to bridge disciplinary boundaries and promote a more nuanced and interconnected understanding of our shared heritage.

ABSTRACTS

1 INTEGRATING PALEOMETAGENOMIC DATA WITH ARCHAEOLOGICAL EVIDENCE TO STUDY POPULATION DYNAMICS IN THE SOUTHERN ANDES DURING THE LATE INTERMEDIATE PERIOD

Rascovan, Nicolas (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Luisi, Pierre (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Ponce Soto, Gabriel Yaxal (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Nelson, Elizabeth (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Willingham Grijalba, Arve Lee (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Lopopolo, Maria (Institut Pasteur, Université de Paris Cité, CNRS UMR 2000, Microbial Paleogenomics Unit, F-75015 Paris, France) - Barberena, Ramiro (Laboratorio de Paleoecología Humana, Instituto Interdisciplinario de Ciencias Básicas (ICB), Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET), Facultad de Ciencias Exactas y Naturales, Universidad Nacional de Cuyo, Mendoza, Argentina; Centro de Investigación, Innovación y Creación, Universidad Católica de Temuco, Chile)

The archaeological record is highly fragmented, and all pieces of evidence must be considered and integrated to better understand the human past. Recent advances in the study of ancient biomolecules in archaeological human remains, and particularly ancient DNA and isotope data, have greatly contributed to this end. Ancient DNA studies have been mainly driven by the analysis of ancient human genomic data, but important contributions came also from genomes of ancient human pathogens and ancient oral microbiota data. However, to date these layers of information have been mostly studied separately and rarely jointly analyzed with archaeological data. In this work we aimed at bridging that gap by analyzing multiple paleometagenomic datasets to study populations from the southern Andes of Argentina and Chile (30–34° S) between 1200–1420 AD (Late Intermediate Period), a period characterized by prevalent migration preceding the Inka conquest. The diets and mobility patterns of the human populations in the area were assessed with N15, C13 and 87Sr/86Sr stable isotope analyses. These analyses revealed a complex pattern of population dynamics, with co-existing local and migrant populations with different dietary patterns. Metagenomics of dental calculus was employed to investigate the oral microbial diversity of both populations, using strain level resolution. Metagenomic analysis of petrous bones was utilized as a source of human genomic data to determine the identity and origins of migrant and local populations, while also serving as a proxy for the environmental microbial background in oral microbiome analyses. Finally, preliminary results from metagenomic analysis of ancient teeth suggest that migrant populations may have been affected by Tuberculosis, raising questions about the role of this disease in the context of these migrations. This work perfectly exemplifies the benefits of a synergic work between archaeologist and geneticists to get more profound understanding of the history of past populations.

2 ANCIENT DENTAL CALCULUS REVEALS ORAL MICROBIOME SHIFTS ASSOCIATED WITH LIFESTYLE AND DISEASE IN GREAT BRITAIN

Weyrich, Laura (Pennsylvania State University) - Gancz, Abigail (Pennsylvania State University) - Farrer, Andrew (University of Adelaide)

The prevalence of chronic, noncommunicable diseases has risen sharply in recent decades, especially in industrialized countries. While several studies implicate the microbiome in this trend, few have examined the evolutionary history of industrialized microbiomes. Here, we sampled 235 ancient dental calculus samples from individuals living in Great Britain (~2200 BCE to 1853 CE), including 127 well-contextualized London adults. We reconstructed their microbial history spanning the transition to industrialization. After controlling for oral geography and technical biases, we identified multiple oral microbial communities that co-existed in Britain for millennia, including a community associated with *Methanobrevibacter*, an anaerobic Archaea not prevalent in the oral microbiome of modern industrialized

societies. Calculus analysis suggests that oral hygiene contributed to oral microbiome composition, while microbial functions reflected past differences in diet, specifically in dairy and carbohydrate consumption. In London samples, *Methanobrevibacter*-associated microbial communities are linked with skeletal markers of systemic diseases (e.g., periostitis and joint pathologies), and their disappearance is consistent with temporal shifts, including the arrival of the Second Plague Pandemic. This suggests pre-industrialized microbiomes were more diverse than previously recognized, enhancing our understanding of chronic, noncommunicable disease origins in industrialized populations.

3 THE NEOLITHIC TRANSITION FROM A BACTERIAL PERSPECTIVE: A POPULATION GENETIC APPROACH

Santos, Patrícia (University of Ferrara) - Vizzari, Maria Teresa (University of Ferrara) - Boscolo Agostini, Rajiv (University of Ferrara) - Ottoni, Claudio (University of Rome Tor Vergata) - Quagliariello, Andrea (University of Padua) - Modi, Alessandra (University of Florence) - Lari, Martina (University of Florence) - Ghirotto, Silvia (University of Ferrara)

The Neolithic transition, one of the main demographic events in Europe 10.000 years ago, marked the shift from hunting-gathering to farming. The adoption of a new lifestyle triggered important changes in the evolution of both humans and their oral microbiome possibly associated with a higher abundance of two bacterial species: *Olsenella* sp. oral taxon 807 (OT807) and *Anaerolineaceae* bacterium oral taxon 439 (OT439). Previous studies on the oral microbiome during this transition gave contrasting results, often limited by small sample size distributed over a broad geographical area characterized by distinct ecological conditions. Moreover, most of these studies did not focus on the genetic structure of these bacteria.

This project combines metagenomic and population genetic analyses to reconstruct the genomes of OT807 and OT439, focusing on dental calculus as a rich source of information. By analyzing published metagenomic data spanning different areas from the Paleolithic to the Bronze Age, our findings suggest an increase in the abundance of both OT439 and OT807 during the Neolithic, in agreement with previous studies. We also highlighted a clear genetic structure associated with this transition for the OT439 bacteria, which is absent in OT807. This suggests that OT439 could be a good marker for understanding Neolithization processes.

4 COMBINED GENOMIC AND LIPID ANALYSES REVEAL NEW INSIGHTS INTO BIRCH TAR USE AND FUNCTION IN THE NEOLITHIC ALPS

Koch, Tabea (Université Côte d’Azur, CEPAM, CNRS, France; Department of Archaeology, University of York, York, UK) - White, Anna (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Denmark; Department of Archaeology, University of York, York, UK) - Little, Aimée (Department of Archaeology, University of York, York, UK) - Wales, Nathan (Department of Archaeology, University of York, York, UK) - Regert, Martine (Université Côte d’Azur, CEPAM, CNRS, France) - Schroeder, Hannes (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Denmark)

Birch tar is the first synthetic material in the archaeological record used as early as the Middle Palaeolithic in Europe. The Neolithic provides a larger corpus of birch tar finds in relation to composite tool hafting, pottery repair and sealing. Tar lumps have been shown to bear tooth imprints, implying they were chewed, and recent studies revealed ancient DNA preservation within such lumps. It remains unknown whether DNA also preserves in other tar artefacts. To address this question, we analysed 30 artefacts from 9 archaeological sites in the Alpine region. We applied organic residue analysis with ancient genomics to characterise the composition and microbial signature of adhesives linked to hafting, repair and lumps. Our results show that birch tar is the main component, while two samples also contain conifer resin/tar. Ancient DNA was found in all categories, identifying oral microbes, human DNA and several plant and animal species. Our study is the first large-scale investigation into birch tar artefacts using a combination of lipid and genomic analyses with implications for our understanding of birch tar functionality, production-related technologies and cultural practices.

5 TRACING PAST INTERACTIONS: METAGENOMIC ANALYSES OF KURĪ PALAEOFAECES FROM AOTEAROA NEW ZEALAND

van Os, Meriam (Department of Anatomy, School of Biomedical Sciences, University of Otago; Archaeology Programme, School of Social Sciences, University of Otago) - Greig, Karen (Archaeology Programme, School of Social Sciences, University of Otago; Southern Pacific Archaeological Research, University of Otago) - Anderson, Atholl (School of Culture, History & Language, Australian National University; Ngai Tahu Research Centre, University of Canterbury) - Campbell, Matthew (CFG Heritage Ltd; Anthropology, School of Social Sciences, University of Auckland) - Collins, Catherine (Department of Anatomy, School of Biomedical Sciences, University of Otago) - Knapp, Michael (Department of Anatomy, School of Biomedical Sciences, University of Otago) - Tucker, Brooke (Archaeology Programme, School of Social Sciences, University of Otago) - Walter, Richard (Southern Pacific Archaeological Research, University of Otago; School of Social Science, University of Queensland)

Aotearoa New Zealand was the last major land mass to be settled by humans, populated about 750 years ago from East Polynesia. The archaeological record suggests that upon arrival, ancestral Māori rapidly radiated across most of the coastal North and South Islands, quickly adapting to new environments and mastering the use of new resources.

The relative abundance of palaeofaeces throughout archaeological sites in Aotearoa New Zealand provides a unique opportunity to study these human-animal-environmental interactions in more detail. This tandem talk will present preliminary results of metagenomic shotgun analyses of thirty kurī (the extinct Māori dog) palaeofaeces, within the broader archaeological context of Aotearoa New Zealand. The samples are from three archaeological sites: the Long Bay Restaurant site in the upper North Island (1430-1485 AD, n=10), Wairau Bar in the upper South Island (early 14th century AD, n=10), and Sealers Bay Camp on Codfish Island/Whenua Hou in Southern New Zealand (two occupation phases: 13-15th & 19th century AD, n=10).

6 A COMPLEX BLEND OF WEST AND EAST: A BIOMOLECULAR STUDY OF WINE MANUFACTURING IN JUDEA OF THE EARLY ROMAN PERIOD

Ben-Gedalya, Tziona (Eastern R& Center, Ariel, Israel; Department of Molecular Biology, Ariel University, Israel) - Spiteri, Cynthianne (Eberhard Karls University Tübingen, Germany; ArchaeoBiotics, Department of Life Sciences and Systems Biology, University of Turin, Italy) - Porat and Herodium Expedition, Roi (Herodium Expedition, The Institute of Archaeology, Hebrew University of Jerusalem, Israel)

An early Roman period winery was discovered in 2017, in the fortress palace of King Herod in Herodium. Located on the margins of the Judean desert along the Dead Sea rift, within an earthquake prone region, the site combines well-defined archaeological evidence of a winery, the Judean desert climate, and contexts sealed by ancient episodes of collapse attributed to earthquakes. Providing the opportunity to systematically study well preserved organic remains of ancient winemaking, the Herodium winery proved an excellent case study for exploring the preservation of ancient wine signatures in different substrates and archaeological artefacts. Wine production processes were studied by applying organic residue analysis to ceramic fermentation vessels and ancient grape pomace remains as well as control sediments. Using Gas Chromatography-Mass Spectrometry we observed well-preserved residues demonstrating evidence of wine and pine tar/resin, the latter probably used as a sealant as thick remnants were found adhering to the inner surfaces of the ceramic containers. Moreover, we further established a new approach to search for evidence of fermentation, applying scanning electron microscopy to the ancient fermentation vessels versus controls. Overall, our study provides insights regarding the interpretation of wine in archaeological findings, enhances understanding of wine making traditions in the Mediterranean basin and informs on a culinary aspect of the vibrant Roman influenced globalization processes in Judea at the end of the first century BCE.

7 ANCIENT WINE MICROBES FROM FIRST CENTURY AD ROMAN CLIENT KINGDOM OF JUDEA

Borry, Maxime (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; 2Leibniz Institute for Natural Product Research and Infection Biology, Hans Knöll Institute, Jena, Germany) - Ben Gedalya, Tziona (Eastern R&D Center, Ariel University, Ariel, Israel; Department of Molecular Biology, Ariel University, Israel) - Warinner, Christina (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Faculty of Biological Sciences, Friedrich-Schiller University, Jena, Germany; Department of Anthropology, Harvard University, Cambridge, MA, USA) - Expedition, Herodium (Hebrew University, Jerusalem, Israel)

This project will be presented in tandem with Tziona Ben Gedalya, who will cover the archeological, and organic residue analyses of this project. From the organic material consistent with grape residues remaining at the bottom of ancient fermentation vessels, we extracted and sequenced DNA using shotgun metagenomics and targeted capture, aiming for enrichment of DNA from fermentation associated microbes. While the analysis of the sequencing data first revealed a partial degradation of the overall microbial communities, we could successfully control for contaminant microbes using soil samples from the fortress and a differential abundance analysis approach. After de novo assembly and binning of the remaining fermentation bacteria genomes, we analyzed the reconstructed high-quality metagen-

ome-assembled genomes (MAGs) from a phylogenetic and functional standpoint. The phylogenetic signal of these ancient fermentation bacteria confirmed both their ancient origin and their affiliation to bacteria associated with wine fermentation. Gene functional analysis of the reconstructed fermentation-associated MAGs revealed both beneficial genes involved in malolactic fermentation and diacetyl production, as well as genes involved in the production of wine spoilage compounds, especially in species typically viewed today as spoilage bacteria. Overall, our analysis brings a new appreciation on the microbiology of winemaking in Roman Judea and enriches our understanding of Roman accounts of flavoring wine with different herbs and aromatics, which may have been performed in part to mask the off-flavor compounds produced by bacterial wine spoilage genes.

8 THE MICROBIOME OF THE HYPOGEAL ETRUSCAN TOMBS OF TARQUINIA

Rinaldi, Teresa (Sapienza University of Rome) - Tomassetti, Maria (Parco Archeologico di Cerveteri e Tarquinia)

The preservation and conservation of hypogeal environments are a significant challenge for the conservators and restorers. The ancient Etruscan Necropolis of Tarquinia, an UNESCO site in Italy, consists of 6000 hypogeal tombs. Among them, 200 are decorated with extraordinary mural paintings, of great value for the comprehension of this important population. We will report how, along the last eight years, a restorer and a biologist approached the restoration and conservation of mural paintings in the Tomba degli Scudi. The Etruscan tombs in Tarquinia, carved in a calcarenite rock, called macco, show a peculiarity with an important role in the conservation of their mural paintings: the presence of a calcium carbonate patina covering walls and ceilings. This deposition corresponds to the moonmilk, a patina of microbial origin. The microbial communities from various tombs were studied and we will show how microorganisms, usually considered as biodeteriorative agents, could help in preservation of these hypogeal environments.

9 EXPLORING CONSUMPTION AND ENVIRONMENTAL PATTERNS DURING THE ROMAN PERIOD IN HARELBEKE, BELGIUM VIA SEDADNA ANALYSIS

Özdoğan, Kadir (Utrecht University; Wageningen University & Research) - Nota, Kevin (Max Planck Institute for Evolutionary Anthropology) - Sanchez Garcia, Guillermo (Utrecht University) - van Mousch, Roy (BAAC) - Garcia Furni, Fabricio (Vrije Universiteit Amsterdam) - de Groot, Arjen (Wageningen University & Research) - Plets, Gertjan (Utrecht University)

Recent studies show that sedaDNA methods could provide information about the biodiversity of past environments. This study explores the use of sedaDNA methods to investigate past consumption habits and their implications on the northwestern border zones of the Roman Empire (The Lower Germanic Limes). We were able to obtain ancient DNA from latrine contents that gave an insight into the biodiversity of the past environment of the region and consumption patterns, with a focus on domestic animal and plant taxa. While our findings were supported by previous archaeozoological and archaeobotanical research, they also demonstrated the complementary nature of sedaDNA studies with other archaeological methods for investigating historical periods. Therefore, this study highlights the potential of sedaDNA methods for improving our knowledge of the past and contributes to our understanding of ancient societies and their interactions with the environment. Furthermore, the future sedaDNA research in the Limes area has the potential to provide a more comprehensive understanding of consumption habits and trade routes in the borderlands of the Roman Empire.

10 PALAEOFAECES FROM A VIKING-AGE URBAN SETTLEMENT AT RIBE, DENMARK - METAGENOMICS, MULTI-OMICS, AND HIGH-DEFINITION ARCHAEOLOGY

Lanigan, Liam (Globe Institute, University of Copenhagen) - Croix, Sarah (UrbNet, Aarhus University)

Palaeofaeces (or coprolites) recovered from archaeological sites have the potential to provide insights into the diet, health and behaviour of past individuals. Recent advances in “-omic techniques” (lipid analysis, shotgun metagenomics and palaeoproteomics), can allow archaeologists to further investigate the “invisible. For instance, reconstructing the microbiome and identifying the host, as well as pathogen detection. Here we discuss the potential of these tools in connection with palaeofaeces recovered from the deep-urban stratigraphy of the Posthustorvetsite, an early proto-urban community dating to the 8th-9th century from Ribe, Denmark investigated in connection with the Northern Emporium project. The preservation of biomolecules in palaeofaeces seems to be highly-variable, and related not only to the “producer”, but also related to micro-climatic conditions of their deposition. The different biomolecules provide contrasting, as well as complementary levels of information, but only where preservation is adequate. We discuss issues with recovering, authenticating, and contextualising biomolecular information from the palaeofaeces of the earliest inhabitants of Ribe.

11 OPTIMIZING A PROTOCOL FOR ANCIENT DNA EXTRACTION FROM CLAY TOBACCO PIPESTEMS

Harder, Reed (Dartmouth College) - Fleskes, Raquel (Dartmouth College)

Clay tobacco pipes were used by European, African and Indigenous persons in colonial North America to smoke tobacco or other plant materials. Clay material preserves well in archaeological contexts, making pipestems a commonly found artifact. Recently, clay tobacco pipes have been shown to harbor DNA deposited from the saliva of persons who smoked from them. However, only one protocol for DNA extraction from clay pipes has been published, utilizing a DNA purification kit not optimized for highly degraded and inhibited DNA samples. In this study, we aim to develop an optimized laboratory and computational protocol for ancient human and oral microbiome DNA extraction and authentication from clay tobacco pipe stems. Nine pipestems were selected from three 17th-18th century archaeological sites in North America (one English site in 17th century Delaware, and two 17-18th century Connecticut sites). Pipestems with tooth marks were preferentially chosen, as they provide evidence of contact with the human mouth and subsequent saliva deposition. The pipestem artifacts and positive/negative control pipestems were subdivided into three parts to test different extraction protocols at the University of Connecticut. Extracted DNAs were dual-indexed and sequenced on one lane of a NovaSeq X Plus. We then compare output metrics, including sample complexity and contamination, to determine the most effective extraction protocol. Using a combination of contamination filtering by statistical models of postmortem damage and read length distribution, we identify the presence of authentic aDNA. We find the extracted DNA to be characterized by a very high proportion of ultra-short DNA fragments. With this optimized protocol for pipestem DNA extraction, we hope to expand the potential for minimally destructive aDNA extraction from ceramic artifacts, avoiding destructive sampling of skeletal remains and informing our understanding of ancestry, biological kinship, and oral health of clay pipe users in the context of their material culture.

12 AMETA: A COMPUTATIONAL METHOD FOR DATA-DRIVEN ANCIENT METAGENOMIC ANALYSIS

Oskolkov, Nikolay (Lund University)

Analysis of microbial data from archaeological samples is a growing field with great potential for understanding ancient environments, lifestyles, and diseases. However, high error rates and false-positive discoveries have been a challenge in ancient metagenomics, and the availability of computational frameworks that meet the growing demands of the field is limited. Here, we propose aMeta [1], an accurate metagenomic profiling workflow for ancient DNA designed to minimize the amount of false discoveries and computer memory requirements. Using simulated data, we benchmark aMeta against a current state-of-the-art workflow and demonstrate its superiority in microbial detection and authentication, as well as substantially lower usage of computer memory.

[1] Zoé Pochon, Nora Bergfeldt, Emrah Kirdök, Mário Vicente, Thijessen Naidoo, Tom van der Valk, N. Ezgi Altınışık, Maja Krzewińska, Love Dalen, Anders Götherström, Claudio Mirabello, Per Unneberg and Nikolay Oskolkov, aMeta: an accurate and memory-efficient ancient Metagenomic profiling workflow, *Genome Biology* 2023, 24 (242), <https://doi.org/10.1186/s13059-023-03083-9>.

13 BONE ADHERED SOIL AS A SOURCE OF TARGET AND ENVIRONMENTAL DNA

de Dios Martinez, Toni (University of Tartu) - Bonucci, Biancamaria (University of Tartu) - Dittmar, Jenna (University of Aberdeen; Edward Via College of Osteopathic Medicine) - Inskip, Sarah (University of Cambridge; University of Leicester) - Robb, John (University of Cambridge) - Scheib, Christiana (University of Cambridge; University of Tartu)

In recent years sediments from cave environments have provided with inestimable data for the study of ancient hominids, but also for past fauna and flora reconstruction. Unfortunately, locations with favourable conditions for ancient DNA (aDNA) preservation in sediments are scarce. In this study we analysed a set of samples obtained from soil adhered to different human tissues and cavities originating from medieval sites of East Anglia. From them, we were able to recover aDNA sequences matching the genomes of endogenous Gut and Oral microbiome bacteria. Regarding human sequences, we have been able to reconstruct the genetic profile of the original individual. We also find the presence of genetic data corresponding to other animals, including members of the genus *Canis*, *Ovis* and *Ascaris*. Moreover, we have been able to retrieve the whole mitochondrial genome and a partial nuclear genome of a Black Rat (*Rattus rattus*). Those sequences displayed damage typical of aDNA and when placed in a mitochondrial phylogeny, fell within other medieval *Rattus rattus* lineages. Our results demonstrate that material usually discarded, as it is soil adhered to human remains, could be used to get a glimpse of the environmental conditions at the time of the death of an individual.

856 SO FALLS THE WORLD: ARCHAEOLOGY AND HERITAGE AGAINST EMPIRE(S)

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Politopoulos, Aris (Leiden University) - Moshenska, Gabriel (University College London) - del Rio, Judit (University of Burgos) - Hadjigavriel, Maria (Leiden University) - Arciero, Roberto (Leiden University)

Session format: Regular session

Our shared pasts, particularly in their Western retellings, are dominated by empires. The Assyrian empire, the Inca, the Timurid empire, the Mali empire, and of course the Roman empire, are some of the most common past polities that are shared in academic and popular history. These entities are often considered inevitable phenomena in global history, as linear developments of powers that grow from their immediate territories, to global domination. The cultural imprint of empires has also been a centerpiece of archaeological and heritage discourse and practice. Palaces, temples, and burials with treasures of great kings and emperors have been sought after from the early stages of our discipline in the 19th century all the way to the present. Such finds have also become mainstays of the way heritage is presented by modern nation states, and the way national identities are built on the grandiose pasts of empires. Palaces become museums or parliaments. Statues of kings and emperors adorn plazas and government buildings, such as the (replica) of equestrian Statue of Marcus Aurelius emperor at Campidoglio in Rome. These emperors are, more often than not, men who have left a bloody history of conquest and destruction but are venerated as the “greats” of history.

In this session we aim to explore and put under scrutiny such imperial narratives, arguing that if archaeology and heritage practice aims at a future that is inclusive and diverse, it needs to deconstruct the histories and heritages of empires. As such we are looking for papers within the broader theme of resistance to power and empire(s) related but not limited to:

Archaeology of empires

Anarchist archaeology perspectives

Heritage & Museum Studies

Contemporary archaeology

Gender and queer archaeology

Any kind of topic pertaining to archaeology and heritage against empire(s).

ABSTRACTS**1 MOBILITY AND INTERACTION IN THE 3RD-2ND MILLENNIUM BCE IN CENTRAL ASIA AND THE MEDITERRANEAN. A CASE OF RESISTANCE?**

Hadjigavriel, Maria (Leiden University) - Arciero, Roberto (Leiden University)

The emergence of complex proto-State societies in Central Asia during the second half of the 3rd millennium BCE marked a significant development. Among them, the Bactria and Margiana Archaeological Complex (BMAC) held a pivotal position. While the political structure of the BMAC remains elusive, evidence suggests the presence of elites or a ruling class. In the first half of the 2nd millennium BCE, notable changes occurred in the region, particularly in pottery assemblages. A distinct style of pottery, characterized by handmade and incised decorations (ICW) emerged. This ICW pottery exhibited clear connections with the Andronovo horizon, leading scholars to interpret it as evidence of Andronovo groups entering the region. These groups, interpreted as pastoralists based on pottery assemblages, settled on the peripheries of BMAC settlements.

Meanwhile, in the Eastern Mediterranean, Cyprus was entering the Bronze Age in the second half of the 3rd millennium BCE, with the so-called Philia Phase. This change has long been ascribed to the arrival of migrant populations from Anatolia, who brought their technologies and subsistence strategies with them. However, recent research has disputed this view, giving more attention to local developments and the agency of Cypriots.

By examining the subsistence economy of Andronovo (ICW) pottery sites and Philia Phase Cyprus, we contend that they resemble their BMAC and Anatolian counterparts while retaining their unique characters. Furthermore, we will explore the concept of “resistance” to the emerging BMAC state from Andronovo sites, and Philia Phase Cyprus challenging the prevailing notion of peaceful coexistence and integration, and taking a closer look into how foreign and local communities interacted. This perspective sheds light on the intricate dynamics of ancient eastern Mediterranean and Central Asian societies and their interactions during this transformative period.

2 THE MAYA ENLIGHTENMENT: COLONIALISM, IMPERIALISM, SUBLIMATION AND THE POLITICS OF PERIODISATION

Kratimenos, Panos (UCL Institute of Archaeology)

While increased focus in recent decades has been paid to conceptions of time in archaeological interpretation, comparably less attention has been afforded to the way in which we ourselves conceive of time in the construction of chronologies to periodise the past. In the current climate of (justified) disciplinary anxiety concerning the appropriation of archaeological work – and the past more broadly – to justify and naturalise exploitative, chauvinistic and re-vanchist practices in the present, the relative paucity of critical reflection on this fundamental conceptual framework which we all necessarily utilise represents a significant gap in archaeological theorising. This oversight is rendered all the more acute given the well-established colonial and imperialist roots of archaeology as an academic discipline, from which many of our chronological conceptual models originate.

In this paper, I focus on the tripartite chronology utilised by scholars of the Precolumbian Maya as a case study to explore the potential of a critical approach to archaeological chronologies and periodisations. By examining this particular chronology's origins and the intellectual histories which underpin it, I demonstrate that the issues at stake are more than questions of temporal accuracy but, rather, matters of reflexivity. Through a process of 'sublimation', problematic assumptions and mentalities upon which periodisations were originally constructed are obscured in contemporary usage, leading to the perpetuation of outdated tropes and a conceptual path dependency in narratives of the past. Conversely, appreciating the arbitrary nature of chronological demarcations, treating such frameworks as negotiable and open to revision, and consciously reflecting on the imperialistic cultural imprints which may have become sublimated within orthodox models of periodisation are powerful tools in opening up new interpretive possibilities to the narration of the past.

3 LATE ANTIQUE MONASTICISM IN EGYPT AS A REVOLUTIONARY COUNTERCULTURE

Schrauder, Julienne (RGK - Romano-Germanic Commission DAI)

Despite Early Christianity being in itself in a way a 'counter-culture' to the Roman way of life and thinking, this angle has so far not been focus of much research. The persecution of Christians by Roman Imperial authorities is in itself a testimony of the conflict between the official rule and a group of people that were seen as a threat. The concept of early martyrdom, i. e. of dying whilst defying the authorities and renouncing the world of the living, could not be more revolutionary for the time in question. It is firmly embedded in the narrative of Christian believers as antagonists of the Empire – and the Empire as antagonist to the Christians. Not without reason is a recurring theme in Christian art and literature that Empires and their rulers are temporary at best, destined for death and oblivion.

But it is not only in textual and pictorial evidence that contempt for the secular and non-Christian powers that be can be found, the archaeological remains, too, can be interpreted this way. In this presentation the early monastic communities and non-communities of Christian practitioners shall be presented as a movement that went against the establishment. Two angles will be highlighted: a) the interaction of monks with structures that are emblematic for Imperial power and representation such as temples, and b) the monastic body as an antithesis to the Hellenistic and Roman ideal.

4 THE SUNBURY ABORIGINAL EARTH RINGS FROM WURUNDJERI WOI-WURRUNG COUNTRY, SOUTHEASTERN AUSTRALIA: EMPIRES, COLONISATION AND SELF-DETERMINATION

Spry, Caroline (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation; La Trobe University) - Lucille Freedman, Delta (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Jones (Wurundjeri Woi-wurrung Elder), Ron (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Wandin (Wurundjeri Woi-wurrung Elder), Allan (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Mullins (Wurundjeri Woi-wurrung Elder), Bobby (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Morrison, Wendy (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Spencer-Gardner, Ariana (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Modra, Lauren (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Gribble, Lauren (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation) - Lasky-Davison, Zara (Wurundjeri Woi-wurrung Cultural Heritage Aboriginal Corporation)

The Sunbury Aboriginal earth rings are a mysterious series of circular features of approximately 20m diameter located on lands traditionally known as Wurundjeri Woi-wurrung Country in greater Melbourne, southeastern Australia. Recent archaeological research indicates the Rings pre-date colonisation by the British Empire in Australia in the late 1700s. However, since colonisation, Wurundjeri Woi-wurrung people and the Rings have been impacted by dispossession and development. This paper presents the results of recent archaeological research of one of the Rings and an assemblage of stone artefacts excavated from this ring, and the results of a Wurundjeri Woi-wurrung-led study documenting the cultural values of the Rings and surrounding cultural landscape. The results highlight the many different faces of the Rings as potential ceremonial locations in the deep past, locations of Frontier encounters during

colonisation, and locations of continued connection and self-determination for Wurundjeri Woi-wurrung people today in the face of continued development threats.

5 SICK, REFUGEES, DETAINEES AND OCCUPIERS: MANY LIVES OF 500-BED HOSPITAL IN TEHRAN

Naeimi, Maryam (Freie Universität Berlin, Germany)

There is this operating hospital in Tehran, that was designed and built by a German architect and a German construction company to be a modern, fully equipped hospital of the capital in the late 1930s. Before it was finished, Iran was invaded and occupied by Anglo-Soviet forces (1941), German construction people were arrested by Allied forces and detained there. Later, Polish refugees were moved to this hospital. These refugees were deportees that were transported in their thousands from Soviet Union to Iran in 1942 to later leave to other parts of the Allied-control world. At the same time, in 1944, the hospital was partly turned into an internment camp where Allied (British) forces held captive Iranian Political prisoners accused to be Nazi sympathizer, anti-Allied or politically dangerous for Allies. Some of the captives were part of the anti-Allied resistance from around the country.

I'd like to present an archaeological diachronic study that sheds light on different occupation phases of the hospital. In doing that I will discuss the resistance of the captives against British forces, the hardship of the lives of Polish refugees and emancipating actions of families of the captives which lead to British forces giving up their authority over the internment camp. All of this will be discussed in connection to the space and its affordance. In another word how resistance is connected to alteration of space.

6 THE HERITAGE AGONY. ENCLOSURE CONTESTATIONS BETWEEN STATES AND EMPIRES IN THE 19TH AND 20TH C. AEGEAN SEA

Lekakis, Stelios (Newcastle University)

Cultural heritage emerges as a national endeavor, originating during the formation of a new collective political identity. This identity, rooted in the shared past, selectively incorporates socially significant events, structures, landscapes, and figures to construct a national narrative that emphasizes triumphant peaks while downplaying equally glorious but minor setbacks. This selective interpretation of the past is evident not only within nations but also within empires, particularly in their later stages (19th to early 20th century) when they clashed with the rising nation-states in Europe.

Focusing on the 19th and 20th-century Aegean Sea, this paper aims to highlight similarities in the perception of cultural heritage among the Ottoman Empire, the Greek Kingdom, and competing European colonial forces. Specifically, it explores the collection and management of antiquities by these entities. The examination extends to the contemporary contexts of Greece and Turkey, raising the question of whether the legacy of this historical contest persists and, if so, what measures are required to address it.

7 "BUT YOU ARE AGAINST ALMOST EVERYTHING!". SOME NOTES AFTER A YEAR OF TEACHING HERITAGE

del Río, Judit (University of Burgos)

Spain, notoriously during the Francoist dictatorship, has engaged consistently in what we could call the political uses of Heritage. The Cid, a prominent character used in the construction of national identity whose military endeavours in the 11th Century are the focus of a well know medieval chanson de geste, is one of the most known symbols of Burgos, said to be his birthplace. A mercenary according to some, a hero to others, it is to this day a cornerstone for cultural tourism in the region. The Cid's Weekend Festival, a dedicated event that takes place in Burgos every year at the beginning of October, is a good example of this. The Festival is marketed as a historical and cultural event, and as such is mentioned in some Cultural Heritage and Tourism course syllabuses. My teaching includes a critical stance about said festival. Here, an autoethnographical account of my experience as a teacher will be combined with content and discourse analysis of past year's edition of the Cid's Weekend. I propose –both in this paper and on my class– that, similarly to what was done in the past, the festival also puts Heritage to political use nowadays, reinforcing a continuationist understanding of culture and the past. I argue that the festival: a) engages a-critically with a character much intertwined with the dictatorship, and b) offers mainly mainstream entertainment along a much trodden path, more focused on attracting tourism than on nuanced re-tellings of the Cid's, despite the official claims. It is my belief that, as politically engaged teachers, we have a duty to deconstruct simplistic narratives and provide radical ideas of reparation and justice that oppose the current statu quo; and that this duty is better accomplished if we can draw from what is familiar and within our reach.

8 NARROW, CAPITALIST CONCEPTS OF PROPERTY MAKE ARCHAEOLOGY AND HERITAGE BORING AND REINFORCE OPPRESSIVE SOCIAL STRUCTURES

Moshenska, Gabriel (University College London, Institute of archaeology)

Most heritage practice and a lot of heritage theory are grounded in uncritical acceptance of narrow definitions of property. This is a reflection of the enduring and pervasive powers of capitalism, nationalism, colonialism, patriarchy and other oppressive ideologies. It is also profoundly boring and intellectually impoverished: we can do better. This limited understanding of cultural property has been critiqued most powerfully by John Carman, who explored a variety of alternative approaches from a heritage perspective, including a brief outline of anarchist critiques of property: David Pacifico is another archaeologist who has approached similar questions from a more detailed and explicitly anarchist perspective.

Capitalist notions of property bore and irritate me. I want to build upon these important critiques of heritage/cultural property to consider how alternative notions of artefacts, human remains, places and landscapes as property – or the rejection of those notions – might constructively reshape heritage practice and thinking around issues such as identity, meaning, authenticity, repatriation, the roles of institutions, and the work of archaeologists and museum curators. Part of this work will be imaginative, challenging the limits of our own understandings. It forms part of a wider project of intellectual unfucking in archaeology and heritage, drawing attention to the oppressive fuckery that impoverishes all of us.

Carman, J. 2005. *Against Cultural Property: Archaeology, Heritage and Ownership*. London: Duckworth.

Pacifico, D. 2018. Beyond the Property Paradigm: Fragments for an Anarchist Approach to Archaeological Heritage. *Journal of Contemporary Archaeology* 5(2): 283-302.

9 THE EMPIRE GAMES BACK: HOW DIGITAL GAMES AND GRAND NARRATIVES GET US STUCK AND HOW WE CAN PLAY OURSELVES OUT?

Politopoulos, Aris (Leiden University) - Mol, Angus (Leiden University) - Lammes, Sybille (Leiden University) - Geritsen, Corine (Leiden University)

Empires have dominated our (hi)stories for too long. Whether in historical literature, documentaries, films, or series, narratives of empire – and its associated rulers, the so-called ‘big men’ of history – are ubiquitous, pervasive, prepotent, and resilient. Understanding how imperial narratives are expressed in the popular sphere is pivotal if we want to deconstruct them both within archaeology as well as in society as part of heritage. In this paper we explore how such narratives manifest and reinforce themselves in one of the most influential of contemporary media, video games.

We will do so by showing how enticing experiences of empire are offered in games such as Sid Meier’s *Civilization*, *Age of Empires*, and *Imperator: Rome* in which players are tasked with creating the ‘greatest’ empire the world has ever seen. We will scrutinise both the aesthetics and mechanics of empires – e.g. palaces, grand cities, maps, resources and ‘golden ages’ – and discuss the Grand Narratives of Empire, propped up by once fashionable archaeological theories, that lay underneath.

Following this, we will show how, from different positions – as players, modders, and indie game makers – people attempt to get unstuck from imperial narratives by, e.g. doing a pacifist run; creating mods that change game mechanics; or critiquing empire through subversive game design. We will reflect on what tools and insights we, as heritage practitioners and scholars of the past, have to contribute to such a playful dissolution of Empire.

At the heart of our paper lies a provocative question: are digital games, as technocratic, accounting, rule-driven, and algorithmic artefacts, de facto a tool of empire? Can game-based counter-practices help us resist and break down empires, old and new, or do they only get us stuck in other imperial systems?

857 PERSISTENT SIGNS ON SURFACES: THE INNOVATIVE USE OF VISUAL ARCHAEOLOGY TECHNIQUES IN INVESTIGATING VOLUNTARY AND CRAFTING MARKS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Previtì, Giulia (Sapienza University of Rome, Department of science of antiquity) - Giorgi, Lavinia (Sapienza University of Rome, Department of Classics) - Langner, Martin (Georg-August-Universität Göttingen, Institute for Digital Humanities) - Lerma, Jose Luis (Universitat Politècnica de València, Department of Cartographic Engineering, Geodesy and Photogrammetry) - Serino, Marco (Università degli Studi di Torino, Department of Historical Studies)

Session format: Regular session

The proposed session aims to offer an occasion to compare different Visual Archaeology techniques used to study worked surfaces. In the last decades, the digital age has completely revised archaeological research and documentation methods, changing the way we investigate (or re-investigate) the ancient world. Computational Imaging are now used in topographic analyses as well as in the study of material culture. Furthermore, at higher magnifications, some techniques are helpful to investigate manufacturing and wearing traces.

Visual Archaeology techniques – such as RTI (Reflectance Transformation Imaging), VRTI (Virtual-RTI), Photogrammetry, 2D/3D image reconstruction – are used to “read” surfaces in more detail than the naked eye. Thanks to these “digital” diagnostic approach, today it is possible to in-depth study inscribed, engraved worked or painted surfaces, made of clay, stone, bone, ivory, and metal. The observation of such traces using Visual Archaeology techniques helps, for example, to reconstruct and interpret texts, signs of writing and decorations as well as to understand how they were crafted and which tools were used, distinguishing voluntary and processing marks, and exploring the real sequence of artisanal gestures behind the artefact itself.

In this perspective, the main goals of the session are:

- offer a space for comparing different Visual Archaeology techniques in terms of developing various scientific intersections with other approaches (such as experimental archaeology, archaeometry, etc.), its cost-effectiveness, efficiency, light conditions, level of detail, magnifications and fieldwork, and discussing limitations and further potentiality;
- explore the possibility of applying these techniques to provide a renewed perspective in relation to the ancient artefacts and their crafting features and their function in order to define the best areas – distinguished by conservation status, degradation, presence of crafting traces, pigments, clay coatings, and patinas – on which indoor and outdoor microscale analyses can then be carried out.

ABSTRACTS

1 POTENTIALITY OF RTI AND HDR ON BRONZE AGE PHAISTOS “WRITING” SYSTEMS: THE PA-I-TO/PHAISTOS EPIGRAPHIC PROJECT

Giorgi, Lavinia (Sapienza University of Rome, Department of Classics) - Greco, Alessandro (Sapienza University of Rome, Department of Classics) - Lopez, Sara (Independent researcher)

The paper aims to show the potential of RTI and HDR applied on signs and marks engraved on hard media, such as clay and stone.

The case study is the writing evidence related to the important Cretan site of Phaistos during the Minoan and Mycenaean period (2nd millennium BC). The site has returned three different writing systems (Cretan Hieroglyphic, Linear A and Phaistos Disk) and examples of a non-scribal communication system (Masons’ marks).

The common element of these writings is that they are engraved on hard surfaces (clay and stone). For this reason, the computational photographic method of RTI can be effective because it applies well to objects that present irregularities on the surface. Moreover, RTI images highlight the way to engrave the signs and the tools used, allowing us to reconstruct the process of “writing” practice in terms of materiality and human action. Also, the use of HDR technology produces photos which, altering exposures and colours, can be useful for detecting surface changes and, particularly, palimpsests.

Currently, the pa-i-to/Phaistos Epigraphic Project is applying these techniques on Aegean writings for palaeographic and epigraphic purposes.

This paper wants to present some results achieved by the pa-i-to/Phaistos Epigraphic project applying RTI and HDR to Minoan and Mycenaean palaeography and the future research perspectives of the project.

2 EXPLORING MYCENAEAN KNAPPERS' TOOLKITS

Boitte, Odysseas (Université Paris 1 Panthéon-Sorbonne; UMR 7041 ArScAn Protohistoire égéenne) - Vargiolu, Roberto (Ecole Centrale de Lyon; UMR 5513 LTDS) - Vosges, Jérémie (UMR 5133 Archéorient) - Procopiou, Hara (Université Paris 1 Panthéon-Sorbonne; UMR 7041 ArScAn Protohistoire égéenne)

Our study aims to discern the tools employed by Mycenaean knappers (1600-1200 BC) for retouching stone arrowheads through pressure flaking. During the Mycenaean era, bronze metallurgy was widely acknowledged, providing two potential materials (copper and bronze) for the tips of pressure flaking tools in addition to deer antler.

Distinguishing between the use of deer antler and metal has been facilitated by specific macroscopic criteria, such as a small pressure point. However, they are not always visible. Our working hypothesis is that, in addition to these criteria, the resulting ripples vary according to the raw material of the tool.

To investigate this phenomenon, we initiated a collaborative experimental project. To accomplish this, a collection of 60 obsidian arrowheads was knapped by J. Vosges, incorporating diverse tools (20 with deer antler, 20 with copper, and 20 with bronze).

These projectile points were imprinted with silicone. In order to obtain the signature of the techniques employed, we will apply macro-scale surface measurements with a confocal rugosimeter and micro-scale ones with an interferometer. In order to characterize the surface signature the method of continuous wavelets transform (CWT) will be employed.

3 THE PORTRAIT OF KING SARGON II: 3D SCANNING, FILTERING AND COMPUTATIONAL IMAGING FOR SEMANTIC DATA EXTRACTION

Diara, Filippo (University of Turin - Historical Studies Department) - de Martino, Stefano (University of Turin - Historical Studies Department)

This research work, inscribed into the European Project ITSERR Italian Strengthening of ESFRI RI Resilience, is related to metric analyses from computational imaging and filtering of the 3D high resolution model of the portrait of King Sargon II. The limestone relief fragment (TO 10407, 89 cm in height and 52 in width), which portrays the Neo-Assyrian king (721-705 BC), is one of the masterpieces in the archaeological collection of Musei Reali in Torino. This relief comes from the ancient city of Dur-Sharrukin (Khorsabad) in northern Iraq that was founded by Sargon II and was his royal residence.

The fragment was 3D documented with Artec Space Spider structured-light scanner (50µm of point accuracy and 100µm of 3D resolution), obtaining a detailed mesh on which perform post-processing analyses for understanding nearly visible details as well as extracting semantic data: in fact, this fragment is a part of a bigger relief decoration coming from the royal palace but it has been detached and partially brushed for masking damages and cutting imperfections. Computational imaging analyses (Deviation analyses, MSII, virtual RTI) allowed non-invasive and precise metric investigations on decoration, unlocking new micrometric details useful for formulating updated hypotheses on decorative apparatus.

4 TECHNOLOGICAL INSIGHTS IN SOUTH ITALIAN RED-FIGURE POTTERY: NEW EVIDENCE FROM COMPUTATIONAL IMAGING AND EXPERIMENTAL ARCHAEOLOGY

Serino, Marco (Università degli Studi di Torino)

Crafting skills, artisanal technological procedures, and related phenomena of knowledge's transfer between craftspeople in antiquity can today be revealed observing signs on ancient artefact's surfaces. In this perspective, the case study of red-figure pottery production in Greece and Southern Italy – mostly painters – was investigated within the A.G.A.T.H.O.C.L.E.S. project, funded by the EU Commission within the framework of the Marie Skłodowska-Curie "Global" Fellowship, 2021–2024.

On the one hand, the RTI (Reflectance Transformation Imaging) allow us to detect various technological features invisible to the naked eye, i.e., different way of approaching the preliminary sketch, fingerprints, ways of applying milots (red ochre) on the vase's surface, sequence of different paintings, marks left by the different brushes, thickness of black gloss and the way it was applied, as well as the overpainting coatings.

On the other hand, experimental archaeological sessions can provide crucial "analogies" related to the technological features observed on vases' surface, allowing us to determinate the right sequence of artisanal gestures applied on these artefacts.

These data – related to the artisanal technology and the painter's gestures behind the entire crafting process – can significantly improve our knowledge on the artisanal ancient world and, in some way, re-humanize it. Together with stylistic, iconographic and morphological analyses, they can provide new clues of knowledge's transfer (and thus their

likely migratory movements) within some specific workshops (the whole ateliers or only painters) in Sicily and Campania, during the end of the fifth and the early fourth century BC.

This paper is also the occasion to debate about the methodological approaches that can be applied today to investigate crafting marks on surfaces, together with the efficiency and the profitable intersections between computational imaging, diagnostic techniques, and experimental archaeology as three sides of the same hermeneutic approach.

5 DIGITAL TECHNIQUES FOR ACQUIRING POTTERY SURFACES: COMPARING METHODS FOR ANALYSING TECHNOLOGICAL TRACES AND IMPRINTS ON EXPERIMENTAL REFERENCE COLLECTIONS

Previti, Giulia (Sapienza University of Rome, Department of Science of Antiquities, LTFAPA Laboratory) - Di Lello, Claudia (Sapienza University of Rome, Department of Science of Antiquities, LTFAPA Laboratory) - Lemorini, Cristina (Sapienza University of Rome, Department of Science of Antiquities, LTFAPA Laboratory)

This presentation discusses the development of protocols related to the study of technological traces and imprints on pottery by comparing different digital techniques at different scales, from macroscopic to mesoscopic.

Within the scope of experimental archaeology studies, pottery reference collections have been created, focusing on intangible and negative traces left on surfaces by plants, fabrics, corded objects, reed-like materials, tools, and finger impressions. To investigate these surfaces, which exhibit different elements (incisions, impressions, fingerprints, multi-tool treatments), various photogrammetric surveys have been conducted, resulting in 3D models of the surface. Through the three-dimensional reconstruction, we can identify traces, marks, or particularly interesting areas to investigate in a next step, at a microscopic scale.

To evaluate different digital acquisition techniques, we compared 3D models generated by means of standard photogrammetry by camera, photogrammetry performed with a macro lens and with a digital microscope and through a stereomicroscope.

The comparison of the models, led visually and with the aid of processing software, helped us to understand the level of detail and magnification achievable by every documentation method. At the same time, it was possible to reflect on the limitations and potential of each method, on the cost effectiveness, efficiency and usability in field work.

The photogrammetric models were compared with the Reflectance Transformation Imaging (RTI) technique to explore the utility of visual-related techniques for the initial assessment of surfaces.

6 THE DARK SIDE OF PHARMACY JARS: THREE-DIMENSIONALITY AND PHOTOGRAMMETRY OF THE POTTERY OF THE GORGA COLLECTION (SAPIENZA, UNIVERSITY OF ROME)

Cymerman Abad, Adriana (Sapienza, Università di Roma)

The work presented, carried out within the project for the digitalization of cultural heritage of the University of Rome "La Sapienza" Museum Pole, falls within the innovative approaches of Virtual Archaeology and the study of macro-traces.

In order to analyze the internal traces left during the turning process, the SFM (Structure For Motion) system was applied, thus obtaining a three-dimensional photogrammetric model of the interior of semi-closed ceramic artifacts.

In particular, the project focused on the three-dimensional digitalization of pharmacy pottery from the Gorga Collection, preserved at the Sapienza Museum of History of Medicine, which amounted to about 700 pieces.

These artifacts have challenged the techniques of the 3D documentation process of their internal profiles, allowing for a critical evaluation of the results obtained on the reliability of the digital model. The average dimensions and the sinuous hourglass shape, which tapers down to a diameter of 6 cm, have been successfully overcome thanks to the innovative application of the photogrammetric method.

7 "THE TRACK SEEN WITH POLYCAM". A COMPARISON OF SFM SOFTWARE FOR 3D MACRO-TRACES CAPTURE IN THE HOLY SEPULCHRE (JERUSALEM)

Vacatello, Federica (Sapienza University of Rome) - Melega, Alessandro (Sapienza Università di Roma)

The introduced contribution means to propose a compared analysis between the software SFM (Structure From Motion) Agisoft Metashape and Polycam for the seen visualization of the macros traces on the materials from the contexts of the archaeological excavation at the Basilica of the Holy Sepulchre in Jerusalem. The exceptionality of the site and the need to make a high level digital documentation, in a short time and specific for the reproduction in virtual reality, not only for each single stratigraphic context, but also of the materials and of the macros traces on them (manufacture of the stone, decoration, etc..), had impose the experimentation of different method of documentation able to reproduce an accurate digital twin, useful to the worksites' needs with times of an emergency dig. For those

reasons, the photogrammetry comes as the most useful solution for those kinds of needs. Now the algorithms SFM to the base of the proprietary software and Open Source became more educated for the making of mesh sufficiently accurate, to consent the visualization of the macros traces that are not perceivable to the human eye. Otherwise, some of them resulted more performing for the 3D a fast capture and a mesh with high resolution. A compare between the results achieved from Agisoft Metashape and the one taken from Polycam, open the possibility to news specific operating protocols specific for the 3D capture of the macro, and offers an investigation direction towards the writing of algorithms proposed to a visualization also for the micro, more performing.

8 VISUAL ARCHAEOLOGY TECHNIQUES TO ELICIT THE HISTORICAL GRAFFITI IN SAINT SOPHIA CATHEDRAL

Almevik, Gunnar (University of Gothenburg) - Westin, Jonathan (University of Gothenburg)

Carved into the walls of the Saint Sophia Cathedral in Kyiv are more than 7,000 inscriptions that span over a thousand years and follow different language and writing systems. The historical graffiti is carved in frescoes and architectural stone elements and constitute a source of knowledge about religious practice, language, trade, and cultural exchange and diversity in Europe. Saint Sophia Cathedral is a world heritage with universal values and a source material for various disciplines and fields of research that, with Russia's warfare against Ukraine, is under acute threat. To safeguard this cultural heritage and source for future research, a project collaboration between Ukraine and Sweden has been initiated aiming to document the inscriptions and publish the data through an online portal.

To collect the necessary raw data, the project applied a series of laser and image-based techniques as well as custom-made topography visualisation software to visually enhance the fine line inscriptions. The cathedral's interior has been scanned with laser to contextualise the inscriptions, and all fresco panels and stone elements with graffiti have been documented with high resolution photography for Reflectance Transformation Imaging (RTI) and photogrammetry through Structure from Motion (SfM). Selected parts are also documented with White Light Scanning (WLS). The techniques and work procedures have been assessed both in relation to the data they need to accurately capture, and their capacity and efficiency when applied to documenting this extensive material. In developing the online portal, a focus group of researchers have assessed the quality of the documentation and proposed requirements for the design of the database and the tools through which to analyse the visual data.

This paper presents the project, and we have a keen interest to get feedback on the work and to discuss the possibilities, limitations and situated considerations for Visual Archaeology techniques.

9 "THE NINE MEN'S MORRIS IS FILLED UP WITH MUD": MATERIAL TRACES OF PLAY AT THE PRIGIONE DEL CASTELLO, NOTO ANTICA

Anthony, Alexander (Syracuse University)

The medieval city of Noto Antica, Sicily, which rests on a plateau that has been continuously occupied since the 9th-century B.C., was completely destroyed by a devastating earthquake in 1693. In 2023, a digital mapping project was undertaken of the two rooms associated with the Prigione del Castello within "Ancient Noto". Utilizing a process of Structure-from-Motion photogrammetry a 3D surrogate of the site was created which was then imported into Blender 4.0 in order to manipulate lighting and animation effects of the model. Through the development of digital methods of material culture analysis in this open-access program multiple pieces of graffiti have been identified throughout one of the rooms of the castle prison. While a complete inventory is still underway, at least five gameboards used for Nine-Men's-Morris, among other names, have been identified on horizontal surfaces throughout the room.

This concentration of gameboards found within a site of confinement still under the ancien regime offers a unique case study in which to discuss the changing structures of discipline in the Early Modern world and the significance and potential meaning of play in these environments. Far from being merely a trivial past-time, play creates material places that become nodes of meaningful social interaction, a structured environment in which to alleviate interpersonal tensions, and a way to 'oppose' the erasure of humanity while in captivity. The current paper presents an examination of the evidence within the framework of play in the archaeological past.

10 UNVEILING THE HIDDEN STORIES: THE IMPACT OF DIGITAL TECHNOLOGIES ON MEDIEVAL EPIGRAPHIC RESEARCH

Luci, Beatrice (Sapienza - Università di Roma)

The inscriptions tell a double story, that of the text and that of the production of the object itself. For this reason the inscribed texts must be studied not only for their textual value, but also for their material value.

Considering this dual nature of the inscriptions, during PhD research has been applied and tested digital technologies to improve the textual and material knowledge of artifacts.

In fact, inscriptions are often irremovable and in urbanized contexts and therefore require some logistical precautions. The only way to be able to analyze the artefact in detail is therefore often through the exclusive use of digital technologies that can adapt to different types of context.

The aim of this article is to explore the advantages and limitations of applying photogrammetry and RTI to selected case studies of medieval epigraphy. Photogrammetry will be applied to investigate aspects of the production cycle (such as the study of traces) while RTI will be applied to integrate the epigraphic texts, with related decorative devices, whose reading is compromised or difficult for various reasons.

11 FROM THE DIGITAL SURVEY OF HISTORIC BUILDINGS TO THE TRACES OF CONSTRUCTION SITES: SOME CASE STUDIES OF THE MIDDLE AGES

Moschetto, Francesco (Sapienza University of Rome, Department of science of antiquity)

The aim of this contribution is to show the potential of the use of high-resolution three-dimensional surveys for the identification of traces on the stone of some architectural artifacts. On some sample sites of Norman-Swabian age placed between Lazio and Abruzzo, a specific procedure of digital acquisition of historical artifacts was used that could assist and enhance the analysis with the naked eye on the field. To a first phase of three-dimensional survey of structures through different techniques such as laser scanner, aerial and terrestrial photogrammetry with different sensors, followed the data processing phase based on a series of deliberate choices to maintain the resolution and accuracy of the different parts of the model. During the processing of the data, particular attention was given to the geometric optimization of the models and to the resolution and number of the textures in order to obtain a high-detail 3d model to be used in the subsequent analysis and extraction of elaborate 2d derivatives. In addition, the use of the drone (UAV) as a photogrammetric dataset acquisition tool, allowed to extend the investigation to all the architectural artifact by including portions of walls placed very high and not reachable by ground analysis. This workflow, therefore, aims to test how much a set of high-resolution superimposed orthoimages in pixel-to-pixel accuracy is able to detect work techniques and damages. In this sense, research should be considered as a preliminary assessment of the effectiveness of such three-dimensional acquisition and visualization techniques and a possible starting point for further Investigations, perhaps of a microscopic type, on the stone elements of architectural artifacts.

12 PHOTOGRAMMETRIC DOCUMENTATION AND VIRTUAL IMAGE ANALYSIS OF THE HISTORIC MARITIM GRAFFITI OF THE SANTA BÁRBARA WALL IN PEÑÍSCOLA (SPAIN)

Lerma, José (Universitat Politècnica de València) - Rahrig, Max (Universitat Politècnica de València) - Patrucco, Giacomo (Politecnico di Torino) - Zurita, José (Museu de la Mar)

On the wall of Santa Bárbara, located between the New and the Prince's Bastions close to the cliff in the eastern part of the historic centre of Peñíscola, some graffiti relating to nautical themes were discovered in 1993. The graffiti can be found on two sections of a wall, one next to the 'Museu de la Mar' with a length of 22 m and the other next to the Baluarte Nuevo with a length of 11 m. They are arranged horizontally at different heights between 0.40 m and 0.70 m, forming a group of approx. 75 figures depicting ship motifs scratched on lime plaster along the outer face of the wall. They belong to ship models dating mainly from the 18th and 19th centuries. The first study was conducted in 1996 by technicians from the Archaeological and Prehistoric Research Service of the Provincial Government of Castellón.

In 2022, it was possible to document the graffiti again using close-range photogrammetry and terrestrial laser scanning. High-resolution orthoimages were extracted from the 3D data, and image analysis was carried out using principal component analysis (PCA) and hybrid image analysis. The graffiti were traced and mapped for further investigation based on these image-sets, revealing additional ships and further nautical motifs.

This paper presents the workflow for the documentation and image analysis of the Santa Bárbara graffiti.

860 GOING WITH THE FLOW: THE MANY FACETS OF GLASS IN PAST SOCIETIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Franjic, Ana (KU Leuven) - Nash, Charlotte (British Museum; University of Kent) - Penn, Timothy (University of Oxford; University of Reading) - Rosenow, Daniela (Griffith Institute, University of Oxford) - Rolland, Joëlle (CNRS, UMR 8215 Trajectoires)

Session format: Regular session

This session is dedicated to the multifaceted evolution of glass use in past societies. Its key aim is to encourage speakers to take a closer look at the transmutable quality of this material, gathered – pun intended – at the intersection of utility and prestige, politics and spirituality, economy and cultural identity. Since its discovery, glass has served both practical and more complex, culturally inflected purposes. Its versatility, malleability, recyclability, and other physical characteristics allowed it to play many different roles in shaping the lived experiences of past societies: from apot-

ropaic eye beads and everyday glassware to stained glass windows and telescope lenses offering links to the heavens. The diverse dimensions of glass use reflect the changing needs and aspirations of past peoples, and even today, glass continues to adapt, shape, and reflect distinct facets of contemporary societies.

We invite contributions that consider varied aspects of glass use and its meanings for past societies. We are particularly interested in research that reflects on the role of glass in the shaping of social structures, and investigates how glass was used to express cultural, religious, and aesthetic values. Furthermore, we encourage submissions that trace the impact of technological advancements, changing political landscapes, power dynamics, and cultural transformations on the changes in glass use, as well as the transitions in the meaning ascribed to glass. This session will bring together researchers working across different periods, themes, and aspects of ancient glass, in order to encourage a greater understanding of historical, economic, cultural, and symbolic significance of this exquisite material, among both specialists and the broader archaeological community.

ABSTRACTS

1 GLASS VESSELS IN MYCENAEAN GREECE: MANUFACTURE, PROVENANCE AND THEIR FUNCTION IN CONTEXT

Nikita, Kalliopi (Hellenic Ministry of Culture, Ephorate of Antiquities of East Attica)

The current paper presents and discusses the occurrence of glass vessels in Mycenaean Greece through published evidence from cemetery sites in the Peloponnese. In the first place, a definition of this distinctive category of glass artefacts with an overview of their main types is provided on the basis of their manufacturing techniques. Glass vessels are not included amongst the typical artefacts produced by the thriving Mycenaean glass industry, which was orientated primarily to glass-bead making. Taking into consideration that glass vessels are characteristic products of alien glass industries, their provenance is explored within the network of external relations of the Peloponnese with the Eastern Mediterranean and the Near East during the Late Bronze Age. Their rarity and uneven geographical and chronological distribution in Mycenaean Greece are discussed in conjunction with the occurrence of glass vessels outside the Peloponnese, in regions such as Boeotia, Crete, Rhodes and in distant Mycenaean sites on Cyprus. The paper also examines the role of glass in gift exchange and diplomatic relations in the Late Bronze Age. Given that Late Bronze Age glass vessels, as in the case of glass minor objects in general, are principally found in burial contexts mostly associated with luxuries and exotica, the paper aims to explain their function in relation to their burial deposition, their possible symbolic attributes and the social status of the dead.

2 THE BLUE OF BARBARIANS: GLASS ORNAMENTS AS MIRROR OF IDENTITIES IN LA TÈNE SOCIETIES

Rolland, Joëlle (CNRS, UMR 8215 Trajectoires)

When the societies of La Tène began to produce glass objects in the 5th century BC, they did so exclusively to produce ornaments that reflected their stylistic and symbolic codes. By reconstructing the various processes involved in the production of these glass beads and bracelets, it is now possible to see the technical evolution of production and identify the typological changes associated with the skills of the craftsmen. At the same time, however, it is also possible to recognise the limitation of these skills, which may be due to economic or stylistic choices. This article aims to examine the place of glass in La Tène societies by looking at the elements of identity it was supposed to reflect. What symbolism is associated with these objects, their shapes and colours? What stylistic or symbolic choices shape their production? Prestigious ornaments in a "barbaric blue", with designs that symbolise identity... the technical and social study of these objects has recently brought to light many elements about the values and role of glass as a social and cultural marker, as a reflection of individuals and societies in evolution.

3 TRANSPARENT TIMES - GLASS VESSEL FRAGMENTS FOUND AT TAYMA (ARABIAN PENINSULA)

Seifert, Antonia (Freie Universität Berlin)

The excavations at the oasis and ancient settlement of Tayma (Saudi Arabia), amid the ancient incense trade route, revealed numerous prestige goods such as metals, incense, and glass. Of over 180 glass fragments found in late Iron Age to Islamic contexts, 101 are the focus of the investigation, which aims to identify their provenance. Were these locally produced glasses, or were they acquired through supra-regional trade networks?

The presence of glass in Tayma for several centuries, both in residential and public contexts, has led to various interpretations of the objects. In this regard, the place and time of deposition of glass fragments will be analyzed by placing them within their archaeological framework, including stratigraphic context, distribution, and chronological classification. For the archaeometric investigation, the non-destructive portable energy-dispersive X-ray fluores-

cence analysis (p-ED-RF) was employed. All 101 glass fragments underwent chemical characterization to assess their composition and production techniques. The combination of archaeological and chemical classification allows the interpretation of the glass fragments as common commodities, material versus exchange value, and prestige goods.

The acquired data sets the stage for an area frequently demonstrated as an intersection in the commerce paths between major entities. However, this area provides implications for understanding the distribution and trade of glass artifacts across Egypt, Mesopotamia, the Mediterranean, and the Arabian Peninsula.

4 TRANSFORMATION OF THE ROMAN GLASS PRODUCTION - CASE STUDY ROMULA-SLOVENIA

Lazar, Irena (University of Primorska, Unesco Chair)

From the end of the 1st century BC through the 1st century AD the Roman glass production faced significant changes in technology, production and trade. On the example of the Roman road and customs station Romula in Slovenia (the Roman province of Pannonia) we would like to present these changes. We would present and compare the finds from the settlement, including mould-made mosaic, coloured and decolourised glass, imported mould-blown objects (Ennon beakers) as well as a wide range of free-blown glass (including a Sentia Secunda bottle from Aquileia) for everyday use.

All these find can be compared with the glass discovered in necropolises of the site, which reflects the use of glass as a grave good. There are important differences observed on these two groups of glass on the site, regarding the quality and dating of the glass items. Archaeometric analysis of the glass from the site was also made and will be mentioned.

5 ROMAN GLASS INSTRUMENTS FOR MEASURING LIQUID CAPACITY

Perovic, Šime (Museum of ancient glass in Zadar)

This paper deals with Roman square bottles housed in the Museum of Ancient Glass in Zadar. They were used primarily for commercial needs of transport or to sell liquids in retail. There are two ways of production of these vessels: free blowing and then pressing on the flat surface or by blowing in open molds which enables getting many regular and uniform shapes.

In our analysis we paid attention only to products made in open molds including several unpublished specimens. Precise analysis of their capacity enabled identification of a series of bottles and some other shapes with square bodies which had various dimensions but always with regular proportions of capacity which are parts or multiplicands of one another.

All these finds which are dated to the 1st and 2nd centuries AD have common characteristics such as capacity corresponding to classification of Roman hollow measures, thick walls and sturdy production, and other morphological particularities such as specifically flattened rim, wide ribbed handle, pronounced shoulder etc. These particularities in design which distinguish them from other similar forms indicate that there was standardized packing in the Roman period which could be used as a measuring instrument for liquid capacity.

It seems to us that the methodology of fine volume calibration can be recognized especially in the way the shoulder bend is performed, which compensates for errors in achieving the precise measurements of the item, that can occur during the process of glassworking.

The use of glass objects in this context of measuring devices should therefore be seen as a set of changes that occurred in Roman times in the perception of glass in general, primarily in terms of the exceptional expansion of the fields in which it is used, but also in the area of improving glass processing techniques.

6 THE SIGNIFICANCE OF USING GLASS IN EARLY ROMAN AQUINCUM

Kelemen, Zsófia (Budapest History Museum; Eötvös Loránd University)

The custom of using glass vessels arrived in the area that later became Pannonia in the first century with the conquering Romans. As Aquincum is located in the north-eastern part of the province, and had been integrated into the Empire only in the last stage of the conquest, it would be easy to assume that it would take time to adapt these new habits. Yet we found glass debris even in the earliest layers of the settlement complex. Not just in the newly founded parts, like e.g. the Civil town, but also in the the so called Víziváros settlement, which was already in use by the indigenous celts. This would suggest, that not only the new settlers brought their vessels with them, but the original inhabitants were also eager to use them. However, this need could be only supplied via trade, at least in the beginning, but it did not deter the consumers. With the evaluation of the finds we see common vessel types for everyday use, but unique luxury pieces, too. This indicates, that however fast was the integration of glass ware into the life of Aquincum's inhabitants, the vessels could also indicate the identity and social standing of its owner.

In this lecture I'd like to present case studies from different parts of the settlement to highlight the multilayered significance of the vitreous finds of early Aquincum.

7 LATE ROMAN GLASS WEIGHTS FROM LAODICEA AD LYCUM

Inceelgil, Yasemin (Pamukkale University)

Laodikeia ad Lycum, located 6 km north of Denizli province in Southwest Turkey, has been one of the most important political, commercial, and religious centres of ancient Anatolia and especially the Phrygian region since the 3rd century BC. After the heyday of the Roman Empire, the city managed to maintain its political and economic power during Early Christianity. It is well known that Laodikeia hosted one of the seven privileged Christian communities named in the Book of Revelation in the New Testament. A monumental and central church -known as the Laodikeia Church- was built in the public center of the city during the 4th centuries A.D. and has been a focal point until the abandonment of the city as a result of a major earthquake at the beginning of the 7th century AD.

This presentation aims to evaluate the disc-shaped glass weights, which constitute a very rare finding group unearthed in Laodikeia. This type of object which became popular, especially in the Late Antiquity appeared in a wide distribution area. They were used to determine the weights of delicate products as well as coins.

The disc-shaped glass weights of Laodicea have been unearthed in two different findspots: Two of them are from shops adjacent to the Syrian Street i.e. the decumanus of the city. On the other hand, two examples with busts of administrators and important depictions related to Christianity have been found during the work carried out in the Laodikeia Church, within the debris of the church on Eastern Street. They draw attention in terms of the industry they are affiliated with. These examples should be considered as indication of the role that the church/the religious organization plays in economic activities and they emphasize the influence of the Empire on the control of commercial activities.

8 GLASS IN THE CONTEXT OF THE ANCIENT IADER NECROPOLIS

Eterovic Borzic, Anamarija (Museum of Ancient Glass in Zadar)

This study focuses on a contextual analysis of glass found in graves from the ancient Iader necropolis (present-day Zadar), one of the best-known necropolises in Roman Dalmatia. The analysis covers more than two thousand graves, comprising different types with both burial rites (inhumation and cremation) and dating from the 1st to 5th century AD. A large amount of glass was found in them, especially in graves with cremated individuals dating from the 1st to 3rd century AD. Using a multidisciplinary approach, the research examines the role of glass objects within Roman funerary practices, social structures, and belief systems. By examining the typology, distribution, and symbolic meaning of glass artifacts, this analysis aims to decipher the cultural and socio-economic contexts in which they were deposited in the tombs. In addition, the study examines trade networks that facilitated the circulation of Roman glass and the connections of Roman Iader with the wider Mediterranean basin.

9 MYTHOLOGICAL DEPICTIONS ON ROMAN GLASS FROM THE EASTERN ADRIATIC

Štefanac, Berislav (Museum of Ancient Glass in Zadar)

Along the eastern coast of the Adriatic Sea, a variety of glass artifacts with cult and mythological features have been discovered that shed light on the cultural and religious customs of the ancient Romans in the area of the former province of Dalmatia. These glass items served not only practical purposes, but also had symbolic significance associated with various cults and mythological beliefs prevalent in the ancient period.

During the 1st century, Roman glass production experienced a significant boom, as evidenced by many archaeological finds from Roman colonies such as Jadera, Salona and Narona. This period was marked by the fruitful development of the aesthetic and creative component of glassmaking. The master glassmakers of that time found their place in the creation of glasses and bottles with embossed and engraved decorations inspired by characters from Greek and Roman mythology.

The paper particularly emphasizes the connection of glass artifacts with the cult of Dionysus and with other eastern deities. By examining the symbolism, iconography, and cultural contexts surrounding these artifacts, researchers can gain a deeper understanding of ancient religious traditions and their significance in society.

10 PLAYING AT (DEMI-)GOD: HERCULES' CLUB, MOULD-BLOWN GLASS, AND SENSORY EXPERIENCES IN THE ROMAN EMPIRE

Penn, Tim (University of Reading)

Roman glass studies are dominated by considerations around typology, production techniques and glass compositional analysis. The approaches provide important insights into the Roman glass industry and the circulation of vitreous materials in antiquity. However, there is room to do more to explore the cultural and social significance of glass in Roman society. This paper takes as its case study a class of early imperial mould-blown beaker known by many names today—bossed, lotus-bud, amygdaloid, teardrop, pineapple, and finally club beakers. I argue that a host of evidence in other media suggests that the beakers are most likely to represent Hercules' club and thereby served as a means

through which mortals could symbolically take on hero's most prominent attribute and therefore emulate or embody this demi-god. In this contribution I identify these vessels, contextualize them among classical depictions of Hercules and his club—especially in relation to the deity's role as a drunken reveller, competing with the likes of Dionysus and Silenus—and consider their symbolic meaning. I then explore the use of these vessels as humorous set pieces within the Roman dining tradition, allowing diners to emulate Hercules with regard to his mythic alcohol tolerance, and investigate some practical considerations regarding their use, including sensory perceptions.

11 THE MANY LIVES OF BLACK GLASS: LATE ANTIQUE AND MEDIEVAL BLACK-GLASS BANGLES IN IBERIA

Govantes Edwards, David (Universidad de Córdoba)

Black glass bangles are a fairly common find in late antique and medieval archaeological contexts in the Iberian Peninsula and in the Mediterranean and the European continent more broadly, and they have been interpreted from a variety of perspectives. Through the chemical analysis of a number of these bangles found in Spain and Portugal, the presentation aims to explore differences in technology and raw materials over time. In addition, chemical composition, in combination with other archaeological and historical evidence, will be used to explore differences in the value assigned to these bangles in various cultural settings. From the apparent attempts to imitate jet and other semi-precious stones in specialised workshops during the Late Roman period in the northwest of the Iberian Peninsula; to the seemingly apotropaic properties associated to heavily-recycled glass in Islamicate al-Andalus and also in the Christian territories to the north, where these bangles are often found in graves of children and women.

12 MATERIAL AND TECHNOLOGY OF EARLY MEDIEVAL (7TH-9TH CENTURY AD) GLASS BEADS IN THE CARPATHIAN BASIN

Bajnóczi, Bernadett (HUN-REN Research Centre for Astronomy and Earth Sciences) - Fülöp, Réka (Hungarian National Museum) - Schibille, Nadine (Institut de Recherche sur Les Archéomatériaux, Centre Ernest-Babelon (IRAMAT-CEB), UMR7065, CNRS/Université D'Orléans) - Szenthe, Gergely (Hungarian National Museum)

The entire Avar period (late 6th–early 9th century AD) in the Carpathian Basin was characterised by a diverse assemblage of glass beads in graves. However, there are several differences between Early and Late Avar bead wearing. The first half of the Avar period (late 6th–early 7th century) is characterised by shorter strings of more colourful beads and eye beads were one of the most popular bead types, whereas in the late Avar period (late 7th–early 9th century) new bead types appeared (e.g., melon-shaped, amphora-shaped), bead strings became longer, brighter colours were replaced by darker shades and various technological solutions were introduced. The aims of our analyses is to demonstrate if there were any changes in the material of the beads as well as to examine the factors responsible for the significant changes.

Early Avar-period glass beads from the Carpathian Basin were formerly extensively studied, however, Late Avar-period beads received little attention. To reveal the innovative beadmaking techniques and other specific technologies, such as copper metal tubes in thread holes and 'hair effect' decorations, used in the late Avar period, we studied bead strings from 172 graves from 12 archaeological sites in the Carpathian Basin. Additionally, to expand our knowledge on glass recipes and coloring technologies of the Early Medieval period (glass raw materials, colorants, opacifiers), we analysed fifty-eight Late Avar-period beads of various forms and colours, in addition to fifteen Early Avar-period beads, by SEM-EDX and LA-ICP-MS methods.

13 ISLAMIC PLANT-ASH GLASS TRADE AND RECYCLING IN THE EASTERN SILK ROADS: NEW INSIGHT FROM NISHAPUR, IRAN

Lu, Qin-Qin (University of Cambridge)

Islamic plant-ash glass (circa 9th–15th century) was extensively traded along the Silk Roads, and its use and reuse offer insights into the inter-regional connectivity and local material culture development in medieval Eurasia. Research on plant-ash glass has largely focused on evidence from the Near East, while the role of various plant-ash glasses in the eastern Silk Road societies, including Iran, Central Asia, and Xinjiang (China), is not well understood. This paper presents our ongoing research progress on Islamic plant-ash glass in the eastern Silk Roads, in particular focusing on an 11th–12th century assemblage unearthed in Shadyakh, Nishapur, Iran, suggesting diverse origins for the glass artefacts and potential recycling practices. An integrative approach for plant-ash glass provenance is employed, which incorporates chemical composition, Sr and Nd isotopes, Nd isotope mixing lines, and Sr-Nd isotope baselines. Chemical and isotopic compositional signatures reveal provenance and trade relations, while the Nd isotope mixing line may capture the dynamics of the mixing process in glass recycling. The results suggest that trade brought glass from Iraq, Syria, Central Asia, and potentially Iran to Shadyakh for consumption, showing that both eastward and westward flows of glass products occurred and that utilitarian glass was traded across distances. Within many of the analysed

assemblages from the eastern Silk Roads, glasses with compositional signatures of Central Asia, the Tigris-Euphrates River Basin, and possibly Iran are often found in the same context, implying a common trade network for glasses with different origins, designs, and functions. It is plausible that trade hubs such as Nishapur and other major metropolises, where various types of glass were gathered, traded, and sometimes reworked, facilitated the “mix and match” of diverse glasses along this major trade artery. (DOI: 10.1016/j.jas.2022.105695 ; 10.1016/j.isci.2023.108450)

14 WINDOW GLASS IN SACRAL SPACES FROM LATE ANTIQUITY TO THE MIDDLE AGES: STATE OF RESEARCH ALONG THE EASTERN ADRIATIC COAST

Jovic Gazic, Vedrana (Museum of Ancient Glass in Zadar, Croatia)

Due to the nature of the material susceptible to breakage even in the most favorable storage conditions, direct confirmations of window glazing in buildings of ancient origin are quite modest. The glass panes are regularly found in pieces and the recognition of the fragments as window glass is often very difficult. The context of the finds is of great importance, so are the traces of the technological process characteristic of the window glass production that can be recognized on the glass fragment surface or in its inner structure.

The aim of this lecture proposal is to present the historic window glass used in sacral architectural context along the eastern Adriatic coast, particularly in the area of Dalmatian region, from Late Antiquity to Late Middle Ages (from 5th to 15th century). The focus is on the material traces of the window glazing of early Christian basilicas, churches and medieval cathedrals on the basis of which the characteristics of the practical use in original architectural environment and the reflections of such practice in social context will be presented.

The archaeological sites considered in the area are situated outside the urban centres (e.g. Podvršje near Zadar, Bilice near Šibenik, Brzet near Omiš...), inside the historic centres with urban discontinuity in the Middle Ages (Salona, Narona) and in urban centres typical of the Dalmatian medieval communes with origins dating back in Antiquity and Late Antiquity (Zadar, Trogir, Split, Dubrovnik...). The secondary material evidence of glazing – the elements of window-pane framing, metal and wooden holders or the pieces of transennae, found in the considered archaeological sites will also contribute to the interpretation of the window glazing practice on the eastern Adriatic coast.

15 THE RELIGIOUS, CULTURAL AND AESTHETIC VALUES OF GLAZING IN ENGLISH MEDIEVAL MONASTERIES

Stone, Bronwen (University of Sheffield; Historic England) - Gherardi, Francesca (Historic England) - Merrony, Colin (University of Sheffield) - Paynter, Sarah (Historic England) - Tyson, Rachel (c/o Historic England) - Jackson, Caroline (University of Sheffield)

Around 1000 monasteries were built in England during the medieval period. From the C12th century these were soaring, gothic structures with the structural strength to carry expansive glazing. This provided not only light in the practical sense, but an ethereal light that enhanced the spiritual atmosphere and which was seen most conspicuously in the monastic church. The excavated glass reviewed originates from seven monasteries in England of two distinct orders, Benedictine and Cistercian. The glass is available to study because of the mid C16th Dissolution of the Monasteries when monastic windows were dismantled to recover the lead strips that held the glass pieces together.

Many windows were highly decorated, primarily with biblical scenes, using coloured glass and painted panes to create glazing schemes that were decoratively very complex and which used colours often in a symbolic manner: the yellow of a halo or the Virgin blue. In contrast, other windows employed a restrained palette and range of motifs to reflect religious dictates, fashion or parsimony. The glass used to glaze these monastic buildings is known from documentary evidence to have been procured from the continent, particularly from France. However, an English glassmaking industry was developing during the C13th and may have also been used to glaze these windows.

In this study, the results of investigations into both stylistic imagery and chemical analysis, indicating dates and provenance, are used to elucidate the complex nature of the use of glazing in a monastic setting in medieval England. This paper examines the aesthetic, cultural and religious values of monastic glazing, using examples from the ongoing research into the origins and use of English monastic window glass.

16 GLAZED TOWNSCAPE – GLASS WINDOWS IN MEDIEVAL TALLINN, ESTONIA

Reppo, Monika (Tallinn University)

Although with a far longer history in the rest of Europe, windows were first glazed in Estonia only by the end of the Livonian Crusades (1198–1227). The local use of glazed windows has not been studied thoroughly – for example, the oldest glass window is currently unidentified. The oldest preserved stained glass window is a crest from 1606 kept in the Church of the Holy Spirit in Tallinn, no longer in situ. As no medieval windows are known to have been preserved, and the oldest depiction of Tallinn hails from 1561, written sources and archaeological finds are the only way to study the use of window glass in medieval Tallinn. With the discovery of a 15th-century landfill where window and stained

glass fragments constitute for 80% of the glass artefacts and data collected from 2013–2024 from other archaeological collections, it has been possible to trace the use of window glass in medieval Tallinn. From urban residences and other secular buildings such as the Town Hall and Town Hall Pharmacy to churches and chapels, this paper examines the changing townscape and relationship with daylight through glazed windows and the work of glaziers in 13th–15th-century Tallinn.

861 INSECTS FOR ARCHAEOLOGY, ARCHAEOLOGY FOR INSECTS: ENVIRONMENTAL STORYTELLINGS FOR THE PAST, PRESENT, AND FUTURE

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Kourela, Eva (University College Dublin) - Shen, Benny (Department of Archaeology, University of Cambridge) - Vanin, Stefano (University of Genoa IAS-CNR) - Davis, Stephen (University College Dublin)

Session format: Regular session

Insects are by far the most diverse organisms on Earth, with many ecological adaptations and interactions. Their ubiquity and fundamental roles in the functional ecology of most terrestrial ecosystems across the planet are reflected in totemic representations, tropes, and knowledge systems of human societies today and throughout history. In the archaeological record, insect remains may serve as environmental indicators and agents of bioturbation, while also offering valuable insights into health and sanitation, past climate change, biogeography, funerary and agricultural practices, rituals, and folklore.

Archaeoentomology, funerary entomology, and other archaeological and anthropological approaches to past human-insect interactions consider insects both as silent witnesses to past activities and as active contributors informing ongoing environmental and social changes. These two views are not contradictory. Instead, they highlight the importance of revealing the intricate relationships between insects, human societies, and the broader environment in *longue durée*. Such understandings may inspire management and adaptation strategies in an era already facing diverse eco-entomological challenges, such as pollinator deficit, biodiversity decline, pathogen control, and global food security.

Echoing the insights from the forthcoming special issue of *Archaeological Review from Cambridge* (39.1) titled “Human-Insect Entanglement: Past, Present and Future” co-edited by some of the organisers, this session invites interdisciplinary contributions related to the themes of temporal and environmental (*sensu lato*) change, funerary archaeoentomology, cultural entomology, and beyond. These contributions aim to unravel the rich environmental stories woven together with these often underestimated agents in our shared history.

This session is the result of collaborative efforts from three separate proposals exploring various aspects of the field. We would like to acknowledge the contributions of the following colleagues: Rachel Brody (Boston College), Nynke Blömer (University of Cambridge), Jake Stone (University of Cambridge), Jeremy Farr (CSIRO; University of Queensland), Jean-Bernard Huchet (CNRS), Nick Schafstall (Czech University of Life Sciences), and Nicki Whitehouse (University of Glasgow).

ABSTRACTS

1 THE HOLE, THE BIRD, AND THE LARVAE: TRANSCENDENTAL TERRAINS IN THE MUNDANITY OF THE !XAM MYTH ‘MANTIS AND THE KORO-TWI:TƏN’

Mguni, Siyakha (University of Cape Town)

Insect biota contributed significant proportions of the foods gathered by the 19th century !xam Bushmen in the Nama-Karoo biome of South Africa’s interior plateau. Judging by the expansive collection of accounts in the Bleek and Lloyd archives the most pervasive insect form is arguably ‘larvae’ and ‘eggs’—of which two types were distinguished in !xam language, !hakən and ||xe:—generally called ‘Bushman rice’ in the colonial period writings. Generally speaking, in line with all culturally valued biological forms within San nomenclatures, it is evident that certain insect categories in hunter-gatherer cognitions were afforded more significance than others. Rationales for cultural selections vary considerably, however, with food merits normally being foremost. Yet these two insect forms were distinctly recognised in those environs for considerations outside their dietary or gastronomic endowments. Exploring the !xam myth titled, ‘Mantis and the Koro-twi:tən’, this paper argues that while the account focuses on the sustainable harvesting of a highly delectable insect form using shared forager technologies and methods, it features a dialogic background that unveils concealed terrains of phenomenological awareness and transcendental realities that permeated the !xam world of experience. Notably, the narrative depth and detail reveal the magnitude of the !xam interlocutor’s complex cultural information.

2 ASSESSMENT OF THE VARIATION IN LAND USE THROUGH ARCHAEOENTOMOLOGICAL STUDIES

Carta, Giuseppina (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa) - Lar-entis, Omar (Centre of Research in Osteoarchaeology and Paleopathology Department of Biotechnologies and Life Science, Insubria University; Soprintendenza Archeologia Belle Arti e Paesaggio per le province di Como, Lecco, Monza-Brianza, Sondrio, Pavia e Varese, MiC) - Leto, Alessandro (Pian di Marte) - Badano, Davide (Department of Life Science, University of Siena) - Vanin, Stefano (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa; National Research Council, Institute for the Study of Anthropic Impact and Sustainability in the Marine Environment (CNR-IAS), Italy)

Archaeoentomology is an interdisciplinary discipline that focus on insect remains from archaeological contexts, providing a further level of understanding of the interactions between humans and environment in an historical perspective. Focusing on this aspect, the study here presented aims to analyse the variation in land use through a detailed analysis of insects found in the archaeological context, comparing them with contemporary samplings. The study, started in 2022, was carried out in "Pieve of San Cristoforo" church situated in Pian di Marte (Umbria) in Central Italy.

Five hypogean crypts (XVIII-XIX century) were analysed and their entomofauna studied. Two of these burials, located on the North-East side of the church, have some drainage channels connecting to the external environment. Through these channels, predator and opportunistic species unrelated to the cadaveric fauna had access to the cadaveric entomofauna. Among them, species in the family Carabidae (Carabus, Pterosticus, Nebria, Trechus, etc.) are known as reliable soil bioindicators.

Pitfall, interception and Malaise traps were employed, along with direct hand collections, during the summer 2022 and in summer and fall 2023 to have a list of the nowadays active species of the area, focusing on informative species.

The analysis here presented was carried out at two levels: 1) comparison between archaeological and nowadays species - it is worth mentioning that the Italian Ministry for Environment and Agriculture published a volume about Carabidae as bioindicator of the Italian soils' use and evolution - and 2) comparing the available cartographies of the area with detailed reports of the land use (eg.: Catasto Chiesa, 1727-1734). The analysis results show a strong difference of the ground beetle entomofauna, whereas no difference appears on saprophagous species. The ground beetle difference reflects the differences in the cartography analysis where it appears a clear forest expansion and a reduction in the agriculture activities.

3 SANITARY AND HEALTH CONDITIONS IN RURAL EARLY MEDIEVAL IRELAND

Kourela, Eva (University College Dublin) - Radini, Anita (University College Dublin)

The analysis of sub-fossil insect remains in archaeological contexts is a vital tool for understanding the ecological conditions and the local environment of ancient settlements, and therefore the way people lived. In the past, like today, insects moved into microhabitat they could colonise. As insects gradually moved, lived and died into occupation sites (by introduction from a host, imports, activities such as butchering, crafts and dumping zones) they left behind their remains; The focus of this paper is the information on health and hygiene of rural societies in early medieval Ireland that can be inferred from ancient insects remains.

This study will also present the integration of other multidisciplinary approaches, including a novel analysis of insect remains strictly associated with ancient human remains. This study will show the benefits of multiproxy analysis to strengthen the results of archaeoentomology for future research, but also, published data from the Early Christian rath of Deer Park Farms (modern Northern Ireland) will provide a general overview of the hygiene levels, and present the progress of the new insect work currently undertaken.

4 INSECTS BENEATH THE ASH: EXPLORING POMPEII'S RUINS THROUGH ARCHAEOENTOMOLOGY (CAMPANIA, ITALY)

Huchet, Jean-Bernard (CNRS, Muséum national d'Histoire naturelle, Paris)

The preservation of crops and stored-foodstuffs figures among the recurrent themes in Classical literature (i.e. Theophrastus, Cato, Varro, Columella, and Pliny the Elder). Botanical study of the charred plant and fruits macro-remains of Pompeii, formerly destroyed by the eruption of Mount Vesuvius in A.D. 79, let suspect that some damage could be attributed to insect pests. Although important multidisciplinary researches have been conducted upon this emblematic archeological site, the entomological approach has been largely neglected.

An archaeoentomological survey carried out at the Laboratory of Applied Research, Pompeii, (Campania, Italy) allowed to evidence many insect remains as well as their traces of activity left among the archaeobotanical material, mainly associated with the charred leguminous grains (Fabaceae) and olive remains (Oleaceae) curated within this institution. The main purpose of these investigations was to evidence, by empirical means, how the foodstuffs protec-

tion methods recommended by the antique authors were really efficient against the stored product pests. The results of these investigations are presented here.

5 INSECT DEATH ASSEMBLAGES: A HELPFUL TOOL FOR RECONSTRUCTING PAST INTERACTIONS BETWEEN HUMANS AND LANDSCAPES IN THE FRENCH CENTRAL PYRENEES

Parrilla, Sarah (CNRS - UMR 5608 - Laboratoire TRACES; CNRS - UMR 5602 - Laboratoire GEODE; LASA - Laboratorio di Archeologia e Storia Ambientale) - Moret, Pierre (CNRS - UMR 5608 - Laboratoire TRACES) - Saulnier, Mélanie (CNRS - UMR 5602 - Laboratoire GEODE) - Py-Saragaglia, Vanessa (CNRS - UMR 5602 - Laboratoire GEODE)

Environmental archaeology provides information about the co-evolution between past societies and their environment, changes in land use and human impact on vegetation cover. In the Pyrenees, this research area has long relied on micro and macro-plant remains (pollen and charcoal). Subfossil insects from natural soils can provide additional information on past human practices such as pastoralism and landscape openness. In past forest contexts, they also have the potential to help us determine openness, canopy density, and the presence of old trees. Insects can therefore be proxies for the age and maturity of forest stands.

To test the ability of insects to reflect different degrees of anthropisation, we sampled in the northern slopes of the French Central Pyrenees three old-growth forest sites (Barrada, Bois-Neuf and Burat), two ancient forest sites (Bernadouze and Lacore) on north facing-slopes, and an ancient mining area (Les Argentières), on a south-facing slope, today in an open landscape. Two pits were dug in each old-growth forest site, two and three in the ancient forest ones, and two in the ancient mining area (one in an ancient waste heap and the other in a natural soil nearby), to collect soils/sediments and extract and analyse insect (n=2396) and charcoals remains (n=4297). Radiocarbon dating was performed on several charcoals (42) from the same sampling layers as the insects, ranging from the Mesolithic to the contemporary period. At all the sites studied, insect remains provided promising data that complement the charcoal record for detection of agro-sylvo-pastoral practices.

6 BEES FOR THE FUTURE: A HISTORICAL ECOLOGY OF BEEKEEPING ON THE CHERANGANI HILLS, ELGEYO-MARAKWET, KENYA

Shen, Benny (University of Cambridge)

Despite of its high economic and cultural importance, pollination services to some of the most important cash crops, and broader ecosystem services that enhance forest biodiversity and soil stabilization, beekeeping and beekeeper communities in sub-Saharan Africa have often been overlooked in development and conservationist literature for their roles in shaping their inhabited landscapes and ecosystems over longue durée. Simultaneously, despite of its well-attested antiquity, apiculture has been generally overlooked in archaeology. Current methods that traced the origin of beekeeping to early agriculturalist Near East, relying on either the remains of apicultural structures or lipid analysis of beeswax, become infeasible when encountered with sub-Saharan African apiculture where hives and receptacles were mainly made from perishable materials and where beeswax was not widely collected until recently.

Following earlier proposition of the concept of 'beescape' to embrace the meshed processes of multispecies intra-actions/co-becomings that reified ecosystem, landscape, and material memories, this study uses historical ecology-minded, multidisciplinary approaches to investigate the living beescape of the Cherangani Hills in Elgeyo-Marakwet, Kenya, by coalescing oral historical, participatory mapped, GIS-based, and remote-sensed, and archaeological materials. The study revealed a complex history of shifting land and forest uses partly dictated by apicultural concerns that provided a preliminary scope into how long-term beekeeping had mediated the landscape modification in East Africa and pointed directions for further historical ecological studies of African beescapes. This study also examines how learning from the ecological and landscape past of beekeeping in Kenya may inspire future policy-making concerning food security, forest conservation, and climate change reactions in both the local and global scales.

7 EVOLUTION OF ARCHAEOENTOMOLOGICAL INVESTIGATIONS IN ITALY

Vanin, Stefano (Department of Earth, Environment and Life Sciences (DISTAV) University of Genoa; National Research Council, Institute for the Study of Anthropic Impact and Sustainability in the Marine Environment (CNR-IAS), Italy) - Carta, Giuseppina (Department of Earth, Environment and Life Sciences (DISTAV) University of Genoa) - Giordani, Giorgia (Department of Pharmacy and Biotechnology (FABIT), University of Bologna)

Funerary archaeoentomology focuses on the arthropods associated with human remains or elements involved in funerary rituals, such as offerings. Over the past few years, several papers have been published on Italian material spanning approximately 5000 years. Since the publication of the paper regarding the state of the art of funerary archaeoentomology in Italy (Tuccia et al., 2022), which mentions 12 Italian sites, an additional 15 new sites have been studied, leading to a better understanding of the insects associated with skeletonized and mummified bodies across Italy. Most studies deal with mummified or partially mummified bodies stored in churches and crypts (15th to 19th

centuries). Among the insects, species from the following families are listed, along with their relationships with human cadavers: Calliphoridae, Sarcophagidae, Muscidae, Fanniidae, Piophilidae, Sphaeroceridae, Heleomyzidae, Phoridae (Diptera); Carabidae, Histeridae, Staphylinidae, Cleridae, Dermestidae, Ptinidae, Cryptophagidae, Latrididae, Zopheridae, Endomychidae, Salpingidae, Curculionidae (Coleoptera); Formicidae, Vespidae (Hymenoptera); Tineidae (Lepidoptera); Pulicidae, Leptopsyllidae (Siphonaptera); and Pediculidae (Psocodea). The presence of species belonging to Acarina, Aranea, and Pseudoscorpionida is also discussed. The analyzed entomofauna allows conclusions to be drawn about funerary ceremonies, cadaver taphonomy, as well as variations in distribution and local extinctions of some species within the investigated timeframe. Additionally, the difference between museophagous and “informative” insects is analyzed and described to provide knowledge and operational skills to meeting attendees.

8 LICE AND DOUBLE-SIDED COMBS: TRACING TECHNOLOGICAL NETWORKS OF EXCHANGE IN THE EARLY MEDIEVAL ATLANTIC ARCHIPELAGO

Brody, Rachel (Boston College)

The human head louse and body louse are creatures of humans, but just the same: humans are creatures of lice. Lice are heirloom parasites—coevolving with us—and we share a very long history with each other. We define these creatures as pests, a status that we have granted them through an existence only made possible by the ways we decide to wear our hair and clothe our bodies. They are, therefore, active subjects and historical actors. In this paper, I argue that by studying people and their lice in the early medieval Atlantic Archipelago, we can engage in new ways with time-old scholarly discourses on economic networks of exchange. In this paper, I will survey fine-toothed double-sided combs, a human material response and act of resistance to lice, to trace technological exchange between early medieval Ireland and Britain. Early results of this work show that the Romans likely introduced fine-toothed double-sided combs in Britain. As lice crawled and climbed from one human host to another, these combs traveled, and this technological innovation eventually spread to Ireland. The relationship between insects, humans, and combs is just one of the many entanglements that came to shape the past.

9 EVALUATING FOR THE FIRST TIME THE POTENTIALS OF LEPIDOPTERA MICRO-REMAINS FROM ANCIENT HUMAN DENTAL CALCULUS

Radini, Anita (School of Archaeology, University College Dublin, Ireland) - Kourela, Eva (School of Archaeology, University College Dublin, Ireland)

Dental calculus consists of mineralised dental plaque and is often referred to as tartar. This is the result of microbial activity on teeth, and if not removed, the mineralisation of the plaque forms a deposit on teeth that can survive for millennia. In the past 20 years dental calculus samples from teeth of ancient populations have been the subject of a wide range of research - from diet to oral microbiomes. This is because, during its formation, dental calculus can entrap and preserve a great variety of particles and molecules from food, the environment, air and water. The majority of studies have looked at particles from food, but insect remains have been found entrapped in this type of ‘deposit’ on teeth. This paper presents, for the first time, the wide range of microscopic remains of Lepidoptera in ancient human dental calculus. It discusses the evidence from a Medieval population from Leicester (England) and discusses potential and limitations in their identification and interpretation.

10 BABY, IT'S COLD OUTSIDE; HOW CHANGING FARMING PRACTICES INFLUENCE THE INSECT BIOTA ON THE EDGE OF THE INHABITABLE WORLD

Konradsdóttir, Hrönn (National museum of Iceland)

Some species of small mould feeding beetles are almost locally extinct in Iceland, most likely due to changes in the human made environment.

This presentation will discuss the different species of insects that lived in the byres, barns, and turf houses of the last centuries and the abundance of the same species in the archaeological record.

Living on the edge of the habitable world has its pros and cons. Changes in farming practices can impact the fauna quickly and permanently and local insect species extinctions do not normally ignite the population to protect the endangered habitats. There are many insect species in Iceland that cannot survive outside the human made environment even though many of them thrive in natural habitats in the warmer southern European climate. Most of these were likely first unintentionally imported during the Settlement Period in Iceland (10-11th century AD).

The first hay baler was imported to Iceland in 1982. This machinery has since spread to most if not all farms, making hay barns obsolete and the ecology of some insect species scarce. Prior to this new technology, the hay would be bound with ropes and stored in barns where the cattle or sheep would live close by in the winter, producing a warm and moldy environment, which is the perfect living condition for some coleoptera species. Today, the hay is covered in plastic and stored outside for the winter months causing a major impact on the fauna.

In this presentation, comparisons will be made between 16th-19th century insect faunas from excavations at high status places and small cottages analyzed by the author. These will also be compared to the modern specimens of the same species in Iceland collected by the Icelandic Institute of Natural History and other resources.

11 WORMS, DRAGONS, AND OTHER INSECTS: A CASE STUDY OF MATERIAL CULTURE FROM 19TH CENTURY WESTERN ALASKA

Althoff, Amanda (Columbia University)

In 1959, Robert Spencer noted in his Inupiaq ethnography that “no account of North Alaskan supernaturalism would be complete” without the mention of worms (1959:295). In their 2015 book on Inuit human-animal relations, Frédéric Laugrand and Jarich Oosten still critique the lack of studies investigating insects in the Arctic. To date, these calls have gone fundamentally unanswered. This paper, based on my doctoral dissertation research, provides a first overview of the diversity and connectedness of insect depictions in Yup'ik and Inupiaq material culture, largely from the 19th century, and now housed in museums around the world. Bringing these cultural belongings back into their cultural, ecological, and historical contexts allows us to recognize stories, names, and relations. It enables us to begin asking, what even is an insect in 19th century Western Alaska?

Bringing together archaeological data, museum collections, oral archives, and Indigenous frameworks, this case study showcases the need to see insects as more than proxies. For instance, with a particular wealth of worm depictions, we are forced to reconsider the universality of the hexapod-as-insect, and instead, see insect-ness and the powers and kin relations that lie therein as a culturally embedded conceptual framework, requiring our careful consideration.

12 ARCHAEOENTOMOLOGY AS A PROXY FOR RECONSTRUCTING ENVIRONMENTAL CHANGES DUE TO HUMAN ACTIVITIES IN A LANDSCAPE BETWEEN LAND AND SEA

Richelmi, Lisa (UMR 5199 - PACEA (University of Bordeaux, France)) - Huchet, Jean-Bernard (UMR 5199 - PACEA (University of Bordeaux, France); National Museum of Natural History (MNHN, Paris, France)) - Verdin, Florence (UMR 5607 - Ausonius (University of Bordeaux Montaigne, France))

France's Atlantic coastline, facing accelerated erosion and relentless retreating coastline, frequently reveals new archaeological remains which are threatened by rapid destruction. Several years of excavations at Amélie Nord (Sou-lac-sur-mer) have uncovered many archaeological structures dated from the Neolithic to Antiquity. These structures, hidden beneath the sand and located on the foreshore, are only accessible at the highest tidal coefficients and for very short periods of time. This waterlogged, anaerobic environment has preserved numerous arthropod remains for thousands of years. The archaeoentomological study of this rich corpus of insects enables us to reconstruct palaeoenvironments and human activities, and to assess their impact on local insect biodiversity. Insects are thus used as bio-indicators of the anthroposystem, making it possible to characterize settlement dynamics in coastal areas and to understand the challenges faced by societies occupying these territories. Ancient populations took advantage of the resources available in this environment between land and sea. The marshes protected by the dunes were used for salt production and oyster farming, while also providing water for livestock. Trees from the surrounding forest were widely used for construction, leading to a retreat of the forest and, consequently, more open environments in Antiquity. In this changing environment, strongly subject to oceanic influences, populations also had to adapt and cope with risks. This diachronic study puts the study of climate change into a multi-millennial perspective and contributes to the development of a memory of risk.

13 CHINESE BUTTERFLY AND MOTH MOTIFS AND THEIR CONNOTATIONS

You, Zhangheng (Xiamen University)

In China's history, insect motifs have appeared on a large number of material and spiritual carriers, such as tombs, arts and crafts, excavated relics, which have been entrusted with unique and rich connotations by the ancients.

Firstly, this report will take an overview of the research on the subject of domestic study in China, which is about butterfly-moth motifs, and systematically describes the existing research results on butterfly-moth motifs in imagery and literature. Secondly, the report summarizes the different characteristics of butterfly-moth motifs from the Tang to the Qing dynasties, analyzing the reasons that gave rise to these characteristics in the specific context of the times. The report then focuses on the connotations of butterfly-moth motifs, including faith connotations and aesthetic significance. The butterfly and moth plays as an important role in the early Chinese belief system, as a symbol of reincarnation and regeneration. They are associated with sun worship and ancestor worship. Together with silkworms and cicadas, they formed an important part of the system of “feathering and regeneration”. After the decline of moth worship, the aesthetic significance of the butterfly gradually emerged, including pure love, freedom and longevity. Finally, the report speculates on the relationship between butterfly and moth motifs and the natural environment due to the fact that the nations with butterfly totems were found to be distributed in the southern provinces and the high temperatures of the Tang Dynasty, when butterfly motifs emerged. The interaction between butterfly moths and

human beings is reflected in all aspects of belief shaping and aesthetic shaping, and the subject-object relationship is constantly changing. Butterfly and moth motifs also have a reaction to their corresponding times and regions, they are of high research value.

14 **WHERE ON EARTH HAVE YOU BEEN? FIRST APPLICATION OF FUNERARY ARCHAEOENTOMOLOGY IN CANADA**

Roger, Clotilde (Université Laval) - Bain, Allison (Université Laval; Groupe de Recherche en Archéométrie) - Huchet, Jean-Bernard (Université de Bordeaux; CNRS)

The study of insects from burials has been exploring numerous archaeological contexts and geographical areas in recent decades. As part of a master's thesis at Université Laval (Québec), 43 burials from three cemeteries from the province of Québec were analyzed through the lens of funerary archaeoentomology, thus constituting the first application of this approach in Canada.

The objective of this study was to assess the validity of this approach in unexplored contexts by evaluating to what extent insects could be found and then so see what information could be derived from them. Although essentially methodological and taphonomic, the scope of this research has allowed the discussion of seasonality of death, health conditions, body exposition prior burial, and possible rapid inhumation, thus placing the human-insect interactions at the heart of reflection.

If in forensic entomology and, by extension, funerary archaeoentomology, the body is considered as a short-lived ecosystem, the remains of insects that once inhabited this body perpetuate valuable heuristic in archaeology and provide access to informations that were once inaccessible. In the context of this research in particular, this perpetuity was reflected in the memorial importance that these insect remains carried. One of the multiple burials in the research corpus, which included Irish immigrants fleeing the Great Famine of 1845-1852, could be dated to the summer of 1847 thanks to the seasonality of death and the brief occupation of the site. This information is meaningful for the descending Irish community of Montréal: as in forensic entomology, placing the death of an individual on a calendar is certainly fundamental for an investigation, but also for mourning and memory. Consequently, funerary archaeoentomology may offer a tangible link between the past and present descending communities. Therefore, the aim of this conference is to share these research results and highlight their contributions and perspectives.

15 **IN THE DIRTY OLD PART OF THE CITY: FISHAMBLE STREET, DUBLIN THROUGH TIME AND IN CONTEXT**

Davis, Stephen (Stephen Davis (Institute of Archaeologists of Ireland)) - Reilly, Eileen (University College Dublin) - Kourela, Eva (University College Dublin)

This paper presents an overview of the remarkable body of work undertaken by Dr Eileen Reilly at the important Viking (C10-11th) site of Fishamble Street, Dublin, comprising the analysis of 104 samples from across multiple phases of early urban settlement. Excavated between 1974-1981 the site yielded exceptional organic preservation and resulted in a large number of samples: while at the time no analysis was undertaken these were archived for future research. A key part of this was analysis of insect remains: the potential for this had previously been shown by Harry Kenward in York and had been recognised at the time of sample collection. Samples were categorised by location – floor layers (aisles; corners), pits/ditches, wall deposits etc. and by phase. In general, the assemblages are overwhelmingly dominated by a small suite of typical 'house fauna' insects which wax and wane through time. These variations across time and space can be equated to the ebb and flow of settlement activities and, most probably, to broader episodes of societal change. This work especially demonstrates the value of in depth sampling and analysis in understanding change at fine spatial and temporal resolution. This paper is given in honour of the late Dr Eileen Reilly whose work over more than two decades was an inspiration to her colleagues and contemporaries.

862 **ARCHAEOLOGICAL HERITAGE ? DIVERSIFYING APPROACHES OF COOPERATION WITH NON-EUROPEAN PARTNERS**

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Kuraszkiwicz, Kamil (University of Warsaw, Faculty of Oriental Studies) - Augustyniak, Zuzanna (University of Warsaw, Faculty of Oriental Studies) - Abebe, Mearg Abay (Mekelle University)

Session format: Regular session

Archaeological Heritage, understood as the material remains of the past, does not rest in a void. It is an inherent part of the contemporary environment, shaping the landscape, societies, and visions of the past. Doubtless, past and contemporary cultures form a continuity, and any link to the past, including intangible remains like memories, customs, identities or linguistic legacy should be understood as part of archaeological heritage. It is essential while researching

non-European cultures that were for a long time victims of the colonial approach, seen either as curiosities or as predecessors of greater (meaning Western) cultures and thus described and explained for the benefit of Europeans, without acknowledging or even noting their proper context which at least severely limited their understanding. To appreciate the context, cooperation between archaeologists with specialists dealing with non-European cultures is needed. Perspectives of non-European partners differ from those rooted in European academic traditions, and – moreover – local contexts lead to shifts in priorities and add possibilities. For example, local initiatives to create community-based museums add interesting new possibilities for disseminating knowledge and integrating research results in a local context. Also, the integration of local knowledge of cultural contexts and traditions, which can enrich archaeological research and support the interpretation of finds, cannot be detached from local communities seeing themselves as guardians of historical sites.

Also, the postcolonial perspective emphasizes researched societies' involvement in archaeological and ethnographical research. Research should no longer be about them, but with them. It is mutually advantageous; local societies may help understand the past, and through involvement, they can effectively profit from it. Invited to join the discussion are colleagues who engage local communities in research on the past or who combine archaeological research with memory studies.

ABSTRACTS

1 **ETHNOHISTORICAL RESEARCH ON AN AKSUMITE SITE AND ITS ENVIRONS IN THE HIGH PLATEAU ABOVE THE „BLACK NILE“**

Abebe, Mearg (Mekelle University) - Smidt, Wolbert (Friedrich Schiller University Jena; Mekelle University)

The results of a German-Ethiopian cooperation are presented. Local inhabitants in Ketema Ra'isi (Central Tigray, Ethiopia) were intrigued by findings of Aksumite coins while ploughing, and by ruins within which since generations they were building and rebuilding their own habitations and as well as by stories about them. The Ethiopian author of this paper grew up at that site, and during his work as a museum expert, he started interviewing family members in cooperation with the ethnohistorian Wolbert Smidt, the second author of this paper. Following the initiative of the local community, the latter was invited to visit the site and document its context, in order to provide a first analysis of local memories. This paper will present a first insight into this cooperation. In a thickly forested area at the fringes of the highlands, there is a church and monastery, locally seen as an important place of refuge, well protected by the rocks and forests and by a steep pathway, which seems to be very ancient and well constructed. The modern church, which has an important manuscript collection due to its position hiding it from marauding armies, displays several Aksumite spolia. Local elders and priests are connecting their route with the ancient Nile of the Bible and tell that it is here that since ancient times people were „crossing the Nile“ - referring to the routes passing through the forest leading down to the Tekkeze, the most important Tigrayan tributary of the Nile. These narratives probably reflect an ancient identity of that place, which was located at the margins of the Aksumite kingdom, and connected itself with the Nile. The paper presents what is known today on the site, following the local inhabitants' invitation of foreign scholars to make their ancient living area known to scholarship and heritage experts.

2 **BALANCING RESEARCH, CONSERVATION, AND LOCAL ENGAGEMENT. A NEW COLLABORATIVE PROJECT BETWEEN ETHIOPIA AND TANZANIA**

Itambu, Makarius Peter (University of Dar es Salaam-Tanzania; Max Planck Institute of Geoanthropology-Germany; CEREGE-CNRS, France) - Itambu, Makarius (University of Dar es Salaam, Tanzania; Max Planck Institute of Geanthropoöogy-Germany; CEREGE, CNRS-France) - Solomon, Tadele (Ethiopian Heritage Authority, Addis Ababa, Ethiopia) - Gallinaro, Marina (Dipartimento di Scienze dell'Antichità, Università di Roma La Sapienza,)

The balance between economic development and conservation of landscape and cultural heritage is a critical global issue, particularly in developing countries. This challenge is compounded by drastic climate change, complex political conditions, and fluctuating economic developments affecting land and resource use. Population growth, inadequate legislative tools and management plans, and a lack of awareness of the value of nonrenewable natural and cultural resources exacerbate these issues. Cultural heritage management in several African countries is still influenced by the laws and structures of their former European colonizers. Furthermore, certain popular beliefs associated with colonial occupation contribute to inadequate care of cultural heritage, especially archaeological heritage. The existence of folk beliefs and myths with no historical basis, such as attributing the origin of rock art to colonizers as a marker to identify the sites with hidden treasures, leads to the vandalization of these sites.

The paper aims to present the current state of archaeological heritage in two areas of Eastern Africa: the Borana zone in southern Ethiopia and the Singida region in central Tanzania. It will introduce the initial steps of a partnership between African and non-African scholars, as well as local and national institutions. The partnership aims to establish the foundation for short- and medium-term actions to implement management plans for areas with rock art. The

goal is to promote sustainable development projects and challenge the misconception that studying and preserving archaeological heritage hinders economic development.

3 COMPLEXITIES OF (ARCHAEOLOGICAL) HERITAGE WORK AMONG/WITH MARGINALISED LOCAL COMMUNITIES IN SUDAN

Kleinitz, Cornelia (Deutsches Archäologisches Institut, KAAK) - Mohamed Ali Saeed, Alfatih (University of Khartoum) - Ebeid-Allah, Hassan (Musawwarat Community Council)

This talk reflects on some of the complexities of working among and with marginalised local communities in Sudan with a focus on the region of Musawwarat, part of the UNESCO World Heritage Entry 'Archaeological Sites of the Island of Meroe'. Here, a collaborative project on the archaeology of (local) pastoralism had successfully bridged the gap between the concerns of the Sudanese and European archaeologists and the local pastoralist population, who had long been engaged as 'workmen' during excavations and conservation work at the monumental archaeological site. Centring pastoralist knowledge empowered the local population to tell their (hi)story of the Musawwarat site and region, which greatly benefitted the archaeological project and also led to the development of locally-led community/rural tourism that in turn promised to benefit the local population. However, this level of mutual engagement also meant that the project documented and made visible the increasing precariousness of local pastoralist livelihoods in view of fast (industrial-)agricultural expansion and the effects of climate change, leading to the rapid loss of rangelands as well as pastoralist knowledge and heritage. Combining Sudanese and European archaeological, social anthropological as well as local perspectives, our joint observations showed the detrimental effects of specific – and in effect unsustainable – ideas of development and progress as imposed by Sudanese state-related actors on the drylands of Sudan and their marginalised people.

