Based on specific case studies, this presentation will provide an overview of the ModLand project's methodology and key outcomes, with a particular focus on the modelling processes of locations potentially associated with agropastoral practices. Moreover, it will explore how these models enable us to reconstruct changing interactions between prehistoric communities and their surroundings.

2 NEW DATA ON BRONZE AGE CEREAL CULTIVATION FROM CENTRAL AND MARGINAL AREAS OF THE TERRAMARE TERRITORY

Carra, Marialetizia (Bologna University; ArcheoLaBio, Centro di Ricerche di Bioarcheologia) - Miari, Monica (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara) - Tirabassi, James (Museo del Po di Revere (MN); Postumiae Antiquarium di Piubega (MN)) - Lamanna, Leonardo (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Cremona, Mantova e Lodi) - Cattani, Maurizio (Dipartimento di Storia, Culture, Civiltà, Alma Mater Studiorum, Università di Bologna) - Cavazzuti, Claudio (Dipartimento di Storia, Culture, Civiltà, Alma Mater Studiorum, Università di Bologna) - Mazzieri, Paola (Soprintendenza Archeologia, Belle Arti e Paesaggio per le Province di Parma e Piacenza) - Boccuccia, Paolo (Museo delle Civiltà, Roma) - Scacchetti, Federico (AR/S Archeosistemi Società Cooperativa, Reggio Emilia) - Bonometti, Paolo (AR/S Archeosistemi Società Cooperativa, Reggio Emilia)

Cereals are one of the main food resources of the Terramare settlements of the Bronze Age. Previous archaeobotanical studies have highlighted many remains of cereals, in all the settlements examined (Santa Rosa di Poviglio, RE; Montale MO; Monte Castellaccio, BO; Pilastrini di Bondeno, FE; etc.)

This project intends to provide new data on cereal cultivation in the Terramare area through the study of new contexts, recently excavated or in progress. Standardized sampling and uniform sample processing techniques are the starting point of the analysis. Obtaining more easily comparable data is the aim of the work.

The different geographical location of the sites is a further point of interest: a central area of the Terramare space (Terramara di Pragatto, Crespellano - BO); a site closer to the area of pile-dwelling influence (Terramara della Bellanda, Gazoldo degli Ippoliti - MN); a border area with the North Western world (Rovere di Caorso - PC) and a more eastern area but with Terramare characteristics (Solarolo, Via Ordiera - RA).

The persistence of traditional Neolithic wheats (*Triticum monococcum*, *Triticum turgidum* ssp. *dicoccon*, *Triticum timopheevi* type) and their relationship with the typical innovations of the Bronze Age (significant increase of *Triticum spelta*, introduction of *Panicum miliaceum*) is one of the main focuses of the research. The statistical weight of barley

(*Hordeum vulgare*) and the possible use of other cereals (*Avena fatua/sativa*, *Secale cereale*, *Setaria* sp.) are the further elements for comparison between the sites.

Given the large quantity of samples (still being processed), the comparison between the sites is carried out by type of structure (pits, stratigraphic units near the ditches, piles of ash, etc.). A further element of discussion is given by the relationship between the different composition of the soils and the statistical weight of the various types of cereals.

3 CROP MANAGEMENT AND CORRELATES IN THE DEMOGRAPHIC BOOST OF NORTHERN ITALY IN THE BRONZE AGE

Cattani, Maurizio (University of Bologna) - Debandi, Florencia (University of Bologna)

The analysis of ancient productivity is helping to understand the process of settlement expansion and demographic increase that characterized several regions in Europe during the Bronze Age. The well-known case study of Northern Italy can be considered the best example of investigating the exploitation of resources and assess the relationships among settlements, agricultural production, water management and food transformation.

Following different approaches, the paper will propose the evaluation of crop productivity, the complete reconstruction of the operational chain of cereals management, from the sowing to food transformation, and the interaction between settlements and the correlates in the landscape and in the daily practices of Bronze age communities.

Starting with experimental cultivations, dealing with ancient climatic conditions, passing through the basic and fundamental characters of ancient cereals, a different vision of agricultural production in the Po plain emerges, confirming a unique moment in the history of mankind that made possible a cultural tradition of a strong link between the farmers' habits and the features of the landscape.

A discussion on irrigation, crop rotation, manuring, field management and crop processing, will conclude the presentation aiming at a complete reconstruction of ancient farming practices that allowed a general prosperity and food availability, presumably at the base of the population growth.

4 THE (GEO)ARCHAEOLOGICAL EXCAVATION OF THE MBA SITE OF LA MURAIOLA DI POVEGLIANO (ITALY): FROM DOMESTIC SPACE TO AGRO-PASTORAL SYSTEM

Nicosia, Cristiano (Università di Padova) - Breglia, Francesco (Università di Padova) - Dal Corso, Marta (Università di Padova) - Dalla Longa, Elisa (Istituto di Scienze del Patrimonio Culturale (ISPC) - Consiglio Nazionale delle Ricerche (CNR)) - D'Aquino, Silvia (Università di Padova) - Manfrin, Maria Sofia (Università di Milano) - Piazzalunga, Giorgio (Università di Padova) - Polisca, Federico (Università di Padova) - Putzolu, Cristiano (Alma Mater Studiorum - Università di Bologna) - Rabitti, Chiara (Alma Mater Studiorum - Università di Bologna)

The excavations at the site of La Muraiola di Povegliano Veronese (NE Italy) were part of the ERC project GEODAP (Geoarchaeology of Daily Practices). The site saw the diffusion on the Veneto plains of embanked settlements connected to active watercourses – the Terramare – that started in Middle Bronze Age 1. This diffusion was accompanied by the establishment of complex agricultural and husbandry systems that entailed a strong impact on the environment. At La Muraiola, geoarchaeology was employed in every step of the excavation, right from the field operations and not just as an 'ancillary' technique or as laboratory practice relegated to the post-excavation. Soil and sedimentary characteristics were at the base of the identification, documentation (using SFM photogrammetry and orthophotomodels for the vectorization of each unit), and interpretation of the site's stratigraphy. Emphasis shifted from the artifacts alone, as it is often the case, to the sediments encasing the artifacts. Sediments were in fact 'squeezed' to extract microscopic inclusions – charcoal, macroremains, phytoliths, coprolites – from them. They were analyzed under the microscope to reveal traces and structures invisible to the naked eye. These included stabling floors, charred dispersions of cereals, garden soils on former dwelling areas, and earth-based floors revealing geotechnical knowledge of local substrates. The geoarchaeological excavation approach, therefore, built a 'bridge' between the intra-site space and the surrounding anthropic landscape. Information about choice of crops and fuel, husbandry practices, and land management traveled along such bridge. Overall interpretation was corroborated by – and not based solely on – material culture. With this presentation we would like to discuss the potential of a geoarchaeological approach to the excavation of a bronze age settlement to provide information about agro-pastoral and landscape systems, especially in areas where local high-resolution pollen sequences are not available due to the geological context.

5 ANIMAL EXPLOITATION AT THE TERRAMARA SANTA ROSA DI POVIGLIO (ITALY) IN THE LIGHT OF 40 YEARS OF ZOOARCHAEOLOGICAL RESEARCH

Maini, Elena (Sapienza - University of Rome) - Cremaschi, Mauro (University of Milan)

The presentation aims to provide a comprehensive examination of the relationship between humans and animals at the Terramara Santa Rosa di Poviglio site, specifically focusing on how zooarchaeological research, alongside both

traditional and innovative methodologies used to investigate animal bones over forty years of research, has shed light on this topic.

Regarding the farming economy of the Bronze Age sites, it strongly emphasizes the importance of sheep and goats. These animals at the Terramara Santa Rosa di Poviglio not only represent the majority of those raised by the inhabitants but also serve as major providers of both final and lifetime products due to their triple vocation. The herds were composed of a significant number of sheep and a relatively limited number of goats, which probably permit to maximize the exploitation of all types of meadow-pasture or forage.

Recent osteometric evaluations confirm the small size of the main domestic animals bred in the village during the Middle and Recent Bronze Ages. Consequently, the little dimensions, particularly noticeable in pigs and cows at Poviglio, result in a reduction in meat production, which is compensated for only by numerous and large herds of sheep. Cattle were exploited as beasts of burden, while the production of dairy products and beef must have been limited, as well as the consumption of pork, testified by an unusually low number of pigs compared to coeval sites.

A well-consolidated and dynamic pastoralism was probably one of the reasons for the expansion of the Poviglio village during the 13th century BCE. Movements of people and beasts can now be highlighted through new approaches to evaluating the trade routes, not only linked with shared material culture with other Bronze Age sites located along the rivers distributed in the Po Plain and the nearby Apennines.

6 SOPHISTICATED LAND MANAGEMENT IN THE MIDDLE-RECENT BRONZE AGE: PALYNOLOGICAL EVIDENCE FROM THE TERRAMARA SANTA ROSA DI POVIGLIO (NORTHERN ITALY)

Mercuri, Anna Maria (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia) - Florenzano, Assunta (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia) - Zappa, Jessica (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia) - Clò, Eleonora (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia) - Zerboni, Andrea (Dipartimento di Scienze della Terra "A. Desio", Università degli Studi di Milano) - Cremaschi, Mauro (Dipartimento di Scienze della Terra "A. Desio", Università degli Studi di Milano)

The integrated palynological and geoarchaeological study provides increasingly detailed knowledge of the subsistence and productive economy of prehistoric cultures. The Terramara Santa Rosa di Poviglio Bronze Age site (Northern Italy) was characterised by a complex system of silvo-agricultural economy and a multifunctional land use as happened in most of prehistoric sites. The site consists of two dwelling areas - 'Villaggio Piccolo' (VP) and 'Villaggio Grande' (VG) - dating back to the Middle Bronze Age and to the Recent Bronze Age, respectively. During the exploration of the hydraulic facilities of the site, a stratigraphic sequence 4 m deep was identified in the moat dividing the VP and VG part of the settlements. The high-resolution VP/VG stratigraphic record provided a ten-year resolved pollen stratigraphy that preserves evidence of environmental changes happened in the Po Plain during the Late Holocene. Pedosedimentary features and biological records (aquatics pollen and algal remains) show that shallow water was permanent at the bottom of the moat at the beginning of the formation of the sequence, while the water level dropped significantly during the last phase of existence of the settlement. Along the trajectory of the settlement, pollen curves show significant trends and short oscillations representing coppicing and crop rotation practices. In the last phases of site occupation, an increased climatic aridity and intensive land use may have had a combined negative effect at the expense of plant cover. Cereal cultivation continued during the late Recent Bronze, but the main traits of the landscape became pasturelands. The study of the final part of the infilling of the moat indicates that the regeneration of the forest did not occur immediately after the abandonment of the village (dated at ca. 3200 years BP), but in the early Middle Ages, when the area turned into a swamp.

7 CULTIVATING COMPLEXITY: UNVEILING BRONZE AGE COMMUNITIES THROUGH RESOURCE STORAGE'S DYNAMICS. THE CASE STUDY OF PYLA-KOKKINOKREMOS (CYPRUS)

Porta, Francesca (Alma Mater Studiorum - University of Bologna) - Sotgia, Agostino (RUG - University of Groningen)

Agriculture played a fundamental role in the development of Bronze Age communities.

This is because using the surplus generated, it is possible to transcend the dimension linked to the mere subsistence of groups and to promote articulated economies and complex networks of exchange between communities.

Even more, the quantity of primary goods produced and the generation of surplus, have often been considered an essential starting point for the emergence of increasingly complex forms of organisation and social inequality.

Through the analysis of agro-pastoral production patterns and resource accumulation, it is therefore possible to describe in detail the organization of ancient societies. Despite this assumption, only a few studies have attempted to combine these two different classes of evidence organically and coherently.

Building upon these premises, the present work presents an analytical methodology capable of reconstructing the practices of production and storage of agricultural resources, as well as how these processes could inform us about socio-economic organization. To achieve this, a combination of landscape carrying capacity analysis surrounding the site and a volumetric study of storage evidence within it will be used. This will enable us to articulate the historical reasoning just mentioned on a quantitative basis, seeking to substantiate the general assumptions with precise figures. Pyla-Kokkinokremos (Cyprus), once the assessment of the territory is completed, will provide us with a perfect case study due to the presence of a rich deposit consisting of hundreds of well-preserved storage vessels. This integrated methodology will allow us to discuss the themes of production and resource management, tackling longstanding issues such as demographic trends and socio-economic organization – crucial aspects in the historical reconstruction within our discipline.

8 PALAEOENVIRONMENTAL EVIDENCE FOR CHANGING LAND-USE PRACTICES DURING THE BRONZE AND IRON AGE FROM NORTHERN GERMANY

Feeser, Ingo (Institute for Pre- and Protohistoric Archaeology, Kiel University) - Filipović, Dragana (Institute for Pre- and Protohistoric Archaeology, Kiel University) - Schaefer-Di Maida, Stefanie (Institute for Pre- and Protohistoric Archaeology, Kiel University) - Kneisel, Jutta (Institute for Pre- and Protohistoric Archaeology, Kiel University)

This paper is focussing on palaeoenvironmental investigations carried out in an interdisciplinary research project (“CRC1266 Scales of Transformations”, www.sfb1266.uni-kiel.de). One aim was to identify quantitative and qualitative land-use changes on different spatial and temporal scales. In order to differentiate site specific (local) from larger-scale (regional and over-regional) developments, the adopted approach involved a comparison of well dated records from archives with different spatial significance. On one hand, near-site palaeoenvironmental investigations were carried in wetlands in direct vicinity of archaeological sites investigated within the overall project. On the other hand, this involved off-site investigations on annually laminated lake sediments from larger lakes within the wider study region. Based on a first case study from the western young moraine area of Northern Germany, local and regional changes in land use activities could be inferred, including local phases of increased pastoral activities and a more general shift from woodland to grass/heathland pasture at around 1200 BCE, i.e. the transition from the Older to the Younger Bronze Age in Northern Germany. New results of a second ongoing case study in the eastern young moraine area of Northern Germany support the idea of this being the local/regional reflection of a more wide spread (over-regional) development in agropastoral activities and woodland exploitation. At the same time, archaeological and archaeobotanical evidence indicate changes in burial practices and settlement organisation as well as a diversification of the crop spectrum. This suggests that the inferred shift in landscape management and woodland exploitation was part of a more fundamental socio-environmental transformation during the Bronze Age in the area of Northern Germany.

9 BETWEEN THE LAKE AND THE MOUNTAINS: SOCIOECONOMY OF EARLY IRON AGE HILLTOP SITES IN THE OHRID LAKE AREA

Šmolková, Markéta (Institute of Classical Archaeology, Faculty of Arts, Charles University Prague, Czech Republic; Institute of Archaeology of the Czech Academy of Sciences, Prague, Czech Republic)

The question of socio-economic changes at the turn of the Late Bronze Age and Early Iron Age in the southwestern Balkans has not been satisfactorily addressed yet, either because of the character of the research conducted on this subject or the lack of relevant material. The current project of the Czech-Macedonian team in the Lake Ohrid region (North Macedonia) builds on previous research activities in this area, which have been mainly devoted to the investigation of the lakeshore areas and its characteristic type of settlements, the so-called Palaffite sites, whose structure and functioning were strongly disturbed by a massive earthquake that took place around 1200 BC.

The new phase of research focuses on the hilltop sites where settlement moved after this catastrophe and the economic and subsistence changes that were associated with this new settlement strategy. This paper aims to present the site of Dolno Lakocherej, which is the first of this type systematically studied in the region. Preliminary results of the three seasons of field research so far and results of some sub-analyses (anthracology, osteology) carried out so far will be presented.

The environmental focus of the research aims to reconstruct the landscape in the immediate vicinity of the settlement, describe the way of its exploitation and the related type of subsistence strategy (with the focus on presumed transhumance activities).

Understanding the forms of economic strategies is an important part of the characterization of early Iron Age society, which was transformed during the so-called Transition period (ca. 1000-700 BC) into a form from which significant social changes emerged in the Archaic period. These changes were manifested primarily through the new burial phenomenon of rich elite graves, the so-called Princely Graves, witnessed by the nearby famous site of Trebenishte.

10 BEYOND GRAZING: A MULTI-ISOTOPE APPROACH TO INVESTIGATE SHEEP FEEDING STRATEGIES IN THE IRON AGE IBERIAN PENINSULA (3RD C. BC)

Messana, Chiara (Department of Prehistory, Autonomous University of Barcelona (UAB), Bellaterra, Spain (ES); Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain (ES); Universitat Rovira i Virgili (URV), Departament d'Història i Història de l'Art, Tarragona, Spain (ES)) - Tornero, Carlos (Department of Prehistory, Autonomous University of Barcelona (UAB), Bellaterra, Spain (ES); Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain (ES)) - Colominas, Lúdia (Institut Català d'Arqueologia Clàssica (ICAC-CERCA), Tarragona, Spain (ES))

During the Iron Age, the principal sources of subsistence for Iberian communities in the north-east of the peninsula were cereal agriculture and livestock husbandry. The latter was mainly focused on caprine, with sheep being the most exploited species due to its excellent adaptation to the Mediterranean climate and environment. Despite the pivotal role of sheep in livestock husbandry, there is limited information on the feeding strategies adopted by Iberian communities for this species. Investigating livestock feeding habits is crucial to comprehend the economic and subsistence requirements of each community. Furthermore, animals' diet could be directly related to regional features and the environmental characteristics in which the settlement was located.

To address this lacuna, this study investigates the sheep feeding habits at four Catalan sites dating to the 3rd century BC: Mas Castellar de Pontós, Tossal de Baltarga, Sant Esteve d'Olius, and Turó de la Rovira. Bulk $\delta^{13}C$ and $\delta^{15}N$ analyses of bone collagen and sequential $\delta^{13}C$ and $\delta^{18}O$ analyses of dental enamel were performed on 74 remains (43 bones, 31 teeth) from 51 sheep. Additionally, other domestic and wild species (153 bones) from the four sites were analysed to establish the local isotopic baseline of $\delta^{13}C$ and $\delta^{15}N$ values.

The results reveal that Iron Age Iberian herders adopted complex and adaptive livestock feeding strategies. The sheep's diet, primarily consisting of C3 plants, displays minimal variation across the four sites. Nevertheless, their feeding habits changed seasonally depending on the pasture availability and the livestock requirements of each settlement.

This study provides the first data on livestock feeding strategies for the Iron Age in the north-eastern Iberian Peninsula. The Iberian communities possessed advanced zootechnical knowledge and employed a significant specialised workforce, suggesting that animal husbandry played a significant role in their economy.

11 INSIGHTS INTO SUBSISTENCE DYNAMICS: EXPLORING ANIMAL HUSBANDRY IN PRE-ROMAN GETAE COMMUNITIES.

Venetatou, Ismini (Freie Universität Berlin)

Exploring subsistence dynamics during the pre-Roman Iron Age in the Eastern Carpathians remains a significant yet underexplored realm of zooarchaeological inquiry. This study focuses on Horodca Mică and Horodca Mare, fortified settlements inhabited by the Getae people in present-day Moldova. Utilizing a multidimensional methodology, taxonomic identification, bone element analysis, and MNI calculations are incorporated. Furthermore, a comprehensive examination of mortality profiles, butchering techniques, and fragmentation patterns is conducted to investigate animal utilization and husbandry practices. Findings reveal a diverse subsistence strategy characterized by a mixed economy. Domesticated animals, notably cattle (48%), pigs (22%), and sheep/goats (15%), played pivotal roles in sustaining ancient communities. Moreover, the presence of wild animals underscores the adaptability of Getae societies, augmenting dietary needs with local wildlife resources. Age-at-death analysis further elucidated patterns of animal husbandry, with peak slaughter ages ranging from 8 to 18 months for cattle and up to 27 months for pigs. The discovery of neonatal pig bones underscores the importance of local breeding and emphasizes the adaptability of Getae subsistence strategies. Overall, this study contributes to our understanding of the intricate interplay between agriculture, animal husbandry, and hunting in pre-Roman Iron Age societies. By contextualizing faunal data within broader socio-economic frameworks, it offers valuable insights into the diverse and adaptable approaches to resource exploitation practiced by the Getae communities of Horodca Mică and Horodca Mare.

466 FACILITATING PUBLIC ENGAGEMENT AND PARTICIPATION IN DEVELOPMENT-LED ARCHAEOLOGY

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Oldham, Mark (NIKU - Norwegian Institute for Cultural Heritage Research) - Watson, Sadie (MOLA - Museum of London Archaeology) - Faccia, Kate (MOLA - Museum of London Archaeology) - Benetti, Francesca (Historic Environment Forum)

Session format: Regular session

This session aims to delve deeper into how we as archaeologists facilitate public engagement and participation within development-led archaeology. We take as our starting point the acknowledgement that archaeology is a social action

and inherently political, and that as a result there are power imbalances in our work. These power differentials are often most clear when aiming to work with the public. How do we try to overcome these discrepancies, and do we succeed in making lasting changes? Is it possible to achieve a more equal and equitable archaeology within current frameworks?

This session will be a Pecha Kucha with speakers allowed six slides and six minutes to present their paper. We would like speakers to present case studies or opinions within the following sub-themes:

- Project design and financing
- Safeguarding and Health and Safety
- Collaboration with constructors and the authorities
- Reaching new audiences

The aim of the session is to stimulate discussion, inspire with good examples, and share ideas and best practice.

ABSTRACTS

1 FACILITATING PHYSICAL AND DIGITAL ACCESS TO SITE

Oldham, Mark (NIKU - Norwegian Institute for Cultural Heritage Research)

In the session abstract, we mention specifically the idea of power imbalances as a factor in facilitating public engagement and participation within development-led archaeology. A significant element of this relates to access to our work, and in this paper I will discuss means of enabling both physical and digital access to archaeological investigations using case studies from our work in Oslo: site visits and dissemination using social media.

When it comes to physical access, health and safety is one of the main factors that we have to consider. It is important that we are safe at work, but it is also important that the public get to engage with what we are doing – and site is a key arena for this. Hence, in dialogue with developers, we need to discuss ways of minimizing risks and mitigating consequences to a level that enables the general public to visit, allowing them to engage with the site in a safe manner and give them a good experience. In terms of digital access, social media is a good means of reaching many more people than just those who can visit in person, and can be an easy means of – somewhat passively – engaging with an audience.

This paper will discuss how both forms of access have strengths and weaknesses in terms of the level of engagement and real involvement they allow for, and the extent to which they change power imbalances.

2 METHODOLOGIES FOR ENGAGING COMMUNITIES IN RESEARCH ON THE MEMORIALISATION OF DIFFICULT PASTS IN WHITECHAPEL

Wolferstan, Sarah (UCL)

UCL's Archaeology South-East (ASE) ran commercially funded excavations at a large site on Stepney Way, Whitechapel 2015-19, in advance of a major redevelopment for L&Q Homes. The site has a long history of occupation: London's largest-known Iron Age settlements; a medieval manor; and its first Tudor playhouse 'The Red Lion'. With a few exceptions, these stories were incorporated into the on-site interpretation and design during the construction phase. However, in the final stages of post-excavation analysis, a new discovery was made that required a different approach due its links with the difficult and painful aspects of Briain's role in the slave trade, colonialism and 18th century prejudice and racism. With an annual festival planned for the site, the context for memorialisation and place-making is at the fore. This talk will highlight the roles of the key influencers, describe the opportunities that were provided to ASE for influencing the site's design in the project's early phases. I will then describe how as a university unit we are making the most of opportunities to apply for seed-funding to build partnerships as well as the creative methods used for engaging new audiences during the post-excavation phase of the project including: commissioning storytellers, bringing on board BAME engagement experts, scoping for socially engaged research partners in areas that may have parallel interests and focusing on co-created research and project design and educational outcomes that allow student-staff partnerships to decolonise the production of knowledge. This case study is an example of an archaeological unit that sits within a Higher Education research setting using storytelling to co-produce the language and an evaluation framework to describe social value together with members of the community.

3 NAVIGATING THE CLIENT-CONTRACTOR-COMMUNITY DYNAMIC

Watson, Sadie (MOLA)

Often the most challenging aspect of providing meaningful participation and engagement as part of a developer-funded archaeological project is the developer themselves, and the expectations they bring, putting their needs first in their role as the ultimate client. These can include common issues such as outputs, budget, and access, all of which are wrapped up in the power dynamic of a commercial arrangement wherein the archaeological specialist is

usually a sub-contractor. Commonly encountered alongside these is the general feeling that the power over design and implementation is not in the hands of the people 'on the ground', despite attempts to share power, collaborate on design, and include the wider public. This short paper will propose some ways through this, some cynical, others not so much! This is likely to be partly a communication issue, so I will also discuss how a reduction in control over outcomes and outputs can be articulated to the client without raising alarm.

4 THE FUTURE PAST: ARCHAEOLOGY AND SOCIAL INNOVATION

Pedersen, Unn (Department of Archaeology, Conservation and History, University of Oslo) - Sontum, Kaja (Department of Archaeology, Conservation and History, University of Oslo) - Bukkemoen, Grethe (Museum of Cultural History, University of Oslo)

The Future Past has used a development-initiated excavation run by the Museum of Cultural History at the University of Oslo to demonstrate how knowledge of the past is transformed with the arrival of new empirical evidence and new thoughts. Inviting youths from schools in Oslo and Viken to follow an archaeological excavation from the outset, the project aimed at providing an in-depth opportunity to learn, understand and partake in knowledge production. The Future Past aims to tap into the power of a globally oriented generation, by involving school students between 13 and 17 years old in shaping future knowledge about the past and reflecting on the interplay of the past, the present and the future. Another aim of The Future Past has been to establish a model for cooperation between public administration, universities and schools to secure swift sharing of knowledge and bottom-up influence. The paper will present the challenges and gain of the pilot project, funded by a social innovation programme.

5 DEVELOPMENT-LED ARCHAEOLOGY AS APPLIED ARCHAEOLOGY

Beck, Anna (Museum Southeast Denmark)

The building of a new neighbourhood north of Køge, Denmark has led to extensive archaeological excavations. Typically, the information gathered from such excavations would go into excavation reports and then into the archive with very little – if any – contact with the following development process at the site. However, in the case of Køge Nord, we have explored ways to strengthen the dialogue between archaeological excavation and the building process by inviting the local public to participate in the archaeological process.

In Køge Nord, this experiment has taken various forms: 1) qualifying keywords from the visions of the new neighbourhood by mirroring them in the local archaeological record and discuss their meaning and content; 2) conducting citizen science driven investigations and using walking as a heritage practice that has learned us about the area and the challenges that meet the new building project; 3) exploring ways to present the archaeological knowledge that discusses themes related to the challenges created by the current development. The aim is to create a more open development-led archaeology that contributes constructively to the context where the development takes place.

Most of these activities lie beyond what normally can be done within the narrow framework of development-led archaeology. However, this form of Applied Archaeology has led to a constructive dialogue with the developer, the City Council of Køge, where the archaeological knowledge has become an active ingredient in the formation process of the future neighbourhood. Based on what we have learned from the project so far, I want to discuss the role of development-led archaeology in the building process and how we can better exploit the privileged position development-led archaeology has as a concrete link between past, present, and future.

468 THE RELATIONSHIP BETWEEN RURAL SETTLEMENTS AND THE TERRITORY DURING THE ROMAN PERIOD AND LATE ANTIQUITY.

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Bouzas Sabater, Marc (Universitat de Girona) - Frigola, Joan (Museu Arqueològic de Banyoles) - Turchetto, Jacopo (Università di Padova)

Session format: Regular session

For some years now, studies on the rural world of the Roman and Late Antique periods have ceased to focus exclusively on the built parts of the sites and have also begun to investigate the environment in which they were located. The results provide significant data to investigate a relationship that must be understood as bidirectional: on the one hand, the environment, with its specificities, conditioned many of the economic strategies of the rural establishments, such as, for example, the way the land was cut, and organised, or the suitability for certain activities, while, on the other hand, the intense pressure they exerted on the environment had a direct impact on the configuration and transformation of the landscape.

Issues to be discussed and analysed are multiple: models and types of settlement (villae, vici, figlinae, nundinae, and other lesser rural settlements), structuring and management of rural areas, adaptation and environmental impact,

commercial and productive strategies, economic dynamics, infrastructure, relation between town and rural world and many others. The review and sharing of these and other points will allow us to draw a clearer picture of the rural world of ancient times and to verify the differences and similarities that exist between very different territories and contexts.

ABSTRACTS

1 RURAL SETTLEMENTS IN ROMAN ALGERIA: NUNDINAE AND FUNDI, BETWEEN THE AURÈS AND LES ZIBANS

Turchetto, Jacopo (University of Padova) - Zanovello, Paola (University of Padova) - Meleri, Andrea (University of Padova)

Rural markets of Roman Numidia played a fundamental role within the context of the spread of latifundia and the increasingly capillary taxation, practiced especially in the final stages of the empire. Situated at focal points along road axes and, generally, near sources of water supply, they were certainly areas of commercial exchange, but above all controlled and managed meeting points between nomadic and sedentary populations. The periodic, indispensable passage of flocks, which were transferred to higher locations in summer, with a milder climate and the presence of water and food, required control and prevention of inevitable conflicts between farmers and shepherds.

As is well attested in epigraphic and literary documentation, landowners often requested from the state authority the permission to set up periodic markets within their own estates, generally in peripheral areas closer to road networks, with a dual advantage: for the landowners, as an increase in profits through trade, and for the state, as reference points, through landowners, as a guarantee of control over transactions and collection of tax levies.

The link between nundinae and fundi appears well documented in Numidia, particularly in those places where, as Pol Troussset recalled, "le limes est un instrument d'échange et d'intégration" and in the Tobna valley, between the Aurès Mountains and Les Zibans, which was "un lieu de symbiose nécessaire entre populations et régions écologiquement complémentaires".

This contribution will attempt to investigate the intertwining among these rural agglomerations, the agrarian organisation of the territory and the road system, within the broader framework of the relations between nomadic and sedentary populations.

2 CHANGING LANDSCAPES AND IDENTITIES IN THE NW OF HISPANIA BETWEEN LATE IRON AGE AND LATE ANTIQUITY

Machado, Diego (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território; Laboratório Associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território; Fundação para a Ciência e Tecnologia) - Martins, Manuela (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território; Laboratório Associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território) - Folgueira Ríos, Francisco (Universidade de Santiago de Compostela) - Dias, Bruno (Universidade do Minho)

The end of the Roman conquest of the NW of the Iberian Peninsula, in 19 BC, ushered in an important set of changes in the organization of the indigenous communities that occupied the territory, perceptible in a new ordering of the settlement, which suited the new political and legal framework designed for Roman Hispania, based on its division into provinces and *conventus iuridici*. The capitals of the *bracaraugustanus* and *lucensis* *conventus* were *Bracara Augusta* and *Lucus Augusti*, cities founded *ex nouo* in strategic locations in relation to the territory occupied by the *Gallaeci bracaraugustani* and *lucensi*, names that included different pre-Roman ethnic groups at the origin of the *populi* and *ciuitates* that shared those *conventus*.

This communication seeks to characterize the social and cultural framework of the populations that occupied the territory of the two *conventus* in the Iberian northwest, before and after their integration into the Empire, in order to understand the changes that took place and the specificities of their settlement and organization. This overview will also allow us to look at the changes in settlement that seem to have resulted from the events that characterized Late Antiquity, a period in which the region was integrated into the province of *Gallaecia* (4th century), the *Suebi* kingdom (5th and 6th centuries) and, finally, the *Visigoth* kingdom (6th-8th centuries), experiencing significant changes. Taking into account the available data, it seems possible to accept that the development of the territories under analysis presents its own internal dynamics, as a result of different interactions between the local substratum and the Roman world, giving rise to new identities that continue to evolve with the generalization of Christianity and the end of Roman rule.

3 URBAN AND RURAL - NEW INSIGHTS INTO THE SURROUNDINGS OF ROMAN SISCIA

Brkic Drnic, Kristina (The Centre for History and Culture of Sisak-Moslavina county)

The Roman colony of Siscia presents one of the most important Roman towns on the territory of the province of Pannonia. In the course of the division of the province of Pannonia Superior by Emperor Diocletian, Siscia became the capital of the province of Pannonia Savia. While the area within the city walls has been the subject of numerous archaeological excavations, the state of research on Siscia *extra muros* and its countryside is still scarce.

Archaeological rescue excavations were carried out between 2021 and 2023 as part of the construction of the Zagrreb-Sisak highway. In the Stupno and Sela sectors, about 4.5-6 km from the modern town of Sisak (ancient Siscia), traces of Roman rural settlements have been found, including remains of wooden architecture, kilns, canals, pits, well and possibly a section of the road from Andautonia to Siscia. In addition to the explored archaeological structures, various small finds of pottery, glass, metal and stone were collected, which provide an insight into the everyday life of their inhabitants.

The aim of this paper is to discuss the morphology and chronology of the rural settlements, the location of the sites in the surrounding landscape, the environmental and communication context, and their physical and economic connections with Roman Siscia.

4 THE VALUE OF DOLIA IN THE ASSESSMENT OF THE ROMAN RURAL ORGANIZATION. A CASE OF STUDY FROM NORTH-WESTERN HISPANIA

Rueda, Maria (Institut Català d'Arqueologia Clàssica (ICAC)) - Járrega, Ramon (Institut Català d'Arqueologia Clàssica (ICAC))

The aim of this communication is to show how the study of *dolia* can help in defining the organization of the rural settlements, specifically those related to the production of wine and, in a lesser degree, those producing olive oil. Not only it shows the areas dedicated to that production, but also it provides evidence for the productive capacity of some of the settlements, particularly those with capacity markings or preserved vessels.

With all this data, we aim to trace the evolution of the rural territory of the northeast of Hispania, and the wine production, from the late second century BCE to the fifth century CE. Moreover, we give us information to evaluate the accumulation of production centres, or the lack of them, and compare it with the current conception of the rural organization of the Roman Hispania. The study of the hypothetical production could also help us in the classification of the settlements in order to define if all of them engaged with the Mediterranean trade.

This study derives from the PhD investigation done by the author, which examines *dolia* from the northeaster area of Hispania (now Catalonia), in the Roman period. This research attempts to create a new typology for this kind of containers, but more importantly intends to provide a new framework to study wine production in Hispania, considering the distribution of settlements with *cellae unariae* and their hypothetical productive capacity.

5 EVOLUTION OF THE PRODUCTIVE ORGANIZATION IN THE RIVER VALLEYS OF THE TERRITORIUM OF DIANIUM (DENIA, ALICANTE) IN THE ROMAN EMPIRE

Álvarez Tortosa, Juan (University of Alicante) - Mateo Corredor, Daniel (University of Alicante) - Molina Vidal, Jaime (University of Alicante)

The introduction of the villa model in the *Tarraconensis* province during the time of Augustus brought about a profound restructuring in the productive organization of the rural environment. This transformation manifested as a significant intensification in both cultivation practices and agricultural processing. However, recent investigations conducted in the river valleys of the *Dianium* territory have revealed the coexistence of different landscape exploitation models and resource utilization, surpassing the conventional villa model. In this framework, a synthesis of the most relevant results obtained is presented as a basis for the discussion of the nature of these rural centres, as well as their relationships with other production centres in the surrounding area and with the urban area of *Dianium*. The research focuses on the context of surplus production of agricultural products, particularly in the realm of viticulture and, to a lesser extent, olive oil production. Ultimately, the aim is to deepen the understanding of agrosystems and the socio-economic dynamics of this territory during the Early Roman Empire.

6 RURAL LANDSCAPE & LATE ANTIQUITY ON THE AGER TARRACONENSIS: NEW APPROACHES

Carrasco López, José (Universitat Autònoma de Barcelona)

In the last few years, the study of Late Antiquity has become more interdisciplinary. A detailed approach to the fields of study has largely been dictated by the heterogeneity of the period. In this sense, the structure and use of the Roman landscape was fundamentally determined by Late Roman rural settlements. Agricultural locations on the fertile plains, as in the case of the *villae*, have been the subject of many studies. However, other settlements, which were

also at the centre of the exploitation of the resources of their territories, such as mining, fishing, etc., have often been overlooked. Also, compared to those on the plains, research on highland settlements is scarce. This paper aims to establish a dialectic between the archaeological sources that can tell us about sites located in the Highlands and those located in the plains. For this purpose, we will use the rural landscape of Tarraco, the provincial capital of Hispania, as a case study.

7 THE STUDY OF THE LATE ANTIQUE SUBURBAN CONTEXTS IN IBERIAN PENINSULA: AN APPROACH TO THE SETTLEMENT PATTERNS

Urbina, Isabel (CSIC) - Castro Priego, Manuel (Alcala University) - Diarte-Blasco, Pilar (CSIC)

This study is an approximation to the homogenisation of the archaeological documentation available on three of the rural areas whose origin is established in the vicinity of the urban foundation of Reccopolis between the 6th and 8th centuries AD. These suburban settlements, La Paeriza, Loma del Badujo and Los Arroyuelos, offer a holistic view of the immediate surroundings of the city, which justifies a process of social and spatial transformation with its own characteristics and different from the rest of the rural areas spread throughout the peninsular territory in the early Middle Ages. The possibilities offered by this work are based on the use of combined archaeological, environmental, geographical and textual data, including those relating to road systems, settlements and the agrosystem. The definition of the suburban settlement pattern is proposed, as well as the characterisation of the structures and materials that make it up, as an instrument for research and heritage management, in order to generate the necessary interpretation and contextualisation of these landscapes in transformation.

8 THE ROMAN VILLA OF COLLET IN THE CONTEXT OF THE COASTAL VILLAS OF THE NORTHEASTERN END OF HISPANIA CITERIOR

Moner, Elisabet (Universitat de Girona) - Bouzas, Marc (Universitat de Girona) - Burch, Josep (Universitat de Girona) - Vivó, David (Universitat de Girona)

The Roman villa of Collet is located in the municipality of Calonge i Sant Antoni (Catalonia), on a rocky spur that rises some twenty metres above the surrounding plains, which in ancient times were occupied by marshes. The great scenographic value of the site made it an ideal place to build an otium villa in Roman times, as well as to exercise control over the surrounding territory.

The site shows different phases of continuous occupation. The first of these consists of a rural settlement with a wine cellar. This was followed by a villa from the Republican period, of a markedly productive nature, the ground plan of which was used in the Augustan period to carry out a number of alterations. Finally, the last phase shows the existence of a villa from the High Empire period.

The imperial villa has residential rooms, in several cases paved with mosaics. The structure of the villa, organised around one or more courtyards that occupy a large area, only confirms the sumptuousness of the site. This villa already fits into the patterns defined for a coastal villa, villas of a stately character, with a large fundus to control and with various luxuries such as mosaic pavements, opus sectile, balnea, etc.

This presentation establishes a comparison between the Roman villa of Collet and other coastal villas in the territory studied, such as Pla de Palol and Els Ametllers. The analysis will make it possible to establish similarities between them, bearing in mind that all three belong to the typology of coastal villas, but also to define the characteristics that differentiate them. The contrast between them will allow us to deepen our knowledge of the coastal villas of the extreme north-east of the Iberian Peninsula, taking into account the new archaeological finds documented at the sites.

9 THE ROMAN VILLA OF CAN RING OR "DELS POMPEU": AN AGRICULTURAL SETTLEMENT ON THE AGER BISULDUNENSIS

Frigola Torrent, Joan (Universitat de Girona; Grup de Recerca Arqueològica del Pla de l'Estany) - Castanyer Masoliver, Pere (Grup de Recerca Arqueològica del Pla de l'Estany) - Tremoleda Trilla, Joaquim (Grup de Recerca Arqueològica del Pla de l'Estany)

The archaeological research carried out in recent years in the Roman villa "dels Pompeu" (Besalú, Catalonia) has allowed us to gain a much better understanding of the territory in which it was located and its relationship with the rest of the surrounding sites, especially with the vicus of Bisuldunum, which was the main settlement in the area.

This paper will analyse the factors that must have been taken into account when founding the villa (location, visual domain, proximity to watercourses, presence of communication routes...), will determine the resources of the territory that were exploited (quarries, forests...) and will make a proposal for the extension and limits of the estate. The environmental impact of the villa and the transformation of the surrounding landscape through the introduction of new crops and agricultural strategies will also be discussed.

Finally, the economic and commercial role of the villa will be examined, both in terms of the local products it acquired (which ones and from where) and in terms of the distribution of its surplus production, mainly centred on wine.