4 STAY IN AND GO OUT: THE COMMUNITY CONNECTION OF A NEOLITHIC CULTURAL MUSEUM IN CHINA THROUGH STUDY TOUR

Lin, Shiting (University of Cambridge)

Archaeological heritage is usually seen far away from public normal lives, especially prehistoric heritage. How to make prehistoric museums link to the public is significant. Facing the increasing demand for diverse tourism experiences, museums need to go out to involve more people. This research, taking the Banpo Museum in Xi'an China as a case study, aims to explore how a prehistoric museum with an archaeological site, through study tours, develops its connection with tourists and communities by getting them into the museum and by going out to reach them.

Banpo Museum, opened in 1958, is the first Neolithic Culture Museum in China. Consisted with collection galleries and an archaeological site, it shows the excavation findings and Banpo site dated back to 6800 to 5300 years ago. Banpo site is a part of Yangshao culture which proves China has Neolithic culture. Nowadays, it develops a "Prehistoric workshop" inside the museum targeting teenagers and a "Happy Tour to Primitive Tribe" outside targeting schools, local communities, and countryside communities. These two series of activities involve not only young visitors but also urban and rural communities, which share knowledge of neolithic culture with the public and improve their responsibility for heritage conservation.

Through analysing this case study, the research can shed light on the contemporary development of prehistorical museums and public involvement of archaeological heritage through study tours. Out of the European context, it can also contribute to the understanding of how museums in the Chinese context reach communities in their ways.

5 SPOILED: RECONSIDERING THE TERM SPOLIA FOR ANTIQUITIES REUSE IN THE OTTOMAN EMPIRE AND BEYOND

Silvia, Sean (Princeton)

Reuse of ancient materials to build new structures is a fascinating phenomenon which can provide rich insights into the lives of people who lived in and around ruins. Yet our continued use of the word "spolia" (originally meaning spoils taken in conquest) to describe this phenomenon and the assumptions that come with it contaminate our scholarship, especially concerning non-western cultures. In the long nineteenth century, the word served an ideological project. Western Europeans used its connotations of rupture to discredit Ottomans claims to ancient artifacts and justify plunder of antiquities from Ottoman lands. The word spolia misrepresented an Ottoman worldview primarily based on continuity with antiquity rather than rupture. The misrepresentation problem is not limited to the Ottomans. Spolia's assumptions of rupture and conquest cause scholars to assume conquest imagery without hard evidence. The word leads us to fixate on moments of rupture, often missing the broader world surrounding reuse in urban geography. The stakes are higher than a mere terminology question, because the 'rupture and conquest' mindset baked into the word "spolia" masks archaeology's destructive history of epistemicide against local knowledge systems. Building off ideas of rupture, local reuse of antiquities in the Ottoman empire is labeled as "protomuseological," "indigenous archaeology,"

and "antiquarianism" to legitimize reuse as a practice and research topic. Yet to reach this laudable goal, local antiquities epistemologies are forced into western knowledge system categories, the very same knowledge systems that violently displaced local ways of life in the long nineteenth century. It should not be necessary to force non-western knowledge systems into western categories to take them seriously, they can and should be recognized as epistemologies in their own right. This paper proposes alternative vocabularies to discuss architectural reuse that reckon with archaeology's violent disciplinary history and foster more productive and ethical discourse.

6 WE'RE IN THIS TOGETHER – SAQQARA AS AN EXAMPLE OF INCLUSION OF LOCAL KNOWLEDGE INTO ARCHAEOLOGICAL ACTIVITY

Kuraszkiewicz, Kamil (University of Warsaw) - Augustyniak, Zuzanna (University of Warsaw)

The current approach to heritage management entails engaging local communities in organising the protection of archaeological sites and making them available for visitors which often includes social events that bring together archaeological teams and members of the communities. This, however, seems to be only a small fraction of opportunities that such a cooperation can offer. As an illustration, the work of the Polish expedition to Saqqara (Egypt) will be discussed. The expedition employs usually 15-30 workers, with the rais (foreman) in charge of them. The workers, mostly farmers from the neighbouring village, have no formal education related to the history of their neighbourhood, but rather a general knowledge transmitted orally. The majority of them work in excavations occasionally, this being their additional source of income. Raises, on the other hand, although also without a formal archaeological education, come usually from families having been involved since generations in archaeological activities and they work on excavations constantly, switching between expeditions in the area. Both groups are usually not familiar with archaeological or conservation methodologies. However, a practical knowledge applied in their life and work can be more than useful in protecting and, moreover, interpreting archaeological objects. For example, some methods and technical solutions applied in ancient Egyptian architecture are – or were recently – continued in rural areas. A common misunderstanding is that the Egyptian heritage has not been re-discovered before the 19th century. However, works of Arab scholars and material evidence indicate that pharaonic sites were being explored long before that date. It may be supposed that the knowledge continues, and the research on an archaeological site should include also an analysis of much later sources and the memories of people living today around or in a close vicinity of the site, as a collaborative work of archaeologists, ethnographers and historians.

7 LIVING HERITAGE, INDIGENOUS WISDOM AND ENDANGERED ECOSYSTEMS: ROZVI NATURE METAPHORS DICHOTOMIZED

Machiridza, Lesley (University of Cologne; Great Zimbabwe University)

Across the globe, the distinction between the tangible and intangible realms of life, especially among Indigenous communities is sophisticated. This stems from the fact that Indigenous Knowledge Systems (IKS) are holistic and relational in nature. Such knowledge is grounded in a deep sense of the interconnectedness of the cosmos, nature and society. Thus, Indigenous communities perceive the landscape as a complex web of living, spiritual and physical things. Through use of metaphors involving mountains, trees, rivers, swamps, pools, groves, tunnels, caves, ancestral burial grounds, monuments and myriad cultural objects, the connections between people, physical environments and spiritual realms are consolidated. For generations, Indigenous communities have maintained this wisdom to preserve endangered ecosystems and entrench their shared identities and history within landscapes. Although the Rozvi (1685-1830) were quite notorious for this tradition, their complex landscape connections are yet to be thoroughly explored. While Rozvi metaphors are closely tied to numerous mountains, rivers, trees, pools and swamps, attached meaning(s) and value(s) remain obscure. Building upon notions of rational reconstruction, decolonial and African-centered paradigms, this paper critically reviews such realities. Furthermore, it challenges the compartmentalization of Rozvi heritage knowledge into strict scientific and spiritual/social categories that barely make archaeological sense, especially when it comes to defining elusive concepts like agency and ethnicity materially.

863 THE LIVES AND AFTERLIVES OF MEGALITHS: DIALOGUES OF PERSISTENCE, REINVENTION AND CHANGE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Pereira Rocha, Leonor Maria (CHAIA/ University of Évora) - Martins, Ana (IHC-Polo Universidade de Évora / IN2PAST) - Whitefield, Andrew (National University of Ireland, Galway) - Meheux, Katie (University College of London) - Sebire, Heather (English Heritage)

Session format: Regular session

Megalithic monuments first appeared in the context of a major social upheaval which saw humans transition to agricultural subsistence and a more sedentary way of life. The monuments span multiple archaeological periods, and remarkably well-preserved examples remain in landscapes across Europe. The meaning and function of megaliths has been reinterpreted by every new generation. The architecture, contents and setting of the monuments have inspired legends and folklore, origin myths and group identities. In modern times, antiquarians and archaeologists have 'professionally' interpreted the monuments, and groups ranging from neo-Pagans and Druids to nation states have adopted the monuments as symbols of their ancestry. Dolmens, menhirs, cromlechs, and alignments continue to fascinate and intrigue tourists, and are among the most visited attractions in many countries. But who decides how competing interests are prioritised? Whose interpretations are right and true? Who owns the past?

This session will explore the ways in which megalithic monuments have been interpreted and reinterpreted through time, with a particular emphasis on the period from the nineteenth century to the present. We seek to compare and contrast perspectives from across Europe, examining motivations, approaches and outcomes. We particularly welcome contributions which consider:

- The development of archaeological investigations, and the resulting classifications and interpretations.
- Custodianship, management, preservation, access, protection, conservation and neglect.
- Authorised narratives: the presentation and interpretation of the monuments for public engagement, education and tourism.
- Contested narratives: the adoptions of megalithic monuments as symbols of social and political identity, religion and belief.
- The place of megalithic monuments in legend, superstition and folklore.
- The future of megalithic monuments.

The proposed outcome of this session is a published collection of essays on how megalithic monuments are understood in the present, how we got here, and what the future may hold.

ABSTRACTS

1 STORIES, LEGENDS AND REALITIES: CASE STUDIES IN THE MEGALITHS OF CENTRAL ALENTEJO (PORTUGAL)

Pereira Rocha, Leonor Maria (CHAIA/Universidade de Évora)

Megalithic monuments, such as dolmens or menhirs, were built to preserve memories and identities. Did the builders envision that these places would be preserved for many millennia, full of mysteries and superstitions?

Today, these monuments serve as important sources of information for archaeologists and anthropologists, shedding light on how ancient populations honored their dead, and providing insight into their religiosity and beliefs, about the afterlife.

The architecture and burial rituals of these sites can help us understand how death was experienced by populations in the Recent Prehistory (4th to 3rd millennium BC), in Central Alentejo. The monumentality of some of these sites has kept their identity alive in the memory of the living over the millennia, leading to the association of popular legends and superstitions. In some cases, their popular importance has led to their transformation or incorporation into religious buildings.

In this presentation, we will explore a set of megalithic monuments that are currently associated with other functions or legends, while also acknowledging their original purpose based on archaeological and anthropological evidence.

("CHAIA/UE [2023] - Research financed with Nacional Funds through FCT - Portuguese Foundation for Science and Technology, within the scope of the fallow projects: Ref.^a UIDB/00112/2020 and Ref.^a UIDP/00112/2020").

2 SEARCHING FOR SPATIAL RELATIONS BETWEEN FUNERARY AND NON-FUNERARY SITES: A GIS APPROACH TO THE LATE PREHISTORY OF ÉVORA (SOUTHERN PORTUGAL)

Diniz, António (CHAIA/Universidade de Évora) - Faria, Nuno (Universidade de Lisboa/Faculdade de Letras) - Ribeiro, Inês (CHAIA/Universidade de Évora) - Almeida, Nelson (CHAIA - U. Évora / UNIARQ - U. Lisboa) - Branco, Gertrudes (CHAIA/Universidade de Évora) - Rocha, Leonor (CHAIA/Universidade de Évora)

Various researchers have dedicated their studies towards trying to understand the archaeological and spatial relationships between funerary and non-funerary archaeological sites. Regarding European Late Prehistory, these types of studies are of interest when dealing with funerary megalithic monuments, as is the case for dolmens and tholoi, and their possible connections to ditched and walled enclosures.

From a spatial point of view, some of the main questions commonly raised are if there is a "direct" relation between funerary megalithic monuments and enclosures/settlements, and how different variables, such as resources (e.g., lithology, hydrology), distances, and intervisibility, have influenced these relations.

The Évora district (Southern Portugal) is a privileged region to research these aspects due to a historically relevant amount of research and pieces of evidence related to Neolithic and Chalcolithic funerary and non-funerary sites. The location of dolmens, tholoi, ditched and walled enclosures in the Évora district allows us to discuss how the abovementioned variables might have influenced the relationships between these different types of sites. We aim to serve as a bridge between what has been done in this geographical area regarding the identification and surveying of archaeological sites, and what information can be obtained through the application of GIS.

3 THE ANDALUSI LIVES OF IBERIAN MEGALITHS

Lillios, Katina (University of Iowa)

The post-Neolithic lives of Iberian megaliths have been increasingly recognized by archaeologists in recent years (for example, Díaz-Guardamino et al. 2015). When Arab and Berber/Amazigh settlers populated the Iberian Peninsula beginning in the 8th century CE, they encountered a landscape that was not only inhabited by other people, including Christians and Jews, but also by countless numbers of prehistoric monuments, including megaliths. In this paper, I examine the evidence for Andalusí engagements with Iberian megaliths, such as Alberite, Menga, and Viera. I also explore the methodological challenges as well as the potential cultural insights gained in discerning the post-Neolithic lives of megaliths. The paper concludes with a consideration of the different words that archaeologists, such as the Leisners, have used to denote the Neolithic versus post-Neolithic 'afterlives' of monuments and their implications to hegemonic readings of the archaeological past.

*** Díaz-Guardamino, M, L García Sanjuán, and D. Wheatley, eds. 2015. The Lives of Prehistoric Monuments in Iron Age, Roman, and Medieval Europe. Oxford University Press.

4 MEGALITHS AND THEIR CONTEMPORARY RECEPTION IN PORTUGAL: ICONOGRAPHY, TERRITORY, AND COMMUNITIES

Martins, Ana Cristina (IHC - Polo da Universidade de Évora / IN2PAST)

Since at least medieval times, megalithic structures have aroused curiosity and given rise to various theories about their construction and functionality.

With the beginning of the formation of nation states, they became particularly interesting as they visually marked the territory and referred to a certain pre-Roman ancestry. A past that was reinforced as early as the 19th century.

Portugal is no exception to this movement, not so much because of political assertion, but because of the need felt by the pioneers of archaeology in the country to fit into the 'state of the art' of European research into prehistoric archaeology. From then on, this theme never left their horizons, but rather grew stronger according to the prevalence of personal (rather than institutional) agendas.

What we are interested in demonstrating and debating in this presentation, however, is the reception of megaliths, especially in iconographic terms, in a further testimony to the relationship that has always been maintained, consciously, between the production of knowledge and archaeological heritage and the sphere of the arts and literature.

We will therefore pay special attention to megalithic examples selected expressly to support, represent, or illustrate certain agendas - namely identitarian -, projects, territories, and communities, ending with their appropriation by political decision-makers and managers of the sustainable development of regions - especially of Évora, Alentejo -, whether on an individual or collective basis, privately or publicly.

Examples that will demonstrate the relevance of using a certain past to act in the present to guarantee a future.

5 THE MENHIRS IN THE PORTUGUESE ORAL TRADITION

Vieira, Alexandra (CITCEM – Center for Transdisciplinary Research Culture, Space and Memory)

The main interest of this research project focuses on the role of archaeological remains, in this case menhirs, as agents in the dynamics of constructing the memories of communities and contemporary landscapes.

This communication seeks to establish a series of relationships between Portuguese menhirs and some beliefs that have emerged or been created over the years by different communities in different regions of Portugal, as a way of interpreting or explaining these pre-existing materialities. We will consider historical documentation, legends and toponyms related to menhirs.

It also considers the new contexts in which some of these specimens have been placed, since many of them have been removed from their original sites. Some of these monoliths were reused and transformed into “statues-menhir”, probably during the Late Bronze Age, and are known by this name. Others were reused as markers to divide land or parishes, and in more recent times crosses were engraved on them. Finally, some of these monoliths were transported to the vicinity of public buildings, gardens, or cemeteries, where they remained as decorative elements.

6 MEGALITHS AND MODERNITY: CREATING NARRATIVES ABOUT MONUMENTS IN INTER-WAR BRITAIN

Meheux, Kathryn (University College London)

During the inter-war period, a new generation of British archaeologists worked to gain control of the discipline and control public narratives about the prehistoric past. The protection, excavation, curation, and interpretation of megaliths played a key role in their ambitions. In keeping with the contemporary emergence of mass commercial culture in wider society, new narratives were developed, designed to provide a ‘common’ archaeological culture about monuments and based on excavation, fieldwork and scientific techniques. This culture was marketed to the public using both traditional methods of scholarly communication, and the new mass market technologies of popular books, magazines, newspapers, official guidebooks, film, and radio.

This modernity of interpretation was intended to sever megaliths from their historic pasts, rooted in local folklore and antiquarianism. But megalithic pasts were more slippery than anticipated. Not only were older, historical and folklore narratives difficult to destroy, but the inter-war period saw the development of new, rival interpretations: pseudo-scientific mythologies, hyper-diffusionist fantasies, and yearnings for distinct and divergent national pasts.

This talk examines these modernist narrative battles fought over megaliths, with a particular focus on Avebury. Here we see how tensions swirling over heritage, scientific excavation, pseudo-science and monument protection found their way onto radio and into popular culture, coalescing in now forgotten attempts to create a rival ‘alternative’ pre-history movement. Whilst seen over by, amongst others, Gordon Childe, the twists and turns of interpretation, reveal that the interpretation of megaliths was never a straightforward battle between ‘correct’ and ‘alternative’ archaeologies, but an ever-changing collective experience of attitudes to the past expressed through multiple narratives.

7 ‘EVERY AGE GETS THE STONEHENGE IT DESERVES – AND DESIRES’(HAWKES 1967): 100 YEARS OF CONSERVATION AND RESTORATION AT STONEHENGE

Sebire, Heather (English Heritage)

This famous quote from archaeologist Jacquetta Hawkes nearly sixty years ago still has resonance today. The monument of Stonehenge has been in the care of the British government since 1918. Since that time programmes of research, conservation and some restoration have taken place under the aegis of state-run conservation bodies such as the Ministry of Works and later English Heritage. Stonehenge and its landscape have a complex and fascinating pre-history as recognised by UNESCO when it was granted World Heritage status in 1996 but it also has a long modern history that tends to reflect the mores of the time right up to the present day.

This paper will assess the history and significance of these conservation programmes which reflected the Stonehenge that was ‘desired’ at the time whether deserved or not. A case study will also be presented on a recent programme of conservation work which was needed as a result of the decay of works from the late 1950s, exacerbated by climate change. This work, although benign to the monument and gaining a favourable response from most visitors and members of the general public, caused a mini-furore among natural historians and some members of the public illustrating how easily ‘fake news’ can be generated and whipped up by social media. Is this really what Stonehenge deserves?

HAWKES J 1967 God in the machine Antiquity, XLI.

8 INTERPRETATION, PRACTICAL REUSE AND POLITICAL MISUSE OF THE CROMLECHS OF CARNAC (BRITTANY, FRANCE)

Perschke, Reena (Gerda-Henkel-Foundation research grant)

The Neolithic stone circles and menhir alignments in the surroundings of Carnac stand highly visible in the landscape of this scarcely wooded coastal region. Therefore, each new generation was challenged to form an opinion about these massive standing stones and their meaning for their predecessors.

The megaliths were repeatedly reused during Bronze Age, Early Iron Age, and Gallo-Roman Age. Beginning with written records, early medieval Church Councils damned the continued veneration of the Breton stone monuments. Since the 17th century, antiquarians and archaeologists began to interpret the cromlechs and alignments as mirrored zodiacs, procession sites, prehistoric calendars, druid groves, or fortifications.

The German conquest of Brittany in 1940 brought an enormous interpretation twist with a sudden ideological misuse of the Breton megaliths for National-socialist premises. German archaeologists measured and excavated the stone monuments of Carnac which were postulated as “proto-Germanic” settlement area. Therefore they were worth to be “reconquered” for the Third Reich – an active retrospective justification for the Wehrmacht’s occupation of France.

Till today, the stone alignments and dolmens are considered by tourists and folklore as ancient sacred complexes. Even the current official French guide of the Centre des Monuments Nationaux is labelled “Les Alignements de Carnac – Temples Néolithiques”. Neo-druids perform their rituals at the megalithic sites of Carnac and reclaim pagan ancestors’ rights. Due to their monumentality, inexplicability and significant visibility, the standing stones sacralise the landscape in many ways even in our enlightened era today. In 2024, geomagnetic investigations will bring new insights in the primary use of the stone circles. But it is to doubt if these scientific results will change the image of the “sacred” cromlechs in the public reception. People’s longing for sacred, ancient sites is hard to change by scientific results.

9 ROMANCE AND THE STONES: UNPICKING INTERPRETATIONS OF IRISH MEGALITHIC MONUMENTS

Whitefield, Andrew (University of Galway)

In medieval Ireland, megalithic monuments were mainly of local interest. They were interpreted through folklore, which usually associated them with supernatural beings and mythical heroes. Superstitious beliefs often prevented the contents of the monuments from being looted, although many were quarried for stone. As land improvements gathered pace during the eighteenth century, the vulnerability of the monuments increased, particularly in prime agricultural areas. The Enlightenment inspired the founding of learned societies, such as Royal Dublin Society (RDS) and the Royal Irish Academy (RIA), which promoted technological and scientific progress, alongside cultural studies such as antiquarianism. Antiquaries travelled to ancient monuments producing sketches and plans, and acquiring artefacts. Large collections were amassed by the RDS and the RIA, as well as some wealthy individuals.

This ‘scientific’ interest in megalithic monuments was tempered by Romanticism. The monuments were attributed to wild Irish savages yet to benefit from the civilising influence of British colonists, or the fallen heroes of an ancient Irish civilisation, depending upon the opposing sympathies of the British administration and the majority Gaelic Irish population. As the Gaelic Irish middle classes expanded in the nineteenth century, Celtic nationalism began to depose colonial narratives, and ancient monuments were adopted as symbols of Gaelic (Catholic) Irish identity. This paper examines establishment of megalithic monuments as icons of national identity, and the legacy of their politicisation on current archaeological interpretations.

10 MULTIPLE NARRATIVES, MULTIPLE ITINERARIES: THE INDONESIAN MEGALITHS IN IOWA CITY, IOWA

Watts, Corinne (University of Iowa)

The reuse, reinterpretation, and reconfiguration of megaliths are often ongoing processes. These changes demonstrate how power structures impact our use and understanding of these spaces and materials through the control of archaeological material, narratives, and meanings. However, competing and changing narratives call into question the exact nature of these power disparities. In this paper, I consider the case study of fifty megaliths at Harvest Preserve, a private sculpture garden and nature preserve in Iowa City, Iowa. Around 3000 BCE, these megaliths were erected on the island of Flores, Indonesia, where they remained for several millennia. In the early 2000s, the owner of Harvest Preserve purchased these pieces through a Chicago-based art and antiquities broker and installed them in Iowa City. This removal and subsequent reinstallation reconfigures how we understand these megaliths, particularly given their new context alongside numerous art pieces and nature trails with only a short plaque to discuss their geographical origin. In this light, I discuss the official narratives of the Harvest Preserve megaliths, their changing interpretations, and the role these megaliths play in larger discussions about the global cultural heritage trade.

11 THE FAIRY TALES OF MEGALITHS: EXPLORING ALTERNATIVE HISTORIES BEYOND ARCHAEOLOGICAL NARRATIVES

Zaleskaya, Liudmila (University of Edinburgh) - Lilley, Kirsty (University of Edinburgh)

The construction and use of prehistoric monuments is a worthy subject of study in itself, but the biographies of these sites extend far beyond their ascribed archaeological or historical period. In Scotland and in Sardinia, the monuments of the Neolithic and Chalcolithic have held an important place in history, folklore, and belief since their creation, with these 'alternative' stories often superseding archaeological explanations in the public perception. Yet, they are often marginalised in scientific narratives put forward by archaeological practitioners, producing a singular view of 'the past'. Should we therefore strive to find ways to capture and incorporate multiple understandings of prehistoric sites? 'The past' is being continuously produced – but who creates it? And why?

Drawing on two case studies – the chambered cairns of Caithness and Orkney, and the architecturally-embellished rock-cut tombs or 'houses of the fairies' of Sardinia – this paper considers the place of these monuments in collective imagination, and their reuse in different periods. In particular, it explores the differential interpretations offered through time by communities and non-archaeologists, the associated folk stories and legends, and strands that appear to transcend cultural and geographical boundaries. In doing so, it reflects on the multiplicity of 'the past' and how we might do more to recognise the many authors who contribute to it, and the tangible implications this has for the present and future care of the monuments in question.

866 CURRENT RESEARCH IN THE AMERICAS. INTERDISCIPLINARY RESEARCH BETWEEN PAST AND PRESENT

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Torras Freixa, Maria (Boston University; IAUB, ERAAUB, Universitat de Barcelona) - Pecci, Alessandra (ERAAUB, IAUB, INSA-UB, Universitat de Barcelona) - Campiani, Arianna (Sapienza-Università di Roma) - Vidal Lorenzo, Cristina (Universitat de València)

Session format: Regular session

Organised by EAA4Am Community for the third consecutive year, this regular session will continue showcasing the vitality and diversity of ongoing archaeological, heritage and ethnohistorical research in the Americas. These past experiences were very successful and requested the need to have common spaces to share current research and create new synergies between scholars and institutions.

The 2024 Annual Meeting motto is 'Persisting with Change', a statement about the links between past and present. In this session, we will embrace this motto offering insights from past or ongoing projects in the Americas, with a special interest in interdisciplinary approaches. We invite researchers who investigate subjects related to archaeology, ethno-history or heritage to submit their contributions. We want to create an open and welcoming space where Americanists can share their work in an inclusive, diverse, and engaging environment. This session will allow us to discover new projects, discuss current theoretical debates and methodological approaches, and enhance collaborations with fellows. Furthermore, this session will help to raise visibility of American Archaeology in European contexts and promote the EAA Community for the Archaeology of the Americas. No restrictions of themes or chronological periods are settled. Also, we are equally interested in applicants working anywhere in Mesoamerica, South America, and North America, including circumpolar regions.

ABSTRACTS

1 PREHISTORIC COLOMBIA. A CONTRIBUTION TO THE STUDY OF MATERIAL CULTURE IN THE OLDEST ARCHAEOLOGICAL SITES

Muttillio, Brunella (Università di Siena) - Lembo, Giuseppe (Ministry of Education, Italy)

Colombia, with its strategic location, represents the gateway to South America, the last continent to be colonized by our species at the end of the Pleistocene.

Despite its crucial role in the international debate on the first peopling of South America, the prehistory of Colombia is an under-researched field, with early human evidence still subject to controversy.

In this context, we present the objectives and outcomes of an ongoing archaeological project in Colombia, supported by the University of Siena (Italy) and the Ministry of Foreign Affairs and International Cooperation of Italy, in synergy with several Colombian universities and institutions.

The aim of this archaeological project is to enrich our understanding of the prehistoric evidence in the Colombian territory, contributing to the broader debate on the earliest human settlement of the Americas.

Specifically, the project aims to analyse and review the material culture of the oldest and most important Colombian sites, dating back to the transition Pleistocene/Holocene (approximately 12,500 to 10,000 years ago).

Since its starting in 2013, the project has provided an innovative contribution to the analysis of the archaeological collections. The results achieved so far, presented in national and international journals and conferences, are of interest for the advancement of research throughout South America. Additionally, the establishment of stable collaborations with institutions in the host country that work on research, conservation, and enhancement of archaeological heritage is relevant.

Moreover, the establishment of enduring partnerships with local institutions devoted to research, conservation, and the promotion of archaeological heritage highlights the project's extensive impact and significance.

2 ARCHAEOLOGY OF SOCIAL REPRODUCTION ON THE COAST OF TARAPACÁ: UNVEILING THE SECRETS OF PUNTA LOBOS

González-Ramírez, Andrea (Universidad Austral de Chile) - Carracedo Recasens, Robert (Universitat Autònoma de Barcelona) - Flores Fernandez, Carola (Universidad Adolfo Ibáñez) - Saez, Aruro (Universidad Austral de Chile)

The Punta Lobos district, located on the coast of the Atacama Desert in Chile, was excavated in 2023 by the Archaeology of Social Reproduction group (ARRESO). New findings reveal occupational diversity reflecting different production and social reproduction strategies among the coastal hunter-gatherer societies of the Tarapacá region. These discoveries enhance our understanding of the social and economic dynamics in the hyper-arid Atacama Desert.

The main objective of the project is to archaeologically document and correlate the proliferation and concentration of settlements with the emergence of new social and political ties between inland and coastal groups. Diversity in the production and use of social space serves as an indicator of these social reproduction strategies, which tend to diminish during the Late Archaic and Early Formative periods, coinciding with a more pronounced architectural standardization in Loa River mouth, known as the "Caleta Huelén 42 pattern."

The documentation of repeated but ephemeral occupations in rock shelters or lens-shaped shell middens in the site suggests seasonal or logistical movements of groups organized by aggregation or kinship. However, we propose that occupations documented in mound-shaped shell middens, some of which exhibited robust habitation floors characteristic of tent-ring architecture, may indicate forms of semi-permanent or permanent habitation.

Punta Lobos stands out for its unique preservation and the abundance of artifacts made from perishable materials, providing a detailed insight into the life and activities of these coastal societies. Moreover, materiality shows that mobility was not limited to the coast but also included movements towards fog oases, water sources, and the Cordillera to obtain vegetal, mineral, lithic, and ceramic resources, revealing a complex network of interactions and economic complementarity strategies with inland territories.

3 ARCHAEOLOGY IN THE INLAND SEA OF ÚLTIMA ESPERANZA (MAGALLANES, CHILE)

Carracedo Recasens, Robert (Universitat Autònoma de Barcelona) - García Piquer, Albert (Universitat Autònoma de Barcelona) - Navarrete, Vanessa (Institución Milá y Fontanals de Investigación en Humanidades. Consejo Superior de Investigaciones Científicas) - Prieto, Alfredo (Fundación Prisma Austral) - García, Christian (Independent archaeologist) - Franch Bach, Anna (Centro Austral de Investigaciones Científicas. Consejo Nacional de Investigaciones Científicas y Técnicas) - Aguilera, Nelson (Corporación Nacional de Desarrollo Indígena (Chile)) - Palomo Pérez, Antoni (Universitat Autònoma de Barcelona) - Piqué Huerta, Raquel (Universitat Autònoma de Barcelona)

Since 2018 archeological research has been conducted in the inland sea of Última Esperanza, near Puerto Natales and the Gulf of Almirante Montt (Chile), led through collaboration between researchers from Catalonia and Chile. The focus of the current investigation spans occupations from the Middle Holocene to the mid-20th century in an area that has received limited investigation and remains largely untouched by recent human activity. The landscape is characterized by channels and mountain mazes where the canoe people inhabited until recent times.

The main objective of the research is to characterize and understand the adaptability and resilience of hunter-gatherer strategies in temperate-cold coastal environments. Our aim is to unravel and characterize their social organization, socio-economic system rooted in the utilization and exchange of marine and terrestrial resources, as well as their relationship with space and mobility in the Patagonian archipelago.

The results are promising due to the quantity and variety of occupations in the form of shell middens of different shapes and new chronologies across all surveyed areas. Additionally, the research has unearthed lesser-known phenomena such as the utilization of portage routes by indigenous communities, cultural marks of bark peeling in native forests, fishing corrals, and new settlement routes have been observed and are under current discussion. This entire archaeological landscape forms an incredible context that goes beyond geographical and cultural boundaries, holding significant theoretical and methodological relevance for the study of coastal hunter-gatherer societies, both in Europe and in other parts of the world.

4 TOWARDS AN IMPROVED UNDERSTANDING OF HUMAN-ENVIRONMENT INTERACTIONS DURING THE LATE HOLOCENE AND ANTHROPOCENE IN THE SOUTH-CENTRAL PERUVIAN ANDES

Branch, Nicholas (University of Reading) - Handley, Josephine (University of Exeter) - Meddens, Frank (University of Reading) - Silva, Barbara (Natural England) - Aramburu, Danna (National University of San Cristóbal de Huamanga) - Mitchell, Joe (University of Reading) - Vivanco, Cirilo (National University of San Cristóbal de Huamanga) - Woodcock, Katie (University of Reading)

We present radiocarbon dated palaeoecological data from two wetlands situated in the Chicha-Soras Valley, south-central Peruvian Andes. Tocotocosa is a geogenous mire with a sedimentary sequence spanning the last ~4000 years, whilst Laguna Tocsacocha is a partially infilled lake basin with a ~1700 year sediment record. Based upon analysis of their sub-fossil pollen, microscopic charcoal and sedimentology, supplemented by preliminary testate amoebae data from Tocotocosa, they collectively provide an important insight into the pre-Hispanic and later land use practices, including the utilisation and management of the wetlands for pastoralism. These data are integrated with archaeological records, and pedosedimentary and phytolith data from nearby agricultural terraces of Middle Horizon and Late Intermediate Period age, and palaeoclimatic data from Peru. This has enabled a comprehensive reconstruction of the relationships between the settlement history of the Valley, agro-pastoral farming and climate variability. Finally, we consider the implications of the findings for future water security and agricultural sustainability in the Peruvian Andes.

5 ANDEAN LANDSCAPE LEGACIES: COMPREHENSIVE DIGITAL MAPPING OF ANCIENT SETTLEMENT AND CONNECTIVITY AND ITS POTENTIAL FOR SUSTAINABLE HERITAGE FEATURES (NW ARGENTINA)

Lazzari, Marisa (University of Exeter) - Oltean, Ioana (University of Exeter) - Oyaneder, Adrian (University of Exeter) - Scattolin, Maria (Instituto de las Culturas (IDECU), UBA-CONICET) - Pereyra Domingorena, Lucas (Instituto de las Culturas (IDECU), UBA-CONICET)

The south-central Andes region provides an exceptional record of high-altitude settlement and circulation of humans, goods, animals, and plants at various spatial scales. These practices have long been the focus of researchers, often drawing on the region's rich historical and ethnographic record as inspiration for modelling the past. Such approaches have highlighted the uniqueness of the Andes region compared to other high-altitude mountainous environments of the world, yet the uncritical extension of some of these models to the distant past has unwittingly obscured the rich variety of indigenous ancient settlement and mobility strategies. As the region continues to be sought after for its mineral wealth, knowledge of its diverse range of human strategies of land use and mobility may not only help us to better understand the region's past and protect its heritage (understood broadly), but also help towards co-designing strategies for sustainable features with its inhabitants.

Building on earlier aerial and field-based mapping, our paper presents the results of the first comprehensive digital mapping of archaeological features visible on the western slopes of the Aconquija Sierra (NW Argentina, South-Central Andes, 66° 15' Long W; 27° 15' Lat S). We applied a multi-scalar methodology using interpreter-led assessment of freely accessible and commercial multispectral satellite imagery and DSM data, as well as of fieldwork including UAV photogrammetric surveys and excavations at key locations on key connecting routes. The potential of these activities to contribute to collaborative heritage protection will also be discussed in the presentation.

6 RECONSIDERING A PRE-INKA BORDER ZONE: NEW RESULTS FROM EXCAVATIONS IN THE FAR-NORTHERN REGION OF PIURA, PERU

Martini, Sarah (Anthropology Department, Yale University) - Nicolas Lorenzo, Dennis (Universidad Nacional Pedro Ruiz Gallo de Lambayeque, Peru)

Archaeologists have argued that the modern border zone between Peru and Ecuador formed a boundary between two cultural areas (the Central and Northern Andes) as early as the final millennium BCE. However, the regions of far northern Peru and far southern Ecuador are poorly understood and documented from an archaeological perspective, particularly in periods preceding the arrival of the Inka empire in the late 15th century CE. Furthermore, there is ample evidence of cross-"border" interactions expressed in the distribution of animals and their products outside of their natural geographic ranges, as well as similarities in styles and technologies of material culture. Against this backdrop and using a long-term historical perspective, we present the preliminary results of our excavations and material analyses of two pre-Inka sites from the far northern Peruvian region of Piura: the highland site of Cerro La Plaza (prov. Ayabaca) and the piedmont site of Las Pampas de Panecillo (prov. Morropón). Drawing on our reconstructed occupational sequence and record of various funerary contexts, we will locate the position and roles of both sites in the existing archaeological landscape. We will present evidence of interactions at various scales and evaluate the utility

of the borderland framework for conceptualizing the relationship between the Central and Northern Andean cultural areas and the lives of the "borderlanders" through time.

7 PRESENTATION OF THE PROJECT "SOUTHERN ECUADOR AND NORTHERN PERU AS AN ANDEAN INTERFACE (AD 500 - 1532)"

Lara, Catherine (UMR 8068 Technologie et Ethnologie des Mondes Préhistoriques, France; Institut Français d'Études Andines - IFEA) - Cardarelli, Lorenzo (Dipartimento di Scienze dell'Antichità, University of Rome La Sapienza; CNR - Istituto di Scienze del Patrimonio Culturale) - Lago, Giancarlo (University of Bologna, Department of Economics) - Montalvo, Carlos (Museo de Arte Precolombino Casa del Alabado, Ecuador) - Tacconi, Samuele (Sainsbury Research Unit, University of East Anglia) - Constantine, Ángelo (Facultad de Ciencias Sociales y Humanísticas, Centro de Estudios Arqueológicos y Antropológicos, Escuela Superior Politécnica del Litoral, Ecuador)

It is assumed that, at least from AD 500, the territory between what is now southwestern Ecuador and northwestern Peru would have become a key interface between the Central and Northern Andes, based essentially on an exchange circuit of *Spondylus* shell and metal artifacts.

However, questions remain about crucial elements related to the functioning of this circuit, such as the origin of these objects, the identity of those who worked them, the directionality of their movement in space and their production contexts.

On the other hand, it is not known who exactly inhabited the settlements in the study area: was it a homogeneous or heterogeneous cultural space, were these settlements independent occupations or a periphery subordinated to the surrounding socio-political formations?

The aim of this paper is to present our project that seeks to help clarify these questions, mainly from a technological study of metallurgical, ceramic and malacological artifacts from the study area.

8 THE FORGOTTEN COAST: RECONSTRUCTING THE SETTLEMENT HISTORY OF NORTHEAST HONDURAS

Reindel, Markus (German Archaeological Institute) - Lyons, Mike (University of Bonn, Department for the Anthropology of the Americas) - Martinet, Adrien (University of Bonn, Department for the Anthropology of the Americas)

In recent years, the Isthmo-Colombian Area has become a focal point of research in Central America. The transition zone to Mesoamerica and the Caribbean region is of particular interest. The Archaeological Project Guadalupe/Colón is reconstructing the pre-Hispanic settlement and cultural history of this long-neglected region in northeast Honduras. Through systematic surveys using modern methods of remote sensing (satellite imagery, SFM drone photogrammetry, LIDAR), traditional prospection and excavation methods, as well as typochronological and archaeometric analyses of artifacts, a growing corpus of foundational archaeological data is being compiled. In this overview, we present the results of surveys and excavations of three settlement phases: Cocal (1000–1525 AD), Selin (300–1000 AD), and Betulia (250 BC–300 AD). The survey area comprises the Atlantic coast, the Nombre de Dios coastal cordillera, and the Aguán Valley to the south, as well as the Islas de la Bahía off the northern coast. So far, 66 settlements have been documented, among which a lively economic and cultural exchange took place during the different settlement phases. The work is being carried out in close cooperation with the Pech and Garifuna communities in Guadalupe, where the results of the archaeological investigations have been exhibited in a local museum since 2023.

9 THE LATE PRECLASSIC USULUTÁN CERAMICS OF HONDURAS. A TYPOLOGICAL STUDY AND NEW PERSPECTIVES FROM THE NORTHEASTERN COAST OF HONDURAS

Martinet, Adrien (University of Bonn; German Archaeological Institute)

"Usulután Wares" is a commonly used umbrella term for multiple diagnostic ceramic types with linear resist decorations prominently featured in Late Preclassic to Early Classic (500 BC to 400 AD) sites from eastern El Salvador and western Honduras, and to a lesser extent from the Gran Nicoya region as well as from the Guatemalan Lowlands. Their area of distribution is traditionally referred to as the "Uapala Ceramic Sphere", with a core spanning from the Gulf of Honduras to the Gulf of Fonseca.

Despite their omnipresence throughout Upper Central American ceramic assemblages, our understanding of these "Usulután Wares" remains superficial, particularly the relationships between the different regional varieties. Recent petrochemical investigations have identified locally manufactured compositional groups outside of the core area of the "Sphere" as well as new sites with access to Usulután-style wares beyond its borders, highlighting the need for a reexamination of the "Sphere" itself.

One of those sites is Bétulia, on the northeastern coast of Honduras. This settlement is currently the only known Terminal Preclassic site (250 BC to 300 AD) in this region, bridging the gap in this area between the so-called Cuyamel

phase (ca. 1200 BC to 250 BC) and the Selin phase (300 AD to 1000 AD). Its material assemblage is distinctively Late Preclassic and indicates its integration into larger interaction networks of this period in the western part of Central America and in southern Mesoamerica.

This study presents a morphotypological classification of Late Preclassic Usulután-style wares in Honduras, allowing for a clearer picture of their spread, influence, and evolution across Upper Central America as well as situating Bétulia's assemblage in those interaction networks. Furthermore, it proposes a new "Uapala Ceramic Sphere", more in line with the latest research results.

10 ECONOMIC EXCHANGE NETWORKS IN NORTHEAST HONDURAS: AN ARCHAEOMETRIC APPROACH

Lyons, Mike (University of Bonn, Department for the Anthropology of the Americas)

Northeast Honduras represents a burgeoning center of archaeological research as appreciation grows for its position as a transitional zone between three major regions in pre-Hispanic Central America: Mesoamerica, Southern Central America, and the Caribbean. In my doctoral research as part of the Archaeological Project Guadalupe/Colón, an archaeometric approach is applied to better understand how the Cocal-period (AD 1000–1525) inhabitants organized their economic system in terms of production, distribution, and exchange. Over the last several years, our project has conducted extensive surveys throughout the area, documenting known settlement sites and registering new ones when possible. Ceramic samples were collected from each surveyed site, while clay samples were collected from nearby natural sources. Each sample has been analyzed with geochemical techniques, such as XRF and XRD, as well as via thin-section petrography. The preliminary results indicate a wide variety of petrofabrics, with some clearly local and others likely imported. Based on this data, regional groups of production can be identified in which clusters of nearby settlements likely produced pottery together, acquired material from the same sources, or depended on a single or few local producers. In turn, interaction between the settlements of regional groups can be detected via non-local ceramics. The result is a complex network of interaction spheres between the various pre-Hispanic inhabitants of the northeast Honduras region, with an emphasis on the island, coastal, and near-coast hinterland valley regions.

11 INTOXICANT CONSUMPTION IN THE PRECOLONIAL CARIBBEAN - HOW TO IDENTIFY PLANTS AND MODES OF CONSUMPTION THROUGH AN INTERDISCIPLINARY METHODOLOGY

López Aceves, Judith Margarita (University of Leicester)

My research is concerned with the study of drug culture and its representation in the precolonial Caribbean (ca. 1500 BC – 1492 AD). Specifically, my work aims to examine and identify the intoxicants consumed by the indigenous communities along the Caribbean Islands, their contexts of use, methods of consumption, and how these were part or creators of their cosmovision and identity.

This project works across anthropology, ethnohistory, archaeometry and archaeology. Through ethnohistory and anthropology, it is possible to recover the wide array of plants that were (and still are) integral to the daily lives of the peoples who inhabited the Caribbean. While incorporating analytical chemistry, metabolomics, and lipid analysis to identify the compounds from the residues obtained from drug paraphernalia, by comparing the obtained compounds to reference material from botanical collections.

A dialogue between these disciplines and the artefacts is necessary to reach the following objectives:

- To identify the different range of intoxicants consumed in the precolonial Caribbean
- To examine original contexts of use, including the materiality of practices associated with the consumption of intoxicants.
- To understand how Indigenous populations prepared, consumed, and valued these substances before the conquest.
- To recognize what drugs meant for the Indigenous populations (cosmovision).
- To compare between the data obtained by analytical chemistry to the information obtained through ethnohistorical sources.
- To contribute to the history of drug cultures in the Americas.

12 NEW INSIGHTS ON ANCIENT MAYA CUISINE THROUGH MICROBOTANICAL REMAINS AND IMAGING TECHNIQUES

Cagnato, Clarissa (Ca' Foscari University of Venice) - Ponce, Jocelyne (Tulane University) - Longo, Laura (Ca' Foscari University of Venice) - Prasek, Marko (Elettra-Sincrotrone SCpA) - Longo, Elena (Elettra-Sincrotrone SCpA) - Tromba, Giuliana (Elettra-Sincrotrone SCpA) - Parisatto, Matteo (Ca' Foscari University of Venice) - Bonetto, Alessandro (Ca' Foscari University of Venice) - Badetti, Elena (Ca' Foscari University of Venice) - Marcomini, Antonio (Ca' Foscari University of Venice)

The study of ancient cuisines, from the specific ingredients used to the manner in which these were prepared, are invaluable if we are to fully understand past societies. Although our comprehension regarding ancient Maya diets has greatly advanced in the last decade, many questions remain, especially with regards to the nuances of the plant-based part of the diet. In this paper, we present some of the advances that are currently being made thanks to the application of multidisciplinary techniques such as chemoprofiling, and imaging through synchrotron radiation micro-computed tomography (SR- μ CT) and Scanning Electron Microscope (SEM). We focus on two main datasets: 1) amorphous carbonized objects (ACOs) that typically lack identifiable components and thus end up classified as "unidentified" or "unknowns", and 2) microbotanical samples taken from the interior of ceramic vessels and from the active surfaces of grinding stones. In this work we present evidence for different processing techniques of maize –a staple crop that has been of nutritional, ideological, and economic importance in the region for centuries– and also discuss the potential of ACOs for a more encompassing understanding of diet and other plant uses by the Classic Maya (AD 250–900). We argue that these datasets should not be set aside: in fact, when they are analyzed using appropriate techniques these can provide novel information on the ingredients used and the ways in which foods were prepared by the ancient Maya.

13 ARCHAEOLOGICAL PROSPECTION IN A NEIGHBORHOOD IN THE CENTER OF TEOTIHUACAN (MEXICO). SEASON 2023-24

Pecci, Alessandra (ERAAUB; IAUB; INSAUB, Universitat de Barcelona) - Moragas, Natalia (ERAAUB, IAUB, Universitat de Barcelona) - Barba, Luis Alberto (LPA, IIA, UNAM) - Ortiz Butron, Agustin (LPA, IIA, UNAM) - Blancas, Jorge (LPA, IIA, UNAM) - Bernal, Itzayana (LPA, IIA, UNAM)

We present an update of an interdisciplinary project to study a neighborhood in the center of Teotihuacan (Mexico), started in 2017 in co direction between the UNAM (A. Ortiz, L. Barba) and the Universitat de Barcelona (A. Pecci, N. Moragas), focusing on the results obtained during the last seasons.

The project is aimed at investigating an area located in the center of Teotihuacan, Mexico, between the river San Juan, the Sun Pyramid and the Street of the Dead, named by Millon "sectors N2E1 and N2E2", through the application of geophysical prospection techniques (georadar, electrical and magnetic studies), topography, aerial photography with drone, the study of chemical residues on the surface and the registration of archaeological materials to locate structures and indicators of human activities. The data obtained until now in selected portions of the two sectors, are compared to the map proposed by Millon in 1973 and allow to suggest preliminary hypotheses about the presence of buildings, their distribution and depth and the relationship of this area with the San Juan River.

The project is financed by the Spanish Ministerio de Cultura y Deporte (Ayudas a proyectos arqueológicos en el exterior) and the Fundación Palarq, and it is part of the activities of the Laboratorio de Prospección Arqueológica of the UNAM, the Institut d'Arqueologia of the University of Barcelona and the ERAAUB research group (2021 SGR 00696) of the University of Barcelona.

14 AFTER CLASSIC TEOTIHUACAN: LIVING AMONG THE RUINS

Torras Freixa, Maria (Gerda Henkel Foundation; ERAAUB, IAUB, Universitat de Barcelona) - Moragas, Natalia (ERAAUB, IAUB, Universitat de Barcelona) - Pecci, Alessandra (ERAAUB, IAUB, INSAUB, Universitat de Barcelona)

In 2021, granted by Gerda Henkel Foundation, we started a research project oriented towards the study of Teotihuacan after its decline ("Living in the ruins of Teotihuacan"). The main goal is to understand and offer insights into how people lived in abandoned urban areas also called lost cities. Rather than looking for the reasons behind the collapse of the Classic period city, we have focused on re-settlement evidence, transformation of the urban built environment and creation of new interactions with its ruins.

The primary aim of this contribution is to describe and discuss some of the results of the project. Mainly through the analysis of archaeological evidence recorded in dispersed literature and salvage excavation reports, and Early Colonial documents, we have been exploring the city's decomposition after 550 CE. This approach gives us hints into how people lived among the ruins of Teotihuacan when its regional leadership seemed to have disappeared. In fact, after its decline, the urban landscape was re-used and re-designed by different settlers and time periods to the present day.

15 'MEGALITHIC' ARCHITECTURE AND THE EARLY CLASSIC PERIOD AT SANTA ROSA XTAMPAK, CAMPECHE: STATE OF THE ART

Paap, Iken (Ibero-Amerikanisches Institut, Berlin)

During the surveys to verify the LiDAR images of Santa Rosa Xtampak in 2022, we documented a pyramidal basement (Building No. 168) connected to the monumental centre of the site by a wide elevated causeway. Its structural characteristics are similar to what is commonly referred to as 'megalithic' or 'petenera' architecture in the Yucatan Peninsula, suggesting a Late Preclassic (300 BC-250 AD) or Early Classic (250-600 AD) date. Our excavations in 2023 showed that, in this particular case, it represents an architecture that seems to have been heavily modified in the Late Classic period, probably on the basis of an older structure. This specific result raises questions both about the definition and history of the so-called 'megalithic' architecture and about the evaluation of the Early Classic period, a period that at Santa Rosa Xtampak (as at other sites in the region) is still underrepresented in the corpus of archaeological evidence, especially with regard to the ceramic material.

16 THE PALACE OF THE SERPENT OR THE CHANGE OF THE GAZE

Munoz Cosme, Gaspar (Universitat Politècnica de València; Universitat de València) - Vidal Lorenzo, Cristina (Universitat de València) - Huchim Herrera, José (Instituto de Antropología e Historia de México) - Horcajada Campos, Patricia (Universidad Complutense de Madrid)

The research that began in 2023 on the building known as the Palace or Temple of the Serpent in the Maya city of Uxmal has revealed the evolution of its construction and its change in orientation: that is, from its initial westward orientation to an eastward one. The study has sought to identify a relationship between the geometric and visual axes and the powerful structure of the Quadrangle of the Nuns.

The volumetric and architectural data obtained from the first surveys are making it possible to investigate the formal and stylistic characteristics of this primitive building, located in the centre of El Conjunto de las Columnas (the Group of Columns), so called because of the columns on its western façade, and thus to propose some initial hypotheses regarding its stylistic ascription and the possible evolution of its construction. In the beginning it may have been a small building comprising one or two vaulted galleries, to which was later added an upper floor accessed via a large staircase and the expansion of the north and south wings. This process was linked to the urban evolution of the environment in the heart of the city of Uxmal.

17 INFRASTRUCTURE, GROWTH AND NEGOTIATION AT PALENQUE, MEXICO: THE LATE CLASSIC BUILT ENVIRONMENT OF A MAYA CITY

Campiani, Arianna (Sapienza University of Rome)

During the Late Classic period of Mesoamerica (600-900 CE), Palenque was a busy Maya city able to concentrate events and peoples. In the VII-VIII centuries, more than eight thousand people were living and interacting within its limits. The daily interchange of persons and experiences was happening between city inhabitants, the people coming from its outskirts and beyond, but also at a more intimate level in the Palenque neighborhoods. For centuries, the Palenque environment was shaped by generations of inhabitants to sustain the actions and interactions of people and things, eventually leading, in the VIII century, to the city form we still appreciate today. In this paper, I will focus on three characteristics of Palenque urban form, its infrastructure, circulation, and neighborhoods. I consider that these interconnected features are able to highlight how city spaces were conceived, modified or used to promote or prevent movement, actions and interactions. Thus, their study bespeaks of city planning, and of the way spaces were designed to reinforce inclusion and seclusion, mainly in response to political and social agenda.

18 CHICHEN ITZA 3D ATLAS - CHANGE DETECTION, VISUALIZATION, AND ARCHIVAL SYSTEMS ENABLING MULTI-SCALAR AND MULTIDISCIPLINARY ANALYSIS AND COLLABORATION

mcavoy, scott (Cultural Heritage Engineering Initiative - University of California San Diego; OpenHeritage3D.org) - Rissolo, Dominique (Cultural Heritage Engineering Initiative - University of California San Diego; Scripps Center for Marine Archaeology) - Stanton, Travis (University of California Riverside) - Osorio León, José (Instituto Nacional de Antropología e Historia (INAH)) - Pérez Ruiz, Francisco (Instituto Nacional de Antropología e Historia (INAH)) - Kuester, Falko (Cultural Heritage Engineering Initiative - University of California San Diego)

Advances in 3D digitization and visualization technologies allow us to capture, contextualize, and analyze artifacts within site-wide LiDAR and aerial photogrammetry, and feature specific terrestrial/mobile LiDAR. In this project the authors extend a large scale interactive digital archive and web visualization framework enabling a fusion and contextualization of site, feature, and artifact data. This framework has been employed to enable collaboration between archaeologists, scientists, engineers, historians, and other specialists.

Chichen Itza is an extensive site containing a vast and distinctive corpus of monumental architecture, stone iconography, and painted murals. Since its initial excavation in 1913, artifacts have distributed widely between museum collections. Many are housed within the former Chichen Itza Museum, the Palacio Cantón Museum in Mérida, the Gran Museo del Mundo Maya in Mérida, and the Chichen Itza INAH archaeological camp. In 2005, CyArk undertook a comprehensive terrestrial LiDAR scan of 6 key structures. In 2014, 2017, and 2022 the National Center for Airborne Laser Mapping (NCALM) at University of Houston conducted aerial LiDAR surveys of the site and surrounding area. These LiDAR surveys provide a geo-reference to align all datasets. In 2018 and the Cultural Heritage Engineering Institute (CHEI) at UC San Diego, partnering with the Instituto Nacional de Antropología e Historia (INAH) Yucatan, performed 60 complementary large site and feature scale photogrammetric surveys contributing to the analysis of architecture and iconography within the Initial Series Group. In 2023, CHEI and INAH undertook three more field seasons, capturing 17 more structures via photogrammetry, 21 structures, substructures, and caves with mobile LiDAR, and over 200 artifacts, sculptures, inscriptions, murals, and rooms, using a sub-millimeter resolution structured light scanner. These datasets are joined together within a single collection, and made accessible online. We present this framework, along with several high-impact case studies for the use-and re-use of these data.

19 INITIAL INVESTIGATIONS INTO ANTHROPOGENIC LANDSCAPE MODIFICATIONS ON OSSABAW ISLAND, GEORGIA, UNITED STATES

Thompson, Amanda D. (University of Georgia) - Holland-Lulewicz, Isabelle (The Pennsylvania State University) - Holland-Lulewicz, Jacob (The Pennsylvania State University) - May, Kenzie (The Pennsylvania State University) - Keenan, Matthew (The Pennsylvania State University)

Ossabaw Island, Georgia in the southeastern United States contains an approximately 4 millennia long history of complex socio-ecological legacies during which Indigenous peoples sustainably managed and exploited Ossabaw's estuarine landscapes. Recent work demonstrates the presence of a canal system used during the island's Euro-American plantation-era economy, primarily for field irrigation but the timing of the initial construction of these features is largely unknown. Because Indigenous canal construction and anthropogenic landscape modification is present elsewhere across the Southeast, this paper offers preliminary investigations into newly identified anthropogenic landscape modifications identified and investigated through the use of historic maps, LiDAR, sediment coring, loss-on-ignition analyses, and AMS radiocarbon dating. These histories provide an excellent locale for the examination of how Plantation era occupations made decisions about landscape use. Indigenous management of the landscape likely heavily influenced and structured Euro-American settlement decisions, consciously or subconsciously. This work presents an overview of our recent work into these anthropogenic landscape modifications.

20 THEIR „TRADITIONAL ENEMIES“ - HOW THE SPANISH INTRUSION CHANGED THE RELATIONSHIP BETWEEN THE PUEBLO AND THEIR NEIGHBORS

Lewandowska, Magdalena (Jagiellonian University, Institute of Archaeology)

19th and 20th century ethnographical sources about the Pueblo people of the North American Southwest leave no doubt who their "traditional enemies" were: the Navajo, the Apache and other nomadic groups from the Great Plains. Specialized hunters who constantly tormented the Pueblo with raids, not giving them even a moment of respite. To quote one Taos Pueblo informant, questioned by Elsie Clews Parson: "They [the Navajo] were the worst.

Yet Spanish historical sources paint a completely different picture. While some raids did take place during early colonial times, the relationship between Pueblo and hunters from the Great Plains was often described as amicable. They've traded regularly to the point of creating a mutualistic exchange system and some Pueblo sought refuge with neighboring nomads – a good example of which is the El Cuartelejo site in central Kansas where the Apache and the Pueblo co-existed in one community in the second half of the 17th century.

So why has this relationship changed so dramatically in just two centuries? How did the Spaniards' intrusion into the Southwest disrupt a new macro-regional system that emerged after the 15th century? What role did the slave trade they introduced played in these changes? And what was the truth behind the relationship between the Pueblo and their "traditional enemies"?

The aim of this paper is to present the Pueblo and their neighbors' relationship in light of both archaeological and historical sources, as well as to demonstrate how Spanish arrival changed the whole dynamic in the North American Southwest.

21 MAPPING THE RELATIONSHIP OF THE SPANISH EMPIRE AND THE CARIBBEAN IN THE 16TH-18TH CENTURIES: CERAMIC ANALYSIS FROM CARTAGENA DE INDIAS

Pujals Blanch, Sonia (University of Barcelona) - Buxeda i Garrigós, Jaume (University of Barcelona) - Mentésana, Roberta (University of Barcelona)

Cartagena de Indias, in modern-day Colombia, was strategically located within the network of routes connecting the American continent to the Spanish metropolis. Originally a hub for looted resources from indigenous groups along the Caribbean, it later transformed into a colonial trade port connecting Europe and the Americas. Shaped by indigenous, creole, and colonial influences, the study of ceramics from Cartagena offers a unique view into the everyday life and practices, beliefs, and needs of the communities involved in their production, trade and use. This paper explores the impact of European colonialism in the Colombian Caribbean region through a study of post-contact ceramics from Cartagena de Indias. The research involves the analysis of ceramics from indigenous, European, and Creole traditions. Materials were sampled from a conventual (Convento de San Francisco), a military (Batería de San Ignacio), and a domestic (Museo del Oro Zenú) archaeological contexts. The techniques employed include X-ray fluorescence (XRF), X-ray diffraction (DRX), optical microscopy (OM), scanning electron microscopy (SEM), and energy-dispersive X-rays (EDX). Archaeometric characterization of these ceramics, primarily serving as transport ware, tableware, and domestic ware, such as bacines, lebrillos and candle holders, would allow us to reconstruct their manufacturing technology and provenance. The TecnoColonial project, of which this research is part of, incorporates a vast amount of archaeometric data from this context. Subsequent comparative analysis with its database would facilitate contextualizing these artefacts within the broader framework of the Spanish Atlantic trade with the Americas. This research is expected to help us in mapping the socioeconomic relations in the Caribbean and giving insights on the technological interinfluence between the Spanish and indigenous groups. Moreover, recognising pottery as a repository of traditions and cultural identities, the examination of these materials would enhance our understanding of the cultural dynamics and societal changes driven by Spanish colonialism in this region.

22 TRACKING THE EXPLOITATION OF MARINE RESOURCES IN POST-COLONIAL BRAZIL THROUGH CHEMICAL ANALYSIS OF POTTERY

Di Muro, Alice (Institute of Environmental Science and Technology (ICTA) and Department of Prehistory, Universitat Autònoma de Barcelona, Bellaterra, Spain; BioArCh, Department of Archaeology, University of York, UK) - Admiraal, Marjolein (BioArCh, Department of Archaeology, University of York, UK) - Fossile, Thiago (Institute of Environmental Science and Technology (ICTA) and Department of Prehistory, Universitat Autònoma de Barcelona, Bellaterra, Spain) - Borba, Fernanda Mara (Museu Arqueológico de Sambaqui de Joinville, Brazil) - Alves, Maria Cristina (Museu Arqueológico de Sambaqui de Joinville, Brazil) - da Rocha Bandeira, Dione (Museu Arqueológico de Sambaqui de Joinville, Brazil) - Craig, Oliver Edward (BioArCh, Department of Archaeology, University of York, UK) - Colonese, André Carlo (Institute of Environmental Science and Technology (ICTA) and Department of Prehistory, Universitat Autònoma de Barcelona, Bellaterra, Spain)

The Atlantic Forest coast of Brazil provided the arena for the first contact between Europeans, African slaves and native South Americans, together with the introduction of non-native crops and livestock and the establishment of one of the world's largest agricultural economies. In the post-colonial era (19th and early 20th centuries), new elites and economic forces emerged around coffee plantations, marking a pivotal moment in Brazilian history. Its coastline served as the country's primary gateway to globalisation, but little is still known about the coastal communities that contributed to the cultural diversity and economic resilience of early modern Brazil. These communities were primarily composed of small-scale fishers and farmers, who constitute some of the historically neglected population in the country. Ceramic artefacts are some of the most abundant remains in archaeological sites in coastal Brazil, and molecular studies have shown their potential for reconstructing past economies and ways of life in pre-colonial societies. Molecular studies, however, have never been performed on ceramic artefacts to enhance our understanding of post-colonial populations, their subsistence systems and livelihoods. In this study, we used organic residue analysis of household cooking pots from late 19th and early 20th century archaeological sites in Babitonga Bay (Santa Catarina), southern Brazil. Through the application of gas chromatography and stable isotope techniques on lipid residues extracted from dozens of ceramic artefacts, our results reveal a great diversity of foodstuff processed at these sites, from marine resources to agricultural and terrestrial mammal products. Furthermore, a comparative analysis of the lipid residue data from pre-colonial and post-colonial contexts shows a complete shift in the use of pottery and types of products processed. This is the first systematic study applying organic residue analysis in historical pottery in Brazil, and showcases the untapped potential of this source for historical information.

23 THE INVISIBILIZATION OF WOMEN IN THE ARCHAEOLOGICAL AND DOCUMENTARY RECORD OF CONTINENTAL PATAGONIA

Sacchi, Mariana (Universidad Católica de Temuco, Carrera de Arqueología, Chile; Universidad de Buenos Aires, Facultad de Filosofía y Letras, Argentina) - Saletta, María (Universidad Nacional de La Matanza)

In this paper, we propose to explore how Western systems of representation, both writing and archaeology, have subordinated the role of Tehuelche/Aonikenk women, through the invisibility of their work and the artifacts that they used. Systematic analysis of information provided by 46 authors that traveled across Southern Argentine and Chilean Patagonia from the 16th to the 20th century allows us to infer the differential patterns of representation among the tasks performed by indigenous men and women. The goal is to discuss this type of underrepresentation of work assigned to women in the written record in comparison with the overrepresentation of artifacts associated with some of those tasks in the archaeological record. We analyze the results obtained by analyzing ethnographic sources and different archaeological sites (published in journals, congresses and workshops) with chronologies from the post-contact period (16th to 20th centuries) in southern Continental Patagonia. For the written record, we will analyze quantitatively the mentions of the tasks performed by women in the manufacture and/or use of lithic and/or vitreous artifacts related to leatherwork. As for the archaeological record, we analyze the N and proportion of endscrapers and sidescrapers present in the sites. The focus is on certain industrial raw materials as indicators of mobility and the analysis of the formation processes in the written record using a gender perspective. Finally, it is considered that the underrepresentation of roles and tasks associated with women in the written record and its understanding through theoretical frameworks of structural archaeology can help us consider roles and tasks related to gender that can be considered beyond the ethnohistoric past and, consequently, can be used to analyze and interpret the pre-contact archaeological record.

24 EVERYDAY LIFE IN THE TROPICS CONTEMPORARY ARCHAEOLOGY AND THE SWEDISH IMMIGRANT COLONY IN BAYATE, CUBA (1905-1920)

Karlsson, Hakan (University of Gothenburg, Department of Historical Studies)

Swedish emigration to the US during the second half of the 19th century and the beginning of the 20th century is well documented by historians and statisticians, but this is not the case with Swedish emigration to Cuba, which is largely unknown. The paper introduces the contemporary archaeological project 'The Swedes in Bayate, Cuba. A forgotten emigration history', and the results of the fieldwork, carried out during 2022-2024, directed towards the material and immaterial remains of the former Swedish emigration colony of Bayate (existing between 1905-1920, in the province of Santiago de Cuba). The project uses a combination of historical, archaeological, anthropological, and botanical source materials, and the work carried out will be exemplified with building remains and artefacts from the colony, that gives us information about the social and material aspects of the everyday life of the Swedish colonists. This with a focus on their construction of identities owed to their cross-cultural interactions with the Cuban society, and how this interaction, in parallel, led to social and material continuity and change.

870 PRESTIGE AND LUXURY GOODS: A MATERIAL APPROACH TO GIFT GIVING AS A TOOL FOR DE-ESCALATION

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Andersen, Anna-Theres (ROOTS Cluster of Excellence, Kiel University; Leibniz Institute for the History and Culture of Eastern Europe (GWZO)) - Schneeweiß, Jens (ROOTS Cluster of Excellence, Kiel University; Centre for Baltic and Scandinavian Archaeology (ZBSA)) - Hardt, Matthias (Leibniz Institute for the History and Culture of Eastern Europe (GWZO)) - Zovko Sostaric, Valentina (Department of History, University of Zadar) - Lund, Julie (Department of Archaeology, Conservation and History, University of Oslo)

Session format: Regular session

In the field of conflict archaeology, research has mainly focused on material traces of violent encounters, leaving the quieter, but equally crucial, narratives of peaceful conflict resolutions on the sidelines. As mechanisms for alliance-building and peace negotiations, various de-escalation strategies have been used to stabilize relations by past societies. One of the strategic tools was the mutual exchange of valuable luxury goods, which has already been traceable in the early Middle Ages and is still observable today as the diplomatic gift exchange.

These gifts can be defined by certain characteristics, like uniquely styled artefacts, a high intrinsic value of materials, and high-quality craftsmanship. In this context, some groups of objects such as arm and neck rings, exotic animals, as well as precious textiles, among others, were particularly suitable as gifts. Gift-giving in intercultural contexts, often intertwined with the art of negotiation, holds the power to soothe tensions, foster goodwill, and engender peaceful coexistence between diverse entities, be they kingdoms, nations, or individuals.

This session explores the material perspective of social processes of negotiation, such as the practice of mutual gift exchange in past societies, by examining objects and/or places suitable for those collective actions of de-escalation.

As organisers, we warmly invite speakers with contributions from various epochs, backgrounds and geographical spaces, offering insights into peaceful conflict resolutions and their material traces.

ABSTRACTS

- 1 GIFT EXCHANGE - A KEY CONCEPT FOR EXPLAINING POLITICAL AND MILITARY RELATIONSHIPS IN PRE-MODERN TIMES?**
Hardt, Matthias (GWZO)
In the archaic world, the exchange of gifts was used both between the leaders of different communities and within individual groups to visually define rank as well as superiority and inferiority. The Roman and Byzantine emperors also used this system to organize their relationships with foreign groups outside and inside the borders of the empire. They used their immense reserves of precious metals from war, tax and fee revenues as well as the workshops of the Comes Sacrarum Largitionum and became role models for many barbarian kings and princes who also had access to such treasures. The lecture will use selected written records (Cassiodorus, Gregory of Tours, Liutprand of Cremona, Gallus anonymus) and archaeological finds (Childeric's grave at Tournai; Sutton Hoo) to illustrate the effectiveness of the exchange of gifts in structuring political relations in the first millennium AD and discuss it on the basis of its classification in ethnological theories (Marcel Mauss, Claude Levi-Strauss).
- 2 BRONZE AGE DIPLOMACY: GIFT-EXCHANGE AND RELATIONAL NARRATIVES**
Melheim, Lene (Museum of Cultural History University of Oslo) - Neumann, Iver (Museum of Cultural History University of Oslo; Fritjof Nansen Institute)
Bronze Age diplomacy is lively described in Mesopotamian, Hittite and Egyptian sources. From the vantage point of the Nordic Bronze Age, interaction between different polities has generally been referred to as political alliances, or, more specifically as guest-friendship (*xenia*). Diplomacy is, however, seldom discussed, and if at all, only in passing. Attempts at explaining how chiefly confederacies in northern Europe interacted with urban states in the Mediterranean region, have instead highlighted gift-giving and trade.
Our point of departure is that warfare and diplomacy are mutually constitutive. Diplomacy includes threats to go to war and takes some of its energy from perceived needs to avoid warfare. Warfare on the other hand, comes with expectations of how diplomacy will work when the war has ended. Bronze Age diplomacy must therefore be understood against the backdrop of martial innovations and increased militarization. But it was also a driver for exchange.
By combining archaeology with insights from the political sciences, this paper argues that diplomacy is an overlooked institution in prehistory, of major importance to understanding how Bronze Age communities forged and curated relations with other polities. Diplomatic systems rest on metaphors related to religion and kinship, the key underlying narrative being that sovereigns and eventually entire nations can be classified as kin. In order to better understand how outsiders can be conceptualized in the context of premodern diplomacy, we use Marshall Sahlins' concept of narrative sociability from "Historical Metaphors and Mythical Realities" (1981). We also argue that in the construction of such relational narratives, material culture and exotic gifts played a crucial role.
- 3 LASTING RELATIONS? SOCIAL VALUES AND TEMPORAL ASPECTS OF GIFT GIVING IN EARLY AND LATE IRON AGE SCANDINAVIA**
Lund, Julie (Department of Archaeology, Conservation and History, University of Oslo)
The paper explores two cases of gift giving and their social and material implications. Whereas analyses of social memory are often utilised to explore questions of social identities within a social group, the examination of gift giving may also throw light on the social relations between social groups. A group of Roman Period graves with Roman import points towards gift giving as a means of producing social bonds of alliances in line with previous analyses. The afterlife of this social relationship and of their affective dimensions have however not previously been examined. This case study provide insight into the length of such social obligations and their temporal and affective dimensions. The second case study examines a Viking Age hoard which contained objects presumably obtained through gift giving. The treatment of artefacts in this hoard points towards the changing social value of the objects, as they moved from one cultural context to another. The paper examines the social consequences that the alteration of value had for the social relations created by the gift giving. Further, it examines the temporal aspects of social relations created through gift giving and their potential to cause social effects.

- 4 BRONZE VESSELS FROM THE ROMAN PERIOD FROM THE SEAT OF THE ELITE IN ZOHORE AS AN INDICATOR OF ROMAN-BARBARIAN RELATIONS**
Elschek, Kristian (Archaeological Institute of the Slovak Academy of Sciences) - Jilek, Jan (Department of Archaeology und Museology, Masaryk university, Brno, CZ)
The Zohor site in SW Slovakia is located 14 km north of the Roman border at the Danube and about 25 km from the capital of the Roman province Pannonia - Carnuntum. The site represents the seat of the Marcomanni and Quadi elites of the Early Roman period from the 1st and 2nd centuries AD. To this central settlement and princely seat belonging rich elite graves, rich urn graves, many dwellings, pits, production objects of special function, ovens for ironworks, a deposit, a sepulchral object and especially a large number of Roman products. To this belonging bronze and luxury silver vessels, millefiori and terra sigillata vessels, gold and silver bracelets, gold and silver fingerings, fibulas, numerous silver and bronze coins, mirrors and Roman weapons. The aim of this paper is to show what role this site, which can be called a "port of trade", played in Roman-Barbarian relations. A suitable indicator are the bronze, silver and glass vessels which play a key role at this site on the Amber Road.
- 5 WARLORDS BENEATH THE SOIL: LEGACY OF PRESTIGE IN GRAVES WITH WEAPONRY ACROSS CENTRAL EUROPE DURING LATE ANTIQUITY**
Hrušovská, Barbora (Masaryk University)
Gift-giving as a tool of increasing prestige, rather than material gain, has been extensively studied in the contexts of Antiquity and the early Middle Ages. Grasping the intentions of donors and motivations of recipients remains archaeologically challenging, sparking inquiries into economic, and more precisely, political advantages, along with potential commitments by recipients. Based on the analysis of graves containing weapons from the 5th and 6th centuries in wider Central Europe, as part of a student's dissertation, this contribution aims to provide insight into the current interpretative possibilities and approaches to the question of luxury grave goods, particularly in connection with specific weaponry. For the purposes of a controlled comparative analysis, some burials without weapons will also be examined. Building on the aforementioned, luxury items will be considered as a possible ultimate reflection of known political gift-giving practices, while acknowledging the potential for alternative reasons for placing objects in graves. The primary goal of this contribution is to elucidate the social dimension of this activity, especially in graves often interpreted as 'warrior graves', however, current archaeology allows for a broader range of explanations and interpretations. Given that the presence of luxury goods in a grave indicates a presumed acceptance of a 'gift', it could be a certain expression of the will to build political relationships or structures as part of representing alliances. Moreover, since burials were usually public and somewhat ceremonial events, they provided donors with a suitable opportunity to demonstrate political commitments through gift-giving.
- 6 (EXOTIC) ANIMALS AS GIFTS IN DIPLOMATIC AFFAIRS?**
Schmölcke, Ulrich (Leibniz-Zentrum für Archäologie, Center for Baltic and Scandinavian Archaeology (LEIZA-ZB-SA), Schleswig, Germany) - Grimm, Oliver (Leibniz-Zentrum für Archäologie, Center for Baltic and Scandinavian Archaeology (LEIZA-ZBSA), Schleswig, Germany) - Yanish, Yevheniia (National Academy of Sciences of Ukraine, I. I. Schmalhausen Institute of Zoology)
Sometimes archaeological finds from prehistoric settlements contain the remains of animals that were not occurring in the region. The question arises as to what these "exotic" animals are all about. One option is that they were princely gifts brought by delegations from other parts of Europe. In the case of the aurochs, this is well documented during the early modern period - shortly before the species became extinct. We will explore this scenario in our paper with a particular focus on the Viking Age (800-1100 CE). In one case we will examine the discovery of a southern European species, the peacock, in Viking Age Norway, in a second case we will examine evidence of Scandinavian species in south-eastern Europe (falcons, walrus). We will also investigate the distribution of camels in early medieval centres of power. Our contribution will be rounded off by a look at historical sources. There, too, animals are sometimes mentioned as expensive and valuable diplomatic gifts.
- 7 UNRAVELING DIPLOMATIC STRATEGIES IN EARLY MEDIEVAL RUS': A CASE STUDY OF GIFT EXCHANGE AND DYNASTIC ALLIANCES**
Andersen, Anna-Theres (ROOTS Cluster of Excellence, Kiel University)
Diplomatic gift exchange and dynastic marriages have been recognised as crucial tools for forging alliances and stabilizing relations among political actors, shaping the socio-political landscape of early medieval societies. Despite their importance, limited archaeological studies have focused on these aspects.
This paper investigates the complex relationship between diplomatic negotiations, dynastic marriages, and gift exchange during the 9th and 10th centuries AD within the Rus'. This region served as a crucial transit zone for diverse

interconnected political entities spanning from the Baltic to the Black Sea. Although the Rus' had no written records of their own at this time, historical reports from their political partners provide insights into the highly ritualised court ceremonial, strategically planned marriages and diplomatic gift exchanges. Drawing upon both historical sources and archaeological evidence, this study illuminates the material manifestations of diplomatic interactions and dynastic marriages between the Rus' and their political partners.

Through a detailed examination of expected artefacts in diplomatic contexts, this case study sheds light on their significance and symbolic value. This research contributes to our understanding of diplomatic practices in early medieval societies, emphasizing the crucial roles played by diplomatic gifts and dynastic marriages in maintaining stable political alliances.

8 DIPLOMATIC GIFT EXCHANGE IN BYZANTIUM

Liveri, Angeliki (Independent Researcher)

This paper presents a selection of gifts exchanged between Byzantine and foreign dignitaries/officials in the West and East. We aim to demonstrate the offered gifts and their importance and significance for the contracting parties, focusing on silk textiles and clothes, jewellery (e.g. crowns) and other luxury objects. We will address the following topics: a) The leaders who had the initiative for these acts (emperors, kings, other officials or rulers), their envoys or ambassadors who undertook to carry out the mission. b) The places where took places the exchange. c) The goods/gifts and the aim of their offering. d) Where possible the contribution of these gifts to the relations between the countries. The gifts vary: from animals, luxury objects/goods (jewellery, silk textiles and clothes, relics and reliquaries etc.) to books and letters. The type of gift depended on the purpose and the person to whom it was offered. We will classify the gifts according the type and the date, the region (Europe-Asia or West-East) and the religion of the parties. We will combine literary sources and archaeological evidence.

9 LATE MEDIEVAL DUBROVNIK'S MATERIAL PERSPECTIVE ON DIPLOMATIC AMITY AND ANTAGONISM

Zovko Šoštarić, Valentina (University of Zadar)

The Republic of Dubrovnik in the Late Middle Ages did not possess significant military power; instead, its survival and further development were built upon a diplomatic network of alliances. However, in certain situations, tensions arose in relations with former diplomatic allies, sometimes leading to open warfare. In this regard, this presentation analyses the role of material artifacts in maintaining established connections and explores how diplomatic gifts were utilized when these relationships were strained or perhaps entirely severed, necessitating their re-establishment.

Special emphasis is placed on diplomatic gifts utilized for conflict resolution, encompassing their type, origin, production methods, as well as their artistic, economic, religious, and emotional value. This analytical framework is designed to provide a more profound understanding of the complex relationship between material reality and diplomatic friendships and conflicts. Through a nuanced interpretation of these factors, the study aims to gain deeper insights into the successfulness of Dubrovnik's authorities in navigating these complexities and discern whether they formulated specific strategies during this processes.

Interpretation will be based on several case studies reconstructed from archival series preserved in the State Archives in Dubrovnik. Specifically, these studies will primarily focus on administrative records and instructions sent by authorities to their ambassadors, who were authorized to represent them before influential political figures during the 14th and 15th centuries.

871 NOT JUST WEAR: THE SYNERGY OF TRACE ANALYSIS WITH OTHER DISCIPLINES AND NON-INVASIVE TECHNIQUES IN ARCHAEOLOGY

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Lemorini, Cristina (Sapienza University of Rome) - Venditti, Flavia (Tubinga University) - Caricola, Isabella (Haifa University)

Session format: Regular session

Trace analysis stands as a well-established methodology, contributing significantly to the interpretation of socio-cultural and economic aspects within ancient communities.

Understanding the importance of wear on the surfaces of archaeological remains —linked to technological and functional aspects— involves using shared protocols. These protocols include standardized procedures for both macroscopic and microscopic observation. Notably, over the last decade, there is been a growing emphasis on applying additional quantitative methods. These methods specifically investigate details of the microtopography related to wear.

While trace analysis can be individually applied to study archaeological remains, its value as an independent, non-invasive, and non-destructive analytical method is maximized when combined with other independent analyses (such as residue analysis, technological analysis and raw material studies) and/or related disciplines (including zooarchaeology, paleobotany, and anthropology). This holistic approach not only strengthens confidence in the interpretation of traceological results but also enhances the reliability of archaeological interpretations.

This session is aimed to involve the participants to discuss about:

1-the integration of traceological studies with other disciplines and/or techniques as an avenue for methodological improvements;

2-the benefits of using traceology integrated with other methodologies to identify and interpret the archeological evidence;

3-the limits and the critical aspects of combining different approaches and the suggestions for overcome these constraints.

We invite scholars to present cases studies from Paleolithic to Medieval Era dealing with multidisciplinary methodologies including macro and microscopic analysis of technological and/or functional aspects of material culture. We encourage contributions exploring materials beyond stone, such as ceramics, metal, hard animal materials, wood, and glass. Additionally, we invite submissions covering diverse surfaces, ranging from objects and artwork to architectural features.

ABSTRACTS

1 QUALITATIVE AND QUANTITATIVE NON-INVASIVE TECHNIQUES FOR THE STUDY OF USE-WEAR: APPLICATION TO LOWER PALEOLITHIC CHIPPED AND PERCUSSIVE STONE TOOLS

Lemorini, Cristina (Dep. Science of Antiquities, Sapienza University of Rome, Italy) - Germinaro, Luigi (Dep. of Geosciences, Padua University, Italy) - Ryder, Spencer (Dep. of Geosciences, Padua University, Italy) - Caricola, Isabella (Zinman Institute of Archaeology, University of Haifa, Israel) - Mazzoli, Claudio (Dep. of Geosciences, Padua University, Italy) - Finestone, Emma (Cleveland Museum of Natural History, Cleveland, USA) - Plummer, Tom (Department of Anthropology, Queens College, CUNY, NY USA) - Gopher, Avi (The Sonia & Marco Nadler Institute of Archaeology, Tel Aviv University, Israel) - Barkai, Ran (The Sonia & Marco Nadler Institute of Archaeology, Tel Aviv University, Israel)

Functional studies of archaeological artifacts benefit from the qualitative investigation of use-wear through the application of various non-invasive techniques based on optical (OM), digital (DM), SEM, and confocal microscopes, possibly coupled with micro-photogrammetry and 3D laser scanning. In the last decade, the increasingly frequent application of non-invasive quantitative techniques to the study of use-wear has been supporting the qualitative investigations for exploring past human behavior. Despite the technological progresses, the quantitative approach still faces several limits and has been applied mostly to experimental replicative materials so far. This contribution illustrates benefits and issues of the integration between the qualitative and quantitative approach, combining OM, DM, and SEM observations with 3D optical profilometry for the study of stone tools from the Late Lower Paleolithic and Early Stone Age. The selected archaeological materials include chipped flint blades from Qesem Cave in Israel (400-200 Ky) and percussive stone tools from Nyayanga in Kenya (3.032-2.581 Ma). Qualitative microscopic observations revealed on both assemblages use-wear patterns related to the processing of animal tissues and plants materials. The surface topography of the artifacts was investigated through the creation of 3D models and the quantification and statistical processing of their morphometric parameters, which were then matched with the qualitative results. The potentialities of profilometry for the textural quantification of different archaeological materials as integration to the qualitative approach are discussed, while highlighting the urge for standardization of analytical protocols and methods of data treatment.

2 COMBINING FUNCTIONAL AND TECHNOLOGICAL ANALYSIS TO INVESTIGATE THE ROLE OF CARINATED ARTIFACTS AND END-SCRAPERS IN THE AURIGNACIAN OF VOGELHERD CAVE

Schürch, Benjamin (University of Tuebingen) - Rots, Veerle (Université de Liège) - Conard, Nicholas (University of Tuebingen; Senckenberg Centre for Human Evolution and Palaeoenvironment)

The identification of cores and tools is essential for interpreting lithic assemblages. However, in the case of carinated pieces the identification as core or tool is not trivial. In the past, this was mostly done by typological or technological criteria. We aim to open a new perspective by combining functional analysis with technological analysis, statistical analysis of the dimensions and refits to discuss the role of carinated pieces and end-scrapers. We conducted functional analysis on over 100 artifacts from the Aurignacian of Vogelherd Cave. The site was excavated in 1931 and yielded deposits rich in finds. The Aurignacian layers IV and V date between 41,000 and 35,000 calBP and are

best known for its figurative art, personal ornaments, and music instruments. The re-excavation of the backdirt from Vogelherd Cave between 2005 and 2023 led to the recovery of additional Aurignacian artifacts that, while lacking optimal stratigraphic control, these artifacts greatly augmented the assemblages of the excavation in 1931 and further enabled refits.

Our results show that dimensions of the pieces used as cores and tools differ and, therefore, allow for a better identification of carinated pieces and end-scrapers as either tools or cores. We can also reconstruct the hafting arrangement of a sample of the end-scrapers. Both are backed up by refits that give more detailed insight into the chaîne opératoire of bladelet production and tool resharpening. With our analysis, we create a baseline to standardize the definition of this artifact group and to allow more pertinent comparisons of assemblages.

3 ON THE AUTHENTICITY OF TWO PRESUMED PALEOLITHIC FEMALE FIGURINES FROM THE ART MARKET: A SYNERGETIC APPROACH

Venditti, Flavia (Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Weiss, Rainier-Maria (Archäologisches Museum Hamburg und Stadtmuseum Harburg) - Schmidt, Patrick (Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Wolf, Sibylle (Department of Early Prehistory and Quaternary Ecology, University of Tübingen)

In March 2022 two female figurines made from mammoth ivory were sold by an auction house in Zurich, together with other prehistoric artefacts. This is a rare event because the scarcity and value of Paleolithic figurines have thus far limited their appearance in the international art market. To shed some light on the authenticity of the two figurines, we performed “in-situ” and non-destructive investigations. Through a combined analytical work including microscopic optical observations, spectroscopic investigations, and comparison with modern ivory figurine replicas we revealed the falsity of the specimens under study. These results stress the importance of carrying out preliminary scientific analyses before claiming the originality of any archaeological objects sold on the art market. Holistic studies such as the one presented here are extremely important because have the potential to stop the circulation of deliberate forgeries as originals on the art market, thus protecting and preserving the value of authentic archaeological and cultural heritage.

4 MULTIDISCIPLINARY APPROACH TO ANIMAL TRACES IN THE BELGIAN FINAL-PALAEOLITHIC AND MESOLITHIC – CASE STUDIES FROM THE MEUSE VALLEY

Halbrucker, Éva (Ghent University) - Pironneau, Camille (Ghent University) - Goffette, Quentin (Royal Belgian Institute of Natural Sciences) - Vandendriessche, Hans (Ghent University) - De Groote, Isabelle (Ghent University) - Abrams, Grégory (Ghent University; Scientific Department, Espace muséal d’Andenne) - Crombé, Philippe (Ghent University)

Archaeozoological analysis can provide a wide range of information not only on animal exploitation but also on activities carried out at archaeological sites and settlement organisation. Microwear analysis of lithic tools provides information on these aspects as well. However, the two methods are rarely linked. In our project, ROAM (Regional Outlook on Ancient Migration), we aim to understand the life (and death) of the Mesolithic population of the Meuse Valley in Belgium by combining the results of many disciplines, including archaeozoology and microwear analysis. In our presentation, we focus on the possibilities of the two latter complementing each other. We discuss the advantages and limitations of combining microwear results of (mainly) lithic implements with observations on faunal remains using a range of case studies. Technological and typological data of the lithics add a deeper understanding of subsistence strategies linked to animals and organisation of the archaeological sites. We explore, for example, the use of animal skins by interpreting the results of skinning seen on animal bones with hide-related traces on lithics, and examine what kind of tools were used to execute these activities. The outcome of residue analysis on the stone tools gives added value to our interpretations.

We also focus on the limitations of the interpretations of these combined methods and explore ways to overcome these.

5 QUALITATIVE AND QUANTITATIVE ANALYSIS OF NATUFIAN SICKLE BLADES: TRACKING SHIFTING CEREAL HARVESTING STRATEGIES AT EL-WAD TERRACE IN THE LEVANT

Cendrowska, Marzena (Wear Analysis Laboratory, Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa; SapienCE, University of Bergen) - Yeshurun, Reuven (Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa) - Caricola, Isabella (Wear Analysis Laboratory, Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa) - Weinstein-Evron, Mina (Zinman Institute of Archaeology, University of Haifa) - Groman-Yaroslavski, Iris (Wear Analysis Laboratory, Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa)

The el-Wad site in the Mount Carmel range, northern Israel, consists of a large cave and an adjacent terrace and is considered one of the key Natufian sites. Current excavations in the northeastern part of the terrace unveiled a ~3,000-year-long sequence (15–12 kya ago), representing the main four stages of occupation. It began with the earliest Natufian, followed by the massive building stage, through the Early Natufian post-architectural phase, and then the Late Natufian. The site provides an unprecedented record that enables conducting multi-focus, intra-site analyses of various aspects of change and development during the Natufian, showcasing the shifts in the sedentary life of these complex foragers

We present a use-wear analysis of 293 sickle blades sampled from the four chronologically ordered phases. Applying the qualitative approach of use-wear analysis, we described varying polish characteristics produced by cereal harvesting in each phase. Important differences between them were noted. Use-wear on sickle blades linked to the harvesting of mature cereals fluctuated (but exceeded 45% in all four periods), with peaks in the earliest Natufian phase and during the Late Natufian. Moreover, our analysis revealed that cereals were harvested frequently in mixed conditions ranging from semi-ripe to fully ripe. Observed traces were then linked to the results of experimental cereal harvesting in wild conditions at different ripening stages. Finally, the variation in cereal polish types was tested through a quantitative analysis of the sickle blades by the application of confocal microscopy.

Our large dataset on wear patterns has yielded novel insights into Natufian harvesting practices spanning both the Early and Late Natufian periods/phases. We interpreted identified shifts in cereal harvesting strategies in relation to changing site occupation intensity. These data open new scenarios and perspectives regarding cereal harvesting and dietary strategies adopted by Natufian hunter-gatherer communities in the Levant.

6 DRILLING DOWN – A TECHNO-FUNCTIONAL ANALYSIS OF NEOLITHIC DICKENBÄNNLI-DRILLS AT KOHLHAU ABRI, SOUTHWEST GERMANY

Huber, Hannah (Eberhard Karls Universität Tübingen) - Venditti, Flavia (Eberhard Karls Universität Tübingen) - Kind, Claus-Joachim (retired, previously State Office for Cultural Heritage Baden-Württemberg) - Tafelmaier, Yvonne (State Office for Cultural Heritage Baden-Württemberg)

The limestone beads found in Middle and Late Neolithic graves and settlements in Southern Germany and Northern Switzerland have been connected to key topics of Neolithic economy such as specialization of labor, surplus production, and supra-regional trade. So-called “Dickensbännli”-drills – small lithic drills with pronounced retouched shoulders – are frequently found in association with limestone beads. Yet, most drill and limestone bead assemblages are not investigated in detail and the drills’ use for beadmaking is often rather assumed than demonstrated. Additionally, all available detailed studies investigate materials stemming from settlement contexts, although multiple bead workshops at cave and rock shelter sites have been proposed.

Here we present the case study of Kohlhou-Abri, one such potential “workshop” site. It was excavated by the State Office for Cultural Heritage Baden-Württemberg between 2015 and 2018; seven find horizons were defined, spanning from the Late Glacial to modern times. In the Neolithic horizon 3, numerous Dickensbännli-drills were found, along with three limestone bead fragments. As part of the ongoing analysis of the site’s taphonomy and in-depth studies of various find categories, we conducted a detailed techno-functional analysis of the drills and the bead fragments to understand their production and use. A technological investigation of the drills was done to reconstruct the working steps undertaken in their manufacture. We then conducted a low- and high-power traceological analysis with an accompanying experimental series. In addition, Raman spectroscopy was applied to characterize residues on the drill tip. Our results provide use wear evidence for the working of limestone with the drills at the site, highlighting the investigative potential of detailed lithic analyses on this category of tools. Moreover, our holistic approach may serve as a reference point for the analysis of drill assemblages in other Holocene as well as Pleistocene sites.

7 FTIR- MICROSCOPY AS A TOOL FOR LITHIC RESIDUE ANALYSIS: AN INTEGRATED APPROACH

Thothiyil, Leanne (Sapienza University of Rome) - Lemorini, Cristina (Sapienza University of Rome) - Ciccola, Alessandro (Sapienza University of Rome)

Residue analysis plays an important role in determining the function of stone tools. Torre Della Chiesaccia is a Chalcolithic cemetery located in the south-eastern part of Rome, Italy and is dated to the second half of the 5th millennium BP. In the current study, foliate points from this site were analysed in-situ for use-residues with the help of non-destructive techniques and use-traces were examined to get a holistic perspective on the function of these points.

Digital Reflected Light Microscopy (RLM) was used as part of the preliminary assessment for the identification and mapping of the residues on the surface of the tools. Scanning Electron Microscopy (SEM), in environmental mode, was applied as a second step to further characterise the morphological features of the residues and obtain clearer images. For the chemical characterisation of the artefacts, SEM coupled with an X-Ray detector (EDX) and Fourier Transform Infrared Microscopy (FTIRM) were used.

The current study shows the potential of identifying use-residues with an integrated approach. It was possible to differentiate use-residues from modern contamination and residues originating due to taphonomic processes. The results of this study suggest that tools acquired from burial settings have lasting use-residues, and the combined use of instruments and use-wear analysis can be a feasible method for identification and in-situ analysis. The use of chemical analysis methods like FTIR-M shows that it is useful for identifying organic residues, even when some of the morphological properties of the residues aren't preserved very well.

8 CONVERGING NON-INVASIVE APPROACHES FOR IN-DEPTH MICRO-WEAR EXAMINATION ON BASALT

Asryan, Lena (TraceoLab, University of Liège, Place du 20-août 7, 4000 Liège, Belgium) - Rots, Veerle (TraceoLab, University of Liège, Place du 20-août 7, 4000 Liège, Belgium; F.R.S.-FNRS Research Director)

Micro-wear studies on basalt pose inherent challenges due to the diverse characteristics of raw materials in terms of mechanical and chemical properties, the resilient nature of basalt making trace formation patterns difficult to control, and the often-altered state of archaeological basalt assemblages. This research presents an innovative and non-invasive methodology for a meticulous examination of micro-wear on basalt tools.

Employing an integrated approach that leverages diverse analytical techniques, including optical, 3D digital, and scanning electron microscopy, our research aims to provide detailed insights into raw material characteristics, residue analysis, and the development of micro-wear on the edges of basalt tools. Additionally, this multi-technique approach addresses challenges posed by post-depositional alterations, enhancing the efficacy of use-wear analysis in archaeological basalt assemblages.

Our results offer valuable information on how variations in raw material impact the formation of use-wear on basalt tools. The combined utilisation of diverse microscopes enables a comprehensive examination of this complex raw material, allowing for a thorough characterisation of diagnostic micro-wear features such as edge damage, rounding, and polish.

The integration of these non-destructive and multi-technique approaches facilitates a multi-dimensional analysis, providing a deeper understanding of the processes influencing micro-wear formation on basalt. Beyond contributing to the field of traceology, our results hold significance for lithic technology and petrology, as they offer valuable insights that can inform advancements in the understanding of raw material utilisation, tool manufacturing techniques, and the broader characteristics and significance of basaltic rocks in the daily lives of early hominins.

9 A CLOSER LOOK AT THE SURFACE: A TAPHONOMIC STUDY OF PREHISTORIC LITHIC SCATTERS IN SOUTHWEST ASIA

Hilbert, Yamandú (Universität Tübingen Paläoanthropologie) - Geiling, Jeanne Marie (Grupo I+D+i EvoAdapta, Dpt. de Ciencias Históricas, Universidad de Cantabria, 39005 Santander, Spain) - Clemente-Conte, Ignacio (CSIC, Institución Milá y Fontanals de investigación en Humanidades, Archeology of Social Dynamics (ASD) Barcelona, Spain) - Uthmeier, Thorsten (Institut für Ur- und Frühgeschichte, Friedrich-Alexander-Universität Erlangen-Nürnberg, Kochstr 4/18, D-91054 Erlangen, Germany)

Stone tools (lithics) are the most durable of Hominin cultural expressions and are an abundant source of information on the productive activities undertaken by prehistoric populations. Due to their resilient nature lithics are sometimes incorporated into strata by processes such as erosion, deposit and redeposition and bear not only traces of their manufacture and use but also complex taphonomic alterations. By analysing traces on the edges of lithics we can gather data on a series of milestones in the development of different behavioural patterns thanks to the methodology instigated by Semenov and made proficient by many researchers over the years. As products of specific task-bound activities undertaken by anthropic agents, their interpretation can be a daunting endeavour due to their, at times,

chaotic nature. This is particularly true for artefacts exposed over prolonged periods to surface weathering processes, which are observed at most surface lithic scatters found across arid and semi-arid environments. The data that can be gleaned from such assemblages, however, is considerable and provides an additional layer of information on resource management, technical know-how, and, to some extent, landscape use. Given that geological processes throughout such environments have, in most cases, erased all sediment cover making an absolute chronological attribution of such surface finds impossible, alternatives for organizing surface lithic assemblages are needed. This presentation will show how recent advances in traceology, in particular confocal microscopy, may contribute to our understanding of prehistoric palimpsest sites. We make use of both qualitative and quantitative methods to classify and organize artefacts that share specific taphonomic features into meaningful samples that reflect relative chronological units, providing lithic technological analysis a new approach to sample organization.

10 A USE-WEAR ANALYSIS OF FIRED CLAY SICKLES FROM MESOPOTAMIA: AN "EXTRA" HAND OR AN ALTERNATIVE TO FLINT SICKLES?

Zagorodnia, Olga (British Museum)

Highly fired clay sickles belong to a well-known class of objects considered typical of the Ubaid period in southern Iraq, beginning with Ubaid 2 (c. 4800-4500 BC). There are 106 samples (complete tools, their fragments and wasters) in the British Museum. They come from the sites of Abu Shahrain, Ur, Tell Al-'Ubaid and Abu Salabikh. All of them have been examined by optical microscopy and scanning electron microscopy to determine their manufacturing and wear characteristics.

They are generally very uniform in shape and size. The length of the complete tools is about 15-20 cm. A technological study concluded that their colour range is typical of calcareous clays made by adding 25-33 vol% quartz sand and firing above 1120-1170°C. They were made in shallow open moulds. The working edge of the sickle was deliberately thinned before firing. The working edges of some sickles were twisted during firing. Some of them show traces of bitumen from hafting.

Use-wear has been recorded along the cutting edge. It consists of a smooth bright polish, flattening the surface, grain crushing and grain extraction. Tools with varying degrees of wear on the working edge have been recorded - from a sharp edge to severe damage from use.

Clay sickles are thought to have been used either to gather plants with an 'extra' hand, which were cut with a flint sickle held in the right hand, or as sickles in their own right (along with flint tools) to harvest plants. This use resulted in distinctive patterns of gloss on the working edges. However, there is no definitive conclusion as to their exact functional purpose. To answer this question we will carry out experiments using similar replicas for cutting grass, cereals, and aquatic plants and compare the resulting use-wear traces on experimental tools with archaeological ones.

11 FROM MACRO TO MICRO: MULTIDISCIPLINARY ANALYSIS OF SURFACE TREATMENT OF POTTERY VESSELS FROM EARLY COPPER AGE EASTERN HUNGARY

Solnay, Eszter (MTA-ELTE Lendület "Momentum" Innovation Research Group, Institute of Archaeological Sciences, ELTE Eötvös Loránd University; UMR 8215 Trajectoires; Paris 1 Panthéon-Sorbonne University, Doctoral School of Archaeology) - Borel, Antony (Histoire Naturelle de l'Homme Préhistorique, HNHP-UMR 7194 (MNHN, CNRS, UPVD), Alliance Sorbonne Université, Département Homme et Environnement, Muséum national d'histoire naturelle; Institute of Archaeological Sciences, ELTE Eötvös Loránd University) - Hrabák, Zita (Hungarian National Museum, National Institute of Archaeology; University of Szeged, Doctoral School of History) - Kreiter, Attila (Hungarian National Museum, National Institute of Archaeology, Archaeometry Laboratory) - Siklósi, Zsuzsanna (MTA-ELTE Lendület "Momentum" Innovation Research Group, Institute of Archaeological Sciences, ELTE Eötvös Loránd University)

Different surface treatments on pottery vessels result in highly variable surfaces. Traditionally, these surfaces are classified macroscopically into broad categories, such as smoothing, polishing, or burnishing. However, it is often difficult to clearly distinguish between these techniques and there is no universally accepted definition of them in pottery studies. Surface treatment can be carried out by various tools with numerous gestures on different levels of dried ceramic surfaces and on diverse ceramic pastes. Moreover, it can be applied before or after firing. Therefore, the final surface depends on numerous factors, where changing one parameter often results in a different outcome.

Thus, the multidisciplinary and multiscale analyses of pottery surfaces are essential to understand the underlying processes. In this contribution, we examined the various types of surface treatment in an Early Copper Age (4500-4000/3900 cal BC) pottery assemblage from Rákóczi-falva-Bivaly-tó Site 1/c (Eastern Hungary). This study is among the first few that attempt to combine macro- and microscopic studies on pottery vessels with thin-section analysis. Our aim is not only to outline different types of surface treatments but also to understand the fabrication procedures behind them (such as tools, levels of drying) and explore the effects of the various surface treatments on the external and internal structure of the vessels. Therefore, an experimental collection was created that provides an

indispensable reference for archaeological pottery surface analysis. The surface topography was studied on multiple scales; macroscopic examination and laser scanning confocal microscopy that allow both qualitative and quantitative analyses. These surface texture examinations are complemented with thin-section analysis of Copper Age vessels. Therefore, this multidisciplinary and multiscale approach strongly contributes to the comprehensive understanding of pottery surface treatments. Moreover, it helps to reveal the similarities and differences between macro- and microscopic, as well as qualitative and quantitative results.

12 POTTERY ANALYSIS: FROM MACRO- TO MICROSCOPIC AND PHYSICO-CHEMICAL INVESTIGATION. CASE STUDIES FROM THE MIDDLE BRONZE AGE IN EASTERN ROMANIA

Drob, Ana ("Alexandru Ioan Cuza" University of Iasi, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheoinvest Center, Iași) - **Bolohan, Neculai** ("Alexandru Ioan Cuza" University, Faculty of History, Iași) - **Vasilache, Viorica** ("Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheoinvest Center, Iași)

The macroscopic analysis requires the application of standardised criteria that are known and accepted in the field of pottery investigation, allowing for objective and coherent observations. Establishing such a study model involves creating databases that enable comparative research and provide important data about various pottery assemblages. These can originate from the same or different sites, archaeometric analysis illustrating common or distinct features influenced by ceramic group interaction, technological skills, and the knowledge level of those conducting the analysis. This type of analysis yields valuable information about surface treatments, wear traces, colour, paste, decoration, inclusions, as well as processing and firing technology.

Microscopic investigations allow for detailing certain characteristics of the paste, establishing the microstructure, and mineralogical elements. Also, important information can also be obtained about surface treatments (ceramic slip, smoothing, polishing), porosity, paste homogeneity, and aspects related to the use of the vessel that can be observed on the surfaces of the ceramic fragment (cracks, residues, and traces).

Determining the chemical composition of ceramics is an important analytical objective that provides information about the raw materials, firing temperatures, and use-wear traces, with results often expressed in percentages. In this work, the interdisciplinary methods used in identifying the chemical composition are represented by SEM-EDX and FTIR.

The study of the ceramic surfaces can yield important results regarding the techniques involved in pottery manufacturing, the finishes and treatments applied, as well as data about use traces and residues. Illustrating these aspects will be done through case studies of the Costișa and Monteoru pottery from the Middle Bronze Age settlements in the Bistrița basin in the East-Carpathian region. Here, significant information has been obtained regarding various traces, such as pigments or organic substances, as well as data about the sources of clay used by these communities in pottery manufacturing.

13 RESIDUE ANALYSIS OF IRON AGE FUNERARY JUG FROM SAMREKLO, REP. OF GEORGIA

Gilb, Hannah (Freie Universität Berlin, Institut für Prähistorische Archäologie)

Pottery is one of the most prominent material grave goods found across all archaeological time periods. Despite its ubiquity, we still guess at the function performed by many of the catalogued types. Applications of analytical testing on archaeological artifacts – much like the analytical testing field itself – have developed exponentially over the past 20 years, providing essential supporting information on material culture that may be imperative to decoding its purpose. Residue analysis on pottery has traditionally been conducted on vessels from settlements to ascertain possible modes of subsistence, but conclusive results on residue analysis testing of pottery in grave goods, for example, may help to answer or eliminate interpretative possibilities within notable, unique, or otherwise unparalleled graves. At the very least, it can help inform funerary dynamics between anthropological, material, and structural configurations. I am undertaking analytical testing of residue analysis at the development laboratory at Pace Life Sciences in Woburn, MA, to help answer these questions. High-resolution LC-MS/MS, host-cell protein identification, and Total Lipid Extraction (TLE) analyses are being performed on a Late Iron Age jug found in a burial from Samreklo, Rep. of Georgia. By choosing analyses that address recovery of the likeliest analytes to be found in the type of jug and location/time period to which it belongs, results offer insight into the possible lifespan of the jug, what – if anything – it could have contained at the time of deposition, and whether these biomarkers could have any connection to the anthropological analyses of the interred child

14 A NEW HISTORY OF BRONZE: TOWARDS AN INTEGRATED APPROACH TO THE STUDY OF METALWORKING PROCESSES

Hitchcock, Matthew (University of Leicester) - **Sych, Dawid** (University of Leicester) - **Tsoraki, Christina** (University of Leicester) - **Crellin, Rachel** (University of Leicester) - **Harris, Oliver** (University of Leicester)

Our understanding of change in the deep past is fundamentally defined by metalworking. The British and Irish Bronze Age (c.2200-600 BC) was a time of technological and social transformation following the use of copper, bronze, and gold. These new materials changed lives, altered flows of knowledge and exchange, and restructured community and power relationships. Our Leverhulme-funded project, a New History of Bronze, at the University of Leicester, UK, takes an integrated approach to exploring and answering questions about who metal makers and users were, and how metals were exchanged, utilised, deposited and valued in the Bronze and Early Iron Ages.

In this paper we will set out our methods along with their technological and ontological limitations and showcase our interim results through a series of object case studies. Crucial to our approach is the integration of wear analysis with a range of other novel scientific techniques such as microXRF, residue analysis, SEM/EDS and experimental archaeology. The combination of different analytical techniques opens up new possibilities in exploring the various stages of the metalwork chaîne opératoire including analysis of the stone tools used in the production and maintenance of metal objects. Here we will demonstrate how new combinations of techniques and a theoretical lens of new materialism are allowing us to produce new narratives about the power and affordances of stone and metal, and their role in the formation and mediation of individual and communal identities in later prehistory.

15 ASSESSING TRACE VISIBILITY AND THE IMPACT OF CONSERVATION IN METALWORK WEAR ANALYSIS: A PILOT STUDY

Dolfini, Andrea (Newcastle University) - **Francone, Serena** (Museo delle Civiltà, Rome) - **Boccuccia, Paolo** (Museo delle Civiltà, Rome) - **Lemorini, Cristina** ('Sapienza' University of Rome)

In the last two decades, the principles and methods of traceological analysis have increasingly been applied to materials other than prehistoric stone tools. The analysis of copper-alloy objects – especially Chalcolithic and Bronze Age tools and weapons – has emerged as one of the most dynamic and fast-developing fields of microwear studies, to the point that it has now developed into a self-standing subfield of traceological research named 'Metalwork Wear Analysis' (Dolfini & Crellin, *Journal of Archaeological Science* 2016). Owing to the unique problems posed by archaeological metals, e.g., surface oxidation, Metalwork Wear Analysis features its own specific challenges to microscopic analysis and trace characterisation, which have not yet been explored fully. This paper, based on a pilot study recently conducted by the authors on Bronze Age and Iron Age collections from the Museo delle Civiltà, Rome, investigates the intersection of three under-researched factors affecting trace survival, visibility, and interpretation in archaeological metals: (1) surface corrosion; (2) conservation practices; and (3) surface staining by silicone casts taken for high-power microwear analysis. In particular, the assessment of conservation practices entailed a desk-based appraisal of conservation methods applied to prehistoric copper-alloyed artefacts and their replication on artificially oxidised modern replicas. The original data presented in the paper allow a better appraisal of researchers' ability to undertake Metalwork Wear Analysis on museum collections and call for better communication between analysts, museum keepers, and conservators working on ancient metals.

16 ADVANTAGES AND LIMITATIONS OF TRACEOLOGICAL RESEARCH ON EARLY MEDIEVAL CLOTHING COMPONENTS (9TH CENTURY SPHERICAL HOLLOW BUTTONS)

Krupicková, Šárka (Institute of Archaeology of the Czech Academy of Sciences, Brno) - **Fořt, Martin** (Czech Academy of Sciences, Institute of Archaeology, Brno) - **Plygawko, Michał** (Czech Academy of Sciences, Institute of Archaeology, Brno) - **Vlasatý, Tomáš** (Projekt Forløg) - **Olbert, Martin** (Czech Academy of Sciences, Institute of Scientific Instruments) - **Tihlaříková, Eva** (Czech Academy of Sciences, Institute of Scientific Instruments) - **Neděla, Vilém** (Czech Academy of Sciences, Institute of Scientific Instruments)

Metal jewellery and clothing components are essential archaeological material for the study of supra-regional elite contacts and testify to the socio-economic structures of early medieval Europe. In addition to traditional archaeological typological methods, the analysis of materials and production techniques has become standard. On the other hand, the detection of traces of wear is a research method that is not yet widespread. We have attempted to integrate this research method using a specific type of artefacts – spherical hollow buttons (in archaeological terminology called gombiks), which were widely used in Central Europe in the 9th century. These artefacts, made of silver, gold or gilded copper alloys, are an example of a broad cultural symbiosis. The morphology of the spherical hollow buttons refers to the buttons of Asian caftans and Byzantine pendants (pendilia). At the same time, the spherical hollow buttons adopt the chased ornamentation known from silk or the stone elements of Mediterranean church architecture. Due to the

lack of written sources, iconography or textile finds, this site- and time-specific type of artefact remains unknown in many respects. For example, we lack the elementary fact of the original function of spherical hollow buttons in the past living culture and the related formation of the origin of this elite symbol in the Central European milieu (in the Principality of Great Moravia). One of the possibilities for further research is the analysis of wear traces and the combination of this knowledge with other proven methods of elemental composition (using the SEM/EDS method) and production technology research. Methodologically, the presented research is based on the combination of the analysis of traces on original artefacts with the analysis of wear caused by experimental use of newly produced replicas.

17 UNWINDING THE BEADS: NOVEL APPROACHES TO GLASS BEAD USE AND PRODUCTION

Montanari, Eleonora (Newcastle University; AHG (Association for the History of Glass))

Due to their tangibility, mobility, and attractiveness, glass beads can be considered as highly personal objects, which often bore significant meaning for those who made, wore and used them. Glass is an artificial material, which means that properties such as colour, opacity and shape of the beads largely reflect intentional choices, which are regulated by the technological know-how and belief systems of a given society. Glass beads are versatile, as throughout their life cycle they can be arranged multiple times in a variety of fashions to form necklaces, bracelets, earrings or garments. When part of a costume, they can act as markers of gender, age or social affiliation through visual codes. Although glass beads are somewhat durable, they can also degrade over time, affecting their legibility as archaeological artefacts and thus leaving us with an incomplete picture.

Do bead manufacture and consumption occur within the same society? Is it possible to separate different configurations or life-stages for individual beads? What does their context of retrieval and broader archaeological background tell us about bead use and significance? What is the impact of glass corrosion on traces of wear by use and manufacture?

To provide an insight into the relationship between making, understanding, and using glass beads these questions will be addressed by examining glass beads from sites in the Wadi al-Ajal (Libyan Sahara) with a multi-method approach. This entails the novel application of use-wear analysis on archaeological and reference collections, alongside the interpretation of the chemical data and experimental bead-making with traditional technologies such as wood-fired furnaces. By taking into account any limitations provided by the dataset and the techniques employed, results are interpreted through the wider lens of production chaînes opératoires, ethnography and theoretical insights on object biographies, potential meanings and value.

880 PARIS OR PARADIGM SHIFT

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Martens, Vibeke (NIKU - Norwegian Institute for Cultural Heritage Research; CCH) - Taylor, Gillian (Teesside University) - Dawson, Tom (University of St Andrews; CCH)

Session format: Regular session

Preservation of Archaeological Remains In Situ (PARIS) was established as an interdisciplinary conference series in response to the Malta Convention/Valetta Treaty (<http://conventions.coe.int/Treaty/en/Treaties/Html/143.htm>) and the paradigm of trying to preserve as much archaeology as possible in situ. The basis for the Convention was to highlight preservation of archaeological heritage as a goal in urban and regional planning policies and set guidelines for funding of excavation and research work and publication of research findings. The Convention also deals with public access to archaeological sites, actions to develop public awareness of the value of archaeological heritage, and it constitutes an institutional framework for pan-European co-operation on the archaeological heritage.

These are all very important factors in modern European heritage management policies. However, when the Convention was written, no-one counted in the factor of Climate Change.

Climate change contributes to more rapid degradation and even complete loss of archaeological sites and/or material types. Decades of archaeological deposit monitoring have demonstrated that in many cases, in situ site preservation is no longer a real option but rather an illusion. Thus we suggest that it may be time for a paradigm shift – not disregarding all the constructive aspects of the Malta Convention, but adhering to the new European Standard on cultural heritage monitoring (EN 17652, 2022 <https://standards.iteh.ai/catalog/standards/cen/6814e478-dbcd-4a7b-a697-4312b260cfc0/en-17652-2022>) to evaluate if in situ preservation is a real possibility, or if threats to site preservation exceed possibilities of adaptation or mitigation and thus leaves preservation ex situ (excavation and documentation) as the only option to preserve the contextual site knowledge.

We invite papers on heritage research and climate change adaptation to think further and work towards solutions for sustainable work on preserving contextual heritage information either in situ or ex situ, enabling the experience of archaeology also for coming generations.

ABSTRACTS

1 ADVOCATING PARADIGM SHIFT

Martens, Vibeke (NIKU - Norwegian Institute for Cultural Heritage Research; CCH)

Climate change impacts the possibilities of preserving archaeological remains in situ. But how can we see or measure that trigger levels have been breached and we need to find ex situ preservation alternatives? At the outset, we need to know which archaeological sites or remains we have and how these might be affected by modern changes. Development, abandonment, or climate change, or a combination? We also need to set threshold values or trigger levels. If we don't, how may we possibly know when to act before it is too late? These values should be relative, and the outset must always be the heritage significance, the state of preservation of a site, and if possible, also environmental conditions. Long-term monitoring or repeated sampling can give information on occurring changes. All these measurements then lead to risk assessments and evaluation of possible adaptive or mitigating actions. The extreme mitigation action is preservation ex situ, by investigation and documentation

2 RESILIENCE, RESISTANCE AND ACCEPTANCE: IN SITU PRESERVATION AND THE PROPERTIES IN CARE IN SCOTLAND

Davies, Mairi (HES Historic Environment Scotland)

Scottish Ministers have, under the Historic Environment (Scotland) Act 2014 ('the Act'), delegated to Historic Environment Scotland (HES) their general functions of managing the 336 properties in care including ensuring their conservation, articulating and safeguarding their cultural significance, providing public access for current and future generations, and managing the associated commercial operations. Those current and future generations, however, will be subject to warmer, wetter winters; hotter, drier summers and increased intensity of rainfall on the wettest days, with sea levels continuing to rise to 2100 and beyond. This has implications for the conservation and safeguarding of the properties in care, and their presentation to the public, with changing climatic conditions altering and accelerating decay processes, increasing the challenge of preservation in situ.

HES and its predecessor organisations have been managing the impacts of environmental change on the properties in care for decades. Many, including the world-famous Skara Brae prehistoric settlement, were taken into care in the 1920s and 1930s and had sea defences installed that are now close to a hundred years old. These defences have provided a century of effective protection but require ongoing monitoring and maintenance and will come under increasing pressure as climate change intensifies. Adaptation and resilience options will be discussed based on principles of resistance or acceptance. This paper will examine how, within the parameters of the Act, HES might build on the last hundred years of conservation to manage, conserve, safeguard and present the properties, coastal and inland, for the next hundred years.

3 LOSING WHAT WE GAINED? A WANING

Groenendijk, Maarten (Green Archaeology)

I anticipate that most presentations in this session will showcase the (very real) dangers of climate change to archaeology. To balance this, my contribution aims to present a slightly different perspective on the subject: we may risk losing much of what we have gained in recent years if we continue to stress the risks of climate change in the way that we do now. With the establishment of PARIS, we have gained so much regarding the possibilities of preservation in situ. PARIS has led to an impressive increase in research on the subject, more information is available on the effects and problems of preservation of archaeological remains and as a result, many more sites are preserved. Today, preservation in situ is finally seen as a valid alternative to archaeological excavations at best, and 'something to consider' at worst. I strongly believe this is an extremely important development, yet in my opinion, the discussion on climate change in relation to archaeology, while warranted and needed, threatens to negate much of those gains. More and more, climate change is used (and misused, as I aim to show) as an argument against preservation in situ, even in cases where this is not a real issue and preservation would very well be possible. I am by no means implying that climate change is not a serious risk to archaeology: it absolutely needs to be considered when assessing the merits and achievability of preservation in situ. However, it is not a risk everywhere, and preservation in situ can still be a valid- or even the best option in many cases. If we don't explicitly stress that aspect, we risk losing much of what we gained, and much more than what we bargained for. How can we adjust our message to prevent this?

4 WHO PAYS? HERITAGE AND CLIMATE CHANGE

Dawson, Tom (University of St Andrews; SCAPE) - Hambly, Joanna (University of St Andrews; SCAPE) - Mitchell, Juliette (University of St Andrews; SCAPE)

The concept of developer-funded excavation is now commonplace, and in many regions, it is normal for the 'polluter pays' principle to be applied when the construction of a new road or building will disturb archaeological remains. The system works because there is a shared acceptance that archaeological heritage has a value, and despite its faults, developer-funded projects have led to an incredible growth in the number of archaeologists currently practicing the profession.

If we accept that our archaeological heritage is valuable and should be either protected or recorded before destruction, problems arise when laws can do nothing to protect sites, and when there is no developer to pay for archaeological intervention, including evaluation. As King Cnut demonstrated, natural process obey no laws; and a lack of a 'polluter' results in an imperfect understanding of buried remains that are under intense threat from climatic processes. Although there often being indications of where sites are located, for example, layers or structures seen protruding from eroding coast edges, it is often impossible to characterise the extent or significance of these remains. If we don't know what is buried, we can't ascribe a value; and without an indication of the worth of the site, it is hard to justify action to preserve the remains either physically or by record.

Although the problem is grave, it is not insurmountable, and collaborative action can make a difference. This paper uses twenty years of experience of looking at coastal sites to share lessons about the opportunities, and complications, of working with severely threatened resources for which no organisation has a statutory obligation to protect. Taking an optimistic view, it will consider values, including those held by communities, and will map out some possible avenues for working with sites threatened by climate change.

5 CHALLENGING PARIS: CASE STUDIES FROM NORTH AMERICAN HERITAGE AT RISK (NAHAR)

Miller, Sarah (Florida Public Archaeology Network)

In the United States the National Historic Preservation Act of 1966 created the current paradigm of historic preservation with the aim to preserve cultural resource in place. The process of consultation set forth in Section 106 of NHPA, mimicked in state legislation, required the identification of cultural resources, identification of potential adverse impacts, and a pathway to mitigation when preservation in place could not be maintained. From 1980-2010, statewide site stewardship programs and the later emergence of public archaeology networks, set similar goals to protect the buried past through education and outreach. Climate Change was not a part of the consultation or preservation through education and appreciation models. By 2010 planners working on long term management plans realized future impacts from Climate Change and raised the alarm. Climate Change then emerged as the number one threat to cultural resources as scholarship, society committees, and management strategies sought to address this need. Yet preservation policy today are the remnants of the old way of thinking about preserving sites in place. The North American Heritage at Risk (NAHAR) and global collective network are helping to push through the old paradigm of historic preservation. Case studies presented at NAHAR meetings from 2021 to present demonstrate the failure of the old paradigm and address the need for action in the face of the current preservation crisis.

6 SUSTAINABLE EARTH: TOWARD AN ADAPTIVE METHODOLOGY OF IN-SITU PRESERVATION AT VÉSZTŐ-MÁGOR, HUNGARY

Seifert, Jerrod (University of Oslo) - Lingle, Ashley (University of York) - Gyucha, Attila (University of Georgia) - Corton, Therese (Cardiff University) - Duffy, Paul (Christian-Albrecht University of Kiel) - Parkinson, William (University of Illinois - Chicago; The Field Museum of Natural History) - Ridge, William (University of Illinois - Chicago) - Riebe, Danielle (University of Georgia)

This paper discusses the innovative approach of in situ preservation applied to a sheltered excavation trench at the prehistoric site of Vésztő-Mágor, Hungary. The in situ preservation methodology involves the deployment of soil probes as well as temperature and humidity loggers to monitor the moisture dynamics within the archaeological context. By employing parallel strands of environmental monitoring strategies, the research seeks to enhance sustainability and adaptive preservation techniques in the face of climate change. The data collected through monitoring will be pivotal in underpinning the intricate relationship between moisture variations and the critical role that soil conditions play in the preservation of cultural heritage.

The use of soil moisture probes shows the dynamic relationship between pedological moisture content within the archaeological profiles and the atmosphere surrounding the exposed trench, impacting site statics. Such knowledge is instrumental in developing tailored preservation strategies that account for the specific environmental conditions at Vésztő-Mágor. The research aligns with the standards outlined in EN 17652:2022, ensuring a methodologically sound and internationally recognized framework for archaeological conservation practices. Moreover, the application of international standards (e.g. ISCARSAH & Salalah Guidelines), and European standards (e.g. Malta Convention),

emphasising the importance of integrated conservation strategies, underpins the study's commitment to holistic preservation.

Addressing the imminent challenges posed by climate change, the adaptive preservation approach advocated in this study highlights the need for strategies that can dynamically respond to evolving environmental conditions. By incorporating real-time data from monitoring, conservation efforts can be more effectively tailored to the site's unique requirements.

This research at Vésztő-Mágor represents a paradigm shift in archaeological preservation by integrating cutting-edge environmental monitoring and adaptive strategies. Project outputs meet several UN Sustainable Development Goals, thus contributing significantly to the broader discourse on sustainable and effective preservation of archaeological heritage in the face of a changing climate.

7 THE VANISHING WALL(S): HOW IS CLIMATE CHANGE AFFECTING HADRIAN'S WALL, AND WHAT CAN WE DO ABOUT IT?

Alberti, Marta (Vindolanda Trust) - Taylor, Gillian (Teesside University)

The Valletta Treaty was signed in 1995, only eight years after Hadrian's Wall had been inscribed on the UNESCO WHS list, and the year before the first Hadrian's Wall Management plan was produced. It is therefore unsurprising that the Treaty's emphasis on 'the conservation and maintenance of the archaeological heritage, preferably in situ', guided early efforts to manage the Wall. PARIS2, in 2001, marked the early recognition of the importance of environmental monitoring for archaeological preservation, and admitted that preservation in situ was only possible if no changes to the burial environment compromised it. 23 years later, only two sites on Hadrian's Wall feature a long-term buried archaeology environmental monitoring system, and a strategic plan to utilise it and develop it: Vindolanda and Magna, both managed by the Vindolanda Trust. This paper discusses the ways climate change is affecting the sites, through both empirical observations from continued excavation programmes, and data collected by a series of probes recording, amongst other factors, pH, Oxidation Reduction Potential (ORP) and rainfall. The paper stresses the importance of acting outside the archaeological silo and in cooperation with environmental scientists. It proposes that only through such cooperation the 'PARIS at all costs' approach can be replaced by MATHS: Monitor environmental preservation, Assess case by case, Targeted well-resourced excavations, Help each other, and share data.

8 CLIMATE CHANGE AND THE COASTAL ARCHAEOLOGICAL HERITAGE OF IRELAND

Pollard, Edward (The Discovery Programme: Centre for Archaeology and Innovation Ireland) - Corns, Anthony (The Discovery Programme: Centre for Archaeology and Innovation Ireland) - Shaw, Robert (The Discovery Programme: Centre for Archaeology and Innovation Ireland) - Davidson, Lesley (The Discovery Programme: Centre for Archaeology and Innovation Ireland)

From 2017 to 2023 the European-funded CHERISH (Climate, Heritage and Environments of Reefs, Islands, and Headlands) Project investigated the impacts of climate change on cultural heritage along the Irish and Welsh coasts. This gathered data on endangered archaeological sites including Bull Island shipwrecks in Co. Dublin, Glascarrig motte, Clonmines historic town, Kilmichael coast guard station and Rosslare Fort in Co. Wexford, promontory forts and mining heritage along the Copper Coast of Co. Waterford, and, Ballinskelligs, Reencaheragh and Ferriter's Castles in Co. Kerry. The project involved historical research, aerial surveys, uncrewed aerial vehicle modelling, palaeoenvironmental coring, geophysical survey, and laser scanning to record changes to archaeological sites. These are in contrasting coastal environments of intertidal zones, estuaries, islands, sand dunes, soft boulder clay and rocky faulted cliffs. This methodology recorded coastline change including the ongoing processes of erosion, flooding, subsidence, slumping and rock falls approaching and destroying archaeological sites. Outputs are including coastal zone assessment, best practice guidance to record and monitor erosion of heritage, maps of change and landowner management plans along with updated records and new sites to the SMR and NIAH records. The sites are further threatened by the wetter climate, storm surges and rising sea level, which could lead to increased erosion and disappearance of the sites.

882 SYNTHESIS, FACILITATOR OR HINDRANCE: SHOULD SYNTHESIS BE PART OF COMMERCIAL ARCHAEOLOGY OR LEFT TO THE ACADEMICS?

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Forrestral, Colin (ClfA RIG Special Interest group.) - Godfrey, Evelyne (ClfA RIG special interest group) - Joosten, Ineke (Rijksdienst voor het Cultureel Erfgoed (RCE)) - Bryant, Stewart (Society of Antiquaries of London) - Evans, Christopher (British Academy)

Session format: Regular session

The “synthesis” of research should ultimately contribute to archaeological narratives that impact on the public understanding of the past. When we talk about synthesis, this includes the masses of grey literature reports from commercial, community, academic or publicly funded archaeological investigations as well as formal publications. But how much should synthesis signpost and when does synthesis become a research agenda or framework?

This session will examine the needs of the different audiences such as researchers, curators, local communities, and the wider interested public - in terms of access to data, narratives and formats. Synthesis is vulnerable to time-lag, and to privileging certain perspectives, as it tends to be undertaken by senior staff, and due to the demographic profile of these staff, very often older, male staff. Whilst their experience and perspectives are valuable, so are those of others.

For some synthesis is about revisiting past data sets and narratives and updating in light with the results of more recent investigations so proving an improved paradigm, for others it's just about drawing together different strands of evidence from across the breadth of the archaeological profession and, more widely, from allied disciplines. Data may be from a single site or from multiple sites/locations, from different aspects of a single specialism or the collation of information from several specialisms.

This session asks:

1. What can synthesis achieve and what is the value of comparative analysis?
2. At what scale of analysis should we be considering synthesis; Regional, National, European or Global?
3. How do we decide on appropriate themes for synthesis?
4. How are synthetic studies used to plan future investigations?
5. How can we achieve more rapid synthetic studies; is there room for interim discussion papers?
6. Should adequate funding for Synthesis be budgeted for at the start of the process?

ABSTRACTS

1 WHAT IS SYNTHESIS? AN OVERVIEW OF OPINIONS GARNERED BY THE RIG GROUP AND IS UTILISING AI A WAY FORWARD

Forrestral, Colin (Independent Researcher)

This paper aims to cover the results of surveys undertaken by the Research and Impact group (RIG) membership in 2019 and various discussion in committee meetings since with contributions not only from individual members but also various commercial organisations. As will become clear there are many similar themes that emerge from these discussions and surveys but also a lot of disagreements on what synthesis was actually for and about.

It will show that on the whole commercial organisations do not see synthesis as part of their remit generally, but it could be asked if commercial organisations were given the funding to include synthesis if they would have the relevant skill sets or would they have to outsource to get the synthesis done. At the same time, will it look into how much should Data/Archive sit directly behind synthesis? Most commercial Project Managers would see synthesis as unacceptable project creep.

This paper will also highlight that within an organisation, different disciplines have different definitions of what synthesis is. They also ask at what level of detail should go into overview and at what stage of the process should be called Synthesis.

Finally, it will consider the option of using AI with the performance and capability increase in the recent past and how it could be used to assist in the synthesis process and its effect on the cost of the synthesis process.

2 THE VALETTA HARVEST PROJECT. SYNTHESIZING ARCHAEOLOGICAL DATA FROM DEVELOPMENT-LED RESEARCH IN THE NETHERLANDS ON A NATIONAL LEVEL

Groot, Tessa (Cultural Heritage Agency of the Netherlands) - Bazelmans, Jos (Cultural Heritage Agency of the Netherlands)

In the Netherlands, since the signing of the Valetta Treaty in the 1990s, archaeological research has been conducted primarily by commercial firms. The research results in hundreds of archaeological reports per year. These provide us with many small puzzle pieces of information, without interrelationship and without a complete picture. To ensure that this data is analyzed in context and provides new knowledge and insights about the past, the Harvest of Malta project was launched in 2012. The Cultural Heritage Agency of the Netherlands, part of the Ministry of Education, Culture and Science, has since initiated 20 projects, in which archaeologists from companies, universities and local authorities, often in close collaboration, have conducted research resulting in as many syntheses. Each of the studies focuses on a specific question from the National Research Agenda for Archaeology. The syntheses provide not only an overview of relevant reports and the knowledge derived from them, but also new research questions for future archaeological field research. As a result, the National Research Agenda for Archaeology is updated on a yearly basis.

In our presentation we will explain, using some examples of projects, how the Harvest of Malta project contributes to the cycle of archaeological heritage management and how we intend to continue to initiate relevant synthesizing research in the future.

3 TELLING DIFFERENT STORIES: AN EXPERIMENTAL APPROACH TO STORYTELLING AND SYNTHESIS ON LARGE-SCALE LINEAR INFRASTRUCTURE SCHEMES

Clough, Alice (MOLA (Museum of London Archaeology); University of Bristol)

Archaeological synthesis culminates with the stories we tell about the past. This paper will introduce ‘Telling Different Stories’, a collaborative doctoral partnership between the University of Bristol (UK) and MOLA (Museum of London Archaeology). The project looks at how archaeological interpretations are developed and communicated in the British development-led sector, looking specifically at some of the largest, most commercial endeavours in archaeology: infrastructure schemes.

In direct dialogue with MOLA’s fieldwork, post-excavation and management teams, ‘Telling Different Stories’ aims to understand the dominant tropes and approaches that inform large-scale development-led practice, and how these subsequently shape and influence interpretations of the past and approaches to synthesis. From there, the project is developing an approach to synthesis and storytelling geared towards multivocality and experimentation.

As with the British development-led sector more broadly, infrastructure schemes tend to produce very particular types of knowledge. ‘Telling Different Stories’ asks: which types of knowledge are privileged in the development-led process, and which are routinely omitted? How is archaeological storytelling influenced by the positionality of the storyteller? How can we know which types of knowledge will be inspiring to future generations? Is an ethical approach to synthesis one that privileges multiple ways of knowing?

4 DEVELOPING A HUB FOR COLLABORATIVE SYNTHESIS IN HUMAN EVOLUTION

Devevey, Godefroy (ICArEHB, University of Algarve) - Aldeias, Vera (ICArEHB, University of Algarve) - Marques, Catarina (ICArEHB, University of Algarve) - Cascalheira, João (ICArEHB, University of Algarve)

Synthesis is particularly adapted to scientific fields where data are typically gathered at a local and regional scale – such as archaeological sites. The synthetic integration of perspectives and primary data from multiple sources yields emergent patterns that would be impossible to achieve through studying a single site, or from a single perspective. The conclusions from synthesis are more generalizable and applicable, gaining considerable inference power, and reframing the theoretical debate. Appropriately, research synthesis both benefits and fosters the adoption of the principles of Open Science. Despite these benefits, there is still a lack of collaborative synthesis in the field of human evolution and prehistoric archaeology. The Interdisciplinary Center for Archaeology and Evolution of Human Behavior (ICArEHB), a research centre based at the University of Algarve (Portugal), has experimented with models to foster synthesis in recent years. Based on this initial success, we are now moving forward with the creation of a hub dedicated to Collaborative Synthesis in Human Evolution. We will host groups of scholars that will exchange knowledge, share data and cross perspectives to create broader archaeological narratives that are scientifically sound while advancing the cause of Open Science. In this talk, we will present our current model, discuss challenges and future pathways to promote collaborative synthesis in Human Evolution studies.

5 KNOWLEDGE-CREATION AND DEVELOPMENT-FUNDED ARCHAEOLOGY IN ENGLAND: HISTORY, CURRENT PRACTICE AND FUTURE DIRECTIONS

Bryant, Stewart (Society of Antiquaries of London)

Since the publication of Government planning guidance for archaeology nearly 34 years ago in 1990, developer-funded archaeology in England has become a successful industry with over 5000 excavations per year with a value of c£250million. However, it will be argued that this phenomenal success has also led to some fragmentation in terms of the public value obtained from publication and synthesis. The results of several recently published national synthesis reports will be looked at, both for the advances in understanding they have achieved, and the issues they highlight in terms of the value of evidence from current development-led excavations for synthesis. Case studies of syntheses from several smaller and more recent excavation projects will also be touched upon as examples of good practice.

Finally, the principal recommendations of The Promotion of Archaeological Synthesis' report will be looked at. These include the creation of a national advisory panel to promote and co-ordinate good synthesis and knowledge creation in England and ways to achieve greater collaboration across the sector, especially between the archaeological organisations engaged in development-led archaeology.

6 WHY SYNTHESIS IS HARD?

Altschul, Jeff (SRI Foundation) - Wait, Gerald (GWHeritage)

Development-led archaeology produces a huge amount of data on all sorts of past events and processes. In theory, this should lead to a boon in synthetic studies on such topics as heritage management, material culture, culture history, socio-environmental dynamics, and socio-cultural practices. Yet, synthetic research is not commonly conducted as part of development projects nor are the data generated by such projects incorporated in meaningful ways in academic research. There are several barriers to synthetic research involving development-led archaeology. First, there is the project-by-project nature of the enterprise in which the objective of project sponsors does not extend beyond the terms of legal compliance. Second, data recording techniques vary by project as does the willingness of stakeholders to allow data to be used in scientific research, making FAIR and CARE issues growing concerns. Finally, the reward systems for applied and academic archaeologists are different. There is little incentive—financial or career enhancement—for applied archaeologists to participate in synthetic research. Academic archaeologists, working with much fewer resources, have enough trouble interpreting their own data, much less incorporating data of others. For archaeology to move beyond the confines of site protection and culture history, we must overcome these issues. How we do so is the subject of this paper.

884 TRANSFER AND RECEPTION OF PUBLIC AND PRIVATE ARCHITECTURAL TYPES IN THE COASTAL SETTLEMENTS OF THE MEDITERRANEAN BASIN

Session theme: 6. The Mediterranean from Within

Session organisers: Ferritto, Roberta (Alma Mater Studiorum - Università di Bologna; University of Pennsylvania) - Lo Monaco, Viviana (Universidade de São Paulo, USP) - Fuduli, Leonardo (Universidade de São Paulo, USP) - Monseff Junqueira, Nathalia (Universidade Federal de Mato Grosso do Sul)

Session format: Regular session

For centuries, the Mediterranean has been the scene and crossroads of different peoples, cultures, customs, and religions. The ancient coastal settlements and access to various sea routes, played a key role in the dynamic of exchange between civilisations. Indeed, they acted as 'gateway settlements', between land and sea, funnelling goods and people in both directions. Public and private spaces, from the spatial organization of the city, from the forum to dwellings, are the product of common outcomes that link social structures, urbanization, and architecture, in a relational association. Throughout the Mediterranean, for instance, architectural types inspired by Roman patterns are present, both in public and private realms, such as basilicas, baths, honorary arches, and maritime villas. In spite of this, the influence of the local architectural tradition is frequently evident. This is due to several factors, including the employment of local craftsmen and architects trained in a different tradition, the availability of different raw materials, and the influence of neighbouring cultures at the periphery of the Mediterranean nations. This session therefore invites papers discussing the transfer and reception of architectural models in both private and public realms, identified between West and East of the Mediterranean basin, along coastal settings and their immediate hinterland. The session seeks to deepen our understanding of how specific local realities influenced later historical developments, to the point of having a strong impact on modern cultures. Therefore, we encourage contributions dealing with all chronological periods. We invite you to participate with contributions oriented towards the following issues and/or other similar ones, such as:

1. Coastal Architectural Features and Regional Variations
2. Factors Influencing the Diffusion of Architectural Features

3. Public vs Private Architectural Features
4. Local Architectural Patterns in the Mediterranean
5. The Interaction Between Architectures and Urban Systems
6. Socio-Cultural Implications of Architectural Choices.

ABSTRACTS

1 ROMAN INFLUENCES AND LOCAL TRADITIONS: A COMPARATIVE STUDY OF MARITIME VILLAS IN THE MEDITERRANEAN BASIN

Ferritto, Roberta (Alma Mater Studiorum - Università di Bologna; University of Pennsylvania)

The Mediterranean coastline and immediate hinterlands host a rich cultural heritage reflecting the intense and varied human activities occurring throughout centuries. Ancient maritime villas, a common feature of the Roman Mediterranean, approached varied architectural solutions. The Roman models identified in Italy, where maritime villas originated and were perfected, often influenced provincial models, where they often emulated the various Italian examples. In Istria, for example, villas are influenced by the central Tyrrhenian models, while in the Iberian Peninsula the 'linear plan type' imitates the open-sea front architecture of maritime villas represented in the painted views from Stabiae and Pompeii. However, local forms also exist, for example in Tripolitania, where the architectural design choices are clearly dictated by other factors, such as the local environment. In terms of monumentality and aesthetic, the majority of maritime villas along the Italian coasts displayed a high degree of grandeur, reflecting the lifestyle of the Roman elite. A symbol of wealth and power, Roman maritime villas represented the political and socio-economic achievements of their owners. Do we detect the same in the provinces? Is there any substantial difference in terms of dimension, function, building and decorative materials? The aim of this paper is to explore what kinds of Roman architectural influences can be identified in the provincial maritime villas, which models are instead inspired by local traditions, and if economic and socio-cultural implications dictated specific architectural choices.

2 THE RECEPTION OF HELLENISTIC ARCHITECTURE IN THE ROMAN MARITIME VILLA OF SOUTHERN CAMPANIA

Perrella, Rosaria (Museo Archeologico Nazionale di Napoli)

The architecture of the maritime villas of southern Campania in the Roman times looked to the most congenial building elements of Hellenistic architecture. The Hellenistic model was absorbed through the reception of public, private and sacred architecture. Each of these aspects was appropriated and reinterpreted in the layout of the Roman maritime villa: the porticoed courtyards of Hellenistic palaces are transformed into the more elaborate peristyles; the arrangement of the villas along steep slopes emulates the monumentality of terraced sanctuaries.

In particular, the Macedonian model of 'living', in both public and private buildings, is the one privileged in the planimetric choices of the maritime villas of southern Campania.

The phenomenon of the Roman villa in this specific territory interprets the Hellenistic model not only in architecture, but also deepens the Macedonian concept of the villa in its economic and social reality, specifically in its definition as a place of fructus.

The intrinsic relationship that the builder creates between the architecture and the surrounding natural landscape, in the constructions of the Hellenistic age, is transformed in the Roman maritime villa of southern Campania into a "bridge" between the structures and nature, in a heterogeneous range of solutions thanks to the complex use of opus caementicium.

3 PROPAGANDA AND PUBLIC ARCHITECTURE IN THE EASTERN SICILIAN COAST UNDER SEVERAN RULE

Fuduli, Leonardo (University of São Paulo)

During the Severan age, Sicily experienced a period of particular remarkable prosperity, and the imperial family had already established strong ties with Sicilian cities during the time when Publius Septimius Geta and Lucius Septimius Severus were proconsuls of the island, A.D. 188-190. Archaeological excavations as provided evidence of the construction of luxury private complexes in Palermo and Lilybaeum, as well as the development of new public buildings. Although the western cities of Sicily were generally more prosperous, the majority of architectural artifacts discovered come from the monuments of the eastern coastal cities.

The coastal cities of eastern Sicily underwent restoration work on some of their main buildings during this time, as for instance the theatre scaenae frons in Taormina, and the theatre in Catania, where an odeum was also built. Limited

information is available about other important cities, like Syracuse, where the last phase of the 'Gymnasium' is believed to have been completed during the Severian period.

Further research should be conducted to determine the origin of the workers involved in the restoration works and the value of these projects. The analysis of the architectural decoration of the monuments in the eastern coastal cities could provide valuable information about the models and craftsman involved in the construction. This analysis could also shed light on possible connections between these cities and Rome, as well as the potential origin of the marble used in these projects.

4 THE DOMESTIC FOUNTAIN OF THE ANCIENT ROMAN DOMUS

Monticolo, Antonio (Pisa University)

The environment of the ancient Roman domus can be seen as the place where the dominus manifested his culture, his desires and his aspirations. Elements such as fountains can be read as the decor of the domus and, therefore, inside ancient houses, fountains are important elements that can testify to the owner's taste. They also interact with the other elements of the house such as architecture, paintings, sculptures. In this sense, the contribution will propose a synthesis of the role of fountains in the structure of domestic buildings starting from the following factors: location, visibility, relationship with the rooms of the house, integration with pictorial and sculptural ornamentation (where reconstructible), relationship with the structure of the vegetation. In relation to this we will start from the extensive documentation of the domus of Pompeii, a city once closer to the coast and comparisons will be made with the ancient city of Cosa also near the Tyrrhenian coast

5 EXPLORING THE FUNERARY ARCHITECTURE OF MOIE DI POLLENZA: DESIGN AND CROSS-CULTURAL INFLUENCES

Ficcadenti, Benedetta (Universität Basel)

Moie di Pollenza, an important Picenum settlement strategically located along the Potenza River and in proximity to the Adriatic coast, experienced a long period of development and prosperity spanning from the late 9th to the 5th century BC. The archaeological finds, primarily discovered from burials, including Etruscan and Greek vases, Baltic amber ornaments, and glass paste objects from the eastern Mediterranean, testify that the city had extensive connections with the inland regions and Tyrrhenian coasts to the west, as well as with other Mediterranean cultures to the east.

In addition to the archaeological luxury artifacts from the site, the architectural analysis of burials is putting in evidence how influences from other cultures are also evident in the different burial typologies attested on the site. For instance, there are simple pit burials with side chambers that are influenced by the models of Tyrrhenian area, and monumental grave circles, intended for the local elite, which are typical of the central regions of pre-Roman Italy.

The aim of this paper is to explore the construction and design of the burials at the Moie di Pollenza site and compare them with similar types found in other territories. Are there differences in terms of dimensions and building materials? Are there unique features found only in the models of Moie di Pollenza? What kind of stylistic similarities exist between the monumental grave circles of Moie di Pollenza and those from other areas? This contribution seeks to outline the influence of other cultures on the funerary architecture of Moie di Pollenza, thus contributing to a deeper understanding of the site and its extensive connections with other Mediterranean civilizations established through both local and long-distance trade.

6 CULTURAL CONTACTS IN JUDAEA-PALAESTINA IN THE ROMAN PERIOD: STUDIES OF THE URBAN GRID AND MONETARY CIRCULATION IN TEL DOR, ISRAEL

Porto, Vagner (University of Sao Paulo)

In this communication we intend to present the results obtained so far in the research carried out at the archaeological site of Tel Dor, Israel. This research is an abroad inter-institutional program which aims to deepen our knowledge regarding the mechanisms of cultural contact and the processes of urban transformation in northern Israel during the Roman period. Tel Dor, locus of this study, is located 130 km north of Jerusalem. The project was divided into two distinct stages that complement each other: 1) aimed to analyze the coins found in the excavations of the archaeological site of Tel Dor, observing their finding places in the strata of Roman occupation. The unpublished material - the result of excavations carried out since the 1980s - which was used to carry out our research, is stored both in the Department of Archeology at the University of Jerusalem. Seeking to understand issues of urbanity of this period, we plotted the coins for better associate them with the finding places, and creating maps, we tried understand the monetary circulation in the city in Roman times. Thus, to better understand the level of monetization of society in that period and, eventually, shed light on possible interpretations of the use of the spaces in which the coins were found. The investigation was done through the survey of the archeological /numismatic data available in the excavation re-

ports and the available bibliography. 2) A fundamental part of this project was carrying out of systematic surveys in Tel Dor, with which we believe to have broadening our understanding of the urban organization of the city. We developed archaeological activities in the area (through the Ground Penetrating Radar technique) in order to identify the Roman city cardo and decumanus based on previous remote sensing studies.

7 THE USE OF ROMAN ARCHITECTURE FOR THE CONSTRUCTION OF RELIGIOUS IDENTITY IN TEL DOR, ISRAEL (I BC - III AD)

Aga Pereira Passos, Letícia (University of São Paulo)

The main subject of this study is the archeological excavation area of Tel Dor, located in the present-day region of Mount Carmel - coastal mountain in northern Israel. Both the historical sources and the excavation carried out at the site indicated that buried within Tel Dor were remains of four different cultures: (1) the Cannanites; (2) The Sikil (one of the Sea People); (3) the Phoenicians, who inhabited the city from 11th century BC throughout the Israelite, Assyrian, Babylonian, and Persian periods, and considerable part of the Hellenistic period; and (4) Greeks and Romans. On this basis, the city unfolds into a dynamic panorama for the study of cultural contacts, especially over the Roman period, allowing a rich analytical study of the transformation processes of the Roman way of life and the formation of the urban landscape in the new territories. The research aims to study the monetary evidence and its religious-iconographic analysis in an archaeological context, together with the urban structure of the city. With many of the features that characterized the cities of the Roman East, Dor had paved streets, squares, basilicas, theaters, aqueducts, decorated houses and monumental temples. Of the latter, one of the discoveries was a northern structure, a temple built on a podium with a temenos (sacred precinct) around it; similar to Roman temples, the earliest of which dates to the 1st century CE. We therefore propose to analyze the urban organization of Dor by focusing on the religious architecture of the city, questioning how religious identity could be connected with the urbanism that developed in the city. Understanding this political and religious relationship in the iconographic representation and urban architecture will allow us to hypothesize about the identity constructions of the population of Dor between the 3rd century BCE and the 3rd century CE.

8 "ENCASED LIKE A GEM". THE ARCHITECTURE OF THE SANCTUARY OF TAS-SILĠ IN MALTA THROUGH MILLENNIA, BETWEEN TRADITION AND RECEPTION

Bonzano, Francesca (Università Cattolica of Milan, Department of History, Archaeology and Art History) - Recchia, Giulia (Sapienza University of Rome, Department of Antiquities) - Semeraro, Grazia (University of Salento, Department of Cultural Heritage)

The paper will discuss the continuity, transfer and reception of architectural types in the sanctuary of Tas-Silġ in Malta through millennia, from the Late Neolithic to the Roman era.

This place of cult - located on the main island overlooking one of Malta's most important harbours, the port of Marsaxlokk - was built during the Late Neolithic and was in use throughout the Bronze Age and the Early Iron Age; when the Phoenicians colonized the Archipelago, the megalithic buildings were still visible, and the site was frequented. An important sanctuary dedicated to the goddess Astarte was established there; the fame of the place of worship increased during the Punic and mostly during the Roman period, when Malta was included in the Roman province of Sicily.

One of the most distinctive features of the sanctuary is the preservation of the main buildings of the Late Neolithic complex through the millennia, although almost totally "concealed" during the Roman renovation. Architectural elements and architecture reflect the extensive network of contacts of which the Maltese Archipelago was part, but also the preservation of the principal megalithic feature is a tangible sign of the conservatism that characterized the site throughout the historical period.

The Maltese Archipelago is located at the boundaries of different cultures; this was a source of dynamism, resulting in exposure to diverse influences. Together with its late prehistoric tradition and local peculiarities, Malta's multiplicity of cultural traditions reflects the religious identity of the sanctuary and of those who frequented it.

9 THE LIBRARY OF ALEXANDRIA AND ITS INTEGRATION INTO THE CITY'S LANDSCAPE FROM THE PERSPECTIVE OF GREEK TRAVELERS

Junqueira, Nathalia (Universidade Federal de Mato Grosso do Sul)

The production of knowledge in antiquity and its packaging was practiced in several ancient cities. Ancient documents show how observation and practice contributed to the development of research in astronomy, mathematics, geography, history, and many other fields of knowledge. These documents were in many cases available in archives and libraries all over the inhabited world. In this presentation we would like to provide some information about the Library of Alexandria, its location, and the place it occupied in the production of knowledge in the ancient world. To this end,

two travelers and their ethnographic works have been selected: the historian Diodoro Sículo (ca. 90-30 BC) and the geographer Strabo (ca. 64 BC – 23 BC), who lived in Alexandria for several years. The aim is to show how this space of knowledge production interacted in the urban landscape and what significance it had for the social dynamics of the city of Alexandria in antiquity.

10 PERIPHERAL ENVY SATIATED: A LATE ROMAN ELITE URBAN MANSION AT KOURION ON CYPRUS

Rupp, David (Department of Classics and Archaeology - Brock University)

In the 4th and 5th centuries CE the greatly expanded imperial administration, civil service and military in the Eastern Roman Empire created a new class of wealthy men. This aristocracy congregated in Constantinople, the provincial capitals, and the major commercial centers. There they vied with one another for status, power, and wealth. Their large, lavish residences in these key centers were one of the prime arenas for these competitions. In these urban mansions a distinctive architectural form evolved that mimicked both public and imperial prototypes and activities. The interiors had elaborate programs of decoration. In specialized spaces they received as patrons their clients (audience chambers) and entertained invited guests and peers (bath suites, reception halls).

In the Late Roman period the island of Cyprus was a peaceful, peripheral place. On its southern coast on the edge of the acropolis of the city of Kourion a sprawling structure was built in the 430s CE. It is known today primarily for its extensive polychrome mosaic floors with geometric compositions and six tessellated inscriptions. The fact that two of the inscriptions refer directly to Christ and Christian values has distracted most discussions from the exact function of the building. A third inscription, a “biography” of the commissioner, a man called Eustolios, indicates that he was originally from Kourion, had donated a public bath, and had constructed this residence.

The “House of Eustolios” adopted the architectural forms and the decorative schemes of the townhouses of his peers in the distant, important cities to create his version of the dominant aristocratic townhouse type, using traditional Cypriot building practices and materials. The impressive mosaic floors were executed by itinerant workshops from Syria. This was a systematic effort by Eustolios of self-representation of his status, wealth, power, *paideia* and Christian beliefs to his clients, peers, and family.

11 THE CULT OF YAHWEH IN THE MEDITERRANEAN BASIN: THE PRESENCE OF JEWS AND SAMARITANS ON DELOS IN THE ROMAN PERIOD

Almeida, Vítor (Museu de Arqueologia e Etnologia, Universidade de Sao Paulo)

This paper aims to understand, by the combination of material culture and textual sources, the multiplicity of religious experiences related to the Semitic god Yahweh and his circularity in the ancient Mediterranean world, from archaeological remains discovered on the island of Delos, Greece. During the period of 1912-1913, a scholar from the École Française D’Athènes named André Plassart came across a building, on the small island of Delos, in Greece, a place known for its wealth related to material culture and religious multiplicity. After the analysis Plassart concluded that the small building was a Synagogue (Plassart, 1914: 523-534). This conclusion made the presence of yahwists on the Aegean coast as early as the 2nd century BCE indisputable. In the years 1979-1980, Bruneau (1982), incidentally, found two marble inscriptions a little further north of the site, buried by a not very thick layer of soil in one of the roads. The finding indicated the possibility that the builders and visitors of the site would be of Samaritan/Israelite origin and not Jewish (Bruneau, 1982: 479). The investigation that followed indicated that a second renovation of the building was carried out in the first half of the 1st century BCE, with this evidence being a very useful element in understanding Yahwist practices in the Roman period, pointing out, with great probability, that the Synagogue was in operation until the second century CE (Levine, 2005: 107-108). The hypothesis raised in this work is that the cultural articulation between yahwists and polytheist populations was a reality in Delos, inserting the cult of Yahweh in a landscape of religious plurality, placed in an architecturally, archaeologically and culturally very important place for the Mediterranean studies.

886 THE ARCHAEOLOGY OF MASS GRAVES: NEW APPROACHES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Saqqa-Carazo, Miriam (Universidad Complutense de Madrid) - Baillie, Britt (Roskilde Viking Ship Museum) - Renshaw, Layla (Kingston University) - Sturdy Colls, Caroline (Staffordshire University) - Schroeder, Hannes (University of Copenhagen)

Session format: Regular session

Many war dead and victims of persecution, across Europe and beyond, lie in unmarked graves—deliberately concealed or forgotten over time. In ‘recent’ cases, archaeological evidence is used to prosecute criminals, ensure dignified

burials for the deceased, and provide answers for family members. In ‘historic’ cases, analysis can provide unique insights into the identities of the deceased, the trajectories of particular diseases, the movement of peoples, previously unknown battles, the make-up of armed forces, etc. This session will probe how new technologies, applications, or increased accessibility of such technologies (e.g. LIDAR, Satellite imagery analysis, smartphone video/photo analysis, data mining, ground penetrating radar, DNA analysis, isotope analysis, etc.) are improving the search efficiency for unmarked mass graves, easing access into difficult terrains, as well as providing new insights into the origins, movement, diet and disease of the interred individuals. As these technologies improve, at times they are able to be applied to assemblages excavated long ago or cold-cases to yield new results. As this field and its applied technologies develop, questions surrounding ethics, operating procedures, and the need for transparency continue to remain at the fore. Inattention to these details can result in miscarriages of justice as well as the political abuse of the results. Hence, this session seeks papers addressing the use of new technologies in the location, excavation, and interpretation of mass graves as well as reflections on the ethical implications of such uses.

ABSTRACTS

1 REMOTE SENSING AND THE IDENTIFICATION OF FAMINE AND OTHER UNMARKED INSTITUTIONAL GRAVES IN IRELAND

Tierney, John (Eachtra) - Davis, Stephen (UCD Archaeology Dept.) - Bhreatnach, Aoife (APEO Consulting)

Since 2011 we have been involved in the survey of over 800 Irish burial grounds as part of a community archaeology project (www.historicgraves.com). In this time we have noted the presence and morphology of unmarked graves in burial grounds and since 2020 we have tested techniques for the identification, recording and interpretation of these features, particularly in 19th/20th century institutional cemeteries. This work reveals an institutional tension between the use of common burial (both narrow and long) and single-use burial features.

Lidar survey in Cork District Cemetery (1847-1960s), Cork, Ireland, has identified three phases of unmarked graves across the 1.2 hectare site. Three different types of graves are also present. 1. mass/common graves of the Great Irish Famine (1847-1850) measuring 2.8m x 2.5m, against the northern boundary 2. early 20th C long graves measuring up to 20m in length x 2m wide. 3. narrow graves (a single grave space (1m wide)) in the western 20th century extension. This work is producing a new typology of institutional mass common graves in Ireland.

Since 2014 in Ireland field and forensic archaeologists have been involved in important and sensitive institutional burial projects, amongst others, those relating to the Mother and Baby Homes in Tuam, Co. Galway and Bessborough, Co. Cork. There are important lessons to learn from these high profile projects including the requirement for the rigorous use of appropriate archaeological assessment methodologies and a familiarity with contemporary burial practices and associated burial features.

In this talk we present our ongoing research focusing particularly on drone SFM and LIDAR surveys, in combination with the work of historians of 19th/20th century institutions, for the purpose of better understanding of burial practices for the anonymous poor. The work is part-funded by the Horizon 2020 EU Incultum project.

2 3D VISUALIZATION AND VIRTUAL RECONSTRUCTION AS TOOLS TO ANALYZE HISTORICAL AND RECENT MASS GRAVES

Mickleburgh, Hayley (University of Amsterdam; Forensic Anthropology Center, Texas State University)

Human graves are the result of a combination of human actions (e.g., digging of the grave, positioning and treatment of the body) and natural processes (e.g., body decomposition, grave formation processes), both of which affect the position of bones and evidence in the grave. The investigation of complex archaeological contexts such as mass graves relies strongly on understanding the significance and evidentiary value of these spatial relationships.

Technological advancements over the past three decades have created an array of options to use 3D modelling, Virtual Reconstruction and 3D animation as research tools to augment reconstructions of the past and test research hypotheses. Digital 3D data capture and Virtual Reconstruction methods allow researchers to analyze and visualize complex spatial relationships and provide new ways to reconstruct events leading up to burial, or to simulate hypothesized sequences of events. In this paper, I explore ways to harness the potential of 3D visualization to study mass graves in an ethically conscientious manner. Using examples of virtually reconstructed graves from the Mass Grave Project, I aim to demonstrate how 3D technology can advance the study of mass graves beyond standard 3D data capture of graves and in situ evidence during excavation (i.e. 3D scanning, photogrammetry). The Mass Grave Project is an interdisciplinary experiment simulating clandestine mass and single graves (primary and secondary) with human body donors at the Forensic Anthropology Center, Texas State University. It aims to contribute to the development, testing, and validation of scientific methods for mass grave investigation, and to train students and practitioners in excavation and field recording methods. The project uses 3D scanned data from experimental graves to create in-

teractive and immersive virtual environments to analyze spatial relationships, test taphonomic hypothesis and provide realistic virtual training tools.

3 INVESTIGATIONS MASS GRAVES OF HOLOCAUST-ERA IN UKRAINE: CHALLENGES AND PERSPECTIVES

Cherkaska, Daria (Staffordshire University)

Forensic and archaeological investigations of mass graves and other sites connected to the Holocaust has developed significantly, particularly over the last 40 years. Employing of archaeological approach for Holocaust studies in Ukraine is not terra incognita. However, the main limitation is a lack of local experts and infrastructure for training forensic archaeologists in Ukraine. There are also no Ukrainian forensic archaeologists are trained for legal or academic projects.

With the full-scale Russian war against Ukraine, the importance of the adaptation and broader application of forensic archaeological methods for investigating criminal acts of mass violence (including the investigation of mass graves) increased dramatically. Forensic archaeological methods were applied for the investigations of war crimes in liberated Ukrainian territories. In addition, it is also important to remember that Ukrainian soil is a multilayer landscape of various genocides and mass violence. This will become more important as more time passes, and it perhaps becomes less clear (in a visual sense due to decomposition) which period graves relate to. Moreover, the ongoing war actually increases the need to search for historic graves. Not only are these sites under threat from the conflict, being able to distinguish between them and more recent graves is imperative to avoid a situation whereby the victims are misidentified as belonging to one episode of mass violence or another.

Another important vector of research in Ukraine is remote sensing technologies. In the short to medium term at least, military operations may limit the resources available for searches for Holocaust-era mass graves in the future, whilst the war itself will also restrict access to these sites. This approach has been a strong impetus to the development in Ukraine since February 2022.

4 MASS VIOLENCE, AGE AND GENDER IN THE EARLY IRON AGE OF THE SOUTHWEST CARPATHIAN BASIN

Iraeta Orbegozo, Miren (Globe Institute, University of Copenhagen (KU); School of Archaeology, University College Dublin (UCD)); UCPH School of Archaeology) - Fibiger, Linda (School of History, Classics & Archaeology, University of Edinburgh) - Mylotamitaki, Dorothea (Globe Institute, University of Copenhagen (KU); CIRB, Collège de France, Université PSL, CNRS, INSERM) - Laffoon, Jason (Department of Archaeological Science, Leiden University) - Makarewicz, Cheryl (Institute of Prehistoric and Protohistoric Archaeology, University of Kiel) - Koledin, Jovan (Museum of Vojvodina) - Bruyère, Caroline (School of Archaeology, University College Dublin (UCD)) - Ramos Madrigal, Jazmín (Globe Institute, University of Copenhagen (KU)) - Schroeder, Hannes (Globe Institute, University of Copenhagen (KU); UCPH School of Archaeology) - Molloy, Barry (School of Archaeology, University College Dublin (UCD))

In this paper, we present the results of the bioarchaeological and biomolecular (re-)analysis of 77 individuals from the Early Iron Age of Gomolava. Situated within the Carpathian Basin in southeastern Europe, Gomolava occupies a position amidst intricate socio-spatial relations, divergent cultural norms and competing landscape-use ideologies. Employing a multidisciplinary framework, we suggest a model for the social context in which the violent events surrounding the death of those buried in Gomolava took place. We explore the cause of death through osteological analysis, discern mobility patterns and diet habits through isotope analyses, ascertain the age and sex distribution across the complete assemblage using a combination of osteological examination, genetic sexing and enamel peptide analysis and establish the age and time frame of the burial event using radiocarbon dating and micro-CT scanning. These findings contribute to our understanding of wider events not only for this transformative period in European prehistory but also, more broadly, on the evolution in complexity of selective violent practice in human history.

5 AN ARCHAEOLOGICAL APPROACH TO THE EXCAVATION OF TERRESTRIAL WW2 AIR CRASHES IN EUROPE

Errickson, David (Cranfield University) - Márquez-Grant, Nicholas (Cranfield University) - Dalton, Kevin (Henry Jackson Foundation) - Humphrey, Kenneth (Defense Prisoner of War / Missing in Action Accounting Agency)

Forensic archaeology has been employed to investigate 'air crash sites', often considered mass graves in their own right. The Defense Prisoner of War/Missing in Action Accounting Agency (DPAA), USA have a commitment to provide the fullest possible accounting for missing personnel from 20th century conflicts to their families and the United States. Over 72,000 of these missing individuals are from the Second World War, with many from the United States Army Air Force (USAAF) making up this number. An active partner of the DPAA, is Cranfield University whose

forensic institute specialises in actively searching, locating, recovering and identification, where possible, of human remains from a number of conflict sites. Cranfield University has been partnering with DPAA since 2018 and in the last three years alone post-Covid, it has contributed to 12 of these recovery missions, mainly in Italy and Germany.

This presentation focuses on two different air crash investigations where forensic archaeology has been employed to locate and recover missing WWII personnel where possible. These incidents were different in nature and pose different challenges. The first example is a B-17 crash site in Germany and the second, a B-26 crash site in Italy. These cases present the challenges faced by the forensic teams and approaches and improvisation in terms of recovery. The presentation focuses also on lessons learned which may help future missions of similar characteristics.

6 ADVANCED OSTEOLOGICAL TECHNIQUES IN THE EXHUMATION AND ANALYSIS OF A HISTORIC MASS GRAVE IN RONCESVALLES, SPAIN

Bonthorne, Emma (Aditu Arkeologia; Department for Continuing Education, University of Oxford) - Zurek-Ost, Andrea (Department of Anthropology, University of North Carolina) - Loe, Louise (Oxford Archaeology) - Griffiths, David (Department for Continuing Education, University of Oxford) - Schendzielorz, Sofie-Kristen (Centre for Anatomy and Human Identification, University of Dundee) - Valle de Tarazaga, Francisco (Aditu Arkeologia)

During excavations at the Silo de Carlomagno (Roncesvalles, northern Spain), a historic mass grave dating to the late 18th/early 19th century was uncovered in the semi-subterranean levels beneath a 12th century church. Although mass graves rarely present a straightforward challenge, the case of Roncesvalles was compounded by the complexity of the surrounding funerary contexts, composed of the heavily fragmented, commingled bone of the ossuary intermixed with articulated burials contemporary to the mass grave. Despite the theoretical and logistical challenges of this type of deposit, the mass grave represents an enormous source of information on the individuals who were involved in the numerous conflicts that took place in the region, and which remain largely absent from the local historic records.

This paper explores the excavation methodology and in-situ recording techniques implemented to track potential bone articulations that were tested in the temporary field laboratory. The incorporation of data from proteomics (specifically peptide analysis) and strontium stable isotope analysis aided in the interpretation of the conflict-related commingled deposits at the site, providing insights into the demographic composition and geographic area of origin of those interred in the grave. These results were further supported by osteological trauma analysis, which identified various examples of weapon-related skeletal trauma consistent with the chronology of the grave in both the commingled and articulated burials. With close to one million bones and bone fragments recovered over five seasons of excavation, the project represents one of the most exhaustive and large-scale investigations into commingled, multi-period deposits studied in the Iberian Peninsula. The presentation explores the integration of interdisciplinary approaches, including new techniques, to such a site and discusses methods of mass burial excavation and analysis within the wider context of the Convention and Napoleonic Wars (1793-1815).

7 ARCHIVAL FORENSIC ARCHAEOLOGY: A NOVEL APPROACH TO HISTORICAL EXHUMATIONS

Saqa-Carazo, Miriam (Universidad Complutense de Madrid)

Dealing with violence implies transiting spaces, but also times. What happens when mass graves have already been exhumed in the last century? What can forensic archaeology do about historical exhumation processes? What happens when the way to locate mass graves is to dig in historical archives? In this paper, I will explore a case study concerning an exhumation carried out by the Spanish Dictatorship in Madrid in 1942. In the Spanish context, the existence of mass graves, as well as the intervention on them, has a historical background that begins in the first year of the war. From a historical perspective, it is considered that part of the first phase of exhumations of mass graves in Spain was initiated on the corpses of the victors. For more than 15 years, the dictatorship carried out a process of locating, prosecuting and exhuming the corpses it considered to be its own victims (1936-1951). In this paper I will demonstrate how the use of a specific interdisciplinary methodology, applied to the study of historical and forensic archive documentation, is a novel approach to the location of mass graves and the study of their exhumations. This new approach allows for a joint assessment of several dimensions of the same event, focusing not only on the historical, forensic and archaeological aspects, but also on the political and social consequences and uses derived from the physical management of human remains in past conflicts.

888 FROM MATERIAL LANDSCAPES TO COGNITIVE LANDSCAPES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Verdonkschot, Jadranka (INCIPIT-CSIC) - Guénin-Carlut, Avel (University of Sussex; Kairos Research; Active Inference Institute)

Session format: Workshop

There is more to perception than meets the eye, literally. Although sight in many ways has been the preferred object of study for our understanding of how perception is shaped, our eyes are only one of the elements involved in the en-active process through which we experience the world we live in as a landscape of objects and opportunities for action. It is the engagement of an agent with its world, instantiated by the joint dynamic of the mind, body and environment, which constitutes and explains perception.

With this in mind, studying the duality of material culture and cognition in landscape archaeology holds great potential for uncovering patterns of thought in societies. The cognitive theory of Active Inference describes action and perception as an integrated process through which agents “infer” (and produce) their niche, given the prior knowledge about their world which is encoded in their own internal dynamics. This provides us with a powerful theoretical tool to relate the human actions we trace in a landscape to subjective patterns of perception and the underlying structures that guide the thought of society. Mind and action converge in the landscape. At the same time, it is necessary to recognise that the encounter between cognition and materiality is always historical. The temporally implied element of the historical, not merely contextual, existence of social relations is important.

This workshop consists of a keynote to frame the topic, followed by presentations and a round table of invited speakers for discussion. Participants are invited to present their own research and the implications of the study of perception in landscape. Ultimately, the aim is to build a common understanding of the convergence between theoretical neuroscience and archaeological practice, oriented toward the collaborative construction of novel methodologies and new support networks for future research.

893 PROFESSIONAL ARCHAEOLOGY IN EUROPE: THE STATE OF THE ISSUE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Giorgio, Marcella (ANA - Associazione Nazionale Archeologi (Italian National Association of Archaeologists); Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Pisa e Livorno (Italian Ministry of Culture)) - Festa, Giovanni (University of Salzburg (Austria))

Session format: Discussion session (with formal abstracts)

The work of archaeologists has changed a lot in recent years, taking great strides towards a thorough professionalization and taking strides to be equal to more structured professions. This evolution, however, followed different stages and times throughout Europe, depending on the specific characteristics of the individual States and the legislation applied in them.

This panel will be a moment of reflection on the state of professional archaeology in Europe by presenting data that shows work and professional life of European archaeologists, how archaeology and its workers are perceived in society, what specific difficulties involve this field of work compared to other high scientific level professions.

We welcome reports that offer a deep and wide vision of the work of professional archaeologists in the various European States, aim to understand their real professional conditions and initiate a comparison which can be followed by the identification of shared collaboration strategies.

This session is organized in collaboration with the Italian National Association of Archaeologists (ANA), which is part of the Advisory Committee of the EAA 2024. The session would be an opportunity to show data of the 3rd National Census of Italian Archaeologists proposed by ANA during the fall/winter 2023-2024.

ABSTRACTS

1 COMMERCIAL ARCHAEOLOGY IN THE UK: MANY JOBS, FEW CAREERS?

Festa, Giovanni (University of Salzburg)

In the UK, more than three-quarters of the workforce working in archaeology is employed in the private sector. In recent years there has been a massive government investment in infrastructures for roads and rails such as the High Speed 2 project. This project has engaged many archaeological contractors in collaboration, forming several joint ventures working simultaneously in different locations of the same project.

On the surface, there was never a better time to get into commercial archaeology; the sector has faced, and is facing, a labour shortage due to several reasons, such as the falling student numbers in archaeology programmes, the lack of a sustainable career structure, the effect of the COVID-19 pandemic and the UK departure from the European Union. The presentation aims to set out an overview of the strategies adopted to satisfy the lack of a trained workforce and the approach adopted in the commercial sector to support individual archaeologists for a senior career trajectory.

2 PROFESSIONAL ARCHAEOLOGY IN IRELAND: THE STATE OF THE ISSUE

O Maolduin, Ros (Institute of Archaeologists of Ireland) - McCullagh, Niamh (Institute of Archaeologists of Ireland)

The IAI is the representative all-island organisation for professional archaeologists working in the Republic of Ireland and Northern Ireland. We aim, through the representation of our members, to advance and strengthen the profession of archaeology in Ireland. Our vision is that we will have a vibrant and sustainable archaeological profession that actively contributes to the protection of our archaeological resource, which in turn contributes to the social and economic well-being of the entire community. This paper will provide an updated overview of the archaeological profession in Ireland, drawing on recent surveys and strategies including Archaeology 2030 (NI) Archaeology 2025 (RIA) and the findings from an ongoing survey and development strategy commissioned by the Institute of Archaeologists and conducted by Mantra Strategy (2024) and DISCO (Cleary & McCullagh 2012-2014). It will set this within the context of the legislative framework in both the Republic of Ireland and Northern Ireland, and the complexities which that can entail.

3 FROM “STATE ARCHAEOLOGY” TO “PUBLIC ARCHAEOLOGY”: LOOKING FOR AN ITALIAN WAY TO LINK ARCHAEOLOGICAL HERITAGE AND SOCIETY

Knobloch, Roberto (Cooperativa Archeologia)

Public archaeology and cultural heritage management are two fields which only in recent times became subjects of extensive research in Italy, where the adjective “public” is generally referred to a State-owned asset, instead of a matter of public interest. All Italian archaeology is virtually a public archaeology, because the State is the owner of the new findings and the person in charge of heritage conservation and archaeological research. On the one hand, this State monopoly is the highest recognition of the role of archaeology as common good; by the other hand, it can become a noose which suffocates the active involvement of civil society and the economic and scientific freedom. This paper will focus on how Italian legislation addresses relations between public authority, local communities, scholars, volunteers, practitioners, traders and ordinary citizens, in an effort to strike a balance between the various stakeholders engaged in archaeological activities. Topics of the contribution will be divided in four main themes. The first (archaeology and local communities) will cover the role of local governments, municipalities and local history museums in archaeological heritage conservation and management, as well as the work of local historians, amateurs and volunteers. The second (archaeology and economics) will deal with contract archaeology and the role of professionals and contractors. The third (archaeology and research) will address the issue of freedom of inquiry, namely the license for archaeological excavations and the right to publish new data and findings. The fourth (archaeology and education) will focus particularly on open data and copyright of cultural heritage images.

4 WIND OF CHANGE: BEING AN ARCHAEOLOGIST IN ITALY BETWEEN REALITY AND PERCEPTION

Garrisi, Alessandro (Associazione Nazionale Archeologi) - Giorgio, Marcella (Associazione Nazionale Archeologi)

In the last 10 years an undeniable change happened in the world of Italian archaeology: an evolution that has affected every aspect of the archaeological profession. The 2014 Professional Recognition Law (Legge 22 luglio 2014, n. 110) and its Regulatory Decrees (2019) (D.M. 244/2019, allegato 2 “Archeologi”) have triggered a phase of change towards an evolved, modern and structured professional archaeology even outside the traditional area of the constructions sector. This is quickly moving archaeology towards new professional challenges.

But how has Italian archaeology changed or is changing? How are archaeologists perceived and how do they perceive themselves in Italian society? What challenges await Italian archaeologists for the continuous improvement of their profession? How are the Covid-19 pandemic and the PNRR (National Recovery and Resilience Plan) projects of recent years impacting this phase of change?

These are some of the questions that this panel wants to answer, also by showing new data from the 3rd National Census of Italian Archaeologists proposed by ANA - National Association of Italian Archaeologists during the first months of 2024.

895 PERCEIVING AND SHAPING LANDSCAPES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Schaefer-Di Maida, Stefanie (Institute for Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266) - Di Maida, Gianpiero (CCEHN Project – Niedersächsisches Landesamt für Denkmalpflege, Hannover) - Wollentz, Gustav (Nordic Centre of Heritage Learning and Creativity)

Session format: Regular session

The prehistoric use of landscapes is a fundamental field of study in archaeology that has recently been investigated by many interdisciplinary research approaches. But while it is often only about the reconstruction of certain sites and their subsistence and organization, with this session we would like to bring together different approaches to the perception of whole landscapes that have been actively divided, structured and shaped between the Palaeolithic and the beginning of our current era in Europe. As existing research has shown, landscapes have always been modified and used in different ways, be it through the creation of landmarks or places of memory (e.g., megaliths, burial mounds, towers), boundary lines (e.g., pit alignment, fortifications) or other functional as well as sacred sites (e.g., cooking stone pit areas, cult sites, deposition sites). In addition to such artificially created elements that shaped landscapes, natural features were also used, shaped and integrated into people's perception of their own environment, such as caves, forests, trees, bodies of water, wetlands, islands and mountains. While today – following a naturalistic world-view – western-educated scholars often make the distinction between artificial and natural landscape elements, for prehistoric societies this has to be concretely questioned and viewed from different angles.

For our session, we are interested in contributions that deal with prehistoric perceptions of landscapes from both theoretical and ethnoarchaeological perspectives and link these to archaeological evidence. Furthermore, we are interested in diachronic perspectives, which look in particular at phases of change in function and use or changes in the structuring and shaping of landscapes. Interdisciplinary discussions that also include landscape and land use reconstructions are very welcome. We are also interested in spatial analyses that focus, for example, on modelling or predicting landscape changes.

ABSTRACTS

1 NEANDERTHALS AND THE CAVE

Di Maida, Gianpiero (Niedersächsisches Landesamt für Denkmalpflege)

Caves are central elements in the folklore of many cultures of different regions and times. It is easy to imagine that their physical characters (dark, humid, with different acoustics) must have contributed to this aspect, also due to a radical different set of perceptions' stimuli toward their visitors in comparison with the upper world. These aspects together can help in explaining the prominent role that caves have played in both the lives and the collective imagination of humanity: from Teotihuacan to Cuma, caves have often been connected with rituals and religion, and some of them have resisted with similar functions until today (Amarnath). Examples of their relevance in symbolic contexts are also present in many and ancient written texts: it is not by chance that arguably the most famous analogy in the work of Plato features a cave in a very prominent position.

In Palaeolithic times, although we cannot know with precision the role they played for the different groups, it seems obvious to attribute to caves a central place. From shelter and everyday-life duties, to rituals and the elective place where art was made and enjoyed, it is difficult to argue with their centrality within the Palaeolithic lifestyle. Some cases though seem to reveal more than others do in this regard: as the Tuc d'Audoubert, or the Chauvet cave. Hence, the enormous relevance of caves in the history of our species is established. The importance and role they played in Neanderthal's communities is instead less clear, specifically in connection with the still hot-debated and very divisive topic concerning Neanderthals' cognitive abilities. This contribution will investigate the interaction between cave environments and Neanderthals, with the aim of unfolding Neanderthal's use of this specific landscape type. The case of the Einhorn cave (Germany) will be discussed in detail.

2 WHEN THE SHEEP GOES MARCHING IN. PERSPECTIVES ON THE PREHISTORIC SYLTHOLM FJORD, DENMARK

Groß, Daniel (Museum Lolland-Falster) - Koivisto, Satu (Museum Lolland-Falster) - Måge, Bjørnar (Museum Lolland-Falster) - Philippsen, Bente (Norwegian University of Science and Technology) - Robson, Harry (University of York) - Brinch, Marie (Museum Lolland-Falster) - Schmölcke, Ulrich (Leibniz Zentrum für Archäologie; Museum Lolland-Falster)

The prehistoric Syltholm Fjord is one of the best investigated prehistoric landscapes in Denmark, and the island of Lolland's only point that is visible from continental Europe. Long barrier islands formed a protected fjord landscape during the Stone Age, which served as a settlement and fishing locale particularly during the Neolithic.

In this presentation we will provide an overview of research into the former Syltholm Fjord and the surrounding landscape. We aim to discuss the area's relevance for Neolithic people and explore in which ways the water- and landscapes inform us about prehistoric decision-making and spatial understanding. This will be based on new analyses of faunal materials and extensive stationary fishing structures that will be contextualized within the wider region as well as selected snap-shot scenes from the Neolithic Syltholm Fjord, providing fascinating insights into past realities. We will attempt to incorporate the factual archaeological data into an interpretation of human self-perception against the background of the introduction of new technologies during the Neolithic period in southern Scandinavia.

3 NOW YOU SEE ME. INFLUENCE OF LANDSCAPE ON SETTLEMENTS FROM THE NEOLITHIC TO THE EARLY BRONZE AGE IN NORTH-EASTERN GERMANY

Raese, Hendrik (Institute for Pre- and Protohistoric Archaeology, CAU Kiel)

Following decades of surveys, field work and dedicated research projects especially in the course of large linear infrastructure projects (e. g. motorways and pipelines) numerous settlements from the Middle Neolithic to the Early Bronze Age (3500-1500 BCE) were identified in north-eastern Germany. This opens the possibility to search for changing settlement location preferences by means of pre- or postdictive modelling. While these models are traditionally based mostly on environmental variables (aspect, slope, soil type, etc.) they can be refined by including socio-cultural variables (visibility, previous occupations, transport networks, etc.). The focus will be here on three aspects of the visual perception of landscape: First, the location of burial mounds as these are interpreted as visible markers of interregional routes and considered to be built along an existing path network. Second, the total or cumulative viewsheds and visual neighbourhood configurations based on terrain and elevation as indicators of the general (in)visibility of a place. Third, the general vegetational land openness according to REVEALS models shows the direct impact of human activity on their surroundings.

These facets of land use and landscaping emerge or change during the analysed time period and will be investigated as possible influences on the settlement site selection criteria of prehistoric societies.

4 EVERYTHING HAD IT'S PLACE? SHAPING AND PERCEIVING BRONZE AGE LANDSCAPES IN NORTHERN GERMANY

Schaefer-Di Maida, Stefanie (CAU, Institut für Ur- und Frühgeschichte)

Everyday we are still confronted with elements of Bronze Age landscape formation (1800-500 BCE) in northern Germany, as the monumental burial mounds still stand out here and there - when they have been preserved and not yet levelled by agriculture. However, during the Bronze Age there were many more elements that organised, divided and highlighted landscapes, by sparking a certain perception. The transition from the Early to the Late Bronze Age, around 1300 BCE, brought with it many societal changes: e.g., change in burial ritual, settlement organisation, land-use. With it, new elements become visible in the landscape, which must have triggered a new perception of the surroundings. In addition to burial mounds, we can reconstruct urn cemeteries, cooking stone pits areas, Celtic fields, hoards and places of illumination in the landscape – all of them appear to be linked to specific time phases and sometimes to specific landscapes. The following aspects that characterise the different landscapes of a region are particularly striking: 1) places were consciously used and reused, 2) places were made visible, 3) places were used for special, non-everyday occasions, 4) places were associated with particular topographical or environmental positions. This contribution presents the various landscape elements of the Bronze Age in northern Germany and discusses their perceptive power against the background of the spatial-temporal development.

5 ANCESTRAL COMMONS: SHAPING THE INTERCONNECTED WORLDS OF BRONZE AGE PASTURES IN NORTHERN EUROPE

Houghton, Mark (Aarhus University) - Løvschal, Mette (Aarhus University; Moesgaard Museum)

New human-provoked and maintained landscapes emerged across Northern Europe during the third and second millennia BC: open stretches of heathlands affording grazing pastures and social opportunities. The commitment between humans and heathlands produced ancestral commons, literally and figuratively, understood as an entanglement between pasture, funerary barrows, and pastoral mobility. These ancestral commons revealed new social affordances which bound communities to landscapes in novel ways and strengthened senses of reciprocity and cooperation.

Focusing on key regions of Northern Europe, we combine palaeoecological and archaeological evidence to identify the character, strength, and temporal depth of these emergent links. Variations in this system are evident across these regions, with ancestral commons taking on distinctly local characters while remaining articulated with the overarching phenomenon. In this way, prehistoric landscape perceptions are revealed to have been broadly recognisable yet locally specific. We argue that an ancestral commons framework opens up our understandings of how the ancestral dead shaped pastoral landscapes and the negotiation and management of day-to-day land use practices. Considering the ancestral commons as deep-time more-than-human entanglement, we identify socially and economically important rhythms of return which contribute to a new, shared anthropogenic landscape horizon and an ancestral past.

6 STRUCTURE OR CHAOS? A TALE OF TWO COOKING PIT AREAS

Beck, Malene (Østfyns Museer)

On the central part of Funen two of the largest cooking pit areas known in Denmark are set within sight of each other. Both areas originally consisted of more than 1500 cooking pits but where one area is structured in long parallel lines the other area seems chaotic with no evident system. The cooking pit areas have different landscape connotations and probably express different functions or purpose, although they were in use simultaneously.

The structured area, with 16 parallel rows of cooking pits, is the locus classicus Rønninge Søgård, partly investigated by prof. Henrik Thrane in the 1970's and 80's. New excavations has provided a better understanding of the cooking pit area. The long rows seem to be the result of few larger gatherings conducted around 1000 – 800 B.C. coeval with a significantly high depositional activity in the area. The seemingly large and organized gatherings in connection with very prominent bronze age hoards could be interpreted as society handling some sort of stress or change.

3 kilometers west of Rønninge Søgård a chaotic looking cooking pit area encircles a hill in an otherwise flat landscape characterized by wetland areas, where numerous bronze age depositions have been discovered. The preliminary AMS dates indicate, that the area was in use throughout the Bronze Age, which makes it possible, that the cooking pits are the result of several minor events or visits to the site.

Landscape analysis indicate, that the two areas were interrelated, as the cooking pit lines at Rønninge Søgård were oriented and aligned according to the hill. The landscape analysis along with analysis of bronze age depositions and settlements raises questions about how the landscape was perceived, utilized and structured during the bronze age, and the paper tries to answer some of these questions.

7 FROM ARCHAEOLOGICAL EVIDENCE TO ENCHANTED WORLDS: A PROPOSAL TO EXPLORE PREHISTORIC LANDSCAPES

Díaz de Liaño, Guillermo (MOLA (Museum of London Archaeology)) - Gonzalez San Martin, Ana (Brown University)

The goal of this talk is to briefly explore some of the challenges, as well as the possibilities, of trying to infer how prehistoric landscapes could have been perceived by their prehistoric inhabitants.

The study of how landscapes were perceived in the past requires approaching not only the archaeological evidence, but perhaps, more dauntingly, the very cognition and ontological frameworks of prehistoric societies. Our proposal involves combining resources from several disciplines, including sociology and cognitive anthropology, to create a framework through which we are able to infer how the landscape was perceived, through the analysis of empirical archaeological evidence, particularly in relation to the social and economic complexity of past societies. Our proposal aims to break away from the conventions that structure Western ontological categories, and thus our conceptualisation of landscape includes a plethora of non-human entities, with varying degrees of subjectivity and power, that according to this framework would have inhabited the landscape alongside human beings.

This methodological proposal is briefly illustrated with case studies from two Mediterranean contexts: the southeast of the Iberian Peninsula, during the Chalcolithic and Bronze Age (3300-1550) and inland Bronze Age Cyprus (2600-1000).

8 ISLAND FORESTRY - AVAILABILITY, MANAGEMENT AND PERCEPTION OF WOOD RESOURCES ON ISLANDS FROM AN ARCHAEOLOGICAL AND ETHNOGRAPHIC PERSPECTIVE

Speciale, Claudia (Institut Català de Paleoeologia Humana i Evolució Social (IPHES); Universidad Rovira i Virgili (URV); University of Gothenburg (GU)) - Picornell-Gelabert, Llorenç (University of the Balearic Islands (UIB)) - Vidal-Matutano, Paloma (Universidad de La Laguna (ULL)) - Allué, Ethel (Institut Català de Paleoeologia Humana i Evolució Social (IPHES); Universidad Rovira i Virgili (URV))

Marine islands have more or less limited territories surrounded by the sea and their ecological balance is often more fragile than the one on the mainland. On islands, plant species and ecological associations can be very peculiar and sometimes human communities have developed local behaviors to address to these specific features. Furthermore, biodiversity and species niches can be under threat and biological resources can be rapidly eroded due to human and/or climatic pressure. There are several historical cases of fast erosion of plant species after human arrival and even more in the recent past in the Mediterranean with the phenomena of re-colonization of the 18th and 19th century (it is for example the case of Lampedusa and its exploitation as a charcoal kiln). Finally, despite being a crucial resource in the daily life of a community, arboreal plants and their availability are often underestimated in the evaluation of habitability of places, while their role was definitely of main importance, especially for the first communities colonizing and settling such new territories.

We present the data from small and bigger islands of the Mediterranean (Sicily and the circum-Sicilian volcanic islands), of Sri Lanka, Equatorial Guinea and the Canary Islands in a comparative framework. We collected the most significant historical and ethnographical data on the wood management, to understand the role that arboreal plants have or have had in the recent past, spacing from the practical to the symbolic significance. We want to understand if and how historical and ethnographical data can help in the reconstruction of the perception of wood resources on islands and their potential management among the human communities. Ultimately, we aim at using this information to adjust the interpretation of the anthracological data from archaeological sites and their role in the sustainable management of the island forestry.

9 PALSTAVES FACING THE SEA: EXPLORING COASTAL HOARDING TRADITIONS DURING THE TRANSITION FROM BRONZE AGE TO IRON AGE IN NORTHWESTERN IBERIA

G. Faro, María (Spanish National Research Council) - Armada, Xosé-Lois (Spanish National Research Council)

The hoarding of metals is one of the most characteristic practices of the cultural dynamics documented during the Bronze Age in the Atlantic region, especially in its final stage. Northwestern Iberia hoards are usually composed by palstaves with two rings and there is a highlighted concentration along the province of Pontevedra shoreline. Hoarding is a human practice that involves the deliberate removal of specific objects from consumption and circulation spheres and the intentional hidden in selected places. Hence, deposits are a symbolic materialization of the relationship between humans and the landscapes they were shaping through their practices.

The central question guiding this research was: Do coastal palstave hoard sites in northwestern Iberia follow a consistent pattern of selection of the site? However, the intrinsic characteristics of these archaeological discoveries present some challenges when attempting to analyse and recreate the cultural landscape to which they belong. This is due to the fact that most deposits appeared in poorly defined archaeological contexts and were often found by chance during agricultural activities many years ago, leading to uncertainty regarding the precise location of hoard sites. Nevertheless, despite being ancient discoveries, they remain in the collective memories of the inhabitants of the towns where they were located, and inquiries among local communities usually yield successful results in recovering information about these discoveries.

To address our question, we revisited the towns where palstave hoards were discovered along the shoreline of the province of Pontevedra (Galicia, Spain), aiming to enhance the accuracy of our data. Finally, we employed Geographic Information System (GIS) to conduct visibility analyses, exploring the decision-making processes underlying the selection of hoard sites. We have identified changes in the selection of hoarding sites traditions along the Late Bronze Age and the transition to Iron Age.

10 REIMAGINING MINING LANDSCAPES IN THE SIEGERLAND (GERMANY) - THEORY AND PRACTICE OF CULTURAL APPROPRIATION AND SHAPED SPACE

Stähler, Carmen (Ruhr-University Bochum)

The Siegerland (North Rhine-Westphalia) is thoroughly investigated research area for mining and iron production during the Iron Age in Germany (Stöllner, 2020). However, its landscape and settlement patterns are viewed from an ecodeterministic perspective only, due to its peripheral and climatically unfavourable location, the abundance of ore, and rare number of non-production-sites resulting from poor preservation and high detection filters. Thus, plural,

and diverse concepts of space and landscape besides the nature-culture-dichotomy and economical behaviour and perception have rarely been considered.

To approach this landscape differently, processes of settlement, mining, transport, etc. are conceptualized as practices of landscaping/making landscape (Ingold, 1993; von Rüden, 2022), meaning collective and intertwined practices and perceptions of and in space, which shape landscapes in a culturally specific way/habitus by appropriation. Thereby, it is possible to analyse landscaping quantitatively (GIS-tools e.g. least-cost-path, viewsheds), and qualitatively via social spaces, the practices of their appropriation (e.g. walking, sensing, mining), and the chances of their appropriation (e.g. accessibility). In this way, spatial practices from production- and non-production-sites can be compared within the framework of a Cultural Appropriation of Spaces and Things (CAST) (de Certeau, 1984; based on Hahn, 2004).

This paper will outline the theoretical and methodological background of CAST and present first examples of its application: By taking practice theory seriously, natural features or raw materials are not predetermined as (un-)favourable but checked against practices of appropriation such as walking by, digging through, looking at etc. Furthermore, smelting sites are dynamic spaces, not only on-site due to the duration of production and its residues, but off-site as well: They influence ways of moving about them (road networks) and thinking of them (e.g. places of social cohesion/memory/avoidance). This approach will shed light on how people experienced, shaped and constituted spaces and landscapes by and beyond mining.

11 GENDER AND COSMOLOGY IN EARLY IRON AGE MORTUARY MONUMENTS AND LANDSCAPES

Murray, Matthew (University of Mississippi)

This paper presents an exploration of gender and cosmology in the shaping and perception of mortuary landscapes during the early Iron Age (ca. 700-450 BC) in southern Germany. Monuments and their landscapes were simultaneously a metaphor for idealized social relations and a resource for social negotiations of those ideals. Maintenance of the social fabric of Iron Age society and its cosmological integrity were also intertwined, and both were concretized in physical acts of burial that embodied the earth with the agency of ancestors. Gender and cosmology are multilayered ways of ordering the world at different scales of complexity and integration from social beings to the entire universe. At times, these conceptual systems overlap. I briefly survey global anthropological literature that elucidates links between gender, cosmology, and landscape, and I use observations from early Iron Age mortuary landscapes at the Heuneburg, Magdalenenberg, and Glauberg in Germany to illustrate the notion that cosmological landscapes may be entangled with engendered landscapes. The way that human groups organize themselves can reflect fundamental ways that they perceive the organization of the cosmos, and mortuary landscapes are powerful settings in which people engage with these organizational structures.

12 WITHIN THE STORIES OF A LANDSCAPE

Karlsson, Anna-Karin (Kalmar County Museum)

The island Blue Maiden is located off the Swedish east coast between the mainland and the island of Öland. Huge boulders and steep cliffs provide a dramatic landscape. Weather phenomenon makes the visible experience of the island intriguing, with it vanishing, turning upside down and occasionally floating above the surface.

Archaeological fieldworks revealed extensive human activities in the Mesolithic. A rock shelter held massive cultural deposits containing lithic and osteological material. Charcoal from the deposits was radiocarbon dated to 7000 BC. In a cave nearby, a distinct ritual feature was identified. Around 4000 BC the activities on the island cease, and there are no traces of activities until medieval times. In the late 15th century, the island is mentioned for the first time in written sources, where it is said to be connected to powerful forces. Since then, the Blue Maiden has been associated with folklores related to bad luck, evil and witches.

Blue Maiden makes an interesting site for exploring how stories of the landscapes are created out of former inhabitants' dwellings and understanding of the landscape. The island holds archaeological sites with clear stratigraphical layers. Drawing on Tim Ingold it can also be argued that there are unearthing processes in play, where old patterns rise to the surface as new ones sink down. This results in a landscape where stories of today are created based on past perceptions and understandings of the world. But how far back can these stories be traced, and is that at all an important question?

901 UNDERSTANDING THE RESEARCH PROCESS AS A CHAÎNE OPÉRATOIRE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Kaiser, Jessica (Uppsala University) - Huvila, Isto (Uppsala University) - Friberg, Zanna (Uppsala University) - Battle Baró, Sabina (University of Barcelona)

Session format: Regular session

As archaeologists, we are very familiar with gaps in the record. The data we collect for our research are often fragmented and incomplete. Imperfect data notwithstanding, we use the methods available to transform ambiguities to unambiguities in order to construct narratives about past societies. In the last few decades, this process has increasingly involved an array of digital methods and tools. Gone are the days when a site archive consisted of a large stack of papers languishing in the office of the site director. Not only are the final datasets digitized for preservation, but in many cases the data are born-digital without ever being put on paper. However, this new way of collecting and storing data raises new challenges in data curation and reuse. The focus of this concern has generally been the final dataset, with repositories specifying which types of metadata need to be included for its archiving. More recently, researchers have pointed out that data descriptions, conceptualized as paradata, need to accompany all stages of the research process, since choices made along the way can greatly affect outcome and results. We suggest envisioning the research process as a conceptual chaîne opératoire, where not every link is preserved. To understand archaeological knowledge production, it is crucial to pay attention not just to the rationale behind using a particular methodology, but also to the specific ways in which it is implemented during the research process. By applying the chaîne opératoire approach to trace the knowledge production process, we can make visible the practices that shape archaeological knowledge production today. We invite papers on any aspect of the research chain. We are particularly interested in papers that discuss methods for preserving and/or retrieving process- or paradata in order to facilitate the curation and reuse potential of archaeological data.

ABSTRACTS

1 CHAINED TO THE METHOD? HOW MIGHT DATA COLLECTION INFLUENCE POSTERIOR SHARING

Battle Baró, Sabina (Universitat de Barcelona)

More and more, archaeological data are collected with digital methods, both on the field and in the laboratory. This is allowing the creation of a higher volume of digital-born data. Obviously, these methods contribute to a more exhaustive record of the finds and can have important implications such as allowing big data analysis. However, it has been widely discussed in the literature the consequences this datafication has over the discipline and the way we work, manage our data, build interpretations, or even conceive science itself.

Understanding the archaeological research process as a chaîne opératoire helps us identify the choices we make in each step and can allow us to evaluate their implications. As one of the first links in the archaeological research process chain, data collection lays the foundations for the following stages. Moreover, it can shape our way of understanding the archaeological record and even rule the amount, type, and quality of the data we keep, and we dispose of. But are we aware of that when we choose to embrace digital methods? And how do our methodological choices influence further steps, such as data management and sharing?

In this communication, we will try to explore these questions using the insights derived from a series of in-depth, semi-structured interviews that delve into the habits and perspectives of Catalan archaeologists on data management, sharing and reuse. We will approach the different collection methods and the researchers' experiences when creating and managing the data, while trying to reflect on the impact those practices can have on the posterior sharing of the data.

2 PRACTICE AS (NOT) A SUM OF ACTIONS: MEETING TWO CHAÎNES OPÉRATOIRES HALF-WAY

Huvila, Isto (Uppsala University)

The notion of chaîne opératoire stands out as an interesting concept for thinking about archaeological work, knowledge production and its underpinnings in the archaeological stratum and its coming into being. Tim Ingold (2022, p. 262) asked a seemingly innocent question of whether it would be possible to conflate two chaînes opératoires: the one of the archaeological stratum and the one of its making, or in his example, a wall and the process of building it. The question was rhetorical in the sense that he dismissed the possibility straight out by noting that neither of them are series of discrete steps but rather "converging and diverging strands of a continuous braid", complicate rather than additive.

If we accept Ingold's view of the knotting of the multiple chaînes opératoires conceptualisable in archaeological knowledge work, there are several follow-up questions to ask. One is how the multiple chaînes opératoires come together.

Another is what implications the coming together have on using the concept of chaîne opératoire to understand archaeological knowledge production, and third, if and how archaeological knowledge production is documentable and approachable through the different ways intermingling chains of actions.

The presentation inquires into the nexus of multiple chaînes opératoires present in the archaeological knowledge production. Based on observations in several studies of the documentation of archaeological data creation conducted in the ERC-funded research project CAPTURE, it aims at detangling the relation of archaeological practices, knowledge production, the processes archaeology investigates, and how they are documentable and knowable. Discussing process documentation in terms of paradata, the presentation contributes to the on-going discussion on the documentation and communication of the practices and processes of data creation, processing and use that have been identified in the literature as crucial for future reuse of data.

3 PREREGISTERING ARCHAEOLOGICAL RESEARCH DESIGNS AND TESTING SHORELINE DATING

Roalkvam, Isak (University of Oslo)

Lewis Binford, among several archaeologists, criticised a failure in the discipline to distinguish between post hoc accommodative arguments – also called postdictive or hypothesis-generating research, and research designs aimed at testing these by evaluating their predictions against new or independent observations – often termed predictive or hypothesis-testing research. One tool that has seen increased use outside archaeology and some use within the discipline to maintain this distinction is the concept of preregistration of research designs. Preregistration is argued by its proponents to counteract so-called hindsight bias and the propensity of the human mind to inadvertently press data to meet a favored hypothesis. Detractors of preregistration, on the other hand, highlight the impossible task of foreseeing all analytical choices that have to be made in the course of a study, and worry that preregistration will instead function as an analytical straight-jacket.

I have recently proposed a formalised version of the somewhat idiosyncratic dating method known as shoreline dating, which is used for dating coastal Stone Age sites in Fennoscandia. This was based on an exploratory, postdictive study. To assess the reliability and precision of the method, further testing of the proposed implementation of the dating method is therefore necessary. To establish a transparent and sensible test, and to aid in the task of convincing myself and others that the method has been adequately confronted with independent data in such a test, the study design will be preregistered.

In my paper I will discuss some benefits and drawbacks of preregistration in general, and outline the approach I have used in an attempt at assembling a reasoned and not overly constraining preregistration of a framework for testing shoreline dating.

4 TRUE INTEGRATION: THE JOURNEY TO PRESENT ARCHAEOLOGICAL DOCUMENTATION WITH THE CRM FAMILY

Jansen, Jane (Arkeologerna; Intrasis) - Stead, Stephen (Paveprime Ltd; Open University)

This continuing integration study considers how the body of archaeological excavation databases of The Archaeologists (a department within the National Historical Museums of Sweden) is being prepared for integration utilising the CRMarchaeo and other extensions of the CIDOC Conceptual Reference Model (CRM). New details on how this will be done will be presented in this paper. We will show how CRMarchaeo will be applied on the Intrasis data model and how we will implement it on thousands of databases.

The Archaeologists create many new Intrasis-databases each year and the project is looking at making the full richness of both observations and interpretations available as a queryable resource. In addition the para-data of how the transformation from the internal Intrasis data-structure to the CRMarchaeo representation is being performed, is being modelled using the CRM family of ontologies. This enables the full digital provenance of any individual element of the full data-set to be assessed as well as understand the evolution of techniques used. This will allow scholars to consider both the archaeologically investigated past and the techniques used to manage the documentation of this past: the history of the discipline so to speak.

There is one further area of interest. It is the documentation of competing interpretations of primary evidence and the reasons for the selection of one interpretation over another. This is being done using CRMinf.

The presentation will showcase the work undertaken by Intrasis and Paveprime since last year to enrich both the archaeological record and the record of the documentation practice itself.

5 BROKEN LINKS OR PARALLEL CHAINS OF EVIDENCE? DIARIES AND PRO FORMA FROM A SPECIALIST PERSPECTIVE

Kaiser, Jessica (Uppsala University)

Diaries have been an integral part of the archaeological toolkit since the birth of the discipline. Early examples often weave together information on fieldwork and recent finds with colorful narratives of local happenings and scenery from the personal perspective of the author. In step with the pursuit of enhanced scientific credibility and objectivity of the discipline culminating in the processual archaeology of the 1960's, the focus shifted towards a more scientific approach, emphasizing objective data collection. The field notebook was repurposed as an instrument for empirical recording, ostensibly shedding its subjective nature. In the subsequent decades, the notebook has more and more given way to standardized pro forma, aimed at streamlining the archaeological process – some would say at the expense of interpretation. More recently, the post-processual emphasis on the subjectivity of archaeological practice has resulted in a number of archaeological projects (e.g. Çatalhöyük, Leskernick, Citytunneln) leveraging field diaries for reflexivity and advocating for an acknowledgment of the subjective underpinnings of knowledge creation. Subsequent studies have evaluated overlapping or disparate types of information contained in field diaries and standardized sheets from both academic and commercial archaeological projects (e.g. Berggren 2009, Mickel 2015, Sandoval 2021) as well as critique the purported spontaneity of published diaries (Anderson and Krstanovic 2008). However, while the acknowledgment of subjectivity has taken hold in archaeology in general, more 'processually' oriented specialists have perhaps been slower to follow suit. This paper aims at investigating whether similar interpretive disparities or overlaps can be recognized in specialist records, by comparing information from notebooks and pro forma produced by the bioarchaeological team at the Wall of the Crow Cemetery, Giza.

902 ARCHAEOLOGY OF WILDERNESS: HUMANS, ANIMALS AND LANDSCAPES THROUGHOUT THE HOLOCENE

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Vukovic, Sonja (Laboratory for Bioarchaeology, Archaeology Department, University of Belgrade - Faculty of Philosophy) - Larsson, Petter I. (University of Helsinki, Department of Cultures, Archaeology) - Marom, Nimrod (School of Archaeology, University of Haifa) - Živaljević, Ivana (University of Novi Sad – Faculty of Philosophy)

Session format: Regular session

Anthropogenic impact on the environment resulted in unprecedented crises, including climate change and biodiversity loss. Archaeology, with its deep-time perspective on humans and paleoenvironments, has become an active participant in the study of these dramatic Anthropocene changes. Identifying anthropogenic influences on ecosystems and separating these from natural processes is challenging. Bioarchaeological records sequester information on past multispecies communities. The refinement of methods for detecting and differentiating natural processes from human and livestock presence, such as sedaDNA, isotopes, biogeochemistry, and non-pollen palynomorphs but also archaeological and osteological approaches can provide a rich and diverse picture of the past and tell its stories in new ways. These allow us to push the boundaries of our knowledge and test old interpretations of past socio-ecological processes. They provide opportunities to develop new models about human-environment interactions and to examine challenging questions, like how well we can detect changes in disturbance regimes, track changes in the intensity of land use, identify low-intensity activities, Holocene extinctions, past translocations, the genetic diversity of wildlife, animal and plant domestication and the subsequent spread of agriculture, deforestation, urbanization and industrialisation.

This session aims to bring together speakers who apply innovative research designs to explore and communicate the interactions between culture and nature during the Holocene. We encourage the contribution of speakers from diverse fields (including environmental archaeology, multispecies archaeology, bioarchaeology, and archaeogenetics). The need for innovative methods and approaches to study socio-ecological processes is not only necessary for improving knowledge of past human-nature interactions and how these shaped landscapes; they can also help us to build more robust models and theories to connect archaeology and ecology, where answering many 'grand challenges' depends on our ability to think across human behaviour and ecosystem processes.

1 UNTANGLING THE ENIGMA OF ANTHROPOGENIC INFLUENCE ON VEGETATION COMPOSITION

Larsson, Petter Ingolf (University of Helsinki)

Here I present new data on anthropogenic modification on a landscape than can be described as marginal and unfavourable for agricultural purposes. The study is based on a pollen core from Lake Dalstråk in the northern parts of the Åland Islands (Finland). The region, with a hilly topography, offers an opportunity to get a good signal of understory proxies due to localised transportation of pollen and spores through surface run-off. The data is explored statistically through correlation analyses to resolve evidence of small-scaled anthropogenic land use and modification of the vegetation. The results, spanning from the end of the Bronze Age until the modern era (c. 740 BCE–1920 CE), suggest a previously unknown ecosystem modification of the landscape through low intensity agrarian practices. Due to the complex, non-equilibrate state of ecosystems, there is no single analysis that provides a holistic understanding underlying causation for variability and change in species composition. However, correlation analysis of apophyte pollen and spores against anthropogenic indicators and landscape openness indicators proves useful for interpreting palynological results and can be used as an interpretive aid in exploring the pollen signal while avoiding circular interpretations. Correlation analysis was also proved to be prolific in highlighting patterns that generally tend to remain obscured. Except for new knowledge on prehistoric land use on Åland, the study provides a relatively easy methodological approach that can be adapted and used on various sites on a global scale.

2 PALAEOENVIRONMENTAL CHANGES THROUGH THE HOLOCENE IN CACHEU (GUINEA-BISSAU): PRELIMINARY PALYNOLOGICAL AND FIRE RESULTS

Domingues Gomes, Sandra (UNIARQ - Centre for Archaeology, University of Lisbon) - Costa, Ana Maria (LARC - Archaeosciences Laboratory, DGPC - Directorate General for Cultural Heritage, Portugal; BIOPOLIS and CI-BIO; IDL-University of Lisbon) - Freitas, Maria Conceição (Dom Luiz Institute; Department of Geology, Faculty of Sciences, University of Lisbon) - Mendes, Patrícia (Archaeosciences Laboratory, DGPC - Directorate General for Cultural Heritage, Portugal) - Arvela, Rute (UNIARQ - Centre for Archaeology, University of Lisbon; Department of Geology, Faculty of Sciences, University of Lisbon) - Gomes Coelho, Rui (UNIARQ - Centre for Archaeology, University of Lisbon; Department of Archaeology, Durham University, UK)

The ECOFREEDOM interdisciplinary project aims to understand the social and environmental impacts of slavery and colonialism in the region of Cacheu, an important town-port in the transatlantic trade of enslaved people between the 16th-19th centuries. We hypothesize that the forced displacement of local populations left discernible imprints on the environment. To investigate palaeoenvironmental changes in this area, including human activity, we conducted palynological analyses on a sedimentary sequence in the Cacheu estuary (CH2).

The 3.9m sedimentary record of CH2, composed by intercalations of sandy mud and muddy sand, and rich-shelly layers, was retrieved from a mangrove area, adjacent to abandoned rice fields. An AMS radiocarbon date was obtained for the base of the core (ca. 8400 cal BP), with further dating efforts underway to refine chronological constraints.

Our analysis, employing an adapted protocol to maximize the recovery of organic material, revealed sporomorphs representing the local mangrove forest, indicative of relative stability of past vegetation, in this area. Notably, the evolution of fire history emerged as a significant aspect, albeit requiring additional dating to elucidate accurate temporal patterns. Concurrently, investigations have commenced on a second sedimentary sequence (CH3) with higher levels of organic matter, collected in a rice field. Future endeavors aim to explore inland lagoonal systems surrounded by transitional vegetation zones, to provide further insights into regional vegetation dynamics.

These studies hold paramount importance, as Guinea-Bissau lacks prior palaeoenvironmental data essential for contextualizing archaeological and palaeoecological research. Understanding the interplay between human activities and climate is imperative for disentangling their impacts. Moreover, given the susceptibility of low topography regions like Guinea-Bissau to the effects of global climate change, palaeoecological investigations play a pivotal role in elucidating vegetation resilience. Our findings contribute to a deeper comprehension of West African palaeoenvironments, emphasizing the significance of palynology in reconstructing past landscapes.

3

NEW FINDINGS ON HUMAN IMPACT IN GREATER POLAND DURING THE MIGRATION PERIOD BASED ON HIGH-RESOLUTION PALAEOENVIRONMENTAL RECONSTRUCTIONS

Czerwinski, Sambor (University of Gdańsk, Faculty of Oceanography and Geography - Department of Geomorphology and Quaternary Geology, Gdańsk, Poland) - Lamentowicz, Mariusz (Adam Mickiewicz University, Institute of Geoecology and Geoinformation - Climate Change Ecology Research Unit, Poznań, Poland) - Izdebski, Adam (Max Planck Institute, Institute for Geoanthropology, Jena, Germany) - Marcisz, Katarzyna (Adam Mickiewicz University, Institute of Geoecology and Geoinformation - Climate Change Ecology Research Unit, Poznań, Poland) - Niebieszczański, Jakub (Adam Mickiewicz University, Faculty of Archaeology, Poznań, Poland) - Hajdas, Irka (ETHZ, Laboratory of Ion Beam Physics, Zurich, Switzerland) - Gromig, Raphael (Max Planck Institute, Institute for Geoanthropology, Jena, Germany; University of Cologne, Institute of Geology and Mineralogy, Cologne, Germany; Simon Fraser University, Department of Earth Sciences, Burnaby, Canada) - Wagner, Bernd (University of Cologne, Institute of Geology and Mineralogy, Cologne, Germany) - Gałka, Mariusz (University of Lodz, Faculty of Biology and Environmental Protection - Department of Biogeography - Palaeoecology and Nature Conservation, Łódź, Poland) - Kołaczek, Piotr (Adam Mickiewicz University, Institute of Geoecology and Geoinformation - Climate Change Ecology Research Unit, Poznań, Poland)

High-resolution palaeoenvironmental reconstructions offer detailed insights into past anthropogenic impacts, aiding in updating archaeological knowledge. The shortage of archaeological and high-resolution palaeoecological data makes the Migration Period (MP, ca. 300–510 CE) in Greater Poland poorly understood. Climate deterioration and population displacement in Europe, characterized this period. Moreover, in Greater Poland - where the first structures of Polish statehood were formed - little is known about settlements before ca. 800 cal. CE. To fill this gap, we conducted a high-resolution investigation (pollen, selected non-pollen palynomorphs, micro and microcharcoal, plant macrofossils, and micro-X-ray fluorescence scanning) of two close sites (Kazanie mire and Lake Lednica, located approx. 9 km apart) in areas associated with the initial Slavic dynasty (Piast) state formation. This study aims to determine how the socioeconomic crisis during the MP before the appearance of Slavs in Greater Poland affected the local settlement (and whether it was continuous human activity) and how vegetation responded to this transition. The results reveal that at Lake Lednica, hornbeam was gradually selectively logged as early as ca. 600 cal. CE, leading to a substantial decrease in its proportion in forests until ca. 900 cal. CE. In Greater Poland, it was the time of establishing the first statehood. Our data for this period indicate an increased human impact, as evidenced by the rise in the percentage of various pollen types, including cereals and ruderals. At the Kazanie mire, the regeneration of hornbeam occurred as late as the beginning of the 6th century cal. CE and dominated in forests until the end of the 9th century cal. CE when low human impact was observed. The disparity in the hornbeam's response between the two sites may be attributed to local forest transformation by past societies, initiated much earlier at the Lednica site compared to Kazanie.

4

HUMANS AND LANDSCAPES IN THE MID-KAMA REGION THROUGHOUT THE HOLOCENE

Shumilovskikh, Lyudmila (Georg-August-University Göttingen, Germany) - Batalova, Vlada (Georg-August-University Göttingen, Germany) - Orlova, Elizaveta (Perm State University, Russian Federation) - Pereskokov, Mikhail (Perm State University, Russian Federation) - Sannikov, Pavel (Perm State University, Russian Federation) - Salova, Julia (University of South Bohemia, Czech Republic) - Mingalev, Vitaliy (Higher School of Economics, Perm, Russian Federation) - Vyazov, Leonid (University of Ostrava, Czech Republic)

The increasing pressure on nature with increasing human population size is often considered as a gradual process, however, human pressure on a regional scale can be related to the birth, flourishing and fall of a specific culture, its disappearance or transformation into a new culture adapted to a new environment. Thereby climate and environmental changes are often considered as triggers of cultural transformation in addition to political and socio-economic causes. Land use in pre-industrial cultures was constrained by habitat capacity, where overexploitation led to ecosystem devastation and social collapse. Conversely, non-human triggered events like (pre-modern) climate change or change in the hydrological regime could initiate population collapses and migration processes, leading to cultural re-adaptations. Such human-environment interplay is especially distinct at ecological borders of human existence, characterized by harsh climate conditions like in the boreal forest region. An exceptional example of human-environment interactions is provided by the societies in the boreal zone of the mid-Kama region of European pre-Urals. This region offers long-term settlement history covering the entire Holocene as well as numerous palaeoecological archives to trace human-environment interactions. Using multi-proxy analyses including pollen, non-pollen palynomorphs, archaeobotany, loss-on-ignition, radiocarbon datings, micro- and macrocharcoal, we investigate the changes in forest cover, fire activity, grazing intensity and agricultural practices of the region based on three peatland cores and archaeological sites from the region. All data are compared to population dynamics and subsistence economies of different cultures in order to evaluate the socio-ecological processes in the mid-Kama region throughout the Holocene.

5 HUMAN-ENVIRONMENT INTERACTION IN THE LIGHT OF WOOD EXPLOITATION BETWEEN SISTAN (IRAN) AND GUJARAT (INDIA) DURING THE IV-II MILLENNIUM BC

Minervini, Ignazio (University of Salento) - Madella, Marco (Pompeu Fabra University) - Fiorentino, Girolamo (University of Salento) - Primavera, Milena (University of Salento)

This contribution presents the results of anthracological analyses carried out at four different protohistoric settlements located between West and South Asia: Shahr-i Sokhta (Sistan-Iran, 3900-2000 BC), Bhandu Qubo (Sindh-Pakistan, 2800-1900 BC), Taloor Jee Bhatt (Sindh-Pakistan, 2600-1900 BC) and Loteshwar (Gujarat-India, 3600-3300 BC). For each site the charcoal assemblages were recovered in order to investigate the human-environment dynamics through the reconstruction of wood catchment basins. Anthropogenic impact on landscapes (land-cover), cultural influence on ecosystems and possible chronological variability of the assemblages were also considered in connection to regional and local climatic settings.

Although the sites are chronologically comparable, they show differences from several points of view. Shahr-i Sokhta represents an urban and industrial settlement of the Helmand Civilization, in the western part of the study area. It is located in the center of an extensive trade network and was influenced by the seasonal dynamics of the Helmand River. In the central part of the study area, Bhandu Qubo and Taloor Jee Bhatt, small urban settlements of the Indus Valley Civilization, were also integrated into productive and commercial networks. Bhandu Qubo is located in the central Indus Valley while Taloor Jee Bhatt sits at the edge of the Thar Desert; both were influenced by the seasonal dynamics of the river and the summer/winter rains. The easternmost site, Loteshwar, is a seasonal settlement linked to the Indus Valley Civilization but with an important influence from local cultural traditions. The site is located in an area of brief but periodic high humidity due to the Indian Summer Monsoon.

Examining the differences between anthracological data originating from the sites and located in areas with diverse climates and environmental features has provided the opportunity to assess the structure and dynamics of the woody vegetation and to investigate changes in terms of climatic and social pressures.

6 A WETLAND WILDERNESS AND ITS DESTRUCTION. THE DEVELOPMENT OF A PEATLAND FOREST IN THE WESTERN NETHERLANDS

Bazelmans, Jos (Cultural Heritage Agency, Netherlands (RCE), Ministry Education, Science and Culture)

In recent years, more than 500 bog oaks have been collected, sampled and dendrochronologically dated in the peatland area between the cities of Amsterdam and Utrecht. They provide a very detailed picture, with unique chronological resolution, of the late-prehistoric and early-historic development of an alder bog forest with oaks. Geological and palaeo-environmental studies allow the forest development to be placed within the long-term development of the area. The area first features extensive reed and sedge peatlands, with large lakes, and later reed, sedge and woodland peatlands cut by a Rhine tributary. The paper shows how forest development, in the absence of human presence in the area, initially, as of ca 1400 BCE, came about in interaction with the middle Dutch river area. Later, from the beginning of the late Iron Age, and especially in the early Roman period, human influence becomes visible in forest development. Felling, possibly also by the Roman army, leads in a short time to the complete and final destruction of the local oak stock.

7 ENVIRONMENT AND PLANT GATHERING AT THE MESOLITHIC LJUNGAVIKEN SITE IN SOUTHERN SWEDEN

Vanhanen, Santeri (The Archaeologists, State historical museums) - Lagerås, Per (The Archaeologists, State historical museums) - Persson, Carl (Carl Persson Fornforskaren) - Kjällquist, Mathilda (The Archaeologists, State historical museums) - Hammarstrand Dehman, Karina (Sydsvensk Arkeologi)

Around fifty Mesolithic huts and numerous other structures were found well preserved below lake mud and two meters of sand in southern Sweden at the Ljungaviken site in Blekinge. The lake mud and the sand had accumulated by the rising sea-levels of the Litorina-transgression sealing the site from later disturbances. More than hundred radiocarbon dates show that the site was relatively short-lived and occupied during centuries around 6500 cal BC, corresponding to the local Mesolithic period. Depositional circumstances allowed good preservation ancient plant material which was studied by pollen, macrofossil, and wood anatomical analyses. Plant material revealed aspects of local environment and gathering of wild plants for food and fuel. Analyses showed that people built their huts near the shoreline in woods dominated by pine, but further away lie areas with more broad-leaved trees, where hazelnuts and several other plants were gathered for food and probably medicine. Wood anatomical study of the charcoals showed negligible changes in the environment which indicate sustainable fuel gathering from the surroundings. Results of the study contribute to our understanding of human-environment interactions of prehistoric hunter-gatherers.

8 WILDLIFE IN THE LANDSCAPE: WILD ANIMAL AND PLANT SPATIO-TEMPORAL DISTRIBUTIONS DURING THE HOLOCENE IN SERBIA

Sabanov, Amalia (University of Belgrade - Faculty of Philosophy) - Radinović, Mihailo (University of Belgrade - Faculty of Philosophy) - Mladenović, Teodora (University of Belgrade - Faculty of Philosophy) - Radišić, Teodora (University of Belgrade - Faculty of Philosophy) - Marković, Dimitrije (University of Belgrade - Faculty of Philosophy) - Pavlović, Nemanja (University of Belgrade - Faculty of Philosophy) - Vuković, Sonja (University of Belgrade - Faculty of Philosophy)

Human activities such as agriculture, deforestation and urbanization, and other factors like climatic fluctuations, altitude variations and demographic shifts have influenced the distribution of wildlife over millennia. By examining the dynamics of human-wildlife conflict, the ARCHAEOWILD project aims to elucidate the intricate relationships between humans, animals, and landscapes in the context of changing socio-economic and environmental conditions throughout the Holocene. This presentation introduces a synthesis of all (un)published data on wild mammal and plant remains from archaeological sites across Serbia throughout the Holocene, encompassing various periods from the Mesolithic to Medieval times. Utilizing information sourced from all available publications, we conducted statistical analyses and spatial mapping using QGIS to discern spatio-temporal patterns in wildlife distribution. We aimed to identify and understand the possible trends of wild species distributions between individual sites, site types, regions and periods. Our work contributes to the broader theme of the Archaeology of Wilderness, shedding light on the nuanced interplay between human societies and their natural surroundings over time and providing an exclusive overview of the spatial and temporal distribution of wildlife during the Holocene. Findings presented here give valuable insights into the long-term impacts of human civilization on wildlife populations and ecosystems, highlighting the importance of interdisciplinary approaches in understanding past landscapes and informing contemporary conservation efforts.

9 EXPLORING THE INTERPLAY OF CLIMATE, BIODIVERSITY, AND HUMAN SOCIETIES IN NORTHEAST AFRICA THROUGH SPECIES DISTRIBUTION MODELS

Lazagabaster, Ignacio (University of Liverpool, Department of Evolution, Ecology & Behaviour, Liverpool, United Kingdom; National Research Center for Human Evolution (CENIEH), Burgos, Spain) - Thomas, Chris (University of York, Department of Biology and Leverhulme Centre for Anthropocene Biodiversity, York, United Kingdom) - Spedding, Juliet (University of Liverpool, Department of Archaeology, Classics and Egyptology, Liverpool, United Kingdom) - Ikram, Salima (The American University in Cairo, Department of Sociology, Egyptology and Anthropology, New Cairo, Egypt) - Snape, Steven (University of Liverpool, Department of Archaeology, Classics and Egyptology, Liverpool, United Kingdom) - Solano-Regadera, Irene (University of Liverpool, Department of Evolution, Ecology & Behaviour, Liverpool, United Kingdom) - Bro-Jorgensen, Jakob (University of Liverpool, Department of Evolution, Ecology & Behaviour, Liverpool, United Kingdom)

Understanding the intricate relationship between climate change, biodiversity shifts, and human activity is crucial for unravelling the complexities of ecological dynamics throughout history and contextualizing historical events. The rich zooarchaeological record of Holocene northeastern Africa provides a unique opportunity to investigate long-term biodiversity trends amid significant climatic fluctuations and societal changes in ancient Egypt. Here, we integrate species distribution models (SDMs) with zooarchaeological records and insights into past human ecology to discern the roles of climate-driven shifts and human activities, such as overexploitation and agricultural practices, in shaping biodiversity patterns over millennia.

We conducted SDMs using current distributions of 56 large (>10 kg) wild mammalian taxa present or likely present in northeastern Africa during the Holocene, encompassing species like bovids, giraffes, felids, and hyenas. Employing modern occurrence data from online repositories and range distributions, we used Bayesian additive regression trees (BARTs) to assess variable (climatic and topographic) importance and nine different algorithms to generate distributions of habitat suitability. The paleoclimatic simulation utilized encompasses the last 8000 thousand years and is tailored to recreate the northern influence of the African monsoon during the African Humid Period (AHP).

Our findings indicate a decline in suitable habitats for species requiring relatively high humidity and dense vegetation in favour of arid-adapted taxa over time, particularly towards the end of the AHP. Maintenance of environmental suitability for species beyond their extinction date suggests that human impact was likely a significant contributor to various species' declines. Stacked community projections illustrate a general reduction of suitable environments in the region's western deserts, with favourable habitats moving southward in tandem with increased human settlement around the Nile. We further use the zooarchaeological record to discuss the resulting environmental suitability projections within the context of societal transitions in Ancient Egypt and regional climate change.

10 **MODELLING PAST FORAGING STRATEGIES IN ARID ECOSYSTEMS: BRINGING TOGETHER TRADITIONAL ECOLOGICAL KNOWLEDGE AND COMPUTATIONAL ARCHAEOLOGY**

Paliou, Eleftheria (University of Cologne) - Angourakis, Andreas (University of Cologne; Ruhr University Bochum)

Simulations of hunter-gatherer mobility and behaviour are frequently used in archaeology to shed light onto the subsistence strategies, survival resilience and social development of early human societies. Integral to these models are foraging practices that would have been determined by socio-ecological dynamics. Nonetheless, the archaeological record offers only sparse and indirect evidence of such practices, which makes theory and model building on foraging behaviour particularly challenging for archaeologists. Despite numerous ethno-archaeological studies, several aspects of human-environment and human-animal interactions in the context of traditional hunting practices (i.e. hunting on foot, with a bow and arrow as opposed to firearms, and without orientation instruments) are still poorly understood. This paper will discuss how quantitative and qualitative datasets on traditional hunting practices, obtained in the framework of an interdisciplinary and collaborative project that brings together archaeologists and indigenous hunting experts, can inform theoretical and computational models of hunter behaviour in arid ecosystems. The project offers a rare opportunity to capture using geospatial technologies the movements of Ju/'hoansi and Hai//kom San game tracking experts during hunting bouts in arid landscapes in Namibia. During five field seasons, which took place between 2019 and 2023, a variety of georeferenced quantitative data (including movement trajectories, heart rate, caloric expenditure, and wind data) were collected. Furthermore, valuable qualitative insights into traditional ecological practices (i.e. controlled small-scale fire practices aiming at increasing plant and animal resources) were gained during fieldwork. This paper will discuss how these datasets can be used to support simulations of foraging behaviour, and especially agent-based models that seek to explore the interplay between environmental changes and foraging decisions in arid ecosystems. We conclude that Traditional Ecological Knowledge can contribute to a better understanding of past socio-ecological processes, and encourage advancements in modelling past human ecosystems.