10 NEW INSIGHTS OF WOOD MANAGEMENT AND ARBORICULTURE PRACTICES IN THE ROMAN SETTLEMENTS OF VILAUBA AND CAN RING (GIRONA, SPAIN)

López Castillo, Eva Maria (Univesitat Autònoma de Barcelona) - Berrocal Barberà, Anna (Departament de Prehistòria Universitat Autònoma de Barcelona) - Castanyer Masoliver, Pere (Museu d'Arqueologia de Catalunya-Empúries; Grup de Recerca Arqueològica del Pla de l'Estany (Banyoles, Girona)) - Frigola Torrent, Joan (Grup de Recerca Arqueològica del Pla de l'Estany (Banyoles, Girona)) - Limier, Bertand (ISEM, Institut des Sciences de l'Evolution-Montpellier, Université de Montpellier/CNRS/IRD/EPHE; INRAE, Centre Occitanie-Montpellier) - López-Bultó, Oriol (Museu d'Arqueologia de Catalunya) - Piqué Huerta, Raquel (Departament de Prehistòria Universitat Autònoma de Barcelona) - Terral, Jean-Frédéric (ISEM, Institut des Sciences de l'Evolution-Montpellier, Université de Montpellier/CNRS/IRD/EPHE) - Tremoleda Trilla, Joaquim (Museu d'Arqueologia de Catalunya-Empúries; Grup de Recerca Arqueològica del Pla de l'Estany (Banyoles, Girona))

The aim of this research is to approach the practices of wood management and arboriculture in the north-east of the Iberian Peninsula (from the 1st century BC to the 7th century AD), based on the study of archaeological wood and charcoal remains from the site of Vilauba (Camós, Catalonia, Spain). The study focuses on the remains recovered from inside a well, which are contextualized in the frame of this rural settlement that spans from Roman times to Late Antiquity. A reference collection of the anatomical and other morphometric features of cultivated, managed and unmanaged trees of the species identified at the site has been made in order to obtain comparative materials to analyse the archaeological remains. The main characteristics observed in the reference material are presented here and compared with the archaeological material. The analysis of both type of samples, modern and archaeological, is based on the application of a tried and tested methodology, the roundwood method (Out et al.). The results are contextualised with those obtained in other archaeobotanical studies, such as from the analysis of fruit and charcoal remains, carried out at the site, and in the historical context of the region. The results obtained have provided information on arboriculture practices in *Prunus* sp. and *Vitis vinifera*, and possible management practices in taxa such as *Sambucus nigra* and *Salix* sp.

470 BRIDGING THE WALLS: COMPARATIVE PERSPECTIVES ON FORTIFIED SETTLEMENTS

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Lucci, Enrico (University of Bari Aldo Moro, Dipartimento di Ricerca e Innovazione Umanistica) - Fontana, Giacomo (University College of London, Institute of Archaeology) - Migliavacca, Mara (University of Verona, Department of Cultures and Civilizations) - Črešnar, Matija (University of Ljubljana, Faculty of Arts Department of Archaeology; Centre for Interdisciplinary Research in Archaeology) - Fernández-Götz, Manuel (University of Edinburgh)

Session format: Regular session

The period between the 3rd and 1st millennia BC in the Mediterranean and Temperate Europe saw the rise of militarised communities and the significant increase of extra-domestic economies, such as long-range exchange of prestige goods and raw materials. In this framework, the emergence of fortified settlements was of particular significance, embedding new rising ideological, political and socioeconomic aspects, but also signifying a profound transformation of human interactions with the landscape.

From a social perspective, the construction of monumental defensive structures necessitates significant and repeated collective efforts, reflecting a stronger internal cohesion of communities. However, archaeological data concerning the spatial arrangement of domestic spaces also reveal increasingly complex forms of internal community organisation, with both examples of hierarchical and heterarchical structures. On the other hand, the prolonged occupation of strategically important locations could deeply affect the political structure of the landscape as well as the environment, due to intense exploitation of soil and natural resources.

In recent decades, fortified settlements have attracted a wide array of interdisciplinary research efforts, spanning from traditional artefact and bioarchaeological studies to geoarchaeology, GIS, geospatial, and remote sensing analyses. While these efforts have significantly expanded our understanding, the development of this research field has followed uneven trajectories across the investigated periods and geographical areas. Persistent gaps remain in the theoretical frameworks, methodologies, and data linkages within archaeological research.

This session aims to transcend regional and chronological boundaries to offer a comparative analysis of the varied phenomena related to the rise of fortified settlements in the Mediterranean and Temperate Europe between the 3rd

and 1st millennia BC. We invite contributions at different scales of analysis, from intra-site studies to regional and macro-regional approaches, thus helping to enrich interdisciplinary and comparative debates on the topic.

ABSTRACTS

1 SOCIETIES BEHIND FORTIFICATIONS: MIDDLE BRONZE AGE MULTI-LAYERED SETTLEMENTS IN CENTRAL HUNGARY

Jaeger, Mateusz (Adam Mickiewicz University in Poznań) - Niebieszczański, Jakub (Adam Mickiewicz University in Poznań) - Kulcsár, Gabriella (Hungarian Academy of Sciences)

One of the most characteristic forms of archaeological sites dating back to the Middle Bronze Age in central Hungary is fortified settlements. Many of these sites exhibit complex stratigraphy resulting from several hundred years of habitation and various modifications of economic and living spaces. Their fortifications commonly consisted of a simple combination of a wall and ditch, although in exceptional cases, these elements formed more complex structures. The aim of the presentation is to present the current results of the Polish-Hungarian project focused on the microregion of Kakucs. In this area, five settlements surrounded by various forms of fortifications are known. The main goal of the research is to establish the absolute chronology of the ditches and, consequently, to answer the question about possible relationships connecting the inhabitants of individual settlements in the first half of the second millennium BC. The authors will present the results of excavation research, non-invasive surveys, and geological drilling (including vibra-coring), which were used to construct chronological models.

2 THE ABANDONMENT OF FORTIFIED SETTLEMENTS DURING THE TRANSITION OF THE HUNGARIAN MIDDLE AND LATE BRONZE AGE

Szabó, Nóra (Research Centre for the Humanities)

The Middle Bronze Age (2000/1900-1450 cal BC) settlement network went through a complete transformation by the beginning of the Late Bronze Age Tumulus culture in the Carpathian Basin. The reasons for the changes that affected all aspects of life and occurred at the boundary between the two periods are still not fully understood: in addition to the transformation observed in the archaeological record, new types of solutions, relationships, and ideas emerged in the economic systems and social arrangements. The abandonment of the existing system transformed the former standardized worldview at the community level, including how to idealize a settlement in its environment. The fortified settlements evaluated as central settlements in the Middle Bronze Age can be seen in several types, however, their multi-level subordination to each other is not clear. But the communal spirit and the practice of cooperation (voluntary or forced) that created these settlements can be assumed. The development of community spaces and structures of fortification that transform the environment requires organization and a lot of time and energy. This is why it is surprising the abandonment of this hard-constructed system and the use of other types of settlements in the late Bronze Age. The land use of settlements is also changing, the former places are no longer or rarely used. The appearance in the landscape of the settlements in Budapest and its surroundings and the quality of the connections between them can be analyzed at several levels. Trends can help not only to understand the settlement structure and the role of fortified settlements but also to explore the relationship of communities to the landscape.

I will present the role of fortified settlements through the analyses of the settlement structure and modeling of road networks in the region around Budapest during the Middle and Late Bronze Age.

3 A MIDDLE BRONZE AGE HILLFORT WITH A MEGALITHIC-'CYCLOPEAN' WALL NORTH OF THE ALPS. NEW EXCAVATIONS ON THE STÄTTEBERG, BAVARIA

Metzner-Nebelsick, Carola (LMU Munich) - Nebelsick, Louis (UKSW Warsaw)

This lecture presents the results of a research project carried out since 2019 on the Bronze Age hillfort on the Stätteberg near Neuburg on the Danube in Bavaria. The results of our ongoing excavation campaign are as surprising as they are spectacular. They demonstrate that the site, which is located on a spur rising directly above the Danube, was surrounded by a fortification covering an area of 86 hectares beginning in the Middle Bronze Age. The 5.5-hectare tip of the plateau, the hillfort's acropolis, was crowned by an extensive burnt offering sanctuary and defended by an imposing two-phase fortification. Its massive inner ring comprised a 3.30 m wide double-shell 'cyclopean' stone wall built of hewn limestone blocks, filled with smaller stones, and tamped clay. The limestone part of the wall is still preserved up to a height of 1.80 m (originally over 2 m). It was the stone plinth for a much higher pisé/stamped earth wall. The great limestone blocks of this structure were systematically extracted directly in front of this wall. It is the oldest stone quarry yet known in Central Europe.

¹⁴C dating makes it likely that this fortification was erected in the Middle Bronze Age in the early 15th century BCE. It was burnt down along its entire length and systematically razed around 1200 BCE.

4 EARLY IRON AGE HILLFORTS OF THE SOUTH-EASTERN ALPINE REGION AND HOW WE APPROACH THEM

Crešnar, Matija (University of Ljubljana) - Vojaković, Petra (University of Ljubljana, Faculty of Arts, Department of Archaeology, Centre for Interdisciplinary Research in Archaeology (CIRA); Arhej d. o. o.) - Mušič, Branko (University of Ljubljana, Faculty of Arts, Department of Archaeology, Centre for Interdisciplinary Research in Archaeology (CIRA); Gearh d. o. o.) - Gruškovnjak, Luka (University of Ljubljana, Faculty of Arts, Department of Archaeology, Centre for Interdisciplinary Research in Archaeology (CIRA)) - Prijatelj, Agni (University of Ljubljana, Biotechnical Faculty, Department of Soil and Environmental Sciences) - Horn, Barbara (University of Ljubljana, Faculty of Arts, Department of Archaeology, Centre for Interdisciplinary Research in Archaeology (CIRA); Gearh d. o. o.) - Grčman, Helena (University of Ljubljana, Biotechnical Faculty, Department of Soil and Environmental Sciences)

During the early first millennium BC, distinct regional cultural characteristics developed in the south-eastern Alpine region (i.e. present-day Slovenia and its surroundings). One of these was the emergence of monumental hillforts, which became the centres of the Early Iron Age. Although the research of antiquarians initially focused on the burial mounds, which contained the most valuable artefacts, the first excavation campaigns of hillforts took place before the end of the 19th century. Given this long history of research, one might think that we know everything there is to know about the hillforts, their fortifications, their internal organisation, their role in the settlement patterns etc. In most cases, however, only the (preliminary) chronological framework has been established. Nevertheless, things are changing! The wide range of research methods integrated in the investigations of Early Iron Age hillforts and their surrounding landscapes has undergone significant development in recent years. Rather than simply collecting extensive data or focusing on individual features or sites, our main aim was to create a 'methodological toolbox' which, due to its systematic nature, could be applied (almost) anywhere under similar environmental and archaeological conditions.

Our first research step aimed at using remote sensing data (e.g. ALS) to understand the wider environment of the area. The next steps involved multi-method geophysical surveys followed by minimally invasive ground-truthing (including coring and shovel pits) to determine the most suitable areas for intensive geophysical surveys, geochemical mapping and further invasive investigations, i.e. excavations. The latter is importantly being supported by the micro-geoarchaeological research, which quickly became one of the most important parts of our investigations delivering eye-opening results.

5 MILITARISATION OF SOCIETY AND FORTIFICATION OF TERRITORIES IN IRON AGE GAUL

Krausz, Sophie (Université de Paris 1 Panthéon Sorbonne; UMR8215 TRAJECTOIRES)

Militarisation is the process that structures the organisation of a society or territory and gives it a military character. It expresses a series of security standards, of which the concept of fortifications is an essential component. Militarisation can be both a factor of peace and a factor of war, with elites constantly engaged in maintaining one and preventing the other. It makes it possible to create an armed peace whose permanence is guaranteed by the constant control of the social body.

The ideology of war and peace was able to evolve with the complex political systems that emerged in the last millennium BC. During these changes, political mutations altered the configuration of territories and led to the construction of monumental fortifications on several occasions. At the end of the Iron Age, civitates were gradually emerged in Gaul, representing more or less stable political and juridical entities that Caesar was able to establish in the middle of the 1st century BCE.

The development of fortifications in Gaul during the Iron Age could be symptomatic of the militarisation that accompanied new political systems. The aim of this paper is to investigate the connections between the development of fortifications and political models involving the militarisation of society in the Iron Age. It draws on several criteria: a five-stage theoretical classification of militarisation processes (Krausz 2023), ancient textual sources attesting to states of war in Gaul, the way in which military actions were carried out and of course archaeological data on fortifications in the Late Iron Age.

6 SEEING THINGS: CONFRONTING SUBJECTIVE NARRATIVES ON VISIBILITY WITH COMPARATIVE METHODS

Whitefield, Hans (LeiZA Center for Baltic and Scandinavian Archaeology; Freie Universität Berlin)

The invocation of visibility as an essential element of prehistoric enclosures is one of a number of a-priori characteristics used to describe their function and purpose. In light of this, viewshed analyses have proliferated drastically in the past two decades due to the availability of GIS tool systems, however, this implementation has been noted as theoretically problematic from the beginning. While most criticisms focus on the implementations of digital tools and the reliability of digital models, a much more perfidious problem is present in the practical theory. Visibility studies are frequently designed to validate subjective observations about prominence and surveillance in the landscape. These studies regularly neglect negative outcomes and by doing so are only used in order to validate the anachronism of a militarized viewshed. The projection of our modern teleological conceptions of landscape into the past need a thorough reexamination with empirical methods.

This paper presents both standard observational methods and newer quantitative methods for the analysis of visibility as a motive for the construction and function of prehistoric enclosures. This is done by comparing a large contiguous dataset from Lithuania, Poland and Russia with smaller comparative data groups from Britain and Western Europe. Furthermore a number of observational and experimental methods are presented to test whether or not prehistoric enclosures cooperated or competed.

7 WORK IN PROGRESS AT MONTE PALAZZO, A STRATEGIC HILLFORT IN THE VENETO PRE-ALPS

Migliavacca, Mara (Department Cultures and Civilization University of Verona) - Balasso, Alberto (PETRA) - Bandera, Silvia (Department Cultures and Civilization University of Verona) - Donadel, Valentina (Department Cultures and Civilization University of Verona) - Maltese, Giuseppe (Department Cultures and Civilization University of Verona) - de Neef, Wieke (Institute of Archaeology, Heritage Science, and Art History (IADK) Otto-Friedrich-Universität Bamberg)

Since 2022 the University of Verona has been working with an archaeological fieldwork at Monte Palazzo di San Tomio (Malo, Vicenza), in north-eastern Italy, after some surveys done in the previous years. In the 1930s a brief investigation and a following excavation by Soprintendente Ghislanzoni and Ghellini count had already discovered the traces of the protohistoric occupation without specifying the chronology and nature of the settlement.

The site occupies a small hill facing the underlying plain; several remains of walls have been discovered all around the top of the hill, as well as along the slopes and at the bottom of the hill. The function and building technique of these walls are among the core issues that the research team is facing, looking for comparisons with similar situations. The finds discovered to date certify a prolonged occupation of the settlement, from the Recent Bronze Age to the Late Iron Age, and there are hints of a change in use of the hill through time. These data suggest the importance of human interactions with the landscape, and a bioarchaeological investigation has been undertaken in agreement with the CNR of Torino. Moreover, the typology of the findings suggests an important contact between the hillfort and the surrounding areas, especially the neighbouring Alpine Trentino one, so the hillfort occupied a strategically important location, probably controlling long-range exchange of goods.

8 CASTEL DE PEDENA (SAN GREGORIO NELLE ALPI, BELLUNO): A HILLTOP SETTLEMENT ALONG A BORDER AREA

Donadel, Valentina (University of Verona) - Angelini, Anna (Fondazione G. Angelini - Centro Studi sulla Montagna) - Leonardi, Giovanni (Università di Padova)

The paper focuses on the Castel de Pedena site: a hillfort located in the north-eastern Alps, with a long life span dated from the Ancient Bronze Age to Early Iron Age, with a non-continuous occupation. The excavations on the site were carried out by the protohistoric team of Padua University from 2006 to 2012 and focused mainly on the eastern slope of the hill, which was the most preserved area. The paper will present the main structural characteristic of the hillfort, especially the terraces and fortification walls along the slope and the blockbau structures built on the summit. Another theme that will be analysed is the cultural characterisation of the settlement and its changes through time, since the site is located in a border area, between the Veneto and Trentino regions, that was characterised by the presence of the Alpine Luco/Laugen culture in the Late Bronze Age. Finally, a series of archaeometric studies carried out on both pottery and bronzes can shed light on the supply system of raw materials as well as on cultural and trade relations.

9 THE PREHISTORIC “CASTELLIERI” OF TRIESTE: A NEW CRITICAL OVERVIEW OF THE ARCHAEOLOGICAL LANDSCAPE WITH THE SUPPORT OF REMOTE SENSING TECHNIQUES

Berti, Eleonora (University of Udine; University of Trieste; Ca' Foscari University of Venice)

Between the late 3rd and the 1st millennium BC a surprising number of hillforts – known as “Castellieri” – spread across the north-western corner of the Balkans, i.e. in the Istrian peninsula and in the Karst territory up until the Isonzo and Vipava valleys. Within this wide region, evidence found in the area of the current Italian province of Trieste present several interpretative problems, due to a lack of extensive field investigations and scientific publications. The definition of local hillforts is still mainly based on the work of Carlo Marchesetti, who discovered a large number of sites in the late 19th century, and the majority of the alleged “Castellieri” has never been analysed by recent studies with a critical perspective.

In the present contribution, we aim to reevaluate the past bibliography regarding the Trieste Karst in order to clarify the real quality of current available data. To do so, we have also taken advantage of the help of some remote sensing analyses: in particular, we have examined data collected with airborne LiDAR technology, provided by the Friuli Venezia Giulia Region. This tool gave us the opportunity to verify the presence of the archaeological evidence mentioned in bibliography and to discover some possible new ones in parts of the province that had never been studied before, giving us the idea that the territory was intensely exploited, even more than once thought.

Many problems remain concerning the historical and sociological interpretation of the distribution observed, mostly because of the lack of thorough chronological definitions of our hillforts, for which new researches will be necessary. Nevertheless, our contribution highlights the most critical points of the area and offers an updated topographical representation of the “Castellieri”, from which future studies can start.

10 BUILDERS OF WALLS IN BRONZE AGE SOUTHERN ITALY: THE CASE OF COPPA NEVIGATA

Cazzella, Alberto (Former Sapienza University, Department of Antiquities) - Recchia, Giulia (Sapienza University, Department of Antiquities) - Lucci, Enrico (University of Bari A. Moro, DIRIUM)

The massive fortifications defending some Bronze Age settlements in the Central Mediterranean are the result of collective and repeated efforts by individuals composing a community. These structures could be interpreted as a significant level of social cohesion. This, coupled with the lack of a distinct presence of centralised and institutionalised political powers, has led scholars to generally characterise such societies as a single body, potentially underestimating the impact of existing internal divisions—such as social or kin groups—on the community's life, from domestic production and consumption processes to the social mechanisms through which pluralities, inequalities and fractures emerged and were managed.

The Bronze Age fortified settlement of Coppa Nevigata, which is one of the most extensively excavated sites of Southern Italy, constitutes a pivotal key case study for exploring such topics. This settlement provides notable information on the transformation over time of both its fortification lines and the spatial organisation of dwelling and productive areas. Such evidence can be analysed and interpreted from the Marxian – collective Agency perspective, which aims at highlighting the role of collective actions as triggering factors in socio-economic transformations.

In this presentation, we will discuss the theoretical and methodological approach to recognizing internal groups within the community of Coppa Nevigata and explore their potential range of relationships. We will present diverse interdisciplinary analyses conducted over the past years and ongoing studies, combining and discussing them in order to shed new light on the changes in the social organization of Bronze Age societies in the Central Mediterranean.

11 EARLY MYCENAEAN FORTIFICATION AND COMMUNITY BUILDING AT MALTHI, GREECE

Worsham, Rebecca (Smith College) - de Raaff, Yannick (University of Gothenburg)

The fortification wall at Malthi, in southwestern Greece, has generated much discussion in the scholarship of Middle and Late Bronze Age Greece for its apparently early date, and as far as its relationship to the later, much more substantive fortifications of the Mycenaean world. While the fortification is significantly later than suggested by its original excavator, the revised date of construction of about 1600 BCE places it in a time of major social change on the Greek mainland, the so-called Shaft Grave period. This paper builds on new work carried out at the site under the aegis of the Swedish Institute at Athens to discuss the social context of the construction of the fortification at Malthi, its range of possible meanings at this particular historical moment, and the broader consolidation of labor that it must have represented. We argue that the appearance of the fortification wall at Malthi was the result of the aggregated labor of the populace of the surrounding area, suggesting a shift away from social definitions based on household membership toward the creation of settlement-based (and even supra-settlement) communal identities. The investment of time, labor, and resources represented by the fortification extends also to a concomitant reorganization of the interior space of the settlement, including the construction of rooms lining the fortification, a clear emphasis on agglutinative building, a terracing project within (and outside of?) the village, and paths of movement through the

settlement guided by a fairly robust gate system. As is the case with other town walls, the fortification at Malthi must serve both practical functions (i.e., defensive, terracing) and more symbolic functions—here, a visual statement of social belonging and exclusion, as well as perhaps hegemonic aspirations.

12 DEFENSIVE SYSTEMS IN THE SOUTHERN LEVANT DURING THE MIDDLE BRONZE AGE II-III

Berti, Bianca (Sapienza University of Rome)

The paper will examine the evolution of fortification systems in the coastal and hinterland areas of the Southern Levant during the Middle Bronze Age II-III (1800-1550 BC) through a number of illustrative case studies. In fact, in the context of the evolution of defensive systems, the period between the 18th and the end of the 16th century BC represents a remarkable moment for the Levantine area, in connection with an important period of urban development but also with a significant destruction caused by the Egyptian campaigns which changed not only the political and socio-economic situation of the region but also its defensive strategies. For each site, in addition to the identification of types and construction techniques employed, of primary interest is to trace and contextualize those elements of continuity and discontinuity that occurred in the development of defensive solutions at an intra-site and regional scale and that can be differentially understood as a witness of innovation or rooting in tradition. Thus, the synchronic and diachronic analysis carried out on the basis of the defensive typologies recognized will make it possible not only to investigate the evolution of individual settlements but also the relationships between each site and try to find the reasons behind keeping the same form or changing it during the use of these systems over the centuries.

13 A MULTISCALE QUANTITATIVE APPROACH TO SAMNITE FORTIFIED LANDSCAPE AND ITS POTENTIAL FOR CROSS-REGIONAL AND CROSS-CULTURAL ANALYSIS IN OTHER HILLFORT SOCIETIES

Fontana, Giacomo (University College London)

The 5th and 4th centuries BC witnessed rapid development of a fortified landscape in the region anciently known as Samnium, in central southern Italy. The inhabitants, the Samnites, organized themselves in markedly different ways from their urban neighbors. Instead of cities, they constructed hundreds of hillfort sites that research increasingly reveals as remarkably empty. The non-urban organization of the Samnites, along with their remarkable resistance to Roman expansion, has been the subject of ongoing debate that still lacks a clear explanation.

This presentation adopts a quantitative approach to address the debate on Samnite society. LiDAR was utilized to develop a new dataset of hillfort sites across south-central Italy. This dataset enabled the exploration of site categories through multivariate cluster analyses and a novel labor-cost model for polygonal masonry. Building on this, geospatial statistics were employed to analyze the spatial and political structure of the Samnite landscape. Fieldwork conducted during the Ancient Hillforts Survey provided empirical validation of the computational approach.

The presentation discusses how adopting a comparative theoretical framework was instrumental in shedding new light on Samnite society while avoiding the region-centric views that have dominated past debates on Samnite organization. In doing so, the Samnite case was aligned with recent studies on hillfort societies in Temperate Europe and elsewhere, revealing remarkable similarities in the ways different societies organized themselves. Furthermore, it discusses the potential of the multiscale computational approach developed for comparative cross-regional and cross-cultural analyses on hillfort societies.

14 A FORTIFIED LANDSCAPE: LANDSCAPE AND IDENTITY IN THE ARCHAIC ATERNO VALLEY (ABRUZZI)

Scarsella, Elena (Independent Researcher)

During the Archaic period (mid 7th to mid 5th century BC), central Apennine was part of a larger network, connecting the Tyrrhenian and the Adriatic coasts of Italy. The mountains themselves were indeed the grand stage of a mosaic of interactions (not always peaceful) that eventually gave origin to the wide ethnic groups known from the classical literary tradition.

In this complex framework, the mountainous landscape of the Apennines plays a major role not only in defining territorial compounds but also in dictating necessities of defence and control of economic resources. Indeed, the harshness and the difficulties of a mountainous environment ensure a general scarcity of resources and it also creates the basis for a strong competition over the few exploitable land and resources. Hence, pivotal assets such as grazing land, mining ores and trade routes became the focus of an intricate system of hillforts and outposts that covers, visually and strategically, the entire Apennine route network.

This paper, through the case study of the settlements of the Aterno Valley (Abruzzi), focuses on the possibility of defining one or more fortification systems and to lead them back to cultural and/or political entities active at the same time in the area under examination. Indeed, an enhanced warrior ideology is highlighted by the widespread presence of

weapons in grave assemblages and testifies the necessity to display (if not practice) violence in order to assert control over borders. The role of war and of its display, then, becomes a pivotal one in defining not only territorial authority, but also in keeping together the delicate and dynamic network of Central-Italian Archaic multiple identities.

15 BETWEEN MOUNTAINS AND SEA. PRELIMINARY DATA FROM THE SURVEY OF THREE PROTOHISTORIC FORTIFIED SETTLEMENTS IN SOUTHERN ALBANIA

Carbotti, Federica (University of Bologna; University of Salento)

Enclosed between the ancient Acroceraunian mountains and the Ionian Sea, southern Albania shorelines seems unwelcoming at a first glance. Steep mountain slopes just up against the coast make landings barely accessible and entrances to canyons that provide inland connections difficult. Despite this, uplands are marked by a dense population consisting of small and medium-sized settlements and fortified sites in strategic locations, often controlling landings and communication routes. The geomorphological features of the territory make archaeological research often very challenging in these places, resulting in a lack of fitting and up-to-date documentation that can shed light on the internal organization and role of fortified sites in their territorial context.

This paper focuses on three of these sites, Badhra, Karos and Kukum, located between the modern centers of Himara and Borsh. Traditionally dated between the Early Bronze Age and the Early Iron Age, they are considered as fortified settlements or shelters for shepherds and represent some of the few fortified sites to have been covered by archaeological excavations and other non-systematic research in the past. These are the starting point for the new activities of the FortNet Project, which from 2023 aims to review the available documentation and implement it with non-invasive methodologies to better understand the function and development dynamics of fortified sites on the coast of ancient Epirus from a diachronic perspective. Preliminary data drawn from the first campaign of fieldwalking and topographic survey by drone and GNSS, along with the resulting spatial analysis, were used to highlight the role of these sites in relation to supply basins and local resources and to highlight possible connections with the Mycenaean world whose presence is simultaneously attested further south along the coast of Greek Epirus.

16 HOW DEPTH IN TIME AND FAR IN SPACE: MULTIPROXY PROSPECTION OF THE IRON AGE HILLFORT OF IRULEGI (ARANGUREN VALLEY, NAVARRE)

Aiestaran, Mattin (Aranzadi Science Society; EHU/UPV) - García-García, Ekhine (Aranzadi Science Society; SOT) - Ruiz-Gonzalez, Daniel (Aranzadi Science Society) - Narbarte-Hernandez, Josu (Aranzadi Science Society) - Mendizabal-Sandonis, Oihane (Aranzadi Science Society; EHU/UPV) - Agirre-Mauleon, Juantxo (Aranzadi Science Society) - Mujika-Alustiza, Jose Antonio (EHU/UPV) - García, Jesús (Gobierno de Navarra) - Sesma, Jesús (Gobierno de Navarra) - Iriarte, Eneko (UBU)

The archeological survey works carried out in the Irulegi site, located on top of the Irulegi mountain (Aranguren Valley, Navarre), indicate that it is one of the most prominent examples of protohistoric fortified villages in the vasconic territory in the western circumpyrenean area due to its long diachrony and the good preservation of its remains.

This site has been prospected in an intra-site interdisciplinary approach, using different geophysical and direct methods. Geophysical prospections, geo-archaeological surveys, chemostratigraphic analysis, test-pits and excavations have been made in the area.

From the surveys carried out, it is inferred that the hillfort was erected for defensive purposes and for control of the surrounding territory in the Middle Advanced Bronze Age, between the 15th and 11th centuries BC, in the context of the rise of fortified settlements in the nearby areas. Since then, and throughout the Iron Age, it has been occupied until the first third of the 1st century BC, when it was abandoned after an attack by the Roman troops in the context of the Sertorian wars.

This continuity in the archaeological record, together with the excellent quality and preservation of the archaeological evidences that were found, makes Irulegi a reference settlement for the knowledge of the emergence of fortified settlements in strategically important locations as the Irulegi mountain and the socio-economic evolution of the protohistorical populations in the circumpyrenean area.

17 HILLFORTS IN CENTRAL-WESTERN IBERIA. INTERPRETATIVE BIASES AND NEW APPROACHES IN THE STUDY OF HILLTOP SITES

Menéndez-Marsh, Fernando (University of Groningen)

The 2nd Iron Age (4th century BC-1st century BC) in central-western Iberia is associated with the presence of fortified settlements located on hilltop locations. The most characteristic feature of these sites is the presence of defensive elements enclosing the elevated location. Despite being the most representative archaeological site of this period in Northern Alentejo (Portugal) and Western Extremadura (Spain), knowledge of these sites is unfortunately limited.

The preponderance of classical sources over archaeology and ideological uses of the 'indigenous resistance' discourse against Rome have provoked an absence of an Iron Age archaeological tradition and the focus on certain topics such as ethnicity. Consequently, the interpretations of the hillforts have been subjected to be fitted within the descriptive structure set by the classical authors who wrote about the indigenous communities from etic points of view. Moreover, the interpretations of these sites are affected by generalisation (features identified in one hillfort are assumed to be present in others), an excessive focus on functional interpretations of the enclosures, and of erroneous chronological interpretations derived from their assumed condition of index-fossils of the pre-Roman period. Additionally, the narratives surrounding their abandonment are influenced by the traditional 'romanisation' framework producing unsatisfactory and Romano-centric perspectives.

In this proposal, a Landscape Archaeology study of hillfort location will be presented which attempts to go beyond the issues presented previously and propose alternative interpretations derived from their spatial setting within the territory.

18 SAME HILL, DIFFERENT CLIMB? A MACROREGIONAL COMPARATIVE ANALYSIS OF FORTIFIED HILLTOP SETTLEMENTS

Davies, Kelly (Cardiff University)

Fortified hilltop settlements, or 'hillforts', have been built by different societies around the world for millennia. They are often a dominant feature within their landscapes, archaeological interpretations, and public perceptions of heritage. There are up to 30,000 later prehistoric hillforts across Europe, as well as numerous examples of comparable earthen constructions in Asia, Africa, Oceania, and North and South America.

This ongoing PhD research aims to transcend regional, chronological, and disciplinary boundaries to offer a macro-regional analysis of fortified settlements. Utilising case studies in New Zealand, Japan, and the USA, and a mix-methods approach combining archaeological, ethnographic, and experiential data, the research aims to understand why these unconnected societies chose to build and use 'hillforts'? What difference(s) and repetition(s) can be seen between these societies and their fortified settlements? And moreover, by conducting a comparative analysis of these case studies, what insights might we gain for our understanding of European Iron Age hillforts?

19 FORGING IDENTITY: EXPLORING THE CULTURAL IMPACT OF WALL CIRCUITS IN THE TARANTO REGION

Rizzo, Raffaele (University of Bari Aldo Moro)

The construction of wall circuits represents a process through which a community builds its own identity, alters the surrounding landscape, and creates its own "landscape of memory". The period between the end of the Bronze Age and the arrival of Greek settlers in southern Apulia represents an excellent example of these dynamics, which can be investigated through GIS. Spatial analyses such as visibility, accessibility, catchment or network analysis help reconstruct the impact of walls on the territory and on different communities, reconstructing communication networks among various settlements or assessing their recognizability in the territory. In the specific case, furthermore, the study of fortifications can help reconstruct and evaluate settlement dynamics in the area of Taranto before and after the arrival of Greek colonists. Within the communities of Salento, indeed, the construction of walls can be interpreted as an action of the community, coordinated by an emerging elite that channels the workforce. In the moment following the arrival of the colonists, however, the walls allow the definition of a new and dynamic border area or middle ground and the reconstruction of the expansion of colonists into the chora.

20 FORTIFIED LANDSCAPES IN ANCIENT EPIRUS: NEW RESEARCH IN THE HELLENISTIC SITE OF ÇUKA E AJTOIT (ALBANIA)

Bogdani, Julian (Sapienza University of Rome)

Fortifications are a very well-known and paramount feature of the archaeology of ancient Epirus, and as such, have been made objects of many studies in the last century. On the other hand, stratigraphic data has been for many decades very scarce, only limited to major centres and never directly related to defensive structures. If we add to this the often-inaccessible nature of the minor fortified sites, it becomes clear why stylistic analysis is traditionally the only methodology available in dealing with these infrastructures.

The recent generalised availability of affordable technologies capable of documenting remote areas with accurate metric precision, such as photogrammetry from drone-captured images or LiDAR, is slowly changing our perspective. The study case of the hilltop site of Çuka e Ajtoit, a fortified site of the Late-Classical and Hellenistic period is highly significant in the context of coastal Epirus. The circuit of the fortifications is fully integrated into the natural slopes and cliffs and provides a detailed overview of different masonry techniques used in the region, from irregular polygonal to trapezoidal, and finally to ashlar, challenging the traditional chrono-typological model used so far. Trenches excavated

in different areas of the site are providing additional stratigraphic evidence to call into question chronologies of contexts based uniquely on masonry styles, at least at Çuka e Ajtoit.

While data collected with new protocols are still statistically limited and style-based dating remains for the time being the main recourse we have for regional-scale analysis, it is possible to start a broader methodological discussion based on our enhanced capability of collecting and analysing highly precise and detailed data from the field.

21 THE ROLE OF ARCHITECTURAL TRANSFER IN THE PRE-ROMAN DACIAN LANDSCAPE OF POWER: THE CASE OF HELLENISTIC TOWERS

Dragan, Andreea (Institute of Archaeology and Art History Cluj-Napoca, The Romanian Academy) - Ferencz, Iosif (The Museum of Dacian and Roman Civilization Deva, Romania; West University of Timișoara, Romania) - Rogobete, Carmen (Independent researcher; Yardi Systems) - Gál, Ágnes (Babeș-Bolyai University)

The architectural landscape of pre-Roman Dacia witnessed a specific convergence of Mediterranean influences and local adaptations, particularly evident in the construction of stone towers as part of fortified sites. These towers emerge starting with the 1st c. BCE as a distinct architectural phenomenon within the regional context of fortified settlements. They introduce in the local built landscape a new type of construction, using new types of materials, which prove an intimate understanding of Greek architecture either from the part of the commissioner or architect and, at the same time, mirror a stark distance from the local architecture of buildings through size, sturdiness and even colours. However, while Dacian towers owe their genesis to Hellenistic architectural paradigms, their development reflects indigenous agency in the choice of materials, function and spatial configuration, thereby infusing the architectural landscape with hybrid expressions.

Starting from the idea that the built landscape has the capacity to activate specific behaviour and attitudes of those interacting with it, this paper aims to explore the potential of Late Iron Age towers from pre-Roman Dacia in instrumentalising social, economic and political strategies. The complexity of factors that intertwine towards an architectural choice and its realisation will be explored through a comparative lens focusing on the roles and spatial arrangements of Dacian towers vis-à-vis Hellenistic structures. Ultimately, the study will examine how the reference to cosmographical distant places of political and cultural prestige could have been used by the leading actors of pre-Roman Dacia as social and ideological content, inferring their integration into broader networks of cultural and political prestige, yet anchored in a local set of exigencies and aspirations.

472 ARCHAEOLOGIES OF CLIMATE CHANGE?: CURRENT ISSUES AND FUTURE DIRECTIONS

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Heitz, Caroline (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research) - Riede, Felix (Aarhus University, School of Culture and Society, Department of Archeology and Heritage Studies; Aarhus University, iCLIMATE Aarhus University Interdisciplinary Centre for Climate Change) - Bogaard, Amy (University of Oxford, School of Archaeology) - Hafner, Albert (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research) - Ruiz-Giralt, Abel (Culture, Archaeology and Socio-Ecological Dynamics, Universitat Pompeu Fabra)

Session format: Regular session

Global warming is currently one of the biggest societal challenges that also affects scientific disciplines like archaeology. This was emphasized by the 'EAA 2021 Kiel Statement on Archaeology and Climate Change'. The effects of climatic changes on ancient civilizations have been studied since the early 20th century, but the range of research topics regarding climate change and archaeology has expanded considerably in recent years. In this session we seek to gain a deeper understanding of the thematic interdependencies among the many contemporary 'archaeology of climate change' by mapping these fields of research and their diversity. This involves a broad range of topics, from new, interdisciplinary approaches to research on the impact and social response to climate change in the past, over threats to archaeological heritage due to climate change today and the relevance of insights from archaeologies' unique long-term perspective for the present and future challenges of global warming. Not least, climate change communication is also becoming an acute topic in archaeological practice, from sustainable excavation methods to public outreach, from carbon-reduction in conference organization to museum exhibitions. We invite scholars from all archaeologies and adjacent disciplines to present their latest theoretical, methodological as well as case study-based work to discuss the following questions:

- How do current experiences and societal debates influence our hypothesis and narratives of the past regarding climate change?
- What terminology and interdisciplinary methodologies need further development to research climatic changes and climate related hazards in the past?

- How is global warming endangering archaeological sites and what measures could be taken to ensure their preservation?

- How can we translate archaeological research results to relevant publics, and what are major hurdles?

With these questions, we would like to carve out the current debates, to explore the future avenues for the 'archaeologies of climate change'.

ABSTRACTS

1 CLIMATE CHANGE RESILIENCE AND VULNERABILITIES OF WATERFRONT COMMUNITIES - MIXED METHODS RESEARCH ON 'PILE DWELLINGS' AROUND THE ALPS (4000-800 BCE)

Heitz, Caroline (University of Bern, Institute of Archaeological Sciences, OCCR) - Ismail-Meyer, Kristin (University of Basel, Integrative Prehistory and Archeological Science (IPAS)) - Aellen, Cyrielle (University of Bern, Institute of Archaeological Sciences, OCCR) - Roe, Joe (University of Bern, Institute of Archaeological Sciences, OCCR)

Exploring how waterfront communities coped with floods and long-term lake level changes in the prehistoric past is crucial for a deeper understanding of the vulnerabilities and resilience capabilities related to climate-driven hydrological hazards in the present and future. In this paper responses to climate change effects on lakeshore settlements during the Neolithic and Bronze Age in the Alpine region will be examined using high temporal resolution data from the UNESCO World Heritage pile dwellings. Rising lake levels repeatedly rendered former lakeshore settlement areas uninhabitable and led to temporary interruptions of local settlement activities. To omit pitfalls of environmental determinism and to critically assess the narrative of the causal influence of climatic variability, we apply a socio-archaeological mixed methods approach that combines qualitative and quantitative methods from archaeology and micromorphology with time series statistics on temporally highly resolved archaeological and paleoclimatic proxy data. First results show that Late Neolithic settlements were resistant to seasonal flooding but vulnerable to longer-term lake level rises of higher magnitudes. Settlement communities as such, however, were resilient to both, as spatial mobility and translocal socio-spatial configurations were an inherent part of their way of life. For the Bronze Age, however, these interrelationships are still poorly understood and subject of our current research project "RISE: Climate Change Resilience and Vulnerabilities of Bronze Age Waterfront Communities (2200-800 BCE)".

2 LEAPING INTO THE BRONZE AGE: UNDERSTANDING THE COMPLEX INTERPLAY BETWEEN CLIMATE AND HUMANS IN BELGIUM AROUND THE 3.2 KA EVENT

Leonard, Hannah (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel) - Capuzzo, Giacomo (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel; University Of Trento: Department Of Humanities; Bagolini Laboratory: Archaeology, Archaeometry, Photography) - De Mulder, Guy (Ghent University Archaeology Department, Research Group Protohistory) - Deforce, Koen (Royal Belgian Institute of Natural Sciences, Research Group Quaternary Environments And Humans) - Pincé, Possum (Royal Belgian Institute of Natural Sciences, Research Group Quaternary Environments And Humans) - Boudin, Mathieu (Royal Institute of Cultural Heritage, Radiocarbon Dating Laboratory) - Verheyden, Sophie (Royal Belgian Institute of Natural Sciences, Research Group Geological Survey Of Belgium) - Snoeck, Christophe (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel)

Global concerns about climate change are ever-growing and an emphasis on how these events will impact contemporary societies has led us to look to the past to see how previous populations were affected, especially during the Bronze Age. The LEAP project (LEARNING from the Past) seeks to answer this by evaluating the impact of Rapid Climate Change events (RCCs) on pre- and protohistoric societies and the environment in Belgium through a multidisciplinary approach.

Palaeoclimatic, palaeoenvironmental and palaeomobility data are used to see potential repercussions of the 3.2 ka BP climate event on the transition from the Middle to the Late Bronze Age in Belgium. Statistical modelling applied to available radiocarbon data for Belgium shows a population contraction during the Middle Bronze Age, followed by a resurgence during and after the 3.2 event and a shift in funerary practice from cremation deposits under barrows to cremations in flat graves (urnfields). Strontium isotope analysis comparing populations before and after the 3.2 RCC provides an additional framework for investigation and highlights potential episodes of human mobility and changes in funerary rites, as well as changes in landscape use that can be correlated to climatic deterioration or improvement.

Through using this data, we can see how climate change can affect past communities and place today's climate change within this historical perspective. Through a consideration of the environmental and societal impacts, the LEAP project hopes to be able to inform policymakers on potential future scenarios and enhance public awareness.

3 DEMOGRAPHIC DYNAMICS BETWEEN 3550-1550 BCE IN SELECTED STUDY REGIONS OF CENTRAL EUROPE AND THE ROLE OF REGIONAL CLIMATE INFLUENCES

Großmann, Ralph (Pre- and Protohistoric Archaeology Kiel)

It is clear that environmental hazards recurred throughout the Holocene. Episodes of increased socio-environmental stress combined with resource scarcity are likely to have promoted demographic breakdowns and possibly triggered migrations.