11 **AS TIME GOES BY: HUMAN-WILDLIFE DYNAMICS IN THE DANUBE GORGES THROUGHOUT THE HOLOCENE**

Markovic, Dimitrije (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade) - Živaljević, Ivana (Department of History, Faculty of Philosophy, University of Novi Sad) - Vuković, Sonja (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The Danube Gorges in Serbia, commonly referred to as the Iron Gates, showcase not only breathtaking landscapes but also hold significant archaeological importance, with traces of prehistoric settlements and numerous Roman and Medieval fortifications along its banks. It boasts rich biodiversity, providing a habitat for diverse flora and fauna along the river course. Optimal hunting and fishing conditions, i.e. particular types of whirlpool fishing, proved to be of crucial importance for the initial human settlement in the early Holocene. Since the Roman period, the Danube Gorges have witnessed the imprint of human activity, from the engineering marvels of emperor Trajan's preparations for the Dacian wars to the contemporary reshaping of the region with the construction of the Iron Gates Dams. By analyzing mammal and fish remains from archaeological sites, as well as by looking into the data regarding the biodiversity of the modern-day National Park in this area, our research will shed light on how these immense anthropogenic activities have shaped the biodiversity of the Danube Gorges. The research mostly relies on data collected within the ARCHAEOWILD project, that is, the published material from different period sites, as well as on the archaeozoological analyses done by the authors themselves. Key species such as red deer, brown bear, wild boar, aurochs, and beluga fish take center stage, providing a nuanced understanding of historical coexistence and the enduring impact of human societies on the region's fauna.

12 **PERSISTENCE, DISAPPEARANCE, REDISCOVERY: THE EXTINCTION DYNAMICS OF THE EUROPEAN WILD ASS AND AUROCHS IN THE NORTH-CENTRAL BALKANS**

Živaljević, Ivana (Department of History, Faculty of Philosophy, University of Novi Sad) - Mladenović, Teodora (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade) - Marković, Dimitrije (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade) - Radišić, Teodora (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade) - Radinović, Mihailo (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade) - Popović, Danijela (Laboratory of Paleogenetics and Conservation Genetics, Centre of New Technologies, University of Warsaw) - Vuković, Sonja (Laboratory for Bioarchaeology, Department of Archaeology, Faculty of Philosophy, University of Belgrade)

Whereas an unprecedented number of megafauna species became extinct during the late Pleistocene, some of them – such as the European wild ass (*Equus hydruntinus*) and aurochs (*Bos primigenius*) – persisted in selected Holocene refugia. The Pannonian Plain and the Balkan Peninsula proved to be such refugial and biodiversity hotspots. Nevertheless, their populations dwindled, becoming particularly vulnerable to human predation, and eventually perished by the

middle and late Holocene respectively. In this paper, we explore the extinction dynamics of the two species, including their changing environment and relationships with humans, from various strands of evidence obtained by archaeozoological and aDNA analysis, radiocarbon dating, ethology, palaeoclimatic reconstructions, and from archaeological and historical records. During the late Pleistocene, the wild ass predominantly inhabited the Eurasian steppe-tundra and forest steppe regions, whereas its survival in the Pannonian Plain in the Holocene is corroborated by its sporadic occurrence in faunal assemblages from Early Neolithic sites. By using one of these sites as a case study, we conducted archaeozoological and aDNA analysis and radiocarbon dating of wild ass bones to infer the date of their latest survival in the region, and contextualize them within other *hydruntinus* populations and human foraging practices. On the other hand, the aurochs roamed the forests across vast expanses of Eurasia during the Pleistocene and into the Holocene. The archaeozoological record suggests that it was commonly hunted in the Balkans in prehistory, with its numbers greatly diminishing from the Bronze Age onwards, and persisting up to the Medieval period only sporadically. Our research included radiocarbon dating of the youngest aurochs bone finds to establish a terminus post quem for their extinction in the region, as well as a study of their morphological variability through time and possible links with anthropogenic pressure.

13 **REVEALING THE NATURAL AND CULTURAL HISTORY OF THE BROWN BEAR (URSUS ARCTOS) IN THE CENTRAL BALKANS THROUGH ARCHAEOLOGY AND ARCHAEOGENETICS**

Vukovic, Sonja (University of Belgrade - Faculty of Philosophy) - Popović, Danijela (Laboratory of Paleogenetics and Conservation Genetics - University of Warsaw) - Dimitrijević, Vesna (University of Belgrade - Faculty of Philosophy) - Marković, Nemanja (Institute of Archaeology, Belgrade) - Mladenović, Teodora (University of Belgrade - Faculty of Philosophy) - Marković, Dimitrije (University of Belgrade - Faculty of Philosophy) - Dimitrijević, Ivana (Institute of Archaeology, Belgrade) - Orton, David (BioArCh, Department of Archaeology, University of York) - Zorić, Bojana (Institute of Archaeology, Belgrade) - Živaljević, Ivana (University of Novi Sad - Faculty of Philosophy)

Brown bear, the strongest and the largest animal native to Europe, experienced a large population decrease during the Holocene, and even regional extinctions. In the Central Balkans, in present-day Serbia, brown bear populations are declared as strictly protected mammal species and are subjected to regional protection measures. The analysis of a large number of faunal collections from Holocene archaeological sites in the region revealed that brown bears were regularly hunted throughout (pre)history, which suggests that they inhabited the local woods in the long term. However, due to anthropogenic pressure, the local environment and consequently the brown bear habitats, underwent significant changes throughout the Holocene. Introduction of domestic plants and animals in the Early Neolithic and the subsequent spread of agriculture, large scale deforestation and urbanisation from the Roman era onwards, as well as hunting of the beasts for fun and pleasure, must have impacted the brown bear populations in the region. To understand the population history of brown bears in the Central Balkans, within the ARCHAEOWILD project (funded by the Science Fund of Serbia) we conducted a genetic study of ancient brown bears in this region for the first time. The study of mitogenomes of brown bears revealed three known European subclades in the dataset from the Central Balkans, with the addition of a new haplogroup not previously discovered elsewhere. We will use the obtained archaeogenetic data from diachronic and regional perspectives to discover the possible trends of brown bear population changes. Furthermore, we will link the genetic dataset with specific archaeological contexts, as well as taphonomic features of the bones, which tell individual stories about human-bear interactions. We believe that the results regarding the past populations can stimulate current conservation efforts in the management of brown bears.

14 **ANCIENT ENVIRONMENTAL GENOMICS UNCOVERS EXTIRPATED FISH SPECIES AND VEGETATION DYNAMICS IN THE CARPATHIAN BASIN**

Zampirolo, Giulia (Section for Molecular Ecology and Evolution, The Globe Institute, University of Copenhagen) - Penezić, Kristina (BioSense Institute, Novi Sad) - Ruter, Anthony (Centre for Ancient Environmental Genomics, The Globe Institute, University of Copenhagen) - Orton, David (Department of Archaeology, University of York) - Živaljević, Ivana (Faculty of Philosophy, University of Novi Sad) - Pedersen, Mikkel (Centre for Ancient Environmental Genomics, The Globe Institute, University of Copenhagen)

The arrival of farming communities in the Central Balkans (~6200 cal BC) initiated profound environmental transformations in the region that continued throughout the Holocene. Here, the Danube meanders with their periodic floods provided ideal conditions for agriculture and access to water resources in the lowlands of the Great Pannonian Plain. Evidence from the faunal record dating back to the Early Neolithic (~6200-5300 cal BC), as well as historical records from later periods, attests to the importance of animal husbandry and fishing activities, however, tracking the impacts of such practices over time represents a major challenge. Ancient environmental genomics has shown to provide new insights into the long-term dynamics of past aquatic and terrestrial ecosystems. In this study, we present metagenomic results from two old river deposits (also referred to as paleo-meanders) of the Danube and two archaeological contexts spanning the mid-Holocene to the modern era. We detect extirpated sturgeon (*Acipenser* sp.) at Donja Branjevina (Bačka district, Serbia), where we also detect other fish taxa. In addition, we find evidence

of agricultural and grazing activities at Magareći Mlin (Bačka district, Serbia) and in both archeological and river deposits at Donja Branjevina. This work demonstrates the successful application of ancient environmental genomics to paleo-meanders and archaeological contexts within a multidisciplinary framework, in which, paleo-genomics, archaeology, and paleoecology synergise to untangle the complex human-environment interactions across different temporal scales.

15

UNRAVELING THE GENETIC HISTORY OF CATTLE: THE GABRIDGE PROJECT

Sosic Klindzic, Rajna (University of Zagreb Faculty of Humanities and Social Sciences) - Tomac, Goran (University of Zagreb Faculty of Humanities and Social Sciences) - Grguric Srzentic, Maja (University of Zadar) - Krznaric Skrivanko, Maja (Vinkovci Municipal Museum) - Drzaic, Ivana (University of Zagreb Faculty of Agriculture) - Brajkovic, Vladimir (University of Zagreb Faculty of Agriculture) - Ferencakovic, Maja (University of Zagreb Faculty of Agriculture) - Curik, Ino (University of Zagreb Faculty of Agriculture) - Miracle, Preston Thor (McDonald Institute for Archaeological Research University of Cambridge) - Cubric-Curik, Vlatka (University of Zagreb Faculty of Agriculture Laboratory for Archaeogenetics)

The GABridge project is a continuation of the collaboration between geneticists and archaeologists initiated by the Mendthegap project (H2020-TWINN-2015-692249). The Mendthegap project addressed research capacity gaps in archaeology and genetics in Croatia, culminating in the establishment of the Laboratory for Archaeogenetics at the University of Zagreb Faculty of Agriculture for conducting archaeogenetic analyses. Building upon this foundation, GABridge focuses on studying the origin and history of cattle in Western Balkans. The project assembles a multidisciplinary team comprising experts in molecular genetics, population genomics, animal breeding, computer science, and archaeology. This diverse expertise allows for a comprehensive investigation into the genetic diversity of cattle over time. GABridge sets out several research objectives. Firstly, it aims to determine the genetic diversity of ruminants in the Paleolithic era to gain insights into the genetics of pre-domesticated cattle. Additionally, it seeks to contribute to understanding the domestication processes of cattle during the Neolithic period in Western Balkans. The project also aims to resolve the chronology of cattle expansion through the analysis of ancestral recombination graphs and to explore the genetic origins of modern Croatian cattle breeds. The methodology of GABridge involves utilizing next-generation-sequencing, specifically sequencing mitochondrial and whole genomes of ancient cattle, to achieve its research goals. The analysis will extend to examining over 12,000-year-old cattle bones. The project also emphasizes theoretical advancements, including the assessment of genetic introgression, effective population sizes, and individual admixture. By leveraging interdisciplinary expertise and cutting-edge technologies, GABridge seeks to provide valuable insights into the domestication processes, genetic diversity, and population dynamics of cattle, while fostering collaboration between archaeologists and geneticists for ongoing exploration of the past.

16

PALAEOPROTEOMICS OF ANDEAN CAMELID FIBERS

van den Hurk, Yuri (UMR 7209 Archéozoologie, Archéobotanique - Sociétés, Pratiques et Environnements (AASPE), Centre national de la recherche scientifique (CNRS), Muséum national d'Histoire naturelle (MNHN)) - Dufour, Elise (UMR 7209 Archéozoologie, Archéobotanique - Sociétés, Pratiques et Environnements (AASPE), Centre national de la recherche scientifique (CNRS), Muséum national d'Histoire naturelle (MNHN)) - Goepfert, Nicolas (UMR 8096 Archaeology of the Americas (ArchAm), Centre national de la recherche scientifique (CNRS), University Paris 1 - Panthéon-Sorbonne) - Zirah, Séverine (UMR 7245 Molécules de Communication et Adaptation des Micro-organismes (MCAM), Centre national de la recherche scientifique (CNRS), Muséum national d'Histoire naturelle (MNHN))

Large numbers of Pre-Hispanic Andean textile specimens have been recovered during various excavations from Peruvian archaeological sites dating from the Mochica culture (CE 100-850) area in modern Peru. These textiles are both works of art and also represent a unique biocultural archive with the potential to provide deep-time data regarding the social, cultural, ideological, and ecological history of the past Mochica society and the animals they interacted with. Understanding the cultural choices that governed the design and usage of textiles necessitates to document the nature of the animal fibers used.

Camelid fibers were used for the creation of the textiles, which can either derive from the domesticated llama (*Lama glama*) or alpaca (*Vicugna pacos*), or their wild ancestors, the vicuña (*Vicugna vicugna*) or guanaco (*Lama guanicoe*). Fiber morphology does not allow to differentiate between the four taxa and by extension therefore limits assessments of past exploitation of South American camelids in Peru.

Palaeoproteomic analyses of keratin and keratin associated proteins (KAP), which are robust and potentially species specific proteins in animal fibers, can provide insight into the past exploitation of these four taxa and reconstruct the interaction between the Mochica culture and South American camelids. Although palaeoproteomic research on keratin and KAPs is not as well developed as similar research on collagen, some species specific peptides for the four different taxa have been identified.

Through palaeoproteomic analysis, using LC-MS/MS, on archaeological textile remains we answer cultural historical, zooarchaeological, and historical ecological questions as well as provide novel approaches relating to the rapidly evolving field of palaeoproteomics.

?WHAT DOES POTTERY TELL US?? INTERPRETING THE NEOLITHIC LIFESTYLE IN THE SOUTH OF EUROPE: TRADITIONS, CULTURAL IDENTITY AND INTERACTIONS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Espada-Martín, Estibaliz (Universidad Autónoma de Madrid) - Cattiaux, Méline (Laboratory TRACES (UMR 5608); University Toulouse 2-Jean Jaurès) - Turini, Mailys (Université Côte d'Azur de Nice, laboratoire du CEPAM (UMR7264, CNRS))

Session format: Regular session

The Neolithic was a crucial period in the history of humankind due to all the transformations that took place from economic, environmental, social and symbolic spheres. However, the neolithization was a complex phenomenon that covered various experiences depending on the geographical and socio-economic context.

In the South of Europe, the emergence of the early agro-pastoral societies is likely related to a coastal demic diffusion from East to West. The Neolithic period (6th – 3rd millennia cal BCE.) is characterised by a population increase, the multiplication of longue-distance contacts and specialisation of craftwork.

One of the most abundant sources of information available for this period is pottery. Because of the technological and cultural implications involved in it, pottery, at every step of its manufacture, such as the choice of raw material or the addition of temper, can be a proxy in the understanding of societies. Hence, this remains allow us to explore continuities/ruptures in time, cultural affinities and influences between neolithic groups.

Recent methodological approaches in ceramic studies, like the systematization of technological studies (based on the chaîne opératoire concept), the increase of experimental references or the development of biomolecular analyses, have helped us to update our comprehension about manufacturing process and uses of pottery and, in consequence, about the social implications of this technology.

Therefore, the aim of this session is to create a space for a multidisciplinary debate in where researchers can draw up alternative narratives about the cultural dynamics of Neolithic societies. Some of the possible issues that can be discussed are the following ones:

- Ceramic traditions: know-how, social identities and cultural boundaries.
- Interactions: diffusion of items/knowledge, imitation, acculturation and conservatism.
- Manufacture continuities and innovations through time.
- Raw materials studies.
- Residue analysis: culinary patterns, craft activities, symbolic aspects,

ABSTRACTS

1

CONCEPTUAL METAPHOR THEORY IN ARCHAEOLOGY: SEEKING METAPHORS AND SYMBOLS ON PAINTED POTTERY FROM MIDDLE NEOLITHIC CENTRAL GREECE

Angeli, Effimia (Maria Curie-Skłodowska University)

Within the realm of human expression, there exists a utilization of conceptual metaphors in various forms and modalities, one of which takes the shape of material culture. While conceptual or cognitive metaphors are closely tied to cognitive linguistics, abstractions about nature and structure can serve as a means for metaphorical reconstructions through and/or from archaeological evidence originating from nonlinguistic communities. The primary focus of this investigation is centred around the figurative and symbolic implications found within specific decorative themes present in the Middle Neolithic Red-on-White pottery discovered in Central Greece. Additionally, this study seeks to establish a clear distinction between the terms 'symbol' and 'metaphor' by drawing upon the principles of cognitive archaeology and cognitive linguistics. As a result, the chosen methodological approach endeavours to demonstrate that certain cultural meanings embedded within the archaeological record may be deciphered in an alternative manner, surpassing the interpretations they have thus far received. While the context in which archaeology is conducted undoubtedly plays a crucial role in interpretation, it is important to recognize that human cognition operates through universal processes. Pottery, as a tangible artefact of material culture, can convey metaphorical representations of knowledge and memory. Additionally, the repetition of distinct patterns within a specific geographic area can provide insights into social identities and delineate stylistic boundaries.

2 OCULADOS: THE EYES, WIDE OPEN

Andina, Fernando (Universidad de Granada) - Gámiz Caro, Jesús (Universidad de Granada)

Oculados - the eyed idols - are one of the most iconic and extended Neolithic-Chalcolithic symbolic representations of the Iberian Peninsula (5500-2250 cal. BC). The same motif, the wide open eyes, was carved on several types of materials like stone, "betilos", bone, wood and were painted in rock shelters. Also, the direct relationship between pottery and Oculados found in funerary contexts reveals its symbolic character. Still, the origin of these figures remains unclear, with no consensus among the researchers (Soler Díaz, 2020).

Our work is about the origin of Oculados. We focused on a ceramic vessel with an Oculado carved on it, as case study. It was found at Costamar (Castellon, Spain), an archaeological site located by the Mediterranean sea. This was one of the earliest Neolithic communities of the Iberian Peninsula (VI millennia BC). The vessel was a functional 16 litres capacity container, discovered in a domestic context and with a very different size from the small ritual or votive pottery with Oculados found so far (Flors, 2009). We also added a paleogenetic research about European first Neolithics. Such study states a direct link between farmers from Aegean Sea and first Iberian Neolithic communities, supporting a "Leapfrog" model of colonisation. It also reveals the complex interaction between these pioneers and the local Mesolithics. (Hofmanová, 2016; Horejs, 2021)

Pottery was not only one of the technologies brought by the first farmers to Iberia. It also seems to have been vehicle of a complex system of beliefs. From a diachronic perspective, pottery is the proof of the survival of symbolic representative patterns.

3 STYLE VS. TECHNIQUE: EARLY NEOLITHIC POTTERY FROM AMZABEGOVO (BARUTNICA), NORTH MACEDONIA

Burke, Clare (Dept. of Archaeology, University of York) - Stojanovski, Darko (Austrian Archaeological Institute)

North Macedonia is a key region for understanding the transition to Neolithic ways of life, linking pioneer areas with the rest of Europe. Archaeological data suggests several Macedonian regions saw the establishment of early settlements by different agricultural groups, who have been defined in relation to the distribution of settlement types and particular pottery styles. However, whilst pottery has formed a key evidence source for defining chrono-cultural groups and boundaries, there is little information about the use of these containers, or lab-based analyses to address foundational questions relating to the raw materials and technological choices used to make them.

This paper will present one of the first studies of Neolithic pottery from North Macedonia to use an integrated programme of analysis combining traditional archaeological and lab based approaches. It will discuss the typological, macroscopic, and petrographic analysis of pottery from the key site of Amzabegovo (Barutnica) - the type-site for the formation of the Amzabegovo Culture. Through reconstructing the chaîne opératoire of pottery crafting and including the full repertoire of shapes and styles present in the assemblage, it has been possible to see shared choices in terms of raw materials, with the consistent use of silicate rich sandy raw materials and organic tempering, alongside shared techniques of slab hand building methods, across different pot styles. This suggests a strong overarching technological tradition and shared concept for making a wide repertoire of vessels. It has also been possible to identify a close relationship between the technology and materials used for the production of ceramic containers, and those for architectural daub. Some of the results from Amzabegovo share similarities to data from Early Neolithic pottery analysed from other areas indicating that some aspects of potting knowledge had a wide distribution that crossed perceived cultural boundaries, alongside more individualised innovations and adaptations.

4 BREAKING BONES. NEW INSIGHTS ON NEOLITHIC POTTERY PRODUCTION IN NORTHEAST ITALY (6TH AND 5TH MILLENNIA CAL. BCE)

Ciela, Marika (University of Trento) - Amicone, Silvia (Archaeometry Research Group, Eberhard Karls University of Tübingen; Institute of Archaeology, University College London) - Salzani, Paola (Superintendence of Archaeology, Fine Arts and Landscape of the Provinces of Verona, Rovigo and Vicenza) - Pedrotti, Annalisa (University of Trento)

The Early Neolithic period in northern Italy (c.a. 5400-4800 cal. BCE) is characterised by the presence of a mosaic of distinct material cultures defined on the basis of extensive pottery typological classifications that traditionally shaped our understanding of cultural manifestations and their developments. Fiorano material culture, which extends mainly from Emilia Romagna to Veneto region is one of the most significant phenomenon of this period.

The neolithisation of the Po Valley and the development of Fiorano material culture is object of a continuous debate that needs now to be readdressed through a more nuanced approach to the knowledge and skills behind pottery making. This paper presents the results of a technological study conducted on a collection of ceramics from various contexts in the western Veneto plain (north-eastern Italy). The aim of the study is to reconstruct ceramic production traditions with a particular emphasis on the selection and processing of raw materials.

To achieve this, a comprehensive macroscopic examination was undertaken and more of 100 samples from four different sites were selected for ceramic petrographic analysis. These specimens represent the typological and technological variability observed in the assemblage under study.

The results of petrographic analysis show a variety of tempering strategies at different sites that seems to be driven both by ecological constraints and cultural choices. The identification of ceramic fabrics marked by bone tempering in all the sites under investigation seems to be particularly relevant to discuss the exchange of technological know-how among the communities who lived in the Veneto plain and their external relationships.

Overall, this study represents an important contribution to the study of Early Neolithic in northern Italy and the neolithisation of the Po Valley as offers for the first time new and fresh insights into ceramic production and socially related aspects through a interdisciplinary approach.

5 TRACING NEOLITHIC PATHWAYS: INVESTIGATING CLAY RESOURCE EXPLOITATION IN CENTRAL ITALY

Chiarabba, Emma (Sapienza University of Rome) - Medeghini, Laura (Sapienza University of Rome) - Capriotti, Sara (Sapienza University of Rome) - Forti, Luca (University of Milan) - Conati Barbaro, Cecilia (Sapienza University of Rome)

The Neolithic period is characterised by significant socioeconomic, environmental, and cultural changes. Neolithic groups had to have varied degrees of mobility and adaptation to their surroundings.

This research proposes a multidisciplinary approach to investigate the exploitation and circulation of clayey raw materials during the Neolithic using ceramic indicators. This will be achieved through the identification, mapping, and petrographic characterization of clay deposits between Sabina (Latium region) to Abruzzo. The study areas are the Grotta Battifratta site in Sabina and the Teramo area sites (Grotta S. Angelo, Ripoli), which share many ceramic features. The characterization analyses performed on the different classes of ceramic paste found at different sites combined with the landscape analysis allow us to understand the provenance of clay raw material between the late 6th and 5th millennia B.C.

To date, the lack of Neolithic data and archaeometric investigations in this region poses a significant barrier to the understanding of resource exploitation practices and settlement dynamics of the Neolithic. This study is the first step towards reconstructing Neolithic transapennine pathways and possible interactions between different human communities in order to increase our understanding of social dynamics inside Neolithic societies.

6 POTTERS WITH THEIR TOOLKIT: IDENTIFICATION OF POTTERY PRODUCTION TECHNIQUES AT CORO TRASITO CAVE THROUGH SURFACE TRACEOLOGY

Díaz-Bonilla, Sara (Departament de Prehistòria. Universitat Autònoma de Barcelona.) - Gassiot-Ballbè, Ermengol (Departament de Prehistòria. Universitat Autònoma de Barcelona) - Rey-Lanaspa, Javier (Dirección General de Patrimonio Cultural del Gobierno de Aragón) - Clemente-Conte, Ignacio (Institución Milà y Fontanals. Consejo Superior de Investigaciones Científicas)

The creation of experimental programmes in archaeology makes it possible to better understand the production process of prehistoric pottery. It is an excellent way to obtain information about economic the activities of ancient societies. At the same time, it also contributes to the development of new ways of analysing pottery at the macro- and microscopical level.

Surface production traces have rarely been approached from a global and experimental perspective. For this reason, an experimental program has been developed for the interpretation of identifiable traces on pottery surfaces. This approach find sense in the archaeological record. Therefore, in this communication, we present the first results of the application of the traceological proposal to the study of the ceramic assemblage from the Coro Trasito.

The Coro Trasito cave is located in the Central Pyrenees. It is a quite permanent settlement, where activities such as livestock herding and farming practices have been reported in the area around the site. The site was occupied during two different periods: Early Neolithic and Bronze Age. Tools related to the production of new pottery vessels have been identified at this site, especially in the Neolithic period. The aim of this research is to reinforce the knowledge about working processes and pottery tools involved in the production. In addition, the analysis of surface production traces provides an insight into the identification of the use of tools with perishable materials.

7 CERAMIC TRADITIONS AND SALT PROCESSING IN NORTHERN IBERIA: THE EARLIEST NEOLITHIC EXPLOITATION OF SALT VALLEY OF AÑANA IN WESTERN MEDITERRANEAN

Cámara Manzaneda, Javier (Departamento de Geografía e Historia, Universidad de La Laguna) - Weller, Olivier (CNRS, UMR 8215 Trajectoires. De la sédentarisation à l'État) - Plata Montero, Alberto (Fundación Valle Salado de Añana) - Gomart, Louise (CNRS, UMR 8215 Trajectoires. De la sédentarisation à l'État) - Camarero, Cristina (Qark Arqueologia SL) - Martínez Torrecilla, José Manuel (Qark Arqueologia SL) - García Martínez de Lagrán, Íñigo (Departamento de Prehistoria y Arqueología, Universidad Nacional de Educación a Distancia)

The Salt Valley of Añana has become a new representative site for understanding the development of the Neolithisation process in the north of the Iberian Peninsula, and for gaining a better understanding of the economic strategies of these first farming communities around one of the oldest salt exploitations in the European continent. The launch of the NéoSAL research project, led by a French-Spanish team, has revealed an exceptional stratigraphic sequence linked with the salt exploitation and processing dating back to at least 5200 cal. BCE, which has yielded a large quantity of potsherds associated with several Early and Middle Neolithic layers (more than 500kg).

Through the lens of technological traces, and particularly the restitution of the technical gestures hidden behind the pots, this paper aims to characterise which were the potential contact networks of the early agropastoral groups from Añana and whether they shared or not the same idiosyncratic ceramic traditions (i.e., coiling sequences & spiralled patchwork technology) as the Neolithic communities of the Mediterranean sphere. Similarly, by examining the use-wear traces left on the surfaces of the vessels (e.g., abrasions, salt incrustations & post-firing drillings) this work addresses how the vessels were used for salt processing and in which phase of the process they were potentially involved. The combination of these two approaches provide new insights into how ceramic artifacts were integrated in the early salt productive processes and whether the exploitation of this mineral resource was carried out by one or several groups of producers.

8 NEW CONTRIBUTIONS TO THE UNDERSTANDING OF THE EARLY NEOLITHIC IN CENTRAL IBERIA: RECENT DISCOVERIES AND FORTHCOMING APPROACHES

Espada-Martín, Estíbaliz (Universidad Autónoma de Madrid)

Through the years, the different early Neolithic pottery groups in Iberia have been determined by their characteristic decoration. Thus, the Cardial ware from the coastal areas can be easily distinguished from the southern Almagra pottery type or from the Epicardial of the interior.

Nevertheless, the gradual increase that regional studies experienced from the 1960s onwards led to unequal research. The Mediterranean coast of Iberia and its distinctive Cardial ware became the main focus of investigations, overshadowing other areas such as central Iberia.

The middle Tagus Basin is a good example of this situation. Due to several factors, this area was supposed to be hardly inhabited by human groups and always depending on the Mediterranean coast. This river is the largest one in Iberia, crossing it from East to West and, therefore, might have a relevant role in the neolithization of inland Iberia, as a geographical link between the Atlantic and Mediterranean areas.

Fortunately, new evidence was discovered at the beginning of this century: new sites, a greater amount of evidence and some additional dates have notably increased the data set available on the Neolithic from the middle Tagus Basin.

The aim of this communication is to present those new sites inventory and the first results of my research on the technology and typology of Early Neolithic pottery from this area, mainly the macroscopic and morphological studies, but also the new methodology to be implemented in the analyses of those ceramics.

904 MOBILITY, MOVEMENT AND INTERACTION IN THE ANCIENT WORLD: NEW AVENUES OF INTERPRETATION

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Hamilton, Derek (SUERC, University of Glasgow) - Monnereau, Aurore (Globe Institute, Section for Molecular Ecology and Evolution, Faculty of Health and Medical Sciences, University of Copenhagen) - Díaz-Zorita Bonilla, Marta (University of Tübingen) - James, Hannah (Vrije Universiteit Brussel) - Soncin, Silvia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAReA) centre, Sapienza Università di Roma)

Session format: Regular session

Scholars have long engaged in debates regarding patterns of movement and migration of past populations. The uncovering of migration routes, identification of interactions with local populations, and the evolution of social identity via shared cultural and social experiences has relied primarily on the examination of material artefacts and historical

records. Nevertheless, the precise demographic nature of these events is still hotly debated, notably in terms of mobility and interaction between incomers and local populations.

Nevertheless, the past decade has seen rapid developments in the field of bioarchaeological scientific techniques (isotopes, proteins, aDNA). Those methods have enhanced how we approach and understand the complex cultural dynamics associated with movement and mobility. With the growth of Big Data approaches, new quantitative modelling methods, and the use of multi-proxy techniques, archaeologists are gaining insights into cultural practices, genetic diversity legacies, interactions between communities, and kinship. However, we would argue the speed at which the science is moving has been impacting archaeology by creating big datasets without the 'space' necessary for reflection and the generation of new discourses.

This session aims to engage researchers in an interdisciplinary conversation, to discuss mobility using different techniques and considering alternative ways of mobilities. It also aims to discuss interaction between communities, as well as exploring the concept of identity evidenced by material culture and biological evidence. We welcome researchers that investigate these topics using bioarchaeological techniques and are especially interested in case studies from across European contexts, from the Mediterranean world to Scandinavia and all the places in between.

ABSTRACTS

1 INVESTIGATION OF CHANGES IN POPULATIONS IN CENTRAL ANATOLIAN IN THE NEOLITHIC PERIOD

Vural, Kivilcim (Middle East Technical University) - Kazancı, Duygu (Middle East Technical University) - Yorulmaz, Sevgi (Hacettepe University) - Özbaşaran, Mihriban (Istanbul University) - Duru, Güneş (Mimar Sinan Fine Arts University) - Mustafaoğlu, Gökhan (Ankara Hacı Bayram Veli University) - Baird, Douglas (University of Liverpool) - Ancient DNA Team, METU/Hacettepe (Middle East Technical University)

Central Anatolia played an important role in the Neolithic Transition in West Eurasia, which involved diverse cultural exchanges with neighbouring regions that shaped a new way of life based on sedentism. In addition to such cultural exchanges, previous analyses of ancient genome data from this region suggested different episodes of population admixture that occurred between the Epipaleolithic and the Late Neolithic, involving neighbouring populations from the Levant, North Mesopotamia, Caucasus/Zagros, and the Aegean/Balkans. However, these mobility and admixture processes still wait to be detailed.

This study uses ancient DNA data to investigate the dynamic changes in population demographics and genetic compositions within Central Anatolia between c.13,000 to 6,000 BCE. In addition to published paleogenomes from Central Anatolian Epipaleolithic and Neolithic sites, we analyse newly generated paleogenomes from the sites of Aşıklı and Boncuklu from the Early Neolithic period, and also the first genomes from Balıklı, a contemporaneous settlement from the Cappadocia region. Our study tackles the persistence of population structure between the Konya Plain and Cappadocia regions from the Early to the Late Neolithic, and also the contribution of these regional populations to Çatalhöyük. We also investigate the timing of eastern admixture in Central Anatolia. Our findings contribute to a deeper understanding of the demographic processes that shaped Central Anatolia during the Neolithic era and provide insights into the interplay between local and regional population dynamics during this critical period of human history.

2 ARCHAEOGENETICS IN THE TRAISEN VALLEY: MOBILITY AND SOCIAL STRUCTURE DURING THE IRON AGE IN NORTHEAST AUSTRIA

Carlhoff, Selina (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Mötsch, Angela (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Ramsil, Peter (Department of Prehistoric and Historical Archaeology, University of Vienna) - Lamnidis, Theseas (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Novotny, Friederike (Department of Anthropology, Natural History Museum Vienna) - Wiltshcke-Schrotta, Karin (Department of Anthropology, Natural History Museum Vienna) - Schifffels, Stephan (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Extending from Eastern France to the northern Balkans, the Early La Tène culture of the Central European Iron Age is associated with high levels of artistic crafts, as well as intensification of long-distance trade relationships with groups from Scandinavia to the Mediterranean. The Traisen valley in northeastern Austria is one of the core regions of the Early La Tène period, where proximity to important trade routes along the Danube and mountain valleys supported a high density of La Tène settlements and associated cemeteries. The archaeological assemblage has been studied extensively and provides excellent background for archaeogenetic case study of community structure within a Central European microregion and its cross-regional connections. We extracted ancient DNA from 235 individuals from seven sites within the Traisen river valley to understand connectivity from the local to continental scale. We deter-

mined close and distant genetic relationships within and between sites, including several groups of closely-related individuals buried in close proximity to each other and second-degree relationships spanning across different sites. We also characterised the genetic diversity of the ancient individuals, which includes individuals most closely related to northern as well as southern Europe. Finally, we combined genetic, isotope and archaeological information to assess long-distance mobility patterns and understand the role of the Traisen valley in the cross-European trade networks.

This project has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (grant agreement number 851511) and the Austrian Science Fund (P36086-G "CATA").

3 EXPLORING CULTURAL DYNAMICS AND HUMAN MOBILITY DURING THE BRONZE AGE IN THE FRENCH UPPER SEINE VALLEY

Chevallier, Solène (Inrap Siège; LAMPEA UMR 7269, CNRS, Aix Marseille Univ, Ministère de la Culture; Archaeology, Environmental Changes & Geo-Chemistry) - **James, Hannah** (Archaeology, Environmental Changes & Geo-Chemistry) - **Peake, Rebecca** (Inrap Centre-Ile-de-France; Artheis, UMR 6298, Université de Bourgogne, CNRS, Ministère de la Culture) - **Herrscher, Estelle** (LAMPEA UMR 7269, CNRS, Aix Marseille Université, Ministère de la Culture) - **Snoeck, Christophe** (Archaeology, Environmental Changes & Geo-Chemistry)

The recent evolution of palaeogenetic and isotope analyses over the last few decades has provided us with a new perspective to examine past human mobility and interactions. In the Upper Seine Valley, in north-eastern France, previous studies have unveiled a change in cultural influences, especially during the transition from the Middle to the Late Bronze Age, based on the observation of a shift in population dynamics and funerary practices. In an area where links to the Atlantic sphere were strong, the expansion of cultural groups from the east known as the tumulus culture at the end of the MBA marks a decisive change and heralds a new era. These diverse influences see the emergence of a new material culture and funerary practices that suggest greater social interactions and human movements. To better understand mobility and contacts during this period of transition, we conducted strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) analyses on human cremated bones from archaeological sites located in the Upper Seine Valley. By directly working with the osteoarchaeological collection, we aim to place the human back at the center of study. 103 human samples from 8 sites, with a maximum distance of 25 kilometers between them, and 97 plants, covering an area of 1600km² around the sites, were analysed. The results show two distinct human groups based on the Sr values. The plant based local baseline of bioavailable strontium will help understanding the population movement and landscape management. The identification of these two distinct groups enables us to apprehend the social interactions and the cultural influences in this restricted area.

4 UNCOVERING POPULATION CHANGE AND REGIONAL DIVERSITY IN THE CENTRAL LEVANT FROM 2ND TO 1ST MILLENNIUM BCE THROUGH ANCIENT DNA ANALYSIS

Freilich, Suzanne (Max Planck Institute for Evolutionary Anthropology) - **Feldman, Michal** (University of Tübingen) - **Eisenmann, Stefanie** (Humboldt University of Berlin) - **Skourtanioti, Eirini** (Max Planck Institute for Evolutionary Anthropology) - **Mittnik, Alissa** (Max Planck Institute for Evolutionary Anthropology) - **Schultz, Michael** (University of Göttingen) - **Krause, Johannes** (Max Planck Institute for Evolutionary Anthropology) - **Stockhammer, Philipp** (Max Planck Institute for Evolutionary Anthropology; Ludwig-Maximilians-University Munich)

The 2nd and 1st millennium BCE in the central Levant have been studied extensively, revealing how the region was greatly influenced by Hittite, New Kingdom Egypt, Neo-Assyrian, Babylonian, and Persian empire expansions, triggering significant human mobility. However, due to the dearth of genetic data available, particularly from inland sites in the 1st millennium BCE, it remains unclear if population genetic patterns reflect the cultural and demographic changes noted in historical and archaeological records. To address this, we have analyzed ancient human DNA from 28 individuals who were buried at the tell site of Kamid el-Loz in the Beqa'a plain of present-day Lebanon, dating to two distinct periods: the Middle Bronze Age (c. 2000-1500 BCE) and the Persian-Hellenistic period (c. 539-63 BCE). This site, identified as Kumidi in Late Bronze Age textual sources, and overlooking important trade routes, developed into a fortified city during the Middle Bronze period, and potentially acted as the Egyptian administrative seat in the 14th century BCE. The site shrank in importance during the Iron Age I and II and was extensively used as a cemetery during the Persian-Hellenistic Periods. Through this new genomic dataset, we report evidence of diverse ancestries and population structure between Kamid el-Loz and the nearby contemporaneous coastal site of Sidon in the Middle-Late Bronze Age, and detect gene flow at Kamid el-Loz after the Bronze Age, bringing Iranian- or Caucasus-like ancestry. These findings extend our genetic knowledge of the region to inland sites, and shed new light on regional patterns of demography, genetic structure and mobility in the 2nd to 1st millennium BCE central Levant.

5 HUMAN MIGRATION IN THE ANDES: ISOSCAPES AND PALEOGENOMICS

Barberena, Ramiro (Centro de Investigación, Innovación y Creación, Universidad Católica de Temuco; CONICET) - **Tessone, Augusto** (Instituto de Geocronología y Geología Isotópica (INGEIS); CONICET) - **Le Roux, Petrus** (Department of Geological Sciences, University of Cape Town) - **Santana, Francisca** (Pontificia Universidad Católica de Chile) - **Lucero, Gustavo** (Facultad de Ciencias Sociales y Humanidades, Universidad Católica de Temuco) - **Cardillo, Marcelo** (CONICET; Facultad de Filosofía y Letras, University of Buenos Aires) - **Luisi, Pierre** (CONICET; Institut Pasteur) - **Rascovan, Nicolas** (Institut Pasteur, Unit of Microbial Paleogenomics)

Migrations are an intrinsic aspect of human societies in the present as in the past and occur across levels of socio-political complexity from small-scale mobile societies to ancient states. The combination of strontium isotopes and paleogenomics offers a robust interdisciplinary approach to the study of the spatio-temporal dynamics of human migration. We develop a bottom-up approach to human life-histories in the southern Andes of Argentina and Chile (30–34° S) between 1200–1420 AD (Late Intermediate Period), a period characterized by prevalent migration preceding the Inka conquest. Here we present the results of an ongoing project seeking to build an isoscape of bio-available strontium across by means of a recently developed random forest modelling approach (Bataille et al. 2020). We integrate this with results for ^{18}O to produce dual geographic assignments of the migrants. Through stable carbon, and nitrogen isotopes we characterize the isotopic niches of the migrants compared to those of local groups. We link the isotopic results produced at a micro-scale (individual and groups) with the macro-scale (populations) revealed by paleogenomics from the migrant communities. This research contributes to the larger endeavor of understanding the development of highly diversified human socioecological niches during the last 2000 years, and how migration contributed along the way.

6 THE GOTHIC TRIBES OF EAST-CENTRAL EUROPE THROUGH THE LENS OF ARCHAEOGENOMIC DATA

Chylenski, Maciej (Institute of Human Biology and Evolution, Adam Mickiewicz University, Poznań) - **Juras, Anna** (Institute of Human Biology and Evolution, Adam Mickiewicz University, Poznań) - **Ehler, Edvard** (Laboratory of Genomics and Bioinformatics, Institute of Molecular Genetics of the ASCR)

The migrations of Goths and their consequences were undoubtedly one of the most significant events shaping European history in the Roman Iron Age. They have always attracted the attention of academics and history enthusiasts alike. These events are not only associated with major historic processes but are also believed to have been accompanied by significant cultural and demographic transformations.

In the territories of modern-day Poland, the Goths are associated with the Wielbark archaeological culture. The presence of stone structures (stone circles and pavements) on its commentaries in Pomerania region, in its early stages, is frequently interpreted as evidence of its Scandinavian origin, where the best analogies for such structures can be found.

Here, through the analysis of more than 300 genomes (including more than 100 newly reported) of individuals dated to the Roman Iron Age, we show that the majority of them differ significantly from earlier and later populations from East-Central Europe. However, that lack of predating, first millennium BCE, genomic data from the Pomerania region hinder our ability to pinpoint the moment this population arrived or formed in this region. Nevertheless, our data show that when the population expanded south-east, somewhere in the 3rd century AD, with minimal admixture with local populations. Similarly, later early medieval populations from East-Central Europe seem primarily represent a population of different origin with only a small degree of admixture from Gothic tribes associated with Wielbark culture.

7 RESIDENTIAL MOBILITY IN EARLY NEOLITHIC BRITAIN: NEW EVIDENCE FROM STABLE SULPHUR ISOTOPE ANALYSIS

Ostrum, Brett (Department of Archaeology, Durham University) - **Gröcke, Darren** (Department of Earth Sciences, Durham University) - **Scarre, Chris** (Department of Archaeology, Durham University) - **Fowler, Chris** (School of History, Classics and Archaeology, Newcastle University) - **Montgomery, Janet** (Department of Archaeology, Durham University)

The nature of residential mobility patterns in Early Neolithic (c. 4000–3400 BC) Britain has primarily been investigated isotopically through the analysis of strontium and oxygen isotopes in tooth enamel. The temporal resolution of bulk enamel, however, is not high enough to identify multiple instances of movement unless several teeth with different formation times are analysed.

Stable sulphur isotope analysis of incremental tooth dentine offers another avenue to examine past mobility. Unlike strontium and oxygen isotope analysis on bulk enamel—which only relate to the time period over which a tooth crown developed—stable sulphur isotope analysis of incremental dentine can cover the entire period of a tooth's formation.

Temporal resolution is also increased with the incremental dentine technique, as each subsample typically reflects an isotopic average over a number of months rather than several years. This extended timeframe with improved resolution over bulk enamel allows for the possibility to identify instances of short-term movement and/or multiple episodes of movement.

Here, we present stable sulphur isotope results from incremental dentine for several Neolithic sites in Britain to explore mobility at different levels of focus, including individual life histories of residential movement, mobility patterns within groups, and comparisons between sites. For some sites, we will discuss how the evidence for mobility (or lack thereof) may be connected to sociocultural aspects of identity, such as age, biological sex, or kinship. By combining a high-temporal resolution technique with varying scales of focus, we hope to expand our interpretations of earlier Neolithic mobility patterns, particularly at the individual and community levels.

8 THE NOAIDI OF KITKA - THE LIFE OF A 16TH-CENTURY SÁMI RITUAL SPECIALIST FROM NORTHERN FINLAND

Peltola, Sanni (Faculty of Biological and Environmental Sciences, University of Helsinki; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Biology, University of Turku) - Moilanen, Ulla (Department of Archaeology, University of Turku) - Salmela, Elina (Department of Biology, University of Turku; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Majander, Kerttu (Department of Evolutionary Anthropology, University of Vienna) - Arppe, Laura (Finnish Museum of Natural History, University of Helsinki) - Oinonen, Markku (Finnish Museum of Natural History, University of Helsinki) - Sarkkinen, Mika (Department of Archaeology, University of Turku) - Sajantila, Antti (Department of Forensic Medicine, University of Helsinki) - Taavitsainen, Jussi-Pekka (Department of Archaeology, University of Turku) - Onkamo, Päivi (Department of Biology, University of Turku)

In 1970, a shallow burial dating to the turn of the 16th and 17th centuries CE was discovered in Kuusamo, North-East Finland. The burial contained the remains of a middle-aged male and artefacts associated with Sámi culture, such as a drum hammer and bronze rings thought to be ritual objects that, according to ethnographic accounts, danced on the drum. The individual was interpreted as a noaidi, a Sámi ritual specialist. During the individual's lifetime, Kuusamo was home to the Kemi Sámi, an indigenous group who spoke a now-extinct variant of the Sámi language. Finnish immigration from the 17th century onwards led to the eventual disappearance of the local Sámi communities.

We examined the life history of the individual through archaeology, ancient DNA and stable isotope analyses. We found that the individual's ancestry is consistent with their cultural connection to Sámi. Despite the genetic similarity, the present-day Sámi carry more West European ancestry than the noaidi does. We also analyzed IBD sharing between the noaidi and the contemporary population of Finland, and found the highest levels of IBD sharing in eastern Lapland, but relatively low in Kuusamo.

The isotope analyses indicate that the noaidi had changed their place of residence during their lifetime. While the Sr values representing early childhood are consistent with the bedrock of Finland, the values reflecting the individual's place of residence during adolescence are highly unusual for Finland and may suggest a place of residence elsewhere. The low values of O, together with dietary modelling hint towards northern marine environments.

Our study provides valuable information about the indigenous populations of northern Fennoscandia in the Post-Medieval period. Even though the study concentrates only on a single individual, it reveals important details about the genetic background, ways of living, and cultural interactions of the Sámi.

9 DECIPHERING MOVEMENTS WITHIN AN ISLAND: TRACING MOBILITY PATTERNS AT MENORCA'S BRONZE AGE THROUGH OXYGEN ISOTOPE ANALYSES IN DOMESTICATED ANIMALS

Marciales, Mauricio (University of Tübingen) - Diaz-Zorita Bonilla, Marta (University of Tübingen) - Timm, Monice (University of Tübingen) - Escudero Carrillo, Javier (University of Tübingen) - Ramis, Damiá (Museu de Menorca, Menorca, Balearic Islands, Spain) - Ferrer, Antoni (Institut Menorquí d'Estudis. Maó. Balearic Islands, Spain) - Leon, Maria (Museu de Ciutadella, Menorca, Balearic Islands, Spain) - Baten, Jörg (University of Tübingen)

Oxygen isotopes serve as proxies for environmental conditions and water sources, offering insights into animal movement and potential human behaviour. By examining animals from distinct locations, researchers aim to uncover shifts in husbandry practices, trade networks, and human settlement patterns. Variations in isotopic signatures among species and sites may indicate differing grazing habits, herding practices, or the importation of livestock, providing valuable context for understanding ancient socioeconomic dynamics, including resource management, cultural exchange, and territorial expansion.

Menorca provides a unique environment that could reduce the variation of oxygen samples due to its meagre hydrology and low altitude. The study investigates oxygen stable isotopes in cattle, caprine, and suids across two Menorcan

sites—Cornia Nou and Cala Morell—dating during the Bronze Age to the Iron Age. Through isotopic analysis, the research aims to discern patterns of mobility among these animals and, by extension, their human counterparts.

Preliminary results from our interdisciplinary approach, which integrates archaeology, archaeometry, and animal ecology, offer valuable insights into seasonal mobility patterns, breeding and nourishment practices, and diverse sources of water intake among domesticated animals in island contexts. Through meticulous oxygen isotopic analysis and contextual interpretation, our study enriches ongoing dialogues concerning prehistoric mobility, land use strategies, and the interconnectivity of ancient societies. This comprehensive framework for reconstructing past human-environment interactions contributes significantly to our understanding of ancient cultures and their adaptation to environmental conditions.

10 INVESTIGATING ANIMAL MOBILITY IN THE ROMAN WORLD. A GEOMETRIC MORPHOMETRIC STUDY OF FAUNAL REMAINS FROM NORTH-EASTERN IBERIAN AND ITALIAN PENINSULAS

Strolin, Laura (Institut Català d'Arqueologia Clàssica (ICAC)) - Colominas, Lúcia (Institut Català d'Arqueologia Clàssica (ICAC)) - Petrucci, Gabriella (Free Researcher)

In Roman times, a wide interconnected system involving economic and cultural aspects reached a high stage of development. Animals, as product of subsistence and trade, were also part of this system. The present study analyses faunal remains as proxies of connectivity and management strategies applying a novel methodology to zooarchaeological evidence: shape analysis through Geometric morphometrics (GMM). Morphological analysis indeed detects the signature of the different animal populations at an intraspecific level and as such enables to trace animal mobility.

In this paper, faunal remains from inland and coastal sites in the north-eastern Iberian Peninsula and the north-eastern Italian Peninsula are studied in terms of shape for understanding connectivity and animal mobility in different areas of the Roman system. A comparative perspective is applied not only between sites located in different landscapes in each area but also at a broader level between distant areas to reveal common practices and local specificities.

11 UNRAVELLING HUMAN IDENTITIES THROUGH STABLE ISOTOPES: EXEMPLIFIED FROM IDENTIFICATION OF AJNALA SKELETAL REMAINS OF 1857

Sehrawat, Jagmahender (Panjab University, Chandigarh, India)

Several heinous crimes committed against humanity have decimated mankind existence as identification of numerous unknown skeletal remains recovered from disguised locations have posed a serious challenge for their identification. Stable isotope analysis of unidentified human remains has proven to be an important forensic provenance tool to reveal their geolocation, mobility patterns, dietary habits, occupations etc., and hence their past geographical life trajectory (Batelink et al 2018).

In one such incident, 282 soldiers were killed, and their bodies were dumped in an abandoned well situated underneath a religious structure at Ajnala (Amritsar, India) in 1857 (Cooper, 1859). Thousands of badly damaged and commingled human remains along with numerous personalized items like coins, medals, bracelets, rings etc., were excavated non-scientifically from this site in 2014. Multi-disciplinary approaches of anthropological, odontological, radiological, molecular, chemical techniques (including stable isotope analyses) have been employed to establish the identity of Ajnala skeletal remains. It was hypothesized that Ajnala individuals were non-local to the site and male soldiers recruited from specific Indian states.

In present study, the dentine collagen and enamel samples collected from third mandibular molars were subjected to detailed multi-isotopic analyses ($\delta^{13}C$, $\delta^{14}N$, $\delta^{18}O$ and $87Sr/86Sr$) using Isotope Ratio Mass Spectrometer with the objective of narrowing down their potential geo-locality, identity affiliations, dietary status and mobility history. The isotope concentrations of carbon and nitrogen varied from -18.7‰ to -22.9‰ and $+7.6\text{‰}$ to $+11.7\text{‰}$, with average of $-20.49 \pm 1.2\text{‰}$ and $+9.31 \pm 1.1\text{‰}$, respectively, $87Sr/86Sr$ values varied from 0.7175 to 0.7277 (Avg. 0.7223). The mean $\delta^{18}O$ value for the studied molar teeth was found to be $14.3 \pm 7.27\text{‰}$ (VSMOW); with values ranging from 16.77‰ to 0.40‰ . The multi-isotopic analyses didn't support the local affinity of Ajnala skeletal remains and attributed their locality to Indian states of eastern Uttar Pradesh, Bengal, Bihar, Orissa and some north-eastern Indian states.

NEW GENOMIC DATA ILLUMINATE COMMUNITY ORGANIZATION AND MOBILITY IN THE LATE NEOLITHIC AND EARLY COPPER AGE CARPATHIAN BASIN

Szecsényi-Nagy, Anna (HUN-REN Hungarian Research Network, Research Centre for the Humanities, Institute of Archaeogenomics) - Anders, Alexandra (ELTE Eötvös Loránd University, Institute of Archaeological Sciences) - Raczky, Pál (ELTE Eötvös Loránd University, Institute of Archaeological Sciences) - Virag, Cristian (Satu Mare County Museum, Romania) - Hajdu, Tamás (ELTE Eötvös Loránd University, Department of Biological Anthropology) - Szeniczey, Tamás (ELTE Eötvös Loránd University, Department of Biological Anthropology) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna) - Reich, David (Department of Genetics, Harvard Medical School, Boston; Department of Human Evolutionary Biology, Harvard University, Cambridge; Howard Hughes Medical Institute, Boston; Broad Institute of MIT and Harvard, Cambridge) - Siklósi, Zsuzsanna (ELTE Eötvös Loránd University, Institute of Archaeological Sciences, MTA-ELTE Lendület "Momentum" Innovation Research Group)

The field of archaeogenetics is evolving with new methodologies that offer scholars fresh perspectives on the connectivity of past communities. Unlike the previously common allele-frequency based population genetic approaches, starting from 2022-2023, the analysis of chromosome segment sharing based on identity by descent (IBD) for ancient DNA has been adapted. This advancement enables the construction of networks that map the biological relatedness between genomes (certain individuals) and communities. As the repository of ancient genomes expands, it enhances network analyses, leading us toward fine-scale examinations of community organizations. This progress is dependent on data quality and sufficiently dense sampling across specific territories and eras.

A case study illustrating this approach is presented, focusing on the Late Neolithic and Copper Age populations of the Carpathian Basin. We discuss human genomic data from archaeological sites from the Upper Tisza region, such as Polgár-Csőszhalom, Polgár-Nagy-Kasziba and Tiszapolgár-Basatanya. Here, we demonstrate the continuity of the Late Neolithic population amidst archaeologically significant cultural transformations around 4500 BCE. By juxtaposing ancient DNA data, previous isotope results and archaeological theories, we reinterpret the connectivity and mobility patterns of individuals associated with distinct archaeological ceramic styles.

Conversely, contemporaneous Early to Middle Copper Age sites from the broader cultural landscape exhibit a variety of community organizations and diverse biological composition (such as Urziceni-Vamă in Romania). These observations caution against making sweeping cultural conclusions, yet they pave the way for new perspectives in addressing archaeological questions of significance.

The archaeological evaluation of the Polgár-Csőszhalom site is funded by a grant from the National Research, Development and Innovation Fund (Grant K124326).

905 MODERNITY AS A COLONIAL PROCESS FROM WITHIN: THE MATERIAL IMPACT OF INDUSTRIALIZATION ON EUROPEAN SOCIETIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Tejerizo, Carlos (University of Salamanca) - Martínez-Panizo, Laura (Real Academia de España en Roma)

Session format: Regular session

Modernity is a very tricky concept. While considered by many as one of the defining features of the emergence of the contemporary world (Giddens, Habermas...), others have harshly, and fairly, criticized its colonial roots (Bhambra, Butler, Quijano, the Comaroffs...) and its ontological limitations (Latour, Bauman...). All in all, it is still a widespread notion and, moreover, one increasingly used by reactionary movements, which use the emergence of modernity and its inherent characteristics, such as industrialization, as key elements for the expansion of "Western" ideas to the rest of the world. Still, we argue that the concept of modernity nonetheless remains a highly useful and critical theoretical tool. It constitutes a worthy analytical tool not only to understand the current state of things, but also to delve into the complex historical process by which pre-modern and pre-industrial societies have been integrated into external dynamics coming from the western economic and political centres in a long, complex and non-linear process. Thus, we propose an understanding of modernity as a colonial process, one whose introduction different ontologies and communities have reacted against, adapted to and often resisted, alongside those other characteristically modern elements such as capitalism, surveillance, imperialism or racism. Furthermore, we consider that industrialization was one of the most relevant vehicles for the development of this dialectical process, and that it had a deep material impact on both past societies and landscapes which can therefore be successfully tackled through archaeology. In this session, we would like to discuss the validity (or invalidity) of modernity as a theoretical concept through the analysis of case studies addressing the impact of processes of industrialization on prior local societies from the 16th century onwards, hoping to invite further reflexive and theoretical contributions.

ABSTRACTS

1 CONSTITUTIONS AND RAILWAYS. ARCHAEOLOGY OF THE AGE OF REVOLUTIONS

Martin, Gorka (University of the Basque Country) - Carrasco-Gómez, Pablo (University of Barcelona)

The 19th century is the cornerstone of the implementation of Modernity. During this century the liberal regime was imposed in the western world. This dynamic had two main foundations. On the one hand, there was a revolution of ideas, the Liberal Revolution, and on the other hand, there was a significant technological transformation, called the Industrial Revolution. One of the major consequences of this process were crucial changes in many aspects that also affected the material culture. However, it was a non-linear and non-homogeneous transformation. The arrival of Modernity caused several controversies, dichotomies, and problems that, more than once, were solved in the battlefield. The French Revolution of 1789 started as a result of conflicts in which revolutionaries and reactionaries ended up confronting their differences. This resulted in a multiplication of civil wars during the 19th century.

The kingdom of Spain was dragged in this international and interconnected context. The conflicts of the 19th century, both international and civil wars, marked the Spanish political arena for the whole century. This long and bloody period had an important impact in the archaeological record. Hence, this material culture represents the consequences of the arrival of Modernity. The oral presentation analyzes the changes caused by the implementation of 19th century's material culture through the data gathered from various archaeological sites. The subject presented focuses on various archaeological sites from the Peninsular War (1808-1814) to the Second Carlist War (1872-1876).

2 « L'ARCHÉOLOGIE DU COLONIALISME N'EXISTE PAS » ANGLOPHONE HISTORICAL ARCHAEOLOGIES LOST IN TRANSLATION IN FRENCH POLYNESIA

Perez, Emilie (University of French Polynesia) - Flexner, James (University of Sydney) - Claret, Moanatea (University of Sydney)

Anglophone traditions of historical archaeology have long focused on the role of European colonialism as a driving force in the shaping of the modern world. Colonialism serves as the umbrella term for a set of interlinked processes. The introduction of numerous diseases, species, mass migration as well as economic, cultural and religious concepts from the Old World /or "introduction of Christian evangelism and capitalist economy"... caused large transformations and reshaping of indigenous societies and landscapes.

Historical archaeology has examined all of these processes, including in the francophone world. However, francophone scholarship generally draws a narrower boundary around « colonialisme » which is seen to be very specifically about imperialist expansion and resulting state-sanctioned dispossession and violence. Drawing on our current archaeological fieldwork in French Polynesia, this paper outlines an argument in favour of a more broadly defined « archéologie du colonialisme » precisely at a time when European countries, including France, reckon with their imperialist past. An archaeology of colonialism should not only focus on state institutions, but also other institutional powers, such as the Catholic Church, that were instrumental to the expansion of European colonial frontiers from the 17th century onwards. Modernity was not only about empire, but also about changing ideologies, worldviews, and material practices, which often transformed long before the official arrival of imperial powers. Archaeology plays an instrumental role in finding and interpreting the material evidence for the colonial processes that set the pre-conditions for imperialist expansion.

3 HISTORICAL ARCHAEOLOGY AND FRANCOPHONE COLONIALISM FAR BEYOND THE ATLANTIC WORLD: CATHOLIC MISSION SITES IN THE MANGAREVA ISLANDS

Claret, Moanatea (University of Sydney) - Flexner, James (University of Sydney) - Perez, Emilie (Université de Polynésie française)

Connections between the Atlantic and Pacific worlds expanded dramatically over the course of the 19th century. With a few exceptions, historical archaeology in the Oceanic region has focused largely on British colonialism, particularly in the settler societies of Australia and New Zealand. Recent work has expanded this research, both to include recently independent Pacific nations, and non-Anglophone colonialism in Spanish, French, Japanese, and Russian sites. Francophone colonialism in Oceania expanded hand-in-glove with Catholic missionary activities. Current research has just begun to understand the material remnants of the large-scale and widespread Catholic expansion in Polynesia.

The earliest and best preserved Catholic mission sites in Polynesia are located in the Mangareva Islands, about 1600km southeast of Tahiti. There are over 100 standing buildings dating from between the 1830s and the 1890s. These include still-used churches, the ruins of separate boys' and girls' schools on different islands, industrial sites, a royal palace for the highest ranking chiefly family, and dozens of 'are po'atu (stone cottages) inhabited by Mangarevans. The technology of mortared stone construction was rapidly adopted by Mangarevan people, who made this kind

of architecture their own, along with industrial pearl cultivation which continues today. The remote Catholic outpost in Mangareva simultaneously represents material connections to the francophone Atlantic world thousands of kilometers distant. Evidence from surface artefacts and excavations demonstrates not only French industrial production, but also trade goods from Great Britain, the Netherlands, and the United States. These sites provide material to reflect on the historical dynamics produced when the Atlantic and Pacific worlds met, including the adaptations of local people to the colonial milieu.

4 THE MATERIAL IMPACT OF INDUSTRIALIZATION IN THE RURAL WORLD. A CASE STUDY FROM NORTHWESTERN IBERIA

Tejerizo, Carlos (University of Salamanca)

The process of modernity can be understood as the historical passage through which societies acquired its main characteristics, such as capitalist economic relations, consumerism, radical individualism or mass production. This process had particular developments in the rural world, which was incorporated into modernity at different paces, sometimes in long historical processes and, in the cases of marginal or peripheral societies, in sudden and radical events. In order to tackle these particularities for the general process, I will propose to approach the question of modernity from a bottom-up approach, using the changes in materiality as the fundamental vector of inquiry. Moreover, and following other scholars such as the Comaroffs or Bhambra, I will understand modernity from a post-colonial point of view, as a dialectical encounter of different cultures with creative and unique outcomes. For this matter, I will be using a case study located in northwestern Iberia, focusing on the material changes operating in the territory of a little village named Casaio, in current Galicia. The impact of modernity in this territory had a major moment of change during the 1930s and 1940s due to the confluence of several historical processes, which includes the so-called "tungsten war" - a diplomatic and economic war around the exploitation of tungsten, used as a military resource by the nazis. In this paper I will analyse how social relations of production, materialities and the environment changed as a consequence of the implementation of tungsten mining. Thus, the deep and sudden impact of industrialization and internecine conflict lays the foundation of an exceptional case study to understand the main nature of the process of transformation from rural to industrial and capitalist societies, that is, of modernity.

5 MEMORIES OF TRANSITION: THE ARCHAEOLOGICAL LANDSCAPE OF MODERNITY IN SARDINIA

Sanna Montanelli, Mattia (University of Cagliari) - Pinna, Fabio (University of Cagliari)

From the archaeological perspective, reflections on modernity as a colonial process find fertile ground in the analysis of material culture expressions in Sardinia. This island, with its rich history of both external and internal colonizations, offers an exceptional case study to explore the material impact of industrialization and modernization processes on previously agricultural or pastoral societies.

Due to its geographical and historical specificities, Sardinia has experienced forms of internal colonization that manifest through the introduction of industrial practices in areas traditionally linked to agriculture and pastoralism. These changes have left tangible traces in the landscape and material culture, from the remains of mines and abandoned industrial infrastructures to changes in settlement patterns and land use.

Archaeology in Sardinia has the potential to reveal how these dynamics of power and economic change have influenced the daily lives of local populations. Through the study of abandoned industrial sites, dwellings, tools, and other everyday objects, archaeologists can reconstruct the stories of adaptation, resistance, and transformation of Sardinian communities in the face of modernization pressures.

In this context, citizen archaeology emerges as a promising approach for sharing and protecting the more fragile and non-monumental archaeological testimonies. Engaging local communities in the research and conservation of their archaeological heritage can not only increase awareness of the historical and cultural value of these sites but also stimulate a critical reflection on modernity and its consequences for traditional societies.

6 THE CONSOLIDATION OF MODERNITY IN ITALY AND SPAIN: THE ARCHAEOLOGY OF COAL MINES DURING THE AUTARCHY

Martinez, Laura (Real Academia de España en Roma)

This research is based on a comparative reflection of social history on the politics adopted by Franco's regime in Spain and fascism in Italy for the exploitation of coal mines and their social consequences. In both countries, the establishment and consolidation of this industry results in transformation of the area, not only in terms of the uses of its landscape, but also socially, generating a social attachment to the mining activity.

The proposed areas of study are part of what are known as just transition territories, those geographical areas that have been immersed in decarbonisation processes in recent decades. These are the Leonese regions of Bierzo and Laciana in the case of Spain and the island of Sardinia in the case of Italy.

Both contexts are immersed at the beginning of the 20th century in the arrival of modernity, as a result to the processes of centralisation of coal production and distribution. Which will result in important urban transformations and contribute to a mass production that will lead to an important exodus of population towards these production centres. This would also bring with it the creation of a network of infrastructures including housing, roads, railways for transport, electrification of the territory, etc.

7 FROM PLANTATIONS TO PRISONS: EXAMINING THE ROLE OF FORCED PRISON LABOR IN ENABLING LATE MODERNITY

Westmont, V. Camille (University of Cambridge)

The rapid industrialization of the US South in the decades following the end of the Civil War has been hailed for the massive social, cultural, and economic transformations that it initiated. However, a closer examination of the social relations embedded within the transformation reveals that white elites effectively re-established a system of extractive colonialism within the region that they maintained through legally sanctioned racialized terror. This paper examines the development of late modernity in the US South through a consideration of the postbellum legal system and the Southern convict lease system in the US state of Tennessee. Looking at the case study site of the Lone Rock Stockade (40GY78), a late 19th-century convict labor prison, the paper explores the ways government institutions have arisen and evolved to manage 'surplus' populations, whether as the result of poverty (Wacquant) or strange-ness (Bauman), that arise in the anxiety-riddled modern world. Using landscape-scale analyses, the material consequences of labor exploitation are interpreted as inextricable side effects of modernity as process.

909 INTEGRATING DATA ON ANCIENT WINE AND OIL PRESSES: CHALLENGES AND INTERPRETATIVE POTENTIAL

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Van Limbergen, Dimitri (Ghent University) - Waliszewski, Tomasz (University of Warsaw)

Session format: Discussion session (with formal abstracts)

In recent years, the field of ancient wine and oil studies has seen major developments in data and methods, with new archaeological, historical, and interdisciplinary approaches now able to extract more and better information out of our datasets. Unavoidably, however, exploiting these developments to the full demands evermore systematization and optimization of the data themselves.

Given the prominence of wine and oil in the ancient world, facilities for their production are a major archaeological proxy for studying the nature, scale, and performance of the ancient economy. Their full potential, however, remains hampered by a profound lack of systematic geographical inventories, insufficient insight into regional and global patterns in site nature and distribution, and the existence of many, non-complementary terminologies, typologies and classifications (in technology, press components, architecture, etc.).

Without doubt, a concerted effort to bring together these data in a database format that allows for detailed questions on 1) the nature, scale and chronology of production, 2) the technology used in these installations, and 3) the relation of installations to settlement, will be a major step forward in our understanding of the ancient economy, from the Bronze and Iron Age to Late Antiquity.

This session brings together regional specialists and expert colleagues currently working on ancient wine and oil production in the Mediterranean and beyond. The first aim is to acquire an overview of current work in the field, and to identify common technical, methodological, and interpretative issues when integrating individual sites and regional datasets. Second, the session also serves as a starting point for a long-term, collaborative network, meant to guide and streamline future work, and to set up a common research agenda.

ABSTRACTS

1 236 : OLEVUM ET VINUM ADRIATICVM

Kopácková, Jana (Archaeological Museum in Zagreb, Croatia)

During the last decades, the study of ancient agriculture and economy has progressed greatly in both methods and approaches. It is now abundantly clear that the production of wine and olive oil was one of the most profitable branches of ancient agriculture, with facilities widely present in both rural and urban contexts. Still, the eastern Adriatic has long remained a blank spot on the map of ancient wine and olive oil production, with old theories of marginal and/or small-scale production reverberating in scholarly literature. This situation has changed significantly in the last decade, and there is now evidence of wine- and/or oil-making for at least 236 sites across Histria and Dalmatia. This also means, however, that there is now an enormous amount of data - including archaeological remains, architectural

elements, texts, archival material, and photographs - awaiting classification and systematization for better contextual and interpretative use. With research ongoing, and new sites regularly being added to this growing corpus of data, the integration in a wider online database with the possibility of constant editing offers an optimal solution for these and other areas in the Mediterranean and beyond. This talk reflects on some of the challenges that come with this new initiative, illustrated through examples from the Adriatic.

2 THE TECHNOLOGICAL VARIATION OF THE SALONA PRESS

Stojkovic, Bozidar (Institut für Klassische Archäologie - Universität Wien)

While literary and archaeological sources now provide a good picture of wine and oil production in ancient Dalmatia, much less attention has been devoted to the typological study of individual press parts and mechanisms. Since the end of the 19th century, excavations have repeatedly shown the technological adoption and use of screw and winch mechanisms in this area of the Mediterranean, while also shedding light on the serialization of the pressing units. The Salona lever press forms a most representative case, where a winch mechanism was positioned between two stone posts. Similar adapted technical details have been attested in numerous press installations in and around Salona, but also further afield across the Istrian peninsula to the southern part of Dalmatia. From a broader territorial perspective, it is clear that the Salona press has similar technological adaptations as those installations found in the villa of San Rocco in Italy and Passoir in France, while the latter two also differ in substantial ways from the Salona exemplar. This paper reflects on these links and variations in technology, by scrutinizing the technical details of this press mechanism and providing a possible reconstruction.

3 REGIONAL TRADITIONS AND TECHNOLOGY OF ROMAN PRESSING INSTALLATIONS IN CENTRAL AND SOUTHERN ITALY

Bäse, Sonja (German Archaeological Institute)

In recent years, the long-held theory of a gradual development in press technology from windlass to screw has been questioned. Taking a look at central Italy, in the modern regions of Lazio and Campania, there is only rarely evidence of changes in existing installations, and most presses seem to have continued being used without innovations. Instead, the evidence points to the importance of local resources for their construction, and to a prominent role for customs and knowledge of local artisans and farmers. This is in line with the evidence from other areas in the Mediterranean, where studies have attested to the use of regional and local types of press technology and counterweights. This talk will take a closer look at the Roman press installations in Lazio and Campania, taking into account over 200 sites to scrutinize construction materials and operating mechanisms, so aiming to identify local and/or regional characteristics, and to understand better possible distributions and developments of technology. In Campania, four regional clusters with distinctive press mechanisms can be identified, showing, for example, differences in lever-and-drum presses between the area around Vesuvius and northern Campania, and in lever-and-screw counterweights between two other zones. Clusters are less clearly discernible in Lazio, in part due to less preserved evidence, but the importance of local resources is obvious, as is the use of different variations of lever-and-drum presses, and occasionally direct screw presses.

4 ECONOMIC SUSTAINABILITY IN A ROMAN CITY OF THE ANCIENT VASCONES: NEW DATA ON WINE PRODUCTION

Lorente Sebastián, Paloma (Universidad de Navarra) - García de la Barrera, Luka (Universidad de Navarra) - Larequi Fontaneda, Javier (Universidad de Navarra)

The Roman town of Los Bañales de Uncastillo (Zaragoza) in the territory of the ancient Vascones is one of those urban and economic paradigms of the so-called *parva oppida* that characterized and sustained the Roman Empire in the 1st-3rd century AD. Recent excavations and surveys in the surrounding territory have resulted in the identification of three wine presses to the south of the town, and two vats for wine production within the northern urban quarter, thus revealing a new facet of urban economic power. In this talk, we will discuss the new data of the wine presses found at El Huso y la Rueca and La Figuera, focusing on their analysis and contextualization, as well as their typology, functionality and chronology. This reveals, within the territory of the town, the existence of a possible industrial belt of winemaking facilities around Los Bañales, well-embedded within the management and exploitation of natural resources in the area. This paper so advances our insights into the economic functioning of this agrarian community, serving as an example of the role of these *parva oppida* in the provinces of the Roman Empire. Our talk concludes with a discussion on how to best extrapolate these data and contextual parameters to use and integrate into an Empire-wide database of ancient wine and oil presses.

5 IS IT POSSIBLE TO RELIABLY IDENTIFY THE FUNCTION OF ANCIENT PRESSES THROUGH ORGANIC RESIDUE ANALYSIS?

Polla, Silvia (Freie Universität Berlin)

Characterizing the nature of ancient agricultural production, that is, by capturing the function and use of press installations, is far from straightforward, especially when the archaeological traces are inadequate and the distinctive crushing tools are no longer preserved. The issue is complicated even further by the real possibility of multi-purpose installations (Mattingly 2009). Recently, the rise of organic residue analysis has introduced the use of chemical data into the debate. In particular, samples of *opus signinum* used for coating and waterproofing vats in pressing installations can be analyzed by Gas Chromatography-Mass Spectrometry (GC-MS) techniques (Pecci et al. 2013). This paper critically evaluates the potential and limits of organic residue analysis for identifying reliable biomarkers related to the functioning of wine and/or oil presses against the background of archaeological and environmental characteristics.

Mattingly, D. J. (2009). 'A new study of olive oil (and wine?) production in northern Tunisia'. *Journal of Roman Archaeology* 22: 715-720

Pecci A., Cau Ontiveros M.A., Garnier N., Identifying wine and oil production: analysis of residues from Roman and Late Antique plastered vats, *Journal of Archaeological Science*, 40,12, 2013.

6 PRESSING ISSUES IN THE NILE VALLEY. PROBLEMS AND POTENTIAL IN RESEARCH ON WINE INSTALLATIONS IN EGYPT AND SUDAN

Dzierzbicka, Dorota (Polish Centre of Mediterranean Archaeology, University of Warsaw)

Sources concerning wine production in the Nile Valley offer significant potential for studies on ancient winemaking. Dozens of pressing installations dating from the Graeco-Roman period have been identified, and most have been published at least in a preliminary fashion, providing relevant material for comparative studies and geographical considerations. Textual sources, most remarkably documentary papyri, offer unique insights into the social and economic aspects of the winemaking industry, shedding light on not only local but also more universal, Mediterranean practices. These texts also provide groundwork for establishing and comparing terminologies. In addition to significant potential, however, the dataset from the Nile Valley also has its methodological peculiarities and caveats, which should be taken into consideration when using it as comparative material in broad-scope studies on Mediterranean winemaking. The paper briefly presents the state of the art and dataset, indicates the local specifics of winemaking in the Nile Valley, lists some challenges in dealing with material from this region, and points to potential research avenues and questions that may be addressed using this dataset in future studies.

7 GEOSPATIAL AND CHRONOLOGICAL ANALYSIS OF WINE AND OIL PRODUCTION IN ROMAN HISPANIA

Gruber, Henry (UNC Chapel Hill)

Wine and oil production were two of the keys of the Roman economy in Hispania from the late Republic until at least the third century CE. However, the duration and scale of production of both these liquid commodities beyond the so-called "Third Century Crisis" and into late antiquity is debated. This paper presents a first look at a dataset of 305 Iberian olive press / production sites, 143 wine production sites, and 229 unspecified presses gathered from a systematic survey of published (and some unpublished) literature. The facilities are all geolocated, and associated with site types, datable material culture, and other criteria for analysis. Above all, the dataset seeks to move beyond typology and towards chronology to track medium-term trends in production. The paper therefore begins by discussing the construction of the dataset, before considering three ways to date production. This is especially important for those sites that have only been surveyed. Two promising and complementary ways to date production are to date activity through the presence of dated material culture (coin, ceramics), and to restrict the dataset to stratigraphically excavated. There is also a brief discussion of the problems in seeing late amphora types in the published record. With the chronological reflections done, the paper turns to diachronic analysis. It presents the presses active over time, and two recently excavated sites that show production into late antiquity. It argues that the production of these commodities continued well into the late Roman period before abruptly coming to an end in the early fifth century CE. Whether this represents a crisis of demand as the markets for these products collapsed, or is the result of a supply-side crisis caused by instability in the peninsula itself, remains to be determined.

8 MULTI-SCALAR AND MULTI-REGIONAL COMPARISONS OF SPECIALIZED OLIVE OIL PRODUCTION IN THE ROMAN EMPIRE

Rice, Candace (Joukowsky Insitue for Archaeology and the Ancient World)

Multi-scalar and multi-regional investigations studies of oil production inform debates on Roman economic life as they provide links between locally specific strategies and broader imperial-scale patterns. While much of the Mediterranean basin was capable of growing olives, only a handful of regions actually did so at a substantial scale. This paper draws on my own investigations into specialized oil production across four different regions of the Roman Empire: Sabine Italy, Istrian Croatia, Lycian Turkey, and Narbonensian France to illustrate both the benefits and challenges of working across multiple scales and geographies.

My excavations at the Roman villa of Vacone have revealed a large, specialized olive oil production facility with four oil presses constructed during the early empire. By the mid-Empire, however, specialized production was replaced by diversified production of oil and wine. The excavation of both domestic residence and pressing installations allows for a detailed look at a local response to wider economic change, both as the owner of the villa invested in specialized infrastructure for olive oil and then later diversified to keep up with changing market demands. In 2024, I begin excavations at the oil production facility at Barbariga (southeastern coast of Istria). Explorations in the early 1950s, published only through plan, revealed a large oil production facility with at least eight olive presses. Initial geophysical results demonstrate that substantially more of the pressing facility remains, emphasizing the remarkable size of the facility and raising further questions about the organization of production.

Comparing these two ongoing projects to previously published but newly collated data from regional case studies, here including Lycia and Narbonensis, allows for further insights into scale and strategy. These case studies highlight differing economic decisions related to the same industry and emphasize the diversity in approach to one of the cornerstones of the Mediterranean economy.

9 APAO: AN ONLINE ATLAS ATLAS OF PRESS FACILITIES IN ANCIENT OCCIDENT FOR THE ANR MICA PROJECT

Bernigaud, Nicolas (CNRS ASM - UMR 5140) - Bouby, Laurent (ISEM) - Peña Cervantes, Yolanda (UNED) - Pérez Jordà, Guillem (Alicante University) - Rocca, Elsa (Université Paul-Valéry Montpellier 3) - Séjalon, Pierre (INRAP) - Mauné, Stéphane (ASM - UMR 5140 CNRS) - Carrato, Charlotte (Mosaique Archéologie)

As part of the ANR MICA project (2023-2026), we undertook to build an online atlas of ancient press facilities in southern Gaul and the western Mediterranean (Iberian Peninsula, ancient Morocco). The objective is to bring together the various existing archaeological datasets to model the geography of ancient winegrowing and/or olive-growing regions using spatial analysis methods. The creation of the online atlas is based on an analysis of published sources. The attribute table of the vector layer includes about ten fields that mainly provide information on the nature of the remains (counterweight, area, mola olearia, etc.), their location and their chronology. The analysis work is currently concentrated in southern Gaul and in the western part of the Mediterranean basin. The aim is to perpetuate this atlas after the MICA project. In the longer term, it could integrate data from other geographical areas (notably those of the Eastern Mediterranean), to produce an online map of ancient press installations on the scale of the Roman Empire. In this paper, we will present this atlas, first results of analysis and discuss its future development in a collaborative network.

10 RECONSIDERING PLINY THE ELDER'S PERSPECTIVE ON WINE: HOW MUCH HAS HIS VIEW IMPACTED US?

Falaschi, Eva (Eberhard Karls Universität Tübingen)

Pliny the Elder's wine books (NH 14, 17, 23) have been compulsory read to find information on viticulture and wine production in ancient times and compare it to the archaeological data. The idea of the *Naturalis Historia* as an encyclopaedia that cannot and should not be read from its first to its last page, but can be excerpted to extrapolate single pieces of information has deeply impacted the modern use of this text. However, new studies on the *Naturalis Historia* have shown the strong presence of an author who chooses, selects, organizes and manipulates information to propose his vision of the Roman Empire to the reader. How can our studies on wine production in ancient times change, if we consider this new perspective? How did Pliny and his personal view influence our reception of wine production and our research? Philology and archaeology must reflect on this issue and reconsider their use and study of literary sources on wine. And if you imagine an archaeological database on wine production, can the literary data find a place there? If yes, how? What are the possibilities and the limits of their inclusion?

915 3D HERITAGE. DIGITAL HUMANITIES FOR DOCUMENTATION, ANALYSIS, AND DISSEMINATION OF MATERIAL CULTURE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Rouco Collazo, Jorge (Institute of Heritage Sciences (Spanish National Research Council)) - Maldonado Ruiz, Alexis (University of Leiden) - Carrero Pazos, Miguel (University of Santiago de Compostela)

Session format: Regular session

In the last decade, 3D analysis and processing techniques have undergone significant theoretical and technical advancements. The quality and quantity of data obtained through various 3D techniques have marked a substantial leap forward, and Archaeology is no longer a mere bystander. As a result, their application has become increasingly common, where various techniques are employed to document, analyze and disseminate cultural heritage in three-dimensional ways.

In this regard, the huge variety of 3D methodologies and techniques allow to apply them in a wide range of work, from macro to microscale. These go from satellite imaging and remote sensing through airborne photogrammetry on Unmanned Aerial Systems (UAS) platforms or airborne LiDAR, among others, to close range photogrammetry for small objects. All these techniques have gained significant relevance in the field. The adoption of these innovative methodologies has brought about a methodological revolution, with profound theoretical implications on how we study material culture and how to research in Humanities in the Digital Era.

This session aims to be a space for presentation and debate of the state-of-the-art 3D methodologies for documentation, analysis and dissemination of the landscape. The primary objective is to engage in discussions about methodologies, application challenges, new theoretical perspectives, and the future directions. Thus, papers on methodological and theoretical issues on 3D applications for the study of the Landscape will be welcomed, including case studies of methodological relevance.

The outcome of this session will be an up-to-date overview of a field constantly undergoing significant methodological updates within Archaeology and Digital Humanities, thereby fostering discussions of considerable value for the exploration of current applied methodologies and the advancement of theoretical debates.

ABSTRACTS

1 ANALYZING SYMMETRY IN ACHEULEAN HANDAXES: A TECHNOLOGICAL AND GEOMORPHOLOGICAL APPROACH

Rosolani, Erica (International Master in Quaternary and Prehistory) - Ollé, Andreu (Insitut Català de Paleocologia Humana i Evolució Social (IPHES); Departament d'Història de l'Art, Universitat Rovira i Virgili, Tarragona, Spain) - Arzarello, Marta (Sezione di Scienze Preistoriche e Antropologiche Dipartimento di Studi Umanistici Università degli Studi di Ferrara) - García Medrano, Paula (UMR 7194 Département Homme et Environment, Museum National d'Histoire Naturelle, Paris, France; Department Britain, Europe and Prehistory, British Museum, London, United Kingdom; Insitut Català de Paleocologia Humana i Evolució Social (IPHES); Departament d'Història de l'Art, Universitat Rovira i Virgili, Tarragona, Spain)

Since their discover, Acheulean handaxes have been considered by archaeologist as one of the first hints of symmetry perception in the human lineage and have opened a heated debate in which different positions are taken regarding their meaning, functionality and the cultural role they might have played. During the last decades, these tools have been approached through different type of analyses, from more classical technological analysis to the use of software for the evaluation of 2D and 3D images. In this work, we present the application of both technological and Geometric Morphometric analyses on materials coming from three different key European sites: Galería (Atapuerca, Spain), La Noira (Centre Region, France), and Guado San Nicola (Molise, Italy). All sites are dated within Marine Isotopic Stage 12/11 and were selected because they document a significant technological change between their early Acheulian occupation and the following ones. The sample of the study is composed by handaxes and cleavers from the sub-unit GIIa of Galería, Stratum c of La Noira, and SU C of Guado San Nicola. Geometric Morphometric analysis applied on the latter has been performed with Artifact GeoMorph Toolbox 3D (AGMT-3D), together with a deep technological analysis, allowed us to have a complete view over the assemblages variability. The aim of this study is to expose both the methodology and the results obtained comparing the three assemblages to provide a contribution within the study of human occupations in south-western Europe during MIS 11.

2 DIGITAL PHOTOGRAMMETRY IN SERVICE OF UNDERWATER ARCHAEOLOGY: CASE STUDIES FROM THE BULGARIAN BLACK SEA

Georgiev, Pavel (Centre for Underwater Archaeology, BG; Centre for Maritime Archaeology, UK)

With digital archaeology becoming more accessible, it has established itself as a major tool for documenting underwater archaeological sites. However, the water environment presents a different set of challenges such as low visibility and floating particles. To overcome them, a flexible approach must be adopted to achieve fast and reliable results. In this paper is presented, a cost-effective methodology that can provide them. It has been successfully applied in several underwater archaeological sites researched by the Centre for Underwater Archaeology along the Bulgarian Black Sea coast. They range from the submerged fortifications in Nessebar, the fragments of which are spread over a large area; to the inundated prehistoric settlement at the bay of Ropotamo River, whose archaeological remains are more than 2 m deep into the seabed; and the Urdoziva shipwreck in Kiten, a 24 m long ship which is well preserved almost to main deck. To document them a set of action cameras was used that are attached to a common frame and shoot at a different angle. That way enough overlap is produced even in the lowest of visibilities. Afterwards, the images are corrected in open-source software and processed in Agisoft Metashape. The workflow is adapted to remove interference from the seawater. That gives us ready-to-use results on the next day.

3 UNCOVERING LOST DETAILS: ENHANCING ANCIENT INSCRIPTIONS THROUGH COMPUTER VISION AND DEEP LEARNING

Aioanei, Andrei (Strasbourg University) - Manz, Marian (University of Basel) - Hunziker-Rodewand, Regine (University of Strasbourg) - Fornaro, Peter (University of Basel)

This paper introduces an innovative visualization framework to enhance the readability of ancient inscriptions and facilitate automatic analysis. We apply our methodology to the 8th century BCE Panamuwa inscription from the Hadad statue (KAI 214), which poses interpretive challenges due to surface erosion and subtle edge details. We generate a high-fidelity 3D model of the inscription to enable in-depth geometric analysis and provide a substrate for image enhancement. Image processing algorithms accentuate obscured glyph features such as soft edges. We further augment the visual data with depth maps and other representations to underpin our deep learning architecture for recovering eroded inscription elements. Our framework entails successive phases of epigraphical enhancement enabled by digital techniques: 1) Creating an accurate 3D model, 2) Applying image processing for feature enhancement, 3) Generating synthetic representations to expand available inscription data, and 4) Leveraging neural networks to reconstruct missing details. This research aims to enhance visualization and uncover lost knowledge for researchers, revealing new insights. It establishes computational epigraphy at the nexus of archaeology, computer vision, and digital humanities - setting a new standard for exploiting 3D/2D models, image enhancement, depth mapping, and deep learning to analyze archaeological artifacts.

4 UNVEILING THE PAST: EXPLORING THE EPONIMOUS SITE OF CUCUTENI CULTURE THROUGH 3D DOCUMENTATION AND PUBLIC ARCHAEOLOGY

Brunchi, Radu (Alexandru Ioan Cuza University, Arheoinvest) - Asandulesei, Andrei (Alexandru Ioan Cuza University, Arheoinvest) - Tencariu, Felix-Adrian (Alexandru Ioan Cuza University, Arheoinvest) - Brasoveanu, Casandra (Alexandru Ioan Cuza University, Arheoinvest)

The Chalcolithic culture of Cucuteni is renowned for its exquisite painted ceramics, reflecting exceptional artistic skill. Equally remarkable are the remnants of residential structures unearthed in archaeological digs. These constructions often bear the signs of intense fire damage, sometimes causing the clay walls and floors to vitrify. Despite this destruction, significant traces of daily life and ancient spirituality are preserved within. However, excavating and accurately documenting these layers of destruction pose considerable challenges.

Thankfully, advancements in 3D documentation techniques have revolutionized the recording process, enabling faster and more objective preservation of archaeological data. Our methodology begins with comprehensive 3D scanning of the site's surroundings, providing crucial context. Subsequently, we focus on meticulously documenting the layers of destruction within the archaeological trench, creating detailed 3D models.

For our study, we selected a dwelling located within the eponymous Cucuteni settlement of Cetățuia in northeastern Romania. This structure features extensively burnt walls, collapsed atop a suspended floor, which overlays a ground floor containing various artifacts such as loom weights and ceramic vessels. Without the aid of photogrammetry, recording these materials in situ would have been arduous and time-consuming. The 3D models generated not only facilitate academic research but also serve as valuable tools for education and public engagement. Through a freely accessible online portal, we integrate all collected data—including photographs, archaeological surveys, and illustrations—adopting a Public Archaeology approach to broaden accessibility and understanding of the site.

5 VIRTUAL ARCHAEOLOGY AS A METHOD OF PROMOTING THE PHOENICIAN-PUNIC HERITAGE OF THE BAY OF CADIZ (SW, SPAIN)

Sicre-González, Pablo (Universidad de Cádiz)

This proposal implements Virtual Archaeology as a technique and methodology for the historical-archaeological analysis and study of Phoenician-Punic elements of the coastal landscape of the Bay of Cadiz. These elements are the wall of Cerro del Castillo (Chiclana de la Frontera, Cádiz), the necropolis of the city of Cádiz and the wall of Castillo de Doña Blanca (El Puerto de Santa María, Cádiz). We will present the final results of the virtual reconstruction carried out in the first of these cases; the methodology to be followed in the work we are currently carrying out on the necropolis of Cádiz; and we will conclude with the proposal of our Master's Final Project on the defensive system of the last construction phase of the site of the Castillo de Doña Blanca. All these works of analysis and studies conclude with a powerful graphic section, essential for the enhancement of the coastal cultural heritage of the Bay of Cadiz.

6 LET THERE BE LIGHT. 3D DOCUMENTATION AND VISUALIZATION OF STEĆI TOMBSTONES: A COMPARISON BETWEEN DIGITIZATION USING PHOTOGRAMMETRY AND STRUCTURED LIGHT

Škerjanec, Luka (Research Centre of the Slovenian Academy of Sciences and Arts, Institute of Anthropological and Spatial Studies)

Stećci are medieval tombstones scattered across the landscapes of the Western Balkans. Out of approximately 60,000 known stećci, current research suggests that only 8% of them are adorned with various bas-relief decorations, and inscriptions dedicated to the deceased have been documented on fewer than 400 tombstones. Despite their large number, the stećci seem to be disappearing from the landscape. The deteriorating conditions are particularly evident in the pronounced weathering of certain tombstones, exacerbated by the prevalent use of local limestone as the primary carving material. This material choice, combined with environmental factors, has significantly degraded the quality of the iconography and inscriptions on these monuments. A series of tombstones from the area of the medieval Dabar parish were scanned. The capture methods encompassed photogrammetry (Structure from Motion) and scanning with structured light (Structure from Light). The main goal of the research was to compare the results of these two three-dimensional documentation methods and evaluate their suitability for visualizing highly degraded inscriptive and decorative surfaces of these tombstones. Several techniques exist for visualizing stone carvings with 3D models. Those that are applied to mesh geometry, generating a visualization based on various shading techniques; and those in which height information, in the form of a raster DEM is extracted from the surface of the 3D geometry that is then used to apply GIS visualization techniques. The most comprehensive evaluation of a surface requires combining the results of different visualization methods to ensure a thorough assessment.

7 EVOLVING PRACTICES IN EXCAVATION METHODOLOGY: 3D ANALYSIS OF A SLAVIC CREMATION BURIAL MOUND

Stepnik, Jakub (University of Warsaw)

The archaeological research conducted for nearly a decade by the Chodlik Archaeological Mission has been characterized by a focus on modern digital documentation techniques applied during the excavations of the Early Medieval Slavic cremation burial mounds. These techniques aim to preserve knowledge about the structure of monuments and examined features, forming the basis for scientific inference. Since the beginning of excavations in 2011, digital orthophotography has been a key tool in field documentation. However, recent advancements have introduced photogrammetry, opening up new research possibilities.

Leveraging the full potential of photogrammetric documentation allowed the creation of a multi-level digital database resembling a computed tomography of the site. However, the database created was not a final goal but the beginning for 3D-aided research of the burial mound.

A significant departure from similar projects is the use of Blender software dedicated to 3D graphics instead of GIS-related programs. Due to its characteristics, it allowed greater interaction with 3D models by adding possible interpretations of contexts. Creating a 3D "research hub" enabled a holistic analysis of stratigraphy along with the planigraphy of artifacts, allowing the formation of new questions and hypotheses otherwise impossible to be formed using traditional documentation. The utilization of 3D databases in archaeology opens up various possibilities that, if fully embraced, can potentially revolutionize the processes of excavation, analysis, and teaching.

8 AUGMENTED REALITY APPLIED TO THE SILVER WAY AND ITS POWER DYNAMICS IN LATE ANTIQUITY AND EARLY MEDIEVAL TIMES

Barja-Márquez, Carlos (University of Vigo)

RurAllure is a European project (H2020) led by the University of Vigo (Spain) that promotes an understanding of the cultural heritage sites traversed by different paths that lead to pilgrimage landscapes and routes in Europe.

As a member of this team, I focus on late antiquity and early medieval worship buildings that due to their significance were not abandoned but are not located in populated areas. These buildings, namely churches, must be understood as an expression of power dynamics that transformed the territory. My research addresses such dynamics proposing augmented reality methodologies as an approach to the topic to digitally recreate that territory and its history.

In this contribution, I will discuss two case studies of two churches, namely Santa María de Mixós and Santa Mariña de Augas Santas, to present their potential for studying territorial power dynamics within the Silver Way of the Camino de Santiago by documenting, contextualizing, and analyzing their data. The main aim of my research seeks to have an impact on society by providing a historical narrative about these sacred buildings and their value.

All in all, the use of the augmented reality in this project intends to create an alternative to physical interactions in historical buildings in order to protect and preserve them from damage.

9 OSTEOGRAMMETRY: APPLICATIONS FOR SFM MODELING IN BIOARCHEOLOGY AT SAN DONATO DI LAMON

Vail, Alexander (Northwestern University) - Fiorin, Elena (Sapienza Università di Roma) - Forlin, Paolo (Università di Bologna; Northwestern University)

Structure-from-motion (SfM) photogrammetry has been employed in archaeological research for several decades to document sites, contexts, and artifacts, demonstrating the advantages of its metric accuracy and simple process. However, bioarcheological applications have been largely limited to modeling in-situ burials. A standard method for close-range photogrammetry to model previously excavated human skeletal remains has been largely unexplored. To remedy this, we critically examine the suitability of SfM photogrammetry for investigating human skeletal remains in bioarcheological research contexts by applying the method to a case study using material from the medieval cemetery at San Donato di Lamon, Veneto, Italy. We examine three samples of skeletal elements exhibiting unique paleopathological characteristics. These elements were modeled on site, and later measured and analyzed exclusively using the SfM models. This serves as a practical application of the method to an ongoing excavation and demonstrates the non-metric and paleopathological potential of SfM models. Each of these samples demonstrate how SfM models can be used to investigate and analyze non-metric skeletal features such as congenital and traumatic pathologies. This case studies demonstrate that SfM models, when created with a standardized and suitable method, can serve as an accessible replacement or supplement for handling skeletal material in-person. Results from our study demonstrate the potential of digital methods in the osteometric and paleopathological analysis of human skeletal remains, expanding the methodological repertoire of bioarcheology. Moreover, our findings illustrate how the use of SfM skeletal models offers potential solutions to the unique ethical and logistical challenges surrounding the study and display of human remains. We also begin a broader discussion surrounding how these models may be employed in public cultural heritage projects, such as an upcoming museum installation in Lamon, as an alternative to displaying real human skeletal material.

10 POINT CLOUDS AND CULTURAL LANDSCAPES: METHODOLOGY AND PROBLEMS OF 3D TECHNOLOGIES IN EARLY MEDIEVAL CONTEXTS

Gallego-García, Mar (Universidad de Alcalá) - Diarte-Blasco, Pilar (Instituto de Historia. Consejo Superior de Investigaciones Científicas (IH-CSIC)) - Castro-Priego, Manuel (Universidad de Alcalá)

This work presents the main results of the research group Archaeology: Landscapes, Colonialism and Cultural Heritage of the University of Alcalá, which have been carried out in recent years, within the methodological application of new technologies. Among them, those that have played a central role have been the use of terrestrial 3D Laser Scanner, LIDAR and photogrammetry, in diverse archaeological spaces, ranging from large medieval spaces endowed with a strong monumentalisation, to specific contexts in excavation processes. The research carried out stresses the need for planning prior to data collection, as a way of avoiding misleading results, in which the ultimate aim must also be present from the start of the project. On the basis of the data obtained, the methodological difficulties observed, the main problems in the management of the documentation, as well as a reflection on future aspects of the development of laser technologies and their deepening in new areas of analysis are discussed.

11 SUB-MILLIMETRIC SFM 3D SCANNING OF MEDIEVAL ARCHITECTURE: PHOTOGRAMMETRIC DIGITAL TWIN OF THE DURHAM NORMAN CHAPEL FOR CONSERVATION AND HERITAGE MANAGEMENT

Jansen, Alexander (Durham University, Department of Archaeology) - Rennie, Gillian (Durham University; University Library and Collections, Durham University; University College, Durham University)

This paper presents a new workflow and improvements to optimise the quality and resolution of archaeological 3D photogrammetric data, and aims to promote a higher degree of standardisation in 3D scanning practices across the fields of archaeology, conservation and heritage management.

This will be presented through the case study of the Norman Chapel. Constructed around the year 1080 CE the Norman Chapel is among Durham Castle's most important spaces and the city's oldest building, and part of the Durham Castle and Cathedral World Heritage Site. In September 2023, the discovery of water damage in its interior required fast action to protect our cultural heritage. Following the discovery of a leak, the author of this paper was immediately tasked to 3D scan the entire ceiling of the chapel at a sub-millimetric spatial resolution. Due to the height and shape of the chapel, a custom workflow had to developed to optimise the scanning process.

The purpose of this 3D scan is the creation of a digital twin of the ceiling, both to digitally preserve it and to serve as a reference point for comparing future 3D scans against. This will allow us to monitor the state of the chapel over the years, track potentially expanding cracks, identify damage by salt and moisture, track erosion of the sandstone, and (through colour analysis) to inspect possible degradation of medieval plaster.

To ensure the captured 3D data is suitable for these purposes, it should meet a large number of requirements. The first 3D scan of the roughly 7 by 10 metre ceiling was rendered as a dense point cloud and a 550 Megapixel orthomosaic ceiling plan with a spatial resolution of ca. 800 pixels per square centimetre, a level of detail that even allows us to pinpoint all the tiny spiders on the ceiling.

12 FLYING CASTLES. SFM PHOTOGRAMMETRY FOR THE DOCUMENTATION, ANALYSIS, AND DISSEMINATION OF THE MEDIEVAL CASTLES OF THE ALPUJARRA (GRANADA-ALMERÍA, SPAIN)

Rouco Collazo, Jorge (INCIPIT)

Aerial Structure from Motion photogrammetry, using unmanned aerial vehicles, has been a revolution in the three-dimensional documentation of archaeological remains, especially those that are difficult or inaccessible. This has been fundamental in its application to the fortifications of the Alpujarra, located on the southern face of the Sierra Nevada (Granada and Almería). This area has an intense rural settlement with several fortresses during Middle Ages.

This is an area with an abrupt mountainous orography, which conditions life in the region and also the methodology to be applied. The fortresses are located on rocky plateaus, often on cliffs, so the only way to document them is through the use of UAS.

In this presentation we will explain the workflow for the documentation of these fortifications with precision 3D models and their interesting applications as a basis for research on built heritage. But also the possibilities of the 3D format as a basis for its use in the conservation and dissemination of this fortified heritage.

13 THE USE OF DIGITAL TECHNIQUES FOR AN INTERDISCIPLINARY ANALYSIS OF URBAN TRANSFORMATION: THE NORTHERN NEIGHBORHOOD OF ALULA OLD TOWN (SAUDIARABIA)

Torre Guibert, Manon (Archaïos) - Soubira, Thomas (Archaïos; Laboratoire Traces UMR5608) - Quentinet, Colin (Archaïos) - Lesaichere, Anaëlle (Archaïos) - Vernet, Apolline (Archaïos; Laboratoire Orient et Méditerranée UMR8167)

This presentation explores how digital technology, beyond its function of transmitting heritage to the general public, is a useful tool to understand the changes of an urban neighborhood through time. The use of georeferenced photogrammetry of current elevations and buried masonry not only provides a basic 3D visualization of the actual remains, it allows the comparing of the numerous data collected at different research stages by underground archaeology, geophysical survey, architectural study, and building archaeology, through 3D restitution hypotheses, connecting macroscopic urban observation to microscopic stratigraphical details and integrating the scientific inputs of each specialist into the historical reading of urban transformations.

The northern neighborhood of AlUla Old Town, a heritage site located in northwest Saudi Arabia and abandoned in the 1980s, is a perfect case study. In this area, the construction in 1956 of a mosque, Al Zahra Mosque, visibly modified the general layout of the neighborhood. Indeed, earlier urban planning has been identified in the surrounding buildings' façades. Archaeological data and stratigraphy provided by excavations in the mosque and adjacent streets also attest to several phases of occupation and abandonment. Radiocarbon dating and material studies contribute to completing

the chronological sequence of the neighborhood, with an occupation as early as the 10th century AD. Digital technology, through the development of volumetric hypotheses, makes it possible to simultaneously read scientific data gathered from different research angles on a common medium for each occupation phase and allows us to witness the evolution of the urban context over time.

This research is part of the interdisciplinary MuDUD project carried out by Archaios since 2021, funded and steered by the French Agency for the Development of AIUla (Afalula) in partnership with the Royal Commission for AIUla (RCU).

14 UNVEILING SOUTHAMPTON'S PAST: DIGITAL NARRATIVES, AUGMENTED REALITY, AND COMMUNITY ENGAGEMENT FOR ACCESSIBLE PRESERVATION

Pedrotti, Felix (Southampton Marine and Maritime Institute, University of Southampton) - Grant, Michael (Ocean and Earth Science, University of Southampton) - Strutt, Kristian (Department of Archaeology, University of Southampton) - Cooper, Neil (Department of Archaeology, University of Southampton)

Southampton's Old Town is a historic centre in the city of Southampton, showcasing impressive medieval archaeology and standing structures. These include the Bargate, the Tudor House, and many hidden vaults that provided storage for the town's burgeoning trade in wine and wool. These remains are augmented by a substantial array of objects preserved within Southampton's designated Museum Collections. These legacies serve as an invaluable resource, unveiling the crucial role of Southampton as a prominent maritime gateway. Unfortunately, many of these monuments and objects remain largely inaccessible to the general public due to various barriers, including linguistic, geographic, mobile, and financial limitations, as well as preservation needs. In response to these challenges, a transformative project was initiated by the authors in collaboration with Southampton City Council (SCC), and funded by the Southampton Institute of Arts and Humanities (SIAH). The goal is to preserve and showcase Southampton's archaeological heritage, making it accessible to both local and international visitors through digital narratives and Augmented Reality (AR) experiences.

Between 2021 and 2024, this project has identified suitable methodologies for creating a digital record of historical monuments, artefacts, and documents that speak to Southampton's past. Early events in 2023 showcasing this data at the Southampton Science and Engineering Festival and the National Heritage Open Days served as pilot studies. In 2024 the project promoted Knowledge Exchange between SCC, Southampton's residents and historical societies. It also enhanced the local Historic Environment Record by providing 3D recorded models of historic monuments, ensuring the preservation of these sites through digital archives and web-based experiences, including Augmented Reality. This presentation will illustrate how this project came together and how various methodologies used during this project developed a better framework within public engagement, contributing to a better understanding of modern society, archaeological connectivity, and cultural awareness.

15 THE ACCESSIBLE PAST. VIRTUAL MUSEUM OF THE ANCIENT SPEZIERIA OF SANTA MARIA DELLA SCALA, ROME

Vázquez de Ágredos Pascual, María Luisa (Universitat de València) - Muñoz Cosme, Gaspar (Universitat Politècnica de València) - Vidal Lorenzo, Cristina (Universitat de València) - García López de Andújar, Vanesa (Universitat de València) - Horcajada Campos, Patricia (Universidad Complutense de Madrid) - Durá Martínez, Esther (Universitat de València) - Tardi, Simona (Universitat de València) - Martínez García, María Julia (Independent Scholar)

Between the 11th and 19th centuries, the city of Rome housed around 300 apothecaries of religious origin that were associated with convents, monasteries, and hospitals. These establishments played a significant role in Rome's history during the High and Late Middle Ages, the Renaissance, and the Baroque period. Many of them began to close as secular pharmacies gained increasing prominence and leadership. At the beginning of the 20th century, two of these religious apothecaries still remained in their original locations: one within the Benedictine Monastery of Santa Cecilia and the other at the Convent of Santa Maria della Scala, belonging to the Order of Discalced Carmelites. However, since March 12, 1936, when the first one was moved to the Vatican Apostolic Library, only the apothecary (spezieria) of the Convent of Santa Maria della Scala remained in its original place. This makes it the sole testament to a distant and recent past in which these establishments actively participated in the daily life of Rome. Ten years ago, we initiated a project to study and enhance the ancient spezieria of Santa Maria della Scala. In its current phase, the project combines the use of new 3D technologies, augmented reality, and information and communication technologies (international thesaurus of materia medica) for the development of its Virtual Museum. This museum will also integrate innovative museographic narratives based on the results of recent years' archaeological, physicochemical, historical, historical-artistic, botanical, and mineral research on the hundreds of drugs, fragrances, and colors preserved there. This conference presents, as a preview, an advancement of the aforementioned Virtual Museum.

16 CASTELO D'ARROXO. A DIGITAL AND MORE INCLUSIVE PERSPECTIVE OF A MODERN AGE FORTIFICATION AT AS FIGUEIRAS (CASTROPOL, ASTURIAS)

Maldonado Ruiz, Alexis (University of Santiago de Compostela; Universiteit Leiden) - Busto Zapico, Miguel (University of Granada) - Lara Piñera, Francisco (Universidad Nacional de Educación a Distancia)

The present work is the first attempt to digitise one of the most important Modern period fortifications in the area of As Figueiras (Castropol, Asturias). It is considered very possible that this fortification, built during the 18th century, acquired a certain prominence in 1806, during the events of the War of Independence, when, in connection with Ribadeo, a defensive line of the Eo estuary was created.

During the archaeological interventions of 2022 and 2023, it was decided to carry out a systematic three-dimensional documentation of the structure, the excavation probes and the immediate surroundings.

For this task, it was decided to use photogrammetry by Unmanned Aerial Vehicle, supported by terrestrial photogrammetry. On this digital data we did several spatial analyses and a partial three-dimensional reconstruction of the structure. The results were subsequently processed for the creation of physical typhological replicas adapted for visually impaired people. These adapted replicas were subsequently printed using 3D printers based on.

17 VISUALISING HERITAGE: USING DIGITAL TWIN TECHNOLOGIES FOR CONSERVATION, REGENERATION AND OUTREACH

Wilson, Andrew (University of Bradford) - Sparrow, Thomas (University of Bradford) - Moore, Joe (University of Bradford) - Gaffney, Christopher (University of Bradford) - Croucher, Karina (University of Bradford) - Ichumbaki, Elgidius (University of Dar es Salaam) - Bates, Richard (St Andrews University) - Becker, Katharina (University College Cork) - Evans, Adrian (University of Bradford) - Booker, Olivia (St Andrews University)

Visualising Heritage is a research group responsible for the development of 3D capabilities for imaging and visualisation at the University of Bradford, UK. Recent infrastructure investment from the Arts and Humanities Research Council has extended the scale and reach of these possibilities, in particular with use of mobile mapping technologies (incl. Leica Pegasus TRK 700 EVO and Mosaic Viking 360 camera) and use of immersive spaces that will be discussed in this presentation.

These new digital twin capabilities have been brought to bear upon challenging city-scale and townscape heritage applications that have responded to varied needs in the UK, Ireland and Tanzania – from city-wide digital twins, to healthy highstreets and community-scale interventions. Collectively these represent opportunities to serve place-based research – helping to anchor humanities-based narratives that connect people, heritage and place; address regeneration, monitoring and conservation needs; whilst also signposting to different outreach opportunities including heritage for identity and wellbeing; discovery and interpretation; and in support of tourism and the creative economy.

18 A REFERENCE DOCUMENT FOR THE STUDY OF 19TH CENTURY NAVAL ARCHAEOLOGY

Silveira Martins, Adolfo António (C.E.U.-Cooperativa de Ensino Universitário; Universidade Autònoma de Lisboa) - Rodrigues Pereira, José (Portuguese Navy. Retired) - Martins, Adolfo (História, Territórios e Comunidades. CFE. Universidade de Coimbra)

The aim of this paper is to present and preserve a handwritten document from 1830, produced to assist the shipbuilders of the French naval port of Brest, and the results of the developed comparative study between the ships included in this manuscript and the Portuguese frigate D. Fernando II e Glória, exhibited in the Lisbon Maritime Museum. The document is of great importance for the study of mid-19th century naval archaeology. The manuscript is entitled 'Dimensions des Mâture et Plans de la garniture des mâts pour les Bâtiments de chaque rang', with the reference Cx. 1, 17450, and is part of the Leite Vasconcelos archival collections at the Portuguese National Archaeological Museum.

The document highlights a number of peculiarities and specific milestones in 19th century shipbuilding as an instrument of social and political modernisation. The manuscript contains detailed drawings of hull dimensions/proportions and rigging for each class of ship: liner, frigate, corvette, brig and schooner.

In this way, the research team has recorded the information contained in the manuscript in detail and converted it into a 3D digital environment for more comprehensive cultural practices, in order to clarify the differences between the established rules and practices of the time, and to compare them with the features of the Portuguese frigate D. Fernando II e Glória, now a historical ship in the Lisbon Maritime Museum. The results of this research will be presented in the form of comparative tables illustrating the differences identified in dimensions and proportions, the use of digital technologies where the two ship models (3D models) are set aside, and the overall conclusions.

916 INTEGRATING NEANDERTAL LEGACY: FROM PAST TO PRESENT. FROM SCIENCE TO SOCIETY

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Mihelic, Sanjin (Museum of Arts and Crafts, Zagreb) - Janković, Ivor (Institute for Anthropological Research, Zagreb) - Leskovar, Tamara (University of Ljubljana) - Romagnoli, Francesca (Universidad Autónoma de Madrid) - Rivals, Florent (Institut Català de Paleoeologia Humana i Evolució Social)

Session format: Regular session

Since the discovery of Neandertals in the Kleine Feldhofer Grotte in Neander Valley, Germany, in 1856, they have remained at the forefront of scientific debates and captured the public imagination as our favourite 'cavemen.' Despite the evolving perspectives—from brutish beings to potential evolutionary links to humanity—the term Neanderthal has never faded from relevance. In recent years, numerous discoveries of their physical and cultural remnants have shed new light on our understanding. Genomic data extraction from fossils and sediments, coupled with innovative analytical methods, has provided profound insights into their biological legacy. Concurrently, research efforts across various disciplines have highlighted their diverse behaviours across space and time, fostering collaboration among scientists and driving the field forward.