Here, we test hypotheses of socio-environmental dynamics from a European perspective and present results on the impact of climate and environmental hazards on past societies.

Specifically, this project aims to calculate and compare human activity and demographic trends based on ^{14}C summed probability distributions (SPDs) for three Central European regions with a high concentration of archaeological sites and radiocarbon dates, which serve as a proxy for demographic trends. In addition to the published data, we present other proxies for human activity based on environmental or land openness data.

The study regions include: The Circumharz region, the Northern Alpine foreland, and the Czech Republic/Lower Austria. We focus our research on the Late Neolithic to Early Bronze Age.

In addition, the demographic results are correlated with regional climate data in order to assess the impact of environmental hazards, in particular climatic bond events.

The results show that demographic "booms" in one region were accompanied by "busts" in neighbouring regions, raising the possibility that regions prospered at the expense of their neighbours or that population shifted from one region to another. In addition, the results show statistical correlations between population fluctuations and hydroclimatic patterns. Thus, climate was at least partially responsible for demographic trends and may have had an impact on social inequality.

4 THOUGHTS ON CHRONOLOGY: CURRENT PROBLEMS AND POSSIBLE FUTURE DIRECTIONS FOR COMPARING PALAEOCLIMATOLOGICAL AND ARCHAEOLOGICAL DATA

Schirrmacher, Julien (Christian-Albrechts-Universität Kiel)

As highlighted by the 'EAA 2021 Kiel Statement on Archaeology and Climate Change' archaeological and palaeoclimatological research together offer the opportunity to learn from the past. However, the basis for this is precise and robust chronologies in both archaeological and palaeoclimatological data. A particular problem here is certainly the rather small number of precise age control points – especially in older archives. In palaeoclimatological datasets, this often leads to a vague temporal determination of climatic events. For archaeological datasets, the dependence on broad cultural epochs (e.g. Neolithic, Bronze Age etc.) is a crucial issue. A suitable solution to this is not only to increase the number of datings in future studies, but also to organize interdisciplinary fieldwork hand in hand. Furthermore, working with already available data can help us to avoid certain pitfalls for future studies.

In this talk I will present my personal thoughts on current problems of chronology when comparing palaeoclimatological and archaeological data. These problems will be illustrated using published and unpublished data. An updated aoristic approach will be presented as a possible methodological solution when working with existing data. In terms of future directions for the generation and comparison of palaeoclimatological and archaeological data, I will present our strategy for a recent fieldwork in Andalusia.

5 THE ARCHAEOLOGY OF CLIMATE: SEARCHING FOR RAINS IN THE THEBAN NECROPOLIS (EGYPT) IN THE 16TH CENTURY BC

López, Laura (CSIC, Madrid)

A Spanish archaeological mission, known as Proyecto Djehuty, has been working on the excavation and restoration of the tomb-chapels of Djehuty, Hery (TT11-12) and its surroundings at the north of Dra Abu el-Naga since 2001. In front of the open courtyard of TT 11, a relatively large mudbrick offering chapel and its enclosure wall was found, dating to the 17th or very early 18th Dynasty (ca. 1520 BC).

The excavations conducted around the mudbrick chapel and its surrounding wall uncovered evidence of substantial rainfall that is clearly preserved in the stratigraphic sequence. This rainfall led to the destruction of a portion of the chapel and the flooding of its shaft.

This talk aims to present an initial examination of heavy rains and their impact on the necropolis attested in the stratigraphy. Based on the consistency of pottery chronology, the decorated plaster fragments from the chapel, and wooden votive figurines found near the structure, it is proposed that the heavy rains occurred at the very beginning of the 18th dynasty (ca. 1520 BC). This climatic event can be associated with the incident described in the so called "Storm Stela" during the reign of King Ahmose.

6 IDENTIFYING RESILIENT CULTIVATION STRATEGIES IN RELATION TO CLIMATE CHANGE IN PREHISTORY

Bishop, Rosie (University of Stavanger)

Identifying resilience in relation to climate change in the archaeological record is not straight forward. There are challenges with identifying chronologically and spatially relevant climate shifts that would have affected past human communities, and in establishing causality between contemporary climate changes and human actions in the past. There is also a need to avoid environmental determinism when comparing archaeological and palaeoclimate data. Ultimately, to overcome these issues, sophisticated approaches which combine multiple strands of evidence from different disciplines and diverse theoretical approaches are required.

This presentation will discuss these issues using a case-study which explains current evidence for resilience and adaptation of cultivation strategies in Neolithic Scotland. The evidence for differences within and between regions with regards to agricultural and societal adaptations at this time, as well as for temporal change in agricultural practices highlights potential interactions between local short-term human decisions and the impact of longer-term climate change, although there are challenges with linking this evidence to climate change. The presentation will then outline a new interdisciplinary research project, which will build on this research, with the aim to develop the methodology for identifying resilient agricultural practices in the past in relation to climate change. Using a comparative approach focusing on Atlantic Scotland and Southern Norway throughout prehistory and by incorporating data from different disciplines, the project aims to provide a more sophisticated understanding of long-term human-climate interactions in the past.

7 QUANTITATIVE ETHNOARCHAEOLOGY AS A TOOL FOR EXPLORING HUMAN ADAPTATION TO CLIMATE CHANGE

Ruiz-Giralt, Abel (Pompeu Fabra University) - Biagetti, Stefano (Pompeu Fabra University; University of the Witwatersrand) - Lancelotti, Carla (Pompeu Fabra University; ICREA (Catalan Institution for Research and Advanced Studies))

Traditional ecological knowledge represents a rich reservoir of adaptive solutions for various environmental and climatic conditions. Traditional socio-ecological systems often emerge from long-term processes of adaptation at the local level, resulting in highly resilient systems that have endured for hundreds or even thousands of years. In this paper, we propose the utilization of computer modeling techniques to explore past-to-present food systems through time. To do so, we employ ethnographic information recorded over the last 200 years, retrieved from large online databases (such as eHRAF, D-PLACE). Unlike particularistic studies focusing on one or a few cases, this transcultural, cross-temporary approach can highlight patterns of human ecological behaviour shared among different communities regardless of time and space. As archaeologists, employing such a procedure allow us to enhance our understanding of the adaptive mechanisms shaping long-term socio-ecological systems in the past. This is extremely relevant in addressing the challenges that humanity is facing in relation to the ongoing ecological crisis, thereby showing the importance of including humanities and social sciences in the battle against climate change.

8 INSIGHTS ON TERRACE FARMING AND HUMAN ADAPTATIONS TO LATE HOLOCENE CLIMATE CHANGE IN NORTHERN APENNINES (ITALY)

Brandolini, Filippo (Massachusetts Institute of Technology ; Università degli Studi di Milano)

This study pioneers the utilization of Optically Stimulated Luminescence Profiling and Dating (OSL-PD) in the realm of Italian landscape archaeology. Focused on the Northern Apennines region, its primary objective is to unearth the origins of terrace farming systems. The findings paint a vivid temporal portrait, suggesting that the establishment of agricultural terraces predominantly unfolded during the 11th to 13th century CE. This pivotal period closely intertwines with intricate socio-economic dynamics, such as the “encastellation process”, and coincides with the climatic fluctuations characterizing the Medieval Climate Anomaly (MCA). Subsequently, the historical rural landscape witnessed continuous transformations in the centuries that ensued.

Notably, the main phases of reconstruction correspond to the coldest periods of the Little Ice Age (LIA), offering new insights into the historical interactions between human activities and the environment during the Late Holocene in this study area. Moreover, this research seeks to provide insights beyond the archaeological context, highlighting the enduring significance of terrace farming as a viable agricultural approach in response to the current changing environmental conditions posed by Current Global Warming (CGW) in Northern Italy.

9 FOOD PRODUCTION, CLIMATE ADAPTATIONS AND ECONOMIC INTEGRATION IN NE IBERIA: A MESSAGE FROM THE PAST TO THE FUTURE THROUGH BIOARCHAEOLOGY

Nieto-Espinet, Ariadna (Grup d'Investigació Prehistòrica (GIP), Departament de Geografia, Història i Història de l'Art, 2021-SGR-01607-ARQHISTEC, pl. Victor Siurana 1, University of Lleida, 25003, Lleida, Spain.) - Tarongi, Miguel (ISEM-UMR 5554, University of Montpellier, CNRS, EPHE, IRD, 2 place Eugène Bataillon, CC065, bat. 21, Montpellier, Cedex 5 34095, France) - Aguilera, Mònica (Dep. de Ciència i Enginyeria Forestal i Agrícola, ETSEA, Av. Alcalde Rovira Roure 191, University of Lleida, 25198, Lleida, Spain.) - Alonso, Natàlia (Grup d'Investigació Prehistòrica (GIP), Departament de Geografia, Història i Història de l'Art, 2021-SGR-01607-ARQHISTEC, pl. Victor Siurana 1, University of Lleida, 25003, Lleida, Spain.)

Since its implementation, the Common Agricultural Policy (CAP) has played a significant role in the transformation of crop and livestock farming in Mediterranean landscape areas. Through its subsidy and support policies, the CAP has encouraged the production of certain crops and livestock practices to the detriment of others, leading to a radical change in the agricultural and livestock structure of these regions. Priority has been given to intensive high-yielding crops, as well as intensive livestock with “improved” breeds. On the other hand, more sustainable traditional agro-pastoral systems adapted to the Mediterranean environment have been progressively abandoned. This has had a significant impact on biodiversity, agricultural landscapes, and has contributed to the loss of biological and cultural diversity across Europe.

With climate change and the energy crisis, an intense debate has emerged on the sustainability and impact of the current food production model, which relies heavily on non-renewable natural resources.

In this paper, we aim to address these questions from a diachronic and interdisciplinary approach that integrates archaeozoological and archaeobotanical data from the NE peninsula between the Neolithic and Medieval periods. The results provided warn, on the one hand, of the current disconnection between agricultural models and local ecosystems. On the other hand, they show the potential of bioarchaeological research to provide knowledge on the evolution of agricultural and livestock practices, as well as their adaptation and complementarity in different political systems. Bioarchaeology can provide key insights into which livestock and agricultural species that have been the most sustainable in Mediterranean landscapes over time. In this sense, knowledge transfer is crucial to establishing an effective dialogue between science and society, connecting the past with the present. We will reflect on how bioarchaeological research rooted in the territory facilitates the transfer of knowledge with citizens, producers, and local public administrations.

10 THE IMPACT OF CLIMATE CHANGE ON YORTA YORTA INDIGENOUS ARCHAEOLOGY IN THE MURRAY RIVER REGION, SOUTHERN AUSTRALIA

Bestel, Sheahan (Independent Researcher)

The Yorta Yorta people have lived along the banks of the Murray River for at least 20,000 years. Yorta Yorta lands flooded periodically throughout prehistory, so communities living here are used to regular flooding. Today, however, their cultural heritage is under threat from climate change, including from the ever-increasing floods that wash away or damage cultural heritage sites including mounds, middens, artefact scatters and ancestral remains. The introduction of weirs and locks on the river has attempted to control the floods, but climate change means the floods are becoming more and more erratic and sometimes the weirs overflow after heavy rains. Yorta Yorta staff including cultural heritage officers and archaeologists are now carrying out works to monitor and protect cultural heritage after recent devastating floods. I will discuss recent archaeological monitoring and cultural heritage protection works carried out by the Yorta Yorta which attempt to mitigate the effects of climate change.

11 FROM SATELLITES TO SHORES TO STAKEHOLDERS: DECODING CLIMATE CHANGE'S IMPACT ON AFRICA'S COASTAL HERITAGE - INSIGHTS FROM SENEGAL, KENYA, TANZANIA

Ochungo, Pamela (British Institute in Eastern Africa) - Akintayo, Akinbowale (University of York) - Athie, Adama (Institut Fondamental d'Afrique Noire) - Kabiru, Angela (British Institute in Eastern Africa) - Merlo, Stefania (McDonald Institute for Archaeological Research, University of Cambridge) - Michaut, Elias (McDonald Institute for Archaeological Research, University of Cambridge) - Ndiaye, Assane (Institut Fondamental d'Afrique Noire) - Nema, Victoria (Digital Earth Africa) - Sagna, Nicolas (Institut Fondamental d'Afrique Noire) - Lane, Paul (McDonald Institute for Archaeological Research, University of Cambridge)

For the past 40 years, research and action on the impact of climate change on archaeological sites has enormously benefitted from the use of remote sensing and spatial modelling. The advent of freely accessible satellite imagery, such as the Landsat archive provided by USGS and NASA, has facilitated longitudinal studies of past and more recent environmental changes, including forest dynamics and coastal lineaments and assisted in the prediction of future threats. In Africa, the impact of global warming on heritage at smaller scales has been relatively underexplored, pri-

marily due to limited availability of digital data on heritage sites and personnel to undertake threat assessments. At the same time, the predominant reliance on non-digital means of communicating of key stakeholders, such as National Authorities and other bodies that are mandated with the safeguard and monitoring of sites, is a challenge to the communication of results from computational analysis. In this paper, using the case study of coastal vulnerability mapping in Kenya, Tanzania and Senegal, we showcase a methodology developed by the Mapping Africa's Endangered Sites & Monuments (MAEASaM) project that combines the use of digital approaches (such as the systematic creation of digital data on sites and monuments and the use of remote sensing based multitemporal modelling) with conventional cartographic methods, (e.g., like printed maps/reports) to enhance information sharing's reach and efficiency while also accommodating the varied technological capacities and preferences of our stakeholders. Combining information on hundreds of coastal sites in the MAEASaM Arches database and leveraging Digital Earth's Africa Coastal Erosion Datacube, we evaluated shoreline evolution from 1985 to 2023 to identify sites most susceptible to coastal erosion. The results offer insights into the spatial dynamics of coastal vulnerability that we have presented to diverse stakeholders via a combination of static and dynamic presentations.

12 FIRE ARCHAEOLOGY: ASSESSING, MANAGING, AND PREVENTING FUTURE DAMAGE TO ARCHAEOLOGICAL SITES FROM INCREASING FIRE SEASONS DUE TO CLIMATE CHANGE

Swenson, Dain (Büro für Archäologie Neupert, Kozik, & Simm)

By the year 2100, climate change projections predict temperature increases on the European continent of 2.1 to as much as 5.7 degrees centigrade, depending on the long-term actions taken to thwart carbon emissions by national governments. This increase in temperature has broad implications for European ecosystems and regional climates. Already some nations in Europe have begun grappling with the consequences of the warming climate. In 2018, large forest fires swept through Sweden. In 2023 there were summer fires in Greece, Portugal, Spain, and Italy. Europe is being forced to adapt to summer fire seasons which are increasingly similar to those experienced in North America, and they will continue to grow as temperatures climb this century. As experience has shown archaeologists in North America, a strategy of disaster prevention planning and management has been successful in limiting damage to cultural heritage sites in vulnerable parts of the USA. A sub-discipline focused on the protection of cultural heritage in vulnerable areas during the wildfire seasons has developed. These "Fire Archaeologists" work closely with national park services, tribal governments, and fire fighters to identify and protect vulnerable sites such as rock art, historic buildings, or other areas susceptible to ongoing fires. This paper will briefly discuss projected regions on the Europe with high risk of seasonal fires according to current climate change predictions, provide an overview of the strategies used in north America by fire archaeologists, and conclude by discussing current readiness levels and strategies which archaeologists in Europe may consider moving forward, with the goal of planning for changing fire risk to cultural heritage in Europe.

Keywords: fire archaeology, climate change, risk mitigation, cultural heritage.

13 ARCHAEOLOGIES OF CLIMATE CHANGE: THE CASE OF THE ARCHAEOLOGICAL SITE OF OLYMPIA

Pateraki, Kleanthi (Currently Independent Researcher)

The archaeological site of Olympia in western Peloponnese, Greece has been a UNESCO World Heritage Site since 1989. It was included on the World Heritage List on the basis of criteria I, II, III, IV and VI. It is the second most visited archaeological site of Greece after the Acropolis.

The aim of this oral presentation is to examine the archaeological site of Olympia as a typical example of an archaeological site which has been strongly affected by climatic changes during the last 24 years.

Attention will be focused on the natural disasters and extreme weather phenomena, such as earthquakes, floods, fires, windstorms, and hail that have threatened to overwhelm the specific archaeological site since 2000.

In addition, the measures that all the relevant agencies (the Hellenic Ministry of Culture, the Ephorate of Antiquities of Iliia, the German Archaeological Institute of Athens, etc.) have taken, in order to protect the site when these phenomena occur, will be presented.

14 THE HISTORIC ENVIRONMENT AS AN AGENT OF CHANGE IN THE CLIMATE EMERGENCY: A COMMUNITY CENTRED APPROACH

Scardina, Audrey (Historic Environment Scotland)

Environmental change over time has always impacted the built environment; however, the combination of accelerating incremental change and increasingly frequent severe weather events triggered by the climate emergency have put increasing strain on the management of the historic environment. Our Past, Our Future, the Strategy for Scotland's Historic Environment (2023) states that, 'At its heart, therefore, the historic environment is about people... about our

connections with each other and with our places and planet; about the legacies we inherit and those we leave behind. The historic environment is Scotland's story. And it is Scotland's future'. How, then, can historic environment management and policy bring people to the forefront of the conversation, adapting to community needs to be flexible, yet resilient, in the face of climate change and loss? And, if we change our perspectives to see the historic environment as something that is active, ever-changing and defined by the people, connections, and stories it entails, how does that shift our capacity to engage with it?

This paper will present the initial findings of a two-year-long, Arts and Humanities Research Council funded postdoctoral research project at Historic Environment Scotland (HES) which has set out to answer these questions through the running community engagement events at historic and archaeological sites managed by HES. In it, I will present the methodology for grassroots engagement with communities, methods of data analysis used, and initial results of community perspectives on issues such as loss of the historic environment, how can these HES managed sites give back to communities, and other key topics related to the climate emergency.

15 ENDANGERED HERITAGE - CLIMATE CHANGE RISK ASSESSMENT AND MITIGATION TOOL WITHIN THE TRIQUETRA PROJECT (SMUSZEWO - CASE STUDY)

Byszewska-Lasinska, Agata (National Institute of Cultural Heritage, Poland)

The climate changes we are experiencing often have a negative impact on archaeological heritage. There are many factors caused by climate changes that pose a threat to archaeological relics - heavy rains, floods, periods of drought, changes in groundwater levels, changes in the nature of vegetation, erosion. The first step for countering the effects of climate change in the context of archaeological heritage preservation is to identify and assess the impact of individual factors on archaeological structures, and then to develop appropriate tools for assessing and mitigating the effects of threats. The project TRIQUETRA Toolbox for assessing and mitigating Climate Change risks and natural hazards threatening Cultural Heritage is dedicated to develop such tools. One of the planned results is the construction of a platform to assess the impact of various types of hazards on monuments. A systematic approach to identifying threats will be possible through the introduction and testing innovative technologies for their assessment, (Flash Lidar for 3D mapping of underwater relics and attempts to monitor erosion, a spectroscopic sensor for monitoring water quality and so on.

In my paper, I'd like to present various types of TRIQUETRA tools tested at an archaeological site - relics of a defensive settlement of the Lusatian culture in Smuszewo (Poland). The wooden structures, preserved underground and underwater, are threatened due to fluctuations in water levels and rising temperatures, algal blooms or local flooding caused by heavy rainfall, as well as agricultural practices (among other things, by associated chemical changes in soil and water). The solutions developed under the project will allow to assess the risks and develop a strategy to counteract the effects of climate change not only at this site, but will be applicable in similar situations, for other archaeological sites.

16 KEEPING UP WITH THE CORROSION: HOW CLIMATE CHANGE IS AFFECTING THE DETERIORATION OF METALLIC MATERIALS IN UNDERWATER CULTURAL HERITAGE SITES

Cesareo, Ludovica (Department of Geosciences, University of Padova, Padova, Italy) - Coletti, Chiara (Department of Geosciences, University of Padova, Padova, Italy) - Germinario, Luigi (Department of Geosciences, University of Padova, Padova, Italy) - Maritan, Lara (Department of Geosciences, University of Padova, Padova, Italy) - Demesticha, Stella (Department of History and Archaeology, University of Cyprus, Nicosia, Cyprus) - Martins, Flávio (Centre for Marine and Environmental Research (CIMA), University of Algarve, Faro, Portugal) - Ruberti, Fabio (IANDT S.R.L., Marina di Pisa (Pisa), Italy) - Michalis, Panagiotis (Institute of Communication and Computer Systems (ICCS), National Technical University of Athens, Athens, Greece) - Mazzoli, Claudio (Department of Geosciences, University of Padova, Padova, Italy)

In underwater archaeological sites, the metallic materials naturally undergo physical, chemical and biological changes determined by water, sediment and living organisms. But how climate change is influencing this deterioration process? This research, conducted within the THETIDA project (<https://thetida.eu>), focuses on identifying threats posed by climate change to underwater cultural heritage sites, with a specific emphasis on the diverse risks - both direct and indirect - that endanger metallic materials, such as anchors, cannons, and structural elements. Several climate phenomena have been documented in reports of the Intergovernmental Panel on Climate Change (IPCC): sea levels rising, ocean surface temperature increasing, ocean acidification, changes in ocean circulation, extreme wave events and deoxygenation. The objectives of the research are to investigate the deterioration effects associated with climate change, assess their evolution across different environments, and develop prediction models. Different pilot sites included in THETIDA offer varied historical backgrounds, construction materials, and biological ecosystems, enabling a comprehensive comparison: the US Army WWII PB4Y-1 bomber aircraft Liberator off the coast of Praia de Faro (Portugal), the sunken submarine chaser Equa near La Spezia, and an Ottoman shipwreck in Famagusta bay, Cyprus.

As first step of the project, the methodology involves monitoring variables such as temperature, salinity, pH, oxygen levels, and the intensity and direction of currents, alongside the depth and location of each site. In situ corrosion measurements analysis have been performed and mock-up samples of selected alloys have been also placed in the sites, to explore, as next step, the early stages of deterioration and biocolonisation.

Acknowledgement:

This research has been funded by European Union's Horizon Europe research and innovation programme under the THETIDA project (Grant Agreement No. 101095253) (Technologies and methods for improved resilience and sustainable preservation of underwater and coastal cultural heritage to cope with climate change, natural hazards, and environmental pollution).

17 A CHILD-FOCUSED APPROACH TO CLIMATE CHANGE EDUCATION IN THE CONTEXT OF CULTURE HISTORY MUSEUMS

Vestergaard Meyer, Mathilde (Aarhus University) - Riede, Felix (Aarhus University)

Children and playful inter-generational learning were central in how societies adapted to climate change in the past. Likewise, we also appreciate that children are vital when it comes to contemporary climate change adaptation. Yet, when searching for connections between children and climate change, most scholarly work has concerned itself with the psychological and physiological effects. The dominant approach to engaging publics in regard to climate in culture history museums, if present at all, has been limited to content exhibitions. We here assert the need for a new approach to climate change education that is child-focused. In general, culture history museums around Europe that both educate about climatic change and do so in a child-focused way are not many. This is also true for the Danish culture historical museums, where only few explicitly seek to educate children on environmental matters, highlighting the gap that needs to be filled. Working towards such a new approach, archaeology can offer evidence-based insights into the importance of children in the adaptation to climatic changes in the past. Then taking this knowledge into the present via the popular and trusted interface that museums represent will, we suggest, help to not only shed light on the importance of children's societal agency in the past but also empower them in the present. One way to communicate the, at times, challenging theme of climatic changes is via child-centred exhibitions and through gamification. Through gamified experiences, whether complete games or merely game elements, cultural learning in children will be supported in a playful yet impactful way. No matter the pedagogical methodology, bolstering the visibility of past climate change and its causal role in culture change is, we argue, essential for museums to become catalysts of positive social change in this domain.

18 ALTERNATIVE PRESERVATIONS IN THE TIME OF CLIMATE CRISIS

Cottom, Tyler (University of Amsterdam)

Climate change cannot be stopped, and will cause irreparable damage to heritage sites. In some places, it will be impossible to prevent the loss of cultural and natural properties of value. As climate changes, landscapes will also change, transforming the meaning and memories associated with them and allowing new narratives to form. There are options for dealing with this loss: to accept and forget or document and save. Archaeologists must utilise modern methods to save as much as they can in as little time as possible, using digital technology to investigate the past and salvage all viable material evidence in the digital world. As a result, digital preservation has become an essential method for the documentation of heritage resources during times of crisis. Traditionally, visitors would need to visit a site or a museum to receive historical messages, but the advent of 3D reconstruction and Virtual Reality changes that. Digital Preservation creates a new realm for research when the field is no longer safe or accessible. These preservation techniques preserve, promote, and complement heritage landscapes. Further, it allows people to revisit and lost heritage landscapes, reconnecting with cultural memories, emotions, and ties.

19 IS ARCHAEOLOGY READY TO ADDRESS THE CLIMATE HERITAGE PARADOX?

Holtorf, Cornelius (Linnaeus University)

In my paper I argue that for archaeology to address adequately the global challenges of climate change, it needs to overcome the Climate Heritage Paradox. This paradox consists of two apparent contradictions:

(1) At a time when humanity on Earth needs panhuman solidarity, trust, and collaboration to be able to face enormous global challenges together, archaeological and other forms of cultural heritage are still mostly managed and interpreted within frameworks of national governance.

(2) In contemporary society, when humanity anticipates and prepares for climate change and various associated transformations in the future, archaeological interpretation and cultural heritage management predominantly look backward and emphasize preservation and continuities.

There is, therefore, a need for developing new understandings of archaeology and cultural heritage that (a) express a need for humanity to collaborate globally and overcome national boundaries, and (b) are predominantly about stories of change and transformation rather than about preservation and continuity. I argue that such a change of framework will protect and enhance the societal benefits of archaeology and cultural heritage in the age of climate change. For as we are anticipating many transformations in the context of the climate crisis, we must rethink and transform even archaeology and cultural heritage so that it can meet contemporary and future needs.

482 "PAST IS NOT PAST": ENVIRONMENTAL EFFECTS OF PAST LAND USE ON PRESENT RESOURCES ECOLOGY. ENVIRONMENTAL ARCHAEOLOGY BETWEEN RESEARCH AND APPLICATION

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Pescini, Valentina (Catalan Institute of Classical Archaeology (ICAC), Tarragona, Spain) - Aniceti, Veronica (Consejo Superior de Investigaciones Científicas - Institució Milà i Fontanals (CSIC-IMF), Barcelona, Spain.) - Cevasco, Roberta (University of Gastronomic Sciences (UNISG), Pollenzo, Italy) - Gabellieri, Nicola (University of Trento (UNITN), Trento, Italy)

Session format: Regular session

The environmental effects of historical management and production systems are not confined to the past but persist in current resources ecology. Indeed, recent research is demonstrating how the present-day risk of uncontrolled fire, the loss of biodiversity and soil erosion are not solely attributable to climate change but also to changes in environmental management systems and the abandonment of agro-sylvo-pastoral practices that have occurred for centuries (or even millennia).

Past environmental management systems and land use have left specific geo- and bio-markers that are archaeologically identifiable in soils and sedimentary archives. These markers are the legacy of historical (and pre-historical) uses of environmental resources and serve as evidence of environmental effects that these management systems have had on the local ecosystem.

Studying these markers allows archaeologists to uncover the trajectory of environmental formation and transformation processes over time, contributing to a more comprehensive understanding of current environmental changes.

Dealing with historic environmental management involves addressing issues directly related to food production, and more broadly to foodways and their connections with local environmental resources ecology and situated landscapes (foodscapes).

How can these results be applied to improve environmental conservation and regeneration policies, promoting more sustainable management of resources?

How can these research findings be leveraged to raise social awareness about environmental issues related to food (e.g. food production/consuming/discard, food-taboos, food identities, food sovereignty)?

Our session welcomes Environmental Archaeology investigations embedded in interdisciplinary frameworks, where research results have been applied in the following areas: 1) improvement of environmental management policies 2) bio-cultural heritage enhancement 3) re-discovering of local gastronomic heritage and 4) foodways and foodscapes characterisation.

We invite contributions involving expertise from fields such as Historical Ecology, Geography, History, Anthropology, Ethnography, Gastronomy; we also encourage collaborations with non-scientific audiences, including policy-makers, local stakeholders, inhabitants and producers.

ABSTRACTS

1 DISENTANGLING THE SOCIOECOLOGICAL TRAJECTORIES OF MOUNTAIN OLD-GROWTH FORESTS IN THE FRENCH PYRENEES OVER THE LAST CENTURIES

Burri, Sylvain (TRACES UMR 5608 CNRS-Université Toulouse Jean Jaurès, France) - Saulnier, Mélanie (GEODE UMR 5602, CNRS-Université Toulouse Jean Jaurès, France) - Larrieu, Laurent (Université de Toulouse, INRAE, UMR DYNAFOR& CNPF-CRPF Occitanie, France) - Labbas, Vincent (IRPA-KIK/Université de Liège, Liège, Belgium) - Py-Saragaglia, Vanessa (GEODE UMR 5602, CNRS-Université Toulouse Jean Jaurès, France)

The key role of old-growth forests (OGFs) for biodiversity and the mitigation of global change is recognized worldwide. The European Biodiversity Strategy 2030 highlights the necessity of mapping, monitoring and strictly protecting the few remaining OGFs in Europe. Since European OGFs are not primary and fully natural ecosystems, but rather legacies of long-term socio-ecological trajectories, a prerequisite for achieving this objective is a detailed

characterisation of these OGFs from both an ecological and a historical perspective. This talk presents the results of interdisciplinary research on two old-growth fir-beech forests (Burat and Bois-Neuf, Haute-Garonne) in the French Central Pyrenees, carried out as part of the Bendys ANR project. Based on the cross-referencing of historical data on forest management, use and species and dendrological composition, and dendroecological data (from 95 fir and 56 beech), we have reconstructed the specific socio-ecological trajectories of these OGFs over the last 4 centuries and we assessed the impact of human management and use on their current species and dendrological composition.

2 "BROCCOLI OUT OF THE FOREST!" PERSPECTIVES AND ISSUES IN INTERPRETING HISTORICAL ALPINE WOODSCAPES AS FOODSCAPES

Lemmi, Francesca (University of Trento - UNITN, Trento, Italy) - Gabellieri, Nicola (University of Trento - UNITN, Trento, Italy)

In 1876, while traversing Val di Fiemme (Trentino), the English traveler Walter White amusingly observed local residents collecting cones from *Pinus cembra* to extract pine nuts consumed as food, which they referred to as "broccoli". Despite its implausibility in certain aspects, this unique testimony for the region raises the question of how to identify, characterize, and map historical practices of food production and collection in wooded environments, along with their environmental impact.

Interdisciplinary research has long sought to characterize the ecological effects of specific historical production practices, such as grazing, through the cross-utilization of documentary and field sources. However, it is more challenging to historically or archaeologically identify the consistency, prevalence, and consequences of collecting "wild" products like herbs or cones, as well as secondary resources integrated into agricultural and pastoral cycles, such as tree leaves.

In this regard, this contribution aims to explore applicable methods and sources by providing examples from the Alpine context of the current Province of Trento. Particular challenges arise from the lack of conventional archaeological evidence on the ground and the scarcity of archival documentation detailing non-taxable and loosely regulated activities. The proposal suggests rediscovering historical practices by examining current trees and vegetation cover, with a specific focus on two plant species, *Pinus cembra* and *Larix decidua*. This approach seeks a dialogue between environmental resource archaeology and historical geography to overcome the view of wooded landscapes solely as timber producers, revealing their connection to other agro-pastoral activities and a multiplicity of functions such as of "foodscape".

3 AN ARCHAEOLOGY OF GATHERING PRACTICES: TAKING ACCOUNT OF HABITAT HISTORICAL DYNAMICS

Cevasco, Roberta (Università di Scienze Gastronomiche di Pollenzo) - Pieroni, Andrea (Università di Scienze Gastronomiche di Pollenzo)

Adopting the historical approach to the gathering site/ecosystems wild food herbs and mushrooms species position could be rearranged with respect to the dichotomous categories "domestic" and "wild" in land use studies. The ethno-botanical-historical approach proposed here requires to spatially and socially contextualize local collecting practices using emic (and non-ethic) categories, recovering through multiple sources the past ecological knowledges of local gatherers/actors.

Different research carried out in North Apennines (NW Italy) has highlighted how wild food herbs and mushrooms are in a condition of semi-domestication as the presence and abundance of the collected species is the result of the activation of the ecosystem within cycles of practices of local agro-silvo-pastoral systems.

Examples relating to the collection of different mixtures of spontaneous herbs known as prebugiun and gatafin (including for example *Sonchus oleraceus*, *Hyoseris radiata*, *Reichardia picroides* - Cichorioideae sub-family), or single herb as crumbotti, a wild lactuce (*Lactuca perennis*) will be discussed in relation to their habitat history/variation in time. A special mention will be made to the collection of edible mushrooms known as spinaroli (*Calocybe gambosa*) observed directly in mountain pastures of the upper Aveto valley activated by dairy production practices.

The sources used in these researches, in addition to oral sources and historical ecology observations, are of a cartographic, iconographic and bio-sedimentary nature. To date, the results have not been applied in biodiversity conservation policies (e.g. in the management plans of the SCIs in Liguria and Piedmont, which yet include the historical gathering spaces mentioned here).

4 TRANSHUMANCE LANDSCAPES IN THE SOUTHWESTERN ITALIAN ALPS: THE CONTRIBUTION OF PALYNOLOGY IN ENVIRONMENTAL AND CULTURAL HERITAGE

Braga, Lorenzo (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia, Via Campi 287, 41125 Modena, Italy) - Rattighieri, Eleonora (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia, Via Campi 287, 41125 Modena, Italy) - Pescini, Valentina (ICAC - Instituto Catalán de Arqueología Clásica, Plaça d'en Rovellat, s/n, 43003 Tarragona, Spain) - Rellini, Ivano (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa, Corso Europa 26, 16132 Genoa) - Florenzano, Assunta (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università degli Studi di Modena e Reggio Emilia, Via Campi 287, 41125 Modena, Italy)

Past environmental management systems and land use are important factors determining the current environmental setting and changes in ecosystem structure and function over time. One such practice, transhumance, played a key role in forming and managing rural Mediterranean landscapes. Despite its inclusion in the UNESCO Intangible Cultural Heritage in 2019, transhumance is disappearing, negatively affecting biodiversity and increasing hydrogeological and wildfire risks. Understanding transhumance-influenced landscapes and biodiversity responses to pastoralism is vital to re-promote it as a virtuous management system. Its environmental impact over time can be fruitfully assessed through palynological investigations applied to biostratigraphical records from human-influenced contexts or to archaeological deposits.

This contribution presents palynological data obtained from two test-pits (T1S2, 1579 m a.s.l.; T1S3, 1742 m a.s.l.) excavated in the area of Pian Rosso-Monte Mongioie (SW Italian Alps), a historically documented transhumance area. As part of an environmental archaeological project on past transhumance practices, this work aimed to reconstruct the late Holocene plant landscape of the area, focusing on pasture indicators (pollen and non-pollen palynomorphs). In T1S2, pollen of herbs linked to pastoral practices, such as Cichorieae and other Asteraceae, and soil erosion-associated fungal spores suggest the local presence of pasture/grazing activities. Pollen deterioration typical of animal digestion was observed, further supporting this hypothesis. In T1S3, Poaceae and cereal pollen and coprophilous fungal spores were frequent, indicating local animal stalling with straw. The cross-checking of these records with radiocarbon, soil chemistry and documentary research will be discussed to untangle the complexity of past agro-silvo-pastoral practices and their effects over time. The first results of this research notably remark that, in interdisciplinary frameworks, palynological investigations provide high-resolution information on environmental changes linked to human activities. In reconstructing such a detailed environmental history, Palynology allows an assessment of historical sustainability, significantly enhancing our knowledge of past virtuous environmental management.

5 A PLEA FOR AN ENVIRONMENTAL ARCHAEOLOGY OF HUNTING RESOURCES: LOST FOODSCAPES IN THE LIGURIA MOUNTAINS (NW ITALY)

Moreno, Diego (University of Genoa)

Environmental Archaeology and Historical Ecology research carried out on a local scale (i.e. individual landscape) in the Ligurian mountains (NW Italy) have revealed how the present ecology/biodiversity (e.g. the herbaceous species composition of the ground cover) is directly related to complex historical land use practices, now completely lost. In the mid-19th century, most of the upper lands were shared in a common system of environmental resource use, the so-called "comunaglie". Through this management system, an important stock economy based on ovine transhumance was supported almost continuously since the late Middle Ages. The pastoral fire regime and general local grazing and foddering practices activated the landscape ecosystem producing several differentiated habitats that became highly suitable for game-keeping. These landscapes have now largely disappeared following over a century of abandonment of agro-silvo-pastoral practices and the effects of recent rewilding policies. Some evidence documenting the positive effects of such historical pastoral production will be discussed through the analysis of sedimentary, iconographic/cartographic, documentary, and oral sources as well as ethnographic/naturalistic museum collections. Examples (mainly situated in the NW Ligurian Apennines) will be in relation to hare (*Lepus europaeus*), wolf (*Canis lupus Linnaeus, 1758*), and fowling habitats. The interest in research on game resource planning will be also discussed. To understand this "unvoiced" management and wild animal relationships in such a particular societal context we need to redefine both the current land use categories (e.g. cultivated/uncultivated places, wild/domestic animals) as well as hunting/game practices by placing them in the historically changing local foodways.

6 UNTOUCHED WILDERNESS OR CULTURAL LANDSCAPE? HISTORICAL REINDEER CORRALS AS A TOOL FOR STUDYING PAST HUMAN INFLUENCE ON SUB-ARCTIC ECOSYSTEMS

Myrsky, Eero (University of Helsinki; Arctic Centre, University of Lapland) - Manninen, Outi (Arctic Centre, University of Lapland) - Lähteenmäki, Maria (University of Eastern Finland) - Ilmolahti, Oona (Arctic Centre, University of Lapland) - Kumpula, Timo (University of Eastern Finland) - Korpelainen, Pasi (University of Eastern Finland) - Stark, Sari (Arctic Centre, University of Lapland)

Reindeer have been a part of northern ecosystems since the beginning of the Holocene and the history of reindeer herding in Fennoscandia dates back over 1000 years. Reindeer is considered a keystone species in northern ecosystems, and can alter the structure of vegetation communities and soil properties with intense grazing. In early phases of the history of reindeer herding, animals were kept in small numbers and for different purposes, but from 1600's onwards a transition towards more large-scale herding started to occur, resulting in higher pressure on local ecosystems due to a significant growth in herd sizes. As vegetation succession in the cold environments is slow, many of the past disturbances caused by herding related activities are still visible today. Intense herding practices can even lead to a shift in vegetation to completely alternative states, where it can remain more or less stable for centuries. In this case, a dominant dwarf-shrub vegetation usually gets replaced by graminoids. Due to the long-lasting effects of land use on the environment, a sufficiently long time-scale is required to understand how past land use has shaped the landscape of the present day.

We gathered data from historical reindeer corrals from a wide geographical range in northern Fennoscandia. These corrals were used from 1800's to 1950's by local Saami people for different herding related practices such as reindeer separation, milking, and calf marking. After the cessation of their active use, the vegetation has had a long time to recover. We collected vegetation and soil data from the corrals, and also photographed many of them for the Sámi Museum Siida. We show that the present-day landscape in northern Fennoscandia is in many ways shaped by historical human influence, and that the historical herding activities still shape the landscape, resulting in distinct, often more diverse, vegetation communities.

7 CREATING LANDSCAPES. MEDITERRANEAN MARKET AND ANIMAL HUSBANDRY IN IRON AGE AND ROMAN CATALONIA: ZOOARCHAEOLOGICAL DATA IN PERSPECTIVE

Valenzuela-Lamas, Silvia (Archaeology of Social Dynamics (ASD), Institució Milà i Fontanals, Consejo Superior de Investigaciones Científicas (IMF-CSIC); Centro de Arqueologia da Universidade de Lisboa (UNIARQ))

From the Neolithic onwards, human agency over land use has progressively increased, and animal husbandry has played a significant role in the creation of landscapes. Recent regional syntheses reveal that significant changes occurred in many areas of Western Europe between the Iron Age and Roman transition, and some economic productions have persisted until today. This presentation will provide an integrated perspective of the zooarchaeological record in Catalonia (NE Spain) between the first millennium BCE and Late Antiquity (c. 800 CE) by combining archaeological, environmental, zooarchaeological and isotopic data. The archaeological record suggests that wine, cereal and wool production (and related industries) had a major impact on land use from the Iron Age onwards. This productive model has persisted –with some modifications – until recent times. The presentation will discuss the potential of archaeology to characterise long-term economic processes, and will relate present-day animal husbandry in Catalonia with the changes in forest cover, land use, and the current scenarios in the context of climate change.