Beyond academia, Neandertals have emerged as invaluable assets in heritage preservation, tourism, and education. This session serves as a platform to showcase the latest findings from diverse scientific fields related to the Neanderthal legacy. By encouraging interdisciplinary discussions and addressing pertinent issues, this session aims to bridge the gap between different disciplines. Moreover, it will spotlight best practices, fostering engagement with diverse audiences beyond the scientific community.

The session is organized within the framework of the COST Action 19141 Integrating Neanderthal Legacy: From Past to Present (iNEAL).

ABSTRACTS

1 INTEGRATING NEANDERTAL LEGACY: FROM PAST TO PRESENT (SLIGHT RETURN)

Mihelic, Sanjin (Museum of Arts and Crafts, Zagreb) - Janković, Ivor (Institute for Anthropological Research, Zagreb)

The year 2020 marked the starting point of a four-year Action entitled Integrating Neanderthal Legacy: From Past to Present (iNEAL) (CA19141), financed through the European Cooperation in Science and Technology (COST). The Action is aimed at assessing and addressing biases in Neanderthal legacy and creating a pan-European, and wider, network of scholars involved in Neanderthal research. The ever-growing datasets related to Neandertals (archaeological, fossil, genomic etc.) resulted in specialization of scientists of different disciplines that often have less than adequate understanding of other fields involved with Neanderthal research. Further, socioeconomic factors and different trajectories of development of scientific disciplines in different countries resulted in biases toward the 'western countries', while many of the sites in e.g. the former 'Eastern bloc' were poorly represented or published. The iNEAL Action is addressing these and other biases through its working groups (WG1: Fossil data; WG2: Cultural data; WG3: Molecular data; WG4: From Past to Present). Special attention is given to training of young researchers where disciplines are underdeveloped. Further, among the Action Goals is bridging the gap between scientists and other interested parties (general public, touristic sector, museums, business, legislators etc.) in order to utilize socioeconomic aspects of various types of Neanderthal legacy.

2 THE TOURTOIRAC ROCK SHELTER: A "FORGOTTEN" LATE MIDDLE PALAEOOLITHIC AND EARLY UPPER PALAEOOLITHIC SEQUENCE WITH CANNIBALIZED NEANDERTHAL REMAINS

Doyon, Luc (CNRS UMR5199 PACEA) - Crevecoeur, Isabelle (CNRS UMR5199 PACEA) - Armand, Dominique (CNRS UMR5199 PACEA) - Beauval, Cédric (Archéosphère) - Bosq, Mathieu (GéoArCQ) - Rosso, Daniela (Universitat de Valencia) - Royer, Aurélien (UMR6282 Biogéosciences) - Rufà, Anna (Universidade do Algarve) - Michel, Alexandre (Conseil départemental de la Dordogne) - Vaissié, Erwan (Paléotime)

The Tourtoirac rock shelter is known since the end of the XIXth century but was only formally excavated by Henri Laville between 1968 and 1972. The site remains largely undocumented, being only briefly cited in regional syntheses. No reappraisal was carried out until 2021, when new excavations began with a multidisciplinary team.

The Tourtoirac rock shelter presents a complex stratigraphy including three units without reaching the bedrock. US1 yields a lithic assemblage attributed to a Middle Gravettian occupation while the US2 and 3 contain stone technology assigned to the Levallois and Quina Mousterian. The faunal assemblage is dominated by Reindeer throughout the sequence and includes numerous bone retouchers, albeit they are more frequent in Middle Palaeolithic contexts.

Over twenty human remains were discovered in recent excavations and when studying old collections from Laville. The anthropological assemblage mainly includes hand phalanges, metacarpals, and lower limb bone fragments. Two decidual teeth were also identified. In total, they are attributed to four individuals: two adults, one adolescent and one child. Most human remains were found in association with Mousterian occupations, except for a single decidual tooth found in the Middle Gravettian level.

Complete and/or diagnostic human remains from Mousterian occupations are all attributed to Neanderthal. Interestingly, they often bear evidence of anthropogenic modifications such as cut marks as well as percussion notches and flaking suggesting long bone breakage to access marrow. Some human long bone fragments were used as bone retouchers and other expedient tools. Together, these modifications are similar those documented at Goyet, Belgium, where mortuary practices associated with commensal cannibalism were identified (Rougier et al., 2016). Our results question the implications of recurrent cooccurrences of specific mortuary practices and technological behaviour involving human remains documented in Quina Mousterian contexts at a regional scale (e.g., Mussini, 2011; Verna & d'Errico, 2011).

3 LA ROCHE-COTARD (LANGEAIS. FRANCE). UNE GROTTTE ORNÉE PAR NEANDERTAL

Marquet, Jean Claude (Chercheur associé GeHCO (Lab. de géologie. Fac. Sciences. Tours); ORCID 0000-0001-6250-4720; CITERES. Lab. Archéologie et Territoires. Tours) - Wojtczak, Dorota (Integrative Prehistory and Archaeological Science, University of Basel, Suisse.; ORCID 0000-0002-3259-0792) - Freiesleben, Trine Holm (Department Physics, Technical University of Denmark, Roskilde, Denmark)

Cette grotte a été découverte lors de travaux en 1846. Elle a été vidée des deux couches moustériennes qu'elle contenait en 1912, à la base un Moustérien typique à débitage Levallois et au-dessus un Moustérien de tradition acheuléenne. Les panneaux de tracés digitaux et de ponctuations digitales, connus depuis longtemps, n'ont été soumis pour validation à un spécialiste de l'art préhistorique qu'en 2008 puis présentés à une table-ronde de l'EAA à Budapest en 2022. Les principaux panneaux ont été présentés dans un article (<https://doi.org/10.1371/journal.pone.0286568>) en juin 2023. Certains de ces panneaux attestent d'une intentionnalité très forte de la part de l'homme ou de la femme Néandertal qui les a réalisés.

Une approche de la datation de ces panneaux a été obtenue grâce à la méthode OSL (Luminescence Stimulée Optiquement). Le dégagement de l'entrée de la grotte en 1846 et la fouille de 1912 ont préservé localement les sédiments qui se trouvaient autour de l'entrée. Le diagramme bayésien obtenu à partir des nombreuses datations a permis de dater la fermeture de l'entrée de la grotte de 57 000 années.

L'objectif de cette présentation est de montrer aussi d'autres productions graphiques également réalisées dans la grotte, récemment étudiées et de les croiser avec celles déjà connues.

Jean-Claude Marquet, Université de Tours (France)

Dorota Wojtczak, Université de Bâle (Suisse)

Trine Holm Freiesleben Technical University of Denmark.

4 UNDERSTANDING THE SITE FUNCTION AND NEANDERTHAL SUBSISTENCE STRATEGIES THROUGH THE MICRO-WEAR ANALYSIS OF THE STONE ARTEFACTS FROM LA ROCHE-COTARD SITE

Wojtczak, Dorota (IPNA, Basel University) - Marquet, Jean-Claude (Chercheur associé GeHCO Lab. de géologie. Fac. Sciences. Tours)

Stone objects are often the best represented and conserved cultural remains at Palaeolithic sites. Stone artefacts as an assemblage and individually retain a unique story covering the time from being picked up, all the way through their lifecycle; manufacture, use, and possibly recycling, and finally discard. Stone tools related to many aspects of the everyday survival of prehistoric people and as such are remarkable sources of insight into their lives. Here we present results of the micro-wear studies undertaken on stone artefacts originating from the Middle Palaeolithic occupations during MIS 5, 4 and 3 at the La Roche-Cotard (LRC) site in France. The site was occupied several times by Mousterian hunters, which were roaming the environs of the Indre-et-Loire region and left some remarkable evidence of both engraved abstract patterns on the cave walls and hundreds of stone artefacts, which have been thoroughly examined by low and high-power microscopic analyses. These results contribute to interpretations on the site function and reveal a broad-based subsistence strategy of their producers. Moreover, the data also advocates that tasks undertaken on site were not limited to graphic production on the cave walls alone. These conclusions help progress the current discussion on the complexity of Neanderthal technological behavior and their cognitive skills.

5 THE UNUSUAL FRONTAL BONE MORPHOLOGY FROM HAHNÖFERSAND, GERMANY

Röding, Carolin (Paleoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen, Germany; Institute for Archaeological Sciences, University of Tübingen, Germany) - Profico, Antonio (DFG Centre of Advanced Studies 'Words, Bones, Genes, Tools', University of Tübingen, Germany; Department of Biology, University of Pisa, Italy) - Merkel, Michael (Archäologisches Museum Hamburg und Stadtmuseum Hamburg, Germany) - Harvati, Katerina (Paleoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, Eberhard Karls University of Tübingen, Germany; Institute for Archaeological Sciences, Eberhard, Karls University of Tübingen, Germany; DFG Centre of Advanced Studies 'Words, Bones, Genes, Tools', Eberhard Karls University of Tübingen, Germany)

Frontal bone morphology is considered informative concerning phylogenetic and taxonomic affinities in hominin fossils. For example, a clear delimitation between the brow ridge and a flattened trigonum supraorbitale is viewed as a typical feature of *Homo sapiens*. In contrast, a flat frontal squama and prominent supraorbital region are characteristic of Neanderthals and Middle Pleistocene individuals from Europe and Africa. The evaluation of individual frontal bone features can lead to contradicting results between studied features.

The enigmatic frontal bone from Hahnöfersand, Germany, is one example that shows a mix of modern human and supposed Neanderthal features (Bräuer, 1980). The well-preserved frontal bone was originally dated to ca. 36 ka and interpreted as a potential hybrid between Neanderthals and modern humans. However, a later revision of the dating to ca. 7.5 ka warrants a new look at this specimen (Terberger, Street & Bräuer, 2001).

Here, we aim to analyze the ectocranial morphology of the frontal bone from Hahnöfersand using the method of surface registration. This almost landmark-free approach allows us to study the entire preserved morphology. Our comparative dataset included Neanderthals, Middle Pleistocene individuals from Europe, and a diverse *Homo sapiens* sample. Multivariate analyses (PCA) show the greatest morphological affinity between Hahnöfersand and *Homo sapiens*. In addition, Hahnöfersand is closest to Holocene modern humans in overall shape based on Procrustes distances. Our results showed no effect of the reported mix of features in the frontal bone from Hahnöfersand on its clear affinities to *Homo sapiens*. Therefore, our morphological re-evaluation is consistent with the revised date for this individual.

The surface registration method has great potential for the study of isolated and fragmented fossil remains. Here, we showed that this potential extends to relatively large and well-studied anatomical features whose shape might be difficult to capture in its entirety using traditional geometric morphometrics.

6 TAXONOMIC ASSESSMENT OF THE HUMAN REMAINS FROM THE MIDDLE PALEOLITHIC SITE OF GROTTA DEL POGGIO (CILENTO, SOUTHERN ITALY)

Piccirilli, Erica (Department of Cultural Heritage, University of Bologna, Italy) - Sorrentino, Rita (Department of Biological, Geological and Environmental Sciences, University of Bologna, Italy) - Seghi, Francesca (Department of Cultural Heritage, University of Bologna, Italy) - Belcastro, Maria Giovanna (Department of Biological, Geological and Environmental Sciences, University of Bologna, Italy) - Talamo, Sagra (Department of Chemistry G. Ciamician, University of Bologna, Italy) - Harvati, Katerina (Paleoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, Eberhard Karls University of Tübingen, Germany; Institute for Archaeological Sciences, Eberhard Karls University of Tübingen, Germany; DFG Centre of Advanced Studies 'Words, Bones, Genes, Tools', Eberhard Karls University of Tübingen, Germany) - Ricci, Stefano (Department of Physical Sciences, Earth and Environment, Unità di Ricerca di Preistoria e Antropologia, University of Siena, Italy) - Moroni, Adriana (Department of Physical Sciences, Earth and Environment, Unità di Ricerca di Preistoria e Antropologia, University of Siena, Italy) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna, Italy)

Grotta del Poggio is a key site for the Middle Paleolithic of southern Italy as it contains a pivotal anthropogenic deposit (layers 2-13) which has been referred to the MIS6 on geological basis. This deposit is part of a more than 20 m thick stratigraphic sequence that continues in the adjacent shelter. Excavations at the cave were carried out between 1964-1974 by Palma di Cesnola. After an erosional event, the cavity was used as a burial cave during the Bronze age. Thermoluminescence dating from layer 17 of the shelter sets a terminus ante quem for the cave's series at 111.800±9.500 BP. A human upper left first molar in situ in layer 6 and a human left talus hypothetically attributed to layer 4 were found in 1967. No archaic features were observed on the talus, thus questioning its attribution to Neanderthal. Conversely, the molar exhibited an evident Neanderthal-like morphology (i.e., taurodontism, strongly expressed hypocone, Carabelli's trait) and crown diameters fell within the Neanderthal variability range.

This contribution shows the geometric morphometrics (GM) and radiocarbon analyses aimed at clarifying the taxonomic attribution of these findings. Routine workflows were performed to create 3D models of the molar and talus. Then, GM analyses were conducted on the molar 2D crown outline and on the talus 3D shape. Additionally, the talus was subjected to radiocarbon dating to elucidate its absolute age.

The GM analysis on the molar crown outline confirmed its taxonomic attribution to Neanderthal, while the talus resulted to belong to recent *Homo sapiens*. The radiocarbon dating directly obtained on the talus corroborated this attribution, giving the authors the chance to hypothesize that this bone could have accidentally slipped down from the uppermost layers containing the Bronze age occupation during the excavation of layer 4.

7 INVESTIGATING NEANDERTAL SUBSISTENCE AT THE ROMUALDOVA PEĆINA (CROATIA) SITE THROUGH A MULTIDISCIPLINARY APPROACH TO FAUNAL REMAINS

Vidas, Lia (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb, Croatia) - Radović, Siniša (Institute for Quaternary Paleontology and Geology, Croatian Academy of Sciences and Arts, Zagreb, Croatia) - Silvestrini, Sara (Department of Cultural Heritage, University of Bologna, Ravenna, Italy) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt am Main, Frankfurt am Main, Germany; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia, Modena, Italy) - Sommella, Eduardo (Department of Pharmacy, University of Salerno, Fisciano, Italy) - Salviati, Emanuela (Department of Pharmacy, University of Salerno, Fisciano, Italy) - Marin-Arroyo, Ana (Grupo I+D+i EvoAdapta (Evolución Humana y Adaptaciones durante la Prehistoria), Departamento Ciencias Históricas, Universidad de Cantabria, Santander, Spain) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna, Ravenna, Italy) - Janković, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb, Croatia)

Neandertal subsistence has been a subject of investigation on a global scale for many years. Yet, there are gaps in our understanding of specific patterns of their subsistence in both temporal and geographical settings. One of the poorly understood regions is the Eastern Adriatic. This is at least partially due to the scarcity of the sites and relatively poor preservation of faunal remains. However, some sites hold important information about Neandertal diet, use of space, and other related issues. One of these is Romualdova pećina on the western coast of the Istrian peninsula. The cave is relatively simple in morphology and lies on the southern slope of a relict river gorge (the Lim Channel) today filled with sea. Excavated since the 1960s, it provides evidence of occupation of Neandertals and later, Upper Palaeolithic humans, but was used mainly by carnivores, such as bears and hyenas. Untangling the dynamics of these interchanging occupations on the site is a complicated but much-needed task. Here we investigate the faunal assemblage of the Middle Palaeolithic layers (6-21, trench 3; 9-13, trench 2) of the cave through morphological, taphonomic and palaeoproteomic approaches. Although highly fragmented, the assemblage has proven rich in faunal taxa. Even though carnivore activity is frequent, the lithic assemblage suggests an anthropogenic factor in the formation of the site as well. Apart from the open-air site of Campanož in southern Istria, where no organic material is preserved, this is the only Middle Palaeolithic site in the region. Therefore, a better understanding of Neandertal occupation in this area is of extreme importance for a complete understanding of Neandertal behaviour on a larger scale. The work presented here is in accordance with the aims of the CA19141 iNEAL and was done as a part of the ERC SUBSILIENCE and PREHISTRIA (IP-2019-04-7821) projects.

8 NEANDERTHAL OCCUPATION OF THE IONIAN ISLAND OF KEPHALONIA, WESTERN GREECE. PRELIMINARY RESULTS OF THE ASHORE PROJECT

Elefanti, Paraskevi (University of the Peloponnese) - Marshall, Gilbert (University of the Peloponnese) - Yiannouli, Evyenia (University of the Peloponnese)

For ten years, the diachronic ASHORE project has focused on the southeastern part of the Ionian Island of Kephallonia, during which over a thousand Middle Palaeolithic chipped stone artefacts were recovered. They include Levallois-Mousterian flakes, cores and tools, mostly related to raw material provisioning using beach pebbles, comparable to the so-called Pontinian industries of western Italy.

Most of the material was recovered from around 18m above sea level, with the richest concentrations from marine terraces formed in weakly cemented shallow marine deposits to the south of the village of Poros. Rich in fauna, these sediments were easily eroded, resulting in the formation of the distinctive platform that we see today. Based on OSL dating, recent geological modelling of marine formations in southern Kephallonia has attributed the 18m terrace to the MIS 3c interstadial, around 53ky. Relating geo-chronology to the phasing of the Middle Palaeolithic is difficult, given the lack of clear temporal markers. Ongoing fieldwork should help us to establish whether similar, although much smaller scatters from other terraces in the sequence, can also be interpreted as raw material provisioning during earlier phases, or simply the isolated traces of contemporary subsistence on higher ground.

Complex interaction between sea level change and tectonic uplift within the Ionian zone has led to the preservation of terraces on which Levallois-Mousterian chipped stone artefacts were recovered, pointing to the use of more remote islands. The size of Kephallonia would have proved a strong pull factor, while the beach pebble raw materials would have encouraged a coastal focus, resulting in the substantial assemblages recorded by the ASHORE project. In contrast, convincing Upper Palaeolithic or Mesolithic evidence has so far been elusive, possibly a result of inundation during the post-glacial period.

9 BEYOND THE MODEL: CHALLENGES IN DISTINGUISHING TYPES OF OCCUPATION IN LATE NEANDERTHAL SITES

Lubrano, Valentina (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB)) - Blasco, Ruth (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili (URV)) - Rufà, Anna (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB); Univ. Bordeaux, CNRS, MCC, PACEA) - Rivals, Florent (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); ICREA) - Rosell, Jordi (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili (URV))

The exploration of Late Neanderthal behaviour is a central topic in archaeological research, with a primary focus on unraveling the complexities of Middle Palaeolithic archaeological sites. Behavioural analysis plays a pivotal role in revealing the diversity of sites, providing crucial insights into occupation typology and site functionality. Additionally, it plays a key role in elucidating mobility patterns, social interactions, and the group sizes inhabiting caves and shelters.

The typology of a site is intimately connected to its function and the nature of sustained occupation. Determining the duration of Neanderthal occupations presents a significant challenge, given the complexities of distinguishing between long-term and short-term occupations. This challenge stems from the fact that archaeological assemblages are often palimpsests, potentially leading to erasure of information or partial preservation, accumulation, and transformation of subsequent activities.

Several factors have been identified to assess the duration of Late Neanderthal occupations, including the volume of archaeological remains, knapping sequences, evidence of butchering activities, extent of carnivore damage, taxonomic diversity, hunting spectrum, spatial distribution, and overall extent of the occupied surface. Despite the formulation of a general model based on these criteria to differentiate and identify occupations at the end of the Middle Palaeolithic, diverse data from various archaeological sites challenge this general paradigm. This diversity shows that the criteria for defining types of occupation are not homogeneous within the scientific community, creating a need for a comprehensive literature review. The objective of the present study is to scrutinize existing literature, elucidating the strengths and weaknesses of specific features within the current model used to classify types of occupation. By doing so, the study also aims to contribute to a more nuanced understanding of Late Neanderthal behaviour and the complexities associated with interpreting archaeological evidence from this period.

10 HOW CAN I HELP? NEANDERTHALS AS A CHANNEL FOR PUBLIC ENGAGEMENT. INSIGHTS FROM PORTUGAL

Pereira, Telmo (C.E.U.-Cooperativa de Ensino Universitário)

It is widely acknowledged that scientists often exert minimal effort or lack the capacity to communicate their research comprehensively, resulting in a significant gap in public understanding. This deficiency impacts awareness and interest and leads to misinterpretations of scientific results, including about the human past.

Most people exhibit limited awareness of the importance of comprehending prehistoric times and how such awareness would be helpful when addressing many contemporary phenomena (e.g. migration, environmental changes, etc.).

Neanderthals emerge as a compelling bridge to connect with the public. Their universal appeal generates curiosity, making them an ideal subject for public discourse. Over the years, effective communication about Prehistory, including Neanderthals, has proven to be a strategic means of securing local support, funding, and people and student involvement. This success often stems from personal interactions rather than relying solely on competitive grants.

In an era where financial resources are increasingly scarce and directed towards more pragmatic areas, emphasizing how Prehistoric Archaeology and Paleoanthropology can help with the present and prepare the future may be achieved through empathy rather than solely relying on academic brilliance.

Drawing on personal experiences in Portugal, this presentation will give examples of tangible outcomes of successful communication strategies in Neanderthal studies. We hope to inspire effective communication approaches, fostering a deeper connection between the scientific community and the public and, ultimately, having fun.

11 BREAKING THE EDUCATIONAL ONE-WAY ROAD: THE PALEO EXPERTS

Welper, Dustin (Stiftung Neanderthal Museum)

It's usually a dream: an in-depth dialogue with a group of visitors about the Neanderthal life style! But fluent conversations within tours and workshops are usually only brief and rare encounters. Within museums, the exchange of knowledge is mostly one-sided. Like a waterfall, years of study and learning paleolithic archaeology and human evolution pour down on the visitors, but you learn nothing about their opinions and feelings about what they have just learned. It is not easy to break up this one-way road.

The research project "Neanderthals and us" (2022-2025) is a cooperation between the Erasmus University Rotterdam (with Prof. Hub Zwart, PhD Student Susan Peeters), Leiden University (with Prof. Marie Soressi and PhD Student Karel Kuipers) and the Neanderthal Museum. It investigates the question of how our image of humanness changes when we learn more about Neanderthals. Within this project, Neanderthal Museum has decided to take a different approach to communication: by organizing the citizens' panel the "Paleo experts".

In exciting workshops, not only do our "Paleo experts" learn something about paleolithic archaeology, Neanderthals and the museum, but also, we as researchers learn something from them. The participants add their different perspectives, new impressions and let us draw on a much larger and diversified pool of knowledge. This makes them an essential part of "Neanderthals and us".

Over the next 1.5 years, the "Paleo experts" will participate in the interactive events of "Neanderthals and us", while meeting and discussing different researchers and artists from the field of philosophy and archaeology. In addition to the workshops, they are also invited to participate in blogposts and other documentation activities of the project.

In this talk, we will introduce the project and the Citizen panel, as well as the methods, workshops and insights of the participants.

918 PUBLIC BENEFIT: SHARING, CRITIQUING, BRAIN-STORMING AND BLUE-SKYING EXPERIENCE AND IDEAS TO HELP ARCHAEOLOGY BENEFIT WIDER SOCIETY IN THE FUTURE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Lewis, Carenza (University of Lincoln) - Schulke, Almut (University of Oslo) - Fernández Fernández, Jesús (University of Oviedo) - Rummel, Christoph (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts)

Session format: Public Benefits of Archaeology Advisory Committee

To retain public support, archaeology's wider benefits must be felt and recognised as widely as possible. This session explores how well we are doing this, and how it might be done better in the future by sharing case studies, ideas, issues and opportunities. Reflecting the five key priorities of the EAA's Public Benefits of Archaeology Advisory Committee, we welcome papers that:

1. Present and assess case studies which show how archaeology has benefitted people and places and/or the range of approaches being used to do this, including benefits to tourism, visitor economies, employment, places, place-making, heritage assets, regeneration, education, health and wellbeing, communities and connectedness, the environment and more.
2. Explore the commonalities and differences across Europe in the understanding of, aspirations for, and achievement of public benefit from archaeology, including attitudes in archaeology/heritage sectors; different approaches to presenting archaeology; different opportunities for public engagement; different awareness/perceptions of archaeology in wider society.
3. Consider our understanding of the means, mechanisms and processes through which archaeology benefits people and places, including the use of new discoveries, new data, new approaches, new types of benefit, and new approaches to transnational sharing.
4. Identify emerging opportunities and threats impacting the capacity of archaeology to benefit - or harm - wider society, including changing public attitudes; social cohesion; education; health priorities; political change (at local, national and/or international levels) including devolution and conflict; legislative change; economic perturbation, headwinds and policy change; environmental change and climate crisis and more.
5. Offer strategies for disseminating awareness of the public benefits of archaeology so it can inspire archaeological practice and inform policy-making that will increase archaeology's capacity to benefit society in the future.

The session will include ample opportunities for open and inclusive discussion.

ABSTRACTS

1 ARCHEOLOGY MATTERS

Host-Madsen, Lene (Museum Skanderborg)

During the last ten years, Museum Skanderborg has worked strategically to develop new communication formats that release archaeology's potential and benefit wider society. Museum Skanderborg wants to reach beyond the physical framework of the museum building. Archaeology is everywhere in the city and in the landscape. We work to break

down hidden barriers for whom archeology is relevant. We do this through collaboration. We develop strong concepts together.

We wish to present and discuss some of the work we have done by presenting case studies ranging from development of new residential areas' through place branding and settlement strategies, which creates a better framework for attachment and communication between old and new residents. To the The eScape project that is all about combining art, archaeology, past and present on archaeological sites. To Archaeological excavations conducted in cooperation with the public. And finally ending at the new Museum on the Train Station Platform One. "The cultural Waiting Room". We put the museum right where people are. With the location at the train station, the museum becomes both a place where you learn about the past and a living meeting place. The ambition is that the physical setting will change the way we think and use museum experiences.

Our projects are based on the desire to utilize archaeology's superpower and create very special experiences across institutions, professional bases, social approaches and geographies in an equal dialogue.

This paper will put forward the concept as an inspiration for others and seek to evaluate on the weaknesses and strengths in the projects so far and finally line out a vision for future works.

2 THE PUBLIC BENEFITS OF HUNTER-FISHER-GATHERER COASTAL HERITAGE - THE HORIZON MSCA DOCTORAL NETWORK ARCHE AND ITS PAST-PRESENT-FUTURE APPROACH

Schülke, Almut (Museum of Cultural History University of Oslo)

Hunter-fisher-gatherer remains in the varying coastal areas across Europe are highly endangered through destruction by climate change, coastal erosion or intensive development in areas of agglomeration. Today situated under water or on land these fragile, and often merely visible remains gain little public attention and are under-communicated. However, they are highly important for our understanding of the human past. They thus have a large potential of being put at the heart of present and future public benefits. The newly started HORIZON Marie-Sklodowska-Curie Doctoral network "Archaeological Coastal Heritage: past, present and future of a hidden prehistoric legacy" (www.arche.uio.no) trains 10 PhD students in the scientific and public value of the hunter-fisher-gatherer legacy across Europe. This talk will present the objectives of this training network, with special focus on the prospects of public benefits inherent in it. These encompass aspects such as:

- The administrative integration of cultural and natural heritage in coastal areas to benefit sustainable landscapes and their use – both for inhabitants, visitors/tourism and other stakeholders,
- Public participation and sharing through dialogue on and communication of this unique heritage and its meaning, and
- More sustainable coastal economies – in the light of this fragile heritage and through knowledge, which draws on sustainable hunter-fisher-gatherer practices.

3 COMMUNICATING THE PUBLIC VALUE OF ARCHAEOLOGY IN ESTONIA

Lillak, Anu (National Heritage Board)

The Heritage Conservation Act in Estonia states that archaeological survey must be based on the principle of minimum intervention and is financed by the party responsible for the damage to heritage. The number of rescue excavations is rising, meaning that most new excavations are financed by developers. At the same time the term minimum intervention can be redetermined for every new project as formulation of guidelines and standards for archaeologists is still an ongoing process in Estonia. Consequently, the amount of intervention, the choice of methodology as well as sampling strategies are too often under dispute as the opinions on the best available practices differ and the developer is interested in paying as little as possible.

The expression of wider benefits of archaeology are therefore of utmost importance explaining the developers the reasons behind their, sometimes unwilling, investment in archaeology. Communicating its numerous benefits helps with "translating" archaeological heritage even to the people who are not personally interested in it. Presentation of archaeology, especially in novel ways, also aids with the ongoing discussion about the best available practices and helps us reach balance between the scientific and public interests as well as the developer's concerns.

I will briefly discuss the current situation in Estonia and present a few examples. The first will show how small-scale archaeological watching brief may grow into research changing our understanding of the Viking Age and benefit the local community years after the initial discovery. The second example will discuss how fascinating presentation of archaeology stimulates the creativity of archaeologists, helps to engage the public, and prevents misunderstandings and misconceptions.

4 ARCHAEOLOGY ON THE FRONTIER: ENHANCING EDUCATIONAL PROGRAMS IN REMOTE ISLANDS

Arciero, Roberto (Leiden University) - Maggiulli, Ornella (UCL - University College London) - Genovese, Martina (Stazione Zoologica Anton Dohrn; University of Messina) - Torreggiani, Irene (University of Oxford) - Capriotti, Martina (University of Camerino)

Lampedusa and Pantelleria rank among the most secluded islands in the Mediterranean Sea, situated between Sicily and the African coast. Educational programs often require tailored approaches compared to those on the mainland of Italy, as students on these islands frequently face limitations regarding available resources, such as materials and teachers. Moreover, the considerable geographical distance exacerbates their isolation. Whether it involves museum visits, theater events, or any educational program, meticulous preparation is necessary, often requiring students to travel to the mainland with significant obstacles. In short, the geographical location of these islands presents significant challenges to education.

In 2023, a team of researchers from various institutions and disciplines collaborated to co-develop an education-focused project (RESPIRE) for the islands of Pantelleria and Lampedusa. The RESPIRE project aimed to engage experts on the islands to develop initiatives that could inspire the younger generation. Likewise, it provided students with opportunities to explore their islands through diverse research activities encompassing marine biology, botany, geology, and archaeology. The present contribution specifically highlights preliminary results from the archaeological aspect of the project.

The archaeological investigation of the RESPIRE focused on the Anthropocene heritage of Lampedusa island through plastic objects studied on selected beaches. The objective was to analyze these objects using archaeological methods to understand their origins, chronological, and social significance. Importantly, during the first field season a group of high school students actively participated in this contemporary archaeological research alongside the authors of this paper, showcasing how archaeology can effectively contribute to shaping education programs in remote areas.

All in all, this paper wants to underscore the meaningful involvement of high school students in archaeological research and highlights the potential impact of archaeology on education initiatives in remote locations.

5 EDUCATIONAL AND OUTREACH PROGRAMS IN THE ATHENIAN AGORA

Viktoratou, Io (Steinmetz Family Foundation Fellow, the American School of Classical Studies at Athens)

The American School of Classical Studies at Athens (ASCSA) employs various methods to engage the public with archaeology, ranging from educational initiatives to outreach programs. This paper examines the evolution of educational programs in the Athenian Agora initiated by the ASCSA and under the auspices of the Ephorate of Antiquities of Athens, focusing on their role in making archaeology accessible to society.

The Agora, located in the city center of modern Athens, and the second most visited archaeological site in Greece, has for the first time educational and outreach programs for the local community. Emphasizing the significance of engaging local people of all ages residing near the archaeological site, the paper explores methods for initiating and maintaining public support, including the provision of online accessible materials, such as open access to artifacts from the Agora. It demonstrates how archaeological datasets are utilized for educational purposes, fostering learning, storytelling, and enjoyment in contemporary society. Moreover, the paper highlights the role of educational programs based on the Athenian Agora archaeological material in fostering a sense of ownership and involvement among the community in heritage management.

Central to these efforts is the development of educational programs tailored to the educational Systems of the various countries involved. The aim is to create programs with compelling central themes, incorporating materials relevant to interests of the participants. Preliminary findings from evaluation forms bring to the fore the educational themes that resonate with children and teenagers, informing the design of future educational materials. The ASCSA aims to enhance engagement and learning outcomes in archaeological education initiatives.

6 ABRISKETA: A PUBLIC BENEFIT ENCOURING ARCHAEOLOGICAL PROJECT

Campos-Lopez, Teresa (University of the Basque Country (UPV/EHU)) - Fernández Carvajal, José Ángel (Ondare Babesa) - Elorza, Lorena (Ondare Babesa) - González, Aitziber (Ondare Babesa) - Valle, Amaia (Ondare Babesa) - Ortega, Ander (Ondare Babesa)

Abrisketako Done Peri/San Pedro de Abrisketa is an initiative aimed at researching and preserving the historical and cultural heritage of Arrigorriaga, locality located in the Basque Country, Spain. Specifically, it involves enhancing the value of a medieval church through archaeological research, dissemination, and education, in an initiative developed by the community, with institutional, corporate, and participation of the Academia.

This element has been of archaeological interest due to its historical and architectural significance. However, scientific approaches to it had not been undertaken until now. In fact, it has always been surrounded by a halo of mystery due to its historical importance and its location in a privileged natural and geographical area.

Thanks to this project, led by a local association, various archaeological research and interventions have begun, yielding interesting results. Alongside this, efforts in socialization, dissemination are being developed, involving work in school, high school, and engagement with different audiences. This has resulted in an unexpected social response and has led the local people to connect with their heritage -elements they had previously overlooked-, thinking they lacked any heritage of interest.

The future presents numerous challenges: the element lacks legal protection, owned by a company, and with great value to the community. In this regard, opportunities and challenges will test the capacity of archaeology to work for the benefit of this community, generating networks, social cohesion around the project and local heritage. The aim is also to improve the necessary legislative changes for its conservation, promote strategies to be a driving force in the development and advancement of the locality, favour the reduction of tensions among stakeholders. However, the goal remains to develop strategies for disseminating awareness regarding the societal benefits of archaeology, with the aim of sparking interest in archaeological pursuits and offering valuable perspectives for policymaking.

7 CULTIVATING SUSTAINABLE CHANGE: ARCHAEOLOGICAL IMPACTS AND BENEFITS IN RECENT PROJECTS BY THE UNIVERSITY OF OVIEDO AND LA PONTE-ECOMUSEM

Garcia, Victor (University of Oviedo) - Cerra Gonzalez, Lucia (University of Oviedo) - Fernandez, Jesus (University of Oviedo)

This paper provides an overview of some projects recently carried out by the University of Oviedo and La Ponte-Ecomusem in Asturias, Spain, focusing on their public benefits. This initiative is characterized by combining a scientific approach to its work with significant community engagement. This connection is established by designing research programs that encompass both fundamental research, conducted through archaeological excavations, and applied research, delivering evident public benefits. A representative project in this line is “Escandalera, which focuses on recovering cultivable seed varieties of the same species unearthed in archaeological sites. Today, these varieties are nearly lost due to the industrialization of production processes. How have we achieved this? Firstly, through fundamental research, via archaeological excavations in medieval sites and thorough studies in environmental archaeology, we identified the varieties cultivated in the region during the Middle Ages, approximately 800 years ago. Secondly, this knowledge has been employed to search for current varieties through ethnographic work. They are then reproduced using agro-ecological techniques through experimental cultivation. Finally, as a result, the ecomuseum will establish a free public seed bank of high ecological value, suitable for local and quality production processes. This aligns with the objectives of the 2030 Agenda, emphasizing its contribution to the development of sustainable agriculture and biodiversity. Thus, it underscores the crucial role of archaeology in generating tangible and significant benefits for society. By rescuing and preserving historical seeds, it not only contributes to the conservation of genetic diversity but also promotes sustainable agricultural and economic practices. This innovative approach, surpassing the traditional boundaries of archaeological research, demonstrates how archaeology can have a direct impact on improving the quality of life and well-being of the community, solidifying its position as a relevant discipline committed to the present and the future.

8 ARCHAEOLOGY, PLACE AND WELLBEING – JOINING THE DOTS CONNECTING PUBLIC PARTICIPATION IN ARCHAEOLOGY AND WELLBEING IN INDIVIDUALS AND COMMUNITIES

Lewis, Carena (University of Lincoln) - van Londen, Heleen (University of Amsterdam) - Marciniak, Arek (University of Poznan) - Vareka, Pavel (University of West Bohemia) - Verspay, Johan (University of Amsterdam)

Evidence for the impact of public participation in archaeology on personal wellbeing has become increasingly widely apparent in places where public participation is possible. This includes the UK, where there are few restrictions on who can take part in archaeology, and more recently other countries where access has previously been more restricted, including the Netherlands, Czech Republic, Poland and Germany, where researchers have instigated participatory programmes specifically in order to investigate the impact on wellbeing. However, while there is a growing body of literature showing the positive psychological impacts on individuals, other aspects remain less well understood, including the reasons why archaeology specifically confers the benefits it does, and the impact on community as well as personal wellbeing.

This paper will explore the role of place in increasing wellbeing at individual and community levels by reviewing data from projects in which members of the public in four European countries took part in archaeological excavations seeking evidence for the pre-modern development of the rural villages where they lived. Across Europe, millions of people live in (or have connections with) rural communities, whose archaeology and heritage are often overlooked, overshadowed by more conventional ‘authorised’ heritage of ‘the great and the good’ or in towns and cities.

We will review qualitative data from feedback surveys in order to explore the impact of participation on respondents’ attitudes to place and consider the likely impact of this on personal wellbeing. We will also review quantitative data from a recently published experimental psychology survey into the same activity in order to consider how this activity increases community wellbeing.

923 METALS AND METALWORKING I: COMPOSITIONS AND ORIGIN

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Noergaard, Heide (Moesgaard Museum, Department of Archaeology) - Wärmländer, Sebastian (Stockholm University, Department of Archaeology and Classical Studies) - Neiß, Michael (Lund University, Department of Archaeology and Ancient History) - Kmošek, Matěj (Institute of Archaeology of the Czech Academy of Sciences, Brno) - Saage, Ragnar (University of Tartu)

Session format: Regular session

Archaeometallurgy is a multidisciplinary field where researchers with different expertise and different traditions come together to answer questions related to ancient metals and metalcraft. Most research in this field is based on metallurgical analyses, but studies that involve typological seriation, experimental archaeology, or material provenancing are also common. For this session, we welcome full-length papers that investigate metal compositions and metal origins in a very broad sense. Measurements of trace element compositions or isotope compositions are often used to estimate the geographic origins of metals and metal ores. However, origins can also be determined with other methods, such as visual analyses focusing on certain techniques and styles. We also encourage presenting papers addressing artefact origin in a more traditional archaeological way to foster discussion among the participants. Analyses of bulk elements remain important and are often conducted with pXRF instruments on large samples such as coin hoards or collections of copper-alloy objects. In such studies, big data statistical methods can be useful, and their presentation within this session is especially welcome. Ideally, the papers should connect with the EAA meeting theme “Persisting with change”, but this is not an absolute demand. We welcome contributions from all geographic regions and time periods and encourage students and young researchers to present their ongoing research projects.

ABSTRACTS

1 NORTHERN NEOLITHIC COPPER: SOURCES AND CONNECTIONS

Gebauer, Anne Birgitte (Independent researcher)

Southern Scandinavia is exceptionally rich in copper artefacts from the Early Neolithic period of the Funnel Beaker culture, dating to 4000–3300 BC. Copper artefacts were brought here in such large quantities that, in terms of weight, the quantity of metal far exceeds the amount found in the Alpine region and the areas between Scandinavia and the Alps. Evidence in the form of a holding crucible and a possible tuyère from Lønt and the deliberate fracture of a flat axe from Neunkirchen has shown that metallurgy was mastered and practised in the north during the Neolithic. The importance of copper artefacts on the Northern European Plain and in Southern Scandinavia, and their origins have been intensively discussed for decades not the least because local copper deposits were not exploited during the Neolithic or Bronze Age, so that any raw material would have to have been imported. Recently details of the source of the raw material for Early Neolithic copper artefacts from the north have been reassessed and point to Southeast Europe rather than the Alpine area as region of origin. This paper reviews the new information on the origin of the early Neolithic copper, the innovation of copper pyrotechnical processing, and the consequences for the involvement of the north in the reconstructed copper-based, pan-European network of raw material exchanges.

2 PROJECT UŠKIANI: THE IMPORTANCE OF ARMENIAN GOLD FOR BRONZE AGE CAUCASIA

Kunze, Rene (Seminar for Oriental Archaeology and Art History, Martin-Luther-University Halle-Wittenberg) - Bobokhyan, Arsen (Institute for Archaeology and Ethnography, National Academy of Sciences of the Republic of Armenia, Yerevan) - Meliksetian, Khachatur (Institute for Geological Sciences, National Academy of Sciences of the Republic of Armenia, Yerevan)

The Gegharkunik region, on the south-eastern edge of Lake Sevan (Armenia), is a part of the southern Caucasus uniquely suited to demonstrating the intensive interaction between prehistoric settlement and gold mining. Initial approaches have revealed outlines of prehistoric settlement patterns, which can be related to contemporary gold mining in a clearly delineated natural corridor along this supra-regional communication and trade route. The spatial distribution of placer gold and its quantity suggest that prehistoric gold extraction was possible from the sediments of the rivers in the study area. The presence of placer gold in several local rivers, as well as ancient mining traces, has already been demonstrated. The gold deposits can be clearly distinguished from other South Caucasian gold deposits on the basis of their major and trace element concentrations. More than 80 gold objects from various recent exca-

vations and museums have been geochemically analysed. Conclusions can be drawn about the possible origin of the Bronze Age gold from Armenia, together with the geochemistry of natural gold in the area.

The presentation will give an overview of the results of a joint Armenian-German project in Eastern Armenia with a special focus on gold analysis using laser ablation ICP mass spectrometry.

3 THE TRAPEZOID BLADE CONNECTION: GIVING SHAPE TO THE NORDIC BRONZE AGE AND ITS CONNECTIVITY THROUGH A MULTI-PROXY APPROACH

Cornelis, Bart (Curt-Engelhorn-Zentrum Archäometrie) - Wittke, Andreas (Curt-Engelhorn-Zentrum Archäometrie) - Berger, Daniel (Curt-Engelhorn-Zentrum Archäometrie)

The Nordic Bronze Age period Ib (1600-1500 BC) is regarded as the breakthrough of bronze metallurgy in Northern Europe based on a boom in metal supply and the appearance of bronzes in regional styles. This encompasses the Sögel-Wohlde metalwork as well as styles belonging to Fårdrup and Valsømagle. The majority of these styles are influenced by metalwork from the Carpathian basin by incorporating decorative motifs belonging to Hajdúsámson-Apa style. The blades of type Sögel are a prime example. However, type Wohlde blades are an exception, as they tend to be slender variants with trapezoidal hilt plates often lacking decorations. As a result, their sphere of influence is ascribed to the northern Alpine region or the adjacent foothills, where multiple types of trapezoidal hilt plate blades have been identified. However, the relationship between the Nordic and Alpine types remains unexplored.

The research project "Origin, development and technology of the Sögel-Wohlde-Kreis" attempts to disentangle the relationships between these blade types by determining the chemical composition and lead isotope ratios, as well as tin and copper isotope values of ca. 100 trapezoidal blades. The use of multi-proxy data lies at the forefront to check for possible correlations between artefacts by applying statistical methods and mathematical models. The aim is to identify the potential origins of raw materials, relationships between blades as well as metal groups and mixtures of copper types or bronze batches. Results of the chemical and lead isotope analysis show that the Wohlde blades have been made of low-impurity chalcopyrite copper mainly from the Alpine Mitterberg and the Slovakian Ore Mountains, yet sources from Great Orme and the southern Alps are also represented. The question whether the Nordic Wohlde blades are archaeometrically related to their northern Alpine equivalents, and show significant correlations, will be presented based on future data.

4 REVISITING THE BRONZE ARTIFACTS EXCAVATED BY THE FRENCH EXPEDITION AT ENKOMI

Grabar, Edi (Department of History and Archaeology, University of Cyprus) - Pappasavvas, George (Department of History and Archaeology, University of Cyprus) - Charalambous, Andreas (Department of History and Archaeology, University of Cyprus)

The French expedition, led by Claude Frédéric-Armand Schaeffer, excavated at the site of Enkomi in Cyprus during the middle part of the 20th century, from 1934/1946 until 1970. Furthermore, the French continued the excavations until 1973, under the leadership of O. Pelon. Even though several of the many bronze artifacts from these excavations have been published, numerous other examples were not studied and remained unpublished. The repertoire of the Late Bronze Age bronze finds in Enkomi is vast, including numerous types of tools (axes, adzes, chisels, awls, drills, knives, sickles, and shovels), weapons (swords, spearheads, daggers, and arrowheads), vessels (mainly hemispherical bowls and other vessel types), objects of personal use (spiral rings, bracelets, pins, fibulas, mirrors, tweezers, and razors), statuettes, and even ingot finds. There is an additional problem in this situation that the excavation records do not preserve sufficient information on their contexts. This is why the revision of these bronzes, stored in the Cyprus Museum in Nicosia, including detailed interpretations, measurements, and metal analyses of well-preserved specimens, will largely contribute to the interpretation and reconstruction of the social and cultural environment of Enkomi and Cyprus in general. To reach the best possible and most reliable outcome, it is important to include and combine traditional methods and available typologies, together with more recent methodological and scientific approaches, in the study of archaeological material. With the introduction of X-ray fluorescence analysis in this research (pXRF), it will be possible to obtain crucial data on the elemental composition of the bronze artifacts and the provenances of the raw materials, which will provide new insights into metalworking activities and achievements.

5 FROM CYPRUS TO SWITZERLAND? ANALYTICAL EVIDENCE FOR CYPRIOT AND ALPINE COPPER IN THE MIDDLE BRONZE AGE SETTLEMENT OF MÖRIKEN

Berger, Daniel (Curt-Engelhorn-Zentrum Archäometrie Mannheim) - Höpfer, Benjamin (Archaeological Service, Canton Aargau) - Maise, Christian (Archaeological Service, Canton Aargau)

Alpine deposits have long been taken into consideration for the copper supply of Switzerland during the Bronze Age. Notable among these are the mineralisations in the Val d'Anniviers in the western Alps (Valais), the Oberhalbstein area in the central Alps (Grisons), and the renowned mining districts of the Mitterberg area in the eastern Alps (Salzburger Land). However, the precise roles and interconnections of these potential sources remain largely elu-

sive, particularly concerning the Middle Bronze Age, for which obtaining viable metal samples presents considerable challenges. A remarkable opportunity arose with the rescue excavations in Möriken-Wildeggen carried out by the Swiss Archaeological Service of the Canton of Aargau during 2021 and 2022. These excavations unearthed not only the well-preserved remains of a Middle Bronze Age settlement dating to around 1400 BC but also a substantial quantity of metal finds. Besides several finished products, the Möriken assemblage also contains pieces of raw materials. Seven fragments of copper ingots or casting cakes along with one fragment of a bronze sickle were analysed for their chemical, lead and copper isotope composition, which yielded unexpected results. In addition to copper from the Mitterberg district and the South Alpine deposits in Alto Adige, Trentino and Veneto, several pieces of raw material displayed distinct signatures associated with Cypriot copper mines (Apliki mine) reminiscent of oxide ingots. This latter result holds significant importance, notably because evidence for copper from Cyprus in the region north of the Alps is exceptionally rare. It underscores a broader distribution of copper from the island than previously acknowledged, and shows its use and processing in small rural settlements around 1400 BC in Switzerland and potentially beyond.

6 VIKSØ HELMETS REVISITED: LOCALLY MADE OR IMPORTED FROM THE SOUTH?

Noergaard, Heide (Moesgaard Museum, Department of Archaeology)

It is true, the Vikings did not wear horned helmets! But did the Bronze Age people wear them? Science has recently confirmed what Bronze Age archaeologists have always known: the two horned helmets from Viksø in Denmark were made and used in the Late Bronze Age, more specifically before 857-907 BC. We know many contemporary parallels from figurative art, where horned helmets adorn a warrior's head. In addition, over the last 20 years, we have acquired new knowledge about Bronze Age armour so that we can now create not only stylistic but also technical typologies. A technical comparison between the known helmet types and the artefacts from Viksø will shed light on the question of whether the helmets from Viksø should be considered the insignia of a true warrior. The results of an ongoing project will be presented that aims to clarify whether these helmets were local Danish products or imports from the expanding Hallstatt culture. The interplay between a technical analysis, identifying local technical knowledge, and the comparison of archaeometallurgical data from the helmets, local artefacts and Late Bronze Age workshop signatures will give a state-of-the-art answer to the question of local or foreign.

7 INVESTIGATIONS INTO THE DISTRIBUTION NETWORK OF RAW AND WORKED COPPER(-ALLOYS) DURING THE FIRST AND SECOND IRON AGE

Schmidt, Jonathan (Goethe-Universität Frankfurt)

The transition from the Bronze to the Iron Age in Europe marks a significant shift in material culture, usually associated with the collapse of long-distance trade networks and central fortified hilltop settlements. Despite the emergence of iron as the primary material, copper-alloys continued to play a crucial role in crafting personal ornaments and other artifacts during the Iron Age. Especially from the late Hallstatt period onwards, a period of remarkable craftsmanship with a need for high quality copper(-alloys) is evident.

While the prevailing assumption has long been that scrap metal recycling was the sole source of raw material during this era, recent evidence suggests the presence of Iron Age copper mining sites, such as those in Oberhalbstein (Graubünden, Switzerland). This research aims to analyze previously unpublished analytical data alongside existing chemical analyses of Iron Age artifacts from various regions, including France, Germany, the Czech Republic, and northern Italy. Utilizing multivariate statistics, I seek to characterize the raw materials used at selected sites.

By combining these distributions with differentiated typological and technological analyses, this research tries to discern patterns that may reveal workshop circles and craft traditions. Through a nuanced understanding of distribution networks of both raw materials and finished bronze objects, the aim is to contextualize their cultural and historic significance during the first millennium BCE.

8 INTEGRATED ARCHAOMETRIC INVESTIGATION OF CELTIC BIPYRAMIDAL INGOTS FROM THE SCHIFFERSTADT DEPOT (SOUTHWESTERN GERMANY): PROVENANCE, TECHNOLOGY AND AGE DETERMINATION

Stepanov, Ivan (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Brauns, Michael (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Wintel, Johannes (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Friedrich, Ronny (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Marquart, Markus (Museen der Stadt Aschaffenburg, Aschaffenburg)

Celtic bipyramidal ingots are common finds in northeastern France, Switzerland, and southern Germany, providing evidence of iron trade carried out via river routes during the 9th-4th c. BCE. Since these ingots were mostly found without associated artifacts, information about their archaeological context can be reconstructed only through typological analysis, ¹⁴C dating, and provenance analysis. Such an integrated archaeometric approach was applied to

a depot of 20 ingots discovered in Schifferstadt (4 km from the Rhine bank). All ingots are typologically similar and can be identified as type BLS 4 (Berranger 2014). Metallographic analysis reveals that all Schifferstadt ingots, except one (No. 16), are composed of phosphoric iron. Carburized areas were found only in three ingots, where they showed heterogeneous distribution, indicating against deliberate use of steel. The investigation of trace element composition of slag inclusion (LA ICP-MS), metal matrices (ICP-MS), and Os isotopic analyses (NTIMS) generated consistent results, indicating a common origin of all ingots except No. 16. The average Os isotopic composition ($^{187}\text{Os}/^{188}\text{Os}$) of most of the ingots is 0.68, whereas ingot No. 16 has a less radiogenic isotopic signature (0.36).

As no Celtic iron workshops are known near Schifferstadt, and all, except one, analyzed ingots have the same provenance, they were likely produced in the same workshop, which closely cooperated with at least one major and one supplementary supplier of ores/blooms. The workshop must have subsequently sold the batch of ingots to a trader who shipped them down the Rhine. However, apart from the main ore source exploited near the workshop, other deposits were probably also used, as suggested by the presence in the depot of outlier No. 16. The ongoing research on bipyramidal ingots from Germany will allow to better understand the organization of iron trade during the Iron Age.

9 PROVENANCE STUDY ON BRONZE COINS MINTED AT VELIA, ITALY: THE ISSUES ZEUS/OWL AND ATHENA/OWL

Ercoles, Isabella (Dip. Scienze della Terra, Università La Sapienza di Roma, Piazzale A. Moro 5, 00185, Rome (RM), Italy; CHNet, rete per i beni culturali dell'Istituto Nazionale Fisica Nucleare (INFN), Laboratorio Nazionale del Gran Sasso (LNGS), Via G. Acitelli 22, 67100, Assergi (AQ), Italy) - **Castorina, Francesca** (IGAG, Istituto di Geologia Ambientale e Geoingegneria del CNR, Sezione di Roma "La Sapienza", 00185 Rome (RM), Italy; Dip. Scienze della Terra, Università La Sapienza di Roma, Piazzale A. Moro 5, 00185, Rome (RM), Italy) - **Nisi, Stefano** (CHNet, rete per i beni culturali dell'Istituto Nazionale Fisica Nucleare (INFN), Laboratorio Nazionale del Gran Sasso (LNGS), Via G. Acitelli 22, 67100, Assergi (AQ), Italy) - **Carbone, Federico** (Università degli Studi di Salerno, DISPAC, Via G. Paolo II 132, 84084, Fisciano (SA)) - **Trincherini, Pier Renato** (LIMS, LNGS-INFN, Via G. Acitelli 22, 67100, Assergi (AQ))

The project concerns a study on the geographic origin of 65 bronze coins depicting Zeus/owl and Athena/owl, dating back to the 3rd century BC ca., and coming from the Greek colony of Elea/Velia, in Southern Italy. The coins are part of a broader project of research promoted by the University of Salerno. The chemical elemental compositions and the Lead isotope analyses were carried out at the CHNet (Cultural Heritage Network) department of the Laboratori Nazionali del Gran Sasso-INFN by using ICP-MS (Inductively Coupled Plasma Mass Spectrometry) and TIMS (Thermal Ionization Mass Spectrometry) techniques. The primary goals of this study involve discerning a reliable metal provenance for the examined coin samples and investigating the geochemistry of the mining districts. Lead isotope ratios were compared with those from several ore deposits of the main Mediterranean areas (Spain, Italy, Greece, and Cyprus) to fingerprint the sources of the investigated coins. Most of the coins obtain a certain source, overlapping clusters belonging to Greece, Attica (Laurion mines) and Aegean areas (Cyclades islands of Siros, Kea, Antiparos, Serifos and Sifnos). Some coins match with Spain South-East, in particular Cartagena-Mazarron and Almeria areas. Furthermore, a small portion of the coins exhibits uncertain provenance, suggesting the possibility of metal recycling. The provided information aids in reconstructing the trade routes for the supply of metal and understanding the socio-economic relationships of Velia and the role played by low-value coins at Velia.

10 COMPOSITION OF GOLD OF THE JEWELLERY OF THE NORTH PONTIC AREA (7TH CENTURY BC - 2ND CENTURY AD)

Velychko, Yevheniia (National Museum of the History of Ukraine)

Jewellery from Scythian burial mounds of the forest-steppe and steppe zones (dated 7th - 4th centuries BC), from Sarmatian burials of the steppe zone (dated 2nd century BC - 2nd century AD) and Greek cities (dated 1-2 centuries AD) from the collection of the Treasury of the National Museum of the History of Ukraine (former the Museum of the Historical Treasures of Ukraine) have been examined. The metal composition was determined using non-destructive X-ray fluorescence analysis (XRF). These are preliminary interim results as this work has been suspended due to the current military situation in Ukraine.

The general results demonstrate that the metal of jewellery of the Sarmatian period generally has a higher gold content (about 75 - 90%) than in the previous Scythian era (about 50 - 80 %). However, decorations from royal Scythian tumuluses are distinguished by a high gold content (more than 90%).

The main components of the alloy in all studied varieties are gold, silver and copper. Other elements that are most characteristic of gold alloys are platinum and cadmium. The cadmium concentration ranges from 0.07 to 3.7%; the platinum concentration ranges from 0.8 to 8.2%; platinum is more common in gold jewellery of 1-2 centuries. Iron is fixed often. For alloying, additives of copper, nickel, and tin were used, which increased the wear resistance of products. A higher concentration of tin was observed in the solder areas.

As for the use of gold for different elements of the same object, in most cases, the metal of the same composition was used. Only in some cases, there is a discrepancy in the composition of the metal, particularly for the manufacture of loops and twisted wire.

The results of this research will help determine the origin of the metal in the future.

11 TO SAMPLE A COUNTRY: IRON PROVENANCING STRATEGY IN ESTONIA

Saage, Ragnar (University of Tartu)

The aim of the project fundamental research for iron provenancing in Estonia (RAUR) is to establish the conditions for the provenance analysis of iron. This is a highly significant question, as iron was the only metal produced locally in Estonia during prehistory and medieval times.

In 2023, it was demonstrated that it is possible to investigate the origin of iron in Estonia using slag analysis (combined SEM-EDS and LA-ICP-MS approach), but this study only covered some of the iron smelting sites in Estonia. To enable comprehensive research across the entire country, it is necessary to sample and analyze the remaining unexplored iron-smelting locations.

Provenance analysis through chemical composition will allow us to associate finished objects with known iron-smelting sites throughout Estonia, providing answers to whether the iron used was local or imported. More broadly, scientists will have the opportunity to address entirely new research questions that significantly enhance our understanding of past craftsmanship, trade, and culture.

This paper covers the first stage of this project and answers quite an ambitious question – how to sample an entire country. Hence I will explore the decisions of sampling in archaeological collections and during fieldwork.

12 ROMAN OR RENAISSANCE? A METALLURGICAL INVESTIGATION OF A FOLDING KNIFE WITH A PUZZLING ICONOGRAPHY

Søndergaard, Louise (Museum Skanderborg)

The popularity of metal detectors in Denmark results in new types of find on a regular basis. One such find was a complete example of a folding knife. The knife consists of two copper-alloy side plates riveted together around a rusty iron blade. The figural handle had an enigmatic standing figure, that no one could identify with certainty.

The opinions were split: Renaissance or Roman? The knife type seemed Roman, but despite a thorough search in articles, exhibitions, collection catalogues and numerous e-mail requests around all of Europe, not a single parallel to this motive had been found in a Roman context.

Suddenly a new fragment of a similar knife was found by a Danish metal detectorist, and as this one actually looked almost recent, it felt safe to expose it to metallurgical investigations. Multiple chemical as well as lead-isotope analysis were performed on the fragmented side plate and on an in-situ rivet to clarify its composition and possible provenance. The analysis confirmed it to be a high zinc brass that is highly comparable and consistent with published chemical and isotopic data from Roman brasses, especially Early Roman brass analyses. But does this make it bullet proof Roman?

924 ROADS, PASSES AND VALLEYS ? RECENT DISCOVERIES AND PERSPECTIVES IN CAUCASUS ARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Eloshvili, Mariam (ILIA STATE UNIVERSITY; Society of Young Archaeologists) - Chilingarashvili, Gia (Tbilisi State University; Georgian National Museum) - Rahimi, Maryam (Tehran University)

Session format: Regular session

The Caucasus is one of the attractive regions for archaeological investigations. Despite 100 years of research, many questions remain unanswered. It is important to understand the Caucasus with surrounding areas and create a unified perspective of the past.

The session is intended for researchers of Caucasian Neolithic, Chalcolithic, EBA archaeology, we want to get acquainted with discoveries and new studies, rethinking and understanding previous studies and attempt to introduce modern technologies and methodologies in archaeological research of the three very important periods of human history.

- Migration and Mobility - (What was the purpose and means of the migrations, and what were the results of the mobility?);

- Trade and exchange - (What kind of raw materials or products could Caucasus offer to neighbour regions and how did the interest and need change over time?);

- Chaîne opératoire - (Material production techniques, technology and path taken from raw material to waste)
- Ecology, environment, landscape - (How does man use the diverse nature of the Caucasus?);
- Household - (Perception of the house in different archaeological cultures of the Caucasus?);
- Bioarchaeology - (Abstracts related to zooarchaeology, palynology, palaeobotany, and human remains can be submitted in this thread);

The topics selected for the session are universal, and researchers will be able to present their studies on the chosen topics listed above. Through the session, we will once again be able to hold a broad discussion about the Neolithic, Chalcolithic, and EBA of Caucasus Archaeology. By incorporating a wide range of multidisciplinary methods (technology, bioarchaeology, archaeology), archaeological evidence (ceramic, bone and lithic productions, human, faunal and floral remains etc), archaeological and ethnological approaches, this season will further explore the socio-economic and cultural aspects of past societies.

ABSTRACTS

1 FIRST RESULTS OF NEW JOINT INVESTIGATIONS AT GARDABANI KURGAN FIELD

Rova, Elena (Ca' Foscari University of Venice) - Eloshvili, Mariam (Ilia State University, Tbilisi)

In 2023, a new joint project of Ca' Foscari University of Venice in collaboration with Ilia University of Tbilisi was launched in the Gardabani district of Southern Georgia. Its first aim is the investigation of a large barrow field located on a small plateau north of the present border with Azerbaijan, close to the village of Lemshveniera, in an until recently archaeologically nearly unknown region. A preliminary field season (autumn 2023) was dedicated to a pedestrian survey of the whole site and to the production of a photogrammetric plan and DEM of the whole area and of detailed plans of all the visible kurgans (which are more than 60 in number). This allowed to understand the general layout of the cemetery and the distribution of the funerary installations (kurgans and possible auxiliary features), to evaluate their general state of preservation, which seems to be rather good, possible date(s) etc. The paper will discuss the results of the preliminary season and the multidisciplinary strategy planned for the investigation of this important site, and integrate them with the results of the first excavation season (planned for June/July 2024), which will be dedicated to a geomagnetic prospection of the cemetery and to the excavation of two or three barrows.

2 BUILDINGS FROM THE KURA-ARAXES HEARTLAND: REGIONAL BUILDINGS WITH A COMMON TRADITION?

Claut, Sebastiano (Università Ca' Foscari Venezia)

The paper will present the results of the study of ca 250 buildings from 47 sites in the Kura-Araxes heartland. It is based on data concerning building materials, techniques, size and plan types collected from a bibliographical survey. It is common knowledge that Kura-Araxes architecture is characterised by a strong formal heterogeneity, due to the use of simple but very different building materials, as well as the adoption of a great variety of planimetric forms. Buildings almost invariably appear as simple mono- or bi-cellular structures and do not show any clear element suggesting social or functional differentiation. The study tries to map the distribution and mutual associations of the different aspects mentioned above in order to highlight possible regional features and/or chronological developments. Based on the results, at least six different geographical areas can be tentatively distinguished: the Middle-Kura valley; the Armenian-Georgian plateau; the Kvemo Kartli region; the Middle-Araxes valley; North-western Iran and North-eastern Anatolia.

3 FIGURING OUT KURA-ARAXES CLAY FIGURINES

Saribekyan, Mariam (Institute of Archaeology and Ethnography NAS RA; History Museum of Armenia)

During the emergence and expansion of the Kura-Araxes tradition in the South Caucasus, there was a notable advancement in architectural solutions and economic practices. This period also witnessed significant progress in pottery craftsmanship, leading to the creation of diverse clay objects, as well as the appearance of zoomorphic and anthropomorphic figurines in various cultural sites of this era.

The practice of crafting clay figurines began in the Neolithic period, but during this era, anthropomorphic figurines were more prevalent and they are mostly mentioned in the territory of nowadays Turkey, Levant, Turkmenistan. Later, in the Chalcolithic period Narimanov mentions 2 anthropomorphic statuettes in Shomutepe, 21 more figurines in Khramis Didi-Gora, and several anthropomorphic statuettes in Arukhlō. R. Torosyan notes 1 bear-shaped statuette in Teghut. While some of these sites have been extensively investigated, most of the objects excavated especially from the Early Bronze Age site of Harich, which has the largest collection of figurines(347), did not receive the attention of researchers post-excavation and remained unstudied and unpublished for many years. Since 2020, efforts have

been underway to initiate a fresh examination, digitization, and publication of the archaeological artifacts from this monument driven by the recognition that the archaeological material.

The vast majority of figurines represent cattle statuettes, predominantly bulls, rams, and sheep, characterized by highly detailed features. They are crafted from the same type of clay, and exhibit a similar firing technique, using fine-grained clay, occasionally mixed with sand or plant residues.

Later, during the transition to the Late Bronze-Early Iron ages, the earlier small-sized clay figurines crafted with rudimentary techniques gave way to bronze miniatures. These figurines provide valuable insights into the lifestyle and beliefs of the people of that era and studying the technology of their making and distribution serve as a resource for unraveling the Kura-Araxes tradition.

4 TECHNOLOGICAL PRACTICE OF THE LEYLATEPE COMMUNITIES: GROUND STONE TOOLS FROM THE LATE CHALCOLITHIC SETTLEMENTS OF THE KURA RIVER BASIN

Hruby, Karolina (Postdoc Fellow of the Minerva Stiftung, Eurasia Department, German Archaeological Institute, Im Dol 2-6, Haus II, 14195 Berlin, Germany) - Iserlis, Mark (Eurasia Department, German Archaeological Institute, Im Dol 2-6, Haus II, 14195 Berlin, Germany) - Almamedov, Khagani (Institute of Archaeology, Ethnography and Anthropology of the Azerbaijan National Academy of Science, H. Javid pr. 115, AZ1073, Baku, Azerbaijan) - Jalabadze, Mindia (Georgian National Museum, 3 Shota Rustaveli Ave, 0105, Tbilisi, Georgia)

The Late Chalcolithic (c. 4,000-3,500 BC) and the emergence of the Leylatepe phenomenon are turning points for the development of social differentiation, specialized craft industries, and interregional product exchange within the southern Caucasus and south-western Asia in general. The Leylatepe settlements emerged in the diverse landscape of the southern Caucasus with a set of attributes with Upper Mesopotamian associations: architecture, pottery, copper objects, and burial traditions – all very different in nature from earlier Caucasian traditions. And yet, the preliminary evidence from recent excavations in the Karabakh Steppe (Azerbaijan) attests to complex diachronic and site-to-site dynamics within the phenomenon, which stands in contrast to the traditional view of Leylatepe communities as a homogenous migrant population.

A deeper understanding of the phenomenon has been hampered by a shortage of reliable fieldwork data and publications. Preliminary research has been done so far only on pottery and metals from selected Leylatepe sites. This paper summarizes the early results of our research on ground stone tool collections from the Leylatepe sites in the Karabakh Steppe and up the Kura River: Leylatepe, Janavartepe, Sarijali 2 (Azerbaijan) and Berikldeebi (Georgia). Ground stone tools were typically used by the late prehistoric communities to perform a variety of mundane subsistence tasks as well as in specialized crafts developed during the Late Chalcolithic. However, during the 20th-century excavations, they were often omitted or discarded, which led to the paucity of data and collections. The project brings together unpublished material from recent and past excavations to identify technological and raw material choices and patterns of use of Leylatepe ground stone tools. Assessing material from various habitation phases of settlements developing in different environmental settings enhances our understanding of the internal dynamics of the Leylatepe communities and sheds light on their resource management strategies and technological habitus.

5 IRMIS RKA SETTLEMENT: THE FRONTIER SITE OF THE KURA-ARAXES CULTURE: LOCAL TRADITIONS AND REGIONAL NETWORKS

Chilingarashvili, Gia (Georgian National Museum; Tbilisi State University)

The Irmis Rka settlement is situated in South Georgia, within the Samtskhe Javakheti province, near the Turkish border. Positioned atop a natural mountain, with a panoramic view, the site controls the hinterlands and main valleys of the area. Geographically, its strategic location supported the long-term existence of the settlement. It is a multi-layered site that encompasses all stages of the Bronze Age. Currently, based on the preliminary results, the earliest occupation corresponds to the Kura-Araxes culture, which is the most extensively reflected in the settlement. Within the cultural layers and secure contexts of this period, a variety of artifacts have been found that bear strongly developed local signs. Furthermore, there are materials and features that provide evidence of regional networks during this time. A notable example, aside from pottery, is the discovery of a clay hearth with inner projections, which represents the first finding outside of the Shida Kartli region in Georgia.

6 SHAPING LIEUX DE MÉMOIRE IN THE SOUTHERN CAUCASUS: A COMPARATIVE ANALYSIS ON THE KURGAN FROM EASTERN GEORGIA AND WESTERN AZERBAIJAN

Fiori, Stefania (ROOTS Exzellenzcluster; Institut fuer Ur- und Fruehgeschichte Kiel)

During the late fifth millennium BCE, significant socio-cultural transformations occurred in the Southern Caucasus, marked by the increased utilization of metallurgy and the emergence of specialized practices (Sagona 2017). These developments were notably reflected in funerary customs, particularly the tradition of burying the deceased within

burial mounds, known as kurgans, which became widespread throughout the Southern Caucasus. This tradition, spanning from the Late Chalcolithic period (4000 BC) to the Iron Age (1000 BC), persisted for almost three millennia, shaping the region's landscape as enduring lieux de mémoire. Various factors may underlie the location of kurgans, including proximity to natural features, community territories, sources of construction materials, and the presence of ancestral burials. In specific parts of this territory, the use of kurgan grounds and the reuse of kurgans for new burials are not rare phenomena, highlighting the continuous attachment of the populations to ancestral burials. These practices underscore the enduring significance of kurgans, emphasizing the deep-rooted connection between communities and their funerary customs across generations.

This study unveils the results of two comprehensive spatial investigations conducted on the kurgans located in Western Azerbaijan and Eastern Georgia. By integrating data from remote sensing analyses, field surveys, and previously published studies, this research investigates the temporal evolution of the archaeological landscape. Through an in-depth analysis of natural landscape features and the archaeological record, the study delves into unraveling the intricate relationship between these kurgans and their immediate landscape, exploring the formation of lieux de mémoire.

7 BIOMOLECULAR INSIGHTS INTO EARLY HUMAN LIFEWAYS DURING THE CHALCOLITHIC PERIOD OF THE LESSER CAUCASUS

Antonosyan, Mariya (Department of Archaeology, Max Planck Institute of Geoanthropology) - Maurer, Gwendoline (School of Archaeology, Geography & Environmental Sciences, University of Reading) - Saribekyan, Mariam (Institute of Archaeology and Ethnography NAS Armenia) - Mkrtchyan, Satenik (Institute of Molecular Biology, NAS Armenia) - Azatyan, Karen (Yeghegnadzor Regional Museum, Armenia) - Yepiskoposyan, Levon (Institute of Molecular Biology, NAS Armenia) - Roberts, Patrick (Department of Archaeology, Max Planck Institute of Geoanthropology) - Amano, Noel (Department of Archaeology, Max Planck Institute of Geoanthropology)

The late fifth to fourth millennium BCE, corresponding to the Late Chalcolithic in the Caucasus region, is considered to be a time of increasing social differentiation and connectivity that reshaped early farming societies. This period is characterised by a shift from the exclusive use of stone tools towards early extractive copper metallurgy, a technological revolution that prompted increased productivity, growth of social stratification, together with the development of long-distance trade leading to cultural exchange and diffusion. This period also witnessed the intensification and extensification of land use, the introduction of new forms of agriculture, and changes in animal exploitation by wider use of animal products beyond meat.

Despite the growing research efforts in the region, questions related to subsistence dynamics, herding strategies, animal exploitation practices, the use of secondary animal products, as well as adaptation to various environmental conditions during the Chalcolithic still remain to be fully elucidated.

To complement existing knowledge and expand our understanding of lifeways during this key period of human history, we endeavoured a multidisciplinary exploration of the recently discovered Yeghegis-1 rock shelter in southern Armenia. A series of twelve radiocarbon dates reflects an occupation of about five centuries, spanning from the late 5th to the 4th millennium BCE, placing it as one of the latest Chalcolithic occupations in the region.

Here we present a detailed assessment of the taxonomic composition of fauna at the site by combining traditional zooarchaeological approaches and novel zooarchaeology by mass spectrometry (ZooMS) identification of animal remains. We also zoom into the environmental conditions of the region and gain detailed insights into herd management strategies through stable carbon and oxygen isotope analyses of faunal tooth enamel.

8 THE "DESERT KITES": NEWLY INVESTIGATED EXCEPTIONAL MONUMENTS IN THE CAUCASUS

Shakhmuradyan, Mariam (Institute of Archaeology and Ethnography of Armenian Academy of Sciences)

"Desert kites" are large-scale stone structures of different forms, consisting of two or more long rows of stones, of an enclosure that can reach several hectares with cells attached to the latter. These structures were first discovered in the early twentieth century in the deserts of Syria and Jordan by World War I pilots. One of the pilots, looking down on these buildings, likened their appearance to child toy kites, which is why they came to be called "desert kites".

In recent decades, kites have been actively investigated in different regions of the world (Armenia, Turkey, Syria, Jordan, Saudi Arabia, Kazakhstan), but there are still many gaps and issues in determining their function and chronology. According to the current data, the earliest "kites" were built in the Early Neolithic period and were continuously used until the Middle Ages. Different hypotheses have been suggested on their function, including that they were hunting traps for wild ungulates, or were used for livestock or religious purposes.

In the framework of this presentation, the current state of the research of Armenian kites, their geographical and cultural landscapes, morphological peculiarities, as well as the issues of dating and function will be presented. The preliminary results of the excavations of the Aragatsavan and Tlik kite complexes will also be presented, discussing them in the context of Caucasian archaeology.

9 KHRAMIS DIDI GORA - PROFILE CLEANING AND DATING THE LAYERS

Eloshvili, Mariam (Ilia State University)

Khramis Didi Gora is a late neolithic settlement located in the Southern Caucasus, in Kvemo Kartli, Georgia. The settlement has been excavated in 1970-80-is by Georgian Archaeologists Aleksandre Javakhishvili and Tamaz Kiguradze. The settlement has very interesting patterns of traditional Shomu-Shulaveri culture and also plays with unique contributions to it. The Gora is the largest among the Shomu-Shulaveri culture hills and consists of 9 building horizons. This paper will give the chance to the Khramis Didi Gora, to bring the site into scientific discussions.

New 2023 investigations of the settlement will bring the new series of radiocarbon data to the table. The Renewed archaeological excavations on the Khramis Didi Gora took place in October, aiming to clean the trench from previous examinations. The team cleaned the Southern profile for C14 analysis and rebuilt the plans and photos of the last archaeological dig. The 2023 season brought interesting results, which will be an important input to the Neolithization processes of the Caucasus Region.

10 ARCHITECTURAL STRUCTURE AND SUBSISTENCE CONDITIONS OF NEOLITHIC SOCIETIES IN THE SOUTHERN CAUCASUS AND THE IRANIAN PLATEAU

Rahimi, Maryam (Archeology Institute of University of Tehran)

This study investigates how architectural plan influenced neolithisation in the Near East and the Caucasus. The research question is: How did the spatial organization and structures of the Neolithic settlements reflect and impact the social, economic, and environmental changes associated with the transition to farming and domestication of plants and animals? this paper uses a comparative and interdisciplinary approach, combining archaeological data, and ethnographic analogy. The results show that the architectural plan varied according to the regional and local contexts, such as climate, resources, population, and cultural factors. the research also reveals that the architectural plan had significant implications for the social structure, economic activities, and environmental adaptation of the Neolithic societies. examination contributes to the understanding of the Neolithic period and the factors that shaped its cultural diversity and complexity.

Some of the main differences in the architectural plan between the two regions are the shape and size of the buildings, the degree of spatial differentiation, and the presence or absence of communal structures. In the Southern Caucasus, most of the Neolithic sites have circular buildings, often arranged in clusters, with little evidence of internal division or public architecture. In contrast, in the Iranian Plateau, most of the Neolithic sites have rectangular buildings, There is also evidence of the use of circular architecture.

11 CAUSATION WITHOUT LOCATION? RETHINKING KURA-ARAXES SPATIO-TEMPORAL DYNAMICS THROUGH CONTEXTUAL BAYESIAN CHRONOLOGIES

Passerini, Annapaola (Cornell University; Einstein Center Chronoi)

The Kura-Araxes (KA) phenomenon was one of the most enduring and expansive archaeological cultures in Southwest Asia during the Early Bronze Age (3500-2500 BCE). The KA is marked by a distinctive cultural "package" that is found over a vast area including the South Caucasian "homeland", but also in eastern Anatolia, the southern Levant, and northwestern Iran. Because of its geographic extent, studies in the KA have obsessed with the detection of its "origin" and "end" to understand its emergence and expansion through space and time. Among other factors, scholars have called on climate change as the ultimate cause of the KA migration, drawing a sharp line between "core" and "diaspora" communities. However, former attempts have failed to compile a coherent picture for the KA due to their overemphasis of monolithic explanatory models in combination with scarce chronological control. High-resolution radiocarbon dating and Bayesian chronological modeling provide us with optimal tools to build syntheses that are adherent to the contextuality of KA existence. This paper discusses the implications of a series of Bayesian models that were compiled for a subset of KA sites in the "homeland" as part of my doctoral project. Unlike traditional "lumping" approaches, contextual Bayesian chronologies allow us to reconstruct a much more nuanced scenario, addressing dynamics of habitation at specific places and at specific times. In addition to improved chronometric precision, these results also enable us to relate the South Caucasus with broader socio-cultural and environmental challenges that affected Southwest Asia during the 4th and 3rd millennia BCE. Specifically, I will address how occupational dynamics may inform broader perspectives on KA resilience, as seen in the diversity of settlement reconfiguration and endurance across the South Caucasus and beyond.

926 BRIDGING PAST AND PRESENT: EXPLORING COLLABORATIVE APPROACHES IN COMMUNITY AND CITIZEN ARCHAEOLOGY

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Vandeveld, Ségolène (UMR8212 LSCE (Laboratoire des Sciences Du Climat et de l'Environnement, Paris Saclay, France; Université Du Québec À Chicoutimi, Qc, Canada; Université de Sherbrooke, Qc, Canada) - Sanna Montanelli, Mattia (University of Cagliari) - Plourde, Noémie (Université du Québec à Chicoutimi, QC, Canada) - Pinna, Fabio (University of Cagliari)

Session format: Regular session

This session seeks to delve into the multifaceted relationships between archaeologists and diverse communities. In an era marked by growing interest in the democratization of archaeological knowledge, this session aims to critically examine the role of archaeology in meeting public demands and fostering collaborative partnerships. We would like this session to discuss the political implications of our work (memory, recognition, regional development, etc.), including understanding and mitigating the potential culture shock that may arise when working abroad, with non-academics, or with local populations (indigenous or not). Additionally, the session is welcoming presentations on innovative participatory approaches to archaeological research, including in particular those in the framework of 'citizen archaeology'. The public demand (and not just the sharing of knowledge with the public) will be addressed, as a potential future for our discipline, particularly since commercial/preventive archaeology activities could decline with possible measures linked to the ecological transition. Ultimately, this session aspires to contribute to the ongoing discourse on community and citizen archaeology, connecting theories, methods, and experiences and investigating operational protocols and social impacts. Our goal is to discuss the tangible impact of archaeology, a discipline that takes place in society, for society.

ABSTRACTS

1 BUILDING A EUROPEAN CITIZEN ARCHAEOLOGY: KNOTS TO UNRAVEL AND POTENTIAL STARTING FROM THE ITALIAN CASE

Pinna, Fabio (University of Cagliari) - Sanna Montanelli, Mattia (University of Cagliari)

In 2014, the Oxford English Dictionary defined citizen science as the scientific practice carried out by citizens "in collaboration with," or "under the direction of," professional scientists and scientific organizations. Since then, partly due to the activism of authoritative international associations, citizen science has achieved an advanced level of theoretical formalization. In the context of archaeology, however, the field's peculiar regulatory limits, which can vary significantly from country to country, have often hindered its global establishment, except in specific instances of Heritage crowdsourcing. Furthermore, relationship issues between professionals and volunteers continue to pose challenges: while power, authority, and responsibility (expressed in terms of control over a project and its resources) are crucial in fostering these relationships, certain definitions of citizen science do not clearly address such asymmetries. This contribution aims to explore the potential and peculiarities of Citizen Archaeology in Mediterranean Europe, with a focus on the Italian case. Indeed, over the last quarter-century, "Archeologia pubblica" (public archaeology) in Italy has seen a wide array of experiences, evolving alongside theoretical advancements. Yet, it has not reached the development of a structured framework or the identification of shared tools that can effectively combine research objectives with well-designed social initiatives. Through analyzing the journey thus far, it is possible to identify several points of concern that need to be addressed. These emerge from regulatory issues and a series of established practices. Moreover, it is crucial to systematize specific dimensions, such as the widespread recognition of the country's rich cultural heritage (and its regional variations) as not only a political and economic resource but also as a catalyst for genuine engagement, despite the associated risks. This requires effective management and activation.

2 AN EXPERIMENTAL COMMUNITY-BASED ARCHAEOLOGICAL PROJECT IN NORTHERN-GREECE

Zorzin, Nicolas (National Cheng Kung University (Taiwan); Paris 1 Panthéon-Sorbonne, UMR 8215 Trajectoires) - Shackell, Graham (Goldsmiths College University of London)

Since the inception of the Toumba Serron Research Project in 2021, a significant emphasis has been placed on establishing a collaborative initiative that addresses the demands of various audiences. While initially contemplating the concept of 'Citizen archaeology,' our team explored diverse ideas. The primary focus was on initiating a thoughtful examination of environmental crises and the adaptability of Neolithic populations in the area. This involved creating a dialogue with the present-day farming community, understanding the challenges they currently face and anticipate in the future. To accomplish this, an ethnographic study was initiated, involving active engagement with local people to understand their interests and ascertain their demands regarding the historical and present aspects of their living en-

vironment. Simultaneously, an artistic performance was prepared and presented in 2023 in the village of Toumba. The performance presented both details of archaeological data arising from the excavation and a tour d'horizon of the human experience and methodology deriving from participation in the project, whether as student, director, or worker. The performance also explored a possible thematic interpretation of contemporary performance during the inhabitation of Toumba in the Late Neolithic. The reception of the artistic displays and performance varied widely, eliciting reactions ranging from great enthusiasm to total scepticism. Nevertheless, the team's actions and commitment to closely involve local populations have begun to manifest a discernible impact on society. It's important to acknowledge that the effects, although minimal at this point, are anticipated to yield more significant results in the long term.

3 LANDSCAPE OF THE FOLKTALES: TOOLS FOR PARTICIPATORY ARCHAEOLOGY IN THE MONTI LUCRETILI AREA

Rossi, Matteo (Università degli Studi di Roma "Tor Vergata") - Bottoni, Margherita (Università degli Studi Roma Tre)

In Italian archaeological projects, the importance of the community engagement is becoming increasingly evident in the last years. This involvement, as defined by the Faro Convention, is no longer limited to share research activities but aims at making local communities an active and aware part of the data building process, to foster a recovery of their cultural identity.

In the rural and seemingly marginal context of the Monti Lucretili (Latium - Italy), the archaeological survey activities of the MoLuLaP (Monti Lucretili Landscape Project - Roma Tre University) go together with those of participatory archaeology and participatory mapping, focused on the live dialogue with local people, understanding how historical memory - condensed in the oral testimonies of the local population - is crucial, especially in areas where other types of sources are lacking.

In this perspective, a questionnaire was developed to meet two needs. On the one hand to investigate knowledge, awareness, and perceptions that local communities have of the space-time continuum of their territory, and on the other to encourage the strengthening of the social fabric through the reappropriation by communities of a heritage that is often forgotten and compromised.

The questionnaire aims to investigate the views of the inhabitants of the Monti Lucretili on their heritage and their willingness to be engaged, together with aspects related to archaeological knowledge, socio-economic activities and traditions that have shaped the history of the area.

By reflecting on the making of the questionnaire and analysing its answers, this paper seeks to raise two questions that are worth - and necessary - reflecting on: how can these data be useful to local communities? And to what extent can they come to represent scientific knowledge?

4 DISCOVERING THE PAST TO OPEN THE WAY TO RECONCILIATION WITH THE FIRST NATIONS

Plourde, Noémie (UQAC)

The current turn towards reconciliation between the Canadian Government, the settler population, and the First Nations, has seen the emergence of numerous research projects aimed at fostering indigenous self-determination. These projects now include all fields of inquiry, from the social and natural sciences to the humanities. Archeology is no exception.

The discovery in 2017 of traces of human occupation reaching back to 5000 BP on the territory of the community of Mashteuiatsh by members of the Innu Nation has initiated, in partnership with the Université du Québec à Chicoutimi, one such project. But how can we teach community members about their prehistory without participating in the colonialism inherent in the relationship between First Nations and non-natives?

At the junction of the academic and indigenous cultures of transmission and teaching, this project offers the condition of a renewed dialogue between past and present. Allowing a diversity of voices to be heard, this project opens a new way towards reconciliation amidst the rediscovery of the traces a community's past.

5 CINEMA, TOURISM AND ARCHAEOLOGY, THE CURSED ALLIANCE? IF YOU CAN'T BEAT THEM, JOIN THEM!

langevin, erik (Université du Québec à chicoutimi) - Alexandre, Dubé (Université du Québec à chicoutimi)

Over the past thirty-five years, numerous series and fiction films have been filmed, whether from Quebec, Canada or the United States, which have taken the regions of Quebec as their setting, and have erected their sets there. Whether they are series testifying to the distant past or more recent one, these settings have aroused the interest of the communities which welcomed them, attracted by the promise of significant tourist benefits. These hopes have largely been disappointed. After all, many of these filming locations often have only a tenuous connection with the subject of the fiction they host.

What is particular in the present case is the desire, by those who operated this fictional site, to get closer to science and gradually move away from “spectacle” to get closer to playful documentary. The New France Site quickly sought to increase partnerships with the academic world, in order to diversify its contributions to the historical imagination of its visitors. This is where archeology comes into play.

Archaeology, like history, are also works of imagination, a bet on the capacity of the present to represent what has disappeared forever. This communication seeks to explore the history that can be made, despite the difficulties, between the false walls of these ephemeral settings. It is there, on the banks of the Saguenay Fjord, that a reproduction of the hamlet of Quebec was created, evoking the first moments of French colonization. It is also there, that 25 years of archaeological excavations have documented thousands of years of human occupation. The bridge between professional archaeology and community has been filled allowing scientific archeology to win the OSCAR for the coolest scientific discipline.

6 HEALING ARCHAEOLOGY BETWEEN CITIZEN SCIENCE AND WELL-BEING

Megale, Carolina (Museo Archeologico di Rosignano M.mo; Fondazione Aglaia) - Fusi, Martina (Past in Progress srl) - Grella, Marika (Past in Progress srl)

Public, open and inclusive archaeology today represents one of the most important opportunities for the development of the discipline. Archaeology can provide various chances for creative engagement, entertainment, education; scientific evidence shows very clearly that this kind of involvement is good for health. Through interaction with citizens, participative activities adopting an archaeological approach can stimulate physical and psychological well-being, providing a service for the entire society.

Over the last decade, archaeological museums and parks have started creating and delivering programs targeting people suffering from mental illness and dementia, and their carers, introducing the concept of healing museum. The most innovative projects are undoubtedly those involving interdisciplinary teams. These teams are composed of archaeologists, educators, associations and volunteers collaborate with psychiatrists, psychologists and health workers to develop programmes in which archaeology becomes a tool for dealing with problematic situations in the contemporary world, supporting mental health pathways and the treatment of overt discomforts. Under this perspective, archaeological museums appeal as potential resources for new welfare based on prevention and recovery and might become a structural asset for territorial healthcare.

This paper aims to explore the recent developments and experiences in this area, conducted at the Parco di Archeologia Condivisa di Poggio del Molino, al Museo etrusco di Populonia e al Museo Civico Archeologico di Rosignano M.mo (Sistema di Musei e Parchi Partecipativi della Toscana).

7 CIPAMUR PROJECT: INNOVATING FROM COMMUNITY PROCESSES AND NETWORKING IN CULTURAL HERITAGE AND MUSEUMS FOR THE LATIN CONTEXT

Castillo, Alicia (Departamento de Prehistoria, Historia Antigua y Arqueología. Grupo de Investigación Gestión del Patrimonio Cultural. Universidad Complutense de Madrid) - Menéndez, Sonia (Gabinete de Arqueología. Oficina del Historiador de La Habana. Cuba) - Reynoso, Citlalli (Instituto de Ciencias Sociales y Humanidades “Alfonso Vélaz Pliego”. Benemérita Universidad Autónoma de Puebla) - Corpas, Nekbet (Grupo de Investigación Gestión del Patrimonio Cultural. Universidad Complutense de Madrid) - Pastor, Ana (Grupo de Investigación Gestión del Patrimonio Cultural. Universidad Complutense de Madrid) - Segovia, Constanza (Grupo de Investigación Gestión del Patrimonio Cultural. Universidad Complutense de Madrid.)

The Project “Care, People and Archaeology in a resilient world..” (CIPAMUR. Years: 2023-2026) aims at looking into the social dimension of museums and archaeological sites in an innovative and pro-active way, as well as into the role of museums to mitigate conflicts and to promote social values based on diversity, interculturality and education. This work emerges out of the design of methodologies and the contribution of results helping in new professional opportunities as well as strategic changes of the entities/institutions responsible for heritage management. This project stands out from others because of its focus on people to understand their relationship and perception on museums/heritage sites and their archaeological and/or anthropological narratives, as these contribute to the sustainability of local communities. In order to do this, several case studies have been selected (Cuba, Mexico and Spain). The relationship between museum/archaeological sites and territory will be promoted with the subsequent reorientation in heritage policies. Significantly, assessment will not be limited to the final stage of the research but instead it will be part of the whole process.

Our starting hypothesis is that Heritage Management Networks including different local stakeholders have become established in globalized discourses. These seldom take into account changing cultural contexts. Expert groups in archaeology and other heritage sciences aim at mitigating these gaps through participatory studies. Yet, we frequently fail in working with methodological frameworks capable of producing short- and long-term solutions for the stakeholders while empowering surrounding communities. Additionally caring and gender perspectives are seldom included

in these studies that lack in complex thought. How can we improve methodologies in heritage management so they can contribute to creating spaces of wellbeing and care in the main spaces of heritage dissemination: museums and archaeological sites?

*Project supported by the competitive call of the Spanish Ministry of Science, Innovation and Universities.

8 EMPOWERMENT AND CONTROVERSY: GENDER PERSPECTIVES IN ARCHAEOLOGY

Algrain, Isabelle (Université libre de Bruxelles)

Gender archaeology has revolutionized archaeological research by challenging conventional narratives and offering new insights into ancient societies. This paper explores the political ramifications and applications of gender archaeology, highlighting its potential to illuminate complex societal structures and engage modern communities. Amid debates over its legitimacy, gender archaeology has proven to be a tool for social justice, amplifying marginalized voices and driving regional development, thereby extending its influence beyond academia to effect real-world change.

This analysis examines gender archaeology’s dual nature: its capacity to empower communities and the risks associated with its politicization. By showcasing case studies, the paper illustrates how gender archaeology acts as a conduit for political expression, supporting transformative initiatives or sparking controversy. By championing a ‘citizen archaeology’ approach enriched with gender perspectives, this paper advocates for the democratization of archaeological knowledge, aiming to enhance the discipline’s relevance and societal impact. By fostering an inclusive and participatory archaeological practice, gender archaeology underscores the importance of connecting theoretical frameworks with community engagement, promoting a discipline that is both socially engaged and impactful.

9 CONTEMPORARY HERITAGE AND ARCHAEOLOGICAL APPROACHES - OPPORTUNITIES AND BARRIERS FOR COLLABORATION

Benetti, Francesca (Independent Researcher)

Metal detecting is a divisive subject in Italy. A hobby for some people, it is viewed with suspicion or disapproval by many archaeologists. According to the Legislative Decree 42/2004, archaeological research is reserved to the Ministry of Culture (art. 88), which may allow other bodies to carry out research. Occasional finds must be reported within 24 hours of their discovery (art. 90), keeping them where they are found. Metal detecting is prohibited without authorisation in protected areas (L. 22/2022), but not formally forbidden in other areas, even though metal detectorists must comply with the law and report all archaeological finds. However, finds dated to contemporary age are in an intermediate legal status and are frequently not perceived as ‘archaeological assets’. As a result, they often end up being not reported creating a knowledge gap and not allowing authorities to protect contexts with historic significance, such as those dated to the First World War. On the other hand, the reporting of all finds dated to contemporary age poses new challenges from the managerial point of view.

This paper will present the results of a survey run among the members of an association which promotes ‘responsible’ metal detecting in Italy, and teaches its members the requirements of cultural heritage legislation. We will underline the agency of metal detectorists on the field and the weight of their understanding of what an ‘archaeological find’ is (and therefore must be reported to the authorities), with serious consequences for heritage authorities. A better understanding between archaeologists and metal detectorists is the first step to develop citizen science approaches, enabling the recording recent (industrial) heritage which might have a very high historical significance but relatively low ‘intrinsic’ value.

10 THE APPROACHES OF COMMUNITY PARTICIPATION IN INDUSTRIAL HERITAGE: A CASE STUDY OF WANGSHIAO INDUSTRIAL HERITAGE SITE, CHINA

Mu, Aijia (The University of Oulu)

Community participation has been proven to be indispensable in the process of heritage-making and management, yet it encounters challenges in practice. This paper consists of a part of a doctoral project that explores the dynamics of community engagement in industrial heritage. It delves into the interactions between the community and the place, examining their sentiments, memories, and emotional responses during the transformation of industrial remains into heritage. Using the Wangshiao Industrial Heritage Site in China as a case study, this paper conducts a content analysis of official documents to examine the community participation and negotiation process with the government regarding the demands of the community during the heritage-making process as well as the role of archaeologists in government-led heritage projects. The findings show that the community is limited to the information level of participation, whereas, the community engages with the government about needs and interests in various ways. In addition, archaeologists shoulder more responsibility to the government than the community. This paper reflects on reasons behind the information level of participation in the Chinese context, and calls for more interactions between archaeologists and communities through participation approaches that will be employed in the bigger project.

927 REFLECTING HISTORY IN ARCHITECTURE AND VERNACULAR DESIGN ? DIRECTING SUSTAINABLE FUTURES

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Teräväinen, Helena (Aalto University) - Rönn, Magnus (Chalmers University)

Session format: Regular session

Scholars from Aalto University, Finland, Chalmers University of Technology, Sweden, National Technical University, Athens and Tampere University, Finland, have proudly joined forces to organize a multidisciplinary session called: 'Reflecting History in Architecture and Vernacular Design – Directing Sustainable Futures.' This headline illustrates a session that provides knowledge facilitating essential insights from the past for the development of a sustainable built environment in the future. The objective is to explore the past and offer possibilities for directing the future towards sustainability, to shape our perception of the present and the vision for tomorrow more clearly: 'Historia magistra vitae,' wrote Cicero.

Through case studies of architecture and urban design, heritage, and material culture in relation to designing sustainable dwellings and settlements, the approach of sustainable innovations that enrich the cultural heritage of various regions in Europe will be presented and critically analysed. This perspective primarily focuses on place and space and the ways in which design is influenced by sustainable inventions and interventions at sites. By applying architectural theory and history and viewing vernacular heritage as innovations that fit a thriving, sustainable future, the session is expected to provide new insights into creating architecture and ways of living that are sustainable and suitable for the cultural characteristics of different sites in Europe.

We hereby invite scholars in architecture and urban design, architectural conservators, and archaeologists to participate in the session, submit papers, and make contributions within the overall theme of the session, which is specified in four directions: 1) Sustainability, heritage, and the urban space, 2) Innovation, new thinking in architecture, and learning from the past, 3) Expressions of history in sustainable design, 4) Architecture and archaeology in cooperation.

ABSTRACTS

1 THE GREEK ARCHIPELAGO'S ARCHITECTURAL FORMS OF SUSTAINABILITY : FROM TRADITION TO FUTURE

Kouzelis, Athanasios (Chalmers Univ. of technology; Univ. of West Attica)

The paper illustrates the knowledge that provides important past insight for the development of future sustainable built environment. The study of the past plays a key role in addressing sustainability, shaping our perception of the present, and our views of the future: 'Historia magistra vitae,' wrote Cicero. Using case studies of vernacular architecture and material culture in relation to a recent sustainable dwelling and settlements in the Greek Archipelago's islands, an approach of sustainable innovations that enriches the cultural heritage of the region will be presented.

This approach is chiefly concerned with domestic space, and the ways in which it articulates and is itself articulated by sustainable inventions and interventions. It is based on the methodological issues of using architectural and archaeological evidence in order to provide a more comprehensive view of a cultural compensation on ongoing and future sustainable planning in the Greek Archipelago's islands.

By applying the property of vernacular architecture and seeing in it innovations that fit for a thriving sustainable future, it is expected an application of advanced knowledge in creating the kind of architecture and means of living that is sustainable and appropriate for the area's cultural peculiarity.

2 VERNACULAR ARCHITECTURE IN THE NAVIA RIVER BASIN (ASTURIAS, SPAIN). A BUILT LANDSCAPE IN A RURAL MOUNTAIN AREA

Rodríguez-Pérez, Santiago (Universidad de Oviedo)

This communication presents a preview of the results of the author's doctoral research, focused on the study of the landscape and vernacular architecture in a territory of Asturias (Spain), the Navia river valley. This is a mid-mountain area, where an interesting ethnographic and architectural cultural heritage is preserved.

The techno-ecological adaptation of local communities to the environment entailed the agricultural transformation of the landscape and its conversion into a human habitat, through architecture as a cultural tool, in a long-lasting process. This research explores how the communities in the area constructed the landscape and their own architectural language, through the different building typologies and their historical evolution, and their relationship with their culture.

In the study area, the peasant habitat is structured around the *casearía*. The *casearía* is the living and productive space of the peasant family, and groups together domestic spaces (housing), and productive spaces (barns, stables, cellars, auxiliary buildings, etc.), as well as farmland and grazing land, rights over common land, mills, forestry areas, etc. Grouped into hamlets and parishes, they have been the basis of rural settlement in the northwest of the Iberian Peninsula since the Middle Ages. Alongside them, we find a whole series of constructions that make up the cultural landscape (road networks, plots of land and terracing, canalisations, etc.).

Today, although these rural spaces are still inhabited and the community still maintains identity links with its heritage, the conservation of this architectural landscape faces several challenges: abandonment and ruin due to emigration and rural depopulation, urban speculation, as well as the absence of social awareness, economic resources and legal protection regulations.

3 WOODEN FACADES IN FRANCE AND SCANDINAVIA REVEAL THE ROLE OF TRADITIONAL PRACTICES IN REGENERATIVE ARCHITECTURE

Brun, Géraldine (Göteborgs universitet)

The regenerative paradigm that architecture is entering was first conceptualized by Lyle in 1996 although it is partly based on older principles that allowed to shape durable buildings for centuries. For example, regenerative architecture does not consider buildings only as constructions but also as part of a place (Mang and Reed, 2012), reminding of vernacular design which "embodied the local characteristics of a place" such as the climate, the native materials and the history of the traditions (Nagashima, 1999). Traditional practices can inspire regenerative strategies but are hardly found captured in written words (Wahl, 2016), instead, they remain either kept alive by marginal practitioners or frozen in our tangible heritage which is hard to make sense of today (Nilsen, 2021).

The ongoing research seeks to inform regenerative architecture with local traditions of wood cladding in different places in Scandinavia and in France. A forensic approach is adopted to attempt to "reconstruct the course of events and understand the motivations" (Almevik, 2012), consisting of claddings' craft-based observations complemented by practitioners' interviews, literature, dendrochronology for dating and wood species identification.

In Champagne in France, vernacular buildings are clad with "tavillons", thin clapboards held by vertical battens, a design connected to the traditional use of split oak. Sawn boards from poplar and alder also function as "tavillons", although abrasion threatens their longevity (Brun, 2023). While more profitable non-local softwoods start to replace poplar and alder, the regional import of shingles sawn from chestnut wood for cladding churches is already considered a tradition. In Sweden, board-on-board is the dominant cladding system, and using pine heartwood with high density is known as the traditional recipe for long durability. However, case studies indicate that alder and spruce have been considered suitable for cladding certain buildings, and that low density pine can be synonym of high quality.

4 THE HERITAGIZATION OF DIFFERENT BUILDING TYPES IN A FINNISH RURAL TOWN

Teräväinen, Helena (Aalto University)

This paper explores the distinctness in evaluations of the built heritage on different levels in a rural town in Finland.

Lapua Cathedral was designed by architect C.L. Engel in the neo-classical style and completed 1827. This church is the fifth in the parish and has always been highly respected among people, and self-evidently listed into the national important cultural heritage environments (CHE 2009)

Vernacular houses in Ostrobothnia have been two-storey, red wooden houses, facades featuring the classicism. Those were significant also in Lapua until 1960's but obviously, too modest to be appreciated as cultural heritage.

Throughout history administrative buildings have been highly respected, as well as symbols of power. Lapua Town hall by architect M. Björklund was completed 1924. The activities in the building have changed during one hundred years, but the appearance has remained original. In the 1960's it was nearly demolished but instead the municipal council decided to repair it heavily. The architectural values were not acknowledged until 1990's when the first historical building inventory was published.

The latest building types recognized with historical values are factories and other production buildings. The example in Lapua is the old cartridge factory from 1920's, now known today as Old Paukku, the culture center. The first town plan 1994 with conservation marks was not accepted by the municipal council, but the regional plan raised the value recognition and now it listed as a national level heritage. The protective town plan was accepted at last, but the wooden workers' canteen from 1924 is still threatened.

The research question: "How the values of users, owners, planning and museum experts in the case study have been varying on local, regional and national levels in the heritagization?."

5 EXPERIMENTING WITH SCENARIOS AS TOOLS FOR ANALYZING CONFLICTING IDEAS IN BUILDING CONSERVATION. A SCENARIO EXERCISE ON IDEAS OF JOHN DEWEY

Östman, Leif (Novia)

We have been involved in an inventory of old buildings in a coastal area, with obvious conflicts between preservation of wildlife, tourism and cultural heritage, implicating a favored neglect which will lead to the destruction of cultural heritage. The aim of the inventory of old buildings was to evaluate their value as representations of seafaring history in the area and make proposals for regulations for the planning of the area. Almost all original functions have ceased to exist. There is no staff needed for piloting or service of the lighthouses on the islands, and there are very few fishermen left. The aim of this paper is to clarify concepts and their implications for this cultural heritage in the long run. The mode of study is based on the ideas of John Dewey and his "Pattern of Inquiry". The approach is focusing on "deliberately instituting cases which will throw light on the specific empirical causes of success and failure". I present and discuss three different scenarios, based on specific interests regarding this coastal area: protecting the nature and allowing the built heritage to deteriorate, turning the buildings into exclusive vacation homes by means of material investments, or renewed coastal fishing as providing resilience in case of deteriorating food supply due to climate change. The paper exemplifies the qualities of the objects in relation to building conservation practices in Finland, but the main outcome is a comparison of scenarios as a test of ideas in order to promote a better understanding of the conflicting ideas, as well as testing the idea of scenario-building as a method for supporting and managing a productive dialogue about conflicting ideas.

6 DECORATING HOMES WITH CRUDE CONSTRUCTIONS: EXCAVATIONS AS A FORM OF HOME REPAIR

Kalakoski, Iida (Tampere university) - Sirén, Riina (Tampere university)

Vernacular architecture is defined as "architecture without architects". Correspondingly, vernacular repair could be defined as "repair without professionals". In both cases, instead of being influenced by educated designers or craftsmen, builders and repairers learn from their peers, such as earlier generations, friends, neighbours, or, as very often today, from various forms of media, both social and traditional. Home decoration magazines, for example, are an important platform for sharing domestic repair ideas and practices from one home repairer to another.

Our study focuses on home repair practices that involve removing building materials, such as wall papers, sheets, claddings, or plaster, to reveal the underlying structures and to leave them visible in the room. Such practices appear as a contemporary home decoration trend, which is spread, as we claim, through home decoration magazines. An apparent motivator for such excavations is, in addition to the prominent impact on the interior, the ease to accomplish the changes by a home-repairer. In this study compare the repair practices presented in Finnish home decoration magazines to the international conservation declarations, published by ICOMOS.

Revealing the log frame, brick masonry, or floor or ceiling blanks influence not only the usability and functionality of the space but also the authenticity and materiality of it. For domestic repairers, the exposure of aged constructions may emphasize the difference between not only the methods and materials of distinct ages but also of past and present in general. Experts, in turn, value the original materials and original design of the buildings. We claim that these excavations reveal a contradiction between vernacular repairers and conservation expert's perceptions of good maintenance for historic buildings.

7 ARCHITECTURAL SCANDALS IN GOTHENBURG: PROFESSION AND POLITICS COMPETING IN AREAS OF NATIONAL IMPORTANCE IN CULTURAL HERITAGE POLICY.

Rönn, Magnus (Chalmers University of Technology; Kulturlandskapet)

In 2016, the city of Gothenburg organized a design developer competition at a site close to Götaplasten, which is the most significant place in the city. The competition was important to politics and guidelines steering architecture and cultural heritage at the site. The winner was a design team composed of two companies in Gothenburg; a developer (Serneke) and an architectural office (Semrén + Månsson). The land allocation agreement established in 2017, demands the developer to carry out a parallel assignment.

In 2020, the developer invited companies to prequalification for competing in the parallel assignment, organized in collaboration with the city and the Swedish Architects. However, the office behind the winning design in the competition 2016 was excluded. This is the first scandal. The winner in this parallel assignment includes the same architectural firm that reviewed the design proposals in the first competition. This is the second scandal. There is a business relationship involved in the process, challenging ethical rules.

After the jury pointed out the best solution for the assignment, a new political majority criticised the winning design. They stopped the architecture from being implemented in 2023 due to the lack of a classical form. Instead, a new design must be drawn up. This is the third scandal. The rules have been changed. The work of the jury became

meaningless. The adaptation of the design to the site, its urban context, cultural values and architectural qualities, are questioned by politicians. The case shows how ethical principles, intended to steer professional actors, are applied at a demanding site facing politicians. The city is acting both as the organizer of the first competition, co-organizer of the parallel commission, landowner and authority responsible for the detailed development plan of the site.

928 WHY WE SHOULD PERSIST IN MAKING ARCHAEOLOGY ACCESSIBLE AND INCLUSIVE TO ALL?

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Hunt, Abi (University of Lincoln; Harlaxton College; Enabled Archaeology Foundation) - Gerberg Hostrup, Sebastian (Museum Lolland-Falster)

Session format: Round table (without formal abstracts)

This round table will build on our panel at EAA 2023 where we asked if archaeology was a hospitable discipline. We will invite discussants from our 2023 panel, along with activists supporting a range of minority groups in archaeology to discuss why we all need to persist in making archaeology accessible and inclusive to all. We will aim to take an intersectional approach to the question and will consider that people have multiple identities, including age, gender, families and parenthood, disability, race, religion, sex, and sexual orientation, that are discriminated against, and used to marginalise and exclude people from archaeology. Our consideration of why we need to persist with our work will help us formulate the key messages we need to convey to governments, archaeological funders, organisations, statutory bodies, and the general public about the benefits engaging a diverse range of people with the archaeological process, management, interpretation in our work for the benefit of the public and society across Europe.

929 WHAT IS THE VILLAGE? REGIONAL COMPARISON OF EARLY EUROPEAN AND NEAR EASTERN PREHISTORIC VILLAGES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Marciniak, Arkadiusz (Adam Mickiewicz University) - Kuijt, Ian (University of Notre Dame)

Session format: Session with keynote presentation and discussion

The emergence of larger Neolithic villages in the Near East and the spread of village systems into the Balkans and eastern Europe around the Black Sea represents a major evolutionary transition in how people organized their economic and social lives. The appearance of a large, densely packed village focused on farming and herding of stock, highlights the creation of a new way of life, with shared and interconnected practices from the Near East and south-eastern Europe. While significant research has explored aspects of changing economy, residential architecture, and the organization of space from individual settlements, surprisingly little research has stepped back from the scale of the individual building and household, considered regional and inter-regional practices, and asked "What is the village?".

In this session, we aim to consider a range of understudied multi-scalar aspects of villages as a unit of analysis with the aim of advancing comparative perspectives of villages within and between neighboring regions. This includes thinking about villages at increasing scales, including the life-history of individual Neolithic buildings, how long they served their residential character, the character of clusters of buildings with physical gaps between them, the size and character of open space, consideration of village biographies, both with buildings made of wood and clay as well as buildings with foundations and walls made of stone, and finally, to address the relationships between regional villages and how these were socially, economically, and biologically interlinked. Presenters will investigate how the creation and maintenance of villages in southwestern Asia and Old Europe were shaped by a range of region-specific variables, such as settlement practices, the character of the local environment, access to construction materials, and variables of global significance, in particular the early Holocene climate oscillations.

ABSTRACTS

1 NEOLITHIC FARMING AND "THE VILLAGE": INSIGHTS FROM WESTERN ASIA AND SOUTH-EAST EUROPE

Bogaard, Amy (School of Archaeology, University of Oxford; Santa Fe Institute, USA)

In response to the central question posed by this session ("what is the village?") I reflect on available evidence for Neolithic settlements as communities of shared agropastoral practice, knowledge and materials, drawing on examples from western Asia and southeast Europe. Practices ranging from the choice and care of preferred crops and livestock to culling patterns and storage behaviour have fundamental implications for the ecology, resilience and sociality of

Neolithic settlements. Examples to consider range from fantastically long-lived sites of millennial duration, as in central Anatolia, to shorter-lived but recurrent occupations of 1-2 centuries along lakeshores, as recently investigated in south-east Europe through the ERC synergy EXPLO project, a collaboration between Oxford, Thessaloniki and Bern. Considering land-use practices at different social scales, from the individual house to the local community (“village”) and wider region, I seek to trace themes such as ownership, inheritance, collaboration and cooperation. I develop the argument that a critical mass of households was needed to make early farming work, and that the emergence and spread of “villages” was necessary to the establishment and evolution of early farming.

2 THE DEATH OF THE NEOLITHIC VILLAGE: ÇATALHÖYÜK AFTER AN ABRUPT DEMISE OF THE INCIPIENT NEOLITHIC LIFE

Marciniak, Arkadiusz (Adam Mickiewicz University)

For more than half a millennium, the imposed egalitarianism provided a solid foundation for the unprecedented growth of the community inhabiting the large Neolithic settlement at Çatalhöyük. Around 300 years before its ultimate abandonment, however, this incipient Neolithic lifeways came to an abrupt end. Çatalhöyük around 6300 BC, once filled with hundreds of occupied houses, was now largely deserted, and a majority of the population left.

Focusing on our ongoing work at Çatalhöyük, in this presentation I outline the major steps in the process of folding up the Neolithic village. What was the Neolithic village like, physically and socially, after a larger portion of the population had departed? In particular, I will discuss the re-occupation of the previously abandoned houses, the life-history of newly built houses, the character of their clusters, and the forms of open space. It will also outline how recently unearthed architectural buildings illustrate attempts by the remaining portion of the population to re-institute the incipient Neolithic mode of life in a largely transformed way. Using the Çatalhöyük example, the ultimate goal of the paper is to scrutinize the character of Neolithic villages long after they lost their primordial character.