484 ARCHAEOLOGIES AND HERITAGIZATIONS OF HISTORIC AND CONTEMPORARY VIOLENCE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Baillie, Britt (Roskilde Viking Ship Museum; University of Amsterdam) - Kim, Geonyoung (University of Cambridge) - Saqqa-Carazo, Miriam (Universidad Complutense de Madrid) - Renshaw, Layla (Kingston University) - Walker, Yoon (SOAS)

Session format: Regular session

In the aftermath of violence, the identification, excavation, and analysis of sites at which such acts were carried out can be key to ensuring justice and a sense of closure for the families of those who perished. Once located, the process of excavation can evoke strong reactions and at times polemical debate. These places, be they concentration camps, sites of massacre, or incarceration, can become iconic sites of commemoration and often accrue memorials or become 'sacralized' sites of memory. However, many recent conflicts are not waged by opposing militaries, but rather by paramilitary or guerilla combatants, or by state actors against their own populations. During conflicts, alliances between various groups may shift. A consensus on who to commemorate is not always forthcoming. Competitive commemoration, desecration, or willful neglect may immediately follow a conflict. In turn, the sites of 'pain' of the

'Other' may be 'orphaned' on the 'wrong' side of a border or the 'fault line of memory'. What new discursive spaces do these sites open? Can one ensure that their heritagization acknowledges their respective historical and political specificities without reify divides? What can be learned from non-state sanctioned 'grassroots' activities at these sites (without romanticizing them)? Can such sites contribute to sustainable peace?

The discovery of older historic sites of violence often result in headline grabbing articles. Does the heritagization of historic sites of violence necessarily entail voyeurism and 'dark tourism', or does it contribute to a valid exploration of violence? Can historic sites of violence be understood through the same lenses as their more contemporary counterparts? How and why does their excavation and heritagization differ from those encountered for more recent examples?

Themes may include, but are not limited to:

- archaeology of sites of violence;
- management of the material remains of violence;
- museology, memorialization, and heritage interpretation of violence.

ABSTRACTS

1 LANDSCAPES OF THE OTTOMAN CONQUEST: BATTLEFIELDS, HERITAGE, AND MEMORY IN SOUTHEASTERN EUROPE

Parvanov, Petar (National Archaeological Institute and Museum - BAS)

Nothing quite captures the historical imagination like warfare. And very few stories of conquest can match the Ottoman military expansion from Gallipoli to Vienna and its consolidation of power over the Balkan peninsula. This presentation will report on a project re-evaluating the accounts on four prominent battles through an integrated conflict archaeology perspective. The principal case studies include, the battle of Maritsa (AD1371), the first battle of Kosovo pole (AD1389), the battle of Nikopol (AD1396), and the battle of Varna (AD1444). In the centre of the approach was the understanding that battle sites are not merely the setting for interpersonal violence rather than culturally and socially constructed landscapes of conflict. The military experience in the late medieval Balkans is provisionally reconstructed by complementary textual and archaeological observations on the modes of terrain use, markings on the sites etc. Arguably, the material signature of organized warfare holds a particular value for the long-term commemoration and cultural heritage. The comparative and interdisciplinary analysis on these foci of the Ottoman conquest shows a rather disproportionate scholarly and public interest on the different sites. It also reveals the varying entanglement of contemporary interpretation and heritagization of space with the narratives about violent events in the distant past.

2 THE TANGIBLE AND INTANGIBLE LEGACY OF THE FIRST WORLD WAR: THE SASSARI BRIGADE FROM REMEMBRANCE TO MYTH

Azzalin, Giovanni (University of Sassari) - Milanese, Marco (University of Sassari) - Magnini, Luigi (University of Venice)

This paper aims to investigate how the remembrance of the Sassari Brigade – one of most famous military unit of the Royal Italian Army during the First World War – was transmitted in time, focusing on the landscape transformations from the battlefield to the existing memoryscapes. Indeed, in the aftermath of the conflict, and still today, monuments have been built on the former battlefields to remember the fallen thus becoming landmarks of celebration and glorification in the Fascist Era, then memory and, lastly, commemoration.

In order to do that, different kind of information are taken into account: firstly, archaeological data has been collected through the study of historical aerial photographs, cartography and ground truthing to reconstruct and understand the Sassari Brigade warscape; then, monuments, epigraphs, restored cemeteries and other evidence of military remembrance have been mapped to evaluate the activities carried out in memorialisation (e.g. methodology and goals of restoration). The gained information has led to investigate how memory from different generation, social extraction and geographic origin shapes the feeling concerning the brigade, thus making the places as real "pilgrimage" sites (in institutional, commemorative, associative and individual terms). These different approaches in the transmission of memory are also manifested physically through the creation of dedicated venues or events that can, sometimes, directly affect First World War sites. Emblematic are the historical re-enactments that re-excavate the original trenches in absence of archaeological expertise to use them for their purposes or, also, the countless illegal digging activities conducted by people armed mostly with metal detector that, in a kind of distorted voyeurism, disrupt the archaeological contexts. In this perspective, violence is not only simulated in events, mostly promoted to attract macabre tourism, but is also applied ex novo on sites that deserve greater protection and preservation.

3 **TRANSLATING IMPERIAL VIOLENCE: INTERNATIONAL AND DOMESTIC INTERPRETATION OF ASIA-PACIFIC WAR MUSEUMS IN KYOTO AND TOKYO, JAPAN**

Moxham, Oliver (University of Cambridge)

The Asia-Pacific War (1931-45) remains a divisive conflict in East Asia, not only between nations but also within Japan where narratives are split between progressive, peace-oriented, or nationalist perspectives. War museums present material heritage from the same conflict in contradictory ways: a medal for the annexation of Manchuria into the Japanese empire is shown with pride in the Yūshūkan Museum of War in Tokyo, while the Ritsumeikan Museum for World Peace in Kyoto presents bloodied clothing of civilians killed by Imperial Japanese soldiers to demonstrate the violence of imperial expansion.

Discourse analysis of Google Maps reviews at these museums reveals that these contradictory narratives of the Asia-Pacific War elicit opposing interpretations from domestic visitors on how the conflict and empire ought to be remembered. However, linguistically adjacent to this are the interpretations of overseas visitors, some of whom personally identify with the history of the Asia-Pacific War, seeking to understand the Japanese perspective on the conflict through translated materials at these sites.

This paper presents a year's worth of data-gathering at these two war museums, analysing their English and Japanese texts and comparing them with domestic and international visitor interpretations to understand the role of translation in facilitating or impeding intercultural narratives of past violence. My findings suggest translation is essential in allowing stakeholders of past conflicts to develop an international historical perspective. However, without consultation with international stakeholders, translated narratives of international violence can fail to address or even outright dismiss information important to international visitors. Despite this, stakeholder visitors demonstrate a capacity to learn from war narratives even when they disagree with how they represent past violence, instead providing additional information in neutral online spaces like Google Maps for future visitors.

4 **BEYOND THE FENCE: A COMPARATIVE ARCHAEOLOGY OF THE FRANCOIST CONCENTRATION CAMPS (DES-ALAMBRAR)**

Muñoz-Encinar, Laura (University of Barcelona (UB). Barcelona, Spain.; Spanish National Research Council. Institute of Heritage Sciences (INCIPIIT CSIC). Santiago de Compostela, Spain.) - Alegre Lorenz, David (Autonomous University of Barcelona (AUB). Barcelona, Spain.) - Aragüete Toribio, Zahira (Independent researcher) - Douglas, Lee (Goldsmiths University of London. London, United Kingdom.) - González-Trejo, Alejandro (Spanish National Research Council. Institute of Heritage Sciences (INCIPIIT CSIC). Santiago de Compostela, Spain.) - Incio del Río, Cristina (Spanish National Research Council. Institute of Heritage Sciences (INCIPIIT CSIC). Santiago de Compostela, Spain.) - Rodríguez-Hidalgo, Antonio (Spanish National Research Council. Institute of Archaeology of Mérida. (CSIC-Junta de Extremadura). Mérida, Spain.; Catalan Institute of Human Paleoeology and Social Human Evolution (IPHES-CERCA). Tarragona, Spain.) - González-Ruibal, Alfredo (Spanish National Research Council. Institute of Heritage Sciences (INCIPIIT CSIC). Santiago de Compostela, Spain.)

In Spain, there were nearly two hundred concentration camps. Between 367,000 and 500,000 prisoners went through those camps, from the coup d'état in July 1936 until January 1947, when the last camp ceased to operate. The 'rhetorical' end of the civil war in April 1939 resulted in tens of thousands of prisoners being (re)integrated into the social fabric of the "New Spain". From then on, thousands of inmates embarked on a journey which, in the best case, would take them to concentration camps, prisons, or forced labour camps. The diversity of spaces that the camps represent is substantially unknown, and its comparative study presents a potential source of historical knowledge. This paper outlines the first results of the project DES-ALAMBRAR, which addresses the analysis of Francoist concentration camps from the study of the material culture left behind by the violence exerted on them.

The results have provided new data about the complexity of Franco's repressive apparatus and its organisation. The outcomes of the project reveal new aspects of the role played by violence as a form of social control as well as the extreme living conditions to which the inmates were subjected. Many of them were executed or died as a result of diseases derived from the hard living conditions inside the camps. Furthermore, it allows us to shed light on the specific violence applied to women, descendants of prisoners and other minority groups in society. Our results have also allowed us to get closer to the traces of the past that remain in the present of Spanish society— where together with the multiple materialities of war and the Dictatorship, there are also concentration camps or forced labour camps, as well as the bodies of those who disappeared and the mass graves where they are buried.

5 **HERITAGE-MAKING IN SPANISH CIVIL WAR LANDSCAPES: A CASE STUDY FROM THE MERINDADES AREA, BURGOS**

Perez-Juez, Amalia (Boston University)

In 2022, we started working in an area where domestic and foreign troops gathered in 1937 to prepare a crucial episode of the Spanish Civil War: the beginning of the battle of Santander. We have catalogued remains from the Italian and Spanish troops, inventorying war-related vestiges (trenches, memorials, shelters, engravings, etc.) and recorded memories from the shrinking local population. This work serves the larger goals of the project, which include a proposal for the preservation of Civil War remains and the resignification of heritage spaces and monuments, some of which are clearly anti-democratic.

The state-led strategies implemented in the aftermath of the war to create an official history have extensively shaped the understanding of the conflict. Part of these official strategies were processes of heritage-making that left a clear imprint on the landscape, such as the oblivion of vestiges of Italian participation in the Merindades or the construction of the Memorial to the Sagardia Column. By presenting this case study, we aim to scrutinize how heritage spaces can be dealt with during the current democratic moment.

This research prompts a critical question: can the revision of places of memory contribute to contemporary peace? While this may seem idealistic, the study argues that landscapes play a crucial role in fostering a profound comprehension of war, fascism, and repression. The pursuit of knowledge can provide a pathway to better understanding, extending closure beyond the immediate local community to encompass society more broadly.

In conclusion, this presentation seeks to shed light on the transformative journey of landscapes entangled in the Spanish Civil War, offering insights into the multifaceted layers of memory, monumentalization, and heritage interpretation. The exploration of Merindades region, where the Italian troops gathered before the battle of Santander, serves as a microcosm, revealing broader implications for understanding of historical facts.

6 **COUNTER-MEMORIES OF THE SPANISH CIVIL WAR: THE VANDALISM OF THE IRON BELT (BASQUE COUNTRY)**

González Cantera, Tania (University of Girona)

War heritage helps us to understand the different narratives surrounding a traumatic historical event. For example, the Republican fortified line known as the Iron Belt reflects the memory/forgetting dynamics of the Spanish Civil War memorialization in the Basque Country. Due to its wartime importance, the Iron Belt was the first war site to receive heritage status in the region. This status has not spared it from suffering different types of vandalism (from partial destruction to the proliferation of graffiti) over the years, which has, in fact, recently intensified. This paper explores the vandalism around the Iron Belt and its surrounding heritage through a selection of three sectors. We have used an interdisciplinary method based on the creation of a geospatial database of the Iron Belt's heritage elements. This information has later been analysed by means of geographic information systems (GIS) and data visualisation (R Studio).

Results show that this phenomenon is transversal and that in some cases it has become a chronic problem. Moreover, in those sites where vandalism actions have a clear intention for vindication, as in the case of political graffiti, they are directly related to their socio-cultural context. Beyond the intention of these (re)actions that claim an alternative political model, we wonder if they also seek to promote a *damnatio memoriae* process or if any of these interventions may even be protected in the future.

7 **FROM TABOO TO COMMEMORATION: CHANGES IN AUTHORISED NARRATIVES OF THE GEOCHANG SANCHEONG-HAMYANG 1951 MASSACRES**

Kim, Geonyoung (University of Cambridge)

In February 1951, the 11th Division of the Republic of Korea Army carried out civilian massacres of civilians in the Geochang Sancheong-Hamyang of the Southern Gyeongsang Province region in South Korea. For decades, the massacres were concealed by authoritarian regimes, until a special law (Geochang Incident Special Act) was legislated in 1996. This legislation enabled the ground of the official support of the commemorations of the massacres including the construction of memorial parks and exhibition halls in the Geochang and Sancheong region.

This study aims to discuss the changes in the authorised narratives of the Korean War (1950-1953) civilian massacre sites through a comparative analysis of two local exhibitions in Geochang and Sancheong. In particular, it investigates the changes in the stakeholder power dynamics in site management that enabled the disclosure of the once-restricted past. The talk will first present an overview of the stakeholders related to the massacres both in the Korean War era and the post-legislation period. Second, it will compare the conflicting visual and textual narratives of the two exhibitions that are managed respectively by the municipality and an association of bereaved family members. Lastly,

the talk will briefly discuss the role of the exhibition display in weaving the memoryscape of the Korean War heritage as a conflicting past.

8 ISLAND OF THE BOYS - HERITAGIZATION OF VIOLENCE AND DEATH

Walker, Yoon (SOAS University of London)

This presentation introduces and examines the process of heritagization of state violence within a contemporary framework, with a specific focus on the case study of the 'Seongam Academy' in South Korea. Established as a reformatory in 1943, towards the conclusion of the Japanese colonial era, the academy served as a site where the colonial government detained boys deemed to have 'potential problems' on an island known as 'Seongam.' Isolated from the mainland, the island underwent a transformation into a concentration camp during World War II, where the boys were forcibly mobilized for the war effort under conditions of severe deprivation and violence. Following liberation, South Korea witnessed a continuation of harsh living conditions and unjust treatment within the confines of the academy. Despite the transfer of ownership to the local government, the institution persisted in maintaining a violent and scarcely survivable environment. Those held in custody endured forced labor, acute hunger, rampant abuse, and even fatalities.

The second part of this presentation will explore the transformation of the academy into a commemorative site over time. Since its closure in 1982, concerted efforts by victims, local historians, and social activists have led to its recognition as a heritage site by the local government. This presentation will illuminate how a location once marked by sorrow and violence has been transformed into a place of remembrance, allowing for the recollection of its tragic past.

9 POPULAR CULTURE AND BRITAIN'S 'SMALL WARS'

Lawes, Tonia (University College London)

Popular culture as an area of heritage is something that can also be considered when exploring historic and contemporary violence. As well as playing a role in shaping the narrative both during and after a conflict, cultural artefacts can also become sites that demonstrate changing commemoration practices, or spaces for non-state sanctioned narratives to be put forward and debated.

My focus for exploring this has been 1950's Britain, particularly cultural artefacts that depict non-World War Two conflict narratives involving the British military. Though involving a range of actors and types of warfare, i.e. guerilla and irregular, some have referred to these conflicts using the term 'Small Wars'. This term has been rightly criticised and debated for its potential to undermine the pain and perspectives of those involved in the conflict, and indeed could have a long-term influence in the way it is remembered. The focus of this paper, however, is the role of popular culture as a discursive space for negotiating and renegotiating this remembrance. Exploring how narratives in cultural artefacts (both the intended and the interpreted) question or align with each other over time can contribute new understandings to the way in which violence is interpreted and memorialized; and indicate what their role might be in encouraging or undermining sustainable peace. Furthermore, exploring popular culture can provide insights into the impact of the violence on those removed from the location itself, i.e. civilians of countries who sent soldiers to assist.

Through exploring British novels and film that depicted the Korean War (1950-1953) either during or immediately after the conflict, I will demonstrate how popular culture can contribute to our understanding of how historic violence was being understood, negotiated, and ultimately commemorated in landscapes far removed from the site of the violence itself.

10 MEMORIALIZING GENOCIDE IN SOMALILAND: WHEN POLITICAL VIOLENCE, CLANNISM, AND STATE-BUILDING INTERSECT

Elgerud, Lucia (Bohusläns Museum; University of Tennessee Knoxville)

Memorialization of mass violence can constitute an important post-conflict process for families of the dead alongside the recovery and reburial of human remains. Although in Somaliland--an autonomous but internationally unrecognized region in the Horn of Africa--such memorials would be inextricably linked to ongoing state-building processes and underlying clan power structures. A government institution in Somaliland has been surveying and exhuming mass graves from the dictatorial 1960-90s Mohamed Siad Barre regime since the region self-declared autonomy in the 1990s. The author participated in the mass grave exhumations in 2014 and later conducted ethnographic research amongst families of the dead to investigate the impacts of the work. During interviews, Isaaq clan members--the clan predominantly targeted by Siad Barre troops and the majority clan in Somaliland--called for memorialization to commemorate the dead. Alongside the need for memorials, Isaaq clan family members widely expressed the need for international recognition for Somaliland, pointing to what community members consider to be genocide--although not universally considered as such--committed during the dictatorship. Conversely, during interviews with minority clan members in Somaliland--including from the Samaroon and Gabooye clans--they expressed less favorable views toward both mass grave exhumations and memorialization, despite having lost loved ones during the dictatorship.

Somaliland minority clans too were subjected to violence with large number of killings committed, although by Isaaq rebel forces as opposed to state actors. In addition, several interviewed minority clan members were not in favor of Somaliland international recognition, opting for reunion with Somalia. This presentation explores the ways in which political violence, clannism, and state-building intersect on the topic of genocide memorials in Somaliland as uncovered during evaluations of human remains recovery operations. Moreover, this work conveys the ways in which minority clan losses become "othered" as reflected in the appeal for memorials while threatening the tenuous intra-regional peace.

11 TERRORISM AS CULTURAL HERITAGE: MAPPING MNEMONIC TRACES FROM THE 2011 TERRORIST ATTACK IN OSLO'S GOVERNMENT QUARTER

Guttormsen, Torgrim (Norwegian Institute for Cultural Heritage Research)

The focus on terrorism as contentious heritage crosses related topics within memory studies and studies of contemporary archaeology. In this presentation, terrorism is examined based on what is defined as mnemonic traces of terrorism and what these traces as 'wounds and scars' express as heritage. The approach opens up several reflexives, hence ethical as well as political, and not least conservation ideological questions. The presentation introduces the Norwegian Institute for Cultural Heritage Research's (NIKU) work in mapping mnemonic traces from the terrorist attack on 22 July 2011 in the Government Quarter in central Oslo. What traces have been documented after the terrorist attack and what significance should they have, dynamically over time in the 22 July memorial landscape and in the design and use of the new Government Quarter in Oslo? The presentation provides methodical insight into how NIKU has worked with these issues from perspectives intersecting terrorism, heritage and urban planning.

492 ASSESSING DAMAGE CAUSED TO ARCHAEOLOGICAL HERITAGE: EXPECTATIONS AND REALITY

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Olevska-Kairisa, Irina (Maastricht University) - Mödlinger, Marianne (University of Genoa; University of Innsbruck; University of Salzburg) - Kairiss, Andris (Riga Technical University) - Godfrey, Evelyne (Uffington Heritage Watch, Faringdon, Oxfordshire, England)

Session format: Regular session

Recent times have been marked by the escalation of conflicts in different parts of the world: the war in Ukraine and armed conflicts in the Middle East, to name but a few. In addition to human and material sacrifices, each such conflict deliberately or inadvertently targets heritage sites, causing irreparable loss to individuals and groups, including local and professional communities, researchers, society as a whole, and even future generations to whom our shared memory and knowledge should be passed on.

The damage caused by such heritage crime is complex and multifaceted. We aim to discuss theoretical and practical issues related to the assessment of damage caused by looting, theft and illicit trafficking in artefacts in conflict zones. Discussions will also cover the rights of those affected to access justice and obtain appropriate redress, the development and use of criteria and methodologies for identifying the socio-economic and legal impact of the illicit treatment of sites and artefacts, and preventive and post-conflict measures to reduce the damage caused.

Papers for this session may include but are not limited to:

- Crimes affecting archaeological sites and artefacts;
- Archaeological damage assessment and respective criteria;
- Legal regulation of heritage crime, including the protection of suffered parties;
- Violation of (fundamental) "cultural rights";
- Socio-economic consequences of heritage crime.

ABSTRACTS

1 CULTURAL HERITAGE UNDER THREAT - TWO YEARS OF UKRAINIAN EXPERIENCE

Androshchuk, Fedir (National Museum of History of Ukraine)

In my presentation, I will summarize two years of experience in protecting cultural heritage in Ukraine. The presentation will highlight three main directions of work undertaken by the National Museum of the History of Ukraine.

Firstly, I will discuss the preventive measures taken to protect the museum collection during the initial days and months of the Russian invasion. I will address the problems faced and provided solutions for organizing space to protect unevacuated exhibits.

Secondly, I will discuss the work done in relation to “the ICOM Red Lists” and other measures taken to prevent illicit trafficking of cultural goods during time of war.

Lastly, I will provide examples of the protection and digital documentation of museum collections and immovable cultural monuments of international significance.

In conclusion, I will draw attention to some outstanding issues that still need to be addressed, such as the development of a national strategy for protecting cultural heritage and collaboration with international supportive actors. Additionally, I will discuss legal matters concerning the documentation of crimes related to the illicit trafficking of cultural goods and their return to the country during times of war.

2 LATE SCYTHIAN SITE CHERVONY MAYAK IN KHERSON REGION: THE VICTIM OF WAR

Symonenko, Oleksandr (Institute of Archaeology National Academy of Sciences of Ukraine) - Dzeladze, Olena (Institute of Archaeology National Academy of Science of Ukraine) - Sikoza, Denys (Kherson Inspectorate of Historic and Cultural Monuments Protection)

Late Scythian archaeological complex Chervony Mayak is located on the outskirts of the same name village in Kherson region. It consists of the hill-fort and burial ground and has official rank of the site of national importance. The first graves were discovered randomly in 19th century and the necropolis was partly explored in 1976-1977 and during 1986-1988 by Moscow archaeologists. Since 2011 the burial ground is excavated by the Late Scythian expedition of the Institute of Archaeology of National Academy of Sciences of Ukraine. In total 177 burials were excavated until 2022. Earliest burials of the necropolis can be dated by the Mid-La Tène fibulae to the late 2nd – 1st centuries BC, the bulk of graves are dated to the 1st – first half of the 2nd century AD, and part of them ought to be dated to the late 2nd – first half of the 3rd century AD.

But the research was interrupted In March 2022 when all Kherson region including Chervony Mayak was very fast captured by Russian invaders. Archaeological sites shared the sad fate of all cultural heritage. During the occupation the base of Late Scythian expedition was looted and completely destroyed by Russian soldiers. Until now, archaeologists have not managed to get into the liberated areas up the Dnieper, where the Late Scythian sites are located. Now the right bank of the Dnieper in the Kherson region is suffering of continuous Russian shelling from the left bank. Taking into account that Late Scythian sites are located on the very shore of the former Kakhovka reservoir, they certainly suffer from missiles and artillery fire.

It is unknown when Chervony Mayak will be available for further exploration. The only thing we can and must do now is to publish a full study of the current material.

3 EXPERIENCE IN WORKING WITH ARCHAEOLOGICAL MONUMENTS AFFECTED BY THE RUSSIAN-UKRAINIAN WAR, USING THE EXAMPLE OF “BILHOROD KYIVSKYI.

Zotsenko, Ivan (Institute of Archaeology, National Academy of Science of Ukraine) - Lavrov, Vitalii (Architectural-archaeological expedition, Institute of Archeology, National Academy of Sciences of Ukraine) - Ivanova, Oleksandra (National University of Kyiv-Mohyla Academy)

Since 2014, Russia has waged an ongoing war in Ukraine, causing widespread destruction not only to cities and villages but also to cultural and archaeological heritage, which bears the brunt of the conflict’s impact. The Monitoring Archaeological Expedition, conducted by the Institute of Archaeology, National Academy of Sciences of Ukraine, in collaboration with the Deutsches Archäologisches Institut, surveyed 345 archaeological monuments in the Kyiv region during 2022-23. Of these, 97 landmarks exhibited war-related damage, with a total affected area of 2,381.59 m².

From February 24th to April 2nd, 2022, Kyiv and its environs experienced active hostilities. This report delves into the consequences of the Russian-Ukrainian war on a nationally significant archaeological site, the medieval city “Bilhorod Kyivskiy.” Spanning 100 hectares, the site contains 1,400 meters of fortifications, temple foundations, and preserved archaeological objects.

During monitoring, the following types of damage were recorded at the monument:

1. Consequences of missile and artillery attacks;
2. Construction of military engineering infrastructure;
3. Arrangement of artillery positions;
4. Mining the territory;

Throughout 2023, archaeological investigations focused on non-operational fortifications, involving excavation and the conservation of damaged areas. The subsequent step involves a legal and financial evaluation of the cultural heritage damage, with the aim of holding responsible parties accountable. Ukraine’s regulatory framework for this process includes the Law “On the Protection of Cultural Heritage” and international obligations outlined in the UNESCO Convention, particularly the “Protection of Cultural Property in the Event of Armed Conflict,” and related protocols.

Of notable importance are the Articles of the Hague Convention on the Protection of Cultural Property in the Event of Armed Conflict of 1954, ratified by both Ukraine and Russia. Both nations are bound to uphold the principles outlined in the Convention to preserve cultural property during armed conflicts.

4 OCCUPIED HERITAGE IN CRIMEA: 10 YEARS OF ILLICIT EXCAVATIONS

Lifantii, Oksana (National Museum of History of Ukraine)

2024 is the 10th year since the Autonomous Republic of Crimea (ARC), Ukraine, was occupied by the Russian Federation. Illicit archaeological excavations thrive here during all this time of occupation, despite the Second Protocol to the Hague Convention (1999) of 1954 for the Protection of Cultural Property in the Event of Armed Conflict.

As of 2014, more than 930,000 items from the Museum Register of Ukraine were stored in the museums of the ARC, and more than 2,000 monuments of archaeology were in the State Register. The ancient city of Tauric Chersonesus, with its chora within the boundaries of modern Sevastopol, was included in the UNESCO World Heritage List.

The total losses of the cultural and archaeological heritage of Ukraine in Crimea due to the actions of occupiers are catastrophic and unprecedented. There are no available data on the total amount of excavation done by occupiers in Crimea. The leading Russian archaeological institutions work here. The Hermitage created the most extensive expeditions operating illegally in the Crimea: they are excavating the ancient cities of Nymphaeum, Kalos Limen, Chersonesus, Theodosia, Myrmekion, Pantikapaion and many others. Many objects newly discovered during the illegal construction were investigated “for demolition”, for example, the necropolis of the Roman era Frontove-3 (2018) and the settlement Kosh-Kuyu I (2015, 2017-2018). The illegal construction of the 310-kilometre Tavrida highway alone led to the destruction of at least a hundred archaeological sites, many of which are newly discovered.

The results of such works are published mainly in Russian scientific journals, some of which are in the Scopus list (e.g. Rossijskaja Arheologija, Stratum Plus). However, some non-Russian-based journals publish the results of these illicit excavations. It creates the problem of scientific acceptance of the occupation, which can not be tolerated in civilised society.

5 ARCHAEOLOGICAL HERITAGE MANAGEMENT METHODOLOGY AS A PREVENTIVE TOOL FOR HERITAGE PROTECTION

Kairiss, Andris (Riga Technical University)

The preservation and development of cultural (incl. archaeological) heritage is beneficial to the interests of various stakeholders. Thus, offenses against cultural heritage that result in damage, destruction, decontextualisation or illegal relocation have a strong negative socioeconomic impact and long-term consequences. These impacts and consequences are particularly pronounced in military conflict areas, bringing to the fore both preventive measures to protect it from potential threats and subsequent measures to comprehensively assess and minimize the damage. At international level, there are still no common criteria for assessing the damage caused by heritage crime, which is largely due to the lack of a common understanding of the socioeconomic impact of tangible cultural heritage.

The development and implementation of a methodology for the management of archaeological heritage would not only have a positive impact on its’ socioeconomic development, but would also support (incl., as a preventive measure) heritage protection against the threat of crime, as well as in times of crisis, allowing, inter alia, to:

- identify the socioeconomic benefits of the use of cultural heritage and to identify the types of harm caused to different suffered groups by heritage crime (damage, destruction etc.),
- identify the necessary forms of cooperation between state and local authorities, NGOs, scientific community, local residents and other stakeholders for heritage protection and development,
- facilitate the assessment of the socioeconomic damage caused (incl. for the purposes of investigations and legal proceedings),
- promote the protection of the rights and socioeconomic interests of suffered parties.

The presentation, based mainly on analysis of Latvian situation, will provide an insight into the nature of the methodology for the management and socioeconomic development of national immovable cultural heritage (incl. archaeological), focusing on its usefulness also in times of crises. Methodology development process is based on the author’s research carried out in 2019-2023.

6 ASSESSING THE IMPACT OF HERITAGE CRIME ON ARCHAEOLOGISTS

Olevska-Kairisa, Irina (Maastricht University)

In addition to being immovable property objects, heritage sites bear significant socioeconomic value. When the heritage site is damaged, it inevitably affects the interests of different kinds of stakeholders (to different extents based on the relationship of the respective stakeholders vis-a-vis heritage objects). Thus, the harm caused goes far beyond mere damage to property.

One of the important groups of stakeholders, suffered as a result of heritage crime, is researchers. The latter often serve as conduits of information and knowledge, thus contributing substantially to the increase and justification of the socioeconomic value attributed to heritage sites in the first place. Nevertheless, evidence suggests that, as a general rule, neither the impaired rights of the researchers, nor the harm they suffer by such actions are recognized or redressed within the legal proceedings. Thus, the voice of archaeologists is heard neither at the adjudicative, nor at the political level.

The presentation will be based on the research of the author and the survey performed among the members of the EAA, which is expected to establish:

- the nature and scope of heritage crimes' impact on the scientific/professional community of archaeologists and heritage professionals, thus helping in more accurate identification of the affected individuals and groups;
- the severity of the infringement of cultural rights of such community (including the right to access, enjoy and research heritage objects, participate in decision-making, etc.) caused by illegal intervention into the integrity of archaeological sites, thus contributing to the interpretation of the apparent scope the infringed fundamental rights.

The findings of the presented research will contribute to understanding and performing of the comprehensive archaeological damage assessment caused by illegal excavation, looting, vandalism, destruction or any other illegal activity damaging archaeological sites.

7 THE IMPACT OF WAR ON HERITAGE: LESSONS FROM THE NORTHERN ETHIOPIAN CONFLICT

Bekele, Tadele (Ethiopian Heritage Authority) - Abreha, Haftamu (Ethiopian Heritage Authority) - Negash, Arkebe (Ethiopian Heritage Authority) - Asmare, Belsti (Ethiopian Heritage Authority)

War imposes life-altering costs on human lives, economies, and societal well-being, making recovery tough. The recent conflict between the Ethiopian government and the Tigray Defense Force (TDF) exemplifies this reality. Beyond devastating human losses on both sides, heritage sites of historical, religious, and archaeological significance were directly and indirectly targeted. A team of experts from the Ethiopian Heritage Authority deployed to Tigray region to assess the war's impact on these sites, using the ICCROM Damage and Risk Assessment form as a benchmark. However, the war's complex nature and multitude of actors involved hinder fully understanding the damage and associated risks. Therefore, this paper draws lessons from the assessment to benefit future heritage protection during wartime.

The post-war assessment highlights the crucial role of pre-war heritage management and documentation, particularly in tracing looted movable objects. Moreover, existing domestic legal frameworks and adopted international laws influence the nature of interventions during war. Recognizing the fact that war developments take due process before the breakout, all stakeholders have a vital role in raising awareness to minimize damage and, especially, looting beforehand. Engaging local institutions like universities and heritage associations can significantly contribute to spreading the message of wartime heritage protection.

8 THE STATE OF PALESTINE'S UNESCO WORLD HERITAGE SITES

Godfrey, Evelyne (Uffington Heritage Watch, England)

The State of Palestine currently has four cultural sites inscribed on the UNESCO World Heritage list. They are: Ancient Jericho/Tell es-Sultan (2023); Birthplace of Jesus: Church of the Nativity and the Pilgrimage Route, Bethlehem (2012); Hebron/AI-Khalil Old Town (2017); and Palestine: Land of Olives and Vines – Cultural Landscape of Southern Jerusalem, Battir (2014). Of these four sites, the two latter (Hebron and Battir) are currently on the UNESCO List of World Heritage in Danger. In addition, a site proposed by Jordan, 'Old City of Jerusalem and its Walls' (1982) is also currently on the List of World Heritage in Danger. The State of Palestine's 2012-2020 Tentative List consists of 13 sites, including three in the Gaza 'strip'. This paper will review the World Heritage lists of Israel and Palestine and discuss archaeological damage assessment and the potential impact of the ongoing conflict on the "Outstanding Universal Value" of these listed sites.

9 TEMPORAL ANALYSIS OF LOOTING PITS IN TŪWĀNEH, SOUTHERN JORDAN 2002-2022

Wiesner, Piotr (Jagiellonian University, Kraków) - Kopij, Kamil (Jagiellonian University, Kraków) - Ćwińska, Paweł (AGH University of Kraków) - Puniach, Edyta (AGH University of Kraków) - Sochacki, Grzegorz (AGH University of Kraków) - Misk, Łukasz (Jagiellonian University, Kraków) - Bodzek, Jarosław (Jagiellonian University, Kraków)

This presentation focuses on the quantitative analysis of looting processes at the archaeological site of Tūwāneh in Southern Jordan spanning the years 2002 to 2022. The study relies on publicly available archival satellite imagery (Google Pro 2013-2021), low-altitude photogrammetric orthomosaics (2018-2019), archival aerial photographs (2002, 2007), and a surface survey conducted in 2022.

The research explores both temporal and spatial patterns of looting at the site level, aiming to understand the extent and impact of these activities over two decades. The analysis of satellite imagery reveals certain limitations, particularly in areas with dense constructions and debris, emphasizing the need for complementary methods.

The integration of surface survey data collected in 2022 adds a valuable layer to the analysis, providing a ground-level perspective on the observed patterns. The findings emphasize the importance of a multifaceted approach to looting quantification, combining remote sensing methods with field surveys for a more accurate and nuanced assessment of archaeological sites.

This study contributes to the broader discourse on archaeological preservation strategies, showcasing the complementary role of satellite imagery and surface surveys in monitoring and mitigating the impact of looting on cultural heritage.

10 MAPPING DAMAGE: ASSESSING POST-CONFLICT AND POST-EARTHQUAKE DAMAGE IN SYRIA

Montesanto, Mariacarmela (University of Florence) - Abate, Nicodemo (CNR-ISPC) - Alvaro, Corrado (Università di Roma-La Sapienza) - Masini, Nicola (CNR-ISPC) - Norini, Gianluca (CNR-IGAG) - Pedrazzi, Tatiana (CNR-ISPC) - Pucci, Marina (University of Florence) - Sansonetti, Antonio (CNR-ISPC)

Damages and changes represent for archaeologists, historians, geographers and geomorphologists visible milestones in the reconstruction of the past and in the safeguard of the present. They are silent testimonies of actions and actors in the past and provide crucial information to safeguarding policies and musealization. MAPDAM Project focuses on the concept of damage and destruction both as a modern phenomenon caused by conflict and economic crisis and as a past event that determined major changes in the history of a region. The project focuses on the region of Tartus in Syria, a coastal area that has experienced in the past twelve years conflict and economic crisis.

The main goals of the project are both to provide reliable data to safeguard the archaeological heritage of the region of Tartus and to increase the historical, geographical, and archaeological knowledge of the area in pre-classical and classical periods.

Based on an interdisciplinary approach, using an open access webgis, the Project explores damages and patterns of changes at three different scales.

The long-term major outcome of MAPDAM is a renewed shared awareness of the causes of damage and decay, of the economic and social, as well as strictly cultural, dimension of the damage in the archaeological field impacting not only the scientific community but also local social groups.

This paper focuses on the post-conflict and post-earthquake damage assessments accomplished so far by MAPDAM at the archaeological site of Amrit (Tartus region), well known for its monumental Phoenician and Hellenistic structures. Moreover, it will present the post-conflict measures employed not only to reduce the damage caused by the war and the recent earthquake, but also to make cultural heritage preservation sustainable and raise awareness among local and international communities.

11 IMMEDIATE RESPONSE. THE PROTECTION OF THE PAST DURING TIMES OF CONFLICT AND THE RECENT WORK OF HERITAGE FOR PEACE

Sabrine, Isber (Heritage for Peace)

The preservation of cultural heritage during times of war has emerged as a critical global concern, necessitating a concerted effort to protect irreplaceable artifacts, monuments, and cultural sites. This paper explores the pivotal role played by non-governmental organizations such as "Heritage for Peace" in the safeguarding of cultural property amidst armed conflicts. Focused on the protection of tangible and intangible heritage, these initiatives aim to mitigate the devastating impact of war on humanity's shared cultural legacy. With a focus on collaborative efforts involving local communities, national and international organizations, and governments to prevent, mitigate, and recover from cultural heritage losses, Heritage for Peace is dedicated to examining the challenges posed by armed conflicts to cultural heritage, including intentional destruction, looting, and illegal trafficking of artifacts. Drawing from work in Gaza, Syria, Ukraine, Sudan, Libya and Yemen, this research aims to contribute to the discourse on preserving our shared cultural identity in times of turmoil, underscoring the significance of Heritage for Peace and its counterparts

in fostering a global commitment to the protection of cultural property, promoting resilience, and contributing to the reconstruction of societies affected by conflict.

ADVANCED TECHNOLOGIES IN THE ASSESSMENT AND MITIGATION OF ARCHAEOLOGICAL HERITAGE DAMAGE IN CONFLICT ZONES

Giovanelli, Riccardo (Istituto Italiano di Tecnologia; Università degli Studi di Milano) - Bernardin, Michela (Istituto Italiano di Tecnologia) - Sech, Gregory (Istituto Italiano di Tecnologia) - Traviglia, Arianna (Istituto Italiano di Tecnologia)

In times when conflicts pose an increasing threat to archaeological heritage, the need for efficient protective, evaluative, and mitigative strategies is fundamental. The ALCEO (Automatic Looting Classification from Earth Observation) project addresses this challenge by employing artificial intelligence (AI) and remote sensing technologies to automatically detect looting activities especially in conflict-ridden and remote areas. This methodology accelerates the processes of site protection, and it facilitates timely interventions by instantly alerting relevant Law Enforcement Agencies (LEAs) or cultural heritage institutions to new incidents of looting.

In addition, ALCEO developed a framework to address the study of looting on a temporal scale by identifying changes (i.e. appearance/disappearance or modifications) in the looting pattern across different moments of observation. This enables the monitoring of looting activities on a quantitative basis and measures variations across time, potentially evaluating how much main socio/political events contributed to the development of the phenomenon and the damage to cultural heritage.

At the heart of ALCEO is a dataset of annotated features of looting activities, composed of 6,790 elements across significant archaeological sites, which include the sites of Dura Europos and Ebla (Syria), Aswan (Egypt), Arpinova, and Cerveteri (Italy). Specifically, in Dura Europos, the project detected that from April 2013 to September 2014, corresponding to 2 years of the Civil War, looting features rose from 1,019 to 3,843. Ebla saw a progression from 30 features in September 2004 to escalating numbers in subsequent years: 172 in April 2014, 250 in July 2018, and 154 in July 2022.

The project promoted ground truth campaigns for selected case studies, which were essential to support the correctness of remote interpretation and to derive information on the type and intensity of the phenomenon and its potential implications at the socio/political/economic level.

ANIMALS MEDIATING THE REAL AND IMAGINARY: IN SEARCH FOR NEW UNDERSTANDINGS OF HUMAN-ANIMAL RELATIONSHIPS

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Mansrud, Anja (University of Stavanger) - Care, Barbara (Department of Art History and Archaeology/FNS, University of Fribourg, Switzerland) - Filioglou, Dimitris (The Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA Athens) - Oehrl, Sigmund (Museum of Archaeology, University of Stavanger) - Armstrong-Oma, Kristin (Museum of Archaeology, University of Stavanger)

Session format: Regular session

The study of animal remains from archaeological sites occupies a prominent position in the study of ancient societies, helping us to explore subsistence strategies, use of landscape and environment, mobility and seasonality, craft techniques, among others in a variety of cultural contexts across space and time. However, archaeological enquiry into the human-animal relationship tends to remain focused on human agency and exploitation of animals, rather than on human-animal relationships, interactions and engagements, and proceed along distinct trajectories in scholarly literature, focusing either on zooarchaeological, bioarchaeological, literary, iconographic or artefact research. By exploring the intersection between real and imaginary animals in the past, this session aims to evaluate and contextualise various ways in which humans and animals interact, as reflected by:

- Animal representations on various media, such as in literary and iconographic materials, that enables insight into the diverse roles of animals in life-worlds, religions, cosmologies, and ontologies.
- Traces of animals and animal materials in the archaeological record, including transformed animal body parts (e.g., exploited animals, source of food, companion animals, sacrificial victims, votive offerings, ingredients for magical spells) and ritual practices.
- Evidence of everyday practices acknowledging how communities were co-created in inter-species dialogues, exploring how relationships between humans, domesticated and wild animals have unfolded and differed over time, such hunters and fishermen seeking out or attracting prey, transhumance routes co-created by humans and animals, and animals moving into human settlements as commensal species or fully domesticated co-inhabitants, eventually forming deep-rooted social bonds.

We invite papers that open up new channels of dialogue and cross-disciplinary collaboration, explore the space unfolding between humans and animals as living beings with agency, and how encounters with animals have sparked the human imagination irrespective of chronological periods. We are seeking examples of best practice, to further develop the field.