3 ASINGERAN, THE SOCIO-ECONOMIC TRANSFORMATION OF A CHALCOLITHIC RURAL (?) COMMUNITY IN THE PLAIN OF NAVKUR

Iamoni, Marco (University of Udine)

The Chalcolithic era in Northern Mesopotamia is widely recognized as a period during which local communities underwent significant socio-economic changes. While the general characteristics of this era are well-known, it is increasingly evident that each region experienced unique processes with diverse manifestations of these changes.

The area of Navkur, a large plain extending between the upper Zab and the local hills near the modern city of Ba'adre, is relatively unexplored during this period. Recent data suggest that human rural communities thrived there since the end of the 6th millennium BCE, thanks to the resources of the local territory. Excavations conducted at the site of Asingeran are bringing to light information that demonstrates these changes.

This paper aims to provide a preliminary view of the transformation through an analysis of available evidence concerning the burial tradition of infants. It combines this analysis with a study of the local structure of the settlement and the economic activities characterizing the site throughout the 5th and 4th millennia BCE. Although the overall picture is preliminary in many details, it offers a model that appears to share points of contact, as well as some substantial differences, with what is known from other contemporary sites in Northern Mesopotamia. In particular, it challenges the paradigm of small sites as evidence of rural communities and suggests that the area of Navkur might have witnessed different outcomes in what could be termed a phenomenon of ‘micro-complexity’.

4 KOVAČEVO AND THE OLDEST NEOLITHIC VILLAGES IN THE BALKANS

Demoule, Jean Paul (Université de Paris I Panthéon - Sorbonne)

Excavations covering more than 2,000 m² at Kovačevo, in south-western Bulgaria, have revealed the evolution over a millennium of one of the oldest Neolithic villages in the Balkans. The earliest phases (from 6200 BC onwards) developed over a limited area, while at the end of the Early Neolithic period the site covered almost six hectares. The dwellings are rectangular, made of wood and wattle and daub. The earliest dwellings were large and built on the ground. In more recent phases, they are smaller and built over pits used as crawl spaces, which are used as rubbish pits once the house has been abandoned. A few rare children’s graves have been found under or beside the houses, a custom well known in Anatolia, but rare in the Balkans. The location of the adult cemetery is unknown. The abandonment of the village at the time of its greatest expansion, followed by a more limited occupation in the Middle Neolithic, may suggest logistical difficulties. In fact, when agricultural colonization resumed westwards with the Bandkeramik, the villages remained still small until they reached the Atlantic coast.

5 OVERGROWN VILLAGES OR PROTO-URBAN CENTRES? MODELLING THE DEMOGRAPHIC GROWTH OF A TRYPILLIAN MEGA-SITE

Kiosak, Dmytro (Odesa I.I. Mechnikov National University; GPR Human Past, UBM, U-Bordeaux)

Trypillia mega-sites (4100-3400 BCE, Central Ukraine) have received several interpretations: from temporary gathering places to proto-urban centres. One of the most common interpretations of this phenomenon is that it is an overgrown village. That is, the agglomeration of the population took place mechanically, without acquiring a new quality – hierarchies, management, division of labour, etc. The Trypillians chose to settle together in a place – the sum of all these villages – instead of living in many small villages. What made this possible? From the point of view of anthropological theory, there are limits to the growth of human collectives, and it is likely that the maximum possible population of thousands of houses far exceeded these limits for a Neolithic agricultural community. We will try to highlight some of the technical parameters that would be required for the existence of such an overgrown village using agent-based modelling, and then discuss their correspondence to the current views on the complexity and organisation of early farming society.

6 ‘THE TRYPILLIA MEGASITES WERE NOT VILLAGES!: WHAT NON-VILLAGES CAN DO TO INFORM VILLAGES.’

Gaydarska, Bisserka (Historic England) - Chapman, John (Durham University)

To call Trypillia megasites (TMS) ‘large villages’ is akin to calling a “Schweinschaxe” a large pork chop. In the following paper, we seek to demonstrate that this is a categorical mistake. Our baseline comparison is that the TMS equivalent of an “Early Balkan Village” (EBV) is a single Quarter.

It is apparent that the principal difference between a TMS and an EBV is that of scale, with implications for every aspect of life. The tension between ‘global’ and ‘local’ identities was a recurrent feature of TMS life. Our expectation is that such tensions would not be part of EBV life, where inter-household rivalries would have been more significant. A second example is that an entire inter-EBV exchange and mating network is found within a single TMS. Thirdly, the enclosure ditch around TMS required more work for the entire TMS community than for the far smaller EBV ditches increasingly found in geophysical plots, although TMS ditch-digging was probably organised on a Quarter level. Fourthly, the TMS inner open area was central to political decision-making and social life, with access to the open area from all Quarters. Were there such open areas within EBVs? The potential for such development seems to have stemmed from the creation of the ‘dispersed’ Late Neolithic Anatolian village.

Other themes for comparative discussion include the spatial patterning in house layout and variability in house size according to Quarters, as well as the location of two special features – Assembly Houses (communal structures) and pottery kilns.

Perhaps the most important inference from TMS plans is the potential for democratic decision-making. If an egalitarian structure was possible on such large sites, was it not highly probable on EBVs?

In this paper, we seek to give a human face to these structural analogies between Trypillia megasites, their Quarters and EBVs.

7 UNSTRUCTURED VILLAGES? SETTLEMENT ORGANIZATION IN NEOLITHIC AND ENEOLITHIC SITES OF THE NORTHWESTERN CARPATHIAN BASIN

Wunderlich, Maria (Institute of Pre- and Protohistoric Archaeology, University Kiel)

In contrast to the structured, long-lasting settlement sites known from the Neolithic periods in southeastern Europe or the Near East, the northwestern Carpathian Basin (western Slovakia, Moravia and Lower Austria) only exhibits loosely structured and low-density settlement sites. This is a marked difference from the aforementioned areas. Only a few of these sites have been labelled as villages within research discourses due to their common lack of clear communal features and less complex forms of spatial and, presumably, socio-political organization. Yet, excavations and research projects have revealed interesting diversities of house inventories and house forms, as well as differing concepts in the use of space within and between settlement sites that seem to be influenced by changing perceptions and motivations of the communities using these sites.

This presentation will investigate the suitability of the village concept in the northwestern Carpathian Basin region, using a case study from the Neolithic and Eneolithic/Chalcolithic periods. Intra-site analyses, including mean house distance, house inventory variability, and open space indexing, will be used to examine these case studies in a regional comparative framework. The talk will explore methods for describing various forms of spatial organization and the use of space within and between villages, and ways to connect these with comparable and overarching terminologies. This will include an examination of the relationship and usefulness of terms such as ‘village’ or ‘settlement site’.

8 VILLAGE VIBES IN LONGHOUSES? SETTLEMENT STRUCTURE OF THE LBK IN LESSER POLAND AND KUJAVIA

Pyzel, Joanna (Maria Curie-Skłodowska University in Lublin) - Czerniak, Lech (University of Gdańsk)

The communities of the first Central European farmers of the LBK are mainly known from settlement sites consisting of a variety of features, including the iconic longhouses, which are surprisingly similar across the vast area of this culture. Settlement studies have mainly focused on the level of the individual house and household as the most appropriate unit for studying LBK communities. Much less attention has been paid to the question of whether these houses formed spatial and social units of a higher order (a village), whose inhabitants shared a common identity, or whether they were merely random spatial clusters of individual households. In our presentation we will focus on the problem of the existence of villages in the LBK in two regions along the Vistula River in present-day Poland: the upland of Lesser Poland and the lowland of Kuyavia, where large-scale rescue excavations on motorway routes provide insights into the settlement structure of these communities. We will look at the organisation of space, the dynamics of settlement, and the similarities and differences within the sites analysed, which will allow us to explore which community(ies) inhabited a settlement/village and what held them together. We will also look at similarities and differences within and between the regions studied to explore whether there was a supra-regional model of LBK settlement and underlying social organisation.

9 SCALAR STRESS AND SOCIAL NETWORKS IN NEOLITHIC VILLAGES

Kuijt, Ian (Univ. of Notre Dame)

The appearance of larger-scale aggregate villages across many, but not all, areas of the Near East after 8,500 BC (\pm) led to the reorganization of social networks. Researchers are only now starting to understand how the increased physical compaction and increase in number of people, resulted in scalar stress within early villages. From an evolutionary standpoint, analysis suggests that, at least on some level, the evolution of the households and villages, in their many forms, were partially linked to adaptive shifts from highly centralized single-node network systems focused on key individuals to those of decentralized multi-node social networks based on households and Houses. This paper explores the relationship between the increased number of people living in early villages in south eastern Europe and Anatolia, and the social stress that must have existed within these communities as villages expanded, and how this process might have changed social networks at the household and community level.

930 BARBARIANS AT THE GATE OR BEHIND THE GATES? THE COLLISION OF THE MATERIAL CULTURES OF THE INVADER AND THE INVADED

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Miller Bonney, Emily (California State University Fullerton) - Prew, George (National Museums Scotland)

Session format: Regular session

Material culture records how people comprising a community respond to changes in their circumstances. Invasion, when one culture suddenly and hostilely intrudes on another, constitutes a particularly intense cultural shift. Invasion imposes profound, disruptive, and traumatic changes on a community, compressing transformative shifts into brief time frames. Both the invader and the invaded likely view the other as a barbarian because of their cultural differences. Invaders try to force change as they insist on subordination of the prior culture to their own. The target of the invasion will resist. Responses, in whatever direction, from the individual to the community, are particularly charged and fraught with danger, sometimes compliant and sometimes subversive. These responses can materialize in an array of different media, ranging from radical shifts to insistent continuity, hybridisation to selective incorporation to outright rejection of the forces and elements involved in that change. The emergence of post-colonial theories and archaeologies in the last few decades has invigorated the study of responses to invasion. Recent world events have underscored the importance of understanding the variety and complexity of material culture responses to the imposition of alien cultural elements on communities and the fear of cultural erasure.

We invite contributions on all aspects of creative responses to invasion without restrictions to the chronological period or geographic locale, and particularly welcome those that reflect on the competing views of just who is the barbarian. Contributions can examine a single object, an assemblage or a more general cultural expression, from a single pot to an architectural format and beyond. Papers could address a particular individual or draw on larger narratives and wide datasets, and we encourage consideration of response on all levels, from those of the individual, to artistic and cultural movements, to wider forces affecting multiple cultures and/or periods.

ABSTRACTS

1 WORKING AT THE BOUNDARIES: ROLE OF CELTIC ART IN NAVIGATING SOCIAL CHANGE DURING AND AFTER THE ROMAN CONQUEST OF BRITAIN

Joy, Jody (Museum of Archaeology and Anthropology; University of Cambridge)

Star and Griesemer (1989) have identified a category of objects they call 'boundary objects' which are "...both adaptable to different viewpoints and robust enough to maintain identity across them" (Star and Griesemer 1989, 387). In this presentation, I argue that so-called Celtic art, the decorated material culture, particularly metalwork, in use in the British Isles at around the time of the Roman invasion of 43 CE and for decades after, acted as boundary objects. By providing many different facets which could be drawn upon in social interactions between the 'invader' and the 'invaded,' Celtic art was pivotal in negotiations and renegotiations of identity throughout the Conquest period. With a focus on torcs and neck-rings, I will examine what some of these interactions might have looked like and highlight the critical role of material culture in shaping and navigating social change.

2 'BARBARIAN' ART IN A 'ROMAN' PLACE: THE 'CULTS OF THE HEAD?' PROJECT

Ellis-Haken, Rebecca (University of York) - Armit, Ian (University of York)

The Roman invasion of southern England in AD 43 is often seen as an abrupt turning point in Britain's past: the shift from prehistory to history. Yet interactions between the expanding Roman world and Iron Age communities in Britain affected material expression over a much longer period. Artefacts from the first centuries BC and AD in England and Wales can often show a myriad of artistic influences, from the insular La Tène, to the imported Roman, or a hybridity which appears to fuse the two. The recognition of the continuation of insular art on 'Roman' period objects, as outlined in recent changes to the Treasure Act (2023), demonstrate that conversations about how we classify this hybridity in art are moving forward for metalwork artefacts. The same, however, cannot so far be said for other classes of material culture.

The discovery of around 200 anthropomorphic stone heads from Dean Hall Roman Temple (Gloucestershire), the most ever excavated from a single site in the UK, forces us to visit this topic with a focus on stone statuary. This paper introduces the Leverhulme Trust funded 'Cults of the Head?' project, which aims to record, analyse, and contextualise this discovery within the visual culture of Late Iron Age and early Roman Britain and Europe. It outlines initial results relating to the stylistic analysis of the heads, focusing on the apparent acceptance of 'barbarian' art in a 'Roman' place.

3 RELIGION AS AN INVADING FORCE: THE CASE OF ROMAN MERCENARIES IN EGYPT

Ringheim, Hannah (ETH Zurich)

What constitutes an invasion does not necessarily involve aggressions and combative warfare; the gradual takeover of a community's social, political and economic life can transpire subtly and result in new material culture and behaviors that are just as long term and invasive as war. One enduring method of invading can take place through the infiltration and adoption of new religious practices. This paper investigates how mercenaries acted as political pawns as part of a larger infiltration of an invading force by diffusing cults and religion. An example of this comes from the Roman army in Egypt, where the military was fundamental in creating new ritual cults in a cross-cultural environment and then transcending religious ideologies beyond the boundaries of Egypt. This in turn helped to solidify the identity of local communities as part of the Roman Empire.

As early as the first century BCE, epigraphic and papyrological sources point to foreign mercenaries in the Roman army who received land grants for their service in Egypt, resulting in a permanent migration. Furthermore, material evidence from specific cult sites, such as the Caesareum in Alexandria, Philae, and Karnak reveal soldier dedications in local sacred spaces. Mercenaries found commonalities in local religions to then make dedications using their own practices. Likewise major economic hubs in the eastern desert further reflect military dedications in local cults. This paper analyzes case studies of these texts and dedications from Philae, Karnak, and Elephantine that show the spread of Roman cult by mercenaries. This infiltration ultimately had an enduring impact that led to the hybridisation of local Egyptian religions with Roman cults, thus securing Roman social, political, and economic rule over the region.

4 "THEY TURN UP IN THE STRANGEST PLACES..." NEW NARRATIVES OF THE ROMAN CONQUEST IN SCOTLAND THROUGH CHANCE FINDS

Prew, George (National Museums Scotland)

The impact of Rome on the lands which would one day become Scotland should not be understated. While the Roman invasion of Scotland was not as comprehensive as their conquest of the rest of Great Britain, too much of the focus on Roman activity in and around Scotland focuses on the two barriers set between Scotland and the Empire,

Hadrian's Wall and the Antonine Wall. Much of this is due to the paucity of evidence which has traditionally appeared of Roman activity in the rest of Scotland, but this is changing massively with the recent explosion in interest in metal detecting, more and more chance finds are coming up from Shetland in the north down to the traditional home of Scottish Roman activity in the Scottish Borders.

This talk presents the evidence which can often be overlooked of chance finds which have come through the Treasure Trove system in the last twenty years, and suggests new narratives to enrich our understanding of Roman activity in throughout their invasion and settlement of Great Britain, its effect on the peoples of what is now Scotland, and the interaction of local peoples with the cultures and material cultures of the invaders on their doorstep.

5 CRAFTING TRADITION? MAINTAINING OR CREATING TRADITION IN OCCUPIED LAND, A VIEW FROM ANCIENT BRITAIN

Adams, Sophia (British Museum)

In this paper I propose that a long-term perspective is needed to recognise the effect of invasion on the material culture of both the occupied and occupier in southern Britain in the first century CE. Manufacturing methods and quality of production have often been employed as marking a separation between local methods and Romanising practices. Though I agree that changes in technology can be seen on either side of the Roman invasion of Britain in this paper I criticise the singular separation of local and traditional on the one hand and imported and new on the other. To explore this issue this paper focuses on copper alloy cast and sheet metal objects particularly those adorned with red materials: coral, red glass and red enamel. The application of red materials to weaponry has been interpreted as a distinctive characteristic of the material culture of Iron Age Britain but the colour is also closely associated with the Roman military. The non-linear progression in materials used and manufacturing methods may be highlighted in an object tour from the fifth century BCE Basse-Yutz flagons from Lorraine, to the first century CE strainer vessel found at Chettle Park, Dorset. Through this process I debate the perception of shifts in craft production and the concept of tradition as an interpretive tool for reaching the unwritten responses to invasion.

6 793 AND 1493: COMPARING COLONIAL DISCOURSES OF 'DISAPPEARANCE'

Maldonado, Adrián (National Museums Scotland)

In the archaeological and historical literature around the Viking Age in the northern and western islands of Scotland, UK, the overarching discourse has always been one of colonisation followed by population replacement. The narratives constructed within this discourse only work when we see only Scandinavian people and practices expanding outward from a homeland, without taking into account the effect of these expanded horizons on Scandinavian identities. The linguistic, historical and archaeological data for these events are patchy and inconsistent, but their interpretation has nonetheless extended into extremes of rhetoric involving genocide and replacement. All of this is very familiar to Caribbeanists who study the aftermath of indigenous contact with Europeans. The trope of indigenous 'disappearance' has long been mobilised to justify displacement and disenfranchisement. New ethnohistoric work on the islands of Puerto Rico and Hispaniola has revealed the persistence of indigenous Taíno lifeways despite the massive disruptions of the colonial period. This paper will draw parallels not between two dissimilar historical processes, but rather in the discourses surrounding two contact events – the first Viking raid in northern Britain in 793, and the first European landing on Puerto Rico in 1493 – in order to highlight systemic colonialist distortions of contact scenarios. It will apply Caribbeanist and indigenous perspectives on discourses of identity formation in medieval Europe.

7 LOCAL RESISTANCE THROUGH MORTUARY ARCHITECTURAL TRADITIONALISM TO A SOFT INVASION ON BRONZE AGE CRETE

Miller Bonney, Emily (California State University Fullerton)

The organizers of this session request reflections on the consequences of cultural collisions associated with invasion – movements of people through an act of assault or a migration or trader/merchant colonization from outside one geographic/cultural area into another. This paper suggests that these cultural collisions also can occur through what might be termed soft invasions. In a soft invasion an administrative center expands its reach across a larger geographic area that shares some generally similar cultural characteristics but with distinct local variants. The entity attempting to assert a broader hegemony seeks a homogeneous and unified culture. Around 1900 BCE the administrative and religious institutions located at the palace at Knossos in central Crete initiated such a process. The emergence of palatial architecture and a more shared vocabulary of ceramic motifs across the island reflect the impact of the Knossian consolidation of authority. As in most soft invasions not all regions submitted to the efforts at cultural homogenization. In south central Crete, particularly in the areas closest to the site of Phaistos, there were dramatic assertions of traditional mortuary customs with the construction of some of the largest circular built stone tombs, a type of structure used for collective burials since the beginning of the bronze age. While the scale of the tombs could be attributed to the emergence of powerful families whose ascendance was tied to affiliation with the Knossian ruling

class, the emphatically local appearance and means of construction also could be read as a form of resistance and an effort to push back against the Knossian authority.

931 TRACING HUMAN STORIES THROUGH STABLE ISOTOPES: UNRAVELLING THE DYNAMICS OF HEALTH AND IDENTITIES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Curto, Ana (HERCULES Laboratory, University of Évora) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Democritus University of Thrace) - Goude, Gwenaëlle (CNRS UMR 7269 LAM-PEA) - López-Costas, Olalla (EcoPast. Área de Arqueología. Universidade de Santiago de Compostela; Dpt of Archaeology and Classical Studies. Stockholm University)

Session format: Regular session

Stable isotopes are now widely recognized as an invaluable asset in osteoarchaeology, offering unparalleled perspectives on the diets of humans and animals, as well as their migration behaviours and surrounding environments. Beyond these applications, stable isotopic analysis has expanded its scope to encompass the examination of metabolic processes and isotopic fractionation, providing nuanced insights into the intricate interplay between disease, behaviour, and isotopic composition. And has even applied to identify soldiers and individuals who perished in historical conflicts. The impact of physiological processes and stress on stable isotopes has garnered significant research attention, with pioneering studies highlighting the complex connections between physiological stress, metabolic processes, and stable isotopic signatures. These studies shed light on the complex relationships among human biology, environmental conditions, and overall health.

Studies investigating factors such as breastfeeding duration and the timing of weaning have revealed distinct markers in skeletal tissues, offering valuable insights into the physiological stress experienced during the transition from breastfeeding to solid food. These investigations have contributed significantly to our understanding of childhood nutrition and its lasting implications for health and growth, enabling researchers to discern the effects of growth disturbances and developmental stress in ancient populations.

By analysing stable isotopes in human remains from different social groups or geographical regions, researchers can uncover disparities in health and nutrition within past populations. This approach helps identify patterns of inequality, differential access to resources, and the impact of socio-economic and environmental factors on health outcomes in ancient societies.

During the upcoming session, we will delve into the intricate relationships between physiological responses to disease and potential alterations in dietary behaviours, aiming to elucidate the complex dynamics among health, environment, and culture in various historical contexts.

ABSTRACTS

1 STABLE SULFUR ISOTOPE RATIOS AS AN ADDITIONAL PROXY FOR THE RECONSTRUCTION OF WEANING PATTERNS - A CASE STUDY

Cheung, Christina (Department of Anthropology, Chinese University of Hong Kong; EA – Eco-anthropologie (UMR 7206), Muséum National d'Histoire Naturelle, CNRS, Université Paris Diderot, Paris, France; UMR 7269, LAMPEA, Aix-Marseille Université, CNRS, Minist Culture, Aix-en-Provence, France) - Herrscher, Estelle (UMR 7269, LAMPEA, Aix-Marseille Université, CNRS, Minist Culture, Aix-en-Provence, France) - Macdonald, Rebecca (Department of Archaeology, Simon Fraser University, Burnaby, BC, Canada) - Richards, Michael (Department of Archaeology, Simon Fraser University, Burnaby, BC, Canada) - Thomas, Aline (EA – Eco-anthropologie (UMR 7206), Muséum National d'Histoire Naturelle, CNRS, Université Paris Diderot, Paris, France)

Over the past three or four years, sequential isotopic analysis of human dentine has become an increasingly common approach to reconstruct childhood lifehistory, and often specifically, weaning patterns in archaeological populations. The isotope systems involved are usually those of nitrogen ($\delta^{15}\text{N}$) and/or carbon ($\delta^{13}\text{C}$). Recent advancement in mass spectroscopy has allowed the simultaneous measurement of carbon, nitrogen, and sulfur isotope ratios in small volume of processed dentine, thus opening up the possibility to incorporate stable sulfur isotope ratios ($\delta^{34}\text{S}$) in sequential dentine analysis. However, one question remains: what can $\delta^{34}\text{S}$ in sequential dentine tell us about childhood lifehistory? In this study, a total of eleven first molars from two Middle Neolithic sites in the Paris Basin region, Balloy 'Les Réaudins' (BLR) and Vignely 'la Porte aux Bergers' (VPB) are sequentially analysed for stable carbon, nitrogen, and sulfur isotope ratios. Our results showed that $\delta^{34}\text{S}$ values in sequentially sampled dentine also show corresponding trends during the weaning period, suggesting it can be used as an additional proxy for understanding major shifts in

diets during childhood. However, the result of this study reinforced the importance of establishing an archaeological local baseline, especially that of sulfur, in order to produce meaningful interpretations of the isotope data generated.

2 EARLY LIFE HISTORIES IN PREHISTORIC ALGERIA: FIRST EVIDENCES BY MULTI-ISOTOPE AND BIOANTHROPOLOGICAL APPROACHES

GOUDE, Gwenaëlle (CNRS, Aix Marseille Univ, Minist Culture, UMR 7269 LAMPEA, France) - Chaïd-Saoudi, Yasmina (Algiers University 2, Institute of Archaeology, Laboratory of Sedimentary Basins & Geodynamics, Algeria) - Stéphane Rottier, Samuel Bedecarrats (Bordeaux University, UMR 5199 PACEA, France) - Sayle, Kerry (SUERC, University of Glasgow, Scotland, United Kingdom) - Bray, Fabrice (UAR 3290 MSAP, CNRS, Lille University, France) - Thibaut Devière, Lou Spanneut (Aix Marseille University, CNRS, IRD, UMR 7330 CEREGE, France) - Babredine Sitouah, Maëlle Couvrat (CNRS, UMR 7269 LAMPEA, France/Algiers University 2, Institute of Archaeology, Algeria) - Domingo C. Salazar-García, Robert Power (School of Archaeology, University College Dublin, Ireland/Universitat de València, Spain) - Laurent Bouby, Apolline Lambert (UMR 5554 ISEM, CNRS, University of Montpellier, France) - David Au Yang, Guillaume Leduc (CNRS, IRD, Aix Marseille Univ, UMR 7330 CEREGE, France)

This study presents an unprecedented documentation on the diet, mobility and lifeways of children and adults at the Prehistoric settlement of Columnata (Sidi Hosni, Algeria). Discovered in the 1930's, the site displays material from the Epipalaeolithic to the Neolithic. In this study we focus specifically on newly excavated burials dating from the 11th mill. to the 9th mill. cal BP. The isotopic compositions ($\delta^{13}C$, $\delta^{15}N$, $\delta^{34}S$) of bone collagen of three individuals and teeth of five individuals (sequential sampling in dentine) were analysed. Information on protein intake, environment and life history from ca. birth to early adulthood (depending on the piece analysed) was obtained. Age-alignment for teeth isotopic sequences was statistically adapted. Stable isotope compositions were measured by EA-IRMS, sex determination was confirmed by employing peptide identification in tooth enamel of four individuals, and environment and food resources were further documented by utilising microremains from dental calculus. Results show protein consumption was based mainly on terrestrial resources with a possible high reliance on plant foods. Carbon and sulphur isotopic compositions suggest the exploitation of three different areas as well as intra-life mobility. Exclusive breastfeeding is visible until ca. 12 months for three individuals (both male and female) and one child seems to have benefited from a longer exclusive breastfeeding period. Weaning appears to start at ca. 12 months but teeth sampled do not provide information on completion of the weaning stage. The isotopic profiles of the third molar of a male individual suggest significant changes (subsistence/mobility?) at ca. 17 years old. Isotopic, proteomic and calculus analysis are funded by the French National Research Agency (ANR Women SOFar 21-CE03-0008) and archaeological research is conducted by Algiers2 University, Institute of Archaeology with the support of Algerian Ministry of Culture.

3 ESTIMATING THE HUMAN DIET IN THE ANCIENT GREEK COLONY OF AMBRACIA USING STABLE ISOTOPES ($\delta^{15}N$, $\delta^{13}C$) AND BAYESIAN MIXING MODEL

Georgiadou, Angeliki (Laboratory of Physical Anthropology, Democritus University of Thrace) - Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Xanthopoulos, Kiriakos (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

The coexistence of multiple traditions in the newly formed Greek colonies led to a cultural hybridization allowed nutrition systems to combine in new ways, as food is a marker of social practice. While extensive research has been conducted on reconstructing the diet of past populations through stable carbon and nitrogen isotopes, only a limited focus has been placed on quantifying colonial diets over time using both chemical and statistical data. In this study, we utilise stable carbon and nitrogen analysis of human and faunal remains together with isotopic mixing models to quantify the relative contribution of different food sources in Ambracia, a Corinthian colony. We examine the individuals' diet to clarify food strategies during the colonization process. A diet of 232 individuals and 17 animals was reconstructed by measuring nitrogen and carbon isotope ratios on bone collagen. The material originates from the western cemetery of ancient Ambracia dated from its foundation (625 BC) to the city's decline (33 BC). Dietary protein was estimated using the Bayesian mixing model MixSIAR.

Our results demonstrate that the first settlers and subsequent generations followed the same diet, consisting mainly of terrestrial animals and a lesser extent of C3 plants (grains, cereals, fruit-vegetables) and marine resources (fish-sea-food). During the Hellenistic period (323-31 BC), in which Ambracia became the capital of the kingdom of Pyrrhus, a clear change was observed in the dietary preferences of the population. We noticed a decrease in the consumption of terrestrial animal protein and an increase in the consumption of plant and marine protein. These observations reveal that the population is beginning to combine food sources to a greater extent, indicating the simultaneous exploitation

of more agricultural and fishery products. Our findings provide a basis for more specialized approaches to understanding the colonial subsistence strategies in antiquity.

4 EXPLORING ROMAN CHILDCARE THROUGH STABLE ISOTOPE ANALYSIS AND NUTRITIONAL STRESS EVIDENCE: A CASE STUDY OF LUCUS FERONIAE AND ISOLA SACRA

Formichella, Giulia (Sapienza University of Rome) - Soncin, Silvia (Sapienza University of Rome) - Tafuri, Mary Anne (Sapienza University of Rome)

The weaning period plays a crucial role in the growth and survival of children, influencing morbidity and, consequently, mortality. As known, weaning induces physiological stress, which in turn is influenced by various factors such as the introduction of complementary foods as well as the duration and frequency of breastfeeding. Additionally, environmental, cultural, and socio-economic factors also contribute. Investigating nutrition during Roman childhood, the timing and methods of weaning, and observing morbidity in both children and adults are essential for better understanding the Roman world.

This study aims to explore childcare within the core of the Roman Empire by examining infant feeding practices at two sites located 30 km from Rome, dating back to the 1st-3rd century AD. The first site is the agricultural settlement of Lucus Feroniae, while the second is the harbour site of Isola Sacra. Our investigation employs stable isotope analysis of carbon, nitrogen, and sulphur carried out on incremental dentine sections of permanent first molars or canines of 8 adult individuals (4 from Lucus Feroniae and 4 from Isola Sacra). In addition to stable isotope analysis, the study incorporates palaeopathological analyses aimed at identifying non-specific stresses such as enamel hypoplasia, along with metabolic stresses like porotic hyperostosis and skeletal indicators of C and D vitamin deficiency.

In this setting, we present preliminary results that allow the identification of the onset and completion of weaning as well as other events that characterise the first period of life of these individuals (infancy, early childhood, late childhood and adolescence). Our results are used to interpret practices of childcare at the sites of Lucus Feroniae and Isola Sacra, and here we compare them with previously published studies on other populations in the core of the Roman Empire and on its margins, to delineate similarities and differences.

5 INVESTIGATING DIETARY ($\Delta^{13}C$, $\Delta^{15}N$, AMINO ACIDS) AND MOBILITY PATTERNS (87SR/86SR) AT THE NECROPOLIS OF SAINT JUST DE VALCABRÈRE

Morcillo, Victor (Universidad Autónoma de Madrid) - Fuller, Benjamin T. (Géosciences Environnement Toulouse) - Van Andringa, William (École Pratique des Hautes Études) - Jaouen, Klervia (Géosciences Environnement Toulouse)

Located at the base of the Pyrenees in southern France, the necropolis of Saint Just de Valcabrère is associated with the Roman town of Lugdunum Convenarum. The site dates from at least the 4th century AD when hypogea and tombs were constructed, and it was used for burials until the basilica of Saint Just de Valcabrère was erected in the 11th century AD. For nearly the past decade, excavations have taken place at this site and over 200 individuals representing late Roman and Medieval individuals have been recovered. Here we explore dietary ($\delta^{13}C$, $\delta^{15}N$, amino acids) and mobility (87Sr/86Sr) patterns with a multi-pronged isotopic investigation of 82 Roman and Medieval human individuals (69 adults and 13 perinatals) and 20 animals from this necropolis. The isotopic results indicate that there was a progressive transition in the diet of these individuals with a reduction of dietary animal protein and an introduction of millet from the end of the Roman period toward the Medieval period. In addition, comparative studies of the graves found unique dietary patterns associated with social class. Of particular interest is the burial of a young woman (18-22 years old) that was found in a 4th century marble sarcophagus but was radiocarbon dated to 1960 ± 30 BP or the Roman period before the site was established. Bulk isotopic analysis results did not indicate a unique diet, but $\delta^{13}C$ amino acid analysis determined that she consumed marine protein. The amount consumed is however not sufficient to explain her anomalous ^{14}C age in relation to the reservoir effect. This study advances our knowledge of dietary and mobility patterns during the Roman and Medieval periods in southern France and highlights the important role of amino acid isotopic results in reconstructing past dietary patterns.

6 FED THE SAME WAY? EXPLORING THE INFLUENCE OF BREASTFEEDING, WEANING, AND CHILDHOOD DIET ON ADULT SEX RATIOS IN MEDIEVAL TUSCANY

Amaro, Alessio (Department of Anthropology, McMaster University, Canada) - Fornaciari, Antonio (Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy) - Giuffra, Valentina (Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy) - Kim, Sang-Tae (School of Earth, Environment & Society, McMaster University, Canada) - Knyf, Martin (School of Earth, Environment & Society, McMaster University, Canada) - Prowse, Tracy (Department of Anthropology, McMaster University, Canada)

Osteological and historical evidence suggests a shortage of adult females during the European Middle Ages, where the number of males was atypically higher than that of females. In modern populations, normal sex ratios (RS = 100 * males/females) range between 90 and 105, but at birth this ratio is typically skewed toward males (RS = 104-107). This ratio tends to become more equal over the life course, as males are typically subject to higher mortality rates.

Here we investigate one potential cause that may have contributed to the shortage of women during the Italian Middle Ages - gendered-based differences in the timing and pattern of breastfeeding and weaning. We reconstruct breastfeeding, weaning, and childhood diet patterns of three medieval populations that lived in Tuscany, Italy (11th - 13th CE). Adult first molars from Badia Pozzeveri (n= 24), Aulla (n= 19), and Montescudaio (n= 32) were used to measure carbon and nitrogen isotope compositions of males and females, applying serial sampling of primary dentine using a 1.5 mm biopsy punch. Each tooth provided between 9 to 12 data points per individual, ranging from birth to 9.5 years, covering the period of breastfeeding, initiation and completion of weaning, as well as post-weaning childhood diet. These data were analysed to explore possible gender-based differences in the way male and female children were nurtured (e.g., prolonged/shortened breastfeeding, early/late weaning). Different feeding practices could have affected the health and survivorship of females, impacting the adult sex ratio in medieval Italy.

By exploiting the incremental dentine development, teeth are an important resource for exploring the complexities surrounding the feeding of children in the past. This presentation demonstrates that serial dentine stable isotope compositions can be used to investigate questions beyond infant feeding practices, and help develop explanations for the unbalanced demographic patterns observed in medieval Europe.

7 DIET ($\delta^{13}C$, $\delta^{15}N$) AND MOBILITY ($\delta^{18}O$) IN THE MEDIEVAL SITE OF NOVIODUNUM (ROMANIA): POVERTY AND THE BOGOMIL NEO-GNOSTIC SECT

García-Vázquez, Ana (ArchaeoSciences Division, Research Institute of the University of Bucharest, Romania) - Vasile, Gabriel ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest, Romania) - Coman, Petra (ArchaeoSciences Division, Research Institute of the University of Bucharest, Romania) - Streinu, Marius (National Institute of Heritage, Bucharest, Romania) - Stănică, Aurel-Daniel ("Gavrilă Simion" Eco-Museum Research Institute, Tulcea, Romania)

The Noviodunum archaeological site, situated on the right bank of the Danube, approximately 20 km from the Danube Delta, being the narrowest crossing ford, and becoming a strategic and economic hub from pre-Roman times to the Middle Ages. A civil settlement developed around the fortification, which in the late mid-Byzantine and medieval periods would be occupied by a necropolis that extends to the interior of the fortification, after the latter was abandoned.

This study presents data from 36 individuals spanning the late 11th to mid-13th century, a period when Noviodunum was under Byzantine Empire and Golden Horde rule. The anthropological analysis aimed not only to establish a biological profile but also to document features shedding light on the individuals' general health and lifestyles. This included non-metric traits, anomalies, pathological conditions, antemortem skeletal trauma, skeletal stature, entheses robusticity, and potential enthesopathies. Correlation with age and sex aimed to unravel insights into mortality patterns in medieval Byzantine Dobruja, revealing notable pathologies/abnormalities like biparietal thinning, sacralisation, spina bifida occulta, cervical rib, and leontiasis ossea.

Dietary patterns were determined, with a group of individuals exhibiting a higher reliance on freshwater fish, while others, with lower $\delta^{15}N$ values, suggested different percentages of C4 plants consumption, possibly millet. A male from a grave associated with the Bogomil gnostic sect's ritual burial, has isotopic values that indicates a vegetarian or vegan diet, aligning with their ascetic lifestyle.

Patterns of mobility varied among individuals throughout their lives, and the $\delta^{18}O$ values also indicate different origins or water sources. Given the proximity of numerous lakes besides the Danube, the varied isotopic values find potential explanations in the availability of different water sources in the Noviodunum vicinity.

8 DIACHRONIC CHANGES IN DIET WITH RESPECT TO THE BLACK DEATH: STABLE ISOTOPIC EVIDENCE FROM MEDIEVAL TOULOUSE, FRANCE

Kacki, Sacha (UMR5199 PACEA, CNRS-Université de Bordeaux, France; Department of Archaeology, Durham University, UK) - Tyler, Janelle (Department of Archaeology, Durham University, UK) - Cordiner, Eleanor (Department of Archaeology, Durham University, UK) - Gowland, Rebecca (Department of Archaeology, Durham University, UK) - Gröcke, Darren (Department of Earth Sciences, Durham University, UK) - Montgomery, Janet (Department of Archaeology, Durham University, UK)

The Black Death (A.D. 1347-1352) caused millions of deaths in Europe over a short period and had a major social and economic impact on late medieval societies. Some scholars have posited that this epidemic caused such unprecedented levels of mortality because the population was already weakened by decades of crop failure and famine, while others suggest that the resulting population decline may have led to an improvement in the diet of the laboring classes. To test both these hypotheses, we analyzed carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) stable isotopes in 172 bone samples from medieval Toulouse (France), collected on skeletons from a mass grave related to the Black Death (BD) (A.D. 1348, n=47), and a pre-BD (A.D. 1330-1334, n=69) and post-BD (A.D. 1380-1545, n=56) parochial cemetery. No significant differences were observed between the pre-BD and BD groups, suggesting that there had been no particular decline in the quality or diversity of food consumed in the last few years before the epidemic. There was, however, a significant shift in $\delta^{13}C$ and $\delta^{15}N$ values between these two groups and the post-BD population. These results indicate a diversification of the diet after the epidemic, with increased access to animal/marine protein and possibly C4 plants. The more notable increase in $\delta^{15}N$ values between the BD and post-BD periods was for females, suggesting that the Black Death had different effects on dietary changes according to sex. Overall, the results demonstrate dietary changes in the aftermath of the Black Death and raise interesting questions around gendered access to diet, possibly suggesting reduced social inequalities between males and females following this plague outbreak.

9 THE URBAN EVOLUTION OF DIET: EVIDENCE FROM ANCIENT THESSALONIKI USING STABLE ISOTOPES, BAYESIAN MODELING AND MACHINE LEARNING

Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.) - Choupa, Maria Nefeli (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.) - Georgiadou, Angeliki (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.) - Protosalti, Soultana (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports, 54003 Thessaloniki, Greece) - Tzevreni, Stavroula (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports, 54003 Thessaloniki, Greece) - Konstantinidou, Krino (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports, 54003 Thessaloniki, Greece) - Vasileiadou, Stella (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports, 54003 Thessaloniki, Greece) - Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.)

Urbanization, the concentration of human populations in cities, influences food system dynamics, including food production and consumption, with far-reaching effects on economic, health, and environmental aspects. Understanding the ways in which ancient food systems sustained the equilibrium between food resources and provisioning, requires a long-term perspective, drawn from a range of sources, including anthropological, bioarchaeological and zooarchaeological records.

In this study we target the food system of ancient Thessaloniki, an exemplary pre-industrial urban site spanning 18 centuries. We integrate stable isotope analysis of carbon, nitrogen and sulphur from bone and dentine collagen from skeletal remains. The isotopic data are analyzed using Bayesian modeling and machine learning to reconstruct the dietary components of infant, childhood and adult diets. We introduce the first open-source pipeline for isotopic data, freely accessible as R code. This tool offers metric calculations, collagen quality assessment, plotting options, and algorithmic integration for dietary and weaning reconstructions.

Childhood diets included C3 plants and animal protein, with limited evidence of C4 plants and fish consumption based on preliminary results of 68 individuals (792 $\delta^{15}N$ and $\delta^{13}C$ measurements from dentinal collagen). Adult diets consisted of C3 plants, freshwater fish and limited consumption of animal protein and C4 plants based on 151 measurements of $\delta^{15}N$ and $\delta^{13}C$ and 131 of $\delta^{34}S$ from bone collagen. These data span from the city's foundation in 315 BC through the 16th century AD, focusing on the Roman period (168-324 AD).

Our findings contribute a deeper understanding of dietary patterns using the largest isotopic dataset from ancient bones and teeth samples in Greece. We pioneer the investigation of urban population sustainability through consistent, reproducible, and efficient research approaches.

This research is part of CityLife, an ERC-Consolidator Grant-funded project investigating long-term human adaptation against the backdrop of urban evolution using ancient molecular, historical, and ecological evidence.

10 MAPPING ISOTOPE SIGNALS IN THE HUMAN PETROUS BONE: ITS POTENTIAL USE AS A TOOL FOR LIFE HISTORY RECONSTRUCTION

KONTOPOULOS, IOANNIS (University of Tübingen) - Chovalopoulou, Maria Eleni (National and Kapodistrian University of Athens) - Garcia-Huidobro, Valentina (University of Tübingen) - Bocherens, Hervé (University of Tübingen)

During the past few years the petrous bone has become the most sought-after skeletal element for palaeogenetic studies as the endogenous DNA yields are often dramatically higher compared to other skeletal elements. Still, many things about the formation and remodelling of its sub-components remain unclear. The inner ear part of the petrous bone, unlike long bones, is assumed to be fully formed in utero. However, it is uncertain whether different parts may attain their adult characteristics in infancy and/or early childhood. It is, therefore, unknown whether the petrous bone can be used to better understand physiological and metabolic changes in ancient individuals.

Since the unique microstructural characteristics of the petrous bone (e.g. the co-existence of woven and lamellar tissue) suggest a complex picture, we present our initial results on the relationship between the isotopic composition of different anatomical sites of the inner ear and their formation time (in utero, infancy, early childhood). Petrous bone isotope mapping with high temporal resolution is achieved through the comparison of a large number of modern human petrous bone microsamples (n=120) to sequential dentine (n=131) collagen isotopic data intra-individually (5 individuals). The potential use of the petrous bone collagen isotope signals as an additional or alternative tool to dentine isotope values for life history reconstruction is further assessed.

11 EXPLORING THE INTERSECTION OF MATERNAL-INFANT DIET, HEALTH, AND SOCIAL STATUS IN INDUSTRIAL LONDON: A COMBINED PALAEOPATHOLOGICAL AND STABLE ISOTOPE APPROACH

Eggington, Jack (University of Reading) - Lewis, Mary (University of Reading) - Müldner, Gundula (University of Reading)

Historical literature has identified socioeconomic status as a significant causative factor in poor health, morbidity, and mortality during the industrial period in England. However, the effect of social status on the maternal-infant nexus of diet and health is less clear, and bioarchaeological analysis offers the only means to directly observe this sensitive relationship.

This study applies a nuanced approach to exploring this issue, utilising both palaeopathological and chemical methods to provide a comprehensive understanding of the status and nutritional health of both mother and child. Young non-adults (20 weeks gestation to 3 years postpartum) and adult females (22-46 years) from the industrial cemetery of St. James, London (n=460) were analysed. The short duration of cemetery use (1789-1853) and defined social stratification, allows for the consideration of broad patterns of diet and health, in addition to individual life histories. Non-specific stress (dental enamel defects and growth disruption), metabolic disease (scurvy and rickets), and caries were recorded using macroscopic and radiographic standards, providing evidence for the impact of nutritional deficiencies in young non-adults and adult females. A sub sample of individuals was selected for nitrogen and carbon stable isotope analysis of bone collagen (n=95) and 30 teeth (20 DM1 and 10 M1) were sectioned for incremental dentine analysis (average of 18 increments for M1, and 9 for DM1).

A high prevalence of scurvy in infant (in the first year of life) individuals (18.9%, n=10) and evidence of growth disruption, could be indicative of poor maternal diet and health, or early weaning practices. Coupling the palaeopathological data with high resolution stable isotope analysis allows for the exploration of these possibilities and the complex interplay of social status, adult and infant diet, breastfeeding and weaning practices and nutritional stress at a population and individual level.

12 EXPLORING POTENTIALITY OF STABLE ISOTOPES AND ELEMENTAL COMPOSITION FOR AIDING IN THE IDENTIFICATION OF BRIGADIERS KILLED IN SPANISH CIVIL WAR

López-Costas, Olalla (Area of Archaeology. EcoPast. CRETUS. Universidade de Santiago de Compostela, Spain; Archaeological Research Laboratory, Stockholm University, Wallenberglaboratoriet, SE-10691, Sweden) - Martínez Cortizas, Antonio (CRETUS. EcoPast. Fac of Biology. Universidade de Santiago de Compostela, Spain) - Benito Sánchez, María (Departamento de Medicina Legal, Psiquiatría y Patología - Laboratorio de Antropología y Odontología Forense. Universidad Complutense de Madrid, Spain)

The Spanish government and people are deeply indebted to the International Brigadiers, people who left their country behind to fight in the Spanish Civil War (1936-1939). One way to repay this debt is to identify those who ended up in an unmarked grave and return the skeletons to their families. In this work we explore the potential of stable isotopes in bone collagen and elemental composition to understand aspects of the lives and death of these men and women. We investigate three male skeletons found in a mass grave with ten individuals and placed in La Casa de Campo, Ma-

drid. The brigade they belonged to is known and their pairs were already identified. From each of them we sampled the 3rd right rib. A secondary objective is to understand intra-bone variability in order to evaluate the homogeneity/heterogeneity of the data. For this, each rib was sub-sampled in 5 fragments from the vertebral end to the sternal end, separating cancellous bone from cortical bone. A total of 32 samples were analysed by FTIR-ATR to understand the bone composition, showing bands of calcium phosphate, carbonate and amides compatible with well-preserved collagen and bioapatite. Collagen was extracted from cortical bone (n=15) obtaining low variability in isotopic composition, i.e., $\delta^{13}\text{C}$ (-18.6±0.1; -18.4±0.1; -18.0±0.1), $\delta^{15}\text{N}$ (11.4±0.2; 11.2±0.2; 11.8±0.3) and $\delta^{34}\text{S}$ (5.5±0.2; 7.0±0.1; 8.5±0.1). Mercury concentrations show large inter and intra-individual differences (60±32µg/kg; 13±3µg/kg; 17±14µg/kg) following a gradient along the rib, higher in the sternal end. This fact is discussed as related to the body position during decomposition. ICP-MS (32 elements) was performed to understand aspects of premortem life (exposure to metals) and soil characteristics. All results are discussed together with the osteological and textual information to narrow the possibilities of these individuals' origin and way of life, approaching their biography. However, some limitations were observed.

932 CONTINUITY AND CHANGE IN THE WAGONS AND CHARIOTS OF LATER PREHISTORIC EUROPE AND EURASIA

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Reinhold, Sabine (German Archaeological Institute) - Ginoux, Nathalie-Cécile (Sorbonne Université; Centre André Chastel (UMR 8150)) - Vardanyan, Benik (Institute of Archaeology and Ethnography NAS RA; History Museum of Armenia) - Giles, Melanie (University of Manchester)

Session format: Regular session

Chariotry is a daring and dramatic aspect of Late Bronze Age and Iron Age life which emerges out of a much longer tradition of wagonry. These captivating assemblages offer unique insights into the transformation of relationships between people, animals and material culture: transforming speed and mobility by compressing time and space. They also quickly become a symbol not just of socio-political power but ritual authority.

This session encourages speakers to present old and new case studies, particularly from the last 25 years, which expand our knowledge of wheeled vehicles. It will include the uniquely preserved chariots found together with four-wheeled wagons in the Late Bronze Age necropolis of Lchashen (Armenia): a watershed moment in the history of wheeled transport. It will also present examples from Iron Age Europe, where two-wheeled chariots began to replace the Hallstatt traditions of four-wheeled wagons by the 5th-early 4th century BCE. Yet our session will argue for a more polychronic approach to wheeled vehicles that challenges neat sequences of cultural change in terms of 'transformation' effects: legacies and traditions that are passed on while being transformed, rather than representing a linear continuum of practice. We thus welcome papers that examine wagons and chariots from different perspectives: co-existence and persistence of technical knowledge, changes in social meaning and value, critically exploring both long distance cultural contacts as well as local craft traditions.

We also encourage presentations on the representation and symbolism of wheeled vehicles, with examples that encompass not just spectacular burials but 'everyday' wagons and draught vehicles. Our session thus aims to debate the ways in which wheeled vehicles transformed agricultural as well as socio-political practice, empowering and distilling fundamental ideas about prestige and personality but also shaping deeper cosmological and eschatological beliefs, including journeys into death.

ABSTRACTS

1 BRONZE AGE WHEELED VEHICLES OF THE CAUCASUS AND BEYOND - AN INTRODUCTION

Reinhold, Sabine (German Archaeological Institute)

Wheeled vehicles were introduced during the mid-4th mill. BCE in area from Southwest Asia to Scandinavia. Whether their invention spread out of a single center or from multiple places is still debated, yet these early wagons changed like little other innovation human lifeways in Eurasia. Harnessing cattle and later horses as engines of labor to wheeled vehicles facilitated agriculturalists to enlarge work and transportation capacity, pastoralists to expand economic networks, and warriors to accelerate their campaigns.

Wagons became part of grave assemblages in the Caucasus from the very beginning. From this time onwards and in expanding geographical regions, wagonry became a central element in funeral rituals. However, we see little differentiation in graves with and without wagons during the 4th and 3rd mill. BCE. Only by the final 3rd mill. BCE the 'Early Kurgans' in the Caucasus, the 'Royal tombs' of Alaça Höyük or the 'Royal tombs' of Ur involved wagons in assemblages that far exceeded those of contemporaneous burials and that can be attributed to ruling political elites. A game-changer in wagonry was the domestication of the horses during the 3rd mill. BCE. After 2200 BCE these

horses spread rapidly from north of the Caucasus into Europe, Central and Southwest Asia, and at least from 2000 BCE they were harnessed in front of two-wheeled chariots. Mesopotamian texts attest to the assignment of chariots to 'royalty', outline the high costs involved in operating chariots but likewise highlighting the acceleration of movement and warfare using them.

I will explore the social history of early carriages in the Caucasus and Eurasia focusing on the interplay of social representation and the use of wheeled vehicles in everyday life that maybe lies at the heart for certain persons to be presented in death driving or in possession of a carriage.

2 WEALTHY TOMBS WITH WAGONS FROM BRONZE AGE GONUR (TURKMENISTAN)

Tufer, Mike (German Archeological Institute, Eurasia-Department)

In the second half of the 3rd millennium BCE the early urban settlement of Gonur emerged as its ritual centre of the so-called Margiana (Turkmenistan). The site is surrounded by extensive necropolises with thousands of graves, of which one stands out due to particularly richly furnished and architecturally elaborately designed tombs. They are referred to as 'Royal Tombs' and included, among other things, four-wheeled vehicles. As draught animals camels were used in addition to donkeys. Similar wagons pulled by camels are illustrated at Central Asian petroglyphs.

Far-reaching contacts by means of these wheeled vehicles can be assumed from evidence of possible four-wheeled vehicles in tombs in Western China that also contained burial objects of Central Asian provenance.

The Margiana is generally a region poor in raw materials. The widespread presence of stone and metal artefacts in the tombs of Gonur, however, is evidence for a continuous supply of raw materials that were then processed in the settlement's workshops. We can assume that the group of people who were buried in the luxuriant graves with vehicles as grave goods acquired their wealth by supplying the settlement with such raw materials. However, it is difficult to determine whether these people were also part of the Margiana's political ruling class. In the so-called 'palace' burials existed that do not contain any grave goods. The sumptuous burials with wagons thus may have been reserved for merchants, whereas the political (ritual?) ruling class had no need to express their importance through grave goods.

3 THE DYNAMICS OF SOCIAL ELITES AND WHEELED VEHICLES IN LATE BRONZE AGE ARMENIA: INSIGHTS FROM THE ARCHAEOLOGICAL SITE OF LCHASHEN

Vardanyan, Benik (Institute of Archaeology and Ethnography; History Museum of Armenia)

In Armenia, wheeled vehicles have played a significant role in funerary rituals since the Middle Bronze Age (23th BC), with four-wheeled wagons being the earliest. The transition from the 3rd to the 2nd millennia BC saw wheeled transport in funerary rituals symbolizing a distinct social status, particularly among elite members of communities.

During Late Bronze Age, spanning the 15th to 13th centuries BC, the social landscape represented by excavated settlements and burial practices changed. The consolidation of military, religious, and economic power around central figures led to the use of wheeled vehicles or symbolic substitutes as key identifiers in associated burials.

Monuments like Lchashen, Lori Berd, Metsamor, V. Naver, Gegharot, Artik, etc. serve as invaluable sources for exploring the cultural, economic, military, and social aspects of the LBA in Armenia. Lchashen, in particular, stands out despite its underexplored excavation data from 1956-1975, highlighting 295 burials now stored in the Historical Museum of Armenia.

While Lchashen's earliest burials with vehicles date back to the MBA, the LBA exhibits remarkable structural diversity. The 23 identified vehicles can be categorized into two-wheeled charts, four-wheeled wagons, and spoke-wheeled chariots. Notably, four-wheeled wagons from this era were harnessed with cattle, while two-wheeled wagons from the 1st half of the 15th century BC were drawn by horses.

Beyond complete chariot complexes, certain burials feature symbolic chariot parts, including wood fragments, wheels, yokes, bridles, horse remains, and charioteer armor. Bronze group sculptures of chariots, depictions on vessels and belts, and rock paintings further enrich the archaeological record.

This report aims to illuminate the circumstances surrounding the discovery of wagons and chariots in Lchashen, utilizing archaeological data to delineate connections between the interred individuals and the states of the Near East. Through this investigation, an understanding emerges of Armenia's pivotal role within the LBA world-system.

4 CHARIOT REPRESENTATIONS ON BRONZE BELTS ICONOGRAPHY FROM THE SOUTH CAUCASUS

Manukyan, Sonja (Freie Universität Berlin; BerGSAS - Berliner Antike-Kolleg)

Chariots from the LBA and EIA are not only found in archaeological contexts but also in contemporary visual arts. In this regard, the iconography of Southcaucasian bronze belts is an indirect source of information for the appearance, use, and symbology of wagons in the late prehistoric communities in the region.

These depictions occur in Akthala, Astghi Blur, Chakhbulag, Lchashen, Narekvavi, Stepanavan, Tli, and Iranian Azerbaijan. Additionally, archaeological evidence (e.g. Nerqin Getashen), indicates the simultaneous presence of belts and actual chariots. It is probable that the association of these two objects is linked to elite status and reveals the importance of chariots in both funerary rituals and visual art.

Several common traits are noted in their representations. Their two-spoked wheels are symmetrically positioned under and above the carriage and depicted from a side view. Horses are the typical draft animals employed. The presence of a yoke connecting the animals, whether four, two, or two pairs, is common. Most chariots feature a shaft between the coach and the yoke. Some chariots include reins, which are connected either to the yoke or to the animals' bits. Regarding the human figures (charioteers and/or chariot fighters), they are often depicted above the carriage. Two variations are observed in Lchashen, where the driver is dismounted behind the vehicle, and Chakhbulag, which lacks it altogether. A unique feature is in one of the Stepanavan chariots, where the chariot is divided into two sectors, one for each passenger.

The resonance of the iconographical approach can give information that is rarely provided by actual archaeological finds, such as the way the chariots were operated, the number of "passengers" they could host, and their function. Moreover, it shows the importance of wagons as an integral part of the existence of these high-status individuals, being portrayed even on their vestments.

5 THE FINAL JOURNEY. CHARIOTEERS AND CHARIOT OWNERS IN IRON AGE TEMPERATE EUROPE

Anthoons, Greta (Independent Researcher)

Remains of a charioteer's accoutrement – a goad or a whip – are rarely attested in chariot burials. Andrew Fitzpatrick has suggested that the driver of the chariot was also the horses' groom, a servant of the individual or family who owned the vehicle. Like the horses – rarely buried with the deceased – the charioteer/groom would have remained in the service of the family after the burial and would have held on to and looked after the goad. This would imply that most individuals buried with a chariot were the (high status) owners but not the drivers of the buried vehicles, which is different from other narratives, where the deceased is generally portrayed as a charioteer. No doubt, both roles were sometimes assumed by one and the same person. We can speculate but have no certainty why a given person was buried with a chariot, and this may vary with time and place. If the vehicle was composite and/or communally owned, as suggested by Melanie Giles for the East Yorkshire chariot burials, the emphasis may have been on facilitating the deceased's journey to the afterlife, rather than on evoking the prestige of owning or driving a chariot.

Drawing on iconographic, textual, and archaeological evidence, this paper will discuss the social status of charioteers in Iron Age temperate Europe and will delve deeper into the issues outlined above.

6 THE TROMPGÅRD BURIAL. -NEW TRENDS IN BURIALS OF FOUR-WHEELED WAGONS, SOUTHWEST SCANDINAVIAN ROMAN IRON AGE, 1ST TO 3RD CENTURY CE

Jepsen, Jeppe (Museum Nordsjælland)

Among elite burials from the southwestern Scandinavian Roman Iron Age, burials with richly decorated four-wheeled wagons stand out. The carts were originally perceived as part of the group of bog offerings, and not as part of status-marking grave gifts. This view that stems from the first find of splendid wagons at Dejbjerg and from Tacitus' Germania. Today it is clear that the four-wheeled wagons are not only sacrificial finds, but rather part of the burial equipment in rich graves from the time just after the birth of Christ. The number of finds of these magnificent chariots has increased sharply in recent decades. They have all appeared either in grave finds or in a context where they have entered complex burial rituals.

One such find is the Trompgård find from Bjergby, Northwest-Vendsyssel. The Trompgård find site was heavily damaged by recent cultivation, yet a pattern emerged where the deceased individual had been cremated and interred in one pit, while the burnt wagon was buried in a nearby pit. And at these two facilities, the ashes from the cremation were deposited in an independent feature. These ash burials are a phenomenon that can be found at other burials in which prestigious wagons are included, Hedegård and Kraghede. The phenomenon is strongly reminiscent of the concept of Bustum. Likewise, there is another characteristic that the burials were carried out in settlements, and suggesting these settlements were burnt down as an element of the burial ritual.

7 ASSEMBLAGES OF POWER: LATER PREHISTORIC AND EARLY ROMAN WHEELED VEHICLE DEPOSITS IN BRITAIN

Giles, Melanie (University of Manchester) - Adams, Sophia (The British Museum) - Moore, Tom (University of Durham)

Chariots and wagons from the middle Iron Age-early Roman era provide the opportunity to explore the concept of an archaeological assemblage through composite, crafted vehicles which spill beyond their materials; harnessing the skills of human and equine participants with wood, metal and hide components, alongside captivating Celtic art affects... producing intimidating displays of power. In this paper, we present a range of recent discoveries alongside the re-analysis of old finds, encompassing both complete chariot burials, hoard components and vehicle deposits. We will present select osteobiographies and object histories of some vehicles, charioteers and their ponies, but we also pay attention to the performative spectacle of vehicle deposition. Recent metal detectorist discoveries have expanded the repertoire of pony gear associated with chariotry in Britain. Our case studies will range from the middle Iron Age to the first century CE, considering both the 'hey day' of chariot burials in Britain and the role of both chariot and wagon as symbols of indigenous authority at the time of the Roman Conquest.

934 SACRED LANDSCAPES IN CONTEXT: CREATION, DEVELOPMENT, AND CONCEPTUALISATION

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Zapelloni Pavia, Arianna (Charles University Prague) - Comes-Trinidad, Emilie (Laboratoire ArAr - Maison de l'Orient et de la Méditerranée (Lyon, France)) - Mazzilli, Francesca (Royal Holloway University of London; Universität Münster) - Terrier, Aurelie (EPFL (Ecole Polytechnique Fédérale de Lausanne) - ENAC IA LAPIS) - von Bechtolsheim, Mirjam (Open University)

Session format: Regular session

This session aims to shed light on the notion of sacred landscapes on the one hand as part of ancient living realities and, on the other hand, as part of analytical categories in Antiquity and the Middle Ages. We would like to expand and deepen current conversations about the meaning(s) of sacred landscapes and the methodologies that scholars can use to investigate religiosity in the landscape with a broad chronological and geographical framework, considering the Mediterranean basin from Prehistory to the Middle Ages. Within this framework, the session will focus on four interrelated themes:

1. 'Creation' explores how and why sacred landscapes were created and recognised in different contexts in the ancient Mediterranean world, or whether they were unique to a geographical location or time.
2. 'Development' hones in on questions of continuity and change within sacred landscapes, exploring the impact of socio-cultural, political, and religious dynamics on their transformations and considering whether they remained constant amidst evolving human contexts.
3. 'Evolution' highlights the shift from the notion of the sacred landscape to a geography of the sacred brought about by the emergence of medieval societies and the new role played by religious establishments in constructing territory.
4. 'Conceptualization' addresses contemporary scholarly frameworks for defining 'sacred landscapes' and explores methodologies for discerning sacred meanings within ancient landscapes.

This session seeks to assemble diverse perspectives from different contexts to elucidate the complex and multifaceted nature of sacred landscapes in the Mediterranean basin throughout one and a half millennia and to generate discussion across disciplines beyond chronological and geographical boundaries. By establishing comparative frameworks, the session will showcase a range of research questions and methodologies that can enhance our comprehension of sacred landscapes.

ABSTRACTS

1 SACRED LANDSCAPE IN ANCIENT EGYPT: ROYAL IDEOLOGY, SOCIETY AND MODERN FRAMEWORKS

Chapon, Linda (Équipe Égypte Nilotique et Méditerranéenne (ASM - UMR 5140) University Paul-Valéry Montpellier 3, France)

In Ancient Egypt, natural landscapes and man-made monuments were intrinsically linked to create a sacred landscape imbued with religious and ideological concepts. Well explored is the Theban landscape (Luxor), whose east-west orientation governed monuments and ritual processions and which undoubtedly impacted ancient Egyptians' living

realities. This area had particular natural features, such as the natural pyramid, that influenced the development of concepts surrounding the landscape and how it was shaped to integrate monuments and rituals, including processional avenues. In particular, temples were multifocal, powerful centres encompassing religious, cosmic, ideological, political and economic aspects. However, monumental architecture and ritual landscapes also embody the supreme function of the king as the provider for the gods. Though exceptional, mainly thanks to monumental sources from the area, the case of Thebes is not unique. It was somehow a recreation of an inherited/reproduced sacred and conceptual landscape for dynastic purposes in the Middle Kingdom (c. 2030-1650 BC) and then again in the New Kingdom (c. 1539-1075 BC). This paper aims to discuss in what way royal ideology and elites, on the one hand, and relationships with the nature of the population in general, on the other hand, were at the heart of the (re)creation of sacred landscapes. Hence, this would allow an approach to how kingship using monuments and rituals was embodied in the sacred landscape and how society integrated and perceived these realities. When exploring these issues, it becomes necessary to reflect on the current frameworks and parameters we use to identify and understand sacred landscapes in Ancient Egypt.

2 TROJAN WANDERERS BETWEEN EAST AND WEST: APPROACHING SACRED LANDSCAPES IN NORTHERN EPIRUS

D'Ambola, Francesca (University of Rome - La Sapienza)

In Epirus the diffusion of narratives connected to the Trojan cycle is mainly documented by written sources. The toponymy also indicates their relevance for Epirote identity and collective memory, especially in the region of Chaonia. Within this cultural landscape, symbolic meaning could have been embedded within natural landscapes and some sites could have been chosen as places of worship.

The paper aims to analyse these narratives, embraced by Chaonian elites since at least the 5th century BCE, and their manipulation over the centuries as a potential contributing factor to the importation of cults and deities connected to the Trojan cycle. Written sources will be related to archaeological evidence, geographical features and iconographic data. From a diachronic perspective, these data will be connected to the broader socio-cultural and political context, with a particular focus on the Hellenistic and Augustan periods, when some Chaonian communities had a privileged position in the dialogue with Rome during the Macedonian Wars and Augustan colonisation.

These traditions show how the Trojan myths were used in the redefinition of sacred landscapes, by acting on local toponymy and monuments. A diachronic view allows us to investigate how landscapes were transformed to better suit new political or social needs, for example, to gain prestige through common ancestors or to facilitate diplomatic relations.

The analysis will hopefully underline the importance of sacred landscapes as a tool for individuals and groups to create a shared identity and to demonstrate their status by adopting mythological narratives and by spreading cults and religious imagery. Lastly, the study of sacred landscapes could enhance the comprehension of the changing political, cultural and social dynamics of the territory.

3 DIVINE PEAKS. MOUNTAINS AS SACRED LANDSCAPES IN ANTIQUITY

Marti, Cynthia (Philipps-Universität Marburg)

This paper aims to explore the sacredness of remote mountainous landscapes in the Mediterranean, with a special focus on Attica and the Peloponnese during antiquity, from the Geometric to the Hellenistic era. Since large parts of Greece consist of mountainous regions, mountains did not only have an economic and social relevance, but are also places where sanctuaries were located, making them into sacred landscapes and places of ritual practices of ancient communities.

The exploration of mountains as sacred spaces prompts the questions about the human-environment interactions in these remote areas at the margin of the polis. In these sanctuaries, both the natural features such as altitude, visibility or vegetation as well as built architecture like temples, altars or temenos play an important role in creating a sacred atmosphere and offer insights into the ways in which ancient communities engaged with their environment. Moreover, mountains also play an important role in ancient myths and, in addition to their significance as places frequented by humans, making them into imaginary landscapes inhabited by deities and mystical creatures.

In summary, this paper aims to contribute to a comprehensive understanding of mountains as sacred landscapes, exploring the interconnections between mountainous regions, cult architecture and practices in peripheral areas. Through interdisciplinary exploration using both archaeological and textual sources, I aim to discuss the economic, social and religious dimensions of sanctuaries in mountainous regions.

4 **SENSING ILLUMINATED OLYMPOS OVER TIME AND SPACE, ALONG WITH ITS TRANSFORMED RELIGIOUS ASPECTS IN HOMER**

Saito, Yukiko (University of Liverpool, UK; Osaka University, Japan)

This paper attempts to explore how viewing Olympos could be recognised or perceived, and transformed over time and space, primarily focusing on the Homeric scenery, providing new insights on how to visualize the ancient vistas as a sensory experience, through colour/light-related epistemological investigation.

Olympos appears ubiquitously in Homer and its varicoloured landscape and brightness have been pictured since antiquity. Its embellishments are various, such as *ἀγάννιφος*, 'snow-capped,' (Il. 1. 420, 18. 186, etc.), *μακρός*, 'tall,' 'lofty' (Il. 1. 403, 2. 48, etc.), *αἰπύς*, 'steep,' (Il. 5. 367, 5. 868, etc.), and so on. At Od. 6. 41-45, Athene with *γλαυκῶπις* goes to Olympos, which is described as standing firmly, unaffected by anything whatsoever – winds (*ἄνεμος*), rains (*ὄμβρος*), or snow (*χιών*) – and the shining light spreads over; *λευκή δ' ἐπιδέδρομεν αἴγλη*. The expression *ἀπ' αἰγλήεντος Ὀλύμπου*, 'from bright Olympos,' occurs three times (Il. 1. 532, 13. 243, Od. 20. 103). Zeus as *αὐτός Ὀλύμπιος*, 'the Olympian himself,' also sends forth *φῶς* (light) as a portent (Il. 2. 308-310). The brightness played a significant part in conveying the religious sense to viewers, and still does today.

Examining the sceneries where *Ὀλυμπος* is portrayed, I elucidate how bright-hue-related aspects of Olympos influenced the ancients' perceptions, while investigating mutual connections of those *Ὀλυμπος*-attached spaces, as well as metaphorical, transformed representations that the Olympos vista indicates. Accordingly, its quintessential effect upon human minds, the multi-faced divine sense of awe that its radiance implies in a space-time continuum is extracted. My objective is to untangle the woven interconnections of colour/light and divinity within the landscapes of Olympos as the poet's aesthetical design, like an orchestration inside the story and beyond, producing not only dazzling visual effects but also the immeasurable sacredness of Olympos that continues to illuminate us all.

5 **WORSHIPPING SILVANUS AT WORK: APPROACHING ROMAN PROFESSIONAL ECOLOGIES AS SACRED LANDSCAPES QUANTITATIVELY**

Glomb, Tomas (Masaryk University)

This paper proposes a hypothesis that the worship of specific deities played a significant role in mitigating uncertainties and reducing risks associated with working environments in the Roman Empire. For example, hunters were tied to animal habitats, miners to mineral deposits, and soldiers to tensions at political borders, and any abrupt change or disbalance in those environments constituted an enormous threat to the livelihood of those professionals. Through appropriate worship, people of profession had the means of transforming their working environment into a balanced sacred landscape protected by a deity. This paper tests these assumptions through a case study focusing on exploring quantitatively the relationships between working environments and the worship of Silvanus, the Roman god of woods, uncultivated lands, fields, and estates. Methodologically, the paper presents formal analyses of geocoded Latin epigraphic evidence as a proxy for both professional activities and situated worship of Silvanus in the Roman Empire. By using spatial proximity analysis and machine-learning predictive models, the paper explores whether it is possible to retrospectively predict a portion of the known places of worship of Silvanus by geocoded locations of professional ecologies dependent on forest conditions. As a result, the paper opens the broader question of to what extent people of profession contributed to the known spatiotemporal distribution of cults in the Roman Empire by transforming their places of work into sacred landscapes.

6 **RESILIENCE AND CHANGE IN THE (RE)CREATION OF SACRED LANDSCAPES IN THE GRAECO-ROMAN CITY OF ISTROS (BLACK SEA)**

Litu, Alexandra (University of Bucharest) - Achim, Irina (Vasile Parvan Institute of Archaeology (Romania))

The city of Istros lies on the Western shore of the Black Sea having been founded by Ionian colonists from Miletus in the 7thc. BC; it entered Roman administration under Augustus and endured until the beginning of the 7thc. AD. It was excavated since the beginning of the 20thc. and during this time a number of sacred structures of Greek age (from Archaic to Hellenistic) and six paleochristian basilicas (four of them are *intra muros* and in close proximity) were identified and researched up to now while the evidence for the Early Roman Age is more scarce. The landscape of the city seems to have been substantially reshaped over time with sacred structures having been built and abandoned. Only one area in the city (in the limits of what has been excavated) apparently shows persistent resilience in its sacred character from the 6thc. BC to the 6thc. AD under various guises - Archaic and Early Roman Age bothroi placed in part immediately underneath a 6thc. Christian basilica with crypt. Offerings found in these bothroi raise the possibility of them being connected to the main deity of this Milesian colony, Apollon Ietros; epigraphic evidence shows that deities evoking Ionian identity were honored deep into the Roman age. Other Greek cult buildings and rock-cut pits with significant finds have been excavated in other parts of the city, but in no demonstrable precedence to later cult structures. This configuration also raises the issue of the (re)creation and limits of sacred landscapes, and of the fluctuation of areas given symbolic weight in a city - obviously, a network created by rock-cut pits differs from a landscape created by Christian basilicas which is expressed not only by their monumentality, but also through their demonstrable connectedness through a system of streets allowing for sacred processions.

7 **CREATION AND EVOLUTION OF A SACRED LANDSCAPE: THE SITE OF SANTA MARTA (CINIGIANO, GR), MIDDLE OMBRONE VALLEY**

Baleani, Benedetta (University at Buffalo - SUNY) - Mandorlo, Alessia (Università del Salento) - Cirigliano, Giuseppe (IMT Lucca) - Massari, Alberto (Università di Trento) - Golia, Vincenzo (Università di Siena) - Felici, Cristina (Università di Siena) - Cirillo, Marianna (ATS - Archaeolandscapes Tech&Survey) - Ugolini, Federico (Università di Siena) - Vaccaro, Emanuele (Università di Trento) - Campana, Stefano (Università di Siena)

Starting from Late Antiquity, the Christianization of rural areas caused several deep transformations of sacred landscapes. In recent decades, this phenomenon in Southern Tuscany has been a polarizing area of study. Of particular interest are religious structures that often overlap pre-existing centers, and become new hubs throughout the end of the Roman Empire and Middle Ages. This trajectory of change reflects the development of local communities and their mutable relationship with the territory. The archaeological site of Santa Marta, discovered in 2007, provides further insight into this phenomenon. Recent excavations, beginning in 2012 and still ongoing, highlight the site's pivotal role in the middle of the Ombrone Valley over many centuries (2nd - 17th cent. CE). Santa Marta, situated along the ancient route that connected the Tyrrhenian coast with the inlands, and the Adriatic Sea, represents an opportunity to document the transformation of an extended Roman *mansio* within a Christian religious space. Stratigraphic investigations have illuminated a 2nd century complex, comprising residential areas, and both a private and a public *balneum*. Despite these structures falling into disuse within the first half of the 6th cent. CE, there are some sporadic traces of activity datable to the following century. From the Early Middle Ages (9th cent. CE), Santa Marta boasted a large church characterized by various construction phases, some of which may precede the 9th century. The centrality of Santa Marta to the local communities is attested by the presence of an extended cemetery, used until the 17th century. Numerous burials, associated with different construction phases of the church, are located both inside and outside the structure. The continuous use of the site seems to derive from the role of the route, which justified the establishment of a *mansio* and enabled the evangelization of the internal rural region.

8 **BRINDISI RURAL CHURCHES AS A MEDIUM OF EVANGELISATION AND TERRITORIAL CONTROL (5TH-8TH CENTURY)**

Zocco, Simone (Sapienza University of Rome)

In the Brindisi countryside (Apulia, Italy), several churches, which can be dated to Late Antiquity and Early Middle Ages, were built near road routes or crossroads.

During the 5th-6th century CE, the road system was the basis of the evangelisation process of the local rural societies: the present intervention aims to understand the dynamics of Christianization, the context in which the first churches were founded, and the relationship between the churches mentioned above and the late antique settlement structure.

In the 7th-8th century, after the Lombard invasion, some of these buildings underwent a series of renovations following precise architectural schemes, while new Christian temples were founded. The resulting ecclesiastical organisation, therefore, appears different compared to previous centuries: the suggested hypothesis is that the churches played a distinct role in this phase, being more focused on the control/defence of the territory in an area of possible friction between Lombards and Byzantines. Through the comparison with different sources, the present contribution will attempt to propose a possible evolutionary landscape model from the perspective of sacred buildings, specifically observing their function within local settlement and social systems.

9 **ENGENDERING RURAL SYMBIOSIS: VILLAS AND CULT IN THE LATE ROMAN PERIOD**

Beckmann, Sarah (University of California, Los Angeles)

The last century has brought to light many late antique villas, which scholars mark as evidence for a late antique "villa boom." Much has been made of widespread architectural and decoration renovations (mid-3rd – early 5th c. CE), and scholars have traditionally explored the degree to which such renovations reinforced social hierarchies. Indeed, late antique villa are frequently conceived as evidence for a burgeoning elite class, for peer polity competition across *domini*, and for increasingly fraught relations across wealthy landowners and their poor clients. My paper challenges these assumptions, which are rooted in literary sources and medieval-oriented teleologies. The relationship between late antique villas and the *rus*, I alternatively argue, was more symbiotic than we have previously admitted.

I make this case using cult structures created *ex novo* in the late antique period at villas in southwestern France and the Iberian Peninsula: mausolea, ritual "pagan" sites, and paleo-Christian structures. These too have been interpreted

primarily as status objects, which obfuscates their role in engendering community in the late Roman *rus*. The quasi-public nature of many of these cult sites, I argue, can and should be treated as a window onto the interdependencies linking villas with the rural populations living on and around them. Rural groups were apparently receptive to estate cult offerings; they made use of them often, as proven by dedications but also by habitation and burial in nearby locales. We may therefore look to villa cult sites to reconstruct not only the sacred practices animating the late Roman *rus*, but also the symbiotic relationships linking subaltern rural populations to villas and the surrounding land, sometimes long after the cessation of elite habitation. So-called private cult sites, I argue, are ultimately poised to bring greater attention to the shape and character of the provincial countryside in late antiquity.

10 REPRESENTATION OF THE "SACRED LANDSCAPE" OF THE FIRST CHRISTIANS IN RURAL PROVENCE IN LATE ANTIQUITY: ARCHAEOLOGICAL APPROACHES

Martinez-Honorin, Fabienne (Archéologie)

In the current state of knowledge, Provence is one of the first centers of Christianity in Gaul during Late Antiquity. The beginnings of this ecclesial institution will gradually take root and become a lasting institution in the Middle Ages. The archaeological discoveries of recent decades encourage us to question this phenomenon and to understand how it spread beyond the cities where it was first established. This region is the ideal study setting to understand the process of Christianization in a space marked by the diversity of its landscape and its relief.

This communication proposes to define what is meant by "sacred landscape" at a period which saw the transformation of the Roman world take place in southern Gaul.

The study will focus on the identification of markers of the new religion through the archaeological evidence recorded, to locate them to have a spatial representation of the places of these cultic practices. Thus, the typological and topographical study of these attestations, in particular of primitive churches, evolving within human occupations in particular habitats, will be able to highlight an idea of the construction of the "sacred Christian landscape" of this period operated by the actors of this diffusion that are the bishops and the Roman aristocrats.

This communication is also an opportunity to present certain spatial analysis methods used to address these questions. They consist of using computer software such as QGIS for the calculations of distance-costs between the different geolocated entities that can consider the slopes of the relief, and for the visibility analysis which boils down to evaluating "the visible space" from a specific location.

11 CLIMBING THE STAIRS OF THE DIVINE ASCENT IN DESERT LANDSCAPES

Pestarino, Beatrice (University of Liverpool) - Lehnig, Sina (University of Haifa; Minerva Stiftung für die Forschung, Max-Planck-Gesellschaft)

Historically, geographical remoteness, extreme climate, epidemics, and conflicts have precipitated demographic shifts, economic decline, and isolation of settlements, particularly in deserts and remote landscapes. Within this context, research reveals two significant roles of religion: spirituality intensifies during crises, and new places of worship emerge in infrastructural and economically weak areas. This study focuses on examining the strategic establishment of religious hubs along the Negev-Sinai route, aiming to combat marginalization and foster economic development.

Revitalizing religious tourism in economically disadvantaged regions can enhance local infrastructure and stimulate business growth. Archaeological examples are the development of monasteries and xenodocheia in the Negev during the 6th century AD and in the Sinai with St. Catherine Monastery. Similar trends persist, as seen in the economic growth of Lourdes, France, driven by Christian religious tourism since the late 19th century.

This paper will chronologically compare settlement patterns and economic models in the Negev desert. During the Roman and Late Antique period, agriculture, particularly wine production, was pivotal for the economy, enabling settlements to expand and invest in infrastructure. However, the decline in wine exports after the mid-6th century AD due to decadal climatic changes and the Justinian Plague led to demographic alterations. Thus, we will explore the economic role of pilgrim accommodations, monasteries, and places of worship amid diminishing agricultural prosperity.

The second part will examine pilgrims' graffiti, showcasing increased attendance and the establishment of new facilities related to religious journeys. Using a cognitive-semiotic approach, it will focus on graffiti clusters at sacred places, exploring the cognitive aspects behind their writing. Newly discovered graffiti at the Monastery of Saint Catherine in Sinai and Mitzpe Shivta in the Negev will be analyzed to understand their role in confirming pilgrims' religious experience and increasing attendance, leading to further graffiti creation in a graffiti mania.

936 TOWARDS THE LIVING CITY THROUGH TIME: INTERDISCIPLINARY APPROACHES TO ANCIENT CIVILISATIONS OF CENTRAL ITALY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Stoddart, Simon (University of Cambridge; University of Kiel) - Bagnasco, Giovanna (University of Milan) - Carosi, Simona (Soprintendenza Archeologia Belle Arti e Paesaggio per la provincia di Viterbo e per l'Etruria meridionale) - Franceschini, Mariachiara (Albert-Ludwigs-Universität Freiburg) - Pasiëka, Paul (Johannes Gutenberg-Universität Mainz)

Session format: Regular session

The Etruscan cities of Tarquinia and Vulci have both been examined over a long period of time exhibiting phases of foundation, resilience, development and decline. Science@Tarquinia is an ongoing interdisciplinary collaboration between the University of Milan and the University of Cambridge, alongside eleven other institutions, where humanistic and scientific methods have been brought together in one unified approach, drawing on geoarchaeology, human remains, animal bones, plant remains, aDNA and isotopes. This work has enhanced our knowledge of ritual process, complemented by the study of rural settlement, site formation processes, ancestry, mobility, health, diet and violence. New research projects in Vulci have reconsidered different phases of intense building activities, (re)shaping of the urban and social structure, or monumentalization of public buildings that alternate with contraction of the settlement area, (partial) abandonment, and crisis mostly related to changing geopolitical and social conditions. Different types of historical and archaeological resilience and persistence have been highlighted by interdisciplinary contributions including archaeometry, prosopography, zooarchaeology and geophysics.

The session aims to address a basic question: how can we describe and model long-term change and transformation in Central Italy by integrating different datasets, structural and biological, both in the cities and their necropolises and in their relation to the wider Mediterranean? How can we model social change with archaeological data?

By combining the two complementary approaches to these two cities we have perhaps for the first time, a more comprehensive understanding of the key life forces underlying the biography of two of the most ancient European cities. We invite other projects to make presentations, alongside our own, that contribute to this interdisciplinary, comparative road towards a deeper understanding of the life of Italy's ancient civilisations.

ABSTRACTS

1 "TARQUINIA PROJECT": SCALES OF OBSERVATION FOR EXPERIMENTAL PURPOSES IN HISTORICAL AND CULTURAL RECONSTRUCTION

Bagnasco Gianni, Giovanna (Università degli Studi di Milano)

This paper focuses on Tarquinia, one of the foremost Etruscan cities at the roots of Europe, as a model for breakthrough research on silent civilisations, lacking direct historical written sources. The project aims at reconstructing cultural history from inside the materiality of ruins, sherds, and fragmentary epigraphic documentation and stimulating the potentialities of every single Archaeology oriented discipline towards a multidisciplinary framework. This kind of observation reveals factors previously unexpected and supports identification of invisible syntactic links connecting material aspects left by ancient communities. However, carrying out global archaeological research at a small, medium, large scale implies the problem of the experimental use of the quality and quantity of data at the intersection between the field of micro- and macro-history. Case studies are selected here to discuss this methodology, from data analysis to research of recurring associations between different categories of evidence. This will, in the first instance, draw on reliable micro-historical reconstructions, then connect to macro-history, by tapping into the overall cultural history of the settlement.

2 THE NEW CITYSCAPE OF VULCI THROUGH TIME: INTERDISCIPLINARY RESEARCH INTO THE ETRUSCAN AND ROMAN CITY

Pasiëka, Paul (Johannes Gutenberg-Universität Mainz) - Franceschini, Mariachiara (Albert-Ludwigs-Universität Freiburg)

The Vulci Cityscape project aims to clarify the settlement strategies and urban structures of the northern part of the ancient city of Vulci using a multiscale approach and an interdisciplinary methodology. A pivotal question concerns the dialectical interrelation between urban spaces with different political, religious, economic, or residential functions. By combining non-invasive geophysical prospection, excavations, and different archaeometric analyses, we aim to reassess and reconstruct a holistic panorama of the cityscape of Etruscan and Roman Vulci. In our paper, we will present the results of the first four years of research, focussing in particular on the geophysical prospections carried

out in 2020 in the northern part of the city and on the ongoing excavation of a Late Archaic temple we discovered immediately next to the well-known Tempio Grande. The area of the temple offers a rich and complex stratigraphy, which seems to range from the Late Bronze Age/Early Iron Age up to the second century AD, comprising phases of monumentalization, re-use, and abandonment. This multiscale approach, which takes into account both the spatial and temporal levels, thus provides a glimpse into the chequered history of Vulci as a dynamic living city through time.

3 **VULCI E I SUOI ABITANTI ATTRAVERSO I SECOLI. LA STRUTTURAZIONE SOCIALE, CULTURALE ED ECONOMICA ATTRAVERSO LO STUDIO DELLE NECROPOLI**

Carosi, Simona (MIC) - Casi, Carlo (Fondazione Vulci) - Regoli, Carlo (Fondazione Vulci)

Di recente, gli scavi nella necropoli settentrionale di Vulci nel settore centrale dell'Osteria e sul Poggio Mengarelli, hanno permesso di avere a disposizione una grande quantità di materiali e, anche attraverso la bioarcheologia e nonostante le alterazioni causate da azioni clandestine, di conoscere associazioni di oggetti di corredo ceramico e personali, tali da consentire una prima ricostruzione della storia della città. Attraverso inoltre l'interpretazione degli usi e rituali che si leggono sul terreno, attraverso i rapporti con elementi allogeni confluiti nei corredi e grazie allo studio delle modalità con cui questi ultimi dialogano con elementi di tradizione locale, oggi è possibile raccontare molto di Vulci e dei suoi abitanti, a partire dalla formazione e nei primi secoli della sua storia. Partendo dalle associazioni e dissociazioni rispetto a schemi precostituiti, si possono trarre informazioni sulla circolazione di modelli e mode, sull'apprezzamento di particolari prodotti e anche come determinate scelte possono riflettersi sulla topografia dei luoghi.

4 **A NEW CULT COMPLEX FROM THE URBAN PLATEAU AT VULCI**

Sabatini, Serena (University of Gothenburg) - Selsvold, Irene (University of Leicester) - Gustavsson, Anna (University of Gothenburg)

This paper discusses preliminary results from the archaeological excavations (2022-2024) at Vulci carried out by the University of Gothenburg, within the framework of the project Understanding Urban Identity (UUI). The project aims to contribute to the understanding of the rise and development of the proto-urban and urban centers of Mid-Tyrrhenian Italy. Our excavation is located on the eastern edge of the urban plateau, an area that according to earlier geophysical prospections was only moderately urbanized. So far, the excavation has revealed three unusual circular stone features in connection to a quadrangular building with stone wall foundation. There is clear evidence of sacrificial activity across the entire area, which suggests we have uncovered the remains of a cult complex in use during approximately the second and the third quarter of the first millennium BCE. The complex seems to have fallen out of use after the Roman conquest of Vulci; however, the absence of material from the Roman period might be due to post-depositional events. Plough-marks on the surface of one of the stone features may indicate that post-Etruscan archaeological layers have been removed by modern agricultural activity. This unexpected discovery highlights the complexity of the urban organization at Vulci. The evidence suggests that beside domestic units, which are unfortunately still poorly documented, the urban plan included various types of religious installations and complexes. The evidence from the UUI excavations show that besides monumental temples, the local population, or maybe specific groups/kins, could practice religious and ritual activities also in decentered sanctuaries of less monumental nature. Through an interdisciplinary approach, the UUI team is currently working to understand the nature of the cult practiced in the newly discovered complex to situate it in the wider societal context at Vulci and beyond. The preliminary results from our analyses will be also discussed.

5 **INTERDISCIPLINARY SCIENTIFIC APPROACHES TO THE ANCIENT CIVILISATIONS OF CENTRAL ITALY: LESSONS FROM SCIENCE@TARQUINIA**

Stoddart, Simon (University of Cambridge) - Cattaneo, Cristina (University of Milan) - Esposito, Carmen (University of Bologna) - Madgwick, Richard (University of Cardiff) - McLaughlin, Rowan (University of Maynooth) - Marras, Gianbattista (University of Cambridge) - Breslin, Emily (Trinity College, Dublin) - Prato, Ornella (University College, London) - Schmidt, Frijda (University of Cambridge) - Marzullo, Matilde (University of Milan)

This paper will explore the state of the art of interdisciplinary scientific approaches to the study of the pre-Roman living city. It will draw on the experience of Science@Tarquinia, an initiative put in play by Giovanna Bagnasco and Simon Stoddart, drawing not only on the expertise of their two universities (Milan and Cambridge), but also on a range of other European and North American institutions. The work has focused on site formation processes (as discussed by a separate paper in the session), the systematic collection of animal bones and seeds employing enhanced sampling techniques and a specially commissioned flotation machine, and multi-faceted study of six inhumations supported by bioarchaeology (osteobiographies, radiocarbon dating, cultural dating, isotopes and ancient DNA). The paper will seek to offer routes to future research as well as reporting on current achievements and make comparisons inter-regionally with the rest of Central Italy where the data are already extant. At a conceptual level, the paper will dwell on the

integration of qualitative evidence from Etruscan archaeology with quantitative evidence in the presence of sufficient sample size from scientific archaeology.

6 **RECONSTRUCTING ETRUSCAN DIET AND MOBILITY AT THE SAN GIULIANO NECROPOLIS, ITALY** **Grimes, Vaughan (Memorial University of Newfoundland) - Tidman, Hope (Memorial University of Newfoundland) - Fulton, Deirdre (Baylor University) - Southon, John (University of California, Irvine) - Zori, Colleen (Baylor University) - Zori, Davide (Baylor University)**

Much of our evidence for Etruscan culture and society is dominated by historical narratives and archaeological investigations focused on large, major habitation and necropolises (e.g., Tarquinia and Veii), while there is a relative dearth of information about minor Etruscan centers and how lived experiences, including dietary patterns and mobility within and beyond Etruria, compare between major and minor centers. The Etruscan necropolis at San Giuliano, Lazio, Italy, represents one such minor center and contains artifacts and skeletal remains associated with over 500 rock-cut tombs found at this site. Since 2016 this area has been the subject of surveys, excavations, and multi-disciplinary study by the San Giuliano Archaeological Research Project (SGARP). Here we report on progress with developing a site radiocarbon chronological framework and application of isotope-based methods utilizing carbon, nitrogen, oxygen, and strontium in the reconstruction of a regional isotope baseline for mobility studies, as well as data related to diet and mobility reconstruction obtained directly from the remains of Etruscan individuals. Our isotope results will be discussed in context with other archaeological evidence from the SGARP and available isotope data from neighbouring major centers to offer a broader perspective on Etruscan lifeways.

7 **SITE FORMATION PROCESSES WITH SPECIAL ATTENTION TO THE STUDY OF CONCOTTO**

Carter, Constanza (University of Cambridge) - Marras, Gianbattista (University of Cambridge) - Zaggia, Caterina (University of Cambridge) - Sheldrake, Molly (University of Cambridge) - Schmidt, Frijda (University of Cambridge) - Marzullo, Matilde (University of Milan) - Stoddart, Simon (University of Cambridge) - French, Charles (University of Cambridge)

The zona monumentale of Tarquinia presents one of the deepest and longest sequences within any Etruscan city, covering the period from the Late Bronze Age to the Roman period. For any urban context, it is crucial to establish the site formation processes that underly such an extensive sequence. As in any archaeological context, urban stratigraphies are made of depositional units bounded by unconformities. Establishing periods of more or less intensive use, and even abandonment, is therefore intrinsically challenging. Following a geoarchaeological approach, we aim to shed valuable insight onto the site history of Tarquinia, establishing the details of deposition, erosion, and exposure of the sediments which have deliberately or unintentionally accumulated across areas of this monumental site. In particular, the ubiquitous solid deposits found at Tarquinia are generically defined as concotto. Often subjected to heat, this can be derived from collapsed mudbrick, daub, kilns, furnaces and other less solid building materials and even refuse. However, the distribution, composition, and origin of concotto elements within the context of Tarquinian stratigraphy, remain poorly understood. The paper will report on the geoarchaeological analyses of the concotto to decipher its origin and purpose in the broader context of the stratigraphy of the site which has been studied for several years, using techniques such as micromorphology, SEM and FTIR. On this basis, an interpretation will be given of the activities on the site in a manner that is complementary to standard archaeological work.

8 **TARQUINIA PROJECT: POTTERY AS A MULTI-LAYERED INFORMATIVE RESOURCE. PRODUCTION, USAGE, INTERDISCIPLINARITY**

Teseo, Daniele (Tarquinia Project - Università degli Studi di Milano) - Marzullo, Matilde (Tarquinia Project - Università degli Studi di Milano) - Bezzolato, Alice (Tarquinia Project - Università degli Studi di Milano) - Micheletti, Sara (Tarquinia Project - Università degli Studi di Milano) - Rossi, Eleonora (Tarquinia Project - Università degli Studi di Milano)

Since its beginning, in 1982, "Tarquinia Project" has implemented a method aimed at innovating the traditional way of conducting archaeological research. The synergistic interaction with other scientific sectors has made it possible to take full advantage of the documentary potential of artifacts and contexts pertaining to the 'monumental complex' and the Ara della Regina sanctuary at Tarquinia. The present contribution intends to offer an overview of the most recent results acquired within fruitful partnerships with the Departments of Inorganic Chemistry and Geology at University of Milan: through an extensive sampling, spanning from impasto to fine pottery, this interdisciplinary approach has allowed us to define the microscopic peculiarities of Tarquinia ceramics and to understand better their full range of usage. The presentation also touches upon the collaboration with the Department of Informatics as part of a project of national interest (PRIN 2022): in particular, "Tarquinia Project" is updating its excavation database and is developing a user-friendly search system to analyze data from various angles and to automate the generation of ArchMatrix based on stratigraphic relationships.

9 RAW MATERIALS, MANUFACTURING TECHNIQUES AND CULTURAL CONNECTIONS IN IRON AGE AND EARLY ORIENTALIZING TARQUINIA

Cerasuolo, Orlando (Archaeological Park of Cerveteri and Tarquinia - PACT) - Bordo, Francesco (Archaeological Park of Cerveteri and Tarquinia - PACT)

The paper aims to present the main aspects of an ongoing research project dedicated to a set of Etruscan artifacts held in the National Archaeological Museum of Tarquinia. The artifacts belong to funerary contexts dating from the beginning of the Early Iron Age to the mid 7th century BCE, that is the period of greater long-range connection between Etruscan society and the wider Mediterranean and European world.

With an interdisciplinary and diachronic approach, the project addresses issues related to provenance and procurement of raw materials; dynamics and interaction between local development and external influence in manufacturing techniques; use and function of exotic and uncommon material in funerary context; social and economic change.

Tarquinia shows the earliest specimen of the granulation technique in Western goldsmithing, but how to frame the specific technique? How was it acquired by the Etruscans? And where was the actual gold coming from? Were the different glass products imported by the Phoenicians, made in Veneto or genuinely local? Silver and lead may have come from Spain; amber from the Baltic; ivory from Egypt, or rather from the eastern Mediterranean. Can we define the time frame of the arrival of exotic material, crafting techniques and craftsmen? All these questions and hypotheses demand a modern inquiry.

The focus of the project lies on exotic and uncommon materials (mainly gold, silver, glass, amber and ivory) on which archaeological study and modern scientific non-destructive analyses (XRF, Raman, DRIFTS, FTIR, HR Digital Microscopy, etc.) are performed for the first time.

Finally, these types of analyses could provide additional insights on the initial stages of the Etruscan Tarquinia, effectively integrating the new information lead by the Science@Tarquinia project and the systematic characterization of specialized handicraft in Pre-Roman Italy (i.e., Bronze Age glass in Northern Italy).

10 COMPARING CENTRAL PLACES: SETTLEMENT AND LAND USE IN ETRURIA

Zeviani, Camilla (University of Cambridge; Christian-Albrechts-Universität zu Kiel)

Etruscan studies have reached great heights in the accumulation of cultural data. This is particularly true for landscape studies: the second half of the 20th century has been fruitful as it saw a growth in survey projects exploring ancient central Italian landscapes. Survey data have indeed a lot of potential for the study of urbanisation, facilitating the quantification of different patterns to draw comparisons of control strategies enacted by different power places.

This paper focuses on the analysis of rural settlement data between the 7th and the 4th centuries BC, when urbanised institutions and lifestyles consolidated. Four case studies are selected and discussed, representing different types of territorial control: Tuscania, a mid-ranking centre tied to the city of Tarquinia; Chiusi and Cerveteri, both urban central places, with different developments and ways to administer territories; finally, the palatial site of Murlo, in open conflict with urbanised realities.

Site trends, proxies of population change, locational analysis and agricultural suitability, using computational techniques (GIS), reveal different rural infrastructures sustaining Etruscan central places. I will show how, despite responding to similar stimuli, these centres adopted different strategies to control their lands and benefit from them.

Relatively new social anthropological studies on state formation and urbanisation are applied: more segmented, irregular processes can better explain the variability defining Central Italian urbanisation and countryside organisation, as consequences of dealing with the challenges of rapid settlement aggregation.

This approach combines therefore quantitative approaches and social anthropology theory, providing nuanced examinations of how structured Etruscan landscapes became, how they were exploited, who lived there, and how relationships with the central place were developed, as well as the different decisions and responses of the central places' leading families to such changes that transformed Etruria into an influential and competing player in the Mediterranean scene.

11 THE BLERA ARCHAEOLOGICAL PROJECT: INVESTIGATING ETRUSCAN URBANISM THROUGH MULTI-RESOLUTION ARCHAEOLOGY

Olsson, Hampus (Swedish Institute of Classical Studies in Rome; Lund University) - Landeschi, Giacomo (Lund University) - Küçükdemirci, Melda (Istanbul University - Cerrahpaşa; Lund University) - Derudas, Paola (Lund University)

The continuity of Etruscan cities and settlements into Roman, and up to our own days, is a hotly debated topic. The Etruscan town of Blera, located approximately 55 km northwest of Rome, was probably founded in the 8th century BC. Unlike many other ancient towns in its vicinity, Blera has never been abandoned and it has retained its ancient

name for more than 2,500 years, albeit in a somewhat corrupt form. Blera survived into the Roman period and gained the status of municipium after the Social War. The Petrolo plateau, located northwest of the medieval city centre, was the site of the Etruscan and later Roman town. The settlement was subsequently abandoned in favour of the adjacent smaller plateau where today Blera's Old town is located. The purpose of the project is to provide a deeper understanding of the structure and organisation of Etruscan smaller towns and how these were affected by the later Roman expansion across Italy. Furthermore, it is intended to map and define different settlement phases on the city plateau, from the Villanovan period to the Early Middle Ages. This will be carried out through a systematic investigation of the Petrolo plateau, where a recently developed theoretical and methodological approach, known as 'multi-resolution archaeology', will be introduced and applied to the study of urbanism in Etruscan small-size towns.

12 A VIEW FROM THE EAST: COMPARATIVE STUDIES OF RURAL SETTLEMENT FROM THE VALLEY OF GUBBIO

Negro, Marianna (University of Cambridge) - Whitehead, Nicholas (Independent Scholar) - Ceccarelli, Letizia (Politecnico di Milano) - Cocozza, Carlo (Max Planck Institute of Geoanthropology) - Fernandes, Ricardo (Max Planck Institute of Geoanthropology) - Teegen, Wolf-Rüdiger (LMU Munich) - Tilby, Emily (University of Cambridge) - Trentacoste, Angela (British School at Rome) - Halpin, Áine (Trinity College, Dublin) - Bradley, Dan (Trinity College, Dublin)

This paper contributes to the interdisciplinary examination of long-term change and transformation in Central Italy by focusing on the landscape organisation in the Gubbio Valley. Drawing from archaeological research spanning the 19th century to the present, the study delves into the evolution of rural settlements within the valley, revealing a nuanced interplay between urban, rural, and religious landscapes from the second millennium BC to the Roman era. The most recent research highlights the correlation between Umbrian sites and Roman landscape occupation, challenging traditional narratives of romanisation.

Furthermore, the paper discusses innovative methodologies, including the re-examination of ceramic materials and digitization of paper records, to elucidate the density of rural occupation over millennia. By integrating cutting-edge scientific techniques such as isotopic and aDNA analysis and presence of pathologies on the sampled teeth, alongside precise radiocarbon dating, we anticipate novel insights into the faunal deposits of Monte Ingino and Monte Ansciano. All this updates the 1994 publication.

This interdisciplinary approach not only enhances our understanding of the landscape dynamics in the Gubbio Valley but also contributes to the broader discourse on long-term societal change and resilience in Central Italy. Therefore, by presenting the study of the Gubbio valley alongside other projects, the paper aims to foster comparative analyses that deepen our comprehension of Italy's ancient civilisations.

938 THE ARCHAEOLOGY OF ANCIENT BORDERSCAPES: MULTIPLE APPROACHES, NEW PARADIGMS

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Gatto, Maria Carmela (Polish Academy of Sciences; University of Leicester) - Nicolini, Serena (Alma Mater Studiorum Università di Bologna) - Ferrario, Marco (University of Augsburg; Università di Trento)

Session format: Regular session

The session proposed solicits papers interrogating the concepts of geopolitical, socio-cultural, natural, symbolic, and spiritual boundaries in the ancient world. Often, even the most defined borders are fuzzier and more complex than they first appear. We propose to approach this complexity through the concept of "borderscapes": the political, cultural, physical, mental, intellectual, and/or spiritual geographies where boundaries are located and where the tangible and intangible practices of boundary-making and boundary-maintenance occur. "Borderscapes" emphasize how boundaries are actively shaped in specific places, though these places need not exist in the physical realm.

The discussion of geopolitical borderscapes will be a focus. From a methodological standpoint, the session taps into recent scholarship on frontier zone history, historiography, anthropology, and archaeo-ethnology from a multidisciplinary and comparative perspective. For too long, borderlands have been approached as spaces (physical and/or discursive) of imperial or state appropriation, violence, and exploitation or as pockets of resistance and defiance of said attempts at people and resource control. Moving forward from such a dichotomy, the session makes a case for reconceptualizing borderlands as spaces of transformation, affecting patterns of community building and state formation (or breakup) within and beyond the frontier itself. Recent scholarship, especially the Imperial Turn, has stressed entanglement, mediation, appropriation, and reassembling of material culture as defining features of borderlands and the processes contributing to creating, reshaping, and even causing their demises. They ought, therefore, to be understood and investigated as critical areas of innovation, capable of affecting both the space of the frontier itself and the wider world(s) entangled with them.

The spectrum for this session is intentionally broad since boundaries have taken so many different forms in the past, and all have changed dynamically over time and across space. Papers exploring ancient borderscapes from any theoretical or empirical perspective are welcome.

ABSTRACTS

1 THE MAKING OF AN ANCIENT EGYPTIAN BORDERSCAPE – THE FIRST NILE CATARACT REGION IN THE 4TH/3RD MILLENNIA BCE

Gatto, Maria Carmela (Institute of Mediterranean and Oriental Cultures Polish Academy of Sciences; University of Leicester)

The ancient Egyptian state, traditionally known as the earliest territorial polity of human history, developed in the Lower Nile region at the end of the 4th millennium BCE. Alongside the political transformations, the complex process of state formation instigated far-reaching and profound changes in the socio-economic structure of its territory. With the example of our modern nation-states and geopolitical borders in mind, we expect such changes to have especially marked its newly established borders. However, current scholarship has determined that the ancient Egyptian state did not function as our modern states do, and this, of course, has consequences on the nature of its borders. While many studies have discussed the ancient Egyptian borders in dynastic times, none has focused on understanding how they came into being. The BORDERSCAPE Project, established at the Institute of Mediterranean and Oriental Cultures of the Polish Academy of Sciences and funded by the Norway Grants and the National Science Centre of Poland, has taken up the challenge by focusing on the ancient Egyptian southern border with Nubia, geographically corresponding to the First Nile Cataract region. The presentation discusses the results of the recently completed project, focusing on detecting the time and nature of discontinuities in settlement patterns, land use and community structuring between the 4th and the 3rd millennium BCE.

2 NARRATIVES AND MATERIALITY OF STATE FORMATION AND BORDER-MAKING: A VIEW FROM THE HASMONEAN KINGDOM

Sabar, Roi (Boston University)

The emergence of the Hasmonean dynasty is well documented in the historical narratives of 1 Maccabees and Flavius Josephus. Centered in Judea, the Hasmoneans gained autonomy around the middle of the 2nd c. BCE, in the context of the fall of the Seleucid Empire. In the following decades the dynasty established a hereditary monarchy, and its rulers expanded the kingdom's territory, until it came to a sudden end with the Roman conquest of the Levant. Being geographically small-scale, and chronologically well-framed, the Hasmonean Kingdom offers a valuable case study for state formation processes.

In this paper I will examine the archaeological evidence (*vis-à-vis* the historical narratives) for the Hasmonean expansion and border-making in the Galilee – the northern region of the realm. Although clear and large-scale Hasmonean archaeological contexts are limited in the region, years of archaeological work produced substantial data on the materiality of the Hasmoneans. This data allows us to reconstruct a significant shift in the settlement dynamics. This trend reached a zenith in the time of King Alexander Yannai (104- 76 BCE) – when two predominant fortresses were built along the margins of the Hasmonean territory in the Galilee.

3 THE IMPERIAL BORDERSCAPE ACHAEMENID NORTHEASTERN CENTRAL ASIA AS A STEPPE FRONTIER ZONE

Ferrario, Marco (University of Trento; Augsburg University)

Volume 3 of the groundbreaking Handbook of Ancient Afro-Eurasian Economies is due to setting a new benchmark in how inter- and intra-imperial connectivity across Afro-Eurasia must be understood and researched. According to the authors, frontier zones ought to be conceptualized first and foremost as ever-changing landscapes (physical as well as discursive) of transformation and innovation, as contested areas in which multiple actors entangled in overlapping and sometimes competitive networks pursue different agendas while jostling for individual as well as group power and resource control. Such insights are critical for a long overdue reassessment of the borderlands dynamics shaping the imperial space of Achaemenid Northeastern Central Asia, which is still often approached as an unruly space contested between agricultural and steppe (nomadic) societies. With the aim of challenging such a fraught and biased narrative, the present paper attempts to sketch, on the one hand, an imperial history of a borderland (looking at Central Asia from the vantage point of the emerging and then established Persian power). On the other hand, it shifts the focus towards a borderland history of an Empire, therefore taking a local approach to Achaemenid imperialism in the region. The outcome is – hopefully – a problematized approach to the Eurasian borderscapes at the edges of and beyond the first Afro-Eurasian hyperpower in world history.

4 PLACE, BOUNDARIES, AND THE (RE)MAKING OF PICTLAND: THOUGHTS FROM THE CARN DROMA SITE IN EASTERN ARGYLL, SCOTLAND

Hansen, Daniel (The University of Chicago)

It is now widely accepted in archaeology that boundaries in the past were often dynamic, permeable, and multiple; archaeologists have been duly cautioned against applying modern ideologies about boundaries to past contexts. Nevertheless, in the past as in the present, contexts arose in which it was pertinent for social actors to define a clear boundary: to identify contrasting groups, to determine criteria of inclusion/exclusion, and to link these contrasts geographically to features of the physical environment. These acts of boundary-making were indeed contextual, but often also materially consequential, shaping the ways people perceived and acted in their environments.

This multi-method paper interrogates the boundaries of “Pictland,” the territory associated with the Picts of late antique and early medieval northern Britain ca. AD 300 – 900. Specifically, it will address the ways in which contrasts between people were mapped onto landscape features and vice versa. It combines historical material with original archaeological and analysis from the Carn Droma site on the eastern edges of Argyll near Tyndrum, Stirling, a site at which prehistoric remains and natural landscape features such as hydrology and geomorphology were understood by some early medieval perspectives as a conceptual limit of Pictland. It then places these findings in the context of other boundary-making events around Pictland from the Roman past through the ethnographic present to offer an account of boundary-making that draws on literature on the semiotics of place-making and social differentiation.

5 BORDERS AND FRONTIERS IN THE LATIN EAST: THE CASE-STUDY OF THE LORDSHIP OF TRANSJORDAN

Sinibaldi, Micaela (University of Warsaw)

In the Latin Middle East, borders and frontier areas have been often associated to the idea of isolated zones, and frontiers have been traditionally understood to comprise a series of forts strategically placed to protect an area against an external enemy. For some scholars, areas of the Latin Kingdom of Jerusalem such as Transjordan were “frontier area par excellence,” simply defined as places where life was less secure than in the heart of the kingdom.

The case study of the Lordship of Transjordan demonstrates how the period of presence of the Europeans in a remote area of the Middle East was not limited to a phase simply characterised by military defence and building of fortifications, but that it involved, instead, a period of significant interaction between the local and the Frankish communities. This phase was characterised by a clear adaptation on behalf of the Franks to the local environment and by an important reliance on the local inhabitants, both of which were crucial strategies of settlement. In addition, those traditionally seen simply as “border” and “frontier” areas were deeply and permanently transformed from the point of view of the landscape as a result of this phase. The entanglements and the relationships between the communities involved in this process are evident from a study of the material culture, which reflects that daily life in Frankish settlements constantly relied on the support of the local environment and people. They are, furthermore, confirmed by an analysis of the documentary sources, which clearly demonstrate that the relationships between the Franks and the local communities were crucial to their ability to conquer and maintain control on the territories selected.

6 RETHINKING WEST AFRICAN STATE-FRONTIER BOUNDARY AND MATERIAL CULTURE: INSIGHTS FROM THE ARCHAEOLOGICAL RESEARCH AT ILORIN, NORTHERN YORUBALAND, NIGERIA

Owoseni, Bolaji (McDonald Institute for Archaeological Research, University of Cambridge)

This paper presents the archaeological research conducted in Ilorin; a historically significant city located at the geopolitical northern frontier of the defunct Oyo Yoruba Empire, which collapsed in the early nineteenth century. Situated between two ecological zones of the savanna and forest regions of present-day Nigeria, Ilorin is recognized for its multi-ethnic society and its role as part of the Yoruba world. This research investigates the socio-political evolution of Ilorin, exploring the city's connections to the broader Yoruba region and beyond before the 19th century. Employing archaeological surveys, and excavations, the study reveals Ilorin's past through the analysis of material culture, with a focus on ceramics. Excavations focus primarily on the site of the present Kwara State College of Education, Ilorin where archaeological material evidence, including pottery, grinding stones, and potsherd pavements were recovered. Radiocarbon dating from excavated units spans the first millennium to the second millennium A.D. These results position early Ilorin within or preceding the timeline of significant centers of the Yoruba region including the Oyo empire and Ile-Ife. This challenges the conventional notion that areas on the borders of major centers merely passively received state appropriation and innovation, showcasing the dynamic nature of West African societies in premodern settings. The research highlights Ilorin as a unique case for Yoruba region frontier or borderland studies, demonstrating that these areas can overlap, share similar features, or even operate autonomously from state/core centers of em-

pires. The findings from Ilorin underscore borderlands' intricate complexity and their importance as contact zones for social interactions and cultural exchanges.

7 **SANCTUARY BORDERSCAPES AND TRANSFORMATIVE VISION: THE CULT OF KYBELE IN WESTERN ANATOLIA**

Rodriguez, Leticia (University of California, Berkeley)

The Phrygian cult of the Mother Goddess in Anatolia is well-known, with early, extensive interaction and exchange between Phrygians and Greek populations likely occurring in the Sea of Marmara region and along the western Black Sea coast in the early sixth century BCE. Subsequent adoption and adaptation of the cult occurred throughout the northwestern and western coasts, processes and practices which ultimately spread to the nearby Aegean islands of Lesbos, Samos and Chios.