ABSTRACTS

1

PICTORIAL MOTIFS ON 6TH/7TH CENTURY SCANDINAVIAN CEREMONIAL HELMETS AND THE TRADITION OF PERFORMING BEARS IN LATE IRON AGE SCANDINAVIA

Oehrl, Sigmund (Arkeologisk museum, universitetet i Stavanger)

The well-known models for the production of figuratively decorated bronze helmet sheets from Torslunda, Öland (Sweden, 6th/7th century AD) show various motifs depicting human fighters interacting with bears and bear-like beasts. On the basis of archaeological finds and contexts, late antique traditions of staged bear fights and hunts, the tradition of bear hunting in the Middle Ages, the information provided by Old Norse literary sources on the subject of man and bear, as well as considerations of modern practices with tamed bears and the associated behavioural biology, this paper aims to provide an answer to the question of what these bear images on the Merovingian-era plates from Torslunda actually represent: Mythical battles and relationships between bear and gods or heroes or very real actions. My hypothesis, which arises from this overall view, is that these pictorial motifs reflect real-life martial performances with trained, captured bears that took place at the courts of the warrior elites of the Vendel culture. In my opinion, the most likely explanation is that captured and trained bears actually were kept as performing bears at the courts of Scandinavian warlords and used for animal fighting demonstrations as part of the warrior cult and martial self-dramatization.

2

ROLES OF IMAGINARY AND NATURALISTIC ANIMAL REPRESENTATIONS IN LATE IRON AGE SCANDINAVIA

Wicker, Nancy (University of Mississippi)

While many academic disciplines are experiencing an “animal turn” characterized by a growing interest in animals and their relationships with humans, what does this ontological shift mean for Scandinavian art of the Late Iron Age (5th–11th centuries CE), which is dominated by so-called “animal-style” art? In this presentation, I contrast two uses of animal representations— on practical artifacts and on objects that may have ritual or protective purposes. I propose that abstracted and imaginary animals and animal parts commonly appear on ostensibly functional items with “binding” potential— brooches that hold clothing together and horse trappings that link horses and human riders. This applied art may appear to be of secondary significance to the function of objects that are decorated with the abstracted animals. In contrast, I observe that more naturalistic animals (and occasional humans) frequently inhabit narrative compositions (where species identification can be crucial) and items with presumed ceremonial or protective purposes. The naturalistic tendency is seen, for example, on monumental picture stones on the Baltic island of Gotland in Sweden and on a wooden panel carved on the end of a wagon from the Oseberg ship burial in Norway. Relatively realistic representations of animals that convey presumed ceremonial or protective purposes are also depicted on certain classes of objects, including early versions of gold pendants known as bracteates, small gold foils, and helmet panels. All animals are not encompassed by what has been described as Scandinavian “animal-style” art. Instead, different roles performed by specific types of animal representation can be delineated.

3

THE GRIFFIN-PEOPLE FROM THE EAST

Jonuks, Tõnno (Estonian Literary Museum)

Over the years, animal representations in the Eastern Baltic have been interpreted based on very rational zooarchaeology. It was assumed that animals were depicted by people whose understanding about nature was similar to our Linnaean taxonomy. During the past decade, it has been demonstrated that, in fact, many Iron Age animal representation can be interpreted as depicting not some ordinary animal species but the mythological beasts – dragons, leucrottas, griffins.

In this presentation I will focus on a group of animal-headed handles found across the Eastern Baltic. Due to the massive beak the animals are often interpreted as raptors, however, some distinctive details suggest they rather were griffins. The fact that many of them are found from central places, raises a hypothesis that griffins could have served as symbols of some Eastern Baltic elite families. The objects are very similar but found sometimes even hundreds of kilometres apart, demonstrating long-distance communication of some selected kins. Such an interpretation helps to open a more nuanced discussion about the Late Iron Age societies.

4 ANIMALS IN CLAY MAKER'S BACKYARD

Blaževicius, Povilas (National Museum of Lithuania)

The analysis of animal traces on building ceramics is a valuable avenue for uncovering historical insights into everyday life, especially during the Middle Ages and the Early Modern period. While building ceramics have traditionally been studied in architecture, their growing significance lies in revealing not only the identity of the artisans behind these artifacts but also the intricacies of their daily surroundings and domestic practices. This research offers valuable insight into the variety of household animals and the distinctive attributes of fauna within specific chronological and geographical contexts. Animal imprints on ceramics provide information about the taxonomic classification of individual creatures, including class, order, family, or genus. These traces also offer information on other aspects such as the creature's stature, physique, age, health indicators, instances of trauma, and degrees of hairiness, thus adding supplementary layers of understanding.

To illustrate the application of this methodological approach, an analysis encompassing nearly 400 artifacts with animal prints from the 13th to the 18th century was conducted in Vilnius castles and Vilnius city, Lithuania, using the method of trasology. This method facilitated the reconstruction of the conceivable structure of households inhabited by craftsmen in Vilnius during the specified chronological period. Preliminary observations underscore that the animals that came close to the finished, albeit unfired, ceramic products were predominantly of domestic origin, with 8% comprising poultry and cats, 10% pigs, and 13% sheep and goats. A noteworthy revelation emerged, identifying dogs as the predominant instigators of "defective products," constituting 61% of instances. This research not only provides a nuanced understanding of cohabitation dynamics between humans and domesticated animals during the 13th-18th centuries but also furnishes a comprehensive assessment of the structure of ceramic workshops in the Vilnius region and the distinctive attributes of their domestic fauna.

5 MINERAL MENAGERIES: INTERSPECIES RELATIONSHIPS IN BRONZE AGE ANIMAL ICONOGRAPHY

Nic Aoidh, Nóra (UCD Dublin)

Chiefs, warriors, conquerors: the European Bronze Age is characterised by concepts of masculine social, political, and religious power. This power is thought to have been legitimised through public displays of divine associations or origins, as well as wealth and influence. Supposed proof of these divine origins frequently consist of certain animal associations: the horse with speed and control, the bull with power, the hybrid beast with the divine, etc. As such, animal iconography is thought to have been a key component in the construction and reinforcement of social and cultural norms. The horns and wings so characteristic of chiefly European iconography are still examined overwhelmingly through the lens of a human-centred, patriarchal social hierarchy. Indeed, much of the previous literature on Bronze Age animal iconography has been written from a functionalist anthropocentric viewpoint, which results in the objectification of animals in a human society. However, these animals were likely not subject to the modern, capitalist perspectives which view them primarily as resources or property. By drawing on Human-Animal studies to assess their depiction, this paper will reassess the potential manifestations of interspecies relationships in Bronze Age Europe. It will also apply posthumanist theory to examples of Bronze Age animal iconography to offer perspectives beyond functionalism and social regulation. The primary focus of this paper will be animal iconography in Nordic Bronze Age rock art, with additional consideration given to effigial animal iconography.

6 A REPRESENTATION OF A MONKEY ON A OIL LAMP: SPARKS OF NURAGIC IMAGINATION AND MARITIME CONNECTIVITY IN THE ANCIENT MEDITERRANEAN

Pisanu, Laura (University of Melbourne)

Representations of primates have been recorded in different Mediterranean sites dated to the Bronze Age and Iron Age. They consisted of wall paintings, figurines, and amulets, which have been mainly found in Egypt, the Aegean and Mesopotamia. Iconographic studies have led previous scholarship to identify the species represented as green monkeys (the Aegean), baboons, and macaque (Mesopotamia), and to discuss them as representation of animals traded or exchanged as gifts from the Egyptian Kingdom to other Bronze Age societies.

Among the various representation of monkeys in the eastern Mediterranean Sea, little evidence is known for the central-western Mediterranean. A bronze figurine manufactured in Sardinia between the Bronze and Iron Age (ca. 11th – 9th century BC) depicts a seated monkey at the centre of an oil lump. This representation is still unique in Sardinia, and a rarely found discovery in central-western Mediterranean. Early scholarship has postulated it was the result of maritime relationships because the Nuragic bronze figurines usually depicted local animals. However, no comparisons and further studies have been carried out to investigate this representation, its possible comparisons with depictions from other Mediterranean areas, and what a monkey could have symbolised for Nuragic people.

By analysing the Nuragic artefact using an archaeological approach based on iconography and study of material culture through comparisons, this paper aims at exploring the representations of monkeys in terms of human mobility, imagination, and interactions between Bronze Age societies and these species. In this way, it would be possible to contextualise the Nuragic artefact in a wider Mediterranean framework in which people (and monkeys) interacted in a complex network of maritime and social connectivity.

7 IDENTIFYING THE HUMAN DOG RELATIONSHIP IN THE AUSTRALIAN ARCHAEOLOGICAL RECORD

Balme, Jane M. (School of Social Sciences, University of Western Australia) - O'Connor, Sue (Australian National University)

Indigenous Australians first arrived by sea in the continent that is now Australia at least 65 thousand years ago. At that time, apart from murids and bats, the native mammals were all marsupials or monotremes. Around 4,000 years ago a placental dog, the dingo, appeared on the continent, which they rapidly colonised. People's responses to this new kind of animal were unlike those they had to any native Australian animal.

By the time of first European colonisation - a little over 200 years ago, dingoes were thoroughly incorporated into Indigenous Australians lives. Early written records note that people used dingoes for a variety of purposes including as hunting companions, guards, living blankets, pets, and occasionally as food. Dingoes were also deeply embedded into Indigenous cosmology holding important positions in stories about landscape creation. They are the only animal with which Indigenous people formed a close bond - in some places they were even incorporated into the kinship system. Archaeological evidence for the development of this human-animal relationship includes, for example, dingoes buried in manners paralleling those used for humans in the same area, rock art documenting ancestral dingo travel, and changes in the faunal records. Despite the clear evidence for human-dog bonding from early times, only a few of the dingo pups taken as pets remained with people. In this talk we will discuss advantages of co-dependence of Indigenous Australians and dingoes from both points of view, how it might be traced in the archaeological record, and the implications for dog domestication elsewhere.

8 THE ROLE OF THE DOG IN THE FUNERAL RITES OF THE SINTASHTA CULTURE (III - II MILLENNIUM BC)

Frikke, Polina (Free researcher) - Usmanova, Emma (Saryarka Archaeological Institute, Buketov Karaganda University, Kazakhstan; Margulan Archaeological Institute, Almaty, Kazakhstan) - Fricke, Fabian (German Archaeological Institute) - Kosintsev, Pavel (Free researcher)

The fact that the dog was of great social importance already in the Neolithic suggests such features as healed fractures and sacralization of the dog in the "funerary landscape". The last feature is observed as special methods of ritual dissection and burial of dogs together with or separately from humans. In the Bronze Age, the socio-cultural importance of the dog increased even more. This phenomenon is associated with human mobility. This process was accompanied by economic changes, the main feature of which was the active development of cattle breeding with the predominance of a meat and dairy diet.

On the territory of the Southern Urals the distribution of domesticated dogs is reflected by the "language" of ritual actions in burials of the Andronovo cultures. One of these cultures is known as the Sintashta culture. The time of its existence dates from the end of the 3rd millennium BC to the first half of the 2nd millennium BC. The main characteristics of the Sintashta culture are probably connected with the emergence of the fortified settlements like Arkaim and Sintashta, with a high degree of sedentarisation based on stall-and-drive cattle economy, and with the existence of burial complexes with multi-component inventory and valuable sacrifices.

Most often, as sacrificial animals, were used: cattle, sheep/goats and horses. The occurrence of dogs in the burials of the Sintashta culture is also a well-known phenomenon. However, the number of dogs is much lower compared to the number of other sacrificed animals. This fact allows us to assume a special status of people buried with dogs. The correlation analysis of traits and the identification of individual status features between burials with and without dogs contribute to verification of this assumption. A comparison of these features will be presented in this report.

9 WHAT DID DOGS DO FOR RITUAL IN ROMAN BRITAIN?

Fleming, Robin (Boston College)

I have found evidence for whole or partial dogs in just over 1,700 structured deposits in Britain dating to the Roman period, mostly from pits, shafts, abandoned wells, and boundary ditches in quotidian places rather than at temple or shrine sites. The dogs in my data were habitually placed in the ground with a constellation of other objects -- whole pots, shoes, coins, tools, keys, whetstones, curated human remains, human and animal heads, and the remains of wild animals and baby animals. I argue that deposits like these are the remains of ritual events held by ordinary people and

were a significant component of ritual praxis in Britain, something participants engaged in to counteract the gnawing uncertainties of everyday life and to bolster bodily and mortuary safety. The questions animating my paper are: what did dogs, as ritual participants, do for ritual? How did dogs' nature and historically constructed role as our flexible, socially engaged, put-upon fellow travelers impact ritual? In what ways did the killing of individual dogs—some probably strays, others certainly personal animals—do to the atmosphere of these uncanny events? The emotions of participants and witnesses? Were the doomed dogs treated in particular ways to heighten ritual-goers' experience? To change the atmosphere of an event? How did the dogs' deaths make each event memorable, different, or the same?

10 **BLURRED ENTITIES: ANTHROPO-ZOOMORPHIC DEPICTIONS ON NORTH CENTRAL CHILE BODYPOTS**

Mansilla, Luis (Universidad de Chile; FONDECYT 11221116; FONDECYT 120276) - Armstrong, Felipe (Museo Chileno de Arte Precolombino; FONDECYT 11221116; FONDECYT 120276)

Pottery depicting various beings is a hallmark of the communities that lived in today's North Central Chile before the Spanish conquest (1100-1540 CE), ancestors of the Diaguita people. Despite interpretations of vessels with "anthropomorphic" and/or "zoomorphic" features, a standardized understanding of the elements constituting these entities' faces and bodies remains elusive. A comprehensive iconographic study of these 'bodypots' has now delineated the prevalent features in depictions traditionally understood as human or animal, considering potential species referenced. This research discusses how these distinctive configurations might depict a mixed entity, blurring traditional distinctions between what animal and human mean. The recurrent depiction of a specific face found in vessels across different archaeological sites suggests its significance, potentially linked to the local socio-political landscape, cosmology, notable figures, or shamanistic practices, thereby influencing the visual and cultural landscapes of the region. These depictions, in addition to a particularly configured face, may lead to a more nuanced understanding of the human-animal relationships, characterising it beyond exploitation dynamics.

This paper is funded by Research Grants FONDECYT 11221116 and 120276.

11 **SEARCHING FOR LATE MESOLITHIC ANIMAL ONTOLOGIES**

Lødøen, Trond (University Museum of Bergen)

This presentation aims to discuss alternative world views associated with animals in the Late Mesolithic of Scandinavia to balance classic, and often chosen, consumption and utilitarian focused perspectives. Despite new archaeological approaches over the later decades, together with ontologies and ethnographic examples that have opened for an alternative and a pre-cartesian understanding of all species, most approaches within Late Mesolithic studies, or other prehistoric studies tend to return to present day conditions, with exploitation and consumption as the predominant values for all animals of the past – in short meat and hide on the run. Even though the great divide between humans and animals is a very recent classification, this is rarely compensated for in archaeological approaches which regularly projects uncritical mirror images of our modern western societies onto the past. This is also frequently supported by cherry picking amongst suitable rock art motives to legitimize modern cartesian world views for the distant past. On the basis of animal osteological material records, burials, votive deposits and rock art studies alternative pathways to uncover Mesolithic animal ontologies will be discussed, bringing in Mesolithic evidence from elsewhere in Europe and also addressing a diversity in terms of ideological, cosmological and societal importance between certain animals for the Late Mesolithic of Scandinavia.

12 **PREDATORS IN PUPILS: INTERSITE VARIABILITY AND HUMAN/ANIMAL LINKAGES OF PPNB PLASTERED SKULLS OF THE LEVANT**

Todd DaSilva, Raven (Dig it With Raven)

Perhaps the most well-known artefacts of PPNB (Pre-Pottery Neolithic B) Southwest Asia are the plastered skulls that were first found at the site of Jericho in the 1950s. These decorated skulls have been found at multiple sites across Palestine, Israel, Syria, and Jordan, with later examples found in Turkey. Since their discovery, they have been subject to multiple, blanketed interpretations, attempting to create one coherent meaning and purpose. While much has been written regarding the description of the skulls and their possible interpretations, their human-animal relationship has not yet been explored.

A new look into these plastered skulls through the examination of the contexts in which they were uncovered, alongside the variations in eye fabrication and pupil design, has revealed that those modelled with open eyes were found solely in domestic contexts. These eyes possess pupils reminiscent of small predators such as snakes, foxes and cats. These non-human attributes may indicate a human-animal linkage reminiscent of larger ritual sites such as Göbekli Tepe and Nevalı Çori that were no longer in use when the skulls were created.

13 **ANIMALS OF THE POLIS: REGIONAL DIFFERENCES IN HUMAN-ANIMAL INTERACTIONS ACROSS THE GREEK MEDITERRANEAN**

Lewis, Sian (University of St Andrews)

My research project, *Zoa Politika: animals that live in the polis*, aims to identify the distinctive animal experience of individual Greek communities. The Greek world was both geographically extensive and ecologically diverse, with poleis founded around the coasts of the Mediterranean and Black Sea, and regional faunas were thus very varied, from the desert species of Cyrenaica and the grazing mammals and birds of the Scythian steppe to the lions of Asia Minor and the fish shoals of the Bosphorus.

Previous studies based primarily on the evidence of literature and art, however, have tended to treat 'the animals of the Greek world' as an unvaried collective, as though the ancient experience of animals, domestic and wild, was the same everywhere. This project begins the overdue process of integrating zooarchaeological surveys of specific sites and regional ecological studies to identify the animals which were present in the landscape and those which were of economic, religious or social significance to each polis. The project draws on the concept (first identified by Nicolas Richer in the 1990s) of the 'communal bestiary'; that is, those animals which an individual polis chose to foreground in both practical and abstract terms, some drawn from the immediate surroundings of the state and its hinterland, and others non-resident species which were chosen to embody the city's collective identity and values.

In this talk I will present two of the case studies for the project, Cyrene in north Africa and Panticapaeum on the north shore of the Black Sea, to demonstrate how each Greek community created and developed its own conceptual bestiary, recognising animals and humans as co-inhabitants and co-citizens of the polis.

14 **ANIMALS IN RELIGIOUS CONTEXTS AND BEYOND: CASE STUDIES AND COMPARISONS FROM 1ST MILLENNIUM BCE CYPRUS**

Hadjikoumis, Angelos (STARC, The Cyprus Institute; Department of Archaeology, The University of Sheffield)

Animal remains recovered in sanctuaries usually represent food waste, resulting from feasts associated with religious rituals. Most of these rituals prescribed some animals as sacrificial victims and even more animals to feed the participants during those feasts. This paper presents zooarchaeological data from Archaic/Classical sanctuaries in Cyprus that provide insights into the lives of sacrificial victims and their interactions with people as living animals, the possible ways their lives ended and how their butchered bodies continued to interact with the organisers and participants of periodic religious events. The zooarchaeological data from sanctuaries are compared against literary references to sacrificial animals and procedures from the broader eastern Mediterranean. Moreover, comparative analyses between sanctuaries and non-sanctuaries further highlight how animal-human interactions were shaped by the context in which they take place (location, season, social and religious conventions, etc). The results of these comparisons highlight interesting differences between religious and secular animal-human interactions, as well as variability within these spheres. Moreover, they highlight the complementarity and discrepancies between literary and physical evidence. In sum, this study seeks to contribute new insights and inform zooarchaeological approaches employed to look into animal-human interactions in 1st millennium BCE Cyprus and the eastern Mediterranean, primarily in sanctuaries but also secular contexts.

15 **FAUNAL USES AT MONTE ALBÁN, OAXACA, MEXICO: SUBSISTENCE, RAW MATERIAL, RITUALITY AND SYMBOLISM**

Martinez Lira, Patricia (Independent scholar; University of York, UK) - Arroyo-Cabrales, Joaquín (Laboratorio de Arqueozoología del INAH, Mexico)

The ancient Zapotec city of Monte Albán, occupied from approximately 500 BC to 850 AD, was the prehispanic Oaxaca's largest and most important urban center. The zooarchaeological material dates from both the Late Preclassic (500 BC-AD 200) and Early Classic (200- AD 500) periods, and was found in association with households and public contexts near the city center. The faunal remains include bones of fish (snook, sea basses, buffalo fish, and bobo mulet); reptiles (mud turtle, pond slider, and green turtle); birds (yellow-winged cacique, common raven, great horned owl, ducks, red-tailed hawk, franklin's gull, harlequin quail, common turkey and curassow); and mammals such

as carnivores (dog, coyote, wolf, grey fox, northern raccoon, white-nosed coati and cougar), artiodactyls (collared peccary, white-lipped peccary, white-tailed deer and brocket deer) and lagomorphs (hare and rabbit). A great number of mammals were found in local habitats near Monte Albán or in cultivation areas, especially those allocated for subsistence activities. However, other species were brought from further away for ornamental, raw material, symbolic and ritual purposes. The animal use is discussed, taking into account archaeological contexts, taphonomic evidence, iconographic representations, evidence at other sites in Mesoamerica, animal representations in codices, stelae, and XIV-century ethnohistoric sources.

16 **PICK OUT THE EASY MEAT. HUMAN - DOG RELATIONSHIP AT 4TH MILLENNIUM PILE-DWELLINGS OF LJUBLJANSKO BARJE (SLOVENIA)**

Toskan, Borut (Research Centre SAZU, Institute of Archaeology) - Škvor Jernejčič, Brina (Research Centre SAZU, Institute of Archaeology) - Peto, Jessica (Department of Archaeology and History, University of Exeter)

Beginning with its domestication in the Upper Palaeolithic, the dog developed into man's best friend par excellence. From the development of lapdogs to the symbolic deposition of these animals in graves and other places of worship, archaeozoology has provided evidence of a special relationship that has developed between us and them since late prehistory at the latest. Before that, the role of dogs in human life is less well understood. In this talk, we will deal with this very topic at the 4th millennium pile-dwelling sites at Ljubljansko barje in the south-eastern Alpine region (present-day Slovenia).

At these sites, the dog is a normal, albeit rare, element of archaeozoological assemblages. Metrically, they correspond to small/medium sized turbarry type, typically observed at prehistoric lacustrine settlements in and around the Alps. A preliminary geometric morphometrics study of the skulls and mandibles indicated marked shape variability, possibly suggesting some kind of human control of reproduction in these animals. Such control may have been motivated by the need for a particular type of dog, either hounds or herding dogs. Finds of cracked dog skulls and bones with butchery marks, on the other hand, suggest that these animals may have served as 'easy meat' in times of hardship. A high proportion of well-preserved dog skulls in one of the pile dwellings also suggests that these animals may have been used for ritual purposes. Last but not least, by studying the diet of these animals using coprolites and stable isotopes, valuable insights could be gained into whether the pile dwellers regarded the dog as a valuable, possibly even beloved companion or rather as a tolerated scavenger.

17 **THE ANIMAL COMMUNITY OF ROMAN RED SEA PORT BERENIKE. PET CEMETERY - DATA ON HUMAN-ANIMAL RELATIONS, VALUES AND IDENTITY**

Osypinska, Marta (Institute of Archaeology, University of Wrocław) - Osypinski, Piotr (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

The burial ground of companion animals, discovered in the Roman Red Sea port of Berenike (Egypt, 1st-2nd century CE), is a scientific phenomenon with apparent analogies among ancient animal necropolises. As in the case of modern cemeteries of this type, we can look for correlates of human reactions to death. Coexistence and the form of human-animal relations have already been a reflection of human cultural, religious and social identities in antiquity. Funeral practices towards animals reflected important values in the social and religious dimensions of ancient communities. We currently have data from nearly 650 animal burials discovered on approximately 110 m². The use of the area as an animal necropolis in the suburbs of the intercontinental port of Berenike dates back to the first half of 1st century to mid- 2nd century. Among the burials identified in Berenike, 92.9% are morphologically diverse cats (*Felis silvestris catus*), including wild steppe cats (*Felis lybica ornata*). Only 4.1% of animals are domestic dogs (*Canis lupus f. domestica*). We recorded 4 morphological types, including toy-dogs. However, 3% of the burials at Berenike were monkeys - in Berenike, these are representatives of two species, both found on the Indian subcontinent: *Macaca mulatta* and *Macaca radiata*.

Research financed by NCN grant UMO-2021/43/B/HS3/02749.

18 **BREACHING THE GAP BETWEEN THEORY AND PRACTICE: THEORETICAL APPROACHES TO HUMAN-ANIMAL RELATIONSHIPS IN BURIALS FROM A VIKING AGE PERSPECTIVE**

Mazza, Selene (University of Cambridge)

The nature of human-animal relationships in the past, like in the present, is intrinsically unbalanced, with humans ultimately holding power over the life and death of many other animal species. This is also true for Viking Age burial customs, where different types of animals were commonly killed to be placed in human graves. Acknowledging this asymmetry, however, does not imply that animals were – and should be considered – passive and inanimate props unilaterally used by humans based on modern anthropocentric ideas of hierarchical and dualistic interspecies relations projected onto past societies. Animals were not simply deposited in Viking Age graves like inanimate objects; they

were mixed with human remains, placed in close contact with human bodies, and sometimes buried without humans at all. Some people, on the other hand, were buried without animals, or not 'buried' at all. Animals were thus not simply 'animals', and humans, as well, were not simply 'humans'.

Moving away from universalistic and one-size-fits-all interpretations, the main aim of this paper is to discuss how contextual theoretical approaches rooted in post-humanism and relationality can be used to balance out archaeological interpretations of human-animal relationships in burials by focussing on the animals themselves as living agents rather than mere dead bones. To start breaching the gap between imaginary humans and animals and their real counterparts we need first and foremost to situate both in the lived-in world as physical entities coming together in specific points in time and space.

Integrating notions from other disciplines like animal studies and ethology, the development of a contextual theoretical framework for the interpretation of human-animal relationships in burials will be illustrated with examples from a case study of graves with animal remains from Viking Age central Norway and evidence from the broader Viking Age world.

19 **PRESERVING LIFE, REVEALING NARRATIVES: TRACING ANIMAL AGENCY IN THE ROYAL DANISH KUNSTKAMMER**

Tissot, Victoria (Aarhus University)

My presentation is based on the ongoing work conducted in my PhD project, which explores the intricacy and diversity of animal lives and afterlives within The Royal Danish Kunstkammer (c.1650-1825), a Cabinet of Curiosities. As an artificial microcosm, the Kunstkammer housed a rich collection of preserved animal matter, spanning the wild and domesticated, local and global, real and imaginary. These animals reveal a complex tapestry of human-animal entanglements, encompassing colonial ventures, scientific explorations, sport hunting, commercial hunting, the keeping of companion animals as well as the development of Early Modern zoos.

By drawing on ideas from 'new materialisms' in the study of Early Modern collections, this research facilitates a shift in focus from the more traditional approach centered around the evolution of museum practices and the individuals who established them to an emphasis on those who were collected and displayed. An interdisciplinary approach to extant material culture, written and pictorial sources allows for a closer look at the individual animal's prior life, death, and journey to the Kunstkammer, as well as the relations they formed with other actors along the way. By further exploring reasons for acquiring, preserving, altering, and organizing animal bodies for exhibition purposes, I seek to contribute to the ongoing animal-agency debate. In this case, questions about agency become particularly relevant when examining the processes in which animals were "immortalized" and transformed through preservation methods, thus engaging in new relations with their surroundings as animal-objects.

By recognizing the agency, thingness, and biographies of seemingly inert preserved animals and emphasizing their vital role within cabinets of curiosities, it is possible to move beyond the conventional understanding of museums as static repositories, offering a nuanced understanding of Early Modern museums as dynamic spaces of vibrant and active matter.

20 **'QUOTH THE RAVEN' - ON THOUGHT, MEMORY, COGNITION AND MULTISPECIES ENGAGEMENTS IN SCANDINAVIAN IRON AGE BELIEFS AND SOCIETY**

Armstrong Oma, Kristin (University of Stavanger)

Two non-humans from Old Norse mythology have achieved a popularity that eclipses the gods of the Norse pantheon: corvids Huginn and Muninn. In pre-Christian Iron Age beliefs, Huginn and Muninn were the shrewd ravens of Odin, the supreme god of Old Norse tradition. These two ravens perched on Odin's shoulders, and their names indicate that they represented thought (Huginn) and memory (Muninn). They were seemingly perceived as guardians of esoteric knowledge and magic in the Iron Age, and from their elevated position on Odin's shoulders, they could see the whole world. They would fly over the land and the sea to spy out everything that went on and brought tidings back to Odin. Initially harbingers of death sent to the battlefield to devour those fallen in war, their role developed into that of messengers. This denotes a belief that they could communicate – talk and make themselves understood – to Odin.

This paper presents and discusses some archaeological objects from the later Iron Age in Scandinavia depicting birds of prey resembling corvids that are interpreted as ravens. Literary sources and descriptions of ravens and crows in Beowulf, the poetic Edda, Snorra Edda and other written sources are considered, with findings compared with recent research on Theory of Mind and the cognitive abilities of corvids.

Finally, the paper explores how ravens were beings that mediated between the real and the imaginary in Norse Iron Age society and mythology, and how close observations of, and interactions with, non-humans became fledgling forces for multi-species engagements in this and in other realms.

21 MEANING OF BIRDS IN THE 6TH-4TH MILLENNIUM BC FROM A SUPRAREGIONAL EASTERN EUROPEAN PERSPECTIVE

Yanish, Yevheniia (Schmalhausen Institute of Zoology of National Academy of Sciences of Ukraine) - Schmölcke, Ulrich (Leibniz-Zentrum für Archäologie, Center for Baltic and Scandinavian Archaeology (LEIZA-ZBSA), Schleswig, Germany)

Bird bones are common in archaeozoological materials from the Neolithic in Eastern Europe; at some sites, they constitute a significant percentage of the total finds. We will consider the significance of birds in the life of the local population during this period based on the results of our research, from Latvia in the north to Ukraine in the south. Finds of bird bones are not primarily known from settlement contexts, but from graves. Sometimes funeral decorations - beads made of bird bones, or individual parts of birds such as wings or paws - are found near the buried person or carefully draped on them. It is therefore obvious that birds had a special meaning in people's conception of the world and the afterlife. In our paper, we want to show how widespread this belief was (temporally and spatially) and which bird species were of particular relevance. Additionally, we want to show whether this belief resulted in a kind of taboo on hunting (certain) birds.

22 BIRDS OF CLAY - MYSTERIES, TRANSFORMATIONS, AND REGENERATIONS OF MEANINGS

Pasaric, Maja (Institute of Ethnology and Folklore Research)

Though the representations of animal or human bodies decrease in frequency during the Eneolithic period in Croatia, in comparison to the earlier Neolithic, a number of zoomorphic objects manufactured from clay have still been unearthed. Amongst them is the vessel in the shape of a bird from the site of Vučedol, which gained the status of probably the most famous archaeological artefact from Croatia. This bird inspired renowned interpretations that elaborated the potential symbolic, religious and mythological values of the artefact, as well as narratives outside the academic discourse that shaped it into a distinguished contemporary ideological and identity symbol. Drawing from recent contributions that not only encourage the focus on the ways in which people relate to material culture but also question the theoretical distinction between active subjects and inert passive objects, the paper aims to move away from strictly representational interpretations of bird figurines. This contribution will consider their materiality, the ethology of particular bird species, and the potential meeting places of humans and birds in their shared landscapes that could have influenced and created specific ways of knowing and being in the world.

23 FEATHERED BEINGS IN ICE AGE ART

Taylor, Bernie (Community Member)

Global anthropologic surveys of hunter-gatherers and mythology from the classical literature widely record feathered beings representing spiritual leaders, deities and shamanic practitioners as well as feathers being worn by ordinary individuals on ceremonial rites of passage. These feathered beings are typically associated with a named individual or positions of religious authority who use the abilities of birds to enter alternative dimensions either above or below. Other anthropomorphic deities, humans and animals frequently interact with the feathered beings in sacred narratives memorializing such mythological events. Ceremonial practices and the sacred narratives of feathered beings appear worldwide in places rock art is not present, suggesting the concept of birds aiding humans emerged before rock art and were integral to the animistic experience in prehistory.

This study examined feathered beings, including birds, therianthropes and humans, depicted in Franco-Iberian Upper Paleolithic cave art. DStretch was utilized to surface otherwise hidden features. The characters in the images were compared over time using established archaeological dating of the panels to examine changes in their feathered representations and contextual themes. The study also looked for close motifs with documented Eurasian mythology.

The findings of this study indicate that Franco-Iberian Upper Paleolithic artists most often utilized feathered beings in larger contextual settings on the cave wall panels. The choice of which bird to represent varied by location. Real and supernatural characters, some which may still be recognized in Eurasian mythology, were surfaced. This study suggests that structural characteristics of feathered beings within their contextual themes may be studied with rock art to gain a unique perspective on animistic traditions in prehistory.

496 FROM MICRO TO MACRO: INTEGRATING MICROMORPHOLOGY AND MICROCONTEXTUAL ANALYSES FOR ARCHAEOLOGICAL INSIGHTS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Adewumi, Opeyemi (Geosciences Center (CGEO), Department of Earth Sciences, University of Coimbra, P-3030, 790 Coimbra, Portugal; Instituto Terra e Memória, Mação, Portugal; Instituto Politécnico de Tomar, Portugal) - Sifogeorgaki, Irini (Human Origins Group, Leiden University, Faculty of Archaeology, Einsteinweg 2, 2332EC, Leiden, Netherlands) - Soares, Miguel (The interdisciplinary Center for Archaeology and Evolution of Human Behaviour, Universidade do Algarve, Campus de Gambelas, 8005-139 Faro, Portugal) - Tomé, Laura (Archaeological Micromorphology and Biomarkers Laboratory (AMBI Lab), Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna, 38206, Tenerife, Spain; Área de Prehistoria, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna, 38206, Tenerife, Spain) - Zambaldi, Maurizio (University of Coimbra, Centre of Studies in Geography and Spatial Planning (CEGOT), FLUC, Department of Geography and Tourism, Coimbra, Portugal)

Session format: Regular session

What is today's role of archaeological soil/sediment micromorphology in unearthing human narratives from different contexts? Soil micromorphology has proven to be a powerful tool for investigating the minute details of natural and archaeological deposits. This method offers a unique perspective, revealing "microscopic whispers" that echo across time and provide essential insights into formation processes, human activities, and environmental conditions.

Rooted in Soil Sciences, micromorphology's scope has expanded to encompass diverse fields of study, from Natural to Social Sciences, broadening its potential and helping us to understand past human cultures and their interactions with the surrounding environment. Micromorphological observations have thus become a recognised and shared basis of the geoarchaeological approach, paving the way for its integration with emerging state-of-the-art methodologies and analytical techniques concerned with the microscopic or sub-microscopic scale. To date, we might be talking about microarchaeology, considering it a 'pocket knife' to decipher context-based archaeology.

In this session, we will explore the integration of micromorphological analyses with other micro-contextual techniques within geoarchaeological investigations, as this integration provides valuable insights that enhance our interpretations of complex archaeological contexts. Therefore, we invite global case studies spanning all chronologies to foster discussions on (A) how micromorphology can be implemented with other micro-contextual analytical tools and (B) how these micro-scale analyses can help us shed light on macro-scale archaeological questions.

This session calls for contributions that not only highlight the current state of the field but also explore its future potential. By examining how micromorphology adapts to emerging methodologies, we aim to chart a course for the ongoing integration of micro-contextual techniques in the ever-expanding realm of archaeology. Together, we envision the continued growth of micromorphology as a cornerstone of archaeological inquiry, enriching our understanding of human history and environmental dynamics across diverse contexts and epochs.

ABSTRACTS

1 MICRO-SCALE PROCEDURE FOR THE INVESTIGATION OF BINDER TYPES IN HISTORIC MORTARS THROUGH COMBINED ANALYSES

Almeida, Luís (HERCULES Laboratory, University of Évora, Largo Marquês de Marialva, 8, 7000-809 Évora, Portugal; UNIARQ - Centre for Archaeology, School of Arts and Humanities, University of Lisbon, Alameda da Universidade, 1600-214 Lisboa, Portugal) - Santos Silva, António (Materials Department, National Laboratory for Civil Engineering, Av. Do Brasil, 101, 1700-066 Lisbon, Portugal) - Veiga, Rosário (Buildings Department, National Laboratory for Civil Engineering, Av. Do Brasil, 101, 1700-066 Lisbon, Portugal) - Mirão, José (Geosciences Department, University of Évora, Colégio Luís António Verney, Rua Romão Ramalho, nº 59, 7000-671 Évora, Portugal; HERCULES Laboratory, University of Évora, Largo Marquês de Marialva, 8, 7000-809 Évora, Portugal)

Microscopic techniques have assumed significant relevance in historical and archaeological domains, specifically, in investigating the evolution of construction activity over time. Applying these robust analysis techniques makes it possible to characterise building materials, relating them to possible origins, the availability of raw materials in the vicinity of the construction and the stratigraphy of applications in different typological contexts. It makes it possible to clarify doubts in a particular context, such as the use of different types of mortar binders in different historical periods. Microscopy and its complementary techniques emerge as pivotal tools for identifying binders in mortars, specifically hydraulic ones. Considering the potential co-application of multiple binders, the use of conventional methods (e.g. X-ray diffraction) proves to be inconclusive. Thus, microscopy techniques assume paramount significance, offering a

definitive analytical approach indispensable for discerning the complexities associated with hydraulic binders in mortars.

The present study aims to contribute to the establishment of an analysis procedure enabling the unequivocal identification of binders in various types of mortars, with a particular focus on hydraulic ones. This work involves the combined use of fundamental micromorphology principles derived from petrography and scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy (SEM-EDS). Mortar samples from buildings with heritage value built throughout the 20th century in Lisbon, Portugal, were analyzed, as well as mortars formulated in the laboratory with different binders and with known compositions that served as a reference. The results from the application of SEM-EDS demonstrated that the proposed methodology allows the identification of binder types and the determination of clusters based on the analysis of the chemical composition of the binder. This procedure has contributed to a microcontextual methodological systematisation.

2 MULTISCALAR, MULTIPROXY APPROACHES TO UNDERSTANDING HUMAN IMPACTS IN THE HADRIAN'S WALL LANDSCAPE

Shillito, Lisa-Marie (Newcastle University)

Micromorphology is a powerful tool for understanding formation processes of archaeological deposits and human activity but is limited to two dimensional observation. Likewise, the very high resolution of analysis provides detailed insights into formation processes of specific contexts, but it can be challenging to link such observations to longer term processes at the landscape scale. This paper presents new multiproxy research in the Hadrian's Wall region, combining a multiscalar approach from landscape to specific contexts at Birdoswald Roman Fort. Micromorphology in combination with archaeobotanical, phytolith and microCT analysis has provided new insights into the nature of fuel use in Roman Britain. In this case, sampling for micromorphology was targeted at specific contexts of interest, to support hypotheses suggested during excavation. Thick charred deposits were observed, with a well preserved 'ashy' layer. On site flotation indicated a high concentration of charred material. Micromorphology samples were collected to better understand the formation processes, and to examine the composition of the ashy layer. The analysis provides specific information on how the site was using fuel, in this case for heating water in the bath house. In turn, this case study links to wider landscape studies, investigating the nature of human landscape impacts in the late Iron Age and Roman period through quantitative palynological analysis of peat cores. More quantitative data on landscape change can be gained from pollen analysis and macrobotanical analysis, whilst microarchaeology provides important contextual information showing the types of activities that may have caused these landscape impacts. Unlike other methods where samples are collected as standard from each unit of excavation, these methods should be more selective and targeted at selected contexts where they can be used to maximise information.

3 FIRE USE AND WASTE MANAGEMENT IN AN EARLY IRON AGE VILLAGE: CONNECTING ACTIVITY AREAS AT CERRO DE SAN VICENTE

Tomé, Laura (Archaeological Micromorphology and Biomarkers Laboratory (AMBI Lab), Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna, 38206, Tenerife, Spain; Área de Prehistoria, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna, 38206, Tenerife, Spain) - Iriarte, Eneko (Área de Paleontología, Departamento de Historia, Geografía y Comunicación, Facultad de Humanidades y Comunicación, Universidad de Burgos, 09001, Burgos, Spain) - Blanco-González, Antonio (Research Group PREHUSAL, Departamento de Prehistoria, Historia Antigua y Arqueología, Facultad de Geografía e Historia, Universidad de Salamanca, 37002, Salamanca, Spain) - Fernández-Palacios, Enrique (Archaeological Micromorphology and Biomarkers Laboratory (AMBI Lab), Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna, 38206, Tenerife, Spain; Área de Prehistoria, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna, 38206, Tenerife, Spain) - Mallol, Carolina (Archaeological Micromorphology and Biomarkers Laboratory (AMBI Lab), Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna, 38206, Tenerife, Spain; Área de Prehistoria, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna, 38206, Tenerife, Spain; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB), Universidade do Algarve, Campus de Gambelas, Edifício 1, 8005-139, Faro, Portugal)

Cerro de San Vicente, situated in the Northern Plateau of Iberia (Salamanca, Spain), is an Early Iron Age village dating from 900 to 400 BCE. Excavations so far have uncovered a prolonged occupation spanning the first half of the first millennium BCE, and open-area excavations have unveiled a complex village layout dating to a late phase (c. 650-550 BCE). This layout features earthen roundhouses with central clay hearths, benches, ancillary mud constructions, and open-air spaces displaying midden deposits. While the dwellings yielded limited archaeological materials, transit areas presented ashy and charcoal-rich dumps mixed with abundant culinary refuse and domestic equipment, including open-air fireplaces and other storage features. These material-rich deposits, associated with diverse households, were initially interpreted at a macroscopic scale. Our research aims to unlock the potential of these middens as valuable

sedimentary archives of information to uncover past daily life practices in the village. In order to address this archaeological issue, we applied a microcontextual, geoarchaeological approach to study two midden sequences from the village. Combining archaeological soil micromorphology, thin section phytolith analysis, sedimentary lipid biomarker analysis, and XRF and XRD analyses, our preliminary results showcase complex microstratified sequences formed through recurrent dumping, trampling, and transit events. Notably, lipid biomarkers and phytoliths exhibit excellent preservation. Micromorphological findings reveal the repetitive presence of trampled earth-based construction materials mixed with organic and charred debris, as well as ash layers likely linked to hearth rake-out events. Remarkably, micromorphological data have also allowed us to establish relative chronologies within the site, and therefore to link different spaces that were likely used concurrently in the village. Future analyses promise deeper insights into domestic space utilization and waste management practices, contributing valuable high-resolution, microcontextual data to the understanding of Iron Age contexts in Iberia.

4 MICRO-CONTEXTUAL APPROACH TO ANCIENT AGRICULTURE: THE CASE OF FERNOVETA (IBI, ALICANTE, SPAIN)

Agulló Mániz, Xavier (University of Alicante, Spain) - Gutiérrez Rodríguez, Mario (UIAI, Universidad de Jaén, Spain) - Grau Mira, Ignasi (INAPH, University of Alicante, Spain)

This comprehensive study aims to critically reassess and enhance our understanding of ancient agricultural practices prevalent during the eras associated with both the Iberian Iron Age groups and subsequent Romans in the Iberian Peninsula. The research employs a microstratigraphic perspective, integrating physicochemical and geochemical analyses with soil micromorphology investigations conducted at the Ibero-Roman site of Fernoveta in Ibi, Alicante. Through the amalgamation of various geoarchaeological analysis techniques, our investigation contributes empirical data, shedding light on historical soil cultivation practices.

We posit as the initial hypothesis that the inland territory of Iberian Iron Age Contestania (eastern Iberia) adhered to the model of Intensive Smallholders, and our study explores the multifaceted implications associated with this agricultural approach. This research significantly enriches the broader discourse on ancient agriculture by offering a nuanced understanding of the specific historical and geographical context of Fernoveta. The implementation of advanced analytical methods not only unveils intricate details of soil composition but also provides valuable insights into the socio-economic dynamics governing the ancient inhabitants of the region.

This presentation stands as a contribution to the ongoing dialogue surrounding protohistoric agriculture, serving as an impetus for further exploration into the intricate complexities of land management strategies during the Iberian Iron Age and Roman periods. Moreover, we will address the challenges and potential applications of the micro-contextual approach in agricultural contexts, always acknowledging any limitations that may arise. As we delve deeper into the intricacies of agricultural history, this study seeks to explore the heterogeneous realities of ancient societies, looking for a more profound comprehension of their agrarian practices and landscape and their socio-economic structures.

5 MICRO-ARCHAEOLOGICAL INVESTIGATIONS OF FOOD STORAGE FEATURES IN TURKEY AND THE KURDISTAN REGION OF IRAQ

Tumolo, Valentina (Università degli Studi della Tuscia - Italy) - Maher, Lisa (University of California, Berkeley - USA)

Storing food has always been a basic need for semi-nomadic and sedentary people, representing both a risk-management strategy and a source of social power that generates and supports social inequality. In archaeological contexts, the ways in which food is stored are associated with a combination of ecological, technological, and social factors. This paper will present the work of an ongoing project focused on the investigation of food storage features from key archaeological sites in Turkey and the Kurdistan region of Iraq dated to the late fifth, fourth, and third millennia BC. The research includes the direct examination of stockpiling facilities through a combination of macro-archaeological methods and micro-archaeological techniques. We focus here on the micromorphology analysis and the associated methodological issues, to examine the implications for interpretation of storage features. In particular, we discuss the debates on micromorphology sampling and representativeness of feature types with respect to the concept of case specific site-formation processes.

6 UNVEILING STABLES: FROM FIELD TO MICROSCOPE. STABLING CRUSTS FROM THE MIDDLE BRONZE AGE SITE OF LA MURAIOLA DI POVEGLIANO (ITALY)

Polisca, Federico (Department of Cultural Heritage, University of Padova) - Baldan, Maela (Department of Geosciences, University of Padova) - Battistel, Dario (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice, Italy) - Breglia, Francesco (Department of Geosciences, University of Padova) - Canti, Matthew (Historic England, Fort Cumberland, Eastney) - D'Aquino, Silvia (Department of Cultural Heritage, University of Padova) - Dal Corso, Marta (Department of Geosciences, University of Padova) - Gherardi, Francesca (Historic England, Fort Cumberland, Eastney) - Piazzalunga, Giorgio (Department of Cultural Heritage, University of Padova) - Nicosia, Cristiano (Department of Geosciences, University of Padova)

The identification of stabling activities is of paramount importance in the reconstruction of the social, economic, and ecological aspects of ancient communities. However, especially in open-air sites under dry preservation, stabling deposits usually leave faint macroscopic evidence in archaeological times, mainly related to post-holes. To recognise ancient stabling areas, therefore, a microcontextual approach is required, involving micromorphology and microbotanical techniques (e.g., palynology, phytolith analysis). In micromorphology, phosphate crusts containing articulated phytoliths are considered reliable evidence and therefore have been named 'stabling crusts'. Yet, if 'stabling crusts' exist in micromorphology, to our knowledge, no field evidence of them has been published so far.

Within the framework of the ERC CoG project GEODAP (Geoarchaeology of Daily Practices), a stable characterised by a sequence of compact, orange-brown 'floors' intercalated to ashy layers was discovered in recent excavations in the Middle Bronze Age settlement of La Muraiola di Povegliano (Verona, NE Italy).

Micromorphological analysis revealed that these 'floors' were, in fact, stabling crusts developed by cementing herbivore dung, fodder/bedding material, and domestic waste. The link between field and micro- data has been ensured by meso-observations using a Keyence microscope that allowed for a 3D description of the stabling crusts. Micromorphology, coupled with microchemical (SEM-EDS, μ XRF) and mineralogical analysis (XRD), revealed the formation processes and the burial conditions that lead to the phosphatisation of the deposits. Furthermore, microbotanical and faecal biomarker analyses on sediments extracted from the stabling crusts allowed us to understand which animals were stalled and provided details on the animals' diet and stalling.

This multidisciplinary study bridges the gap between 'micro' and 'macro' perspectives on indoor stabling activities. It offers crucial insights into the formation processes behind stable crusts, provides criteria for their identification in the field, and highlights their significance in deciphering past herding practices and living conditions.

7 MICROMORPHOLOGICAL INVESTIGATION OF HOLOCENE SLOPE DEPOSITS IN THE MIDDLE TAGUS, PORTUGAL

Adewumi, Opeyemi (Geosciences Center (CGEO), Department of Earth Sciences, University of Coimbra, Portugal; Instituto Terra e Memória, Mação, Portugal; Instituto Politécnico de Tomar, Portugal; IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.) - Oosterbeek, Luiz (Geosciences Center (CGEO), Department of Earth Sciences, University of Coimbra, Portugal; Instituto Terra e Memória, Mação, Portugal; Instituto Politécnico de Tomar, Portugal) - Vallverdú i Poch, Josep (IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.; Àrea de Prehistoria, Universitat Rovira i Virgili (URV), Avenida de Catalunya 35, 43002 Tarragona, Spain.) - Quinta-Ferreira, Mário (Geosciences Center (CGEO), Department of Earth Sciences, University of Coimbra, Portugal)

The Middle Tagus region in Portugal is a distinctive ecotonal area with diverse geomorphological features, a complex geological history, and hydrological factors. This region offers an intriguing setting for studying the formation and composition of slope deposits. Despite the considerable advancement of micromorphology as a scientific discipline and its associated methodologies, it remains largely underutilized in archaeological pursuits, particularly in the exploration of slope deposits within this specific Portuguese region.

This paper presents a comprehensive micromorphological approach to the study of slope soils of key archaeological sites in the Middle Tagus region, notably Cadaval Cave and the Amoreira terrace colluvial deposits. Amoreira is situated on the right bank of the Tagus River, in the municipality of Abrantes, while Cadaval is positioned in a karstic canyon along the Nabão River, part of the Tagus basin as well. Micromorphology has been applied, on one hand, to assess the variation of soils along the slope and, on the other hand, for refining the characterization of late Pleistocene and Holocene microstratigraphic units from already established stratigraphic profiles of these sites. Micromorphological samples were also collected for a better understanding of potential anthropic impact in the diagenetic process.

8 SEDIMENTARY MICRO-FACIES AND SOIL STRATIGRAPHY OF GRAN DOLINA TD-10 (ATAPUERCA, BURGOS, SPAIN)

Warnitz, Lila (IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.; Àrea de Prehistoria, Universitat Rovira i Virgili (URV), Avenida de Catalunya 35, 43002 Tarragona, Spain.) - Adewumi, Opeyemi (Geosciences Center (CGEO), Department of Earth Sciences, University of Coimbra, Portugal; Instituto Terra e Memória, Mação, Portugal; Instituto Politécnico de Tomar, Portugal; IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.) - Martín i Perea, David (IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.; Department of Geodynamics, Stratigraphy, and Palaeontology, Faculty of Geological Sciences, Complutense University of Madrid, C/ José Antonio Novais, 12, 28040 Madrid, Spain) - Vallverdú, Josep (IPHES, Institut Català de Paleoeologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.; Àrea de Prehistoria, Universitat Rovira i Virgili (URV), Avenida de Catalunya 35, 43002 Tarragona, Spain.)

Since the discovery of Gran Dolina, many studies have been carried out to understand the life conditions of the early humans of Europe. However, as the research on the site stratigraphy is still being discussed, the present focus of this study is on the TD-10 to determine the flow types and taphonomical evolution that can be associated with the site. This study proposes an extensive investigation of the TD-10 unit of Gran Dolina through the use of sedimentary geology and soil micromorphology disciplines as frames of reference to explore microfacies analysis. For this purpose, samples from three columns, N12, N17/N16, and K22, coming from the two different sections of Gran Dolina, North-West and South-East, have been transformed into 41 thin sections. They have then been studied through thin sections and under petrographic microscope at different magnifications in order to determine the different sedimentary structure, pedofeatures and microstructures.

A total of 7 microfacies have been described. The analyses of the microfacies pedofeatures and microstructures have allowed to identify several types of soil. Consequently, within these microfacies, four soil types have been identified: inceptisoi (microfacies 1), aridisoi in varying stages of development (microfacies 2), cryosoi (facies 3 and 4), and finally, alfisoi (facies 5). Those soils reflected different paleopedological variations during the deposit of TD-10, such as calcification, mechanical frost disturbance and illuviation paleopedological process. On the other hand, microfacies 6 and 7 are composed of reworked soil resulting from erosional processes and alluvial deposits. In addition, the stratigraphic distribution of the soil forming process shows distinct diagnostic horizon records between the northern-western and southern-eastern sampled profiles. Therefore, TD-10 seem to present different environmental records according to the Gran Dolina sediment cave entrance aperture.

9 MULTI-METHOD GEOARCHAEOLOGICAL APPROACHES UNTANGLE COMPLEX SITE FORMATION PROCESSES AND SOIL BIOGRAPHIES AT EARLY NEOLITHIC PEILIGANG, MIDDLE YELLOW RIVER VALLEY, CHINA

Ma, Zhe (Department of Archaeology, Durham University) - Milek, Karen (Department of Archaeology, Durham University) - Li, Yongqiang (Institute of Archaeology, Chinese Academy of Social Sciences)

This geoarchaeological study examines the impact of environmental and cultural processes on Peiligang, an early Neolithic site in the loess plains of the middle Yellow River Valley, China. Continuous occupation since the Neolithic and complex post-depositional processes caused irregular interlacing of darker and yellower soils, which posed major challenges for the excavation, sampling, and interpretation of the site. The geoarchaeological programme carefully sampled the darker and yellower soils separately in order to identify their formation processes. Quantitative analyses of geochemical properties, including pH, electrical conductivity, magnetic susceptibility, and organic matter content, were compared to micromorphological analyses of both soil types. This multi-method approach revealed that the darker soils, with higher magnetic susceptibility, organic matter content, and artefact densities, were the original Neolithic A horizons amended with cultural material from the Peiligang settlement, which had been subjected to long-term post-depositional pedogenic processes. The yellow soils, on the other hand, were vertebrate and invertebrate burrows infilled with 'clean' loess dragged in from overlying and underlying aeolian layers. The resulting long-term biography of the Peiligang soils, spanning 7000 years, has made it possible to strip back the later phases of soil development and extract the soil characteristics relevant to the early Neolithic phase of occupation. This has major implications for our understanding of Peiligang and will have significant impacts on how other early prehistoric sites on China's loess plateau are investigated.

10 **LAYERS OF TIME: MICROMORPHOLOGICAL RECONSTRUCTIONS AT UMHLATUZANA ROCKSHELTER**

Sifogeorgaki, Irini (Human Origins, Faculty of Archaeology, Leiden University, Leiden, Netherlands) - Huisman, Hans (Section Archaeology, Cultural Heritage Agency of the Netherlands, Amersfoort, Netherlands; Groningen Institute for Archaeology, University of Groningen, Groningen, Netherlands) - Karkanias, Panagiotis (M.H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens, Athens, Greece) - Schmid, Viola (Austrian Archaeological Institute, Academy of Sciences, Vienna, Austria; Human Origins, Faculty of Archaeology, Leiden University, Leiden, Netherlands; Work group of Early Prehistory and Quaternary Ecology, Eberhard Karls Universität Tübingen, Tübingen, Germany; UMR 7041, Equipe AnTET, Université Paris Ouest Nanterre La Défense, Nanterre Cedex, France) - Dusseldorp, Gerrit (Human Origins, Faculty of Archaeology, Leiden University, Leiden, Netherlands; Palaeo-Research Institute, University of Johannesburg, Johannesburg, South Africa)

In this study, we present a comprehensive analysis of the Umhlatuzana rockshelter in KwaZulu-Natal, South Africa, spanning the Middle and Later Stone Age as well as Iron Age (~70,000 years BP to present). Utilizing multi-proxy geoarchaeological data, including micromorphology, XRD, and SEM-EDS, we reconstruct the site's depositional and post-depositional history. Despite macroscopic homogeneity, micromorphological analysis reveals intricate depositional micro-layering, offering insights into past formation processes. Sediments associated with combustion activities are prevalent throughout the deposits, with preservation conditions notably better in the Holocene. Post-depositional geochemical alterations have led to the formation of phosphatic minerals, notably vashegyite, indicative of acidic and moist sedimentary environments. Despite evident bioturbation features, sediment mixing minimally affects the vertical distribution of lithic artifacts, allowing for the analysis of coherent assemblages. This study contributes to understanding human interactions with their environment, highlighting the critical role of micromorphological analysis in unraveling complex archaeological narratives across diverse temporal and spatial contexts. By integrating micromorphology with other micro-contextual techniques, we aim to enhance our interpretations of archaeological contexts and shed light on broader archaeological questions.

11 **AN INVESTIGATION OF GEOCHEMICAL PROCESSES AND STONE TOOL DIAGENESIS AT THE KATHU PAN SITE, SOUTH AFRICA**

Amaral, Selina (University of Toronto) - Chazan, Michael (University of Toronto) - Butler, Donald (University of Toronto)

Kathu Pan preserves evidence of early hominin behaviours from the Middle Pleistocene to the Holocene. The site is an ephemeral wetland situated in an irregular karstic bedrock topography that is fed by local aquifers and lies along the southern margins of the Kalahari Basin. Post-depositional geochemical factors affecting the site are the formation of calcretes and the dissolution and precipitation of silica (SiO₂). This can partially be explained by the inverse relationship between calcium carbonate (CaCO₃) and silica concerning pH. pH values of 9 or above strongly promote calcium carbonate precipitation and silica dissolution, while pH values below 9 exhibit the reverse effect. The investigation of this phenomenon occurring at the Kathu Pan site was prompted by the fact that some of the siliceous, banded iron formation lithics recovered from the site have acquired a silica "rind" and several may have undergone chemical dissolution. While this phenomenon has predominantly affected the lithic artifacts, some of the enamel recovered from the lower Acheulean layers have also had silica precipitate on their surfaces. The ongoing investigation of this phenomenon includes the analysis of lithic and enamel samples with an SEM and SEM-EDS, in concert with the analysis of micromorphological thin sections using optical microscopy along with SEM-EDS. The analysis of micromorphological thin sections allows us to fully investigate and characterize the extent to which silica and calcium carbonate precipitation and dissolution have affected the Kathu Pan site, thus giving us a better understanding of site formation processes. Results of this analysis will be presented and will be used to identify environmental conditions, beyond pH, that are contributing to this phenomenon's occurrence. This work ties into a larger study of site formation processes and palaeoenvironmental reconstruction during a critical period of hominin evolution at Kathu Pan.

12 **REFLECTING ON THE MULTI-SCALAR (MICRO-) GEOARCHAEOLOGICAL RESEARCH: THE CASE OF ARARAT-1 CAVE (ARMENIA)**

Oikonomou, Ioannis (Human-Environment Dynamics Laboratory, Institute of Archaeology, The Hebrew University of Jerusalem) - Karambaglidis, Theodoros (Department of Geological Engineering and Mining, University of Castilla-La Mancha) - Malinsky-Buller, Ariel (Human-Environment Dynamics Laboratory, Institute of Archaeology, The Hebrew University of Jerusalem)

The central objective of any geoarchaeological study is the reconstruction of the formation process of archaeological sites and the extraction of information regarding past human behaviour. While various types and scales of analyses are available, context-specific microstratigraphic techniques are growingly incorporated in the geoarchaeological research, currently constituting an integral and standardised component of the toolkit. This paper explores the effec-

tiveness of a multi-scalar approach, centered on micromorphological and associated context-specific analyses in tandem with macro-stratigraphic investigations and wider landscape considerations. The analytical component includes the use of archaeological sediment micromorphology, coupled with micro-contextual elemental and mineralogical mapping, utilising SEM-EDS and micro-FTIR respectively. An additional series of bulk analyses is also incorporated within the methodological framework. This includes the study of particle size and shape (laser diffraction granulometry & dynamic image analysis), mineralogy (FTIR), elemental analysis (ICP-AES), magnetic susceptibility, pH, colourimetry, estimation of the organic and carbonate content (Loss-On-Ignition), as well as phytolith and ash pseudomorph analyses.

The combination of macroscopic field documentation, microstratigraphic and bulk analyses is used to decipher and reconstruct the formation processes and depositional histories of the Palaeolithic Cave of Ararat-1 (Ararat Depression, Armenia). The preliminary results of this study enable an intricate reconstruction of the interplaying processes, highlighting differential input of geogenic, biogenic, pedogenic and anthropogenic sediment sources. However, have all these methods been shown equally valuable for the research enquiry? Through reverse engineering of the results, we can evaluate the contribution of the different methods in the construction of the cave accumulation narrative.

13 **THE MIDDLE TO UPPER PALEOLITHIC TRANSITION IN IBERIA: NEW SEDIMENTARY AND PALEOENVIRONMENTAL DATA FROM COVA FORADADA AND LA GRIERA**

Soares-Remiseiro, Miguel (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArE-HB), University of Algarve, Faro, Portugal) - Aldeias, Vera (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB), University of Algarve, Faro, Portugal) - Morales, Juan (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA), Zona Educativa 4, Campus Sescelades URV (Edifici W3), 43007, Tarragona, Spain.; Àrea de Prehistòria, Universitat Rovira i Virgili (URV), Campus Catalunya, Av. Catalunya, 35, 43002, Tarragona, Spain.)

One of the most significant events in prehistoric Europe is the population replacement of Neanderthals by Homo sapiens during the Middle to Upper Paleolithic transition. In this regard, the Iberian Peninsula has been the subject of debate concerning the chronology of sites and theorized that it could have acted as a cul-de-sac for both species: refugia for Neanderthals and latest arrival of Homo sapiens dispersals.

However, many of the studied sites in Iberia lack high-resolution data or are controversial regarding site formation, dating, or paleoenvironment. We present the preliminary micromorphological results of the sedimentary and paleoenvironmental sequences from the archaeological sites of La Griera and Cova Foradada (Catalonia, Spain). Cova Foradada is known for being the southernmost Châtelperronian site, while La Griera - which is less than 2 km away - can complement its sedimentary sequence since it contains levels from the Middle and Upper Paleolithic.

The initial results show that part of the sedimentary record of Cova Foradada has been affected by slope dynamics, which has displaced them from their primary position. In La Griera, we have established the depositional dynamics that explain the position of the Upper Paleolithic adjacent to the Middle Paleolithic, as well as noticing the formation of tufa in the Middle Paleolithic levels.

This study will lead to further analysis, including the examination of stable isotopes and lipid biomarkers, to enhance a stronger comprehension of the paleoenvironmental dynamics during this chronological framework.

14 **NEANDERTHAL AND CARNIVORE INTERACTION AT ESCOURAL CAVE (SOUTHERN PORTUGAL): A MICRO-GEOARCHAEOLOGICAL APPROACH**

Alzate, Guillermo (University of Algarve; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB)) - Barbieri, Alvise (University of Algarve; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB)) - Cascalheira, João (University of Algarve; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB))

In this paper, we present the results of a micro-geoarchaeological study which examine the site formation processes of the Middle to Upper Paleolithic stratigraphic layers at the Escoural cave in southern Portugal. Based on archaeological soil and sediment micromorphology, μ -XRF, μ -FTIR and fluorescence microscopy, we explore the different formation processes in and outside the cave, identifying human activities by the variable presence of faunal bones (fresh and heated), micro-lithic artifacts, charcoal and seashells as well as carnivore input evidenced by coprolites, phosphatic grains and chewed/digested bones, along the whole sequences studied. Besides, we observed common formation processes in Paleolithic caves like bioturbation due to roots and soil fauna activities, phosphatized clayey and silty to sandy sediments related with the presence of carnivore coprolites, and precipitation, dissolution and cementation of calcium carbonates. Our conclusions establish a close interaction between Neanderthals and carnivores who shared this paleolithic cave, as well as different episodes of short-term occupations of the site by hominin groups.

REVISITING THE MADONNA DELL'ARMA CAVE (SANREMO, ITALY): NEW DATA ON NEANDERTHAL DWELLERS FROM 1960'S HERITAGE COLLECTIONS

Costanzo, Stefano (Dipartimento di Scienze della Terra "A. Desio", Università degli Studi di Milano, Milan, Italy) - Zerboni, Andrea (Dipartimento di Scienze della Terra "A. Desio", Università degli Studi di Milano, Milan, Italy) - Aldeias, Vera (The interdisciplinary Center for Archaeology and Evolution of Human Behaviour, Universidade do Algarve, Faro, Portugal) - Starnini, Elisabetta (Dipartimento di Civiltà e Forme del Sapere, University of Pisa, Pisa, Italy) - Pappalardo, Marta (Dipartimento di Scienze della Terra, Università di Pisa, Pisa, Italy)

The rugged Mediterranean coastlines conceal hundreds of caves that have been hubs of human occupation since deep prehistory. Some are hosted along the Ligurian coast of Northern Italy, the most famous being the Balzi Rossi caves - well-preserved and archaeologically rich localities occupied since the arrival of *Homo neanderthalensis* and even earlier hominin species, with excavations ongoing since the mid-19th century and finds exhibited worldwide. Evidence for Neanderthal occupation in the region is found at Madonna dell'Arma as well. This site is a narrow coastal cave nested at the base of a Pliocene conglomerate slope and hidden by a sanctuary sealing its entrance. Therein, 1950's-1960's excavations revealed, on top of a MIS 5e marine deposit, episodes of occupation dated to the MIS 5c and 5a, with a rich Mousterian lithic assemblage associated with faunal remains. Despite in-depth early publications, archaeological excavations at the site ceased and the cave remained mostly unexplored since the 1960's; nonetheless, due to the far-sighting of the former excavation director Giuseppe Isetti, remains of sub-lithified hearths and sediment samples were entrusted to the local museum. The pilot study we present here stems from the SPHeritage Project (MUR grant FISR2019_00040, PI: M. Pappalardo) at Balzi Rossi, and aims to valorise the Madonna dell'Arma cave by executing new analyses on Isetti's heritage samples and re-examining the preserved trench sections. New OSL dating and pedosedimentary analyses improve interpretations of site formation processes, whilst micromorphology, associated to palaeobotanical analyses, is employed on hearths to assess the nature of the fire remains and the anthropogenic processes associated with the groups dwelling in this cave. Results give new life to the site, adding value to the local archaeological heritage and integrating our knowledge about the role of Ligurian coastal environs for the spread and behaviour of *Homo* communities in the European continent.

497 FOOD STORAGE AND SECURITY IN PREHISTORIC EUROPE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: McClatchie, Meriel (University College Dublin) - Cleary, Kerri (Archaeological Consultancy Services Unit) - Johnston, Penny (University College Dublin) - Crowley-Champoux, Erin (University College Dublin) - Prats, Georgina (Universitat de Lleida)

Session format: Regular session

Food storage is likely to have played an important role in managing risk, dealing with surplus and providing security for prehistoric communities in Europe. Potential food storage facilities have been recorded at many sites, including large underground pits, overground granaries and structures, smaller vessels such as ceramic and wooden containers, and discrete deposits in peat bogs. Characterising the practices associated with these structures and objects can be challenging, however. Do food storage facilities always reflect a materialisation of surplus? Who was allowed to access stored resources (and who was not), and what types of dishes were created with stored foods? Can food storage enable resilience through adaptive behaviour in the face of environmental and social transformations, and what can storage tell us about ancient concepts of food security? Much archaeological discussion of food storage practices has focused on later prehistory, but is there also evidence for storage facilities in earlier periods? Are there parallels in more recent ethnographic and folklife records that can help us detect 'forgotten' storage practices? It is becoming increasingly clear that consideration of wider social, economic and environmental contexts can help us better characterise storage practices, and it is hoped that this session will highlight the many different ways in which scholars can approach the study of food storage and security. We welcome papers investigating food storage in prehistoric Europe, particularly those that draw upon evidence from archaeobotany, zooarchaeology, landscape and settlement studies, ethnography and related fields.

ABSTRACTS

1 "WHO EVER MISLAID A KEG OF BUTTER?" BOG BUTTER DEPOSITION AS A STRATEGY FOR FOOD STORAGE IN IRELAND

O'Toole, Karen (University College Dublin)

Bog butter is among the most common finds recovered from Irish peatlands. Often recovered in wooden vessels, wrapped in animal skins and bark, or even bare, this unusual find has an extremely long-lived chronology extending

from the Early Bronze Age through to the early modern period. Organic residue analyses have confirmed the dairy origin of bog butters from Ireland, highlighting the potential of these finds to enhance our understanding of early farming and dairying practice. However, interpreting bog butter deposition is challenging, particularly as it is always a stray find; although food storage has been one of the most popular explanations of the practice since the nineteenth century. Based on my PhD research, this presentation will review the evidence for Irish bog butter deposition as a strategy for food storage through the lens of food surplus and food security. It will explore why it may have been important to store butter for future use in prehistory, assess any aspects of these finds that may suggest they were intended to be retrieved, and consider why so many lay undiscovered into the present day.

2 LEAVE NO TRACE? STORAGE IN THE IRISH ETHNOGRAPHIC RECORD AND THE IMPLICATIONS FOR ARCHAEOLOGY

Johnston, Penny (School of Archaeology, University College Dublin, Ireland) - Cleary, Kerri (ACSU Ltd., Ireland) - Crowley-Champoux, Erin (School of Archaeology, University College Dublin, Ireland) - McClatchie, Meriel (School of Archaeology, University College Dublin, Ireland)

Storage has an important role to play in the way that archaeologists understand the development of past societies. Amongst other things, the role of storage has been debated when examining sedentism, the evolution of complex social orders and the conceptualisation of private property.

Drawing on the Irish ethnographic record for the storage of grain and grain products, we examine likely preservation mechanisms for storage features, make inferences about archaeological visibility and discuss the implications for wider archaeological interpretations of storage in past societies.

Our analysis is based on a dataset gathered as part of a two-year research project "FOODSEC: Food Security in Bronze Age Ireland", funded under the 2022-2024 Irish Research Council COALESCE Scheme (Strand 1L IN-STAR+; Project ID: COALESCE/2022/1623). Results suggest that storage methods used in the subsistence-based economies of the recent past probably had very limited chance of surviving in the archaeological record. Because of this, we suggest that the value of the ethnographic record lies not simply in its use as a resource for drawing parallels about practices in the more distant past, but more in the qualitative insights it provides. We highlight the recurring issues and concerns evident in the Irish ethnographic record for storage and suggest that the problems and the worries manifest there can be projected back into the prehistoric past. In this way the ethnographic record enhances our understanding of the everyday lived experiences of those dependent on efficient storage for their survival.

3 ARCHAEOBOTANICAL AND ARCHAEOLOGICAL EVIDENCE OF PLANT FOOD STORAGE IN PREHISTORY IN NORTHERN GERMANY

Filipovic, Dragana (Kiel University, Germany) - Effenberger, Henrike (Effenberger Archäobotanik, Germany) - Kneisel, Jutta (Kiel University, Germany) - Schaefer-Di Maida, Stefanie (Kiel University, Germany) - Wiethold, Julian (Institut national de recherches archéologiques préventives (Inrap), France) - Kirleis, Wiebke (Kiel University, Germany)

This paper presents the current knowledge on plant storage in the prehistory of northern Germany, based on the direct (archaeobotanical) and indirect (archaeological) evidence. First we consider the combined evidence with respect to (a) the question of what kind of deposits we consider as (remnants of) plant stores or storage facilities, and (b) plant taxa and amounts found in such deposits, along with the issues of taphonomy and formation processes. We then show examples of mainly small-scale storage of wild and domesticated plants from pre- and earliest agricultural sites (Mesolithic-Neolithic) and then contrast these with the finds of large stores of plant food discovered at sites from later prehistory (Bronze and Iron Ages). Our discussion focuses on the apparent temporal shift in the social organisation of plant food storage, from predominantly small ('household') to visibly larger ('community') scale, and on the economic context of this practice. We explore parallels in the ethnographic and historical record, where we also find information on the ways in which different plant products could be stored and the purpose of their storage.

4 WAS IT REALLY USED FOR STORAGE? ARCHAEOBOTANICAL ANALYSES OF THE TRB FEATURES IN NORTHERN POLAND

Kofel, Dominika (Nicolaus Copernicus University in Torun) - Adamczak, Kamil (Nicolaus Copernicus University in Torun) - Bienias, Dorota (Nicolaus Copernicus University in Torun)

Archaeobotanical samples were collected throughout two seasons of excavations at two sites: Browina and Kałdus. Both sites are located to the north of Toruń, at the territory of so called Chełmno Land, Kuyavian-Pomeranian Voivodeship, and were intensively settled in the Prehistoric and as well as in historic times. This presentation includes results of carpological and anthracological analyses of plant macroremains preserved as charred in soil samples as well as imprints in pottery sherds and daub fragments. Materials derived from four Funnelbeaker culture (TRB) features.

Assemblages collected from two features in Browina comprised occasional barley (*Hordeum vulgare*) and einkorn wheat (*Triticum monococcum*) grains along with abundant hulled wheats (*T. monococcum/dicoccon/spelta*) chaff. Additionally, samples from Browina consisted of occasional seeds and fruit of ruderal and segetal plants. Meanwhile a sample collected from one of the features in Kafdus contained highly fragmented grains of indeterminate cereals (*Cerealia indet.*) whereas in the second feature nothing but remains of segetal and ruderal plants were identified. Based on the undertaken research, the following questions arose: 1) Were all the researched features used for storage? 2) If not, what other purposes could the features hold? 3) If yes, were the stored goods intended for humans or livestock? 4) Is it possible to establish function of a feature relying just on archaeobotanical data? Some of the questions will find answers during the presentation as studies of plant macroremains, even sparse, might bring to light interesting insights into activities undertaken by Neolithic farmers.

5 STORAGE PRACTICES IN THE BRONZE AND IRON AGE LEVANT: AN ARCHAEOBOTANICAL PERSPECTIVE

Demeulenaere, Eline (Institute for Archaeological Sciences, University of Tübingen, 72074 Tübingen, Germany) - Riehl, Simone (Institute for Archaeological Sciences, University of Tübingen, 72074 Tübingen, Germany; Senckenberg Centre for Human Evolution and Palaeoenvironment (SHEP), 72074 Tübingen, Germany) - Kamlah, Jens (Institute for Biblical Archaeology, University of Tübingen, 72074 Tübingen, Germany)

The history of the Levant is closely interwoven with agricultural endeavours. Storage techniques and methods played a key role in ensuring the sustenance of the population and stimulating urban development.

This paper discusses Bronze and Iron Age storage practices across the Levant (Northern, Central and Southern Levant) through a synthesised analysis of archaeobotanical evidence. The created dataset compiles information from archaeobotanical studies in the Levant that refer to storage contexts in their publications. In addition, an analysis of archaeobotanical material from Kamid el-Loz is included. The comparison of plant material from storage and non-storage contexts is investigated, in order to identify notable patterns between the two assemblages. Subsequently, the stored plant remains are examined to investigate possible regional variations and temporal changes.

Through this research, this paper aims to improve our understanding of storage practices and their significance, shedding light on storage habits, and possible associated socio-economic structures and trade in the Levant during the Bronze and Iron Ages.

6 THE DYNAMICS OF STORAGE VESSELS AND STORAGE: THE CASE OF NEOLITHIC DISPILIO, NORTH GREECE

Voulgari, Evangelia (Laboratory Teaching Staff, School of History and Archaeology Aristotle University of Thessaloniki) - Sofronidou, Marina (Ephorate of Antiquities of Drama) - Kotsakis, Kostas (Professor Emeritus of Prehistoric Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki)

Although the social significance of storage practices among Neolithic farmers is widely acknowledged, our understanding of this critical dimension of life remains inadequate in Northern Greece Neolithic. This paper focuses on storage practices and patterns from Neolithic Dispilio, based on the ceramic storage containers and pithoi. Dispilio is the first wetland site in Greece that has been systematically investigated since the 1990s by the Aristotle University of Thessaloniki. In the multi-layer diachronic development of the settlement from the mid-6th to the early 5th mil BCE, we have restored and recorded over 100 pithoi from a corpus of 1750 whole pots and profiles. This amount is unique in the Neolithic ceramic assemblage of Greece and opens new possibilities in understanding pottery's role in the storage practices of the Neolithic communities. The abundance of pithoi found in Dispilio may be related to the wet conditions of the settlement because of its proximity to the lake. Still, we believe the environmental setting may not offer the only explanation. After carefully analysing their technological and morphological characteristics, we concluded that the pithoi represented far more than a simple practical solution. Instead, they were tools for manipulating the product in social contexts and expressing ideas of social value.

This conclusion is based on two findings from our study. The first is the time-consuming treatment and decoration of their surfaces; the second is the uneven spatial distribution and their correlation with specific domestic units. We propose that these findings provide clues to reconsider ideas about the autonomy of Neolithic households in Dispilio and the relation of the domestic sphere to a public role of storage. Both indicate that the Neolithic dwellings' simplicity contradicts the complexity of the daily lives performed inside and outside the domestic sphere.

Our study has been supported by the ERC-funded EXPLO Project.

7 PRODUCTION, CONSUMPTION AND STORAGE: THE USE OF DOLIA BY THE FBA ENOTRIAN SOCIETY

van Leusen, Martijn (Groningen Institute of Archaeology) - Ippolito, Francesca (Groningen Institute of Archaeology)

For decades the go-to model for the presence of fragments of large clay storage vessels in the archaeology of protohistoric southern Italy has been that of 'elite distribution': a tribal elite, typically ensconced on hilltop settlements, controls the surrounding territory and monopolizes the sources of wealth (agricultural production and external trade contacts). In this model, the presence of the storage vessels known as pithoi or dolia is supposed to indicate storage, possibly in semi-interred cellars, for the purpose of redistribution at communal feasts. Intensive systematic field surveys in northern Calabria, followed more recently by targeted excavations, have begun to undermine this model, or at least its simplistic application.

From the surveys, it was already clear that many single-family rural settlements have multiple dolia, contradicting the idea of elite control over bulk storage. Starting in 2018, the authors ran a program of excavations targeting sites with evidence of storage vessels dated to the Bronze Age-Iron Age transition, including one from a geomorphological setting previously ignored by scholars. A specialist study of the dolium fabrics from the survey was conducted to underpin the impression that multiple fabrics had a broad regional distribution. In this paper, the authors will report on the relevant results from these studies but, more importantly, will pose a new series of research questions with which to probe the 'elite model' and engage with the multidisciplinary approaches that are the topic of this session. Our emphasis will be on the testable hypotheses emerging from these approaches.

8 CHANGES IN STORAGE ON THE GREAT HUNGARIAN PLAIN BETWEEN 6000 AND 4000 BC

Füzesi, András (Hungarian National Museum (Magyar Nemzeti Múzeum))

The history of Neolithic and Early Copper Age in the Carpathian Basin was eventful, so archaeologists have been able to sub-divide it into several parts. Due to this, the analysed millennia between 6000 and 4000 BC had a lot of connections which demonstrate consistent trends. Storage is one of these long-durée changes researchable in many aspects by archaeology.

Storage vessels represented the first solution for preserving. The large globular pottery of the Körös Culture also served as a communication platform, displayed landscape scenes with wild animals and natural, possibly agricultural vegetation. In the following phases of the Neolithic, storage jars were transformed into anthropomorphic ceramics, and the Late Neolithic rectangular bins were decorated with textile style. The technology and size of the vessels are equally significant, even if research on the social and ritual function of the containers has been at the forefront. The functional properties of organic and non-organic tempering were the main factors influencing the vessel use. The quantification of vessel size highlights the wide spectrum of storing. The variability of these data is related to different storage strategies and variants in supply activities.

Outdoor storage in pits was a secondary stage of preservation. The earliest storage pits were dug around 5200 BC. However we have a lot of excavated sites from Neolithic and Copper Age where there are no analyses of these features. This could be because each site only has a small number of storage pits discovered. The combined available information about the outdoor storage is sufficient to make a detailed analyses.

The presentation will focus on the technical aspects of two types of storage. The analyses will also try to find links between the economic, environmental and social dimensions of the choice and adaptation of the different storage techniques.

9 PITS AS PROCESS: EXPLORING THE UTILITY OF PIT FEATURES FOR DIFFERENT FOOD PRESERVATION PRACTICES IN THE PREHISTORIC PAST

Crowley-Champoux, Erin (University College Dublin) - McClatchie, Meriel (University College Dublin) - Cleary, Kerri (Archaeological Consultancy Services Unit, Ireland) - Johnston, Penny (University College Dublin)

Archaeological studies of storage practices have largely focused on the role of the storage environment as pit storage, ceramic vessels, bins, and silos provide visible archaeological signatures. These studies take an important look at the ways that communities were able to store food (mostly grains) for consumption, seed grain, accumulation, and exchange. The capacity for communities to meet their dietary needs as well as to plan for the future are key components in our understanding of food security. There are other substances and more ephemeral practices, however, that played a critical role in diets and culinary practices in the past. Communities in the past would also have depended on dried, smoked, salted, pickled, and fermented plant and animal products to meet their dietary needs through the winter and early spring, to supplement a diet focused on grain-based products and when fresh cultivated foods would not have been available. While these products remain largely archaeologically invisible, this paper expands our view on the preservation of foodstuffs by interrogating archaeological evidence for pits used to process bone grease and

hearths used for smoking/drying that offer a window into preservation practices in the prehistoric past. This research derives data from the FOODSEC project, which examines food storage and security in Bronze Age Ireland, and compares these data with practices known from the broader ethnographic and archaeological record. FOODSEC: Food Security in Bronze Age Ireland was a two-year project funded under the 2022–2024 Irish Research Council COALESCE Scheme (Strand 1L INSTAR+; Project ID: COALESCE/2022/1623).

10 FOOD STORAGE AND PROCESSING STRATEGIES: IDENTIFICATION OF DOMESTIC PRODUCTION IN NORTHEASTERN IBERIA BETWEEN THE 4TH AND 1ST MILLENNIUM BCE

Prats, Georgina (Grup d'Investigació Prehistòrica (GIP-UdL), Dept. de Geografia, Història i Història de l'Art, 2021-SGR-01607- ARQHISTEC, Universitat de Lleida) - Alonso, Natàlia (Grup d'Investigació Prehistòrica (GIP-UdL), Dept. de Geografia, Història i Història de l'Art, 2021-SGR-01607- ARQHISTEC, Universitat de Lleida)

Agricultural practices, such as storage and grinding, have played a key role in the evolution of human society and human–environment relationships. Storing allows the preservation and accumulation of foodstuffs over longer periods of time, thus reducing dependency on seasonal conditions and food seasonality and providing increased socio-ecological resilience under environmental and climatic stress. Additionally, the milling of cereals, other plants and materials, primarily conducted by women, is essential to the subsistence of human societies.