This paper explores questions of syncretism, phenomenology, and other forms of transcultural semiotic interaction across a series of Kybele sanctuary sites in western Anatolia. As an overarching methodological framework, I make productive use of the theoretical notion of 'borderlands', particularly as formulated by Chicana scholar Gloria Anzaldúa, re-situating the ancient works and spaces of my research within their multivalent geopolitical, socio-cultural, and sacred contexts. Utilizing the Latinx conceptual framework of borderlands helps to reveal long-overlooked points of artistic intersection and interaction in Ancient Ionia and Anatolia, while also illustrating that the cultural boundaries that have come to define our approach to both East Greek and Anatolian material culture were actually anything but distinct.

In particular, this paper highlights how Phrygian influence can be observed in religion and cult practice in these borderlands, as manifested in material culture and traces of engagement with topography. Through my examination of space, sculpture, and votives, I demonstrate how, as a goddess of shifting identities constrained neither by physical nor academic borders, Kybele may be viewed as transcultural, a 'divine diplomat' capable of speaking to various communities across Anatolia—as well as those passing through from other regions in the Mediterranean and Western Asia—blurring religious and sociocultural boundaries. I also consider how the connection between sacred sites has been severed not only by academic discourse, but also by modern, geopolitical borders.

8 **FRINGE RELIGION? SANCTUARIES AND THE SACRED IN PELOPONNESIAN BORDERSCAPES**

Dunn, Shannon (Bryn Mawr College)

Ancient Greek border sanctuaries have been commonly understood within scholarship as sacred places that reflected or reinforced the territorial boundaries of different political entities. Though implied to be a distinct group of sacred places, there is no agreement about how these sanctuaries functioned as/at borders. Despite the lasting impact of scholarly models of the distribution and function of sanctuaries in the Greek landscape, the type of site often referred to as a "border sanctuary" has not been subject to a large-scale study which comprehensively addresses this category, and which uses sufficient data to critically discuss the usefulness and verity of such terminology. As those models rely on sanctuary landscapes, both in terms of terrain and of spatial relationships, this study maintains the same focus. In the Peloponnese alone, there were different strategies for border delineation and land claims, and different deities preferred by poleis to guard these marginal or contested areas. Major landscape features tended to be used to determine borders, often associated with sacred sites, such as mountain-top temples at the edges of a territory, or shrines in a pass between two regions. I will demonstrate some of the complexities of religious practices in a border zone with archaeological evidence for access to and control of these sanctuaries, using as a case studies several regional clusters of sanctuaries in major border areas of the Peloponnese. I will also present Peloponnesian patterns of the deities, votives, and topographies associated with "border sanctuaries. I will explore the political and religious systems at play, whether there is a unique religious culture in border zones/micro-regions, and how proximity to different territories and changes in their rule by distant poleis affected the religious communities engaging with border areas.

9 **UNDER THE MOUNTAIN AND BETWEEN THE GULFS: SOUTHERN PHOCIS IN LH IIIA-B**

Ruza, Stefano (National and Kapodistrian University of Athens; La Sapienza, University of Rome) - Scarsella, Elena (Independent Researcher)

This paper aims to investigate how the people inhabiting southern Phocis adapted to the peculiarities of their environment and how, at the same time, they interacted with the Beotian palatial societies between LH IIIA and LH IIIB (roughly 1300-1200 BC). The map clearly shows that the region can be broadly divided in two on the basis of the orography: the western and the eastern one. They both had the mountains and the sea acting as gateway points in the landscape, intercepting the route that connected Central Greece to the Gulf of Corinth. On the other hand, there seems to be the possibility of two different routes that the Phocians may have used to reach Beotia: the western one, dominated by the sites of Krisa and Delphi, appears to be completely independent from any palace; the eastern one,

dominated by Medeon, may have been more directly involved with Beotian authorities, although the Medeon itself may have not been in direct subordination of any palatial centre.

10 **FROM THE HELLESPONT TO THE PILLARS: A BORDER WITHIN AND WITHOUT BOUNDS**

Sink, Samantha (Trinity College Dublin)

Straits such as the Pillars of Herakles and the Hellespont were natural borders of economic and political importance, which provided opportunities for navigation, trade, and military endeavours. While the Hellespont connected the east with the west, the Pillars of Herakles connected the Mediterranean with the Atlantic—the west with the unknown. Although these borderscapes may seem geopolitical, Eratosthenes investigated them to explore the nature of the world and thereby pivoted the Mediterranean world.

Eratosthenes approached geography with originality, demonstrating a movement of shared knowledge within the borders of the oikoumene. Alongside the observation and theorization of physical geography, he was also interested in empirical exploration through mathematical applications. With these methods, Eratosthenes focused on geographic connections from a spatial and oikoumenic, rather than a geopolitical, perspective, on how the straits related to the inhabited (Hellenistic) world.

This paper examines the Pillars of Herakles and Hellespont fragments in Eratosthenes' Geographika to discuss his measurements, methodology, and what they reveal geographically about shared communities of knowledge. By combining the geography of these spaces and the applied mathematics of Eratosthenes, this paper explores borders within the oikoumene and an intellectual community without bounds, which comprised scholars, traders, merchants, and sailors.

11 **"BOUNDARY OF GEZER" INSCRIPTIONS - THE EARLIEST EVIDENCE FOR THE "MIXED BORDERS" CUSTOM (HEBREW: ERUV TECHUMIN)?**

Korzakova, Hava (Bar Ilan University)

Near the town of Gezer, mentioned already in El Amarna letters, on the Merneptah stele, and in the Bible, 13 peculiar inscriptions on bedrock have been found, the first ones by Clermont-Ganneau in 1874, and the last one by Mitchell in 2012. Some of the inscriptions are only partly legible, but it seems that all of them have been originally bilingual, written in Greek and Hebrew. The Greek part in 8 of the inscriptions is a Genitive of "Alkios", a proper name derived from the Hebrew "Helkiya", another inscription contains another name, "Alexa", and one more – yet another name, "Archelaos", also in Genitive. The Hebrew part is the same in all the inscriptions where it is still legible, and it says *techum Gezer*, i.e. "boundary of Gezer". In 3 of the inscriptions the Greek and the Hebrew parts are written in the same orientation, while in the other 7 they are oriented *tête-bêche*. In the inscriptions still in situ the Greek words face the direction of Gezer, and the Hebrew ones vice versa.

It has been suggested that the inscriptions marked the Sabbatical boundary or referred to the administrative boundary. Rosenfeld in 1988 has identified the names from the inscriptions with a family from the Herodian nobility, mentioned by Josephus. The uniqueness of the boundary inscriptions of Gezer demands further explanation as to their purpose. I suggest seeing them as the earliest evidence for the Jewish custom of "mixed borders", (Hebrew: *eruv techumin*), which appears the later halachic literature.

12 **CENTRAL AFRICAN ARCHAEOLOGY OF THE NORTHERN BANTU BORDERLANDS: INITIAL RESULTS OF THE CONGUBANGI RESEARCH PROJECT**

Coutros, Peter (Ghent University) - Zana, Henri (Ghent University) - Nguerede, Lucien (Ghent University) - Pacciarotti, Sara (Ghent University)

Despite being at the center of the continent, the Congo-Ubangi watershed is perhaps one of the least archaeologically explored regions of Africa. This zone extends across where the Democratic Republic of the Congo (DRC), Republic of the Congo, and the Central African Republic (CAR) converge. Due to its location, the Congo-Ubangi region is a borderscape of nested cultural, linguistic and natural boundaries. Most notably, the region straddles an environmental border between the Congo rainforest in the south and the savanna in the north, intermixed with a matrix of various micro-ecosystems which are the basis for group specializations in different subsistence strategies. Likewise, this region contains fuzzy linguistic borders between communities speaking Bantu languages in the south and Central Sudanic and Ubangi languages in the north. Group-specific subsistence specializations appear to override linguistic affiliations when it comes to group identity.

Numerous cultural borders also exist across the Congo-Ubangi region, including those within and between rainforest hunter-gatherers and settled communities. However, due to the dearth of archaeological research in the region, the nature, alignment, and time-depth of these environmental, linguistic, and cultural borders are poorly understood. In this talk, we present the initial results of CongUbangi, an interdisciplinary research project (funded by an ERC Start-

ing Grant # 101116562) employing archaeological, ethnoarchaeological, linguistic and genetic methods to explore the interconnections among these different borders. This paper will focus on the results of a series of archaeological surveys and excavations conducted in northern DRC and southern CAR. This work has centered on the Ubangi River bend, and has identified and investigated numerous new sites between Gemena, Gbadolite, and Bangui. The results of these efforts provide much needed new primary data for establishing a robust occupational history of the region while contributing additional context for larger-scale processes across Central Africa.

13 FUZZY BOUNDARIES AND LANDSCAPE MAKING IN UPPER EGYPTIAN HUNTING PETROGLYPHS FROM THE 4TH MILLENNIUM BCE

Maydana, Sebastián (Universidad de Buenos Aires)

In most palaeolithic societies, hunting is an activity where every member of the community participates, in one way or another. Wisdom pertaining to the chase is thus the single most important knowledge that is passed onto the younger generations. This was certainly not the case in Egypt during the 4th millennium BCE, where typically 99% of every village's food was obtained from agriculture, fishing, gathering, and livestock raising. Under these conditions, it may be puzzling to find that a surprisingly large proportion of rock art depictions from this period show hunting scenes. But it is precisely under these conditions, too, that hunting acquires a number of attached meanings that have nothing to do with what the same practice meant barely centuries before. Hunting in a non-hunting society is performed only by a select few, who for this reason become 'special' members of the community. Borders are drawn with respect to the rest of their community, but at the same time, in view of their special relationship with the animals, boundaries with the non-human world become fuzzy. Furthermore, during the hunting expeditions these extraordinary beings enter a different time regime, a different perception of reality, as Tim Ingold points out. Finally, inscribing the hunted animals as well as the hunters in the desert rocks is a way of appropriating and building the desert landscape by marking off the extension of the communal domain. In this communication, I will analyse the construction of landscape and the placing of boundaries through hunting petroglyphs from Upper Egypt dating to the 4th millennium BCE.

14 BETWEEN EGYPT AND LIBYA - EXPLORING THE COASTAL BORDERSCAPES OF EASTERN MARMARICA

Nikolaus, Julia (Ulster University) - Ray, Nick (University of Southampton) - Blue, Lucy (University of Southampton; Honor Frost Foundation) - Gahnem, Mai (CMAUCH; Ulster University)

The eastern Marmarica region along the northwest coast of Egypt is defined by being the border area to Libya in the west. Today this is a highly militarized zone, with several naval bases along the coast. In the past, however, the borders between Libya and Egypt were not a clear separation in space. In particular, the area between Marsa Matruh and Sollum was a very fluid zone in which both Egyptian and Libyan people lived and interacted over a prolonged period in which the boundaries expanded and contracted in relation to shifts in political power. For example, this area lay outside of the westerly outpost of Zawyet Umm El Rakhm from the time of Rameses II but the outpost did not mark a strict division and was not an impenetrable barrier to the movement of people and goods.

The Northwest Egypt Survey Project took place in November 2023 and explored the coastal area between Sidi el Barrani and Marsa Matruh as rapid agricultural and urban development severely threaten archaeological sites along the coast. The results show that this region is far from being an empty border landscape. Instead, the evidence suggests a very dynamic zone in which production and trade played an important role – an interpretation observed by Rieger who investigated the tableland region south of Marsa Matruh. There is a clear need to re-think and re-evaluate the role of this borderscape along the coastline, as well as investigate what role maritime connections played in this area. This paper will draw on the results of the Northwest Egypt Survey Project to explore the dynamics of this borderscape and how land- and sea-based connections have made this zone a much more fluid one than previously thought.

15 ENCLAVE, GREY ZONE OR WHAT? NUBIANS IN THE GEBELEIN REGION (SOUTHERN EGYPT) IN THE LATE 3RD MILLENNIUM BCE

Ejsmond, Wojciech (Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences)

The reality of ethnic landscapes is complex and often too dynamic to be easily translated into two-dimensional maps with borders and the nature of the presence of certain groups may be difficult to define. The case of Gebelein is a good example of the pitfalls of the concept of ethnic, cultural, or even political borders.

The late 3rd-millennium funerary stelae from the Gebelein region often depict Nubians. They can be recognised by hieroglyphic inscriptions calling them Nehesi (Nubians) and/or ethnic markers (dark complexion, kinky hair, dress, etc). Previous scholars believed they were mercenaries brought to this area by warlords during the turmoil of the First Intermediate Period (ca. 2118–1980 BCE). Their subsequent disappearance from the archaeological record after

that time was also previously explained by their alleged eagerness to blend into the local Egyptian society, to which they were supposedly aspiring. This view is undermined by the fact that Nubians deliberately underlined their distinct ethnicity on the stelae.

A wider examination of their presence in southern Upper Egypt shows that they were living there already before the emergence of the pharaonic state and thus can be regarded as native to this land and they mixed with Egyptians. It seems that they even retained their tribal structure when living in Egypt.

The issue here is how to define such presence. Can we call them natives of the Gebelein region? Did they form an enclave within the state, or southern Upper Egypt was a sort of grey zone inhabited by two native ethnic groups? By bringing together iconographic, philological, and archaeological evidence this paper aims to explore the complexities of the ethnic landscape during the FIP on the example of the Gebelein region.

16 DYNAMICS OF SETTLEMENT PATTERNS AT THE SOUTHERN EGYPTIAN BORDER BETWEEN THE SECOND MILLENNIUM BC AND THE ROMAN PERIOD

Nicolini, Serena (University of Bologna)

The Southern Egyptian border, encompassing the Nile First Cataract, is pivotal in the historical relations between Egypt and Nubia, dating back to the Predynastic period and throughout all other historical periods. The area's cultural diversity and geopolitical significance make it a fascinating subject of study for scholars interested in making and maintaining borderscapes. Despite its importance, the surrounding desert regions have been largely overlooked from an archaeological perspective, while the Nile Valley has been described as central from a cultural perspective. However, recent research is shedding new light on the role of the deserts, the people living in them, and their relations with the valley.

This paper aims to conduct a diachronic analysis of settlement patterns in the region, spanning from the Second Millennium BC to the Roman period. Geospatial, archaeological, epigraphical, and historical datasets will be discussed to comprehensively understand the complex network of cultures and relationships among people residing along the Nile and in the deserts.

Furthermore, the notion of a borderscape as a purely human-made feature or landscape will be addressed. Instead, we will examine the unique environmental and cultural characteristics of the First Cataract region that influenced the intricate dynamics between cultural groups. Analysing settlement patterns and land use will also contribute to determining the area's trajectories and characteristics of entanglement.

17 RECONCEPTUALISING THE BORDERSCAPE OF THE DAL CATARACT IN SUDAN: TRANSFORMATION PATTERNS OF BRONZE AGE NUBIAN CULTURES

Budka, Julia (LMU Munich)

Recent studies in Sudanese archaeology have addressed the complexity of cultural encounters in the Bronze Age in ancient Sudan highlighting material entanglement and various aspects of sociocultural relations. There is evidence for a high degree of social diversity which includes different social groups (Egyptians, Kerma Nubians, C-Group and Pan-Grave Nubians) of either a distinct or of a more hybrid character. Based on archaeological evidence, at the local scale, social, economic and cultural identities influenced, changed and sometimes merged with each other. It is, therefore, timely to consider the existence of multiple 'Nubias' in the Bronze Age rather than a single homogenous entity.

To address the cultural dynamics and diversity of ancient Nilotic groups, the ERC DiverseNile project draws upon the idea of contact spaces – which complements the concept of "borderscapes" as defined for this session. The primary objective of the DiverseNile project is to reconstruct Middle Nile landscape biographies beyond established cultural categories, enabling new insights into the ancient dynamics of social spaces. Its main case study is the Attab to Ferka region in northern Sudan. Next to the Dal cataract and upstream of a rocky outcrop, the Batn el-Haggat, this region is both a geological boundary zone and a cultural contact zone. The area has a long history as a contact space between various cultural groups and either the northernmost realm (e.g. the Kerma Kingdom) or the southernmost region of influence (e.g. the C-Group).

This paper will present archaeological evidence from settlements and cemeteries, primarily the pottery, and discuss the need for a reconceptualization of the borderscape of the Dal cataract in Bronze Age Sudan. The landscape approach adopted by the DiverseNile project and the geographical features of the study area will also be discussed to support this reconceptualization.

FRONTIER WANDERING ON THE NILE'S THIRD CATARACT

Zielinska, Dobrochna (Faculty of Archaeology, University of Warsaw) - Drzewiecki, Mariusz (University of Warsaw) - Ciesielska, Joanna (University of Warsaw) - Polkowski, Paweł (Archaeological Museum in Poznań) - Innemée, Karel (University of Warsaw) - Osypiński, Piotr (Institute of Archaeology and Ethnology Polish Academy of Sciences) - Rosa, Katarzyna (University of Warsaw) - Kurcz, Maciej (Jagiellonian University)

The paper relates to ongoing research around the church at Miseeda in the Mahas region at Nile's Third Cataract (Sudan). In past decades, the region was a part of large archaeological surveys that showed a dynamic history of this rocky section of the Nile Valley.

The current archaeological survey is meant to identify remains of human activities from prehistory to modern times in the close surroundings of the church in Miseeda. The results unveiled an unexpectedly rich archaeological landscape. They helped to link the area with the main regional centres that were active in the past, such as the capital of the Kerma kingdom and the New Kingdom settlement in Tombos. It also sheds light on the changing relations between the kingdoms of Nobadia and Makuria in medieval times.

In this presentation, we intend to situate the results of our investigations within a broader discussion of the frontier-like nature of the region, by both referring to particular timeframes and approaching it from a diachronic perspective.

Along with the archaeological studies, ethnographic research concerning the current understanding of borderness phenomena in the community of Miseeda was undertaken and will be presented by Maciej Kurcz during session #382.

WHO DO BORDERS SEPARATE? A WORKERS' PERSPECTIVE ON THE EGYPTIAN-NUBIAN BORDERSCAPE

Lemos, Rennan (University of Cambridge)

Non-elite experiences of state society and colonization across the borders of ancient Egypt and Nubia in the New Kingdom (c. 1550-1070 BCE) seem to have been similar. From a bioarchaeological perspective, non-elite individuals suffered from trauma to a large extent in both Egypt and Nubia, most likely due to intense work conditions. From a material culture perspective, scarcity dominates the burials of non-elite individuals, usually deposited in simple pit graves with only a handful of items. Cultural contacts or entanglements have been at the core of recent scholarship on Egypto-Nubian interactions in the New Kingdom colonial period. However, my previous work on Egyptian-style material culture from colonial cemeteries in Nubia has emphasized that cultural entanglements were restricted to elites able to consume these objects. These cultural entanglements resulted in different material and social phenomena, which seem to have always ended up reinforcing the colonized aspect of local practices in the colony. In the light of the exclusive nature of 'objects of entanglement' and the material scarcity that defined the lives of the vast majority of the population in the Egypto-Nubian borderscape, this paper discusses borders from the perspective of non-elite or working populations. As a social archaeology 'from below', the paper focuses on the materialization of hierarchization and power that defined how non-elites experienced the Egyptian colonial state. While cultural entanglements separate 'Egypt' and 'Nubia', experiences of scarcity and oppression across cultural borders bring together working populations to find alternatives to state internal and external colonization.

LET'S CROSS THE EASTERN BORDER! NEW EVIDENCE OF AN EARLY 3RD MILLENNIUM BCE OCCUPATION AT SHAQADUD (BUTANA, CENTRAL SUDAN)

Andrea, Manzo (Università degli studi di Napoli; ISMEO-Associazione Internazionale di Studi sul Mediterraneo e l'Oriente) - Giancristofaro, Enrico (Università degli studi di Napoli) - Varadzinová, Lenka (Czech Institute of Egyptology, Faculty of Arts, Charles University, Prague) - Varadzin, Ladislav (Institute of Archaeology, Czech Academy of Sciences)

Shaqadud is a site in the savannah 50 km east of the Nile Valley, in Central Sudan. Excavations conducted there in 1982-1983 by an American-Sudanese team have documented a long sequence from the mid-7th to the early 2nd millennium BCE. This made of Shaqadud a key site for the late Prehistory of the Nile valley South of Nubia and the eastern Sahel. Moreover, the evidence from Shaqadud partially bridged the gap between the 4th and 1st millennia BCE characterizing the chrono-cultural sequence in the Nile Valley tract between the confluence of the Blue and White Nile and the Atbara River junction. However, it did not cover a gap between the late 5th and the early 3rd millennia BCE.

The recent resumption of investigations by the Shaqadud Archaeological Project brought to light evidence of a previously unknown occupation dating to the first centuries of the 3rd millennium BCE, while new surface finds expanded the evidence also for the 2nd millennium BCE. These new finds push back the chronology of Post-Neolithic Shaqadud to ca. 3000 BCE and provide new insights into the possible links with the regions East of the Atbara. In this presentation the newly discovered Post-Neolithic materials will be presented and compared with the ones of

the Butana Group and Gash Group of the Eritrean-Sudanese Lowlands. Indeed, on the one hand the new evidence allows a more accurate assessment of the Post-Neolithic ceramic assemblage at Shaqadud and shortens the gaps in the regional sequences. On the other hand, it is also crucial for understanding the broader East-West connections that involved the site. From our perspective, Post-Neolithic Shaqadud was not marginal, but a crucial node in hitherto poorly known East-West networks, that may have been a cultural corridor in ancient Africa as important as the North-South corridor along the Nile.

RITUALISM AND FUNERARY PRACTICES IN THE MEDITERRANEAN BASIN: OBJECTS, SYMBOLISM, INPUTS, AND RESILIENCE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Conejo, Noe (Università degli Studi di Padova; UNIAHQ-Universidade de Lisboa) - Cáceres Puerto, Carlos (Independent Research) - Ramos Soldado, José Luis (Andalusian Institute of Historical Heritage-IAPH.)

Session format: Regular session

Mobility and cultural exchanges were not uncommon around the Mediterranean in antiquity, whom populations had long been interconnected for centuries before the surge of Rome. However, when addressing migration, individuals often misjudge the implications for the people involved in these processes, and the impact they had in their destinations. Upon their deaths, individuals who were fortunate enough had the opportunity to build something to be remembered by. However, those funerary monuments represent more than a longing for eternity, as they convey the cultural background of the displaced and preserve their cultural ethos in a foreign land.

Scholarship on funerary archaeology has grown exponentially in recent decades. However, academic organisational and intellectual structures often artificially isolate the study of funerary evidence as they encompass established cultural parameters rather than assessing the interconnectivity that the Mediterranean had for centuries. This created artificial boundaries that ignore this connectivity, categorising funerary elements as Punic, Greek, Roman, or Barbaricum. When assessing funerary evidence, we tend to point out the main differentiating elements between cultural backgrounds, effectively neglecting the connections that different communities shared. As academics, we usually ignore that the funerary elements acted as conveyors of identity, which were often assimilated by the local communities, rather than as a characteristic feature of a determined civilisation.

This session brings together scholars who work across temporal and spatial boundaries in the Mediterranean Basin. We will reconsider how to re-evaluate the interconnectivity among the Mediterranean, and how this shaped the diversity of the materiality of belief. The aim is to extend the chronological timeframe of our session beyond the constraints of the Roman Empire to cover a broad range of cultures within the Mediterranean sphere. Thus, we invite contributions analysing funerary practices, cross-cultural influences, and identity from the Phoenician colonisation of the Mediterranean to the Early Medieval Period.

ABSTRACTS

MORTUARY PRACTICES AND IDENTITY IN TEL 'ETON: FROM THE END OF THE BRONZE AGE TO THE LATE IRON AGE

Baruch, Eyal (Bar Ilan University) - Faust, Avraham (Bar-Ilan University)

The cemetery surrounding Tel 'Eton is one of the largest burial grounds in ancient Israel. It was first identified in 1968 when, following extensive looting, the IAA excavated a number of tombs, and since 2006 we are conducting an intensive survey in the vicinity of the mound. The earliest known caves appear to be dated to the Intermediate Bronze Age, but most of the caves are later, and the cemetery was used continuously from the Late Bronze Age to the later part of the Iron Age. An examination of the tombs and their contents reveals interesting patterns of continuity and change over time. Both the plan of the earlier Iron Age tombs and their content expose many outside contacts, but later changes show that the population of the site gradually assimilated and became Israelite in the course of the 10th-8th centuries. From a broader perspective, an examination of regional changes in burial practices suggests that the Tel 'Eton burial traditions influenced the development of the Judahite burial practices (and the so-called "Judahite tomb") in the 8th century BCE.

The first part of the lecture will summarize the results of the survey and excavations that were carried out in the cemetery since it was discovered almost 60 years ago. The second part of the paper will review the changes in burial practices over the centuries, and will reflect on the complex connections between the Tel 'Eton cemetery and the development of the popular Judahite burial of the Iron IIB-C.

2 LA NECROPOLI EST DI POLIZZELLO. INFLUENZE INTERCULTURALI NELLE PRATICHE FUNERARIE DI UN CENTRO INDIGENO DELLA SICILIA CENTRO-MERIDIONALE (TITOLO PROVVISORIO)

Barbera, Antonio (Archeologo specializzato indipendente)

Durante l'intervento saranno presentate alcune considerazioni inerenti ai rapporti culturali intercorsi tra la comunità indigena di Polizzello (CL) e le colonie greche di Sicilia. Esse sono state elaborate con i risultati emersi dallo studio dei contesti funerari e dei relativi manufatti provenienti dalla Necropoli Est del sito e dal loro confronto con altre realtà siciliane coeve.

La necropoli è stata utilizzata dalla comunità sicana che occupò questa altura interna della Sicilia centro-meridionale durante il periodo in cui si intensificarono i contatti con i Fenici e i Greci. In particolare, quest'ultimi furono protagonisti di un continuo confronto -e scontro- con le comunità indigene, le quali da una parte reagirono attraverso un rafforzamento e un ritorno alle proprie tradizioni, dall'altra subirono l'influenza della cultura greca; entrambe le condizioni sono ben testimoniate dalle evidenze archeologiche. Seguendo le diverse fasi d'uso individuate in questa necropoli, è possibile riconoscere una progressiva apertura alla tradizione greca da parte del centro, riscontrabile nella cultura materiale: ne sono testimonianza la scelta dei corredi (non solo per le classi e le tipologie utilizzate, ma anche per le caratteristiche produttive), nonché la disposizione dei defunti e il rituale funerario.

Verso la metà dell'VIII sec. a. C. alcune tombe di età più antica sono riutilizzate e il record archeologico dimostra ancora il perdurare della tradizione funeraria isolana dei periodi precedenti. Un importante cambiamento si verifica nell'VII sec. a. C., quando si nota un momento di rottura con le tradizioni locali, mediante l'adozione di elementi allogeni di tradizione greca in uso fino all'abbandono del centro.

In conclusione, attraverso quasi due secoli si osserva nella necropoli di Polizzello il passaggio da una cultura caratterizzata da uno spiccato conservativismo da contrapporre alle nuove invasioni culturali, ad un periodo in cui quest'ultime riuscirono a penetrare la diffidenza iniziale delle comunità locali.

3 PATTERNS OF CONNECTIVITY IN ARCHAIC MÉTAUROS

Scaravilli, Marco Stefano (MIC - Soprintendenza ABAP RC-VV.) - Quondam, Francesco (University of Vienna) - Hansen, Clara (University of Vienna)

The necropolis of Métauros in southern Calabria (nowadays Gioia Tauro) with approximately 1500 excavated burials from the Archaic Period (7th-5th century), features rituals and burial assemblages that suggest multiple scales of mobility and interconnectivity. This is shown first by a mixture of burial rites that are either associated with long-standing local traditions or with the arrival of long-distance migrants. This is supported additionally by the inclusion and sometimes combination of objects commonly classified as "indigenous" (e.g., impasto ware) and those viewed as "Greek" (Corinthian, Samian, Attic, etc.).

By analyzing a sample of 250 Greek tombs, this study aims to foreground patterns in connectivity and mobility to shed light on the wide range of identities expressed in the context of Archaic burials. We consider, on the one hand, burial rite (treatment of the body, architectural features, grave good assemblages), and on the other aspects regarding the organization of the space and funerary projection of the community. We will show that the dynamics at play went beyond the simplistic narrative that is often perpetuated for this period known as "Greek Colonisation", painting a more detailed and varied picture of Archaic Magna Graecia and the existing cultural identities.

4 RITUALISM AND FUNERARY PRACTICES IN TARTESSOS: THE QUESTION OF IDENTITY IN A WORLD OF CONSTANT CHANGE

Ramos-Soldado, José Luis (Laboratory of Palaeobiology, Andalusian Institute of Historical Heritage)

The funerary practices existing among the Tartessian populations are featured by the coexistence of diverse traditions – Atlantic, Hinterland, and Mediterranean –. This has been mainly considered a result of the dynamics derived from the Phoenician colonisation in the southwest of the Iberian Peninsula during the Iron Age. Hence, and despite the limited and fragmentary archaeological record available in this regard, several customs have been identified, including weapon deposits in water courses, carved stone stelae, both inhumation and cremation burials, and individual and collective tumuli. Among these, the spread of funerary rituals of Eastern influence stands out for their contrasts in comparison with other practices. In this context, for instance, the arising of cremation rituals coincides with the arrival of eastern settlers.

This heterogeneous record has caused an ongoing discussion regarding the identity and cultural definition of the buried Tartessians. Traditionally, it has been considered that the elite emulated certain Phoenician traits as a display of prestige. However, the research conducted in the past decades rather suggests a progressive miscegenation process,

which is especially perceivable in modest burials. The absence of epigraphy and the assorted nature of the grave goods have further intensified this debate.

This contribution addresses the described framework, reflecting on the complexity of defining particular identities before the coexistence and connivance of diverse forms of expression detectable through the material record.

5 SOME PHOENICIAN JEWELS FROM MOTYA (SICILY)

Oliveri, Francesca (former Soprintendenza del Mare)

The study of precious pendants and earrings found on the Phoenician island of Motya in Sicily has offered the opportunity for reflection on fashion habits of the Phoenician of the West Mediterranean.

Jewels are special artefacts: probably born with the will of embellishment, they possess a much deeper meaning than that, upgrading the simple material object with symbolic, magical and religious values or making it an instrument of prestige and ostentation.

This complexity leads toward two substantive aspects related to the duration of use and the geographic distribution of some ornaments.

It is important to remember that even on the occasion of discovery in a perfectly datable archaeological context, a jewel could always be much older, representing, for example, a family inheritance.

Similarly, some productions particularly welcome and fashionable, enjoy wide circulation capable of overcoming regional boundaries, especially those that become portable symbolic objects and bear images of beloved potent deities.

6 THE AFTERLIFE OF FUNERARY MONUMENTS. REUSE AND MISUSE OF THOLOS TOMBS IN CLASSICAL ANTIQUITY

Galli, Alessio (Scuola Normale Superiore di Pisa)

Amongst the most remarkable landmarks of Aegean prehistory, tholos tombs were an important feature of Minoan and Mycenaean funerary practices. Although we mainly recognize them for their original purpose, we cannot ignore the impact that their striking architecture had on the ancient landscape. It is only natural that later civilizations might have reused and reinterpreted the structures of the tholoi to fit new scopes, stripping them of their original identity to give them new meanings. Tholos tombs thus continued to be an important part of the Greek landscape even centuries after their primary use, passing from one civilization to another.

This paper aims to present a catalogue of the evidence of reuse of tholoi in classical antiquity. Previous studies have chiefly been focused on the tomb cults that took over previous burials, but this paper wishes to reverse the narrative and start the analysis from the tomb itself. The reassessment of the evidence linked to the reuse and repurpose of tholoi considers a diachronic span that covers Archaic, Classical, Hellenistic and Roman Greece. I will outline a survey of possible ancient reinterpretations of the funerary structures of Minoan and Mycenaean memory: as heroa for cult purposes, for domestic or industrial use, and as garbage dumps. Each choice of reuse marks a new way in which human groups and communities saw their Aegean past and made use of it, shaping new traditions and identities and parting way with ancient civilizations.

7 CONSTRUCTING LOCAL IDENTITIES IN THE MEDITERRANEAN WEST. FUNERARY CONTEXTS AND CULTURAL HYBRIDISATION IN COLONIA AUGUSTA EMERITA

Cáceres-Puerto, Carlos (Independent Researcher)

Mobility and cultural exchange were not uncommon in Roman times around the Mediterranean, as it continued a long-lasting tradition of interconnectivity spanning hundreds of years. This connectedness favoured the creation of new settlements and communities as the Romans expanded their domains. Some of these settlements were conceived to assimilate preexisting communities, adopting their ethos and cultural practices, whereas others were established from scratch. The latter, often associated with military foundations, saw their first settlers struggle to maintain the ethos of their motherland. Burial practices, funerary monuments, and grave goods conveyed not only the cultural background of the new settlers, but also the story of a community, a belief system, and who they longed to be associated with.

Colonia Augusta Emerita was a Roman colony founded in 25BC in western Hispania. It was established under the direct command of the first Roman emperor, Augustus, and was shortly afterwards named the capital of the Province of Lusitania. The nature of its foundation, as a newly established settlement, intensely shaped the idiosyncrasy of its first settlers. This can be perceived through the funerary record, as they strove to assimilate to other provinces, perhaps to compensate for the lack of a shared identity.

This paper aims to analyse how the inhabitants of Colonia Augusta Emerita negotiated and hybridised diverse cultural influences to shape their identity as a community. I examine the funerary record between the late 1st century BC and

the 3rd century AD to discern patterns of cultural hybridisation, shedding light on the dynamic processes of assimilation, adaptation, and reinterpretation of traditions. The case of Colonia Augusta Emerita offers valuable insights into the complex interplay of local, regional, and transregional influences that shaped the sociocultural fabric of a Roman settlement during the Early Imperial Roman period through the funerary record.

8 IMPERIAL FUNERARY CONTEXTS FROM THE SITE OF UNHOS (LOURES, PORTUGAL). STUDY OF BONE ARTEFACTS, POTTERY AND GLASS VESSELS

Guimarães, Raquel (ERAAUB (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona); IAUB (Institut d'Arqueologia de la Universitat de Barcelona); CHAM (Centro de Humanidades)) - Lopes, Martim (Universitat Rovira i Virgili; CHAM (Centro de Humanidades))

In 2007, an emergency excavation was initiated in Unhos due to road construction, revealing Roman structures previously unknown in the area. Portions of these structures were detected, suggesting they were part of an unidentified villa. Additionally, in another area of intervention further from the initial site, funerary contexts of cremation were uncovered, albeit with poor preservation.

This study aims to comprehensively analyze the materials collected, focusing on at least three distinct burials dating from the late 1st to the 3rd centuries AD. Despite severe fragmentation, some profiles have been reconstructed, revealing a diverse and uncommon assortment of spolia for the Olisipo region, the nearest Roman city. Among the findings are a significant number of bone artifacts and a glazed ceramic of possible local or regional origin, representing a previously undocumented production in this area.

This discovery holds implications for understanding the socio-economic dynamics and cultural exchanges prevalent in the region during this time period.

9 ROMAN-PERIOD BURIAL PRACTICES AND FUNERARY ARCHITECTURE AT HIPPOS OF THE DECAPOLIS: BETWEEN LOCAL, PROVINCIAL, AND CLASSICAL

Eisenberg, Michael (Zinman Institute of Archaeology, University of Haifa; German Institute of Archaeology (GPIA)) - Kowalewska, Arleta (Zinman Institute of Archaeology, University of Haifa)

Antiochia Hippos (Sussita) of the Decapolis, located 2 km east of the shores of the Sea of Galilee, has three recognized necropoleis, all dated to the Roman period (63 BCE–4th century CE). The most prestigious and the best-researched is the Saddle Necropolis located along Hippos' main approach via the saddle. The recent excavations make this necropolis one of the most prominent examples of Roman cemeteries in the Southern Levant. With its various types of burials (hundreds of nari and basalt sarcophagi, numerous pit graves cut into the bedrock with or without stelae, a dozen burial caves with burial niches, funerary podia, and at least two elaborately decorated mausolea) this necropolis represents all the socioeconomic strata of Hippos' residents and the mixed cultural background (Graeco-Roman, Phoenician, and local Semitic influences) from which this funerary structures emerged. This presentation visualizes the excavated components of the Saddle Necropolis, while discussing their possible cultural origins and their common and unique local expression within a polis in the Eastern Mediterranean.

10 "I WROTE ENTIRELY IN (MY) OWN HAND": THE ROLE OF LOCAL STONE-DRESSING WORKSHOPS IN POST-ROMAN FUNERARY PRACTICES FROM ZOARA (JORDAN)

Perez Yarza, Lorena (University of Warsaw) - Borczyńska, Julia (University of Warsaw) - Rea, Andrés (University of Warsaw) - Nowakowski, Paweł (University of Warsaw) - Bastero Acha, Marina (University of Warsaw)

The Ghawr as-Safi site (Jordan) is characterized by an extensive necropolis associated with a Late Antique and Islamic settlement that continued the ancient settlement known as Zoara or Zoora. The necropolis has yielded over 600 funerary inscriptions composed in Greek, Aramaic, Hebrew and Arabic, attesting to the linguistic diversity prevalent in the local commemorative practices. Approximately 250 of these can be precisely dated to the 4th and 5th centuries, aligning with the transition from Roman into the post-Roman and Byzantine world. The analysis of this epigraphic ensemble depicts the regional consolidation of new funerary forms, adapted to accommodate the novel Christian ecumene within the Mediterranean milieu. However, this adaptation unfolds within a local Semitic context that had long been shaped by Graeco-Roman influences. The decline of the ancient world and the emergence of new socio-political dynamics did not put an end to this characteristic cultural framework, but rather encouraged changes in a culture that retained many of its former characteristics.

This paper aims to bring forward the role of the epigraphic workshops of Zoara as agents of a coherent epigraphic horizon with its own cultural dynamics and transformations. Several workshops have been identified through the multidisciplinary study of regional patterns or 'styles' present in the morphology, iconography, funerary formulae and palaeography of stelae. These production places reinvented and adapted Late Antique carving, writing and decoration techniques to the specific needs of the site's inhabitants, even serving as an example of a common local production.

Moreover, the cultural reality of these funerary practices surpasses the traditional temporal categorization of 'Antiquity, Late Antiquity and Byzantine or Middle Ages'. Rather, they need to be viewed in a new Mediterranean grid of local and interconnected spaces that derive from an earlier past as testified by the epigraphic workshops of Zoara.

11 POST-DEPOSITIONAL RITUALISM AT LATE ANTIQUE TOMBS OF THE WESTERN MEDITERRANEAN. LOCAL PARTICULARITIES IN A COMMEMORATIVE KOINÉ

Ardeleanu, Stefan (University of Hamburg)

The transition from the High Imperial period to Late Antiquity was a transformative period in many respects. The spread of Christianity, the fragmentation of the late Roman Empire and massive mobility were just some of the major processes that permanently changed Late Antique societies. Two central areas of people's everyday lives and mentalities were also affected: Concepts of the afterlife and the commemoration of the dead. The paper proposes to shed light on the fascinating variety of ritual practices that were carried out at closed graves in memory of the deceased, which have so far received little attention from funerary archaeology. New research shows that, recurring to a pagan tradition, people continued to eat, celebrate and drink intensively at graves for a long time. Grave paintings, pottery, glass, fauna and botanical finds provide astonishingly detailed insights into the practices carried out at graves. The church tried hard to curb this ritual activity, with geographically very differing and overall little success. Especially, more than 700 Late Antique funerary mensae, ritual-associated tomb markers in the form of banquets built over tombs, show the enormous popularity of these ancient practices, which even continued beyond the Middle Ages and into the modern era in some regions. These postdepositional rituals and ritualized monuments were very common in the Western Mediterranean throughout Late Antiquity, mostly in urban areas and in elite milieus. Due to their technical and structural analogies, they form a veritable 'funerary koiné' along the Western Mediterranean. Simultaneously to these global trends, in each region with high density of ritualized grave markers also local traditions and particularities emerged. Both aspects will be analyzed balanced in this paper.

12 THE USE OF COINS IN LONGOBARD TOMBS: CONTINUITY OF A RITE OR A PRACTICE WITH RENEWED MEANINGS?

Conejo, Noe (Università degli Studi di Padova- Universidad Carlos III de Madrid)

The arrival of the Longobards on the Italic peninsula meant the spread of new funerary practices in the territory. In a highly hierarchical society, the grave was conceived as a space for the communication of meanings, where the social status of individuals and their respective family ties were clearly marked. In numerous necropolises in northern Italy between the 6th and 7th centuries, some tombs contain one or more coins as part of the grave goods. These could be placed with the deceased individually or transformed into personal decorative items together with other elements such as beads and/or semi-precious stones. Traditionally these decorative objects have been considered as status markers, in the case of coins minted in precious metals, and as talismans or magical objects, due to their antiquity, as most of the pieces are from the Roman period, and due to their iconography, with some images related to eschatological ideas. These interpretations can also be related to the untransformed coins deposited on the deceased, which have sometimes been interpreted as a continuation of the famous rite of Charon, the fierce boatman who in classical times guided souls through the underworld in exchange for a coin. A systematic compilation of the coins found in these necropolises provides new data on this practice and allows us to reflect on other aspects that have been overlooked in recent years, such as the weight of the economy in the choice and use of coins in these tombs. In this way, new lines of research are provided on a rite that in form presents continuities with the previous period, but with totally different meanings that make the placement of coins in Longobard tombs a genuine gesture for understanding the mentality of these communities.

13 BETWEEN MATERIAL AND IMMATERIAL. THE GRAVE GOODS AND THEIR DIFFERENT MEANINGS FROM THE 8TH TO THE 10TH CENTURIES

Colagrande, Andrea (Università degli studi di Trento)

The study of Early Medieval funerary contexts has a long historiographical tradition and has undergone considerable development in recent years. Although the collection, analysis and interpretation of funerary data constitute a well-established methodological approach, academic interest commonly tends to wane in relation to the final centuries of the Early Middle Ages, a chronological period for which it is customary to consider the different social and theological implications to imply the absence of funerary objects in favour of a marked immateriality of ritual. The present work deals with the centuries between the 8th and 10th centuries, a chronological arc marked by profound changes at a social and liturgical level, and will attempt to present the current state of knowledge on the evolution of rituality linked to the funerary episode with particular reference to the presence and absence of grave goods in sites from different geographical areas of northern Italy and beyond, with the aim of highlighting how the process of

abandoning grave goods occurred gradually and differently in distinct geographical areas, demonstrating the different responses of communities to the change in funerary ritual.

950 TRADE IN METALS FROM THE BRONZE AGE TILL EARLY MODERN TIMES BETWEEN THE CARPATHIAN BASIN AND THE NORTHERN ADRIATIC

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Kiss, Viktória (Institute of Archaeology, Research Centre for the Humanities, Budapest) - Romhányi, Beatrix (Medieval Studies Department, Károli Gáspár Calvinist University) - Cavazzuti, Claudio (Prehistory & Protohistory Dept., University of Bologna) - Angelini, Ivana (Dep. of Cultural Heritage, University of Padua)

Session format: Regular session

From the beginning of the Copper Age until the pre-modern era, copper played a prominent role in the economy. Mining and trading the metal – be it pure copper or a copper alloy – created corridors of interaction that connected distant regions in Europe and beyond. Previous research has shown that these trade networks existed over the long term, and even when they were temporarily disbanded for various reasons – demographic, environmental or political – they re-emerged as soon as circumstances became favourable. The part of Europe comprising Northern Italy, the Eastern Alps, the Carpathian Basin, and the Northern Balkans was one of the geographical settings where – due to rich natural resources and their long exploitation over millennia – such networks can be traced and studied in a diachronic perspective. The study of such long-term processes requires a complex methodology that includes traditional archaeological methods, material analysis and, in the periods where they exist, the use of written evidence.

The aim of the session is to bring together researchers from different archaeological periods who deal with copper-bearing objects, objects related to mining, metallurgical technologies and metal provenance, as well as other artefacts also connected to copper trading (e.g. animals, textile or other organic materials). The focus of the session is on the diachronic consideration of metal production and trade in the respective geographical region, with a special emphasis on the connections between Italy and the Carpathian Basin, in line with the motto of the conference – Persisting with change.

ABSTRACTS

1 LINKING DISTANT REGIONS: THE STUDY OF TRADE NETWORKS AND TRADE GOODS IN A DIACHRONIC PERSPECTIVE

F. Romhányi, Beatrix (Károli Gáspár University of the Reformed Church)

Copper has been one of the most important raw materials mined in the Carpathian Basin since the early Bronze Age. Its extraction, processing and trade can be traced from the Bronze Age to the Middle Ages and beyond. Recent diachronic studies have shown that on the one hand, the prehistoric distribution networks, which are based on archaeological findings and the analysis of the material, and on the other, the medieval trade networks, which are documented by written records, largely overlap. Based on these research findings, the paper focuses on the trade networks linking Italy, the Carpathian Basin, and the neighbouring parts of the Balkans, with an emphasis on the Middle Ages up to the early-sixteenth century (the copper trade of the Fugger Company) and the written evidence. In addition to copper, other trade goods potentially involved in the exchange – such as salt, livestock, and textiles – will also be thematised.

2 DIFFUSION OF SOUTHEASTERN ALPINE COPPER IN ITALY FROM THE CHALCOLITHIC TO THE BRONZE AGE

Angelini, Ivana (Department of Cultural Heritage, University of Padova)

Recent years have witnessed a notable increasing in the chemical and isotopic analysis of Chalcolithic and Bronze Age metal artefacts conducted by various research teams. Consequently, a wealth of data is now available in the literature, facilitating the reconstruction and tracing of the exploitation of diverse mining areas. Notably, publications on the isotopic characterization of South-Eastern Alpine copper ores (Nimis et al., 2012; Artioli et al., 2016) have led to the revelation that this type of copper spread significantly farther into Northern Europe than previously assumed (Melheim et al., 2018; Ling et al., 2016; Nørgaard et al., 2021), particularly from about 1500 BCE. However, questions remain regarding its spread southward into the Italian peninsula and the beginning of systematic ore exploitation in the South Eastern Alps.

Based on the works of the archaeometallurgy research team at Padova, this presentation aims to provide a comprehensive overview and address these inquiries. The discussion will focus on archaeometric investigations conducted on prehistoric Italian copper and bronze objects, thanks to collaborative efforts and projects spanning the last 15 years.

Approximately one hundred Chalcolithic and one hundred and fifty Bronze Age artefacts have been analysed (with data either published or in press). The presentation will discuss these results to review current knowledge while highlighting remaining uncertainties surrounding the diffusion of Alpine copper in Italy during the specified chronological range.

3 TRADE, METALS AND POPULATION MOVEMENTS

Kiss, Viktória (Institute of Archaeology HUN-REN Research Centre for the Humanities)

Collection of import vessels and bronze artefacts outside of their original distribution area, indicating the interaction of communities living in modern-day Western Hungary in the late Early Bronze Age and Middle Bronze Age (2100-1600/1500 BC), have already suggested trade connections. It was also supposed that these relationships may indicate exogamous marriage customs in a wider region. This paper summarizes the results of a new aDNA study of the burials excavated in the region of western Hungary, combined with data of metal trade. The case study of the burials from Balatonkeresztúr provides evidence of the mobility of small communities coming from the area northeast of the Carpathian Basin in the Early Bronze Age (2400-2100 BC). In addition, after the settlement of these newcomers, the trade links observed within and outside of the Carpathian Basin during several hundred years were confirmed not only by their special type of encrusted pottery and bronze objects but by archeogenetic data. Recent bioarchaeological analyses in this way uncover information of contacts among copper and tin producers, metal traders, as well as bronzesmiths of characteristic local bronze artifacts within a wide area from the region of the Erzgebirge and the Slovakian Ore Mountains, until Eastern Serbia.

4 BRONZE PRODUCTION AND DISTRIBUTION IN EARLY BRONZE AGE FORTIFIED SETTLEMENTS OF EASTERN SLOVAKIA

Oravkinová, Dominika (Institute of Archaeology of Slovak Academy of Sciences) - Števkó, Martin (Earth Science Institute of Slovak Academy of Sciences) - Villa, Igor (Institute of Geological Sciences, University of Bern) - Zachar, Tomáš (Archaeological Heritage Office of Saxony) - Furmánek, Václav (Institute of Archaeology of Slovak Academy of Sciences) - Olexa, Ladislav (Slovak Archaeological and Historical Institute) - Olšav, Štefan (Institute of Archaeology of Slovak Academy of Sciences)

The period around 1600 BC is referred as the peak of the Early and Middle Bronze Age Carpathian metalwork among communities settled in Slovakia, traceable even as typologic and provenance imprint that resonated across wider European trade networks. During this particular era, numerous bronze collections from the so-called Koszider horizon were abandoned and examined in diverse contexts within several fortified settlements in the macro-region of the northeastern Carpathians. Most of them also accompanied the multiple evidence of active local metallurgy. The raw material origin of these artefacts is currently presumed only indirectly, relying on the proximity of exploitable copper deposits in the Slovenské rudohorie Mts., geochemically mapped solely in the western to central regions. Bridging the data gap, we conducted a chemical and lead isotope analysis of bronze artefacts from four fortified sites considered production centers in three different micro-regions of Eastern Slovakia, namely Košice-Barca, Nižná Myšľa, Spišský Štvrtok, and Včelince. To better evaluate their main production characteristics while addressing the degree of material and stylistic homogeneity, we focused on bronze by-products and types of local origin supported by casting molds. Additionally, their provenance was investigated through exploratory analyses of copper minerals from the Spišsko-gemerské rudohorie Mts. hydrothermal ore deposits located in the site-catchment areas. All the results will be summarized to gain a more nuanced understanding of local communities' involvement in then metal trade on cross-regional and European scales.

5 CIRCULATION OF METALS AND MODELS ALONG THE PERSISTENT CORRIDOR BETWEEN THE DANUBE AND PO RIVER VALLEYS DURING THE BRONZE AGE

Cavazzuti, Claudio (University of Bologna) - Kiss, Viktória (Hungarian Academy of Science) - Cattani, Maurizio (University of Bologna) - Lugli, Federico (University of Modena and Reggio Emilia) - Cipriani, Anna (University of Modena and Reggio Emilia)

The areas between the middle Danube and the Po River valleys, as well as neighbouring regions, show intense interactions at least from the Bell Beaker periods until the Late Bronze Age. This is clear from the analysis of artefact types, funerary rituals, settlement features, agricultural strategies. In this paper, we focus on the geographic distribution of specific types of metal items dated between Early and Late Bronze Age, such as solid-hilted daggers and ösenringe, Boiu-Sauerbrunn-Keszthely type swords, and a variety of pins, which emphasize the role of warriors, high-status women, artisans, and their possible mobility across the two areas. Beside that, we will address the theme of production technology, looking at casting techniques and stone moulds, as well as the widespread evidence of well-structured metal workshops within the settlements. In addition, we will present lead isotope data from Emilia-Romagna, which

highlight the presence of copper from the Eastern Alps and Mitterberg during the Middle and Late Bronze Age, emphasizing the role of the alpine metallogenic province for the supply of metal in the two large plains.

6 MIDDLE AND LATE BRONZE AGE COPPER EXCHANGE NETWORKS BETWEEN ITALY, THE EASTERN ALPS AND THE BALKANS

Arena, Alberta (Österreichische Akademie der Wissenschaften) - Gavranović, Mario (Österreichische Akademie der Wissenschaften) - Mehofer, Mathias (Universität Wien) - Mittermair, Nicole (Österreichische Akademie der Wissenschaften)

In this paper, we present recently acquired results, including chemical and lead isotope analyses, concerning copper-based objects from Italy and the Balkans. Our investigation has unveiled a significant influx of copper from the southern and eastern Alps into the Balkans, indicating an apparent disregard for locally sourced copper. Notably, evidence of local copper production has only been found in eastern Serbia between 2000 and 1600 BC.

Our primary aim is to explore the timing of the transition from the utilization of domestic copper to the reliance on imported copper, as well as to identify the preferred distribution routes, such as the trans-Adriatic route and the Sava River Valley. Drawing from a comprehensive dataset comprising over 1000 samples, we can affirm that during the Late Bronze Age (14th-9th centuries BC), the majority of metallurgical workshops in the central and western Balkans were supplied with raw copper from Trentino.

Of particular significance are the Middle Bronze Age artefacts (16th-14th centuries BC) found in both Italy and the Balkans, which have been determined to be crafted from copper originating from Trentino. This discovery underscores an extensive production and a widespread distribution network established as early as this phase.

Our focus will be directed towards newly analyzed Middle Bronze Age artefacts from southeastern Italy, the coastal Balkans, and the Southern Carpathian Basin, shedding further light on the intricate patterns of copper trade and exchange in the region.

7 PIXE EXAMINATIONS OF TUMULUS CULTURE BRONZE OBJECTS FROM THE SZEGED AREA (SOUTHERN GREAT HUNGARIAN PLAIN)

Sánta, Gábor (Independent) - Šmit, Žiga (Faculty of Mathematics and Physics, University of Ljubljana, Ljubljana, Slovenia; Jožef Stefan Institute, Ljubljana, Slovenia)

The transition from the Middle to the Late Bronze Age in the Carpathian Basin is an eventful period with many questions.

Our project was to investigate Tumulus Culture bronze objects from key cemeteries and stray finds near Szeged, SE Hungary (Tápé, Bogárzó, Röske, etc.). They were measured in Ljubljana by PIXE methods in 2010.

The raw materials of the 39 examined objects were classified into the following clusters:

1. Average composition with a subgroup (1a.); 2. zinc-rich objects; 3. lead-rich objects. Tin content varies between 4-20%, with an average of 10%.

Trace element (As, Sb, Ag, Ni) ratios were calculated, and projected onto diagrams from recent literature with the same double logarithmic scaling. On the key Ag/Ni diagram, the objects separate clearly from objects from Mitterberg and fit well with the Ag/Ni ratios known from the Hron Valley in Slovakia.

We compared our results with other analysis data of the Hajdúsámson-Apa-type and Koszider period metals. Among the researchers of the topic, a consensus is beginning to emerge on the intensive Carpathian Basin Early and Middle Bronze Age (until the beginning of Reinecke B) mining of Hron Valley ore deposits. Most of the metal material of the contemporaneous Northern Bronze Age come from there, too. Researchers presuppose a wide-ranging system of relationships in which some communities of the Carpathian Basin could play a mediating role. Around 1600 BC mining and using of the Mitterberg ores became more important and started to dominate the metal supply of main parts of Central Europe until the end of Reinecke Br. D. Our data show that Tumulus Culture communities of the Southern Great Plain in Hungary may continued to prefer copper raw material from the Hron Valley within the investigated period, or possibly some mixture of copper from Hron Valley and Mitterberg was used.

8 THE (RE) DISCOVERY OF THE VETRIOLO BRONZE AGE MINING AREA (TRENTINO, ITALY): ARCHAEOLOGICAL AND ARCHAOMETRIC DATA

Silvestri, Elena (Archaeological Heritage office, Strategic Mission Unit Superintendence for Cultural Heritage and Activities, Autonomous Province of Trento, Italy) - Abar, Aydin (Division of Mining and Resource Archaeology, Department of Archaeologies, University of Innsbruck, Austria) - Bellintani, Paolo (Archaeological Heritage office, Strategic Mission Unit Superintendence for Cultural Heritage and Activities, Autonomous Province of Trento, Italy) - Angelini, Ivana (Department of Cultural Heritage, University of Padua, Italy) - Artioli, Gilberto (Department of Geoscience, University of Padua, Italy) - Lucarelli, Chiara (Department of Geoscience, University of Padua, Italy)

In eastern Trentino (Northern Italy), a total of 205 smelting sites, dedicated to processing copper minerals (mixed sulphides mostly with chalcopyrite), have been recorded so far, most of which are traditionally dated to the Italian Recent and Final Bronze Age. Despite the considerable number of smelting sites, very little data is available on pre-historic mines.

Following the destruction caused by the storm VAIA, investigations at Vetriolo (Levico Terme) restarted in 2020, in the area where Preuschen hinted at prehistoric mining in the 1960s, but could not prove it. A number of features (depressions, heaps and dumps) have been discovered that are likely associated with prehistoric mining activity. Surveys, excavations, and related finds thus far support the hypothesis of local mining during the latest phases of the Bronze Age, and even indicate that mining, beneficiation, and the production of finished products took place on the same site. The archaeological contexts are not the only indication that the Trentino mining district was prosperous at that time. In recent years provenance studies on the origin of copper in metal objects typologically dated to all the phases of the Italian Bronze Age (in particular from the Garda region) and the later European Bronze Age (e.g. Scandinavia, Western and Central Balkans, Bulgaria), have suggested that some of it is of south-eastern Alpine origin (Trentino – Alto Adige/Veneto).

In this paper, mineralogical, chemical and isotopic data from Vetriolo ores, as well as metal objects and a few slags will be presented. This information is integrated into a comprehensive database that covers most copper deposits and many objects in Europe. The approach aims to provide insights into the significance of the mining area in interpreting ancient metal production and exchange in the Alpine region and beyond.

9 SILVER- AND COPPER-INLAYED BELT GARNITURES OF THE 6TH-7TH CENTURIES AD AND THEIR SPREAD AROUND THE ALPS

Samu, Levente (Eötvös Loránd University Budapest) - Koch, Ursula (Curt-Engelhorn-Zentrum Kulturgeschichte an Reiss-Engelhorn-Museen Mannheim) - Daim, Falko (Department of Prehistoric and Historical Archaeology, University of Vienna)

In the early medieval times the belts played a special role in the visual communication. They could express the social status and hierarchy between individuals. In the Avar age Carpathian Basin (6th-9th centuries AD) the belts and belt garnitures were especially accentuated. Thanks to the burial customs and the excavated large cemeteries we have now a relatively detailed picture about the metal sets of these belts and in general about the belt structures.

Among the large variety of belts the silver- and copper-inlayed ones (tauschierte Gürtelgarnituren) build a special group. The iron strap-ends and mounts were decorated with different silver- and/or copper-inlayed ornamental elements. They were spread in large areas between Frankia and the Carpathian Basin from the second half of the 6th century on until the end of the 7th century. Based on their structure and decoration (motives) they can be divided into many different typological and chronological subgroups. Thanks to them we are also able to connect the chronological systems of different regions. Their spatial distribution is also important, as they can mark important communication routes connecting the regions around the Alps and beyond.

10 THE COPPER OF THE AVARS: ON THE PROBLEM OF EARLY MEDIEVAL METAL RESOURCES IN EAST-CENTRAL-EUROPE

Mozgai, Viktória (HUN-REN RCAES Institute for Geological and Geochemical Research) - Villa, Igor (Institute of Geology, Bern University) - Bajnóczi, Bernadett (HUN-REN RCAES Institute for Geological and Geochemical Research) - Szenthe, Gergely (Hungarian National Museum)

Our case study addresses the question of the early medieval revival of copper production in Europe. The focus of the research area is the Carpathian Basin, located on the eastern periphery of the zone influenced by European early medieval processes. The research of where and when early medieval metal production started in the region in our case also provides answers to the question of how the region was linked to the European continental economic network, which is until recently an unresolved problem. Ore extraction and the production of various non-ferrous metals (copper, silver, gold) had important centres in the Carpathian Mountains throughout the Middle Ages until the Modern Era. Concerning the Avar period, our study is based on copper samples taken from 'Late Avar' (c. 8th

century AD) artefacts, which were used for certain purposes alongside the copper alloys predominant in the period, containing mostly lead as alloying material. As the samples were selected from the entire Avar cultural area, results are representative of the entire region, and allow the identification of copper resources accessed by the inhabitants of the Carpathian Basin.

957 DESTROYED, SUBMERGED, AND UNREACHABLE: THE CHALLENGING INTERPRETATION OF HUMAN STRATEGIES ACROSS LOST LANDSCAPES

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Gomes de Almeida, Miguel (Dryas / Octopetala) - Aubry, Thierry (FCP - Fundação Côa Parque)

Session format: Regular session

Prehistoric research responds to a demanding scientific programme aimed at replicating the ethnographers' emphasis on human social relationships, economic strategies, technical procedures, interpersonal variability, and material culture.

This Paleolithic approach (based on complementary analytical tools, such as techno-typological analysis, raw material identification, and site catchment analysis) requires a thorough exploitation of each site's archaeological remains (both artifacts and ecofacts) informative potential, to reconstruct the groups' everyday routines, but also their subsistence strategies and normative cultural structures.

This approach also broadens the archaeologist's horizons by placing each site within the context of the territory(/ies) defined by the movement of objects, people, and ideas deduced from intra-site analyses. Recent research stresses site complementarity and, occasionally, surprisingly large territories or circulation areas.

However, these interpretative efforts frequently struggle with fragmentary and incomplete knowledge of the ecological context and landscapes in which the prehistoric groups evolved.

Although this lack of information is often due to insufficient Palaeogeographic and Palaeoenvironmental reconstructions of past landscapes, as well as the alea of archaeological preservation, regional studies have highlighted the methodological difficulties in understanding the groups' adaptations to landscapes still largely unknown to us.

While large stretches of shoreline are currently underwater because of Holocene sea-level rise, which prevents us from knowing vital information about the economic adaptation to these unique, rich ecosystems, the recent interactions between the effects of climate change and growing anthropogenic artificialization of the landscape further limit our ability to access important archaeological data, or even wipe it out entirely.

Contributions are expected to focus on:

1. Data collection and surveys in environments difficult to access, destroyed, or submerged.
2. The palaeogeographic/palaeoecological reconstruction of lost landscapes.
3. Regional interpretations of human cultural responses to these ill known territories.
4. Resilience and mitigation projects for climate change and anthropogenic artificialization impacts on archaeological resources.

ABSTRACTS

1 AN UNEXPECTED TURN OF (MIDDLE!?) PALAEOOLITHIC EVENTS: PICÕES DOS GRILOS 4

Aubry, Thierry (Fundação Côa Parque; Uniarq - Centro de Arqueologia da Universidade de Lisboa) - Almeida, Miguel (Morph / Grupo Dryas; Uniarq - Centro de Arqueologia da Universidade de Lisboa) - Aires, Sílvia (Fundação Côa Parque) - Luís, Luís (Fundação Côa Parque; Uniarq - Centro de Arqueologia da Universidade de Lisboa) - Silvestre, Marcelo (Fundação Côa Parque) - Ramos, Patrícia (CITCEM, Centro de Investigação Transdisciplinar "Cultura, Espaço e Memória") - Ferreira, André (Morph / Grupo Dryas)

Despite the link between the Palaeolithic rock art concepts, style, and techniques of the UNESCO World heritage sites of the Côa Valley and Siega Verde, the previously known archaeological record in the territory between these rock art concentrations showed scarce evidence of Palaeolithic occupation: most coeval sites were limited to the lower Côa Valley, indicating that humans mainly occupied deep valley refugia, contrasting with limited logistic activities in the plateaus.

Recent archaeological surveys conducted to test this hypothesis, were based on the geological evidence that:

- (1) near-surface impermeability in large areas of the plateau and
- (2) early spring snow melting or rainfall concentration due to climate oscillations

would provide excellent conditions for large herbivores in the plateau areas, at least seasonally, during most Upper Pleistocene.

This survey project documented the Pleistocene occupation of the Côa / Águeda interfluvial plateau: surface lithic remains were identified in numerous locations, including several sites with likely preservation of stratified archaeological layers, which were selected for subsequent intrusive tests.

One of these sites, Picões dos Grilos 4, yielding an abundant surface lithic remains with raw material and technological features indicating an Upper Palaeolithic occupation, was excavated, revealing an unexpected find: while no stratified layers produced objects archaeological related to the surface series, a deep, preserved, isolated layer delivered a technologically coherent set of lithic artifacts similar to other known regional Middle Palaeolithic sites.

This discrepancy between surface remains and preserved stratified archaeological layers has methodological implications, as it means that future surveying should focus on the potential of preserving Pleistocene layers, rather than looking for surface remains.

This consideration only increases our absolute dependency on a detailed reconstruction of past climate and landscape evolution: such knowledge, which is critical for interpreting human adaptation to Past Landscapes, thus becomes equally essential for identifying archaeological stratified sites.

2 SOMEWHERE BEYOND THE SEA SEARCHING FOR MORE AHRENSBURGIAN

Grimm, Sonja (Leibniz Zentrum für Archäologie, LEIZA-ZBSA)

Submerged in today's North Sea and Baltic Sea are large landscapes that Late Pleistocene hunter-fisher-gatherer communities could explore. Different geoscientific and palaeoenvironmental studies have reconstructed these landscapes in the last decades and identified rich and diverse environments that underwent significant transformations after the last glacial maximum (c. 24.5-17.0 kyrs BCE). However, only single archaeological finds that were dredged from the sea ground are attributed to this Late Palaeolithic period. The Cimbrian Peninsula bridges the "lost landscapes" of the North Sea and the Baltic Sea. The archaeological record from this area makes building hypotheses about land use also for the today submerged territories possible.

This presentation brings together our current knowledge about the period from the end of the Lateglacial Interstadial to the beginning of the Postglacial (c. 11-9.3 kyrs BCE). I use the reconstruction of the submerged landscapes of the North Sea and the Baltic Sea as well as of the Cimbrian Peninsula and compare these changing landscapes with our knowledge of the Late Palaeolithic Ahrensburgian settlement and land-use strategies mostly from the Cimbrian Peninsula but also from other areas adjacent to the North Sea and the Baltic Sea. Hence, I aim to understand the development of the Ahrensburgian based on our for different reasons limited knowledge across these lost landscapes.

3 ANTHRACOLOGICAL EVIDENCE ON LOST WOODLANDS OF THE CURONIAN SPIT AND ITS IMPLICATIONS ON NEOLITHIC SITES, PALEOENVIRONMENT AND THE SPIT FORMATION

Peseckas, Kestutis (Nature Research Centre (Vilnius, Lithuania)) - Pilkauskas, Mindaugas (Lithuanian Institute of History) - Piličiauskas, Gytis (Lithuanian Institute of History)

The Curonian Spit separates Baltic Sea from the Curonian Lagoon. It was formed at the end of the Atlantic and the beginning of the Subboreal and is composed almost entirely of aeolian sand. Landscape of the Curonian Spit in the past was repeatedly formed and deformed during the sand dune activation (deflation) and stabilisation (paleosol formation) phases. These processes are attributed to both natural and anthropogenic factors leading to deforestation. As a result of dune reactivation and westerly winds between 3500 and 1000 BP Curonian Spit migrated about 180 m and in the last 1000 years almost 500 m to the east. Today, the Spit is characterised by its unique dune system, consisting of selected and protected areas with still active dunes and dunes stabilised over the last 150 years by the construction of protective dune ridge and extensive tree planting program. Most of the area of the Curonian Spit is covered by forests, but only a fraction of them are naturally grown and have been preserved since the 18th century.

Curonian Spit is also known for its Neolithic sites of Corded Ware and Bay-Coast cultures that settled the Spit during 4th and 3rd millennium BC. For the reasons mentioned above, the prehistoric landscape of these sites is difficult to understand, however in the last 10 years renewed interdisciplinary field research has provided reliable palaeoenvironmental interpretations. Today we add to them the results of the first anthracological analysis of charcoal from the Nida and Alksnynė sites. Different dominant wood species were identified in these sites, suggesting different edaphic conditions in the southern and northern parts of the Spit. The results of this analysis contribute to the understanding of the archaeological sites, their natural environment and functions, and also give an insight into the unique period of the Spit formation.

4 NEUENWALDE - A SANDY SLOPE AND CHANGING WETLANDS IN NORTHERN GERMANY

Mahlstedt, Svea (Lower Saxonian Institute for Historical Coastal Research) - Siegmüller, Annette (Lower Saxonian Institute for Historical Coastal Research) - Wolters, Steffen (Lower Saxonian Institute for Historical Coastal Research)

Some 15 km from the present day North Sea coast and on the edge of a vast wetland area the sandy slope of Neuenwalde has been occupied by early and mid-Holocene inhabitants for several thousand years. During this time the wetlands changed from a floodplain of a little streamlet to a large raised bog region that during Neolithic times also got affected by a temporary marine ingression.

An excavation in the 1960s on sandy grounds has given evidence that the upper part of the slope was inhabited. An intensive survey of the area conducted between 2019 and 2023 searching for well preserved remains in the deeper parts of the slope today covered by wetland revealed several traces of early and mid-Holocene human activity in a constantly changing landscape.

This paper strives to bring together the different aspects of archaeological traces and landscape development with a more general interpretation of the role, which the slope of Neuenwalde played in the life of early and mid-Holocene small scale societies.

5 THE SEA-LEVEL RISE AND THE HUMANE RESPONSE IN THE NEOLITHIC PERIOD IN THE SOUTHERN LEVANT

Indino, Lorenzo (Sapienza University of Rome)

The paper will examine some submerged Neolithic settlements (7500-6000 B.C.) that were exposed off the Carmel coast of Israel, in an area of about 8 km². The discovery of human burials, rectangular stone structures, megalithic structures, olive oil extraction installations and stone-built water wells shows a fully agricultural subsistence economy. The development of wells that utilized coastal aquifers enabled permanent human habitation near the coastline for the first time in this area. But settlements adjacent to the sea are most vulnerable by climate change. Indeed, this period is associated with an abrupt rise in sea-level and consequent alteration of coastal landscapes and their ecology. The humane response to sea-level rise is highlighted by large stones in the water wells to raise the well bases and so enable them to exploit fresh water from the upper to avoid the salinization or the construction of a seawall at Tel Hreiz. These are evidence of mitigation for the climate change in the Neolithic period

6 SUNKEN PREHISTORIC SHIP SLIPWAYS ON THE EAST COAST OF THE ADRIATIC SEA

Parica, Mate (University of Zadar, Department of archaeology)

Recently, several sunken prehistoric sites have been found on the Croatian Adriatic coast. They date from the Neolithic to the Hellenistic period, and some of them contain traces of ship slips.

Some sites are settlements, others are naval trading bases. The most common slipway structures were built in places where the natural slope angle is too steep to pull ships out. In this case, dry stone constructions were used to build ramps with a smaller angle so that the ships could be pulled out more easily. A higher concentration of pottery can be observed in the area of the above-mentioned ramps. If we assume that the towing of ships on dry land was prevalent in prehistoric times, then the Italian Adriatic coast is also very suitable for sailing to the northern Adriatic. This is evidence that ships were kept on the coast from the earliest times and that the Liburnian ships continued this tradition, due to the geomorphological and meteorological characteristics of the Adriatic.

965 IN-SITU SENSING OF (GEO-)ARCHAEOLOGICAL SOIL AND SEDIMENT ARCHIVES: EMERGING METHODOLOGIES AND APPLICATIONS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Werther, Lukas (German Archaeological Institute, RGK) - Verhegge, Jeroen (Gent University) - Brown, Antony (University of Southampton; The Arctic University of Norway Tromsø) - Köhler, Anne (Leipzig University)

Session format: Regular session

In recent decades, there have been significant advances in the use of aerial remote sensing techniques (e.g., LiDAR) and proximal sensing methods (e.g., near-surface geophysics) in archaeology. While these approaches yield high-resolution data at the horizontal level, their capacity for vertical subsurface discrimination is more constrained. This limitation is often addressed by collecting data as the sensor moves down the soil profile or within a borehole. Consequently, the miniaturization of computing and sensing equipment has enabled a growing adoption of direct push-type sensors (e.g., cone penetration testing, color logging tools) in (geo-)archaeology, particularly for mapping deeply buried deposits in-situ, especially in wetlands and floodplains. In parallel, sensors traditionally capable of microscoping

sensing, but originally designed for laboratory use, such as portable X-ray fluorescence (pXRF) and portable OSL (pOSL), have now been adapted for field measurements, enhancing their applicability in on-site archaeological investigations of sections and profiles.

Archaeological investigations often require the integration of multiple sensing techniques, each capturing different types of evidence. However, integration poses significant challenges in fusing different scales, dimensions, and properties and extracting meaningful information from diverse datasets. Moreover, the varying signals and responses encountered in different archaeological and soil materials underscore the necessity for comparative frameworks, databases, and networks. As a result, there is also a growing need for the development and deployment of low-cost, efficient equipment.

This session invites papers that explore novel in-situ sensing approaches in (geo-)archaeological research. Topics of interest include, but are not limited to, direct push sensing, borehole and core applications, long-term monitoring of in-situ archaeological remains, or handheld sensing and imagery applications in excavation settings as well as examples of in situ data with remote/proximal sensing fusion. Submissions that address the session's themes of technological innovation, methodological challenges, and practical applications in diverse archaeological contexts are particularly welcomed.

ABSTRACTS

1 ENHANCING DETECTION OF LOW-CONTRAST PREHISTORIC SITES THROUGH INVASIVE GEOPHYSICAL FIELD INVESTIGATIONS

Verhegge, Jeroen (Ghent University) - Mendoza Veirana, Gaston (Ghent University) - Cornelis, Wim (Ghent University) - Grison, Hana (Czech Academy of Sciences) - Rensink, Eelco (Cultural Heritage Agency of the Netherlands) - De Kort, Jan-Willem (Cultural Heritage Agency of the Netherlands) - Pisz, Michał (University of Warsaw) - Jakubczak, Michał (Polish Academy of Sciences) - De Smedt, Philippe (Ghent University)

In archaeological geophysical prospection, predicting whether an archaeological feature will show a detectable contrast using geophysical methods is challenging due to the variable geophysical responses of the subsurface materials. Forward modelling, simulating instrument responses over synthetic models of subsurface contexts, is one approach to this issue. However, accurately defining the models' parameters is not straightforward. While the geometry of potential archaeological features and soils is static, and can often be assessed through archaeological information, addressing the geophysical properties of features' backfills and soil horizons remains challenging. Furthermore, many of these properties, such as electrical conductivity or dielectric permittivity, are dynamic because they are influenced primarily by soil moisture content, which is variable.

These challenges are addressed by developing practical field strategies for collecting geophysical data and soil samples to better understand and predict the geophysical characteristics of archaeological sites. This includes measuring and sampling excavated sections to refine models that link soil properties to geophysical attributes, and employing long-term geophysical monitoring to evaluate the impact of soil moisture dynamics on geophysical signals.

By improving the parametrization, the ability to simulate the detectability of archaeological features with various instruments is enhanced, thereby improving survey strategies as well as interpretations. Thus, this approach offers a less biased and quantitative approach than relying solely on expert opinion. Finally, this approach offers a route towards integrating geophysical research in invasive archaeological investigations.

The effectiveness of this approach is showcased through case studies in the European lowlands, including a Final Palaeolithic palaeosol horizon in Lommel (Belgium), a Neolithic pit feature in Valthe (Netherlands), and a Neolithic long-house in Radojewice (Poland) to strategize surveys, resolve discrepancies in survey data and enhance understanding of archaeological contexts.

2 DIRECT PUSH- SENSING AND GEOPHYSICAL MAPPING - INSIGHTS INTO A TOOLBOX FOR ENHANCED INVESTIGATION OF FLOODPLAIN STRUCTURES

Werban, Ulrike (Helmholtz Centre for Environmental Research - UFZ, Leipzig, Germany) - Köhler, Anne (Institute for Physical Geography, University of Leipzig, Germany) - Dietrich, Peter (Helmholtz Centre for Environmental Research - UFZ, Leipzig, Germany) - Werther, Lukas (Romano-Germanic Commission, German Archaeological Institute, Frankfurt, Germany) - Zielhofer, Christoph (Institute for Physical Geography, University of Leipzig, Germany)

Floodplain sediments serve as valuable geoarchives, offering significant potential to enhance our understanding of past landscapes. However, conducting detailed investigations, such as excavations, in floodplain areas can be challenging due to high groundwater levels. Consequently, non-invasive and minimally invasive investigation methods have gained popularity in geoarchaeological research over the last few years. Despite their potential, these methods are often underutilized. In our presentation, we aim to provide an overview of direct-push-based in situ sensing meth-

ods for geoarchaeological investigations. We will showcase a diverse range of technologies and highlight the drawbacks and advantages of each method. These include Electrical Conductivity (EC) logs, Cone Penetration Testing (CPT) techniques and innovative color logs all providing vertical highly resolved profiles of subsurface properties associated with fluvial stratigraphy. Moreover, we will explore how floodplain studies can benefit from a combined approach that integrates direct-push sensing technology with near-surface geophysical imaging methods. Geophysical methods allow near surface investigation along transects or even over large areas. This integrated approach allows for a multi-dimensional spatial exploration of floodplains, providing a more comprehensive understanding of their architecture.

3 **LOOKING BENEATH THE SURFACE. RECONSTRUCTING FORMER FLOODPLAIN LANDSCAPES USING MULTIPROXY ANALYTICAL TECHNIQUES ACROSS THE RIVER AVON AND STONEHENGE ENVIRONS**

Pears, Ben (Department of Geography & Environmental Science, University of Southampton, UK) - Hudson, Sam (Department of Geography & Environmental Science, University of Southampton, UK) - Koehler, Anne (Helmholtz Centre for Environmental Research – UFZ, Leipzig, Germany) - Kreck, Manuel (Helmholtz Centre for Environmental Research – UFZ, Leipzig, Germany) - Pohle, Marco (Helmholtz Centre for Environmental Research – UFZ, Leipzig, Germany) - Tomsett, Christopher (Department of Geography & Environmental Science, University of Southampton, UK) - Werban, Ulrike (Helmholtz Centre for Environmental Research – UFZ, Leipzig, Germany) - Zielhofer, Christoph (Institute for Physical Geography, Universität Leipzig, Leipzig, Germany) - Brown, Tony (Department of Geography & Environmental Science, University of Southampton, UK; Tromsø Museum, UiT, Tromsø, Norway)

British chalk river systems are important but sensitive geomorphological landscapes which have a close historic relationship with anthropogenic factors. Over exploitation and the intensification of human activity in the last 500 years (primarily through drainage and water meadow creation) has however led to a loss in the complex and dynamic biophysical mosaic supporting ecological variation used to reconstruct past environmental conditions.

Here we demonstrate a distinctive multiproxy approach combining surface (LiDAR) and subsurface Electromagnetic Induction, (EMI), Electrical Resistivity Tomography (ERT) and Direct Push Colourimetry survey techniques alongside new and traditional sedimentological and palaeoenvironmental methods (e.g. SedaDNA) to look through surface disturbance in the Wiltshire Avon floodplain on the edge of the Stonehenge environs.

The use of this innovative multi analytical methodology has been invaluable in the discovery of discrete palaeochannels and fluvial deposits associated with the early history of the Avon fluvial landscape, particularly from the Mesolithic period to the Bronze Age. The development in our understanding of early to mid-Holocene fluvial dynamics and vegetation history will provide a greater context for human activity and occupation of the area.

4 **DEVELOPING A SURVEY STRATEGY FOR THE DETECTION OF DEEPLY BURIED PREHISTORIC SITES, ADDING VALUE TO GEOTECHNICAL INVESTIGATIONS**

Vanhecke, Michiel (Geosonda Environment nv)

We propose a strategy to detect deeply buried prehistoric landscapes buried below Holocene clay and peat deposits in the polder landscapes and coastal plains of the Low Countries and illustrate its efficacy through recent case studies where it also contributes significantly to geotechnical investigations.

In these contexts, where high groundwater levels and local geology do not allow cost-efficient invasive prospection, non-invasive geophysical survey and/or minimally invasive direct push sensing, in combination with high-quality core sampling allows the reconstruction of Early to Middle Holocene paleolandscapes.

In a first phase, frequency domain electromagnetic induction survey maps shallow variations in lithology. These surface covering proxy data are characterized by a high horizontal resolution but require targeted validation tests (CPT or drillings) on specific locations to allow lithological interpretation.

Secondly, accurate depth sounding data on mechanical and other soil properties are collected using Direct-push sensing (CPT-E, camera-CPT, magneto-CPT). An interpolation of the interpreted measurements leads to an underground landscape model where lithostratigraphic units are defined, anomalies can be delineated and expectations regarding archaeological occupation can be raised. Moreover, the results provide the basis for optimizing the geotechnical survey campaign.

Third, sonic drilling samples complete or discontinuous soil profiles. The large sample volume (10 cm diameter) of this drilling technique allows the validation and correlation of the geophysical and direct push survey data and the resulting cores are suitable for both archaeological applications (artefact scatter mapping, palaeoecological sampling, dating, ...) and geotechnical laboratory analysis (mechanical properties, soil behavior characterization, ...).

Since the geophysical data, CPT-data and soil samples resulting from the geoarchaeological survey are valuable for project developers, contractors, environmental and geotechnical engineering firms, and public authorities alike and

because they supply high-quality soil data for a later stage of the development process, this methodology forms an important bridge between (geo)archaeological research and geotechnical investigations.

5 **ASSESSING MAGNETIC ANOMALIES WITH SUSCEPTIBILITY MEASUREMENTS AND SOIL ANALYSES - A REPORT FROM A ROMAN TOWN IN GERMANY**

Pickartz, Natalie (State Office for Cultural Heritage Baden-Württemberg) - Dreibrodt, Stefan (State Office for Cultural Heritage Baden-Württemberg) - Konrad, Michaela (Institute for Archaeology, Heritage Conservation Studies and Art History, University of Bamberg) - Schmöler, Astrid (Institute for Archaeology, Heritage Conservation Studies and Art History, University of Bamberg) - Kortüm, Klaus (State Office for Cultural Heritage Baden-Württemberg) - Faber, Andrea (Institute for Archaeology, Heritage Conservation Studies and Art History, University of Bamberg) - de Neef, Wieke (Institute for Archaeology, Heritage Conservation Studies and Art History, University of Bamberg)

A Roman site of about 25 ha is located next to the German city 'Neuenstadt am Kocher' in the northern part of Baden-Württemberg. The Roman town was erected as part of infrastructure measures during the relocation of the Limes around 160 CE. The site has been documented over several years by aerial photography and small scale geophysical surveys. The first ground penetrating radar (GPR) and magnetometer surveys were conducted about 20 years ago. Test trenches and excavations were performed at several locations throughout the site, e.g. at the Apollo-Grannus temple. In 2023, the State Office for Cultural Heritage Baden-Württemberg in cooperation with the University of Bamberg surveyed a 17.5 ha contiguous area with magnetic gradiometry. This yielded a comprehensive map of the site with a precise localization of all buildings known from aerial photographs. Apart from those buildings, magnetic anomalies of possible pits or kilns were detected. Some parts of the site show no anomalies that can be associated with archaeological features. To investigate the use and function of the pits and the 'empty spaces', minimal invasive studies are conducted. These include in-situ downhole measurements of the magnetic susceptibility and the determination of soil characteristics (RGB colors, pH values, grain size distribution, Loss on ignition, susceptibility) in the laboratory. The distribution of the boreholes allow also to determine the soil thickness on top of the archaeological layers in different parts of the site and to reconstruct the post-depositional formation and erosion processes. These combined data allow a risk assessment relevant for cultural heritage management.

6 **LARGE-SCALE GEOCHEMICAL PROSPECTION WITHIN THE PROCESS OF RESCUE ARCHAEOLOGICAL RESEARCH - INTEGRATED MULTI-METHODOLOGICAL ARCHAEOLOGICAL PROSPECTION (IMAP)**

Fišer, Jan (University of Hradec Králové) - Horák, Jan (University of Hradec Králové) - Holas, Matouš (Museum of Eastern Bohemia in Hradec Králové) - Holbová, Tereza (University of Hradec Králové) - Katonová, Klára (University of Hradec Králové) - Kindlmann, Petr (Osina Archo) - Plíšek, Jan (University of Hradec Králové) - Rytíř, Ladislav (University of Hradec Králové) - Soltészová, Kitty (University of Hradec Králové) - Bambasová, Sylva (University of Hradec Králové)

This paper brings the overview of large-scale geochemical prospection in the context of the IMAP (Integrated Multi-methodological Archaeological Prospection) project. The IMAP project is primarily focused on the development of methodology and multidisciplinary in archaeological prospection. Methods used in this project include geophysical prospection, traditional archaeological collections, and soil characteristic analyses. The paper will present the approach and results of the main method of the project, which is large-scale geochemical sampling. The extent of the sampled area is 5.5 ha and the number of samples collected exceeds the commonly used datasets in archaeology (over five thousand samples). The strategy of sampling and subsequent processing of samples in this quantitative level, moreover, in the context of time constraints associated with the characteristics of rescue archaeological research, requires specific organizational demands and requirements of a practical and theoretical nature, the sum of which and the approaches of solution we would like to present in this paper together with preliminary results. The aim of the project is to create a unique big dataset, which aims at understanding the transect of the past of a part of the landscape without regard to the delineation of the archaeological site. The project tested new hypotheses and analytical approaches with potential to touch also other scientific disciplines beyond archaeology like soil science, landscape development, environmental sustainability etc.

7 **ARCHIVING THE SEDIMENT ARCHIVE: INTEGRATING IN-SITU GEOARCHAEOLOGICAL DATA AND REMOTE SENSING DATA IN A HISTORIC LANDSCAPE CHARACTERISATION FRAMEWORK**

Jetzinger, Doris (Department of Prehistoric and Historical Archaeology, University of Vienna)

Investigating archaeological landscape histories presents a challenging task that is characterised and exacerbated by the time frame, spatial extent, and diverse topographical settings of the respective study area. The most important

source of information for tackling such research objectives is constituted by soil and sediment archives. Sediments represent key artefacts for archaeological landscape research as all processes and activities that take place within a landscape are recorded via or within the sediment. Multidisciplinary approaches employing joint applications of in-situ and remote sensing techniques, geophysical prospection, and geoarchaeological methods are widely used to study sediments for research on archaeological landscapes. However, after data acquisition little attention is often paid to establishing a solid methodological framework for integrated data archiving, analysis, and interpretation.

In this paper we present a novel approach that is currently being undertaken by the “Life of a Landscape” project to address this desideratum by employing Historic Landscape Characterisation (HLC) as a methodological framework to facilitate an integrated, joint analysis of diverse landscape- and geoarchaeological datasets. HLC is a tool for storing, visualising and analysing information on changes and developments in landscapes over time. Our project aims at creating an archaeological landscape biography of the Kreuttal microregion in Lower Austria by studying the sediment archives via targeted percussion coring, in-situ sedimentological analysis and sampling for pXRF, pOSL, and stable isotope analysis, as well as geophysical prospection and remote sensing techniques. For each data set a separate category is defined within the HLC framework to facilitate analysis and interpretation within a consistent, comparative environment. This methodological framework allows for a multifaceted yet structured study of the project area’s sediment archives that will offer insights into the landscape history, landscape and land-use changes, and human-landscape interactions over time.

8 QUANTUM ARCHAEOLOGY: EXPLORING GEOPHYSICS AS A TOOL FOR THE ANALYSIS OF ARCHAEOLOGICAL SITES

Boucher, Andy (Headland Archaeology (UK) Limited) - Gwilt, Tom (Headland Archaeology (UK) Limited) - Harrison, Sam (Headland Archaeology (UK) Limited) - Walker, Joanna (Headland Archaeology (UK) Limited)

The success of geophysical prospection methods has naturally lead to them being focused on locating and identifying targets for further investigation. We will explore the potential those same geophysical properties have to assist us with understanding archaeological sites ranging from Palaeolithic to early historic in date. We will also look at the obstacles to implementing these methods and ways in which they might become “democratised” within the wider archaeological workforce. We will present examples that include high resolution remapping of features to unravel phasing and predict the parts of site that are most meaningful to investigate, we will consider insitu profiling of magnetic properties and how these can be related to each other. Our aim is to improve the way in which archaeological sites are approached and provide a quantitative approach that can be used to back up more subjective and qualitative observations. We also aim to compare the results from this work alongside information that pXRF can now provide to help formulate future approaches and equipment.

9 ENHANCING GPR DATA QUALITY: DATA COLLECTION, INTEGRATION, AND ANALYSIS IN LONG-TERM MONITORING APPROACHES

Schneidhofer, Petra (Department for Cultural Heritage Management, Vestfold County Council) - Nau, Erich (Norwegian Institute for Cultural Heritage Research) - Tonning, Christer (Department for Cultural Heritage Management, Vestfold County Council) - Cannell, Rebecca (Norwegian Institute for Cultural Heritage Research) - Hinterleitner, Alois (GeoSphere Austria)

Since 2016, the department for cultural heritage management of Vestfold County Council (Norway) and its partners have investigated the influence of environmental factors, particularly soil moisture, on GPR data quality acquired for archaeological purposes. Two projects, namely pilot study The Borre Monitoring Project and three-year project VEMOP focused on the geophysical response in GPR data acquired under different environmental conditions across several known archaeological sites in southern Norway.

The novelty of using long-term monitoring to better understand the connection between environmental factors and GPR data quality necessitated considerable effort in designing a suitable research approach. This approach involved combining the acquisition of different GPR time series with in-situ, real time monitoring of the subsurface properties relevant for electromagnetic wave propagation at each site. Equipment selection, including GPR devices and monitoring tools such as soil moisture sensors, rain gauges, and frost tubes, was based on suitability to research questions, budget constraints, and compatibility with the Nordic climate.

The analysis of the resulting extensive dataset required the development of a custom-written analysis tool: APlinside 1.0 allowed to efficiently integrate the different subsurface and electromagnetic properties recorded, including volumetric water content, bulk electrical conductivity, soil temperature, precipitation rates, snow depth, depth of frostline as well as EM wave velocity and signal attenuation and compare them against the quality of the respective GPR data sets.

This paper provides a detailed overview of the project design, equipment selection, and introduces the application of the analysis tool APlinside 1.0.

10 MORE THAN MEETS THE EYE: HYPERSPECTRAL IMAGING FOR THE RECORDING OF ARCHAEOLOGICAL FEATURES AND DEPOSITS

Crabb, Nicholas (Bournemouth University)

Hyperspectral imaging is a non-destructive technique that captures rich spectral information of a scene or target. Unlike conventional cameras, which record panchromatic imagery, or multispectral sensors that cover a small number of narrow or broad wavelength regions, hyperspectral sensors collect data across hundreds of contiguous spectral bands. The provision of this detailed spectral information can enable an improved characterisation and classification of different materials, and hyperspectral sensors are increasingly widely used for a range of remote sensing and laboratory analyses in other disciplines. For example, it is currently under significant development for analysing geological samples and is employed in the food industry to assess quality. However, the application of hyperspectral imaging in archaeology has been largely confined to ‘horizontal’ remote sensing of the ground surface, as opposed to analyses of vertical subsurface sediment or soil profiles. This is in part due to the high-cost and lack of portability of conventional hyperspectral systems, but the recent availability of more affordable sensors adapted for field-use has meant that there are options available for archaeological fieldwork.

This paper will discuss the potential contribution that compact hyperspectral sensors can make to the recording of archaeological features and deposits. It will present initial results from an archaeological site in southern Britain and provide comparison with other datasets (e.g. conventional site records (section drawings/photographs), pXRF and other geoarchaeological laboratory methods (particle size analysis, loss on ignition, magnetic susceptibility)). It aims to establish whether an improved characterisation of archaeological features can be identified through hyperspectral imaging, that might not otherwise be achievable through recording with common cameras or the human eye. Such an approach has potential to allow for a more quantitative approach to the recording of archaeological features, and for additional details of deposits to be established (e.g. sediment composition and organic content).

971 HEALTH OF LABORING COMMUNITIES ACROSS GEOGRAPHIES OF WORK

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Cianciosi, Alessandra (University of Amsterdam) - Caval, Sasa (Scientific-research center of the SAZU) - Manfio, Stefania (Stanford University)

Session format: Regular session

This session aims to discuss themes focused on laboring communities from antiquity to the pre-modern period, developed by social and environmental archaeologists, as well as historians and ethnographers. We invite participants to reflect on communities that have been marginalized or subjected to exploitation and social inequality. Our focus are the communities engaged in demanding labor activities, often related to the extraction or production of primary sources, and who, as a result, have become primary, albeit unconscious, agents of significant ecological transformations.

The goal is to explore the material life conditions of traditionally marginalized groups of workers in specialized sectors, such as plantations or mines. We would like to hear about different perspectives on how new technologies have influenced emerging environmental and labor-related hazards, and how these communities have coped with the adverse health and environmental consequences of their work activities. Through environmental archaeological data, we would like to discuss if and how working communities developed spaces of resistance against competing powers, as well as the conceptualization and dissemination of new knowledge to manage work-related risks.

Understanding these historical conditions allows us to reflect on labor practices in the past and their enduring material legacy. It also allows us to explore the disparities that persist in the contemporary world and how they can be addressed. We invite speakers to consider (bio)archaeological markers of resistance to inequality or marginalization and their effects, while also incorporating health and social inequality into the discussion. We anticipate generating a discussion about a scholarship on the study of inequality in the past and demonstrating how it can provide unique insights into the range of impacts on people’s health and ways of life.

ABSTRACTS

1 WHO WERE THE MINERS OF THE ROCCA SAN SILVESTRO CASTLE?

Viva, Serena (Department of History and Cultural Heritage, University of Siena; Department of Cultural Heritage, University of Salento) - Bianchi, Giovanna (Department of History and Cultural Heritage, University of Siena) - Geltner, Guy (History Department, Faculty of Arts, Monash University)

The ARC project ‘Pursuing Public Health in the Preindustrial World, 1100-1800’ (Monash University), has the objective of studying premodern age public healthcare, covering preventative practices used by different categories of

people and laborers with a historical and bio-archaeological approach. The project provides an opportunity to return to research at the castle of the Rocca San Silvestro, to investigate the human community and working conditions in a medieval mining context.

From 1984 to 1994, archaeological excavations were conducted on the site, revealing and meticulously documenting a setting characterized by mining areas, production areas, stately and working-class dwellings, a village, a church, and a cemetery.

The subject matter of public health is closely associated with the mining activity, maybe the primary purpose of the site. The ongoing anthropological and paleopathological investigations, after studying mortality patterns and biological characteristics of the sample, aim to understand the extent to which individuals were involved in mining activities, working conditions, health risks, and accident prevention practices. Furthermore, whether it is possible to identify evidence of medical environmental measures that could reduce harm or improve general health conditions.

The research also aims to comprehend all aspects related to mining operations, including the processing of the extracted materials, involving other classes of workers, and determining whether mining was not solely a source of income, but rather a complement to other activities such as breeding and farming.

To achieve this, we need a multidisciplinary approach, so in addition to bio-anthropological analysis the research will include archaeobotanical, archeozoological, geochemical, and chemical analyses, to answer numerous questions on the site's production dynamics, the pollution of the area caused by mining activity, the paleo-diet and the origin of the human community of San Silvestro.

Research like this could give new answers on a very important site in Italy's medieval panorama.

2 **MEDIEVAL MINERS AND SMELTERS: SILVER PRODUCTION, SETTLEMENT AND ENVIRONMENT**

Hrubý, Petr (Masaryk University of Brno) - Malý, Karel (Masaryk University of Brno) - Kočár, Petr (Institute of Archaeology, Academy of Sciences) - Petr, Libor (Masaryk University of Brno)

The lecture will present the results of the multidisciplinary mining archaeological research in Central Czech Highlands (CZ) in the last 10 years, which is focused on the study of medieval mining and smelting sites. It will show the two most archaeologically visible phenomena that were characteristic of silver production. Silver was an essential coinage metal, blood in the veins of the "Old World" economies, and the a means of power projection of the ruling elites. The first was the existence of settlements of miners and metallurgists. These settlements were in all respects different from agricultural villages and towns. They existed usually temporarily, but at the time of the great boom of silver production in the Czech Kingdom in the 13th century it was an important part of the social and settlement structure of the mountains and highlands. The second was the impact of metal production on the environment, especially the drastic deforestation and contamination of soils with heavy metals.

3 **BIOMECHANICS OF INDIVIDUALS FROM A COLONIAL DOCKYARD SITE IN BRAZIL**

De Almeida Prado, Patricia (Université Sorbonne Paris Nord; Universidade Federal da Bahia) - Borges, Caroline (Universidade Federal Rural de Pernambuco) - Nascimento Oliveira, Ana (Universidade Federal Rural de Pernambuco) - Souza Cunha, Claudia (Universidade Federal do Piauí)

This investigation aims to explore the upper limb biomechanics of the individuals buried in one of the oldest colonial cemeteries in Brazil. The archaeological site of Pilar is located in the namesake low-income neighbourhood of Recife. In the colonial period, this area was beyond the walls of what was to become the Village of Recife, latter to become the province capital. Surprisingly, this archaeological site is hardly reported in historical documents.

Regarding the human remains, more than 130 skeletons have been found at the site, some from the late 16th and early 17th centuries, as well as around 200,000 fragments and objects that are being analysed to understand the habits and details of the people who lived there in the 1500s and 1600s. Most individuals excavated are young males between 16 and 25 years old, although rare younger and older ones, as well as a couple of young women, have been found. Furthermore, those individuals are robust and some are over 1.70 m tall. They were buried in simple graves, in dorsal decubitus and mostly facing east. Many burials are double, although simple and triple ones have also been excavated.

To analyse the biomechanical forces on the shoulder complex, 36 pairs of clavicles with at least one muscle and 2 ligament insertions and their respective humeral deltoid insertions were selected. Preliminary analysis revealed that, when present, there is a correlation between the robustness of stress markers of the deltoid muscle on its clavicular and humeral insertions. There is also a correlation between the clavicular insertion of the deltoid and the robustness of the conoid and trapezoid ligament's insertion, demonstrating significant force loads on the upper limb. It should be noted that some individuals are sub-adults and already show robustness in the non-fused upper limb bones.

4 **LABOR EXPLOITATION AND HEALTH INEQUITIES AMONG SUGAR PLANTATIONS WORKERS IN MAURITIUS**

Cianciosi, Alessandra (Ca' Foscari University of Venice) - Manfio, Stefania (Stanford University)

In many colonies, the economy depended heavily on the cultivation of a single crop, and plantation owners employed forced labor, including slavery and indentured labor, to attain and sustain competitive production levels. Recent archaeological investigations in Mauritius have focused on surviving industrial and domestic areas within sugar plantations, providing insights into the intersection of power dynamics and cultural constructs within the configuration of plantation spaces. While the industrial areas underwent many transformations due to technological and industrial advancements, the domestic areas remained relatively unchanged. They were used indifferently by various communities of laborers, including enslaved and indentured laborers, single adult men, and family nuclei. Despite the effective standardization of working-class architecture, namely the use of line barracks associated with wells and water tanks, the accurate survey and preliminary excavations in several sites in Mauritius revealed a greater variability in material culture and dwellings solutions, suggesting spaces of resistance to conforming policies imposed by the landowners' elite. In light of these new insights, this contribution explores and discusses sanitary measures incorporated by labor communities in their domestic architecture, particularly regarding water management. Indeed, the island was plagued by malaria and cholera epidemics, which had a significant impact on certain districts and plantations during the second half of the nineteenth century. A comparative analysis rooted in landscape and architectural archaeology of several post-emancipation agrarian settlements forms the basis for future environmental research on health preservation in Mauritian plantations.

5 **"THE QUALITY OF LIFE": AN ARCHIVE OF INDENTURED LABOURERS' LIVES FROM MAURITIUS**

Caval, Saša (Scientific-research center of the SAZU, Ljubljana; University of Primorska, Koper, Slovenia)

Between the 1830s and 1920s, nearly half a million people migrated from South Asia to Mauritius in search of work. The urge for a better life was so strong that they were willing to cross the Kālā Pānī, even if it meant going against their religious beliefs and ending their reincarnation cycle. The indentured labour system was a British Colonial government experiment in which they wanted to replace slavery with cheap labour.

However, most workers who came to Mauritius decided to stay and build a new life on the island. They settled on the island, had families, and created a different life. The harsh working conditions in the sugarcane fields caused many health issues. People's lives were also impacted by poverty, malnutrition, and other ailments. The middle and second half of the 19th century was especially devastating due to many epidemic diseases that spread across the island and the destructive tropical cyclones that caused severe loss of life, with property and environmental damage.

The presentation will focus on the extensive burial records of the Bois Marchand Cemetery in Mauritius, which date back to January 1868. This cemetery was the largest in the Indian Ocean at its inscription in 1867, and the records provide a unique repository of demographic and disease data. There is no other archive like this for the region. The presentation will examine the health status of indentured workers buried at the Bois Marchand cemetery, as preserved in these burial registers.

6 **LABOUR, SLAVERY AND ETHNICITY IN 19TH AND 20TH CENTURY PEARLING COMMUNITIES, SHARK BAY AND COSSACK, WESTERN AUSTRALIA**

Anderson, Ross (Western Australian Museum)

The 19th century northern Australian pearling industry was controlled by European and colonial Australian interests. From its beginnings it depended heavily on Aboriginal and Asian divers for its labour force, initially wading, and then free-diving to collect pearl shell. Aboriginal and Asian people were valued for their maritime and free-diving skills, underwater vision and ability to undertake sustained physical effort in northern Australia's harsh climate, though their efforts met with little reward. The rapid growth of the shipping-dependent pearling and pastoral industries saw an allied need for construction of pastoral and maritime infrastructure. A shortage of Aboriginal workers (whether willing or not) led to an increasingly rapacious demand for labour, that led the colonial government to introduce laws to control the exploitation of Aboriginal people. The restrictions on Aboriginal labour and ongoing demand for workers saw labour sourced regionally from Malaya, Macassar, Timor, Ceylon, China, the Philippines and South Sea Islands. This paper presents the results of historical research and archaeological fieldwork undertaken into 19th and early 20th century multi-ethnic maritime communities at Shark Bay and Cossack, two significant locations in the early development of the northern Australian pearling industry.

973 PYROARCHAEOLOGY: FIRE-RELATED ENGINEERING, ENVIRONMENT AND CULTURAL PROXIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Schmidt, Patrick (Tübingen University) - Shaw, Candice (University of Toronto)

Session format: Regular session

Pyroarchaeological research encompasses natural and anthropogenic fire. The latter and its traces are understood as archaeological artefacts. This field relies on a large variety of methods to obtain environmental and behavioral proxies informing us on technology, diet, cultural activities and settlement patterns. Arguably, the most striking fire-related behaviour unique to modern humans is the use of heat to transform the properties of materials, processes which are sometimes termed “engineering” or “transformative techniques”. Beyond this, the analysis of fire-related artefacts and sediments can reveal cultural choices, environmental restrictions and variability, and evolutionary consequences. This session will be open to contributions from multiple disciplines concerned with the study of ancient fire, from the origins of fire use to its application in more complex technological innovations. The session puts special emphasis on the analysis of archaeological materials and experimental approaches, including their cognitive, cultural and social implications. Contributions from geoarchaeology, ethnography and ethnoarchaeology are also welcome. This large-scale approach aims at providing a comprehensive dataset on how fire-related techniques were invented and conducted, discusses new analytical tools and allows us to understand the role of fire in cultural evolution.

ABSTRACTS

1 SMOKE ON THE WATER: BURNT MOUNDS AND THEIR CERAMIC EVIDENCE IN BRITAIN

Fitzgerald, Nick (University of Bristol)

This paper will explore burnt mounds and their use in Britain, focusing on their ceramic and geographical evidence. Burnt mounds are a site type peculiar to Britain and Ireland that consist of a mound of fire-cracked rock, often occurring in conjunction with a trough. They are also often located in wetlands. These sites primarily date from the Bronze Age, although examples are also known from the Neolithic and Iron Age. Previously believed to be distributed mainly in Scotland, Ireland and Wales with pockets of activity in England, there is now enough evidence to extend the practice to England more broadly. Despite their apparent ubiquity, there remains no consensus on what purpose these mounds fulfilled. It is apparent that the fire-heated rocks were used to heat water within the trough at most examples, and so most uses that can be devised for hot water have been proposed. Currently the list of theorised uses stands at cooking, brewing, bathing, steam bending for wood, steam for forming leather, metalworking, horn working, and also the fulling of woollen textiles. This paper will examine burnt mounds in Britain through two approaches. Primarily it will examine the results of organic residue analysis at a major burnt mound site in England, presenting further information on the possible activities taking place. In addition, it will also utilise organic residue analysis to explore the relationship between the mound and its associated settlement, shedding further light on the position of burnt mounds within their contemporary societies. This will be combined with a secondary approach applying the preliminary results from a GIS database of burnt mounds in Britain, elaborating on the patterns and distributions found. The combination of these two approaches will provide an opportunity to look at these often undramatic monuments in a new light.

2 INVESTIGATING THE INTENTIONAL AND ACCIDENTAL IMPACT OF FIRE ON CLAY MATERIALS FROM OPPSAL, SOUTHEASTERN NORWAY

Polanska, Weronika (University of Oslo) - Fredriksen, Per Ditlef (Department of Archaeology, Conservation and History, University of Oslo)

Pottery and other ceramic material is produced by intentional heat preservation. While secondary burning damages ceramic material, this burning also preserves important information about the process. What information may be revealed when comparing intentional, controlled secondary firing of ceramic material from a cremation grave with similar material having undergone secondary burning in a nearby context characterised by uncontrolled and accidental circumstances? Here we present the results of a comparative analysis of pXRF and petrographic data of ceramics from recent excavations at Oppsal in southeastern Norway. We focus on funerary pottery from a burial mound and ceramic building material and domestic pottery found in a burned house. The analyses of material from these well-documented neighbouring contexts provide a unique opportunity to not only compare funerary and domestic ceramics in Migration Period Scandinavia, but also shed comparative light on the consequences of secondary burning due to different circumstances, with potentially contrasting levels of fire control.

All materials were analysed with the use of a handheld XRF device. The prehistoric material was supplied by samples of local raw clay from the site's surrounding landscape. The semi-quantitative statistical analysis helped determine which

local clay sources were most likely used in the ceramic production. Additionally, a comparative thin-section petrography of fired clay from Oppsal and other relevant sites revealed how a prehistoric house fire impacted different clay materials.

3 NEW FACETS OF THE FAIENCE INDUSTRY THROUGH SCIENTIFIC ANALYSIS: A CASE STUDY OF THE HARAPPAN SITE OF TIGRANA, HARYANA, INDIA

Singh, Garima (Deccan College PGRI, Pune) - Parmar, Narendra (Associate Professor, Central University of Haryana, Haryana, 123031, India)

The technological advancement of the Harappan craft industry has garnered numerous questions for archaeologists in regards with its lasting technical expertise in modern times. The recent excavation at the Harappan site of Tigrana in the state of Haryana, India has reported in-situ faience from the kilns suggesting the craft manufacturing debris at a large scale.

The paper presents a reconstruction of rural Harappan industrial settlement of Tigrana using refined scientific techniques using Fourier-transform infrared spectroscopy (FTIR) and Thermogravimetric analysis (TGA) adhering to soil samples and faience artefacts collected from the excavated kilns and furnaces belonging to the Harappan (protohistoric) period.

The research work aims to comprehend the craft industry and temperature variations that occurred throughout the heating process by the individuals responsible for manufacturing craft items such as pottery, beads, bangles, terracotta figurines, etc. Since the samples are being analysed, it will enable us to interpret the byproduct of these furnaces and kilns using the database that was created and challenges faced during the analysis, and its limitations in the field of ancient pyrotechnology. The newly updated data in this research will demonstrate how Tigrana's inhabitants appeared to have engaged in both hinterland and international trade with other contemporary Harappan sites and civilizations during their occupation of the corridor during the early and mature Harappan phases dating back to 3000-1900 BCE.

The research work also seeks to identify the social background of a potential rural industrial settlement within the context of all Harappan sites. The presented study will go into great detail about the spatial distribution of excavated sites, producing a significant number of furnaces and faience artefacts. Through scientific study, the paper aims to show how the technological advancement of the Harappans contributed to the development of the Indus Valley Civilization.

4 BONE AS A PROXY FOR FIRE IN THE ARCHAEOLOGICAL RECORD

Shaw, Candice (University of Toronto) - Natalio, Filipe (Weizmann Institute of Science) - Chazan, Michael (University of Toronto)

While the use of fire has undoubtedly played an essential role in our species' evolution, detecting evidence of its presence in the archaeological record presents considerable challenges due to both its ephemeral and friable nature. Fortunately, bone has proved to be a useful proxy, offering not only (circumstantially) exceptional preservation but also the capability to capture past heating events in its mineral structure. Techniques such as FTIR spectroscopy and micro-histology offer insights into how different variables, for example heating duration, temperature, and bone type and size, may impact the resultant signatures of heating episodes in bone. Given the similarities observed in bone mineral altered by ambient-temperature diagenetic processes, the issue of equifinality still persists in bone which may have been heated to lower temperatures. This paper provides an in-depth exploration into the heat alteration of the bone mineral carbonated hydroxyapatite, while evaluating the success of different approaches for its detection.

5 MIDNIGHT FIRE: EXPERIMENTAL APPROACH INTO FUEL MANAGEMENT AND FIRE USE IN THE PAST DWELLINGS REGARDING HEALTH AND HABITABILITY

Robledo, Andrés (Institute of Human Paleoeology and Social Evolution (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; Instituto de Antropología de Córdoba (IDACOR CONICET)) - Burguet-Coca, Aitor (Department of Archaeological Sciences, Faculty of Archaeology, Leiden University; Institute of Human Paleoeology and Social Evolution (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Speciale, Claudia (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Bianco, Sabrina (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Garay-Palacios, Blanca (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art,) - Fernández Iriarte, Tomás (Universitat Rovira i Virgili, Departament d'Història i Història de l'Art,) - Ölz, Marie-Estelle (University of Bologna) - Mas, Bàrbara (Seminari d'Estudis i Recerques Prehistòriques (SERP), Departament d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), Facultat de Geografia i Història, Universitat de Barcelona; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA)) - Rubert, Irene (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Allué, Ethel (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)

The study of anthropogenic evidence of the use of fire from past societies is a useful tool for understanding about the decisions on fuel management, economic strategies and landscape transformation. Fire, as a technological resource, implies decisions and choices made by different human groups regarding the selection, procurement, and use of fuel. In this occasion, we present results from a research project that explores the exposure to by-products of the fire (heat, light, smoke) through the implementation of experimental fires in open, semi-open (rockshelters), and close (huts and caves) dwellings occupied by people in the past. With the objective of studying well-being (health and habitability conditions) by the use of fire by prehistoric communities, we implemented an experimental program in order to measure air quality, heat transmission, and light procurement. The protocols were established with the formulation of hypotheses from archaeological cases with a wide chronological span from the Middle Paleolithic to the Chalcolithic (a: Abric Romaní - Capellades, Barcelona, Spain; b: Molí del Salt - Vimbodí i Poblet, Tarragona, Spain; and c: El Mirador cave - Sierra de Atapuerca, Burgos, Spain). We carried out 25 fire experiments recording different variables including: meteorological conditions (temperature, wind, rainfall, humidity), hearth temperature (8 per hearth K type thermocouples), illumination, heat transfer properties, and measurements of fine particle emissions. The fuel used in all experiments was related to the archaeobotanical record from the study cases: *Pinus sylvestris*, *Quercus ilex*, *Q. faginea*, *Q. pyrenaica*, *Crataegus monogyna*, *Juniperus communis*, and *Prunus spinosa* with different sizes and states (quantity 10 kgs per hearth). The results will add new knowledge about human living conditions and hearth functionality and likewise will contribute to the study of fuel management among past prehistoric societies.

6 INTRODUCING BENZENE POLYCARBOXYLIC ACID ANALYSIS: POTENTIAL OF A MOLECULAR MARKER FOR THE STUDY OF ARCHAEOLOGICAL HEARTHES AND WILDFIRES

Notterpek, Ivy (CEPAM - UMR 7264, CNRS, Université Côte d'Azur; BioArCh, Department of Archaeology, University of York) - Théry, Isabelle (CEPAM - UMR 7264, CNRS, Université Côte d'Azur) - Craig, Oliver (BioArCh, Department of Archaeology, University of York) - Bodu, Pierre (UMR 8068, TEMPS, MSH Mondes, Université Paris Nanterre) - Lucquin, Alexandre (BioArCh, Department of Archaeology, University of York) - Abiven, Samuel (Laboratoire de Géologie, Département de Géosciences, École Normale Supérieure; CEREEP Ecotron Ile De France CNRS / ENS - UMS 3194)

Since its development in 1998, benzene polycarboxylic acid (BPCA) analysis has become a powerful and frequently employed tool in environmental science research for its ability to elucidate the molecular characteristics of charred material on the entire combustion continuum from charcoal to condensates and soot. Applications of the method to ancient soils, sediments, and charred material are presently limited, yet the method holds great potential in archaeological research as a molecular marker for charred biomass, including cases where no or few macroscopic charcoal fragments remain. This study presents a multi-faceted approach to the implementation of the BPCA method in archaeological research. The interpretive potential of BPCA analysis—namely related to the aromaticity, aromatic condensation, and combustion temperature of the charred material—is first demonstrated through the statistical analysis of a BPCA database created for lab-produced charcoal. Variables hypothesized to influence the BPCA signal such as oxygen availability during pyrolysis are raised, highlighting future directions of research. Methodological considerations are elucidated through the presentation of pilot tests on experimental materials conducted to optimize the BPCA protocol for the analysis of archaeological samples. BPCA analysis is then applied to charcoal and charcoal-rich sediments from combustion residues directly overlying Levallois lithic remains in the Middle Palaeolithic (MIS 5) deposits of Ormesson (Seine-et-Marne, France), with the objective of characterizing the fire temperature

reached in different zones in order to differentiate between the natural and anthropogenic origin of the fire. Lastly, complementary approaches such as polycyclic aromatic hydrocarbon analysis to permit source identification and the radiocarbon dating of isolated BPCAs are discussed to emphasize the interdisciplinary potential of this molecular marker for charring new to archaeological research.

7 CRUNCHY BEER: EXPERIMENTAL ARCHAEOBOTANY STUDY IN DETERMINING BEER, BREAD, OR PORRIDGE OF NEOLITHIC AMORPHOUS CHARRED OBJECTS

Berndt, Jessi (Institute for Archaeological Sciences, Universität Tübingen)

Fire is often noted for its destructive nature, while in archaeology it is often lauded for its impact on material preservation. Charred crust amorphous charred objects (ACOs) excavated from burn layers, vessels and hearths, are a source of valuable information, but what is the information they contain and how do we attain it? The amorphous nature of ACOs makes them complicated archaeological finds to interpret. An experimental archaeological approach can be a promising path to establish datasets for working with and assessing ACOs. Here we present the research conducted focusing on cereal crust ACOs.

Experiments were designed and executed for establishing crust shape formation factors, the identification of intended food/drink of cereal based ACOs (such as beer, bread, or porridge), indications of cooking accidents versus intentional heating, and testing the visibility of production methodology signatures involved in the formation of the food stuffs preserved in the charring process. Analysis began by using a newly developed diagnostic metrics cataloguing protocol designed for ACOs, macro and micro morphometric data, recording processing and fermentation characteristics under SEM and CT microscopy, and collated from both the experimental and archaeological traits.

The archaeological ACOs focused on in this paper are cereal crusts from Sipplingen-Osthafen, a waterlogged Neolithic pile-dwelling lakeshore settlement located in Southwestern Germany. This work was done aiming to be used for the better understanding of the specific site material from Sipplingen, but also to aid in developing better methodologies, protocols, and interpretation datasets for working with ACOs in general.

8 NEANDERTHAL ADHESIVE TECHNOLOGY AND IT IMPLICATIONS

Schmidt, Patrick (Eberhard Karls University of Tübingen, Department of Geosciences, Applied Mineralogy, Wilhelmstraße 56, 72074 Tübingen, Germany.)

Research into human uniqueness is gaining increasing importance in prehistoric archaeology. One of the most striking behaviours unique to early and modern humans among other primates is that they used fire to transform the properties of materials. This is so because adhesives are often not available in nature but must be produced. This talk will report on the way Neanderthals used fire to make adhesives. Their adhesive technology was cognitively more demanding than other tool making processes. It fulfils all three criteria proposed for interpreting ancient technologies as being highly relevant for our understanding of human evolution. These three criteria are i) Neanderthal adhesive making requirement more time and/or raw materials than other techniques, ii) making adhesives was difficult and iii) the methods used were purposefully invented and/or evolved from previously simpler techniques. These three hypotheses were tested on several Neanderthal adhesive finds that will be described in this talk.

9 WHAT'S THE DIFFERENCE? PROCEDURAL COMPLEXITY OF FIRE PRESERVATION VS. FIRE PRODUCTION

Klein, Regine (University of Tübingen, Institute for Archaeological Sciences; Research center ROCEEH, Heidelberg Academy of Sciences and Humanities, Senckenberg Research Institute, Tübingen, Germany) - Haidle, Miriam (Research center ROCEEH, Heidelberg Academy of Sciences and Humanities, Senckenberg Research Institute, Frankfurt/Main, Germany; Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, Abt. Ältere Urgeschichte und Quartärökologie, Eberhard Karls Universität Tübingen, Tübingen, Germany)

Fire is an indispensable part of all recent societies. It facilitated our species survival, by providing warmth, light, allowing us to cook, and solving technological challenges. Despite the significance of fire, our knowledge about the development of hominin-fire-interaction remains fragmentary. The main dissent among scholars is about when hominins started to use fire, when they did so regularly and when they depended on it, implying fire-production. Yet, they agree that hominins did preserve fire, gathered from natural sources, before they learned how to make it. This implies that fire maintenance is less demanding than fire production. However, there is rarely any discussion about what activities, skills, knowledge, and mindset are needed for a robust fire maintenance (i.e., preserving fire over a prolonged period). Although, we do know from recent and sub-recent hunter-gatherers that they often prefer to preserve fire instead of making it, again detailed descriptions of the involved activities are lacking. To overcome this research gap, we are applying reverse engineering to an archaeological question, using effective chains to model a system of fire preservation, and are contrasting it against fire production (strike-a-light and hand drill). Our study shows that fire maintenance is complex, involving various activities (i.e.: collecting raw materials and fire, building, maintaining, using, and transport-

ing fire, discarding the remnants). Fire making requires additional activities, skills, and knowledge. The main difference lies in producing an initial spark or glow with a tool-agent-set. Such sets are presumably a new evolutionary development and so far, closely connected to fire production or younger technological solutions. Knowing the system of fire maintenance is an important part of comprehending hominin-fire-evolution and might in future help to understand the regional and temporal inconsistencies distinctive in the archeological fire signature.

10 HEAT TREATMENT IN LITHIC PRODUCTION IN THE EARLY NEOLITHIC OF THE COVES DEL FEM (TARRAGONA, SPAIN): EVIDENCE, SIGNIFICANCE, AND VARIABILITY

Minguell, Arnau (Universitat Autònoma de Barcelona, Departament de prehistòria) - Palomo, Antoni (Universitat Autònoma de Barcelona, Departament de prehistòria) - Terradas, Xavier (Consejo Superior de Investigaciones Científicas (CSIC-IMF)) - Rosillo, Rafel (Independent researcher) - Piqué, Raquel (Universitat Autònoma de Barcelona, Departament de prehistòria)

This study focuses on analysing the evidence of heat treatment in the lithic production at the archaeological site of Coves del Fem, located on the NE Iberian Peninsula. The aim is to comprehend the presence, importance, and variability of heat treatment practice in the knapping processes, as well as its relationship with the raw materials used. The primary objective is to determine whether heat treatment was a common practice in lithic production at Coves del Fem, with a particular focus on the Early Neolithic levels of the site. The morphology of the artifacts and the raw materials used have been examined, and evidence of heat treatment has been identified through the observation of reddening and texture overlays on the artifact surfaces.

A consistent application of this technical procedure has been observed in preforms of cores, in the early stages of lithic reduction. Additionally, it has been documented that many artifacts were crafted from locally sourced raw materials characterized by their relatively low quality. This could have motivated the application of heat treatment for this reason, some experimental approaches to treating local raw materials have been conducted. Preliminary results indicate that heat treatment played a significant role in the lithic production at Coves del Fem, especially during the Neolithic periods, where a unipolar production aimed at obtaining blade blanks has been documented. The heating technique appears to have been related to the quality of the local raw materials and may have been a specialized practice passed down over time. This study provides a foundation for future research exploring the continuity of heat treatment practices, employing methodologies that enable a more detailed characterization of the process.

11 SILCRETE USE AND LITHIC PROVISIONING STRATEGIES IN THE MIDDLE STONE AGE AT NELSON BAY CAVE, SOUTH AFRICA

Watson, Sara (Field Museum of Natural History)

The use of heat treatment to modify the physical properties of lithic raw materials was a major technological innovation of the Middle Stone Age and is one of the earliest documented transformative technologies. Applications of heat treatment on silcrete artifacts are well documented in Still Bay and Howiesons Poort lithic assemblages across southern Africa. Fewer descriptions of heat treatment are available for Early MSA assemblages, but those that are indicate that methods of silcrete heat treatment were already established by at least ~130 ka. However, most research on the use of heat treatment for silcrete lithic artifact production have come from sites where silcrete is a relatively abundant and locally available resource. Less data is available about the context in which silcrete was acquired and modified in areas where it is less prevalent and potentially harder to access, raising questions regarding the role of lithic provisioning strategies in the use and treatment of silcrete in the Middle Stone Age. The site of Nelson Bay Cave, on the southern coast of South Africa, has a long Middle Stone Age sequence including Early MSA and Howiesons Poort assemblages. Here I provide preliminary results that are part of a larger study. I analyzed the Middle Stone Age silcrete assemblage from Nelson Bay Cave to investigate how lithic provisioning strategies influenced the acquisition, treatment, and use of silcrete at the site. In this study, I consider three questions: How was heat treatment implemented during lithic production the southern Cape? Was silcrete use influenced by lithic provisioning strategies in silcrete-poor contexts? And in what ways did silcrete acquisition change from the Early Middle Stone Age to the Howiesons Poort at Nelson Bay Cave?

12 LITHIC HEAT TREATMENT AND REDUCTION TECHNOLOGY IN THE LATE MESOLITHIC SETTLERS OF ROTI NALA, MAHARASHTRA, INDIA

Rajak, Shubham (Deccan College Postgraduate and Research Institute (Deemed University), Pune) - Das, Pronil (Deccan College Postgraduate and Research Institute (Deemed University), Pune; Deccan College Postgraduate and Research Institute (Deemed University), Pune)

Microlithic production technology and hilly landscape occupation are some of the lesser-studied topics in the pre-historic archaeology of India. The present research has been carried out in the Roti Nala village situated on the hilly

uplands of the Pune district in Maharashtra, which aims to investigate the Microlithic techno-behavioural complexities and settlement strategy. In this research, we have conducted archaeological exploration in an open-air site of Roti Nala, collected lithic samples for technological reconstruction, and carried out experimental knapping and heat treatment. While heat treatment has been recognised as a distinctive feature within the limited context of the Indian Mesolithic, its prevalence remains rare in the cultural milieu of the Indian Mesolithic, highlighting its significance in archaeological discourse although relatively few systematic studies are available. In this paper, we aim to shed light on two questions: What technique and heating parameters were used in the preparation of raw material, and which kind of elemental changes, microstructural changes and micro-crystal breakage patterns can be observed in local quartz and other siliceous raw material which helped them to enhance their microlithic technology? We investigated these questions by using experimental heat treatment and knapping for measuring past heating temperatures of heat-treated stones and quantitative surface roughness, micro-crystal breakage pattern and thin section analysis aiming to interpret the techno-behavioural knowledge of raw material selection, raw material preparation, and lithic production in hilly uplands of Maharashtra. Our results show a low-investment procedure for raw material preparation, relying on above-ground uncontrolled camp-fires with 350-450 °C heat. These findings have important implications for our understanding of the Indian Late Microlithic chaîne opératoire in terms of the investment in time and resource utility pattern and for the refinement of archaeological techniques used to identify heat treatment in the Mesolithic culture of hilly areas in Maharashtra.

974 METALS AND METALWORKING II: PRODUCTION AND TECHNOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Kmosek, Matej (Institute of Archaeology of the Czech Academy of Sciences, Brno; Charles University, Faculty of Arts, Institute of Classical Archaeology) - Neiß, Michael (Lund University, Department of Archaeology and Ancient History; Aarhus University) - Saage, Ragnar (University of Tartu) - Wärmländer, Sebastian (Stockholm University, Department of Archaeology and Classical Studies) - Noergaard, Heide (Moesgaard Museum, Department of Archaeology)

Session format: Regular session

Archaeometallurgy is a multidisciplinary field where researchers with different expertises and different traditions come together to answer questions related to ancient metals and metalcraft. Most research in this field is based on metallurgical analyses, but studies that involve typological seriation, experimental archaeology, or material provenancing are also common.

For this session, we welcome full-length papers on metal production and metalwork technology in a very broad sense. Some studies might involve archaeometrical analyses that aim to reveal the different steps in an operational chain. Others might be based on visual analyses, experimental archaeology, anthropology, ethnoarchaeology, or studies of written sources, e.g. of ancient recipes. The social and environmental aspects of metal production and metalwork are also of interest, e.g. organization of production, impact on the natural environment etc. As important advances in archaeometallurgical research often derive from original approaches, papers focusing on new methods will be most welcome!

Ideally, the papers should connect with the EAA meeting theme “Persisting with change”, but this is not an absolute demand. We welcome contributions from all geographic regions and time periods and do encourage students and young researchers to present their ongoing research projects.

ABSTRACTS

1 AT THE CORE OF BRONZE PRODUCTION. ARCHAEOLOGICAL EVIDENCE AND ANALYTICAL DATA FROM BRONZE AGE METAL WORKSHOPS IN NORTHERN ITALY

Barchiesi, Francesca (University of Bologna) - Cavazzuti, Claudio (University of Bologna) - Cattani, Maurizio (University of Bologna) - Debandi, Florencia (University of Bologna) - Putzolu, Cristiano (University of Bologna) - Brunelli, Daniele (University of Modena and Reggio Emilia) - Cipriani, Anna (University of Modena and Reggio Emilia) - De Falco, Maria (University of Modena and Reggio Emilia) - Levi, Sara (University of Modena and Reggio Emilia) - Lugli, Federico (University of Frankfurt)

In the framework of the CAST project (Copper Accumulation, Supply, and Technology among Italian prehistoric societies), we explore several aspects of metalworking among Middle-Recent Bronze Age communities in Northern Italy (c. 1700/1650-1150 BCE), a context where the body of evidence is particularly conspicuous. The project is based on a multidisciplinary approach, which combines archaeometric analysis, traceology, 3D reconstructions and experimental archaeology.

Our paper will address three main research questions:

- 1) How were metal workshop organized?
- 2) Can we identify different levels of complexity of bronze productions?
- 3) What does the distribution of models and artefacts tell us about regional and trans-regional networks?

We will focus on sites with traces of secondary metallurgy in the Po plain and, following a biographic approach, show the results of macro- and microscopic analysis of bronze objects, such as daggers or pins, and clay/stone implements involved in various phases of the chaîne opératoire (stone tools, crucibles, tuyères, casting moulds). High-quality 3D models of stone moulds were acquired using both SfM photogrammetry and 3D scanning, in order to analyse their manufacturing process and use. The two approaches were both compared and combined to define what would guarantee the best possible result depending on the aims, from scientific to museographic and educational purposes. We will also present the result of experimental archaeology protocols, devoted above all to the reconstruction of casting and manufacturing techniques.

2 SOAPSTONE MOULDS IN SOUTHERN SCANDINAVIA DURING THE LATE BRONZE AGE - ORIGIN - USE - DISTRIBUTION

Nilsson, Andreas (Sydsvensk Arkeologi; Department of Archaeology and Ancient History, Lund University)

When we discuss bronze artisans and if they were specialists or part time specialists we need to study all aspects of the craft itself. One of the aspects of the bronze casting craft in Scandinavia that needs to be studied further is the soapstone moulds from primarily the late Bronze Age. This study can be used as one of the bases for the discussions around full-time/part-time specialists and mass production. The study can also be used as one of the bases for a discussion about transport routes for both material and ideas in Scandinavia during the late Bronze Age.

Most researchers agree that soapstone has been used in the Scandinavian Bronze Age to manufacture various types of moulds. The same consensus does not apply regarding the source of the soapstone and the use of the moulds. In discussion it is often argued that the stone comes from Norway, where there are deposits of high-quality soapstone, but there are also deposits of high-quality soapstone along the Swedish west coast where most of the soapstone moulds have been found. There has also been a discussion about whether soapstone moulds primarily have been used for casting the wax model used for casting with *cire perdue*-technique.

I will present the result of a project run at the department of archaeology and ancient history at Lund University. The goal of the project is through experimental archaeology, XRF- analysis and artefact studies to determine the origin, distribution and spread of soapstone and soapstone moulds, but also to determine whether soapstone moulds from the Bronze Age have been used to cast bronze or if they have been used for other types of castings such as casting wax models.

3 NEW ANALYSIS OF THE BRONZE CASTING AT HALLUNDA, SWEDEN

Eriksson, Thomas (National Museum of History, Stockholm)

The Bronze Age complex in Hallunda, outside Stockholm, was excavated in 1969-71. The site was rich finds from settlements, bronze workshops, and the surrounding graves. The site is one of the most well known in Scandinavia and is acclaimed for its well-preserved furnace. The bronze workshop is dated to the late Bronze Age, c. 1100-500 BC.

At one of the sites, Botkyrka 13:1, twelve features were interpreted as furnaces due to abundance of sintered clay. The area is also rich in finds of crucibles, moulds, and bronze melts. Two of the features were brought in 1971 to the museum for prospective investigations.

The features have been thereafter well-quoted and debated. The interpretations have spanned from post-holes, cremation pits to furnaces with cupolas of clay or a combination.

One of these features was excavated in 2023 by a joint project from Upplandsmuseet, the National Historical Museums and Stockholm University. The purpose of the excavation was to confirm or falsify the different interpretations by using new scientific methods. The use of handheld XRF gave new data of the chemical composition of the soil in feature. Among other things, lateral and depth changes in the concentrations of copper, tin and zinc were measured. The quantities were then compared with analyses of finds that had been in contact or had not been in contact with the bronze.

A more comprehensive target was to set the new evidence and results to set the workshop in broader perspective. Hallunda was a nodal point for trade and barter during the Bronze Age with contacts around the Baltic Sea.

4 ARCHAOMETRY STUDY AND RESTORATION OF ROMAN BRONZE VESSELS FROM BURGAS

Karailieva, Violeta (National Academy of Arts, Department of Conservation and Restoration, Bulgaria)

The lack of data from archaeometry analyses of bronze vessels in Bulgaria regarding the AD period clearly stands out. The development and accessibility of different analytical methods provide prerequisites for filling these significant

gaps. Five vessels were selected from the Museum of Burgas, which dates to the 1st -3rd c. AD. The aims are to clarify the technological stages of the manufacturing process, the type of alloy, the products due to the corrosion processes that occur in the object after its burial. ICP-AES was used to determine the elemental composition and type of the alloy. The type of the corrosion products was determined by XRD. The data from the analyses were further used for the conservation treatment and restoration interventions of one vessel. Unfortunately, the vessels are accidental finds therefore the interpretation of the results and the comparative analyses are not complete. Nonetheless, an attempt was made to establish the corrosion processes that resulted in the formation of the main oxides, carbonates, and chlorides. The vessels are documented, their condition, technological stages of their manufacture, and corrosion processes are thoroughly described. Conservation and restoration interventions at the oenochoe began with a mechanical evening of the surface, inhibition, and passivation of the metal. The reintegration of the form was done after the deformations on the edges were carefully retouched. An interesting problem arose while interpreting the results of the elemental composition of the oenochoe. According to analytical data, the alloy used for its manufacturing is brass. However, the zinc content has rather high values, that are uncharacteristic for the period. The pitcher does not leave the impression of a counterfeit. This leads to the assumption that the vessel was made after the 16th century AD. Nonetheless, the question remains open due to the lack of enough analytical data and archaeological context.

5 SYSTEMATIC TECHNOLOGICAL RESEARCH OF GERMANIC KNEE FIBULAE FROM CZECH REPUBLIC

Foucek, Cenek (University of Chemistry and Technology, Prague)

This paper focuses on the identification and comparison of manufacturing techniques among individual groups of Germanic knee fibulae using commonly employed laboratory methods, such as use-wear analysis, metallographic analysis, and XRF elemental composition analysis. We selected 10 representatives each from Central Bohemia and Southern Moravia (together 20 pieces), dating back to the Roman periods B2 and B2-C1.

Prior to any intervention, the fibulae underwent macroscopic, microscopic, and radiographic imaging and photographic documentation. This was followed by use-wear analysis. Subsequently sampling and metallographic analysis were carried out. XRF analysis of samples was done to determine the elemental composition of various parts of the fibulae. It aimed to identify material (dis)similarities of individual fibulae and their groups and material relationships between the body of the fibula and individual parts such as coil spring and the coil axis.

Based on results of such a research, individual groups of fibulae were determined according to manufacturing processes involved in their production. Determined groups are mostly type dependant creating two main of basic shape creation, such as hammering from wire/rod or casting into a mould. The results of this work enable the comparison of determined groups based on manufacturing techniques used for knee fibulae production. Such technological insight was compared with traditional typology grouping based primarily on fibulae morphology.

6 UNBUCKLING THE PAST: TRANSFORMATIONS IN TECHNOLOGY AND CULTURE THROUGH A TRIPARTITE BELT BUCKLE FROM ANCIENT JAFFA

Mazis, Matasha (Technical University Darmstadt) - Ashkenazi, Dana (Tel Aviv University) - Fantalkin, Alexander (Tel Aviv University)

In this paper we present a tripartite metal buckle from the ancient Mediterranean port of Jaffa. The buckle is dated seventh to eighth century CE, an era of sociopolitical transformations from Roman-Byzantine to Arab rule in the Levant. We argue that the buckle represents enduring traditions as well as adaptations in response to momentous social change. Our study involves a comprehensive examination of technology and art: we explore the buckle's composition, fabrication techniques, and cultural meaning. Using X-ray fluorescence spectrometry and scanning electron microscopy with energy-dispersive X-ray spectroscopy, we characterise the composition of each of the buckle's three discrete components and their methods of manufacture. The results reveal the use of both recycled copper alloys and pure copper parts, technical challenges in casting the openwork plate, cold fastening of the components, and heretofore undocumented finishing techniques for this type of buckle: precision-contouring of the openwork shapes. There is no evidence of enamelling, which goes against existing theories about these types of objects. Comparing the techniques and design elements with contemporary examples, we find the buckle has roots in Roman military culture. However, its predominantly religious iconography reflects enigmatic and hidden elements that reflect the geopolitical reality of the era. Our study not only sheds light on contemporary buckle production, but embodies a broader narrative of endurance and transformation during immense social change.

7 A 16TH C. METAL THREAD EMBROIDERY MADE BY COPPER STRIPS, SILK AND SHEEP WOOL, EXCAVATED AT SKRIÐUKLAUSTUR MONASTERY IN ICELAND

Wärmländer, Sebastian (Department of Archaeology and Classical Studies, Stockholm University, 106 91 Stockholm, Sweden; UCLA/Getty Conservation Programme, UCLA, CA 90095, USA)

Textile ornaments involving metal threads were common decorations on liturgical textiles in Medieval and Early Modern Europe. The most prestigious metal threads were made from gold or silver, spun around a core silk fiber. Less prestigious versions employed copper-alloy strips wound around cores of linen. Here, we used different analytical techniques to characterize a metal thread of unusual design, excavated in a 16th c. grave from the Skriðuklaustur Monastery in eastern Iceland. The material identification showed that thin copper strips had been wrapped around fibers of silk, thereby producing metal threads which had been wrapped around a second fibrous core made from animal hair. This was surprising, as very few metal threads with animal hair are known to exist. Species identification of the keratin protein in the hair fibers showed them to derive from sheep, suggesting that imported metal threads with silk cores had been combined with local sheep wool. Given the general scarcity of imported prestige goods in this remote island, we interpret the uncommon composition of this textile ornament as an Icelandic attempt to keep up with the fashion trends in mainland Europe, albeit with elements of locally improvised non-prestigious materials.

8 PIECING TOGETHER A LARGER PICTURE - ENRICHING THE UNDERSTANDING OF PAST IRON PRODUCTION THROUGH SMALL-SCALE ARCHAOMETALLURGICAL ANALYSES WITHIN CONTRACT ARCHAEOLOGY

Svensson, Andreas (Sydsvensk Arkeologi AB)

The understanding of the technological, social and economic aspects of past iron production has made considerable advances in the last decades. In Scandinavia, recent research-projects have been fruitful in advancing new knowledge concerning questions of chronology, technology and socio-economy (e.g. Bennerhag 2023; Rundberget 2016).

However, the bulk of archaeometallurgical analyses conducted in Scandinavia (and perhaps also Europe as a whole) consist of small-scale studies connected to Contract Archaeology-projects. It is within these that hitherto unknown production sites are surveyed and excavated and the material retrieved from them analysed to chart the nature of the metalworking performed in the past. Commonly, the investigation areas as well as the budget for analyses are considerably restricted, and hence the underpinning research questions are often basic. On the other hand, the nature of the research questions posed within the analytical programs enables comparisons between sites and projects.

In this paper, methods and frameworks concerning how these many and disparate archaeometallurgical analyses conducted within Contract Archaeology could be synthesised are suggested and described. Several examples of small-scale analyses performed at the newly established archaeometallurgical lab infra-structure at Sydsvensk Arkeologi AB, Sweden are used to highlight how the knowledge production regarding iron production can be further advanced in the future. The establishment of protocols for exchange of analytic data and interpreted results within the community of practising archaeometallurgists and archaeologists is forwarded as a key aspect in this regard, and the paper aims to encourage discussions on this and other subjects concerning the synthesis of archaeometallurgical analyses.

9 HOW DO WE ACCOUNT FOR THE CESSATION OF IRON SMELTING ON ELBA IN THE FIRST CENTURY BCE?

Monroe, Christina (University of Oxford)

The archaeological record demonstrates that many iron smelting sites on the iron-rich island of Elba were abandoned in the late first century BCE after a peak of iron smelting from the third to early first centuries BCE. A passage from Strabo (c. 63 BCE to 23 CE; Geographica 5.2.6) has been referenced as evidence for a lack of fuel due to deforestation as the reason for the inability to continue to smelt iron on the island. To test this, a study (Becker et al. 2020), used spatio-temporal models to show that complete deforestation of the island in the first century BCE was improbable, but that there was a lack of fuel (a 67% likelihood) between 124–85 BCE.

Although the authors took this result to mean that deforestation was not the cause of the cessation of smelting, I propose that even a lack of fuel would have been reason enough for many of the smelting sites to shut down. If there was a need to transport timber arduously over land or by ship, then it may have prompted the acceptance for shipping ore alone, rather than timber and ore. It was more economically advantageous for most of the iron ore from the mid to late first century BCE to have been mined on the eastern coast of Elba and then directly shipped to Populonia—as it had been from the seventh to fourth centuries BCE—because this was a shorter distance than many of the smelting sites on the northwest and western coast of Elba. Therefore, I argue that the abandonment of most smelting sites on Elba was a formulated economic decision that weighed the saving of time and transportation costs. This demonstrates the intelligent economic strategy of the Romans and exemplifies their adaptability and agency during changing landscapes.

10 NON-DESTRUCTIVE MULTIPROXY SURVEY AS A RESOURCE FOR THE STUDY OF DEVELOPMENT OF THE MEDIEVAL METALLURGY IN SLOVAKIA

Mino, Martin (Monument Board of Slovak Republic) - Petrik, Jozef (Faculty of Materials, Metallurgy and Recycling, Technical University Košice) - Midula, Pavol (Faculty of Environment, Jan Evangelista Purkyně University in Ústí nad Labem) - Ševčíková, Janka (Faculty of Natural Sciences, Matej Bel University in Banská Bystrica) - Andráš, Peter (Faculty of Natural Sciences, Matej Bel University in Banská Bystrica) - Hurajtová, Natália (Slovak Academy of Sciences, Institute of Landscape Ecology) - Styková, Barbora (Nuclear Physics Institute of the Czech Academy of Sciences) - Světlík, Ivo (Nuclear Physics Institute of the Czech Academy of Sciences) - Brabcová, Kateřina (Nuclear Physics Institute of the Czech Academy of Sciences)

A brief written 14th-century mention of a raid on the mining settlement of Kerling was formally the only information source about the settlement. This location belongs to the well-known Au/Ag mining district of the Banská Štiavnica region in Slovakia. Interest in the site was raised by the assumption of the existence of a mass grave of miners who died during the raid. This would be a valuable physical source of information about the origin and the way of life of the medieval miners who are usually hard to distinguish from the rest of the population. The position of the mining settlement was believed to be built around a small chapel on a plateau with the same name as the medieval settlement. The plain is surrounded by traces of medieval and modern mining activity registered as Au/Ag mines. The geophysical survey of the chapel's surroundings did not yield traces of a settlement in the area. However, rare surface finds document medieval activity here. The lidar data identified two foundation terraces of buildings north of the presumed location and a series of remodelled remains of smaller surface mines. Coring on the site provided an important chronological profile of the site, which placed it among the oldest mining locations in the area and also helped to locate the metallurgical site. Although the remains of the miners have not yet been located, an unexpected source of information on metallurgy has been discovered. The geochemical profile of the site was processed and the archaeometallurgical analysis of the obtained slag was carried out. Together with the limonite ore recovered during surface exploration, the results indicate that precious metals were not necessarily the area's original target of mining activities. The contribution combines the results of a multidisciplinary non-destructive survey with comparative material.

11 CULTIVATED PLANT MATERIAL AND OTHER ARCHAEBOTANICAL FINDS FROM IRON AGE SMELTING FURNACES IN WESTERN LITHUANIA

Bojarskaite, Kotryna (Lithuanian Institute of History) - Masiulienė, Ieva (Klaipėda University)

The Bandužiai-Žardė-Laistai archaeological complex in western Lithuania is perhaps the most excavated archaeological massif in Lithuania. The first sedentary communities began to settle there in the Late Bronze Age (1st millennium BC) and carried out various socioeconomic activities until the early Middle Ages (13th-14th centuries). The settlements belonging to this archaeological complex were located around wet and marshy areas. They were rich in bog ore iron deposits, essential for Iron age metal production and metalcraft. It is therefore not surprising that iron smelting and other related activities are the ones the most strongly reflected in the archaeological material of these settlements.

Iron-smelting furnaces has left one of the most noticeable traces in the settlements of the Bandužiai-Žardė-Laistai complex. They are unique short-lived objects, providing both valuable archaeological and archaeobotanical information. Crops grown in the vicinity of iron production sites were used in the iron smelting process and has left irrefutable evidence of the socioeconomic preferences of Iron Age people and their immediate natural environment.

The fact that cultivated plants were used in furnaces as a construction material can be seen from examples elsewhere in northern Europe. However, their exact purpose and how they came to be used in the context of furnaces in western Lithuanian settlements are still not fully explained. Archaeobotanical studies of iron-smelting furnaces have not yet been widely applied in Lithuania and have no equivalent yet. However, the first results from the settlement of Bandužiai, Žardė, which belongs to the Bandužiai-Žardė-Laistai complex, provide unique initial insights and promising results about this ancient practice that was also present on the eastern coast of the Baltic Sea.

12 SMALL REMAINS WITH A BIG MEANING – WHAT CAN A SLAG INCLUSION TELL US ABOUT THE BLACKSMITH'S WORK?

Tóth, Boglárka (Pázmány Péter Catholic University, Institute of Archaeology, Budapest, Hungary) - Török, Béla (Pázmány Péter Catholic University, Institute of Archaeology, Budapest, Hungary; University of Miskolc, Hungary) - Barkóczy, Péter (University of Miskolc, Institute of Physical Metallurgy, Metalforming and Nanotechnology; Miskolc, Hungary) - Kovács, Árpád (Pázmány Péter Catholic University, Institute of Archaeology, Budapest, Hungary; University of Miskolc, Hungary) - Langó, Péter (Pázmány Péter Catholic University, Institute of Archaeology, Budapest, Hungary)

Slag inclusions are small but important remainders of smelting and smithing process. They are found within most archaeological iron artefacts, and it is widely believed that they can provide us information about the provenance of iron artefacts and about the used smithing technology. However, the examination of inclusions in order to answer the questions of provenance is difficult and the results can be misleading or even inconclusive but it seems that they can be very useful during the examination of the manufacturing process of certain iron objects. In the last few years 22 double edged swords from Hungary (dated to the 10th century) were examined within a framework of a multiannual project, the main aim of which was to examine the different microstructure of the blades to determine the possible manufacturing methods of the weapons. In addition, the examination of the slag inclusions of the blades was an essential segment of the project, not only due to the fact that it offers us precious insight into the chemical composition of the slag along with the material but because it was also useful to verify the results of the project, especially during the determination of the various forging technologies of the blades. In light of this, our presentation seeks to highlight the importance and usefulness of the examination of slag inclusions regarding sword manufacturing methods.

The inclusions were examined with optical microscope (OM) and scanning electron microscope equipped with energy dispersive spectroscopy (SEM-EDS).

13 UNDERSTANDING BLOOMERY SMELTING THROUGH CURRENCY BLOOMS AND EXPERIMENTAL IRON FROM ESTONIA

Oks, Kristo (University of Tartu) - Saage, Ragnar (University of Tartu)

In recent years nearly 40 currency blooms have been found from Estonia as stray finds or hoards containing from 3 to 9 blooms. The few of them that have been dated were produced in the 11th to 13th century AD. The blooms can be defined as a product of one successful smelt in a bloomery furnace after which they have been consolidated and given a certain shape, which can be rectangular, loaf-shaped, or round. The uniform shape of many blooms indicates that the rectangular shape was the most standard one in Estonia and it is likely the shape that was used for trading.

Recently many of these blooms have been sampled for provenance and metallographical analysis. The provenance analysis enabled to link some of the finds to certain Estonian smelting sites. However, this paper will focus on metallographic analysis as it gives valuable information about the bloomery smelting process. The currency blooms enable to look at the iron just after the smelting process before it was hammered or carburised. The results of the metallographic analysis of the experimental iron are discussed for comparison as well.

The blooms also provide useful information about the volume of one smelt: the weight of the bloom reflects what could be considered a “normal” output. This is compared to the recent successful smelting experiments, where the output has reached comparable or even larger weights than we see in the case of archaeological currency blooms. Hence, we can say that in terms of weight, the experiments have reached an understanding deep enough to draw meaningful conclusions.

14 THE EFFECT OF THE CONSERVATION PROCESSES ON TECHNOLOGICAL AND FUNCTIONAL STUDIES OF THE KNIVES FOUND IN POLAND

Miazga, Beata (University of Wrocław, Institute of Archaeology)

The knife is one of the most popular archaeological finds, owing to the fact that it is a very useful tool accompanying man from ancient times. During their excavations archaeologists found knives made of flint, copper alloys or iron and steel. The last ones, despite being nearly the same or very close to modern knives, are a very frequent object of study and archaeologists' central focus is on the stylistic or functional recognition. The final identification of the purpose/functionality of each knife without advanced research, including metallographic, is not convincing. Therefore the implementation of research programmes for cutlery, involving raw-materials analysis as well as extensive technological and functional examinations are of critical importance and are performed in Poland, too. The results of microscopic and physicochemical analysis provide new data for further archaeological research.

This presentation is an attempt to summarise the complexity of the work on the iron/steel knives from the point of view conservation and archaeometric. The studies are based on the medieval and postmedieval finds from Poland, which are almost simultaneously subjected to conservation works and less invasive investigations, such as light micro-

scopes observations, also metallographic, scanning electron microscope with EDS spectrometer and X-ray fluorescence spectrometry or microhardness tester analyses.

15 INVESTIGATION OF IRON-WORKING ACTIVITIES OF THE MEDIEVAL HARBOUR AT HOEKE (BELGIUM)

Biernacka, Paulina (Historical Archaeology Research Group, Department of Archaeology, Ghent University, St.-Pietersnieuwstraat 35, 9000 Ghent, Belgium; Atomic & Mass Spectrometry – A&MS Research Unit, Department of Chemistry, Ghent University, Campus Sterre, Krijgslaan 281 - S12, 9000 Ghent, Belgium) - De Clercq, Wim (Historical Archaeology Research Group, Department of Archaeology, Ghent University, St.-Pietersnieuwstraat 35, 9000 Ghent, Belgium) - Dewaele, Stijn (Laboratory for Mineralogy and Petrology, Department of Geology, Ghent University, Campus Sterre, Krijgslaan 281 - S8, 9000 Ghent, Belgium) - Vanhaecke, Frank (Atomic & Mass Spectrometry – A&MS Research Unit, Department of Chemistry, Ghent University, Campus Sterre, Krijgslaan 281 - S12, 9000 Ghent, Belgium) - De Grave, Johan (Laboratory for Mineralogy and Petrology, Department of Geology, Ghent University, Campus Sterre, Krijgslaan 281 - S8, 9000 Ghent, Belgium)

Considering the numerous archaeological studies on the Medieval harbour in Bruges (Belgium), little attention has been directed toward metallurgical activities in this area. Recent excavations have revealed significant amounts of iron slag, fuel residues, and other by-products related to iron production, indicating substantial iron-working operations. This study presents new archaeometrical data on iron production in one of the outer harbours of Bruges, located in Hoeke, primarily focusing on the geochemical and mineralogical analysis of iron slags and fuel used.

Visual examination of the samples unveiled distinctive macroscopic characteristics, including the presence of Plano-Convex Bottom (PCB) slags and hammerscales, suggesting smithing activity. Samples were subsequently analysed using X-ray Diffraction (XRD) to determine mineralogical composition. Additionally, reflected light optical microscopy was employed for further study, to characterise the microstructural features of iron slags.

The geochemical and metallographic analysis of iron slags showed a complex mixture of iron oxides (wüstite FeO and mainly magnetite Fe₃O₄), fayalite (Fe₂SiO₄), and quartz (SiO₂). Microstructural analysis identified the presence of spinifex texture, the occurrence of metallic iron inclusions, and the incorporation of partially dissolved hammerscales within the slag. Moreover, the analysis pointed out that the investigated slag has a significant level of quartz, which could have been used as a flux.

An interesting aspect of the iron activity in Hoeke was the choice of fuel, which in this case was coal. As a result, coal not only provided a sufficiently high temperature but also caused slight alterations to the slags at both macroscopic and microscopic levels.

The obtained results provide first insights into the technological aspects of iron production in Hoeke, confirming the hypothesis that the excavated materials were involved in smithing activities. This research makes noteworthy contributions to understanding the iron activity in late Medieval Bruges.

975 BASKETS AND THEIR BELONGINGS: ARCHAEOBOTANY AND CONSERVATION OF VEGETAL BASKETRY OBJECTS AND THEIR VEGETAL CONTENT

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Andonova-Katsarski, Mila (Division of Palaeobotany and Palynology, Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences) - Herero-Otal, Maria (Archaeobotany Laboratory, Prehistory Department, Autonomous University of Barcelona) - Stelzner, Ingrid (Leibniz-Zentrum für Archäologie, Mainz)

Session format: Regular session

The ancient basketry craft transitioned through the entire human history – from the early prehistoric human groups to the contemporary market of the 21st century. Basket-making is a trans-geographical and pervasive activity, resulting in products of diverse shapes, sizes, raw materials and functions as they service a wide utilisation spectrum by humans. Basketry is also strongly related to the vegetal raw material, including woody and non-woody plants, allowing for the creation of objects not only of different dimensions but also with specific properties such as durability, heavy load-resistivity, excellent ventilation or even waterproofness.

On the other hand, basketry products are often chosen for the storage, transportation and processing of raw materials or products of plant origin (consumables and non-consumables). Sometimes, a single plant may offer its different plant parts for both – a basket and its content. Examples of that could be some cereal species with stems and leaves appropriate for weaving, but also with a good grain yield which could be subsequently stored in a basket; or some tree species that provide outstanding properties for basket-making, but once shaped into a basket could also contain woody materials. The crucial role of conservation science is to uncover, document and preserve these objects, ensuring archaeobotanical analysis of both the baskets and their contents.

This particular link between the vegetal basketry object, its vegetal content (alimentary and non-alimentary) and their conservation is what we aim to explore in the current session. We welcome contributions, independent of their geographical region or chronological period, presenting archaeological, archaeobotanical, conservational or other related studies of both vegetal basketry materials combined with vegetal resources or products contained within basketry items and related to the functionality of both types of plant resources.

ABSTRACTS

1 **ETNO-ARCHAEOLOGICAL APPROACH TO THE BASKETRY OF THE HUNTER-GATHERERS OF TIERRA DEL FUEGO - PATAGONIA (CHILE AND ARGENTINA)**

Piqué, Raquel (Universitat Autònoma de Barcelona) - Franch Bach, Anna (Centro Austral de Investigaciones Científicas (CADIC-CONICET)) - Vietri, Luisa (Independent Researcher)

Tierra del Fuego and the Oriental Channels of Patagonia in Chile and Argentina comprise a vast area of channels, fjords, and islands. In pre-European times, these areas were inhabited by hunter-fisher-gatherer communities who navigated in these channels in their canoes. The Isla Grande of Tierra del Fuego was also home to pedestrian hunter-gatherers. Skilled basket making was a notable craft among the women of these groups, and some of these traditional techniques persist today.

Our research delves into the ethnohistorical documentation and ethnographic collections housed in various museums across Chile, Argentina, and Europe. The primary goal is to address several questions concerning the ecological and technical knowledge of these populations and the purpose of their organic containers. The outcomes of our investigation shed light on the diverse aspects of baskets, including variations in shapes, raw materials, sizes, and production techniques.

Notably, our findings underscore the relationship between these variables and the function of the containers. The predominant use of these baskets was for transporting and storing food and belongings. Remarkably, there is a homogeneity in the raw material employed (*Marsippospermum grandiflorum*) and a noticeable low diversity in terms of shapes and sizes. Its geographical origins and their significance within these hunter-fisher-gatherers societies are also discussed, in particular intergenerational transmission of knowledge.

2 **BASKETRY CREELS: MORPHOLOGY AND USE OF RECENT FINDS IN FRENCH PREVENTIVE ARCHAEOLOGY**

Lecomte-Schmitt, Blandine (Inrap; UMR 5600 Environnement Ville Société) - Flucher, Guy (Inrap) - Peltier, Virginie (Inrap) - Dietrich, Anne (Inrap)

Among archaeological discoveries, creels are of major significance, with findings often limited to fragments. Originating from the Mesolithic period (around 7000 BCE), corded basketry fish traps from Noyen-sur-Seine (Seine-et-Marne) stand as Europe's oldest known discoveries of this kind. The abundance of bone remains from eels and pikes further supports their association with this ancient fishing method.

In the past 15 years, preventive excavations in France have transformed our comprehension of fish traps through the identification of two river fishing sites. Alongside fixed fisheries, various well-preserved wickerwork fishing elements emerged from the sediments of ancient river branches of the Oise and Seine rivers, shedding light on the techniques and uses of these traps spanning from Antiquity to the Middle Ages.

Pont-sur-Seine (Aube, France) revealed six creels associated with a fish weir dating back to the 2nd century AD (Peltier Virginie et al. 2018). Two complete specimens underwent conservation measures by the Arc'Nucleart laboratory (CIA, Grenoble, France), showcasing the existence of at least two types and attesting to the exceptional skills of ancient craftsmen.

Brissay-Choigny (Aisne, France) along the Oise River unveiled another fishing method. Sixteen traps from the late Middle Ages, woven using a distinct technique, are linked to a fish weir (Flucher Guy et al. 2014).

While willow and hazel are primary materials, other options are not excluded. Weaving techniques, openings, and closures exhibit noteworthy similarities and differences depending on trap types.

Fish weirs, well-known since Antiquity, are characterized by long lines of stakes with wattle, using techniques akin to basketry to guide fish towards traps downstream or upstream.

This presentation aims to introduce recently discovered fish trap assemblages in preventive archaeology, covering taxa, manufacturing techniques, and specific features of these fisheries' organization.

3 **BASKETRY FOR THE DEAD: THE TECHNOLOGY OF WARI CANE BOXES**

Rudnicka, Emanuela (Faculty of Archaeology, University of Warsaw)

At archaeological sites cane baskets and reed mats are often found in burials of people of low prestige as well as representatives of the upper classes. Although Peruvian basketry remains mostly unexplored, recent investigations at Castillo de Huarmey in Peru offer insights into this ancient craft. Dating back to the Middle Horizon (600-1000 AD), the site served as a multifaceted locus, encompassing administrative, religious, and funerary functions for Wari culture - the first Andean empire. In 2012, the site yielded the burials of numerous Wari aristocrats, accompanied by an astonishing array of over 1,200 artifacts made of silver, gold, copper, bone, and wood, as well as textiles, pottery, and gourd vessels. In 2022, further excavation revealed the tombs of artisans affiliated with the imperial court, marking a pivotal juncture in unraveling the societal tapestry of the era.

The baskets found in the graves were made of cane, lined with textiles, and decorated with camelid wool yarns. The contents of the boxes, primarily associated with textile production and ceremonial practices, encompassed an array of personal effects, including bronze implements, obsidian tools, wooden utensils, as well as rattles and *Spondylus* shells. Additionally, artifacts indicative of social status, such as ear ornaments and metal plaques, further underscored the stratified nature of Wari society.

This paper aims to present the results of research focused on reconstructing the chaîne opératoire of Wari basketry. Traseological studies involving stone and metal tools, microscopic examinations, and analyses such as HPLC and Raman spectroscopy were employed to identify the raw materials utilized in crafting the baskets. These included cane, resin, cotton, and camelid wool dyed with flavonoids and cochineal, among others. Experimental archaeology research carried out in the Lambayeque and Cusco regions of Peru has led to the reconstruction of a Wari basket.

4 **EXPLORING BASKETRY TECHNIQUES BEYOND CONTAINER CONSTRUCTION: INSIGHTS FROM A COPPER AGE SETTLEMENT**

Aquaro, Antonella (DAI - Deutsches Archäologisches Institut)

This presentation explores the varied applications of basketry techniques beyond traditional container construction. It focuses on findings from the Copper Age settlement of Măgura Gorgana at Pietrele in south Romania (4550 - 4250 BC).

Specifically, a charred woven 'mat' recovered on the floor of a burnt structure prompts the discussion on weaving techniques in wattle and daub house construction.

The results of the anthracological analysis of these remains are presented here, contextualized within the broader pattern of plant exploitation at the site. These findings illuminate the intricate relationship between human societies and the vegetal world, showcasing how technological innovations in basketry intersect with cultural practices and resource utilization.

This examination not only deepens our understanding of prehistoric craftsmanship and technological capabilities but also underscores the sophisticated ways in which early societies harnessed plant materials to shape their material culture and architectural practices.

Overall, this research helps us comprehend the versatile applications of basketry techniques and highlights their significance beyond traditional vessel construction. This study serves to remind us that behind the house constructors were the able hands of basket makers and that the concept of weaving extends beyond physical structures to encompass broader cultural and societal elements.

5 **A LINDEN BAST BAG FROM THE 5TH MILLENNIUM BC**

Klügl, Johanna (Archaeological Service of the Canton of Bern) - Kühn, Marlu (University of Basel; Integrative Prehistory and Archeological Science (IPAS)) - Schoch, Werner (Laboratory for Ancient Wood Research) - Gubler, Regula (Archaeological Service of the Canton of Bern)

Alpine ice patches are valuable archaeological archives, as organic objects survive for thousands of years in their ice. Due to global warming, these are melting and unique perishable organic artifacts are discovered. One example is a linden (*Tilia* sp.) bast bag which dates back to 4344-4248 calBC and thawed out of the ice on the Schnidejoch ice patch in Switzerland. It was found by hikers in 2019 and recovered shortly afterwards as a block.

In this contribution the unique object and the analyses carried out on it are introduced. Further the lifting, uncovering and conservation tests are presented. These led to the decision to spray on 5% PEG 400 and to vacuum freeze-dry the bast fibre object in order to keep the shrinkage of the bast fibers as low as possible.

Today, after conservation, the twisted object measures 19 x 27 cm. In the lower area, which presumably forms the end of the artefact, it is fragmented and a large number of pine needles (*Pinus cembra*) were detected. It is possible that it is an open U-shaped pouch measuring approximately 18 x 24 cm, which was used for collecting, storing and trans-

porting food or other objects. While there are no archaeological comparative pieces, examples of this type of pouch can be found in an ethnographic context among the Ainu, an indigenous people of Japan and Russia.

It is discussed which investigations would still be possible in order to generate further information on the use of the artefact and also on the question of whether the pine needles were accidentally got caught or used intentionally. The conservation carried out is also discussed, particularly with regard to the question of the advantages and disadvantages and consequences of PEG impregnation and what other methods of treatment would have been possible.

6 VARIABILITY AND FUNCTION IN MESOLITHIC BASKETRY FROM CUEVA DE LOS MURCIÉLAGOS (ALBUÑOL, GRANADA, SPAIN)

Herrero-Otal, Maria (Autonomous University of Barcelona) - Piqué, Raquel (Autonomous University of Barcelona) - Homs, Anna (Autonomous University of Barcelona) - Bertin, Ingrid (Autonomous University of Barcelona) - Martínez-Sevilla, Francisco (University of Alcalá)

The scarce evidence of plant fibre-based crafts in archaeological context, their fragmentation, poor preservation, scarcity, and diverse spatial and chronological distribution have limited the research approaches, with raw material identification and technological descriptions being the most common analyses. The functionality of plant fibres containers is frequently suggested by comparison with modern basketry, but it is rarely possible to associate the baskets with a specific function.

The archaeological site of Cueva de los Murciélagos (Albuñol, Granada, Spain), located in the south-eastern part of the Iberian Peninsula, has provided a unique sample of desiccated baskets. The site is a burial cave discovered in the 19th century where several partially mummified bodies, accompanied by various types of goods -plant fibre objects, wooden tools, and other archaeological remains-. The latest radiocarbon analysis places the materials in two different prehistoric periods: the Mesolithic (7986-7391 cal BC) and the Neolithic (4373-3740 cal BC).

This presentation will focus on the sample of 11 baskets corresponding to the Mesolithic ones. We discuss the variability in this group of baskets in terms of their production processes, volume, shape, decoration, and contents, which has been linked to their function. Despite the homogeneity of the production technique and shape, the baskets present differences in respect the size and some technical characteristics. The context of their discovery, related to funerary practices, and their associated content allow us to discuss the functionality of these objects.

7 BASKETS AND THEIR BELONGINGS: A CASE STUDY FROM THE LATE NEOLITHIC PILE DWELLINGS OF THE LAKE CONSTANCE

Andonova-Katsarski, Mila (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences) - Million, Sebastian (Dendrochronological Laboratory at Hemmenhofen, State Office for Cultural Heritage, Baden-Württemberg) - Marinova, Elena (Archaeobotanical Laboratory at Hemmenhofen, State Office for Cultural Heritage, Baden-Württemberg) - Probst-Boehm, Anja (Archaeological Museum of Baden-Württemberg, Konstanz) - Banck-Burgess, Johanna (State Office for Cultural Heritage at Esslingen, Baden-Württemberg)

This study captures five exclusively well-preserved coiled baskets and the archaeobotanical remains of their possible content originating from two Late Neolithic lakeshore settlements by the Lake Constance (Southwestern Germany): Hornstaad-Hörnle (phase IA 3919-3902 BC dendrochronological dating) and Sipplingen-Osthafen (phases SiB 3857-3817/SiE 3718-3660 BC dendrochronological dating). The paper aims to combine several different proxies, such as the analysis of monocotyledonous and woody plants chosen for basket-making, and the archaeobotanical investigation of cereal remains embedded in their fabric. This will allow for a technological overview of the baskets of interest concerning the choice of vegetal raw material for their creation. Finally, the link between basket-making techniques (coiling in particular), and their content (in the case of cereal grains and chaff) will be discussed. By the application of these investigation approaches, we propose several directions of interpretation for the usage of those five basketry products and their role in the Neolithic subsistence of the pile dwellings at Lake Constance. Even acknowledging the very specific taphonomic scenario of the selected case studies i.e. recording both perishable basketry containers along with their possible vegetal content, the paper will point out the potential and implications of the presented multi-proxy approach for different preservations types and various chronologies in a broad geographic range.

8 REVERSIBILITY OF CONSERVATION MEASURES: INVESTIGATING FOOD RESIDUES IN ORGANIC CONTAINERS

Stelzner, Ingrid (Leibniz-Zentrum für Archäologie) - Probst-Böhm, Anja (Archäologisches Landesmuseum Konstanz) - Marinova, Elena (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart)

Archaeological textiles that have been preserved in waterlogged deposits are exposed to many dangers after their discovery. In addition to their high susceptibility to mechanical stress and microbial degradation, drying out can irretrievably destroy the finds. Therefore, conservation of the finds is necessary to preserve them permanently. The ma-

jority of the artefacts that were found in the lake shores and wetlands of the northern Alpine region of south-western Germany complex were treated with polyethylene glycol (PEG) before being freeze-dried. This process was applied to artefacts such as coiled baskets and bark containers, including their food residues. A comprehensive record of the artefacts was created several decades later during the joint project THEFBO (www.thefbo.de). The presentation discusses the analysis of the food residues inside the organic containers after conservation measures were carried out. Test series were conducted on the original material and samples produced through experimental archaeology. Microchemical tests were used to monitor the dissolution of the consolidant PEG. The samples were then analyzed using micro-residue analysis, as well as under reflected light and SEM microscopy. After the dissolution it was possible to determine the botanical characteristics of the specimens without any restrictions. Furthermore, the samples could undergo organic residual analyses to identify any lipids present and to specify the nutritional composition of the contents. This would provide insight into the diet of the prehistoric settlers.

978 THE ROLE OF PUBLIC ARCHAEOLOGY IN HERITAGE MANAGEMENT

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Thakur, Renu (Department of Ancient Indian History Culture and Archaeology, Panjab University, Chandigarh) - Gahlot, Seema (AREA Environmental and Heritage Consultant, 72 Brisbane Street, Dubbo 2830, NSW, Australia) - Bhattacharyya, Banani (Deputy Director, Department of Archaeology and Museums, Haryana, India)

Session format: Regular session

Heritage encompasses both natural and human-created elements, manifesting as tangible or intangible expressions. The survival and preservation of any form of heritage are imperative. This session aims to delve into the role of Public Archaeology in heritage management, soliciting enlightening case studies that illuminate public engagement strategies. Contributions from diverse methodological approaches will be encouraged, with a particular interest in comparative analyses between the global north and south to delineate the scope of heritage management. While involving the public in heritage management fosters understanding and inclusivity, it is not without challenges. The dynamic and diverse nature of communities may lead to conflicts, necessitating exploration of conflict resolution strategies through case studies. Addressing the alienation of indigenous groups from archaeological sites is crucial, as their involvement can be a valuable asset in heritage protection. This session endeavours to guide archaeologists towards a future where Public Archaeology becomes a standard practice, instilling pride and contentment within communities. Recognizing heritage as a catalyst for local socio-economic development and future sustainability, the session advocates for Public Archaeology as a means to garner both visitor interest and financial support. By exploring global case studies, the session aims to showcase how indigenous communities actively contribute to heritage safeguarding, envisioning a participatory approach that transforms heritage into a dynamic and inclusive process, enriched by diverse interests and perspectives. This session is an invitation to join us in reimagining heritage management.

ABSTRACTS

1 PREHISTORIC SITES FROM ARAVALLI HILLS IN HARYANA, INDIA

Bhattacharyya, Banani (Department of Archaeology and Museums, Haryana)

One of the oldest mountain ranges on earth, the Aravalli hills of India, are the prominent landforms shaping the west-Indian climate and biodiversity. Aravallis with its lush green forests used to act as a green barrier and acted as an effective shield against desertification. It checked the spread of the Indian Desert (Thar) towards eastern Rajasthan, Indo Gangetic plains, Haryana and Western UP.

The intensive study area selected was the Aravalli region of the Haryana Landscape. Aravallis bound Haryana in the southwest region. The northern point of the range continues as isolated hills and rocky ridges into Haryana State, ending in Delhi. Sites in five divisions namely, Mahendragarh, Rewari, Faridabad, Gurgaon (Gurugram), and Mewat with an area of 1899 km², 1594 km², 741 km², 1258 km², and 1507 km² respectively, were extensively surveyed for mapping the land use area/Land cover pattern and the status of key wildlife species.

The natural heritage of this region not only has a rich biodiversity but also covers several areas of archaeological finds and sacred groves. Exploration has been conducted in the area covering Shilakhari, Mangar, Kot, and Dhauj located in Faridabad and Roj ka Gujjar, Damdama in Gurugram. Based on this exploration, it is suggested that the area is one of the biggest Palaeolithic sites in the Indian sub-continent, where stone age tools were recovered from different open-air sites as well as from rock shelters including rock arts and petroglyphs. This discovery will take the history of Haryana further back in time.

2 ECHOES OF ANCESTRAL CONNECTION: UNVEILING THE CULTURAL AND SPIRITUAL SIGNIFICANCE OF THE RED HAND CAVES IN KU-RING-GAI NATIONAL PARK

Gahlot, Seema (AREA Environmental and Heritage Consultant)

This paper explores the cultural and spiritual significance of the Red Hand Caves, an ancient Aboriginal rock art site within Ku-ring-gai National Park. Dating back 500 to 1600 years, the hand impressions, crafted with ochre color, serve as a tangible link to the ancestral past of the Darramuragal or Darug and Guringai people. Investigating the traditional lands extending from Sydney's upper north shore to Port Stephens near Newcastle, the study underscores the profound compatibility between the traditional owners and nature, particularly evident during moments of silence, revealing a distinctive perception of time.

The Red Hand Caves are regarded as a symbolic landmark, signifying ancestral tribute and epitomizing the enduring connection between the Darramuragal or Darug and Guringai people and the natural environment. The caves, through intricate rock art, also reveal the transmission of cultural practices and sustainability within Aboriginal society, where ancestors guide successive generations through dreams, songs, and rituals.

The Red Hand Caves transcend their role as mere rock art, encapsulating a timeless connection between the Aboriginal people and their ancestral lands. The study seeks to contribute to the preservation of cultural heritage, fostering a deeper appreciation for the intricate relationship between traditional owners and their environment.

3 WHEN ART AND ARCHAEOLOGY MEET A NEOLITHIC FIGURINE AT SHA'AR HAGOLAN (ISRAEL)

Siegal, Shirley (Shirley's Fine Art School) - Tzur, Maia (Sha'ar HaGolan) - Eirikh-Rose, Anna (IAA) - Vieugué, Julien (CNRS France)

The profession of an archaeologist is a dream for many people. The image conveyed by Indiana Jones to the public is however very far from the reality. At Sha'ar Hagolan, a prehistoric site in Israel excavated under the supervision of Julien Vieugué (CNRS) and Anna Eirikh-Rose (IAA) with the support of the French Research Center in Jerusalem (CRFJ) and the Museum of the Yarmukian Culture (MYC). A novel collaboration between field archaeology and art was initiated to heighten awareness of this profession within Israeli society. Watercolorist Shirley Siegal created a series of paintings during two excavation seasons, with the intention of depicting the entire process from the discovery of objects to their exhibition in museums, encompassing their study in both field and laboratory settings.

During the dig in which professional archaeologists and unexperienced volunteers (including some members of the kibbutz of Sha'ar Hagolan) participated, an 8000-year-old clay figurine was unearthed alongside the stone basement wall of a Yarmukian building. This figurine, that represents a seated woman with large hips, is often interpreted as a "Mother-Goddess". Working on-site, the artist created a series of drawings describing the moment of discovery of the figurine and the excitement it created for both foreign scientists and the local community. The artworks were exhibited at the Brigham Young University, Jerusalem Center for Near Eastern Studies in 2023.

This presentation will outline the distinctive bond formed among art, archaeology, and the local community. It will emphasize the importance of reinforcing the commitment of Kibbutz members to preserving the site and its surrounding environment.

4 MUNICIPAL COUNCILS FOR THE MANAGEMENT OF CULTURAL HERITAGE IN THE CANARY ISLANDS (SPAIN): THE GHOST OF PROTECTIONISM

Morales Casañas, Diria (Universidad de La Laguna) - Pérez González, Elena (Universidad Europea de Canarias)

Spain is one of the European countries with a large and diverse cultural heritage. There are 50 inscriptions on the UNESCO World Heritage List and around 17,000 sites are protected with the highest legal category of protection. This volume of cultural heritage, which must be managed with its specificities, is reflected in the complexity of the co-existence between the local population and the cultural heritage. Therefore, management institutions such as cultural heritage councils or commissions are important to understand how they are affected in both directions.

Cultural heritage boards or commissions are official units for the management of cultural property. These structures can be at different administrative levels. In our work, we will focus on the local heritage councils of the autonomous community of the Canary Islands (Spain), to which we have had access. We will describe the state of their creation and functioning. We will look at the regulations and the acts of their creation and official announcements, as well as the administrative dossier with milestones of intervention in cultural assets.

This work will allow us to better understand the municipal management of cultural heritage in the Canary Islands (Spain), a management which, in our study, is presented as non-integrated and not engaged with the local population. Nor do local councils have the tools to facilitate this engagement. Often, these councils are only nominative and have never been activated.

This analysis will lead us to propose lines of work based on more global, logical, and structural processes of action, with more participatory development, following the trends and demands of cultural heritage management today.

5 ARCHAEOLOGY AND CIVIC PARTICIPATION ON THE DUTCH ISLAND OF TERSCHELLING: HERITAGE PARTICIPATION IN THE CREATION OF ARCHAEOLOGICAL EXPECTATION MAPS

Honshorst, Maaïke (University of Amsterdam; Buro de Brug; CARE Schylge; Steunpunt Monumentenzorg Friesland)

This study examines the added value of implementing the principles of the Faro Convention in the development of municipal archaeological expectation maps in the Netherlands. To investigate this, firstly, an archaeological expectation map was created of the municipal of Terschelling. Additionally, I conducted participatory research using a digital questionnaire grounded on the concepts of 'deep-map' and 'deep-mapping.'

Subsequently, based on the survey results, experiential maps were crafted, highlighting three themes: cultural history, heritage, and the archaeology of Terschelling. These experiential maps reflect the preferences and interests of citizens focused on historical and archaeological sites, themes, and periods.

Furthermore, I compared the experiential map with the concept of the deep-map. Based on this comparison, it can be concluded that the Terschelling experiential map does not meet all the characteristics of the deep-map. However, the concept of the deep-map is well-suited for creating an experiential map because its features align with the principles of the Faro Convention.

In conclusion, based on this paper it can be said that the significance of gathering experiential values and creating an experiential map lies in revealing which archaeological sites and periods capture the imagination and which do not, shedding light on knowledge gaps in history and archaeology among the public. Individuals who perceive certain missing archaeological locations and periods on the experiential map as an issue can respond by drawing attention to these absent periods in society, making them more captivating.

Finally, it is important to note that this study employed just one of many possible methods to explore the added value of implementing Faro Convention principles in creating an archaeological expectation map specifically, by seeking input and advice from citizens through a questionnaire. This means that using other steps in the participation ladder and guide may lead to different conclusions on this subject.

6 HERITAGE PRESERVATION, BENEFIT AND ENGAGEMENT: COMMUNITY ARCHAEOLOGY IN URBAN SPACES

Grewal, Jagtej (Panjab University, India)

The preservation of heritage is approached through various methods within the umbrella of community or public archaeology. Within the urban landscape the preservation of both tangible and intangible heritage has benefited from interventions such as cultural resource management, cultural tourism and community collaboration among others. This paper aims to study such interventions with reference to Amritsar which is in Punjab, a state in North-west India. The city has a rich cultural history as it is the religious centre of the Sikhs (a religious minority in India). The cityscape is home to religious, cultural and historical spaces and narratives linked to people's faith, emotions and economic survival and growth. The paper examines three case studies – the first related to a heritage craft of beaten metalwork and the intervention that enabled the survival of a dying tradition; the second of cultural tourism through heritage walks in the old town that led to the preservation of heritage sites and economic benefits to the community; and third the intervention for preservation of the heritage aspects of an old historic bazaar and the resulting benefits to the trader community. The paper aims to examine the methods employed for these and to study the results accruing from these interventions – that involved the local government, the affected communities and private individuals.

7 MAPPING THE LEGACY OF HERITAGE FORESTS IN THE CULTURAL LANDSCAPE OF INHAMBANE PROVINCE, SOUTHERN MOZAMBIQUE

Gota, Pascoal (Department of Archaeology and Ancient History, Uppsala University)

Inhambane province is part of the southern Zanzibar-Inhambane coastal forest mosaic consisting in several locally protected forest patches, but there no much research done regarding to the history, location and the management systems of these areas. This gap is currently and constantly engraining narratives that criticise local practices of conservation and cultural management, and consequently leading to conservation schemes that overlook the role of custodians and local communities. Relying heavily in satellite images, oral history, historical maps, land use and land cover classifications, I show how forest patches are biocultural and heritages sites being safeguarded by local custodians using a variety of approaches linked to local landscape management. The results are important to understand local conservation practices, and to build methodological approaches concurring for a formal recognition of local residents as stewards of intangible and tangible heritage as well as the biodiversity existing in the forest patches. Moreover, the

findings highlight that there is a room for alternative ways of conservations that goes beyond mainstream conservation approach to biodiversity and cultural heritage, thus opening space for collaboration with local residents.

8 ARCHIVING FOR THE FUTURE: EVALUATING THE POTENTIAL OF PUBLIC ENGAGEMENT IN HERITAGE MANAGEMENT IN UTTARAKHAND, INDIA

Bisht, Monica (SGRR University, Dehradun; Panjab University, Chandigarh)

India is culturally rich country known for its heritage through its nationally important archaeological heritage sites and monuments. Monitoring of these heritage sites is essential as they face increasing risk due to urbanization, tourism, natural and manmade disasters. Few of the biggest challenges for the heritage sector of India is how to record, document, protect, preserve, interpret and showcase the wide range of protected and unprotected built heritage. In a country of such cultural diversity, geographical variance and centuries old remains, a much larger network of organization including public and private sector bodies along with professionals and institutions are required to address these challenges at national, regional and local levels. Many archaeologists encourage the public to be directly involved in archaeological projects. The aim is to provide the public with experience of archaeological skills and methods, as well as insights into the heritage of their local area. People could become an active participant and determine for themselves what archaeological resources mean to them and their community. In this paper we will study how local communities can play imperative role in heritage management with special reference to the state of Uttarakhand located in North India, which is diverse in geographic and economic conditions with different religious backgrounds. The Constitutional Head of the state has already called upon the youth and tribal community to actively participate, preserve and learn from our heritage. We will evaluate how the public interest and demand for contribution in the heritage management can benefit us. We will also discuss challenges, policies and guidelines for its long-term protection, conservation and promotion.

9 GARDENS OF THE ROYAL AND PUBLIC: A CASE STUDY OF HERITAGE MANAGEMENT AT AAM KHAS BAGH, SIRHIND, PUNJAB, INDIA

Sharma, Pratibha (Panjab University)

Aam Khas Bagh is a Mughal garden located in Sirhind, Fatehgarh Sahib, Punjab, India. The complex consists of remains of a highway inn that was constructed for the royals as well as for the public. Today, the complex is beautified with elaborate gardens and fountains and parts of it have undergone conservation and renovation. There is an orchard spread within the vicinity of the complex. Most of the remains of the original compound is in ruins. The complex constitutes various monuments that are protected and maintained by the Archaeological Survey of India. The condition of the complex is deplorable and it requires more effort to preserve its heritage. The site has undergone conservation but the efforts seem to be in vain as presently it is not being ministered to. Better maintenance of the monuments including conservation and cleaning is necessary. Coordination with the local communities including community archaeology initiatives is required for better preservation of our monuments and heritage.

10 ECHOES OF HISTORY: REVITALIZING HERITAGE CONSERVATION AT MAHASU DEVTA TEMPLE

Kala, Himani (Panjab university)

Mahasu devta temple situated on the bank of river Tons in Hanol, Uttarakhand was built in 9th century. This historic temple is dedicated to lord Shiva. Nestled amidst the picturesque Himalayan foothills, the temple holds significant cultural and spiritual importance for the local population. The temple was constructed in Huna architectural style and is currently protected by the Archeological Survey of India but for the effective heritage management of the Mahasu temple a holistic approach is required that balances conservation, cultural practices, community involvement, and sustainable development to safeguard its significance for future generations. Collaboration among various stakeholders, including government agencies, local communities, religious authorities, and heritage organizations, is essential for achieving these goals. Different methodologies can be applied for the preservation of the monument. Awareness regarding the monument needs to be spread among the local community for its preservation and conservation. Through various measures the Mahasu temple's rich heritage can be preserved for future generations to cherish and appreciate.

11 FROM RUINS TO REVIVAL: THE ROLE OF PUBLIC ARCHAEOLOGY IN HERITAGE MANAGEMENT

Thakur, Renu (Panjab University)

The present paper aims to study the role of public archaeology in managing heritage.

Heritage Management encompasses a broader spectrum of activities aimed at conserving and managing Heritage resources for present and future generations. This involves comprehensive strategies. Public Archaeology stands as a vital pillar to understand, preserve, and celebrate rich legacy. It transcends traditional archaeological practices by

actively involving communities in exploration, excavation, interpretation, and preservation of both tangible and intangible heritage. This inclusive approach not only democratizes access to archaeological knowledge but also fosters a sense of ownership and pride within the Indigenous communities. In India, public archaeological has gained momentum in recent years. Community driven projects have raised awareness among people to safeguard Heritage but there is need for sustained support by Government, NGOs, and Academic Institutions to suggest innovative strategies in preserving Heritage and sustainable development of heritage sites. A few case studies highlighting the role of community and challenges faced would be discussed by us. There is an immediate need in India to envision a more participatory approach to safeguard our heritage through innovative public engagement strategies.

982 TRACING & PROTECTING: FACING THE SHADOWS OF ILLICIT TRAFFICKING IN CULTURAL GOODS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Axelsen, Irmelin (Museum of Cultural History, University of Oslo) - Traviglia, Arianna (Italian Institute of Technology) - Runhovde, Siv Rebekka (Museum of Cultural History, University of Oslo) - Vico Belmonte, Ana (Universidad Rey Juan Carlos)

Session format: Regular session

Cultural heritage across Europe is under threat, seemingly increasingly so, with several wars and conflict areas close to (and within) the continent's borders. The circulation of cultural goods with little or no information about their provenience or provenance in the licit and illicit market are glaring testaments to this. Trafficking in cultural heritage objects is an extensive and profitable crime area internationally with high profits and low risk. Moreover, the many actors involved in the illicit and 'grey' trade of cultural heritage are closely entangled.

Despite the most recent positive trends in the recovery of stolen/looted artworks, challenges persist due to inadequate general preparedness to dramatically address and prevent the issue. As international agreements and resolutions emphasize, information exchange and collaboration between researchers, museums, government institutions, actors in the art- and antiquities market, international NGOs and IGOs, and technology developers are needed to counteract and minimize the phenomenon.

By highlighting the urgency and complexity of the problem, this session is conceived as a joint event fostering a cooperative environment and cross-disciplinary alliances among interested stakeholders to deter and tackle the illicit trade. We welcome contributions dealing with:

- current cross-national collaborative initiatives to fight illicit trafficking in cultural goods
- the development of technological tools to increase the antiquities market security and support the Law Enforcement Agencies' endeavours
- practical and theoretical challenges and solutions related to the prevention of cultural heritage crime.
- (un)successful examples of tracing different types of cultural goods, such as portable heritage objects after being uncovered from the ground.
- experiences from cross-sectoral collaboration on seizures and restitution of illicit cultural heritage artefacts.

The session is also seamlessly integrated into the collaborative framework of RITHMS HE Project (G.A. 101073932, coordinated by the Italian Institute of Technology) and DECOPE Project (JPI Cultural Heritage network, partnered by the Universidad Rey Juan Carlos).

ABSTRACTS

1 LEGALITY IN THE FORMATION OF ARCHAEOLOGICAL COLLECTIONS AND FUTURE TRENDS: A CASE STUDY OF THE MUSEO DE AMÉRICA DE MADRID

Labrador Ballestero, Patricia (Universidad Rey Juan Carlos; Grupo de Investigación HIEART) - Martínez Peláez, Agustín (Universidad Rey Juan Carlos; Grupo de Investigación HIEART) - de la Fuente Polo, Paula (Universidad Rey Juan Carlos)

This proposal presents a detailed analysis of the legality surrounding the formation of archaeological collections, with a specific focus on the Museo de América de Madrid. The study explores institutional policies, legal frameworks, and trends in the acquisition of artefacts, outlining the complex dynamics that have shaped the acquisition and management of archaeological pieces at this institution over time.

This contribution considers how national and international legislation has influenced the formation of collections, and how these have evolved in response to legislative changes and shifts in public perceptions of cultural heritage. It takes

a rigorous approach to examine how these legal and social dynamics have affected the acquisition and management of archaeological collections at the Museo de América.

It also assesses current trends in the management of these collections, as well as possible challenges that this institution may face in the future, such as the potential threat of the return of some of its pieces. In short, this research aims to analyse the complex intersections between legality, ethics and museum management in the field of archaeology, using the case of the Museo de América de Madrid as a central case study.

2 TRADITION AND CONSISTENCY IN POLISH APPROACH TO EXPORT OF MOVEABLE ARCHAEOLOGICAL HERITAGE

Wisniewski, Mariusz (MKiDN, Ministry of Culture and National Heritage, Poland) - Szubska, Magdalena (Ministry of Culture and National Heritage, Poland)

Since regaining independence in 1918, Poland has demonstrated a steadfast commitment to protecting its cultural heritage. This presentation aims to explore a particular trace of the policy which started with the Decree of the Regency Council on the care of monuments of art and culture.

We are referring to early recognition of archaeological finds and archaeological artefacts as an important part of common heritage and therefore an effective ban of legal trade and, what is more, perhaps characteristic severe restriction on any export.

At the same time, this act created many routes that Polish legal solutions followed for over a century. This includes legal protection on all archaeological excavations and finds, including those not previously registered due to their nature. Requirement for permits for transport, ban on export and wide prerogative to take control over private property in the name of protection of common heritage at a scale unheard of in the early XX century. For Past 105 years, Poland changed governments, political system, national borders and most of its laws yet amazingly not its approach to control and limit the export of archaeological material. Through the 20 years of independence between world wars and amazingly during communist regime, up until recently official politics and rules of protection of archaeological heritage almost did not change direction. We shall try also, lastly, to explain this direction and implications of it on some of our actions as the Ministry of Culture and National Heritage.

3 ANALYSIS OF THE LEGAL AND ADMINISTRATIVE SITUATION OF TRAFFICKING IN CULTURAL GOODS

de la Fuente Polo, Paula (Rey Juan Carlos University) - Vico Belmonte, Ana (Rey Juan Carlos University)

This study forms part of the research carried out within the European research project DECOPE (Destructive Exploitation and Care of Cultural Objects. Professional/Public Education for sustainable heritage management), which is developing a database on Cultural Heritage legislation in each of the European countries and those in which there is a large traffic of cultural property.

Analyzing these data provides us with interesting information on the level of heterogeneity in the administrative processes in the movement of cultural property and how this hinders their control, benefiting illicit trafficking. For this reason, the administrative processes, and the degree of accessibility of such documentation are examined.

The database covers the following seven areas in each country: the administrative body in charge of managing the trafficking of cultural property, cultural heritage protection figures, exports, imports, customs and goods in transit, conflicting heritage legislation and the international conventions to which the country is a party. Of these seven areas, greater emphasis is placed on export and import issues, as export modalities are analyzed, as well as the documentation and documentation of the country's cultural heritage.

4 TRAFFICKED CULTURAL HERITAGE ARTEFACTS: BETWEEN TRANSNATIONAL GOVERNANCE AND NATIONAL LEGAL FRAMEWORKS

Roland, Håkon (University of Oslo)

Transnational governance, regulations and compliance are essential in safeguarding cultural heritage in war and conflict. When law enforcement or cultural heritage managers come across looted and trafficked cultural artefacts, a consistent set of regulations and ethical and normative guidelines set by transnational governance are put into effect. In a process of restitution, the responsible actors are expected to comply to heritage acts and national regulations, and usually express a strong will and motivation to do so. However, cultural heritage is influenced by informal structures and motivations in such processes, and compliance cannot be understood unambiguously even in cases involving looted cultural heritage of the same origin and nature.

The complex network that influences the construction of value of cultural heritage, how artefacts are activated as economic, diplomatic, and political currencies and how governance and compliance are played out will be discussed

based on two recent case studies from Norway. The two cases involve police seizures of illicit cultural heritage artefacts of identical types and origin, subjected to the same national legal framework. Despite this, the cases ended up with opposite outcomes. One ended up as a successful restitution on bilateral ministerial level, the other with a complete neglect of the seized heritage artefacts. The paper will discuss the relationship between transnational policy and regulations and how the national actors and legal framework comply to this (or not) in cases of trafficked cultural heritage artefacts.

5 CHANNELING SMUGGLING OF CULTURAL GOODS THROUGH THE SCHENGEN AREA. POLICY GAPS IN THE EUROPEAN CONTEXT

Nothnagel Vivas, Katharina (Universidad Rey Juan Carlos)

This study investigates how illicit trafficking in cultural property might be benefiting from differences between EU members states' national regulations on cultural heritage in a borderless space. Europe having a highly developed and established art market, it is also one of the world's largest receiving markets for illicit archaeological artefacts coming from MENA region, other source countries as well as originally from within its borders. Therefore, Europe has a unique scenario where the interests of the single market and freedom of movement interact with those of society as tutelar of a rich cultural heritage and with those of international security. That is why coordination in European policymaking is currently one of the main challenges for an adequate cultural heritage protection against smuggling.

The research methodology consists of a comparative analysis of restrictions on the concession of export permits for cultural goods. The sample taken has been member countries' national policies; policies from non-EU countries within the Schengen Area; and EU community regulation. A specific focus on those countries within the Schengen Area but where EU regulation is not applicable has been made. Results on disparity among policies have been encountered suggesting that these may be functioning as policy gaps due to non-cooperative regulation, through which illicit transit in cultural goods can be channeled.

Further research questions emerge such as what this non-cooperation is due to. Research can be extended to the sought of a common standpoint for European cultural policies: an adequate and specific criminological analysis of the illicit trade in cultural goods. Implications of this study pursue a better anticipation in future to preserve European international security and fight organised criminality in cultural goods by a deeper understanding of cultural export policing in Europe.

6 FINANCIAL CRIME AND THE ART MARKET. A REVIEW OF THE LITERATURE

Runhovde, Siv Rebekka (Museum of Cultural History University of Oslo)

The art market, a lucrative global industry, may face significant risk of financial crime, owing to factors such as transactional anonymity and regulatory gaps. My research investigates these risks within the Norwegian art market, focusing on the roles of i.a. galleries, auction houses, art dealers and antiquarians. By examining both primary and secondary markets, it seeks to understand how current practices may inadvertently facilitate illicit activities and proposes strategies for prevention and regulation. Existing research highlights a lack of risk awareness and self-regulation among market participants, emphasizing the need for enhanced oversight.

As the inaugural phase of the research, this paper presents preliminary insights gathered from a comprehensive review of the existing literature. Illegal trade in cultural artifacts is often economically motivated, but neither research nor regulatory authorities have devoted particular focus to the art market in the context of economic crime. By illuminating potential drivers of financial crime in the art trade, it sets the stage for further exploration and the development of targeted interventions to safeguard the integrity of the market.

7 INVESTIGATING FINANCIAL CRIME IN ANTIQUITIES TRAFFICKING

Gkioni, Maria (ACFE GREECE)

Investigating financial crime is a difficult task in comparison with other kind of crimes, i.e. murder, arson, terrorism. That is because financial crime causes the illegally gain of different assets (such as property or money), usually without violence. Moreover, the dearth of physical violence and victims acquits the perpetrators for their actions. However, financial crime forge harm in business and/or culture. In recent decades many investigations by law enforcement agencies or journalists showed that antiquities trafficking can be related to financial crime, as they can easily provide coverage to criminals and concealment of illegal actions (mainly laundry of dirty money).

This presentation briefly examines the connection between antiquities trafficking and financial crime with emphasis on money laundering. Firstly, a brief description of what constitutes financial crime will clarify its broad definition. Secondly, a glance at different types of financial crime will provide a better understanding of the term and its connection with antiquities trafficking. Thirdly, the analysis of revealed cases will illustrate the way dirty money produced

by antiquities trafficking infiltrate the financial system. Finally, the role archaeological community could play in the investigation and/or prevention and detection of these crimes will be discussed.

8 TUT ON TOUR: 30 YEARS OF DEMAND CREATION THROUGH EXHIBITION

Austin, Summer (University College London)

Tut on Tour is a multidisciplinary investigation into factors that create, enhance, and normalise demand for collecting antiquities. Using the original blockbuster, Treasures of Tutankhamun as the case study, this research investigates the correlating antiquities markets' reaction to 'Tut' blockbuster exhibition by gathering, quantifying, and contextualising 30-years of exhibition and antiquities market data. The objective of this study is to introduce reliable data to the crucial debate concerning the relationship between museum blockbuster exhibitions, end-market demand, and the illicit antiquities trade. The market for illicit antiquities is a demand-driven economic system predicated on collectors and museums acquiring antiquities; thus, we must understand what influences demand for antiquities. Utilising primary-sources and archaeological, economic, museological, and criminological theory, this research addresses the assumption that blockbuster exhibitions influence demand in the antiquities market. Anecdotal evidence and single-auction evidence in journals make up the totality of evidence for this assumption; thus, this research addresses a pivotal gap concerning causality between museums, the market, and the illicit trade. This blind-spot in our understanding of the impact of blockbusters results in museums, nation, researchers, and international legislators making decisions based on assumptions rather than realities.

Using a dual-methodological investigation, this research presents compelling evidence to support the hypothesis that blockbusters generate demand for their subject matter. The results support the hypothesis that the 1970s Tutankhamun exhibitions generated substantial market demand for Egyptian artefacts. The data demonstrates an instantaneous, intense, and sustained demand for ancient Egyptian objects created in direct response to the exhibit. This increase in demand can be linked to an increase in illicit activities.

This study provides a foundation to understand what motivates and inspires demand and collecting with the objective of protecting today's heritage. If we can understand and anticipate demand, more can be done to proactively reduce harm to the finite resource.

9 RITHMS INNOVATIVE PLATFORM: A EUROPEAN PROJECT TO SUPPORT LAW ENFORCEMENT AGENCIES' FIGHT AGAINST CULTURAL HERITAGE CRIME THROUGH TECHNOLOGY

De Bernardin, Michela (Istituto Italiano di Tecnologia) - Riccardo, Giovanelli (Istituto Italiano di Tecnologia) - Leeson, Madison (Istituto Italiano di Tecnologia) - Traviglia, Arianna (Istituto Italiano di Tecnologia)

Fuelled by factors like the high demand in the art market, ease of border crossing, and political instability, the illicit trafficking of cultural goods raises increasing global concerns. Heightened public awareness of thefts, looting activities, and dubious licenses of artefacts' import-export, particularly from conflict-affected countries, has spurred international initiatives to combat the phenomenon.

In this framework, the EU-funded RITHMS (Research, Intelligence, Technology for Heritage, and Market Security) project, currently in its second year of action, steps into the foreground by developing cutting-edge technology tailored to the operational needs of the Law Enforcement Agencies (LEAs) in disrupting this transnational crime.

Central to the RITHMS concept is an interoperable social network-oriented digital platform informed by inputs from diverse disciplines. This innovative platform will identify the interconnections among the actors involved in the (il)licit trade of cultural goods, integrating data from an unprecedented range of sources. Leveraging Social Network Analysis (SNA) methods, which illustrate human behaviour through relational data, the system will provide investigators with insightful intelligence on the activities and evolution of criminal networks.

At this stage, the correlation of open-source data from websites, social media, and databases of missing and stolen cultural goods is building the world's largest knowledge graph of items and individuals connected to the circulation of art and antiquities available to the LEAs.

Comprising four police authorities, two border agencies, a police university, SMEs, and researchers from social sciences and ICT, the RITHMS Consortium strives to offer a comprehensive strategy to combat the illicit trafficking of cultural heritage. Notably, the direct involvement of LEAs in all project phases allows for concrete and fruitful cooperation with the technological partners, which is crucial for effective, tangible results.

10 THE CULTURAL HERITAGE AT RISK DATABASE: PROACTIVE AND REACTIVE MEASURES TO TRACE STOLEN AND LOOTED CULTURAL PROPERTY

Korner, Will (The Cultural Heritage At Risk Database (CHARD))

The Cultural Heritage At Risk Database (CHARD) is a foundation registered in the Netherlands to protect the world's cultural heritage, especially moveable objects that may be at risk. Since 2015, CHARD has registered 'at risk'

objects from museums, warehouses, archaeological and religious sites, archives and depositories in conflict and crisis zones. Registered objects are kept confidential and secure on the leading due diligence database in the art market, the Art Loss Register, so that these objects can be traced if they appear on the market or in police or customs checks.

The proposed EAA presentation discusses how CHARD fits into existing systems to combat the illicit trafficking and sale of stolen cultural goods, drawing together information and resources that are already available, and maximizing the work of all stakeholders. CHARD has already proven an immediate and effective solution, transferring the hard work of archaeologists and museum professionals who painstakingly record cultural objects in the first place, as well as those who risk their lives every day to protect them, into practical tools to assist in the fight against trafficking. The setup and relationships that CHARD has built mean that this work can be undertaken at a fraction of the cost of similar database projects, whilst providing an invaluable data-set for other stakeholders to use in future.

This successful collaboration will be demonstrated in the presentation with case studies, where hundreds of stolen and looted objects have been traced by those involved with CHARD, as well as initiating major law enforcement investigations. These practical examples will show how the cooperation of all stakeholders - law enforcement, governments, museums, archaeologists, the trade and many others - can significantly expand the number of stolen and looted objects being protected and returned, increase possibilities for investigations, and address the illicit trafficking of cultural goods.

11 DOCUMENTING CONFLICT ANTIQUITIES TRAFFICKERS IN RUSSIA'S WAR ON UKRAINE

Hardy, Samuel (NIKU - Norwegian Institute for Cultural Heritage Research) - Telizhenko, Serhii (Institute of Archaeology, National Academy of Sciences of Ukraine (IANANU))

Particularly since the rise of the Islamic State through the civil war in Syria, there has been intense confusion, misinformation and disinformation about pillaging and other forms of profit-motivated looting and theft during conflict and crisis. Based on an international collaboration, using the case of Russia's war on Ukraine and other examples from the European Neighbourhood, this paper will review how fighters and facilitators finance and incentivise participation in armed conflict, terrorism and other processes of political violence; how ordinary criminals exploit extraordinary situations such as military occupation; and how intersecting conflict economies interact.

In doing so, this paper will highlight academic and legal obstacles to the storing and sharing of sensitive and other personal data on cultural heritage crime, even when self-identifying and self-incriminating data is open-source data that has been published openly by the perpetrators in order to facilitate their perpetration of crime and gain from the proceeds of crime. These are significant obstacles to combatting illicit trafficking of cultural goods, particularly when prevention is dependent upon collaboration with experts across organisations, sectors and borders.

984 ARCHAEOLOGY AND ANTHROPOLOGY, TWO APPROACHES ONE GOAL: INSIGHT INTO LIFE AND DEATH FROM THE 3RD TO 7TH CENTURY CE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Mongillo, Jessica (Department of Environmental and Prevention Sciences, University of Ferrara) - Bolder-Boos, Marion (Institut für Altertumswissenschaften (IAW), Arbeitsbereich Klassische Archäologie, Johannes Gutenberg-Universität Mainz) - Dubbini, Rachele (Department of Humanities, University of Ferrara) - Bramanti, Barbara (Department of Environmental and Prevention Sciences, University of Ferrara) - Roascio, Stefano (Ministero della Cultura, Parco Archeologico dell'Appia Antica)

Session format: Regular session

In the 3rd century CE began a period of economic, political, social, and religious changes that paved the way for all those events that led to the crisis and fall of the Western Roman Empire in the 5th century. The whole of Western Europe underwent a great socio-cultural transformation and reorganization caused by the invasion of barbarian or non-Romanised western and eastern peoples (Goths, Franks, Lombards, etc.), and due to economic crisis, climatic changes, conflicts and the spread of infectious diseases and epidemics. Trade networks for supplies shifted towards the East causing new patterns of mobility and movement of people resulting in high inter-individual heterogeneity. These changes affected the areas of the Empire in different ways, especially the limes areas characterised by military occupation.

Anthropology can trace the effects of changes in the life of individuals through the analysis of skeletal remains. Similarly, archaeology attempts to answer the question of whether the funerary practices of this period reflect changes in beliefs and society. For instance, ways of displaying and commemorating the dead shifted after the spread of Christianity, and funerary structures reflect a shared ideology and symbols between Christians and pagans.

The purpose of this session is to combine two disciplines, funerary archaeology, and physical anthropology to explore the social and cultural changes from the 3rd to 7th century CE.

Contributions should include a multidisciplinary perspective, bringing together the analysis of human remains with burial patterns to address the same question. Papers may cover not only the mobility, genetics, demography, diet, and health of individuals of the period, but also the funerary contexts, grave goods, and material culture from various geographical areas, different social contexts, rural or urban areas, throughout the Roman Empire. This session aims to bring together bio-anthropological and archaeological studies to share and update the latest findings.

ABSTRACTS

1 THE ARCHAEOLOGICAL SITE OF VIA APPIA ANTICA 39: A BURIAL PLOT FROM THE IMPERIAL PERIOD TO THE 7TH CENTURY CE

Dubbini, Rachele (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) - Barbara, Bramanti (Dipartimento di Scienze dell'Ambiente e della Prevenzione, Università degli Studi di Ferrara) - Mongillo, Jessica (Dipartimento di Scienze dell'Ambiente e della Prevenzione, Università degli Studi di Ferrara) - Roascio, Stefano (Parco Archeologico dell'Appia Antica) - Bolder Boos, Marion (Institut für Altertumswissenschaften, Johannes Gutenberg-Universität Mainz)

Archaeological funerary contexts provide valuable information on the culture, beliefs, and lifestyle of ancient times. Alongside architectural structures, spatial organisation, frescoes, marble, mosaics, inscriptions, ceramics and terracotta, the depositions of individuals and skeletal remains represent the irreplaceable sign of their existence. The funerary site of Via Appia Antica 39 in Rome was discovered in 2022. It is located in the first stretch of the Via Appia at the gates of Rome, in a critical and borderline space between the urban periphery and the countryside. Here a burial plot from the Antonine era has been discovered, whose funerary use is attested for at least four centuries. The imperial columbaria included incineration burials and, at a lower level, inhumations inside large arcosolia. They were decorated by frescos and black and white mosaic floors. At the end of the 3rd and 4th centuries CE, a renovation took place, the ancient burials were respected, and new arcosolia were opened. The area was abandoned around the 6th to 7th century CE, due to upwelling of the water coming from the nearby Almo river: the dense fills of earth mixed with pottery, bricks and rubble offer a new picture of significant cultural and environmental changes. Furthermore, the variety of primary and secondary burials - in sarcophagi, bare earth and amphorae- and the definition of a space probably destined for children and some deviant burials, provide insight into the Late Antiquity transition in Rome.

2 CHANGES AND PERSISTENCE IN POPULATIONS, SOCIAL USES AND THE CONFIGURATION OF URBAN FUNERARY AREAS IN SOUTH-EASTERN GAUL (3RD-6TH C. CE)

Granier, Gaëlle (UMR 7268 ADES, CNRS - EFS- Aix-Marseille University, Marseille, France)

The configuration of many urban centres changed from the 3rd century onwards; and so the funerary sphere, but to what extent, and according to what social or religious criteria? Using examples from south-eastern Gaul, we will see that two major changes took place in funerary practices: in the 3rd century and in the 5th century. In this context, the funerary areas of the 3rd-4th centuries are highly specific and reflect social, symbolic and technical practices that retain a strong heritage of earlier practices while also incorporating new ones. In many cases, these groups broke with the topography of the Early Empire and were newly created in spaces that had previously been used for different purposes, raising the question of the legal evolution of the status of the plots. These new groups, which remained independent of one another, were formed according to a multitude of criteria: family, collegia, other social groups... and perhaps religious, although it was not considered necessary to indicate this on the grave, through its location or the practices adopted. However, these changes in practices were not accompanied by a change in the composition of the populations and their living conditions. The notion that these populations and the Late antique urban contexts in general were in decline therefore needs to be reconsidered, as does that of the devastating impact of the movements that took place from the 3rd century onwards within the Empire and on its borders. These recent archaeoanthropological studies highlight a rather integrative transformation, which includes a way of thinking about the city and the spaces that are accessible or dedicated to the dead that adapts, both pragmatically and in such a way as to ensure respect for the symbolic rules and fundamental social uses as well as those that emerge.

3 FAMILY AND SOCIETY IN THE ROMAN PROVINCE OF SARDINIA: A FUNERARY CONTEXT ANALYSIS

Serra, Rita (University of Sassari) - La Fragola, Alessandra (Independent researcher) - Gasperetti, Gabriella (Superintendenza of Archaeology, Fine Arts and Landscape for the provinces of Sassari and Nuoro) - Yavuz, Orhan (University of Tübingen) - Posth, Cosimo (University of Tübingen) - Bandiera, Pasquale (University of Sassari)

Necropolis are the mirror of living society and its concept. Analysing the dead city can be useful to better understand the living city. To carry out this concept we did an archaeological and anthropological analysis of a Roman settlement

of Carbia in NW Sardinia. This settlement was cited by sources (Itinerarium Antonini Augusti AD) and has not been discovered yet, but the same place has been discovered as a Roman imperial necropolis (1st-3rd century AD) with cremation and inhumation burials. An archaeological, anthropological and topographical analysis of burial arrangements was carried out and compared to social structure as indicated by sources. The first analysis underlined the absence of a division of the area by ritual, but also a partition by biological profile or type of burial is absent. A topographical disposition, with closed-up burials, with different ages of death and sexes, compatible with family groups, suggested a partition for families or gens, as a traditional division of Roman society. The genetic analysis ran on 10% of the burials scattered in the necropolis, but also with the comparison between burials side by side, showed that there are not relationships between all the individuals analysed for two degrees of kinship. At the same time, population genetics showed different origins between burials close to each other and a more similar origin between topographically distant burials. Considering this, we can say that the disposition of burials in Monte Carru necropolis does not indicate the classical division in Roman society in imperial times, but we can not deny that Sardinian inhabitants were not just a Roman people, but a provincial people with local origin and tradition.

4 THE BURIED AT THE AMPHITHEATER OF ALBENGA. NEW INTERPRETATIONS FOR A SOCIAL RECONSTRUCTION OF A LOCAL CAPITAL IN LATE ANTIQUITY

Roascio, Stefano (Parco Archeologico Appia Antica) - Delli', Elena (Soprintendenza ABAP Bari) - Spadea, Giuseppina (già Soprintendenza Archeologica Liguria) - Bona, Alessandro (Università Cattolica Sacro Cuore di Milano)

The amphitheater of Albingaunum (II AD) was the subject of various archaeological excavations started in the 1930s and ended in the 1980s, recently object of new reflections.

There are still many open questions, the case that presents itself is significant not only to investigate the general dynamics of demonumentalization and refunctionalization of entertainment buildings, but also the new funeral destinations that, in the case of Albenga, allow to open interesting hypotheses about the communities.

The amphitheater in question, located outside the city walls, was abandoned and converted into a necropolis space between the middle of the fifth and the middle of the sixth AD, when the ingauna town - under the emperor Constantius - was reorganized as the local capital of the Maritima Italicorum, with a contraction compared to the early imperial spaces.

Twenty-seven burials were made exploiting the ellipses of the amphitheater and were presented, with rare objects of equipment, in some structure cases, in others in bare ground or probable enchytrismos.

The anthropological analysis, which was possible to conduct on 12 burials, shows a population of 30 individuals, of which 22 adults and 8 subadults, with good living conditions except for rare pathological cases.

Interestingly some male subjects with allochthonous markers, specifically dolichocrania, high stature compared to the native populations and marked muscular insertions and enthesopathies.

The interdisciplinary rereading of the context seems to make plausible the possibility that such individuals can be traced to Gothic soldiers together with their families, certainly present in the area, whose burials suffer from poor archaeological visibility.

Given the strong ethnic and social mobility of late antiquity, it cannot be excluded that these are Central European auxiliaries inserted in the Byzantine ranks, which try to preserve their own cultural identity.

5 AN INSIGHT ON HEALTH STATUS DURING THE EARLY MIDDLE AGES IN CENTRAL AND NORTHERN ITALY (V-VII CENTURIES CE)

Manzo, Giulia (Department of Environmental and Prevention Sciences, University of Ferrara) - Regueiro Salcedo, Ian (Department of Human Studies, University of Ferrara) - Zedda, Nicoletta (Department of Environmental and Prevention Sciences, University of Ferrara)

The complex period between the formal end of the Western Roman Empire in 476 CE and the Lombard domination of Italy (560s CE onwards) is particularly characterised by climate, social and political changes and cyclic episodes of the so-called Justinian plague. In terms of health status and life conditions during this time ancient sources relating to the Italian peninsula are problematic and come mainly from non-medical legal, hagiographical, and archaeological records. However, these sources should be combined with a range of bioarchaeological data to provide broader insights into these issues. The aim of this study is to shed light on the complex transition period between Late Antiquity and the Early Middle Ages, analysing bioanthropological records that give relevant findings on the health and living conditions of Central and Northern Italian populations. We have collected all published palaeopathological evidence on human remains from the V-VII centuries in Northern and Central Italy, including infections, epidemics, mechanical and physiological stress, teeth pathologies and different kinds of traumas. Anthropological data were compared with historiographical and archaeological records to explore how climatic, political, social and health condition changes affected daily life and the organisation of the communities considered.

6 CHILDREN AND ADOLESCENTS AT THE END OF THE EMPIRE: FUNERARY PRACTICES AND BIOANTHROPOLOGICAL ASPECTS BETWEEN THE 4TH-6TH CENTURIES CE

Anedda, Roberta (Department of Environmental and Prevention Sciences, University of Ferrara) - **Masotti, Sabrina** (Department of Neuroscience and Rehabilitation, University of Ferrara) - **Gualdi-Russo, Emanuela** (Department of Neuroscience and Rehabilitation, University of Ferrara) - **Rinaldo, Natascia** (Department of Neuroscience and Rehabilitation, University of Ferrara) - **Bramanti, Barbara** (Department of Environmental and Prevention Sciences, University of Ferrara)

For bioanthropologists, tracing down childhood and adolescence during Late Antiquity and the Early Middle Ages is a difficult task because the concept itself is culturally defined, and even within a single culture, it is sensitive to social status and individual life circumstances. The profound socio-political changes and, in particular, the recurrent moments of crisis, that lead to end of the Roman Empire, between the 4th and 6th centuries CE, had an impact on the younger part of the population. As for burial practices, the written record is ambiguous and some texts state that infants who died in the first 40 days after birth were exempt from the rule of extra-urban burial, or that cremation could be practised only on those who had begun teething. The presence of children in the archaeological record, especially in funerary contexts, reveals a more complex picture, which varies according to geographical location and historical moment within the Roman world. In this study, we provide an overview of non-adults in late Roman funerary contexts, focusing on elements of persistence and new aspects that we can observe during Late Antiquity and the Early Middle Ages, with an example from the two rural Roman-Barbarian sites of Chiunsano (RO, 6th century CE) and Chiesazza (RO, 4th-6th century CE). Funerary archaeology can shed light on the perception of those who had not yet reached adulthood, and on how the advent of new religious beliefs influenced the burial ritual, while the bioanthropology of children can tell us more about how these changes affected the most vulnerable part of the population.

7 BIOARCHAEOLOGICAL INVESTIGATION OF THE NECROPOLIS OF SAN LORENZO DI QUINGENTOLE (MN): THE EARLY MEDIEVAL FACIES

Casagrande, Giulia (Sapienza Università di Roma)

This research focuses on the site of San Lorenzo di Quingentole, in the province of Mantua, a context of Roman origin that undergoes transformations during the medieval period. The aim of this study is to reconstruct the paleodemographic profile and the relevant pathological patterns of the population collected in the early medieval phase (VII-IX century) of the church building.

The 7th-century cemetery mainly consists of inhumations in earth graves and hooded burials arranged outside the double apse belonging to the religious building. The orientation of the burials is predominantly West-East and no grave goods were detected during excavations. The church of San Lorenzo will be used as a cemetery until the 11th century, when it will be decommissioned and demolished.

83 individuals were selected, belonging to the adult (<20 years) and adolescent (12-20 years) age classes, individually subjected to the reconstruction of the biological profile and the search for pathological lesions, especially focusing on trauma identification.

Based on comparisons with contemporaneous and geographically similar contexts, the population of San Lorenzo di Quingentole reveals a mostly balanced sex ratio (1.2), slightly favoring the male component, while the distribution of mortality exhibits a peak in the adult category, within the age range between 20 and 35 years.

The pathological study has allowed the identification of lesions from biomechanical stress and nonspecific infections, which may have involved and fatigued the adult population; whereas signs caused by metabolic and nutritional stress were identified in smaller percentages, suggesting generally balanced nutrition.

A more in-depth study of traumas seemed necessary starting from the bellicose component of the historical-political context, during post-classical centuries: despite the premises, the small percentage of traumas allows us to hypothesize the exclusion of the Mantuan community from the dynamics of conflict and violent encounters widespread in Northern Italy.

8 A BIOARCHAEOLOGICAL UNDERSTANDING OF THE LIVED EXPERIENCES OF CHILDREN DURING THE EARLY MEDIEVAL PERIOD IN SOUTHEAST ENGLAND

Bowers, Alexandra (University of Central Lancashire) - **Stewart, Allison** (University of Central Lancashire) - **Jones, Jennifer** (University of Central Lancashire)

There is a distinct lack of bioarchaeological studies of children from early Anglo-Saxon Britain, despite it being a dynamic period of cultural transition, migration and change. Something unique was happening in southeast England, reflecting a blend of burial practices incorporating both Romano-British and Northern European influences. Key

archaeological questions are not focused on how cultural change happened during the transition period, but rather how this change might have affected the living, breathing people who were experiencing it.

Through studying the child remains it is possible to explore the extent to which this mixing of Romano-British and Northern European peoples in the early Anglo-Saxon period affected population health and social interaction. This research uses 65 non-adults (aged 0-18 years) from the 5-6th century Oakington Anglo-Saxon burial site to investigate childhood burial practices and health during this significant transformation. This paper pairs bioarchaeological analysis of skeletal remains with anthropological investigation of funerary treatment to assess the social role and lived experiences of children. A lifecycle approach is employed to investigate the relationship between biological age, sex and health status at death with burial treatment. Through a multi-methodological approach, we can construct lived experiences and identities rather than just understanding circumstances of death.

Initial findings show that the subadults expressed enamel hypoplasia (80%), cribra orbitalia (30%), and periostitis (c.88%). This provides evidence for childhood stress in the form of metabolic nutritional deficiencies and/or infectious diseases at time of death. These may be reflective of environmental stresses the children experienced during growth, providing an argument for migration and cultural transition being a stressful period in their lives. Furthermore, 22% of varying age ranges and sex were found with grave goods including knives, animal bone, pottery, coins, and jewellery. These variations in grave goods show there were identity distinctions within the population.

9 LIVING IN THE SHADOW OF THE GOTHs: AN ANTHROPOLOGICAL STUDY OF TWO NORTHERN ITALIAN COMMUNITIES DURING THE 4TH-6TH CENTURY CE

Mongillo, Jessica (Department of Environmental and Prevention Sciences, University of Ferrara) - **Zedda, Nicoletta** (Department of Environmental and Prevention Sciences, University of Ferrara) - **Masotti, Sabrina** (Department of Neuroscience and Rehabilitation, University of Ferrara) - **Onisto, Nicoletta** (Department of Life Sciences and Biotechnology, University of Ferrara) - **Gualdi-Russo, Emanuela** (Department of Neuroscience and Rehabilitation, University of Ferrara)

In late antiquity, the Veneto region, located in north-eastern Italy, underwent significant historical and political changes. Several territories, including those gravitating around the ancient delta of the river Po, experienced cultural and demographic changes due to the favorable topographical position for the movement of people and goods. The sites of Chiesazza di Ficarolo and Chiunsano (Rovigo, Italy) are located between the two main branches of the Po with direct access to both the hydrographic network and the land route. Excavation activities carried out in these two settlements discovered inhumation burials that represent the first evidence of the arrival of the Goths in the Polesine territories. This paper presents the results of anthropological analysis conducted on 56 skeletal individuals from the two sites of Chiunsano and Chiesazza di Ficarolo. The burials, dated between the 4th and 6th centuries, are very modest, lacking grave goods and the individuals are oriented east-west with a typically Christian ritual. However, there are interesting exceptions such as the two unique burials with rich, Ostrogothic grave goods at Chiunsano and a group of deviant burials found at Chiesazza di Ficarolo. The bioarchaeological study of the sites revealed important insights into the demographic and population dynamics during this historical period marked by the settlement of barbarian communities in these territories.

987 THE INTRODUCTION OF TIN BRONZE IN PREHISTORIC EUROPE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: **Lackinger, Aaron** (Universidad de Granada) - **Figueiredo, Elin** (Universidade Nova de Lisboa) - **Comendador Rey, Beatriz** (Universidade de Vigo)

Session format: Regular session

The introduction of tin bronze into prehistoric societies has not been synchronous throughout Europe. Understanding this phenomenon in all its breadth, chronologically, technologically and culturally, is the aim of this session. In general, neo-diffusionist visions coexist with alternative theories that propose multifocal origins. The relative scarcity of tin mineral resources and its restricted locations necessarily condition the introduction and consolidation of tin bronze, which may occur at varying rates regarding different regions. Also, the mere presence of tin bronze artefacts in one region does not necessarily imply the adoption of the entire production technology (from ores to metal), since their presence can be a result of imported metal. Combining data on absolute chronology, technological characteristics, metal composition and geochemical characterization (isotopic and trace analysis) at the regional level is necessary to draw a comprehensive overview of the introduction of bronze technology across Europe. The production of a collective map presents an opportunity to glimpse the degree of interrelation between different societies and territories and to discuss the most plausible models for the origin and/or spread of this alloy and/or technology. Likewise, the significance of the incorporation of tin bronze for prehistoric societies should be discussed, based on its usage. To comprehend its significance, it is essential to determine its relative frequency concerning other metals or alloys, the

quality of its alloy, and its preferred application regarding the typology of the first bronze artefacts. Lastly, it is worth to discuss the reasons and timing of the alloy's consolidation at the expense of copper or arsenical copper alloy.

ABSTRACTS

1 THE ROLE OF TIN IN THE FORMATION OF MATHEMATICAL THINKING IN PREHISTORY

Dzbynski, Aleksander (Warsaw University)

Tin bronzes are stable alloys, in contrast to arsenical copper. Arsenic evaporates as metal or as arsenious oxide during melting, heating or forging, leading to unpredictable and therefore undesirable modification of the alloy. The direct addition of tin to molten copper made it possible to control the alloy, which could never be achieved when working with co-smelted alloys based upon arsenic or other natural copper additives. Moreover, the addition of tin, made the resulting metal—tin bronze—not only easier to process (lower temperature for heat treatments required) but it also had the potential to make it even harder. So, suddenly it was possible to bring to bear precision in the creation of an alloy and by doing this it was possible to implement mathematical precision into matter, which must have been one of the greatest discoveries in the human history, although still needed to be cognitively and culturally explored. It seems that this transformation would have not been possible without the use of weighing metrology which appeared, however, at later stages of metallurgy. The paper explores some aspects of this transformation by resorting to archaeological examples from the Near East and Europe between the 4th Millennium and 2th Millenium BC, and to theoretical considerations.

2 TIN AND WHITE BRONZE FROM THE CARPATHIAN AREA IN THE LATE BRONZE AGE

Wittenberger, Mihai (National History Museum of Transylvania, Clu-Napoca, Romania)

In this work, I will present metallurgy in the Bronze Age, mainly in Transylvania with an emphasis on the use of tin.

In comparison with other activities in Prehistory, metallurgy is a unitary chain of activities that begins in the mines, then primary and secondary creation and after manufacturing. In Transylvania we find the succession of all these activities, which proves a superior organization in this region.

The first pieces in bronze with tin appear at the end of the Early bronze age approximately 2300 BC. If in the middle bronze age most of the pieces are prestigious but in the late bronze age things change. Bronze is becoming very popular so the mines are developing.

The last bronze mine in Transylvania located in Rodna Veche (in the northeast of the region) was closed in 2010! This mine is known from the 14th century when here they produced pints of beer in a white bronze alloy similar to bronze in the late bronze age. The specialists of protohistory knew the existence of this treasure. The Transylvania region is known for bronze deposits and its means of communication

Of course, this source is not the only one to ensure the huge amount of bronze pieces discovered in Transylvania. The Uioara depot with more than a ton of bronze and tin has definitely some pieces imported from the West. For a ton of bronze you need minimum of 120 kilos of tin.

My presentation will list and describe the sources of bronze, especially “white bonze” (82% copper, 12% tin-typical metals in Transylvania. To complete my work I will also describe the means of communication.

Transylvania, tin, white bronze, metallurgy, trade, mining.

3 TIN ALLUVIAL ARMORICAN EXPLOITATION SINCE THE BEGINNING OF BRONZE AGE

Le Carlier de Veslud, Cécile (CNRS)

The ancient Armorican Massif is a geological entity partly made up of peraluminous granites rich in cassiterite, deposited at the end of the Hercynian period and associated with large vein systems that are also rich in tin ore. Weathering of these rocks has led to the development of a large number of fluvial and even coastal alluvial deposits. Most of them are easily accessible for open-cast mining operations.