Various types of food storage and processing facilities have been identified at numerous sites, including underground pits, aboveground granaries, ceramic vessels, and grinding tools such as querns, milestones, and mortars. However, characterizing the practices associated with these structures and objects can be challenging. This study focuses on the relationship between macrolithic grinding tools and storage features and how their distribution indicates domestic spaces and production areas at different sites of north-eastern Iberia between the 4th and 1st millennium BCE. Specifically, we aim to determine whether grinding and food processing occurred within storage areas, households, or external spaces interpreted as residential or artisanal. We will achieve this by examining the type of archaeological site (isolated settlements, clusters of silos, etc.), storage structures, and sedimentation patterns within these structures, as well as the presence, contextual information, and location of processing tools. Understanding storage and grinding technologies and innovations is essential for identifying production spaces and domestic areas at the intra-site level from a diachronic perspective.

11 USING EXPERIMENTAL ARCHAEOLOGY TO EXAMINE FOOD SECURITY IN BRONZE AGE IRELAND

Cleary, Kerri (Archaeological Consultancy Services Unit, Ireland; School of Archaeology, University College Dublin, Ireland) - Crowley-Champoux, Erin (School of Archaeology, University College Dublin, Ireland) - Gryson, Dominic (Cornstown House Farm, Meath, Ireland) - Johnston, Penny (School of Archaeology, University College Dublin, Ireland) - McClatchie, Meriel (School of Archaeology, University College Dublin, Ireland) - Miklis, Michael (Heritage crop farmer, Kilkenny, Ireland) - Ryan, Liam (Consultant Food Scientist, Ireland)

'FOODSEC: Food Security in Bronze Age Ireland' was a two-year research project that took a multi-strand approach to examining the evidence for Bronze Age (c. 2200–800 BC) food remains and food storage facilities, with the aim of exploring how society managed the challenges of achieving food security. One element of this research was the use of experimental archaeological approaches to test the capabilities of underground storage for cereal crops (naked barley, hulled barley and emmer wheat). Previous experiments carried out in other countries have demonstrated that pits could successfully store grain for growing the following season, but these were in very different subsoils, climates and water table levels when compared to Ireland. This presentation will outline how we have used our experimental pits to examine temperature, humidity, oxygen and carbon dioxide levels to determine why some pits may fail but others appear to reach and maintain levels optimal for a fermentation process. The final results of the experimental work will be presented, alongside a reappraisal of how people in Bronze Age Ireland attempted to store their cereal grain to optimise their annual yield and aid their food quality and security. (The FOODSEC project was funded under the 2022–2024 Irish Research Council COALESCE Scheme Strand 1L INSTAR+; Project ID: COALESCE/2022/1623).

498 REFUSE IN CONTEXT: ARCHAEOLOGY OF WASTE MANAGEMENT PRACTICES IN ANCIENT MEDITERRANEAN URBAN SETTINGS

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Gutiérrez-Rodríguez, Mario (Instituto Universitario de Investigación en Arqueología Ibérica. Universidad de Jaén, Spain) - Acero Pérez, Jesús (Departamento de Prehistoria y Arqueología. Universidad de Sevilla, Spain; Uniarq - Centro de Arqueología da Universidade de Lisboa, Portugal) - Detry, Cleia (Uniarq - Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras da Universidade de Lisboa, Portugal)

Session format: Regular session

During Antiquity, urban Mediterranean societies spread and developed diverse town models to address the challenges associated with communal living, adopting a variety of solutions. One significant challenge was the daily, massive generation of solid, liquid, and physiological urban waste. While there has been some attention in recent decades towards urban sanitation infrastructure, such as aqueducts, sewerage networks, middens, and latrines, our understanding of the nature and composition of organic and inorganic waste, the temporal evolution of waste disposal areas, and the impact of refuse management practices on urban evolution remains limited.

This session takes a bottom-up approach to explore rubbish in Mediterranean urban settings, fostering the multi-disciplinary characterization of waste in specific archaeological contexts to uncover town biographies. We seek to address various research questions: What is the nature and composition of waste in urban settings? How are refuse areas distributed topographically? What is the temporality and specialization of refuse areas? What types of discarded materials are typically found in sewers, middens, streets, and buildings? What were the waste management practices in ancient towns, and what was the impact of these practices on urban development and population health?

To answer these questions, the session promotes multidisciplinary, integrated studies of urban organic and inorganic waste, combining various methods, such as microstratigraphy, zooarchaeology, archaeobotany, spectroscopy, isotopes, biomarkers, geochemistry, paleoparasitology, and more. The core themes of the session include: 1) the potential of archaeological sciences and microarchaeology in defining urban transformation processes; 2) the challenges of integrating data from different analytical methods, architecture, and material culture at diverse analytical scales, from waste management areas to town; 3) the importance of studying waste within their stratigraphic contexts by characterizing site formation processes. This session aims to cover a broad timespan in Mediterranean history, spanning from the Late Bronze Age to Late Antiquity.

ABSTRACTS

1 URBAN LATRINES IN THE ROMAN PROVINCE OF LUSITANIA: LOCATION, DESIGN AND OPERATION

Acero Pérez, Jesús (Universidad de Sevilla; UNIARQ - Centro de Arqueologia da Universidade de Lisboa)

Latrines, both in public and private spaces, were an essential element of Roman cities. However, their study has been largely neglected in the territories of ancient Hispania. This work aims to provide an overview of urban latrines in Lusitania, one of the three provinces into which Hispania was divided during the High Empire. The analysis focuses on the remains identified in the provincial capital, Augusta Emerita, and in other towns with different levels of urban development, such as Capera, Conimbriga and Mirobriga.

This global approach shows that most public toilets were located in or near the most frequented buildings, especially public baths, whose surplus water was used to flush the latrines. Their design varied from the most monumental, even with internal colonnades, to very small, with a capacity for only a few people.

Concerning residential spaces, the number of known cases is more limited due to the difficulty of identifying toilets, especially if they were modest facilities. They were all located in peripheral areas of the dwellings, in order to have an easy connection to the public sewerage system. Depending on their design two basic types can be distinguished: single-person latrines with very simple operation, where running water was not necessary, and multi-seater facilities, with a similar operation to public toilets.

An overall analysis of the latrines allows us to better understand the functioning of these facilities, their role in the urban and domestic context, and the sanitary conditions of Lusitanian cities.

2 WHERE'S THE LOO? AN ANALYSIS OF THE SPATIAL DISTRIBUTION OF LATRINES IN POMPEII

Trusler, Kate (Wright Paleohydrological Institute; University of Missouri)

The location of sanitation facilities has important social and cultural ramifications about the use and management of waste in the ancient Mediterranean. Several seasons of field work in Pompeii have led to a more precise understand-

ing of residential and business latrines and downpipes (indicators of upper story sanitation features) by challenging commonly held notions about the distribution of latrines around the site and within different property types. The location of residential latrines has been mostly attributed to kitchens, but this study found that latrines are also commonly found near entrances and in dedicated latrines rooms. Businesses sanitation facilities are closely associated with downpipes and frequently located in the front room of shops. While the distribution of upper story latrines, is partly an artifact of volcanic destruction, the distribution of downpipes more accurately represents the importance of private sanitation on upper floors. The patterns have implications for understanding latrine use and socioeconomic variation in waste management in urban environments.

3 **A SUBURBAN DUMP IN POMPEII: CONTEXT, FORMATION PROCESSES AND VALUE OF FAUNAL REMAINS**

Fecchio, Mirko (University of Padova) - Furlan, Guido (University of Padova)

A suburban dump excavated in Pompeii, right outside the Sarno Baths, provides a unique picture of consumption and discard strategies in the ancient city before the eruption of 79 CE.

Located on the southern city boundary, between the plateau hosting the settlement and a marshy area, the context was excavated in 2016 and the study of the whole assemblage is being completed. The study of ceramics provided an overall economic picture, including daily consumption and trade. Glass and metal finds shed light on the effectiveness of local recycling practices, a picture recently confirmed by archaeometric analyses on glasses, which also highlighted the importance of perfume production in the city. The recent study of faunal remains, including mollusks, adds further details to this dynamic frame, providing a first picture of the exploitation of the animals in the area. The taphonomic study on the bones, the mortality profiles of the main domestic species, and the subsequent quantification of the data contributed to reconstructing local breeding practices.

This new information has high relevance not yet because of the quantity of data processed, but because of the quality of the stratigraphic context investigated: this is not the result of redepositions and mixing through time but represents a well-dated mirror of what was discarded in the city (or at least in part of its neighborhoods) on a routine basis.

4 **HOW ANIMAL REMAINS CAN TELL A STORY ABOUT WASTE MANAGEMENT**

Detry, Cleia (UNIARQ, Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras da Universidade de Lisboa, Portugal) - Bustamante-Álvarez, Macarena (Universidad de Granada, Spain) - Heras Mora, Francisco Javier (Extremadura Government, Spain)

A large Roman dumpster was excavated during extensive works directed by J. Heras Mora. This area was situated just outside the Roman wall in Mérida, Spain m2. The dumpster was active between the first century and the beginning of the 5th century, with a profile up to 12 m.

The contents of a person's garbage can reveal much about their way of life, while the management of a city's garbage can provide insight into its overall lifestyle. Mérida, known as Emerita Augusta, served as the capital of Lusitania, one of the provinces of the Roman Empire.

In this study, we utilized animal remains to observe how the dumpster was managed over time and how refuse containing animal remains was handled by the inhabitants of Mérida. Our findings indicate that some waste originated from bone craft workshops in the vicinity, likely more than one, with heightened activity observed in the 4th century. This activity influenced the selection of cattle sizes used for bone utilization. Additionally, we observed the utilization of sheep and goat horns, likely to produce utensils. Furthermore, the presence of animal bones that were food refuse offers insight into the dietary evolution during the Roman period in Mérida.

Moreover, the layers of refuse also surrounded other ritual constructions, such as a small tower with human remains and around 36 dogs and one Egyptian mongoose. This illustrates how the city continued to thrive, engulfing some of the previous monuments, including the initial monument mentioned.

5 **A NEW EXTRACTION METHOD OF INTESTINAL PARASITE EGGS FROM ARCHAEOLOGICAL SEDIMENTS. THE CASE-STUDY OF A BYZANTINE MIDDEN IN SEPTEM (CEUTA)**

García Ruiz, Miriam (University of Jaén) - Gutiérrez-Rodríguez, Mario (University Institute for Research in Iberian Archaeology, University of Jaén) - Bernal-Casasola, Darío (University of Cádiz) - Peña-Santiago, Reyes (University of Jaén) - Sánchez Vizcaíno, Alberto (University Institute for Research in Iberian Archaeology, University of Jaén)

Living in towns of the Byzantine Empire entailed diverse challenges, one of which was the management of the massive volume of physiological residues. This daily necessity was addressed through waste disposal and evacuation facilities, such as middens and sewers. Its deposits can be understood as biological archives of the past, containing relevant information at the microscale about the nature and composition of physiological waste. This, in turn, serves as a potential source of data about living conditions, health, and sanitation practices of the past. Intestinal parasites are among

the most informative microscopic features present in these waste management structures. In this paper, we present a specific archaeological context: a 7th-century AD Byzantine midden located in the ancient town of Septem (Ceuta), the westernmost and final Byzantine possession in North Africa.

A new extraction method of intestinal parasite eggs from archaeological sediments is described. The method is based on successive cycles of sugar gradient centrifugation and has been successfully used for materials of two genera. It has been validated and is able to extract 95% of the eggs present in only three extraction cycles. Results obtained from the analysis of 20 archaeological sediment samples reveal a total of 553 eggs per gram of sediment from two species, one belonging to *Ascaris* and another to *Taenia*. *Ascaris* sp. was more abundant than *Taenia* sp. in all samples. Distributional data of abundance and occurrence are analyzed to detect differences among stratigraphic units.

In sum, this paper aims to present a new intestinal parasite eggs extraction method, discuss its relevance for the understanding of waste management practices in the past, and consider how to integrate this new method into multiproxy question-driven research about the genesis and temporality of middens in byzantine towns.

6 **MULTIPROXY MICROSTRATIGRAPHIC APPROACHES TO WASTE DEPOSITS FOR UNRAVELING ROMAN URBAN REFUSE MANAGEMENT PRACTICES: INSIGHTS FROM HISPANIA AND NORTH AFRICA**

Gutiérrez-Rodríguez, Mario (University Institute for Research in Iberian Archaeology, University of Jaén)

The transformation of urban areas from the Early Empire to Late Antiquity in the Western Mediterranean is a historiographic topic with a long history of development. From the 2nd century onwards, the archaeological record within urban environments became more diverse due to a new conceptualization of urban spaces. These spaces underwent secondary uses and episodes of abandonment, leading to the proliferation of intramural middens, pits, and reflooring sequences. Many of these transformations and changes in urban life were driven by shifts in habits and dynamics related to the management of solid and liquid waste. While written sources do not definitively establish whether there was a regulated system for urban waste disposal in every city during the Early Empire, solid archaeological evidence points to the existence of evacuation systems such as sewer networks and urban and suburban middens. In Late Antiquity, however, middens became prevalent within inhabited areas, obscuring streets, public spaces, and private buildings, thereby affecting urban mobility and the utilization of urban space.

This contribution examines how the evolving dynamics of urban waste management significantly influenced the conceptualization of cities in southern Hispania and North Africa, highlighting that crucial insights into human practices, habits, and attitudes towards urban waste are only discernible at the microscale. We have employed a multiproxy microstratigraphic approach to analyze several urban middens in Hispania and North Africa, incorporating micromorphology, physical-chemical analyses, geochemistry, paleoparasitology and lipid biomarkers. This integrated approach enables us to investigate questions such as the frequency and nature of discarded materials in urban middens, which are essential for understanding the evolution of these features. In sum, understanding urban waste practices turns essential to unravel town biographies from the Early Empire to Late Antiquity in the Western Mediterranean.

499 **NEUTRONS AND SYNCHROTRONS IN HERITAGE SCIENCE: NEW METHODS, TECHNIQUES, AND THEIR IMPACT ON ARCHAEOLOGY**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Nimura, Courtney (Ashmolean Museum, University of Oxford) - Fauvelle, Mikael (Department of Archaeology and Ancient History, Lund University) - Nilsson, Björn (University Museum, Bergen) - Nehzati, Susan (Max IV Laboratory, Lund University) - Fedrigo, Anna (Institut Laue-Langevin)

Session format: Regular session

Heritage resources are the culturally and scientifically significant objects, artefacts, and places that modern society has inherited from past generations. This includes both 'natural' resources, such as fossils, sediments, and landscapes, as well as 'cultural' resources including art, archaeological artefacts, and ancient buildings. As archaeologists, we engage with all these different types of finite resources. In recent years, advancements and investments in neutron and X-ray science have opened the door to new applications that bridge the divide between the sciences and the humanities. They have proved their potential in the study of heritage resources by providing scientists with the tools needed to powerfully, yet non-invasively, characterise, image, and communicate these critically important and often invaluable materials.

This interdisciplinary session draws specifically on the organisers' new research theme at the LINXS Institute of Advanced Neutron and X-Ray Science at the University of Lund, which is funded from 2023–2026. It aims to bring together archaeologists and scientists, from within and outside of archaeology, to explore the cutting-edge potential of using synchrotron and neutron science to study and understand our shared cultural heritage. To maintain broad

inclusivity, this session has no chronological or geographical parameters, but we are keen to discuss the application of neutron, synchrotron, and cutting-edge X-Ray imaging techniques to archaeology specifically.

ABSTRACTS

1 NEUTRON IMAGING IN HERITAGE SCIENCE, SOME EXAMPLES FROM TOMOGRAPHY TO ELEMENTAL MAPPING

Fedrico, Anna (Institut Laue-Langevin (ILL)) - Cantini, Francesco (University of Florence) - Léonard, Fabien (University of Manchester at Harwell) - O'Flynn, Daniel (The British Museum) - Scherillo, Antonella (ISIS Neutron and Muon Source) - Grazi, Francesco (Consiglio Nazionale delle Ricerche Istituto di Fisica Applicata "N. Carrara" (CNR-IFAC))

Scientific investigations and archaeometric studies have played a major role in the field of archaeology, especially with regard to materials that have been transformed through human activity, like metals. In this talk, I will give an overview of how neutron imaging can be useful to improve our knowledge of ancient manufacturing processes of metals, their technological evolution, and how they degrade over time.

Neutron imaging is a non-destructive method that allows the investigation of bulky and dense materials non-invasively. Neutron tomography and radiography can be used to shed light on the inner structure of composite materials and their manufacturing techniques, but also can be used for elemental investigations. In addition, the combined use of X-ray and neutron imaging provides additional element-dependent information which is fundamental in case of multi-phase objects.

The talk will give an overview of some imaging case studies carried out at different neutron facilities in the field of Heritage Science, spanning from Renaissance statues to Egyptian artefacts.

2 APPLICATION OF NEUTRON SCIENCE IN THE STUDY OF ANCIENT IRANIAN WEAPONRY

Rodzinka, Alex (Cranfield University; ISIS Neutron and Muon Source) - Scherillo, Antonella (ISIS Neutron and Muon Source) - Fedrico, Anna (Institut Max von Laue - Paul Langevin (ILL)) - Erb-Satullo, Nathaniel (Cranfield University) - Shortland, Andrew (Cranfield University) - Simpson, St John (British Museum)

Neutron techniques such as neutron diffraction and neutron tomography allow for non-invasive analysis of complex metal artefacts, providing information about their internal structure, conservation status and, via Neutron Resonance Capture Analysis, elemental composition. In this talk we discuss the application of neutron science at ISIS Neutron and Muon Source to the study of Iranian swords from the Iron Age (1250-550 BC). The objects were recovered by the Border Force after being seized on entry to the UK and will be repatriated to Iran, providing an opportunity to investigate both ancient manufacture and modern modifications. Neutron tomography allowed us to discover remnants of iron tangs preserved inside bronze hilts, while neutron diffraction provided information on the crystalline phases present in these metals without sampling. Similarly, iron swords were analysed with neutron diffraction to examine the crystalline phases of iron and estimate carbon content. The non-invasive nature of this technique allows for analysis of many spots throughout the object, which would not be possible if sampling was required. The results provide information about Iron Age metallurgy in northwestern Iran and together form a comprehensive picture of both assembly methods and phase/elemental composition, allowing us to understand better the technological choices of ancient metalworkers.

3 NEUTRONS: A FANTASTIC TOOL FOR CONSERVATION AND RESTORATION SCIENCE AND FOR THE STUDY OF ANCIENT TECHNOLOGIES

Mondelli, Claudia (CNR-IOM-OGG, Institut Laue Langevin, Grenoble-Francia) - Zorzi, Sandro (Department of Molecular Sciences and Nanosystems, Università Ca' Foscari di Venezia, Italy) - Cattaruzza, Elti (Department of Molecular Sciences and Nanosystems, Università Ca' Foscari di Venezia, Italy) - Schweins, Ralf (Institut Laue Langevin, Grenoble, France) - Chaumat, Gilles (ARC-Nucléart CEA, Grenoble, France) - Taglieri, Giuliana (Department of Industrial and Information Engineering and Economics, University of L'Aquila, Italy)

Artefacts of interest in cultural heritage (CH) are often rare, precious, manifolds and complexes and their secrets are difficult to disclose.

Neutrons are a very unique probe to investigate CH samples and their history.

The neutron techniques are a non-destructive probe, often complementary to the x-ray ones, being sensitive to the light elements, as we can find in organic samples as wood or paper, as well in nano-materials for conservation science (for example nanolimes). For our investigations we used mainly small angle neutron scattering (SANS), in particular the instrument D11 at the Institut Laue Langevin, that covers four decades in Q, i.e. it is able to investigate dimensions between the Å to some hundreds of microns: a very interesting range of investigation for complexes systems as those

of interest in CH. Furthermore the fact that with neutrons we can use contrast methods to make in evidence some specific part of the systems, they represent a powerful and very versatile tool for the study of such complex systems. We will present two applications of neutrons in the study of CH systems: a study of the porosity of ancient ceramic and how it is related to a specific technique of production and the historical context; a study of the characteristics of nanoparticles of alkaline earth hydroxide to drive their production on large scale, for curative and preventive eco-friendly treatments of waterlogged wood.

4 SECTIONING WITHOUT A SCRATCH? USING MUONS TO NON-DESTRUCTIVELY DEPTH PROFILE THE COMPOSITION OF ROMAN COINS

Hillier, Adrian (ISIS Neutron and Muon facility, STFC Rutherford Appleton Laboratory, Harwell Science and Innovation Campus, Oxfordshire, OX11 0QX, UK) - Butcher, Kevin (Department of Classics, University of Warwick, Coventry, CV7 7AL, UK) - Green, George (Lincoln College, University of Oxford, Oxford OX1 3DR, UK) - Pongting, Matthew (Archaeology, Classics and Egyptology, University of Liverpool Liverpool L69 7WZ) - Ishida, Katsu (RIKEN Nishina Center, RIKEN, Wako, Saitama, Japan)

Archaeologists have become increasingly familiar with surface-level compositional analyses of artefacts. A common approach is X-ray fluorescence, which returns results from ~0.01-0.03mm deep. Determining the composition deep beneath the surface often requires destructive drilling or sectioning; something routinely not permitted for samples of high historical, monetary, aesthetic, or scientific value.

Negative muons present a solution to this. By controlling the momentum of the muon its implantation depth can be controlled. When muons are captured by atoms within the sample, they release relatively high-energy muonic X-rays. These are characteristic of the element from which they came, allowing us to perform elemental and isotope analysis of artefacts at discrete depths non-destructively.

This technique is particularly useful for investigating if an object has been deliberately surface enriched or gilded. Furthermore, it can bolster new archaeological narratives that are proposed using surface analyses. Presented here are two case studies in Roman coinage:

1) Ancient silver-copper coin alloys have usually been substantially altered by enrichment, so that the balance of silver to copper at the surface is no longer representative of the original blank. In this study, a group of small silver coins of the late Hellenistic and early Roman imperial periods have been analysed using negative muons. We detail the existence of this surface enrichment and replicate the results obtained with destructive techniques.

2) During the AD68/9 Civil Wars, four emperors fought for control of the Roman Empire, a period of serious and sustained disruption. Gold coins from this period are fully pure, slightly debased, and occasionally heavily-debased with copper. We show that the interior and surface compositions are congruent, eliminating surface enrichment, XRF error, or modern contamination as the source of the variation. This allows us to propose new historical narratives e.g., continued debasement after the Civil Wars reflecting their fiscal toll on the state.

5 LOOKING INSIDE ANCIENT (BIO)ARCHAEOLOGICAL FINDS TO DECIPHER THEIR HIDDEN FEATURES

Mancini, Lucia (ZAG - Slovenian National Building and Civil Engineering Institute, Ljubljana, Slovenia) - Bondioli, Luca (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome, Rome, Italy; Department of Cultural Heritage, University of Padua, Padua, Italy) - Drossi, Diego (Elettra - Sincrotrone Trieste S.C.p.A., Basovizza, Trieste, Italy) - Bernardini, Federico (Dipartimento di Studi Umanistici, Università Ca' Foscari, Venezia, Italy; Multidisciplinary Laboratory, The Abdus Salam' International Centre for Theoretical Physics, Trieste, Italy) - Bernardi, Massimo (MUSE, Museo delle Scienze di Trento, Trento, Italy) - Tuniz, Claudio (Multidisciplinary Laboratory, The Abdus Salam' International Centre for Theoretical Physics, Trieste, Italy) - Nava, Alessia (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome, Rome, Italy)

In the last two decades, the ability to perform ex situ or in situ observation using X-ray microradiography and computed microtomography has increased dramatically. Hard X-ray imaging techniques can be applied in many fields from biomedicine to materials science, from geology to heritage science studies, both using synchrotron- and advanced laboratory-based X-ray sources.

Earth scientists and (bio)archaeologists have recently developed analysis protocols suitable to investigate and quantify microstructural features of several materials (i.e. ceramics, glass, stone, textiles, ancient bones and teeth) to extract precious historical and evolutionary information but also for restoration purposes, economic evaluation, and fabrication of replicas.

Research as well as manufacturing applications can benefit from the non-destructive character of these techniques allowing to investigate the external and internal features of an object in the three-dimensional (3D) domain working in static and dynamic (4D = 3D + time) conditions. The basic principles as well as advantages and limitations of these

technique when applied to heritage sciences will be illustrated together with state-of-the-art methods of image visualization and quantitative analysis.

Several case studies will be used to better understand the potential of modern 3D/4D methodologies applied to natural and cultural heritage studies.

502 ADVANCES IN JAPANESE ARCHAEOLOGY

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Stein, Britta (Martin-Luther-University Halle-Wittenberg) - Zancan, Claudia (Università Ca' Foscari Venezia)

Session format: Regular session

Japanese archaeology has received very little attention outside Japan. Even today only a handful of archaeologists in Europe are focussing their research on the pre- and proto-history of the Japanese archipelago, which is often perceived as being peripheral to both the archaeologies of Europe and Asia. Moreover, European researchers in the field of Japanese archaeology face tangible challenges, such as language barriers, limited data access, theoretical disparities, and the difficulties associated with direct fieldwork. Nevertheless, the number of scholars specializing in Japanese archaeology outside Japan has steadily increased in recent years.

This session will showcase the wide variety of research on Japanese archaeology done by scholars based in European institutions. It aims to introduce current research and research trends in Japanese archaeology by sharing information and results of ongoing and recently finished projects. Through the introduction of aspects of Japanese archaeology that have been largely overlooked this session aims to promote a cross-cultural and comparative approach in archaeological research on Japan and beyond. It also aims to establish a network of scholars to initiate a discussion on the possibilities and limitations of researching the pre- and proto-history of the Japanese archipelago while based in Europe.

We invite contributions that encompass a wide range of topics in pre- and protohistoric Japanese archaeology, including but not limited to:

- Trade, exchange, and social interactions
- Rituals
- Burial systems
- Identity and symbolism
- Comparative studies
- Cultural heritage
- Iconography and pre- and protohistoric art
- Museum Studies
- Heritage Management.

ABSTRACTS

1 LIVING CLOSE TO AN ACTIVE VOLCANO: JOMON ENGAGEMENT WITH MOUNT FUJI IN PREHISTORIC JAPAN

Uchiyama, Junzo (Sainsbury Institute for the Study of Japanese Arts and Cultures) - Jordan, Peter (Lund University)

Mount Fuji, the iconic mountain of Japan, remains a young and frequently active volcano. However, despite these dangers, people have continuously lived in the landscapes surrounding Mount Fuji since the peopling of the Japanese Archipelago, approximately 38ka. In this paper we explore the geological history of Mount Fuji and use a landscape archaeology approach to reconstruct how Jomon communities would have engaged with the “growing” mountain, both as a major geohazard that threatened daily existence, but also as an important topographic feature that would have dominated the horizon from all directions. Our contextual analysis of both general settlement patterns and the two large Jomon sites situated close to Mount Fuji generates surprising insights. First, Jomon communities appear to have settled closer to Mount Fuji during times of heightened volcanic activity. Second, they established unique ritual sites - Ōshikakubo and Sengo - which formed nodal points in much larger interaction, exchange and aggregation networks. Third, these sites were the focus of rituals that made explicit reference to Mount Fuji in relation to major celestial events such as summer solstice. Overall, our preliminary research suggests that Jomon communities incorporated understandings of volcanic geohazards into their worldviews, and found way to “live dangerously” via negotiating appropriate relationships with powerful and landscape forces.

2 THE IMPACT OF BIOCULTURAL STRATEGIES ON PREHISTORIC JOMON BIOLOGICAL DIVERSITY

Green, Madelyn (The Ohio State University; Columbus State Community College) - Hubbe, Mark (The Ohio State University)

Jōmon culture is associated with the prehistoric foraging groups who inhabited the Japanese Archipelago from 13,000 to 2,100 years BP. Jōmon groups successfully occupied a wide range of environments and developed cultural strategies, ranging from groups who predominantly gathered plants in the western regions to groups who hunted mammals and collected marine resources on the eastern coasts. These practices resulted in long-lasting occupations, showing adaptation to environmental challenges. As such, the Jōmon are credited as the precursors to practices that resulted in the later cultural and social development of Japanese societies. Despite their success in establishing long-held cultural traditions, it is not clear how their niche construction, or biocultural adaptations to different environments and landscapes, influenced the patterns of biological isolation and contact among the Jōmon. The overarching goal of this ongoing dissertation research is to assess the population affinities of prehistoric Jōmon groups through a contextual lens that accounts not just for biological variables, but also cultural and environmental variables. Three primary data types were collected: 1) cranial morphology, 2) archaeological information on cultural practices, and 3) ecogeographic information. Craniometric data (2D and 3D) was collected on N=474 Early to Final Period Jōmon individuals from 89 archaeological sites across Hokkaido, Honshu, and Kyūshū. Niche construction cultural practices were quantified through five broad aspects of lifestyle and adaptation: 1) subsistence type, 2) mobility level, 3) settlement size, 4) degree of cultural exchange, and 5) climate and ecology. It is expected that societies who share similar lifestyles will be significantly biologically closer than those that do not, independent of the geographical distance (i.e., genetic isolation) between them. Data analysis is ongoing, with dissimilarity matrices being calculated from the biological and archaeological data to assess the relationship between population affinities and niche construction in Jōmon samples.

3 JOMON SEA: THE IRIAE ARCHAEOLOGICAL EXCAVATION ON TSUSHIMA ISLAND

Petrella, Daniele (International Research Institute for Archaeology and Ethnology)

The Japanese Neolithic, the so-called Jōmon Period, represents a vast area in which to develop new and exciting research in archaeology. This is because there are still many questions that need to be answered to better elucidate the evolutionary dynamics of the cultures that characterized it.

IRIAE's project, “Jōmon Sea: Navigation in the Origins of Japan”, aims to study and understand the use of coastal sites, the sea, and waterways during Neolithic Japan, both in terms of movement within the archipelago and contact with surrounding territories.

In its first phase, the project focuses on analyzing the nature and dynamics behind early relations with the Korean peninsula.

The first site identified by IRIAE researchers as a crucial point at which to look for answers that can help clarify these dynamics is Tsushima Island (Nagasaki Prefecture) and, specifically, the coastal site of Ongasaki and Ongaura Bay below it, which perfectly overlook the Korean coast and meet the geomorphological characteristics of possible landings and/or coastal settlements.

That on the origins of Jōmon culture, is a topic that cannot be separated from human and cultural contacts and the relationship with the surrounding environment, which results in an inseparable pair: the relationship with the Korean people and the relationship with the sea.

Among the questions the project aims to answer are understanding how they adapted to changes in the environment with the advent of the Holocene; what the role of the sea was in the lives of the Jōmon people; what their nautical knowledge was; and whether there can be an identifiable pattern in the selection and use six sites in the bay.

4 UNDERSTANDING THE SIGNIFICANCE OF AOTORA STONE: EXPLORING EXCHANGE NETWORKS AND CHRONOLOGICAL VARIATIONS DURING THE JOMON PERIOD

Astier, Clara (Hokkaido University)

The Aotora stone, a distinctive blue tuff found along the Nukapira River in Hokkaido, Northern Japan, serves as a compelling case study for understanding trade dynamics and chronological variations during the Jomon Period the archipelago. Despite being a known resource, the origin of polished Aotora stone axes found around Northern Japan Jomon sites remained elusive until recent research efforts. This paper examines the historiography of petrographical and geological studies in Japan, revealing gaps in archaeological research methodologies and nomenclature standardization.

Furthermore, this study investigates potential trade routes for Aotora stone polished axes across Hokkaido and the Tohoku region during the Jomon Period. Although numerous artifacts exist, many remain unattributed, hindering a comprehensive understanding of material dispersion. Focusing on the variations in exchange modalities throughout

the extensive Jomon chronology, this research aims to elucidate the impact of cultural shifts on trade networks between Hokkaido and Honshu Islands.

This work endeavors to incorporate the prehistoric significance of Hokkaido into both Japanese and international research paradigms. Ultimately, this project seeks to disseminate knowledge of Japanese prehistory to a global audience, fostering interest and understanding in this captivating area of study.

5 VEGETAL TEMPER PHENOMENA

Nishida, Yastami (Niigata prefectural museum of history) - Abe, Akinori (Chiba University) - Mizunoe, Kazutomo (Doshisha University) - Udatsu, Tetsuro (Miyazaki University)

In the long history of pottery making, potters have been using and trying many kinds of tempering materials. While the inorganic temper is predominant, vegetal temper usage is reported from many parts of the world past and present.

Though not widely known, vegetal temper was also used in the Jomon period. It can be observed in the oldest period, the Incipient Jomon pottery. Somehow, the use of vegetal temper ceased and became popular again at the end of the initial Jomon period. In the early phase of the Early Jomon period, the amount of vegetal inclusion was at its zenith. The tradition disappeared by the middle phase of the Early Jomon period in the central part of the archipelago. Still, it persisted till the early phase of the Middle Jomon period in the north. In general, it seems that vegetal tempering was practised despite the shape or size of the pots.

Our project is the first attempt to substantiate the geographical and chronological domains wherein vegetal temper was employed and to identify the plants utilized for tempering with CT scanning, phytolith analysis, thin section analysis and other methods.

It became apparent that the vegetal temper was also used in southwestern Japan, where it has been unrecognized. The term “fiber-tempered pottery”, used for over a century, should be reevaluated since CT scanning and microscopic observations revealed that wood fragments, roots and even fishing nets were also used.

The past examinations of the physical properties of plant-tempered pottery have proven that despite their porous matrix, they are not inferior to pots with inorganic temper. We also have to consider the explanation why the vegetal tempering ceased.

6 CHILD MORTALITY, GRIEF AND SHIFTING CONCEPTS OF PERSONHOOD IN PREHISTORIC JAPAN

Bausch, Ilona (Heidelberg University)

The lives of infants and small children are as precious as they are fragile; straddling the liminal state between this world and the next. Many cultures throughout history have delayed assigning personhood and agency to small children, fearing their loss to the spirit world if claiming them too soon as a member of human society. This paper explores the possibility of shifting ideas of personhood in infants and children in prehistoric Japan, following research by Yasuhiro Yamada on Jōmon burials, and Koji Mizoguchi on Yayoi cemeteries. During the Jōmon period, various categories of data potentially inform on the social relationship between adult community members and small children, and the impact of child mortality on their grieving families: funerary evidence such as burial type and location within the site; treatment of the bodies (when preserved); their location vis-à-vis family or being interred solo; the presence or absence of grave goods such as sacred pigments, adornment and/or amulets. Commemorative material culture may also include imprints of infant handprints, footprints, even teeth prints preserved in ceramic objects.

During the Late Jōmon period (c. 1500BCE), particularly in Northern Japan, a shift in social relations occurred, also reflected in changing funerary customs regarding infants and small children: some were interred separately, with grave goods such as precious jade beads, which before had been restricted to ‘adults’ of reproductive ages. A comparison will also be made with child burials from Mesolithic Europe.

7 EXPLORING THE DEIFICATION OF THE DEAD AS A MECHANISM IN THE EMERGENCE OF LARGE-SCALE COMPLEX POLITIES AND ANCIENT STATES

Mizoguchi, Koji (Kyushu University)

The research of Shin et al.* challenges conventional understanding regarding the emergence of ancient states and complex polities. The author proposes a novel theoretical model highlighting the crucial role of an expansive interactive-communicative horizon driving their development. This paper draws upon their argument to propose that the deification of deceased chiefs is crucial for sustaining and reproducing this extensive horizon and leading to the formation of early states. Drawing on insights from prominent social theorists such as Mauss, Luhmann, and Deleuze & Guattari, the model provides a social archaeological perspective on the mechanisms that led to the emergence of early states. As the interactive-communicative horizon expands beyond shared experiences and mutual expectations, maintaining trust in the exchange machine becomes difficult, impacting the supply of vital resources for connect-

ed communities. A ‘phase transition’ occurs to address this challenge, replacing the traditional gift exchange-based mechanism with unlimited gift-giving to a non-human-yet-human-like entity, i.e., a deity. This practice becomes integral to inter-communal exchange on an extraordinary spatial scale. The author argues that coupling the deification of the deceased elite and the expansive interactive-communicative horizon is required for early state formation.

* Shin, Jaeweon, Michael Holton Price, David H. Wolpert, Hajime Shimao, Brendan Tracey, and Timothy A. Kohler. 2020. “Scale and Information-Processing Thresholds in Holocene Social Evolution. *Nature Communications* 11 (1): 1–8.

8 REVISITING THE MODE, TEMPO, AND THE CONSEQUENCES OF THE DISPERSAL OF FARMING IN PREHISTORIC JAPAN

Crema, Enrico (University of Cambridge) - Brainerd, Leah (University of Cambridge) - Carrignon, Simon (University of Cambridge) - Craig, Oliver (University of York) - Lundy, Jasmine (University of York) - Shoda, Shinya (University of York; Nara National Research Institute for Cultural Properties) - Stevens, Christopher (University of Cambridge)

The dispersal of rice and millet agriculture during the 1st millennium BC was a pivotal moment defining the foundation of the cultural, linguistic, and biological variation observed in present-day Japan. The archaeological record from the Japanese islands has long suggested the existence of a regional variation in how farming is dispersed, as indicated by the presence of significant delays in certain areas and divergent demographic and cultural responses to the cultural package brought in by the continental farmers. Here, we will summarise some of the main findings of the ERC-funded ENCOUNTER project, which is investigating the patterns and the processes of this major transition by re-examining one of the largest archaeological legacy data available in the world. The paper will focus in particular on whether and to what extent slowdowns and accelerations characterised the dispersal of rice agriculture and whether different regions experienced the same demographic response after the introduction of the new subsistence economy. Our analysis combines a wide range of techniques, including Bayesian modelling of radiocarbon dates, multivariate statistics on tool assemblage, and ecological niche modelling of rice agriculture. Results highlight the extent of regional variations in the transition to agriculture in prehistoric Japan and the putative environmental, cultural, and social causes that might explain the observed patterns.

9 HARNESSING DIGITAL & COMPUTATIONAL FRONTIERS IN JAPANESE ARCHAEOLOGY

Loftus, James (Institute for Liberal Arts, Tokyo Institute of Technology)

The field of Japanese archaeology is currently undergoing a significant transformation, propelled by the gradual acceptance of digital and computational technologies. Historically less prominent in global discussions, this shift presents an opportunity to enhance Japanese archaeology’s international visibility and collaboration. This paper seeks to showcase ongoing domestic and international work being conducted in the digital and computational realms of Japanese archaeology, and how these methods are the key to the future of a “global Japanese archaeology”.

Key scholars within and outside Japan are at the forefront of internationalization, integrating digital tools like GIS, computational demographic modelling, 3D analysis, etc. into large scale, international research groups. Their work demonstrates how digital methodologies can revolutionize our understanding of Japan’s past, and further bridge the gap between Japanese archaeology and international discourse.

Despite these advancements, international collaboration in Japanese archaeology still lags. Factors like language barriers, divergent research methodologies, and limited global awareness of Japanese archaeological studies hinder wider engagement. To address these challenges, proactive and mutually beneficial measures are crucial. These include hosting international symposiums, engaging in collaborative projects, and disseminating research in multiple languages. As international scholars, we must ask ourselves, what can my voice add to the discipline? How is my work useful not only for myself, but for domestic scholars as well? Especially with regarding to digital and computational revolution of the field, in order to maximize international impact, inward reflection on “why does Japanese archaeology need to internationalize in the first place?” is critical. If fruitful answers can be gleaned, digital and computational methods are critical tools to the future of Japanese archaeology on a global stage.

10 MEANING OF THE STANDARDIZED KEYHOLE-SHAPED MOUNDED TOMBS IN THE PROCESS OF STATE FORMATION IN ANCIENT JAPAN

Sasaki, Kenichi (Meiji University)

In the middle third century CE, giant keyhole-shaped mounded tombs appeared in the Nara basin of western Japan, and the practice of constructing keyhole-shaped mounded tombs all over Japan except for the northern and southwestern islands continued until the early seventh century. This time period is called the “Kofun period. Apparently, there were a few fixed “standards” of the mound construction, and it is likely that the paramount chief and high-

er-ranking elites in the central polity distributed a standard of mound construction to local elites as a sign of alliance or friendship. In regions surrounding the central polity region, the construction of keyhole-shaped mounded tombs had a strong political connotation, symbolizing the central control over these regions. At the same time, it seems that local elites adopted the keyhole shape for their burial mounds in ways different from the central polity. In regions far away from the central polity, the construction was often economical, as a local symbol of trade routes. Yet in other cases, the construction was religious in nature, such that local people would have believed that the participation in construction would result in better agricultural yield in the next year. The local and regional differences in attitude toward the mound construction would suggest that the central polity was not super powerful, and that local elites were relatively autonomous during the Kofun period when ancient Japanese societies began to evolve toward a state.

11 INVESTIGATING HOMOGENEITY ISSUES IN THE KOFUN PERIOD

Thierfelder, Doreen (Martin-Luther-University Halle-Wittenberg)

The Kofun period (mid-3rd century—end of the 6th century) is characterized by the construction of monumental burial mounds and highly standardized burial practices with fixed sets of burial goods. These assemblages display temporal variations during the Kofun period and show a religious change closely linked to heightened interactions with the east Asian mainland. Yet, Japanese archaeology has often overlooked regional variations in religious practices, favoring a theory of a homogeneous, emerging state.

Due to the extensive and consistent use of bronze mirrors as ritual objects in Yayoi/Kofun period Japan those objects are particularly well suited for a comparative analysis of ritual objects, their utilization and the diversity of religious practices across different regions. Additional ritual objects such as terracotta clay figures (haniwa) and talc imitations were impacted by bronze mirrors and reflect the concurrent religious transformations. The murals within burial mounds contribute to a comprehensive understanding of religious beliefs in the Kofun period.

This paper will present a spatio-temporal analysis of these ritual objects as well as depictions in decorated tombs. Employing a comparative regional approach, it challenges the prevailing notion of homogeneity in Kofun period society and religion, demonstrating distinct regional variations. Furthermore, this paper will show the importance of prioritizing the archaeological material over the written sources from the 8th century to avoid bias and gain a more nuanced understanding of Kofun period religion.

This contribution will emphasize the complexity of rituals in Japanese protohistory. It will caution against framing them solely within the context of later written sources. By analyzing potential regional differences in Japan's protohistory based on ritual objects and decorated tombs, this contribution aims to deepen our understanding of the complex religious belief systems in Kofun period society.

12 REGIONAL IDENTITY AND KOFUN PERIOD HORSE CULTURE

Stein, Britta (Martin-Luther-University Halle-Wittenberg) - Zancan, Claudia (Università Ca' Foscari Venezia)

The introduction of the horse led to profound socio-cultural developments in Kofun period society during the middle and late Kofun period (5th – 6th century CE). In recent years, various aspects of Kofun period horse culture, such as horse burials, horse gear and military equipment for mounted combat have been discussed in great detail in Japanese archaeology. Yet, depictions of horses and riders in decorated tombs and on pottery as well as rider-shaped clay statues and decorated sue pottery have received very little attention and few advances have been made to incorporate these depictions into the wider research on Kofun period horse culture. It is these depictions however, that show significant regional variation and indicate that the role and importance of the horse in both society and religion differed within Kofun period society.

This paper adopts a comparative approach to identify patterns of regional variation in Kofun period horse culture, highlighting differences in iconography, symbolism and funerary assemblages between Northern Kyushu and Kanto. Interregional interactions and center-periphery relationships during the Kofun period will be analyzed to demonstrate that throughout the Kofun period peripheral centers maintained a very high degree of political and economic independence from the central Kinki region. By examining the interplay between material culture, ritual practices, and regional identities, this paper contributes to a deeper understanding of the complex socio-cultural dynamics of ancient Japan.

Finally, this paper highlights the importance of considering regional variation and local contexts in the interpretation of archaeological data by integrating depictions of horses and riders into the wider discourse on Kofun period horse culture and thus shedding light on the diverse cultural landscape of the Kofun period and its implications for broader narratives of Japanese history and archaeology.

13 SEAFOOD BEYOND SUBSISTENCE: 'LUXURY' CONSUMPTION AND MARINE RESOURCES IN JAPAN

Hudson, Mark (Max Planck Institute of Geoanthropology) - Muñoz Fernández, Irene (Complutense University of Madrid)

Historiographically-speaking, Japanese archaeology is very 'fishy': the role of fish and other marine resources in the history of the Japanese Islands has been over-written by a series of influential though often competing paradigms, notably Confucian and Marxist 'agrarian fundamentalism', American neo-evolutionary functionalism, and broadly Romantic ideas about food and environment. Yet human use of marine resources covers a wide range of procurement, storage and consumption behaviours which are rarely given full attention in the Japanese literature. In this paper we focus on delayed-return marine resources. We first attempt to position these resources in broader histories of luxury and consumer revolutions. Historians have discussed a 'consumer revolution' in the eighteenth century, although the extension of global trade networks after the sixteenth century was a key factor in the expanded consumption of new 'global goods'. By contrast, David Wengrow argues that 'commodity branding' can be dated back to the Bronze Age, a proposal that critiques previous research on luxuries in opposition to 'essential goods'. Our talk will examine archaeological and historical evidence for the procurement, consumption and trade of 'luxury' seafoods in Japan from the Bronze Age to the early modern period. Resources considered include abalone, herring, kelp, shagreen (shark and ray skin) and trepang. Some comparison of similarities and differences between Japan and western Europe (especially Iberia) will be made.

505 ETHNOGRAPHIES OF MAKERS AND MAKING: TRADITIONAL CRAFT AND TECHNOLOGY IN CONTEMPORARY SOCIETIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Pearson, Kristen (Anthropology and Inner Asian Studies, Harvard University) - Hobbis, Geoffrey (Knowledge, Technology, and Innovation, Wageningen University and Research)

Session format: Regular session

This session brings together archaeologists interested in contemporary contexts and sociocultural anthropologists concerned with material culture to discuss projects that cross disciplinary lines. Our focus is on highlighting research that investigates material culture practices in present-day societies around the globe as they relate to issues of broader anthropological significance. In particular, we invite contributions from scholars working on makers and making, broadly construed. Ethnoarchaeology as originally practiced had a keen interest in craft as an analogical tool for understanding non-industrial technologies; post-processual developments in 'the archaeology of the present' opened the field to investigations of the technologically diverse present, but, with exceptions such as French technologic culturelle, tended to address questions of consumption and infrastructure rather than craft. We aim to revive ethnoarchaeology's interest in traditional and non-industrial makers and making from a position of engagement with contemporary concerns. How do traditional crafts contribute to resilience in an age of climate catastrophe? How do communities use and understand the making of things as they construct and reconstruct themselves in a rapidly changing world? How do crafts interact with industrial commodities in a globalized economy? How does craft shape ontology, epistemology, sociality, and politics, and what consequences stem from the loss of traditional craft knowledge and practice around the world?

ABSTRACTS

1 MILK WITHOUT HONEY: AN ARCHAEOLOGICAL ETHNOGRAPHY OF LIME ACROSS THE ALBANIAN-GREEK BORDER AND THE EARLY MODERN CULTURAL LANDSCAPE

Moudopoulos-Athanasiou, Faidon (Institut Catala d'Arqueologia Classica)

This presentation wishes to reflect on some aspects of a project conducted in the context of the Endangered Material Knowledge Programme of the Arcadia Fund, entitled: "Burning the Bones of the Earth - Documenting the Traditional Lime Manufacturing in the Region of Epirus". The objective of the project was to unveil the knowledge and craftsmanship nuances of the traditional lime making in both sides of the Albanian-Greek border. Our host institute was the Athens-based Itinerant Workshop on Traditional Building Techniques "Boulouki", and our team consisted of young researchers: architects, a civil engineer, a chemical engineer and an archaeologist.

In this presentation I will outline the basis for our interdisciplinary collaboration and address issues of particular interest in relation to craftsmanship and cultural landscape. Lime was historically of great importance for the culture of the transborder region – being used to create mortars for the iconic regional stone structures and to pave the domestic space. In that sense, it played an important role in social life.

I wish to explore how the language and practice of contemporary lime produces relates to the regional cultural heritage. To do so, I will employ evidence from interviews, excerpts from 20th century literature (Ismail Kadare - AL / Dimitris Chatzis - GR) as well as archaeological observations.

2 DIVING INTO CONTEMPORARY GREYWARE POTTING PRACTICES AND COMMUNITIES IN CATALONIA (SPAIN, 18TH-21ST CENTURIES): SOME THOUGHTS ON POTTERS' RESILIENCE AND PERSISTENCE

Travé Allepuz, Esther (Universitat de Barcelona)

Ceramic production has shaped the industrial and human landscapes of Catalonia, especially in the northeastern area. This activity remains significant in certain places, where it transitions between traditional practices and industrial modes of production. Our contribution aims to explore the construction process of a genuinely artisanal identity and to study the re-signification of the material and immaterial heritage related to greyware pottery production in Catalonia. Indeed, a strong productive tradition that developed during the late medieval and modern periods ultimately turned into an element with inherent heritage value, still persisting today. Within an ongoing research project, we archaeologically explored the material culture originating in these communities throughout Catalonia. The enduring presence of productive activity over time, its recognition in a wide territorial area, different geographic or social conditions, and possibly some random elements were factors that converged in specific locations, allowing for collective awareness and the singularization of traditional pottery as a heritage element.

In recent years, we examined the transformation of production processes through a multidisciplinary approach, including archaeological material analysis, historical study of documentary sources, ethnoarchaeology, and information sciences, to provide an overview of the greyware pottery production and to integrate the material culture and industrial development of this area into archaeological studies. This comprehensive approach seeks to understand the evolution of pottery, encompassing both the material element itself and the social and economic interactions associated with pottery activity, its symbolic nature, or the sense of belonging originating in pottery-producing communities. This contribution offers some preliminary thoughts about the present-day state-of-the-art and suggests further research strategies to dive into the communities' resilience and persistence in maintaining an economic activity that deserves investigation from the archaeological perspective.

3 GENDER, CRAFT AND TINIAN MARBLES: A CASE STUDY OF THE (RE)INVENTION OF TRADITION

Voulgareli, Isavella (Cambridge Heritage Research Centre (CHRC), Department of Archaeology, University of Cambridge)

During the late Venetian rule (17th c.), the (modern)-Greek practice of marble craftsmanship was a dominant feature of the traditional crafts at the Cycladic Island of Tinos in Greece. In Tinos, marble techniques have been traditionally transmitted from fathers to sons (or kinsmen) over the centuries. Drawing upon the idea of 'tradition' (Hobsbawm 1983), we can understand how Tinian marble craftsmanship becomes largely male-dominated and male-oriented through the passage of time. While gender-role attitudes and normative practices still exist within traditional marble craftsmanship, progress is made toward easing their grip. For instance, nowadays, more and more women are becoming marble craftworkers. Female marble craftsmen (across the island and beyond) highlight the women's role in the (re)construction of (modern)-Greek marble craft heritage. This development helps us examine broader disruptions of what is known as traditional marble craftsmanship in the wider geographical area of Greece.

Drawing upon Judith Butler's notion of 'gender performativity' (1999), feminist approaches to the production of knowledge, and reflexive ethnographic methods, this paper aims to explore how the relational (re)construction of Tinian marble craftsmanship produces subversive 'know-how' techniques in response to digital technologies and niche market demands and redefines marble craft tradition amid new societal stimuli. In the first part of my paper, I investigate how current marble craft practitioners navigate changing social settings, and how their navigation relates to the subversion of their professional and public gendered identities. In the second part of my paper, I explore how change in gender expectations influences the performance of traditional marble craftsmanship and the making of (modern)-Greek marble craft heritage.

4 MAKING YARNS: THE RESILIENCE OF MARKA-DAFING DYEING TECHNIQUES (BURKINA FASO, WEST AFRICA)

Douny, Laurence (Humboldt University)

In the context of climate change and the human impact on ecosystems, the textile production of West African rural communities, which relies heavily on natural resources, is endangered. Over the last thirty years or so, responding to a growing lack of indigenous (Anaphe and Epanaphe) 'wild' silks, Marka-Dafing women of Burkina Faso have had increasing recourse to alternative vegetable fibres that require a specific coating treatment to mimic the properties

of the hard-to-find animal material. The dyeing technique, which uses an alkaline fermentative process to confer sheen, elasticity and shades of brown to the fibre, thus reminiscent of indigenous silk, is a long-standing technique used to copy the original tuntun (wild silk textile), the preserve of the elites. Grounded in an anthropology of materials and techniques, this paper looks into the fermentation dyeing of cotton yarns (using plants, cow manure and, when available, waste water derived from the cooking of wild silk nests) by retracing the operational sequence. A descriptive analysis of this dyeing process against the historical backdrop of material depletion since colonial times is provided by a focus on the technical relationships between the container, the dye, the yarns, the surrounding environment and the dyer's skills and knowledge. A particular focus is placed on the adaptative capacity of Marka-Dafing craft in the face of depletion and as a form of resilience regarding adverse biodiversity loss.

5 WAITING FOR THE WATERS: DOCUMENTING TRADITIONAL FISHING PRACTICES ON TANZANIA'S RUFJI RIVER FLOODPLAIN AT A TIME OF RAPID ENVIRONMENTAL CHANGE

Moreau, Marie-Annick (UCL - University College London)

The use of fishing traps was once widespread in pre-industrial societies, from the river weirs of medieval Europe to the salmon fences of the Pacific Northwest. On Tanzania's Rufiji River floodplain, people continue to construct a variety of traditional fish traps from plant materials, adapting their form, placement and management to target fish moving across a seasonally shifting waterscape. The social values associated with trap making and fishing—in the sharing of catches, labour, and access to fishing sites—remain central to local conceptions of fairness and belonging. But what will happen to the knowledge, skills and values involved in trap fishing, and to the material contribution traditional traps make to local livelihoods, if the floods end? The Julius Nyerere hydropower megadam, built without adequate impact assessments or public consultation, is nearing completion on the Rufiji River. The consequent disruption to flooding patterns, coupled with the stresses of a drier and more unpredictable climate, are already testing the productivity of traditional fishing methods, and reconfiguring makers' relationships to their craft. In this paper I reflect on a collaborative project with fishers in one Rufiji village to document through photographs, videos and interviews traditional fishing traps and practices at this moment of transformation, and ask whether a focus on cultural heritage offers a way for affected communities to challenge narratives of hydropower megaprojects as a "green" and just solution to climate change.

6 MEMORY WORK IN MUD, STONE AND WOOD: A CONTEMPORARY ARCHAEOLOGY OF MATERIAL KNOWLEDGE IN TURBULENT TIMES IN SOUTHERN AFRICA

Fredriksen, Per Ditlef (University of Oslo; University of Cape Town) - Bandama, Foreman (The Field Museum of Natural History, Chicago; University of Illinois)

What happens to material knowledges and practices in the aftermath of involuntary uproot and relocation? How do displaced newcomers weave their lifeworlds, knowledges and practices into a novel context in the early stages after arrival? Guided by these queries, this archaeological study of contemporary communities in southern Africa, anchored in a primary case in southern Zimbabwe, employs a temporally layered approach to minority communities experiencing intense mobility in a dense political landscape and facing a state that turns to violent evictions. Our primary aim is to understand craftspeople's practical problem-solving when coping with loss and absence while seeking to re-weave their social webs. Our examples share a common focus on earth materials (mud, soil, clay), stone and wood – easily available, low-cost or cost-free materials frequently used by displaced and refugee communities. Key analytical concepts are material attention, local agency and an expanded version of Achille Mbembe's 'necropolitics'. The approach seeks to merge two research domains only rarely combined: craftspeople's engagements with the socioecological landscape and the sociopolitical relevance of ancestral commemoration and related forms of memory work.

7 TYPOLOGIES, TECHNOLOGIES AND KNOWLEDGE. SW ETHIOPIAN SHABO HUNTER-GATHERERS AND THE CONSTRUCTION OF OTHERNESS.

Salazar-Bonet, Juan (Florida State University - Valencia International Program) - González-Ruibal, Alfredo (Institute of Heritage Studies - Spanish National Research Council (Incipit-CSIC)) - Falquina Aparicio, Alvaro (Institute of Heritage Studies - Spanish National Research Council (Incipit-CSIC)) - Derara Megeenassa, Worku (Department of Archaeology & Heritage Management, Addis Ababa University) - Rodríguez Simón, Pedro (Independent archaeologists)

Typologies of objects, tools and techniques were employed by Western academia to first hierarchize world societies. XIX century European archaeologists and anthropologists established that hunter-gatherer societies were the lowest stage of human development. Their material culture was considered a clear evidence of their primitiveness. In the case of SW Ethiopia, early explorers and travellers reinforced this Eurocentric dominant world-view. Moreover, diverse farming and herding groups in this region, in close contact with hunter-gatherers shared this negative perspective on

these small-scale societies. In the latter case, their consideration of hunter-gatherers backwardness was substantiated in their eating of wild animals and the absence of domestic species rather than in their typology of objects.

The Shabo are a present-day small hunting-gathering group of around 1500 people in southwest Ethiopia. Shabo people still hunt wild animals in the highland forest in the border region of three Ethiopian regional states (Gambela, Oromia and SNNPRS). To obtain several mammal species, they employ spears (bakee) and traps (kambo), two types of objects that have been a common subject of archaeological and anthropological research. Shabo original land is now threatened by large-scale coffee plantations, and they are also under pressure from Christian churches and state development projects. Furthermore, as far as 2023, the Federal State of Ethiopia has not acknowledged their existence as an independent ethnic group due to their nomadic life in the forest. An EMKP-British Museum project has allowed us to record Shabo material culture and, as a consequence, approach a particular technological coherence adapted to the forest. Shabo hunting typologies and technologies challenge the still prevailing pejorative narratives on this group and help to break long-term academic consideration of innovation as a superlative value and the only path to knowledge.

8 PLAYING WITH WOODFIRE: AESTHETIC SENSIBILITIES AND LIFESTYLE ASPIRATIONS OF CERAMIC PRACTITIONERS IN JAPAN AND BRAZIL

Morais, Liliana (College of Sociology, Rikkyo University)

Drawing on semi-structured interviews and participant and non-participant observation with non-Japanese ceramic practitioners in Japan and Brazil, this paper explores the intersection between aesthetic sensibilities and lifestyle aspirations in the allure of Japan-style ceramic wood-firing. Understanding aesthetics as the evaluative judgments of stimuli on the senses (Ingold, 1997), we will see how the technical choice of firing with wood at high temperature in Japanese kilns not only shapes the multisensory qualities of ceramic objects but also gives form and is formed by the lifestyle choices and aspirations of ceramic practitioners. Departing from the proposition that not only people make objects, but objects also make people (Miller, 2005), we delve into the embodied relationships contemporary ceramic practitioners in Japan and Brazil establish with materials, techniques, and aesthetic sensibilities nurtured via direct and indirect transmission of Japanese ways of knowing, seeing, and making ceramics. We explore how these culturally located values, cultivated in the interaction between technology, aesthetics, ethics, and morality (Saito, 2017), are negotiated with broader lifestyle aspirations marked by ideas of sustainability, authenticity, and collaboration with human and non-human others in an age of political and environmental crisis.

9 TO CUSTOMERS WITH CARE: AN ETHNOGRAPHIC EXAMPLE OF BUTSUDAN DISTRIBUTION IN RURAL JAPAN

Hui, Lok Hang (University College London)

Care is an important aspect in Japanese craftsmanship. This paper discusses the ethnographic example of a traditional craft known as Nanao butsudā, a local-style Buddhist altar found in many homes in Nanao, northwestern Japan. A traditional Nanao butsudā is built collectively by five specialist craftsmen with skills learnt and perfected over many years. For many rural households, looking after their butsudā on a daily basis is the most accepted way to show care to the family ancestors, and passing down the altar to the future generations is considered a serious family affair. Customer demand for craft butsudā, however, fell in the late 1990s, when some national manufacturers started mass-producing low-cost alternatives with parts imported overseas in their in-house assembly line. Based on ethnographic research conducted with local butsudā makers and shop owners, this paper demonstrates how the work of creating and conveying care is delegated downstream to the distribution process as production shifts from handcrafting to mechanised manufacturing. Craft making, by definition, refers to the value-added process through which the raw materials become the finished products. This paper suggests that post-production activities, including packaging, transporting installation and coordination with the clients, also play a significant role in converting industrial products into valued family items. One of Marx's main criticisms of capitalist economy is that it causes alienation, in which workers become disconnected from the result of their own labour. In contrast to Marxist theory, this paper presents a case in which the commodity's affective transformation occurs during the distribution process rather than during production.

10 "WE ALWAYS REMEMBER FOR WHOM WE MAKE A TANDYR". ETHNOARCHAEOLOGICAL RESEARCH OF TANDYRS IN SOUTHERN KYRGYZSTAN

Koštial, Jozef (University of West Bohemia in Pilsen)

The presentation has two informative levels: a) describes the construction, distribution and use of tandyr cores as a traditional product of the bread-baking culture in southern Kyrgyzstan; compares these processes with the well-documented phenomenon of tandyr in the Middle East and b) tries to define the implications for potential archaeological

research of tandyr in this area, where (despite their proclaimed general distribution and use) these products have not been archaeologically identified to date. The basic method of the work is the direct collection of ethnographic data at four production locations and dozens of consumption locations through direct observation and formalized questionnaires.

Preliminary results:

- without any formal standardization (given from above), a significant production, material and shape standardization of production can be traced through whole Fergana region
- technological procedures are ritualized by reference to tradition ("we've always done it this way")
- production is limited by ethnicity and gender ("work is for men; Kyrgyz are nomads, Uzbeks artisans").

11 PRACTICAL PARADOXES: EXPLORING THE SOCIAL AFFORDANCES OF THINGS IN CONTEMPORARY MONGOLIA

Pearson, Kristen (Harvard University)

For both Mongol and Kazakh pastoralists in Mongolia, spatial divisions within the yurt are used to mark relational status. Where a person moves and sits within the yurt is not prescribed in absolute terms, however, but varies depending on whomever else is present. In this paper, I will explore how household objects and daily material practices are similarly involved in the construction of relational distinctions and how this impacts the meaning and value of gifts. Focusing on felt carpets (syрмаq), I will show how a focus on relational status pervades every aspect of the syрмаq chaîne opératoire, whether making, keeping, giving, or sitting. Given as a dowry gift, the syрмаq materializes unequal but mutualistic relationships among kin and helps newly established households identify themselves within a network of obligations. For Kazakh pastoralists in Western Mongolia, objects are socially useful insofar as they can be used to mark relational identity and status, a fact that underlies the resilience of some traditional technologies, explains the transformation or disappearance of others, and contextualizes the adoption of mass-produced commodities.

12 TRADITIONAL CRAFTS AS CULTURAL RESILIENCE: ON THE MAKING AND USE OF KHEKHE OBJECTS/SUBJECTS AMONG THE NENETS OF NORTHWESTERN SIBERIA

Solfeldt, Erik (Stockholm University)

The making process of Khekhe objects/subjects rests upon the animistic ontological premises of the past. Khekhe is the Nenets notion of a certain thing in a particular situation, an animation of a thing or a place, such as idols, sledges, drums, poles, and place in chum (Nenets type of tent) and places in the tundra and taiga landscapes. Yet, these animated things are being viewed and explained based on Western notions. First, by missionaries, as the work of the devil, and secondly, by ethnographers and anthropologists, as representations of gods within a failed epistemology and/or ontology. By studying the making and use of these Khekhe objects/subjects from a new animistic theoretical perspective and drawing on the Ingoldian critique of hylomorphism in favour of ontogenesis, I argue that these Khekhe objects/subjects are not static objects of art but a fundamental part of the old ways – a part of the animism that, in the form of an animistic syncretism, has persisted despite Christian missionaries, Soviet politics, and the explanations of both Eastern and Western ethnographers and anthropologists.

13 KEEPING THE HAMMERS' VOICE ALIVE

Ferraro, Emilia (University of Dundee)

The ancient craft of Ecuadorian silversmithing has pre-Hispanic roots, and can be compared to an ecosystem, i.e. a community of interacting organisms and their physical environment. Like any other ecosystem, the silversmithing one also is a complex network of interconnected components – natural and manmade materials (still mostly handmade); relationships (with materials; with different artisans; and between masters and materials), and skills – that work together in synergy.

Like all ecosystems, this one also has a dangerous "predator": the encroaching global economy that in the last three decades especially, has caused Ecuadorian artisans to migrate in search of better economic opportunities; skills to be lost; materials not to be as accessible as before; workshops to be closed; and intergenerational knowledge transmission to be broken.

My research focuses on the Ecuadorian way of creating vessels by hammering on the inside from a single sheet of silver/metal that, to the best of my knowledge, is unique and unknown, at least in the UK, and quite distinct from the better-known method of hammering "on/from the outside" (e.g. angle raising).

Of pre-Hispanic origins, this unique technique conveys a worldview and belief system related to the "feminine" (despite being practiced nowadays almost exclusively by men) and to creation as a process that a) comes from the complementarity of the masculine and the feminine, and b) where the source of all life is believed to come from the inside.

The creation of vessels is not different from any other process of creation of (any form of) life in the Andes. This is conveyed in the language used to refer to techniques, tools and even the makers' relationship with materials, which is permeated by gendered and sexual metaphors.

Note: The research project, still ongoing, is funded by the British Museum under their programme Endangered Material Knowledge Programme (EMKP). Fieldwork was carried out in three traditional workshops in Quito over the summer of 2022.

14 **APPROACHING THE PAST THROUGH PRACTICE: RECONSTRUCTION OF A HISTORICAL GREENLANDIC DOG SLED**

Vitale, Emma (University of Greenland; University of Copenhagen)

Since the emergence of the Thule culture (1000 CE), dog sledding has been perceived as a central means of transportation in traditional Inuit life in the Arctic. However, there is an absence of research concerning traditional Inuit dog sled construction and the operational sequences of this technology. This study investigates Inuit dog sled construction using enskilment methodologies and employs experimental and ethno-archaeological observations to explore the relationship between knowledge and technical practice. It involves the reconstruction and testing of a West Greenlandic dog sled from the 1920s, shedding light on carpentry techniques and construction processes. This method emphasises the interaction between humans, technology, and time, providing essential practical data for future archaeological and historical research, particularly for comprehending fragmented archaeological remains. Inspired by the chaîne opératoire concept, which challenges conventional perspectives and places emphasis on process over the end-product, this research provides insight into understanding Inuit dog sled technology and the complexity of the practice. The connection between artefacts and materially situated practice is demonstrated through the reconstruction of a dog sled, which illustrates the value of physicality in enskilment. It highlights how experimental archaeology can improve our insights into the historical and prehistoric Arctic societies technologies and practices.

15 **THE WANIGELA POTTERS: PATTERNS OF PRODUCTION AND CHANGE. SOCIAL CHANGE AND POTTERY MAKING IN WANIGELA, ORO PROVINCE, PAPUA NEW GUINEA**

Bonshek, Elizabeth (Independent)

The women of Wanigela make distinctive pots using a technique unique in Papua New Guinea. A number of different pot forms are made: if decorated with clan designs they are generally kept for domestic use while cooking pots without clan designs can enter into a long standing regional exchange network in which pots, netbags, barkcloth and mats, all made by women, move between the villages of Collingwood Bay, each object regarded as being of equal value.

This pottery tradition was first reported by the Administration of British New Guinea and Anglican missionaries between the 1890s and 1910; archaeologist Brian Egloff and anthropologist Margaret Stephens documented pot making during the 1960s, the latter noting trans-generational aspects of pottery making. Around the same time, Margaret Tuckson contributed a ceramist's view of pottery making in this region.

Drawing upon this background this paper reflects upon insights into the changing patterns of pottery production gained during my doctoral fieldwork in Wanigela between 2001-2003. In considering the theme of this panel, I trace the social and cultural changes manifest within the armature of this material knowledge practice. The social mapping of material knowledge practices reveals changes in the transmission of pottery making skills and gives pause to reflect upon the concomitant effects on the kinds of designs potters apply to their vessels. In different ways the survival of both design making and the technique of pottery making appear to be threatened.

16 **CONCRETE PASTS, CONCRETE FUTURES: BUILDING ISLANDS IN THE ANTHROPOSCENE (LAU, SOLOMON ISLANDS)**

Hobbis, Stephanie (Wageningen University) - Hobbis, Geoffrey (Wageningen University)

In the Lau Lagoon, Solomon Islands, there is no material process, operational sequence and associated knowledge broader than the creation and maintenance of land itself. The Lau make land in the form of small islands, called fera-i-asi (rock in the sea), inside the eponymous lagoon on the northwest coast of Malaita Province: fashioned out of coral rocks, sand and coconut trees, and using practices dating back to at least seven hundred years. These "artificial islands," scattered across the lagoon, have played the backdrop to everyday and ritual life as it has met a long history of challenges, protecting the Lau from dangers from the mainland, such as malarial mosquitos and raiding parties, and from the ocean in the form of traders, whalers and slavers. Now the ocean itself is a threat. The sea is rising, so too the water's temperature which is bleaching the coral reef. In this paper, we draw on longitudinal ethnography to explore a central component of the assemblage that is the Lau artificial islands: kastom concrete. A binding agent and a substantive material in and of itself, kastom concrete holds the world of the fera-i-asi together. Surprisingly resilient, based off a centuries old recipe, the future of concrete making is uncertain. Industrial concrete is vying to take

its place, threatening a sustainable material practice that may be particularly suited to fend of the negative effects of climate change in the region.

17 **TECHNICITIES AGAINST "TECHNOLOGY": SOME METHODOLOGICAL SUGGESTIONS**

Coupaye, Ludovic (University College Ldon)

This presentation takes as a premise the implied suggestion made by the call for paper that an approach that relies on a strong contrast between crafts and "modern technologies" often risk obscuring the fundamental relational dimensions which underly ways of making and doings, whatever the place or the period. Instead, I suggest exploring how technical activities always actualise culturally and historically specific modalities of relations between humans and their milieus, not only avoids the reproduction of ethnocentric and presentists preconceptions about "technology" but provide also an avenue for revealing the various technicities these relations actualise. Starting with the classical works of Mauss and the French Technologie Culturelle, implemented with more recent works in Material Culture Studies and other disciplines which have discussed "technology", the paper presents some methodological suggestions which could allow the allows to ethnographically, that is empirically, investigate questions of materiality, personhood, agency, political economy, cosmology or "ontology".

510 **ROME'S PLACE IN AN EPONYMOUS EMPIRE**

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Hanson, John (University of Oxford) - Ortman, Scott (University of Colorado) - Bellviure Perez, Joel (University of Oxford) - Dominici, Corso (University of Oxford)

Session format: Regular session

Over the last few decades, there has been significant debate about the place of Rome within the Roman Empire, with scholars suggesting, adopting, critiquing, and rejecting various models of imperialism, colonization, acculturation, resistance, and hybridization, often in response to contemporary social and economic events. At the same time, the combination of recent and on-going excavations and multiple revolutions in archaeological theory and practice, the storage, manipulation, and dissemination of information, and the digital and computational interpretation of ancient remains means that we have never been better informed about the material life of the capital and its relationship to the provinces. The aim of this session is therefore to take the opportunity to reflect on the place of Rome in the empire that bears its name, and its role within the imperial system. In particular, it will consider, first, the extent to which recent discoveries allow us to reassess the demography, topography, and socio-economic conditions of the capital, and, secondly, what newer theoretical models, more powerful computational approaches, and more thoughtful modes of synthesis reveal about the relationship between the capital and other communities. We would therefore welcome contributions that either allow us to reassess the relationship between Rome and the wider empire using new theoretical, computational, synthetical approaches, or that allow us to trace the interactions between them through the lens of social and cultural transmission or the exchange of material remains. Contributions to the session may therefore come in a variety of forms, from direct reports from fieldwork projects to the results of longer-term research initiatives, and could cover a range of types of evidence, from art and architecture to epigraphy, numismatics, ceramics, and bioarcheological and archaeobotanical evidence.

ABSTRACTS

1 **ON THE POPULATION OF ROME**

Hanson, John (University of Oxford)

As part of a renewed interest in the demography of the ancient world in recent times, many scholars have largely come to accept the estimate of around one million inhabitants for Rome at its peak in the second century AD, despite the fragmentary and somewhat problematic nature of the evidence available. In this talk, I will begin by offering a short review of the available evidence for the numbers of inhabitants that lived in the capital, focusing on the information provided by the inhabited area, the grain dole, the so-called Regionary Catalogues, the Forma Urbis Romae, and wider comparisons, before suggesting a new method for estimating its total population, drawing on previous research. This reveals an interesting surprise. The remainder of my talk will be dedicated to understanding this, which I will do by considering the wider catchment of the capital, the level of inequality reflected in Gini coefficients, and the extent to which the capital is representative of other settlements in the empire.

2 HOW CENTRAL WAS ROME FOR ITS HINTERLAND?

Haas, Tymon (University of Groningen)

Rome and its surrounding region, often referred to as the Suburbium, are generally considered as highly integrated, but with a strong focus on the city of Rome itself: economically, with economic specialisation around Rome presumably taking place according to Von Thünen's Isolated State model (Morley 1996); demographically, with high degrees of mobility between Rome and surrounding regions (Witcher 2005); and socio-politically, as surrounding territories were directly controlled by Rome while Roman elites retained spatially dispersed power bases (Terrenato 2019).

While this image of Urbs and Suburbium as one integrated urban system with a globalised countryside (Smith 2020) may by and large hold true, it is certainly also one-sided: based mainly on written and epigraphic sources, it very much focuses on Rome and its political and economic elites as agents of integration. Much less attention has been dedicated to the evidence from the Suburbium itself, which may offer a rather different perspective on the nature of this integration and its effects on the daily lives of rural non-elite. While both excavation and especially survey data are amply available for the rural landscapes around Rome, these data are still rather dispersed and have therefore so far not been approached synthetically from such a perspective.

Drawing on three major survey datasets that have recently been integrated within the Roman Hinterland Project, this paper aims to explore, from a rural perspective, how central Rome was for the surrounding Suburbium. By presenting several analyses of the integrated site and ceramic data, aspects of demographic developments, economic networks and consumption patterns in different parts of the Suburbium are explored in order to assess how and to what extent rural communities were (more or less directly) affected by or dependent on the city of Rome.

3 THE STATIONES ALONG THE SACRA VIA. WITNESSES OF MOBILITY AND REPRESENTATIVENESS OF FOREIGN COMMUNITIES IN IMPERIAL ROME

Grazian, Andrea (Sapienza)

A series of inscriptions found on several occasions in the area of the Roman Forum testify to the presence, starting from the imperial age, of stationes (στατιώνες) from some of the cities of the empire (Caesarea-Anzarbos, Tarsos, Tiberias, Tralles, Sardis, perhaps Bethaisda and a Heraclea), on whose function the scientific debate is still open. Perhaps some of the stationes could be recognized in a series of small brickwork rooms aligned along the southern side of the Sacra via that came to light in the 1990s.

In this contribution we aim to re-examine the issue and all the related problems (chronological, onomastic, topographical), starting from the fundamental testimony of an epigraph, pertaining to a statio of the Tirii in the city of Pozzuoli very rich in data on the functioning of the stationes of foreign cities. At the same time, the in-depth study of the related archaeological issues (decoration, architecture, floor plans) aims at a thorough understanding of the characteristics of these structures, inevitably derived from the function they were meant to perform.

Not adequately emphasized, in fact, appear the elements on the nature of these places as monumenta and on the very close relationship that existed between them and imperial power: the stationes, understood as an architectural structure, constituted, symbolically, the "personification" of the cities on which they depended, which allowed them to be present and "participate" in the public life of Rome, not by chance placed in one of the most politically charged places, the Roman Forum.

In this sense, we intend to investigate in depth the meaning of these spaces linked to the communities of peregrini from the various cities of the Empire, exceptional witnesses of mobility and sociality in the ancient Mediterranean, as well as of the activities and interests at the origin of this mobility.

4 WHAT IS ROME'S ROLE IN THE TRANSFER OF ARCHITECTURAL DESIGN TO THE NORTHWESTERN PROVINCES?

Skolik, Annika (DAI Rom)

This paper attempts to understand the transfer of architectural design to the northwestern provinces during the early imperial period. Based on a classical typological, iconographic-stylistic analysis of entablature/cornices of both rural and urban areas from the Germania Superior and backed by a cluster analysis for the detailed recording of ornamental design possibilities, an infrastructural and topographical analysis of the area of this province is also carried out. In addition to infrastructural connectivity through roads and river paths, resources such as local stone material and the human factor (donors and recipients of the buildings), are also taken into consideration. The questions and issues I would like to address are among other things: How and in what way are Roman ornamental designs adapted in the province? How does the transfer generally take place? Which actors are generally responsible for the transfer? What role do the territories play that had been conquered and established since Republican times, such as northern Italy or the province of Gallia Narbonensis? Does Rome actively engage in this development, or does it rather remain passive by simply establishing the basic infrastructure?

5 DEVELOPMENT AND INEQUALITY IN ROMAN HOUSING IN BRITAIN AND ITALY

Ortman, Scott (University of Colorado Boulder) - Harbison, Victoria (University of Colorado Boulder) - Bulik, Olivia (University of Colorado Boulder)

The long-term consequences of Roman expansion in peripheral provinces is an important research topic around which there is significant debate. Here, we synthesize the archaeological record of housing from the Late Iron Age through the Roman era in Britain to examine spatial and temporal patterns of development and inequality, and we compare these patterns to those from cities in the Imperial heartland. We find evidence that the primary mechanism of development shifted from provincial administration to self-organization over time. We also find evidence that Britain experienced significant "catch-up" growth in the centuries following its incorporation into the Empire. Finally, we find evidence that cities in Britain and Italy exhibit both similarities and differences in their spatial properties. The resulting picture is complicated, and interpretation depends on one's point of view. While Roman Imperial administration was extractive relative to the Late Pre-Roman Iron Age, the material conditions of life for the average Briton also clearly improved during the Roman period.

6 LATE ROMAN COIN FINDS FROM THE MINT OF ROMA ON THE LIMES OF PANNONIA SECUNDA

Lukic, Katarina (PhD student at the Faculty of Humanities and Social Sciences, University of Zagreb)

This paper examines the mint composition patterns of Late Roman coinage found at the military sites along the limes of the Pannonia Secunda, focusing on the presence and share of coins minted in Roma. Pannonia Secunda was a western province and a touch-point between two parts of the Roman Empire. Its portion of the Pannonian limes was a rural and military frontier zone where the army was an impetus of the fresh coins, which then circulated on local markets. Therefore, changes in mint composition patterns and the amount the coin finds could indicate alteration of the military units residing in the area due to political reasons, i.e. who had the actual and who had the nominal authority.

This paper aims to detect such changes through numismatic evidence in the set time frame from the Valentinian dynasty until the last found Late Roman coin on the sites. That is, to examine from the numismatic perspective the turbulent period of external and internal menaces to the Empire at the time of its division. The focal point in the analysis is how the share of coins minted in Roma reflects the idea.

7 PRESTIGE AND LOCAL TRADITIONS BETWEEN ROME AND THE PROVINCES

Christensen, Kristian (recently finished post.doc. at School of Classics, St Andrews University)

Following the dismantling of the Romanization paradigm in recent decades research into the cultural relationship between Rome and her provinces has produced both studies emphasizing wide-ranging interaction (Pitts and Versluys (eds.) 2015. *Globalisation and the Roman World*. Cambridge; Belvedere and Bergemann (eds.) 2021. *Imperium Romanum*. Palermo) and studies emphasizing the limited capability of pre-modern imperial centres for influencing their peripheries (Johnston 2017. *The Sons of Remus*. Cambridge; Dench 2018. *Empire and Political Cultures in the Roman World*. Cambridge) and the hierarchy within which provincial cultures were structured (Fernández-Götz, Maschek and Roymans (2020). "The dark side of the Empire" in *Antiquity*, 94, 1630-1639).

In order to capture these aspects of Roman imperialism in a single framework, the present paper sets out a middle position by employing an interdisciplinary approach that draws on the anthropological model of universalization and localization first designed by Robert Redfield and McKim Marriott. This model envisages agrarian civilization as always consisting of two layers of tradition. The prestige tradition was the culture of the elite and was standardised and codified by literature. The local tradition was the culture of provincial communities.

Unlike in other binary cultural models, however, these two layers existed in a state of perpetual, low-intensity interaction. The paper will demonstrate this through a re-assessment of the implications of a diverse array of archaeological and historical research – including on pottery assemblages in Essex, grave portraiture in the Rhineland, burial mounds in Austria and epigraphy from Asia Minor. Filtered through the anthropological model these sources present the picture a provincial world that drew upon the culture of metropolitan Rome for inspiration. Yet instead of assimilating to the Roman model, they transformed Roman elements to suit local contexts, using them as building blocks for renewing their own traditions under the changed circumstances of imperial rule.

8 HADRIANA PALMYRA

Bobou, Olympia (Aarhus University) - Raja, Rubina (Aarhus University; UrbNet)

One of the most important events in Palmyra's history happened in AD 129, when the emperor Hadrian visited the city as part of his tour of Syria, an event that was documented through various inscriptions. These inscriptions, as well as the material culture from the oasis city have been the topic of intense study by Rubina Raja and her projects Palmyra Portrait Project and the Circular economy and urban sustainability in Antiquity Project. Through such data and

the research conducted in the last 12 years, it is possible to reconsider the relationship between the capital and Palmyra and to re-evaluate the impact that Rome and the Roman Empire in general had on the material culture of the city. In this paper, the visit of Hadrian will be taken as the starting point for re-assessing the relationship between Rome and Palmyra through the material culture of the city. The imperial visit has been rightly seen as a point where the civic centre of Palmyra was transformed, and its elites sponsored public and civic architecture that could be connected to imperial architecture and that of cities of the eastern part of the Roman Empire. The newly re-evaluated evidence, however, allows us to see that the relationship of Rome and Palmyra was more complex than that of a city adopting Roman models of architecture and civic life.

9 RECONSTRUCTING HYBRIDITY IN ROMAN EGYPT: 'THIRD SPACE' IDENTITIES EXPLORED THROUGH THE HAWARA MUMMY PORTRAITS

O'Brien, Louise (University of Liverpool)

The socio-political environment of Roman Egypt represents an area of the Roman empire which experienced hybridity and cultural entanglement that relied upon the cooperation of elite individuals and local administration. This hybridity, displayed most clearly in the Roman Fayum, not only disproves previous culture-historical theories applied to material culture, but indicates that a new approach is required to better understand the hybrid identities cultivated and manipulated by these individuals. The Hawara mummy portraits, as artistic and cultural hybrids, evidence that Fayum elites used culture as a currency, assimilating themselves using new Roman values while maintaining elements of traditional Egyptian belief and practice that can be traced throughout the pharaonic period. This coming together of cultures creates a Third Space – evidenced by material culture that cannot be described solely as Greek, Roman, or Egyptian but instead is all three at once, and is not as clearly defined by social, legal, or political structures as we may assume. Reconstruction, a new methodology aimed at rethinking how we approach hybrid material culture, considers three elements of this phenomenon: Reception, Content, and Perception. It considers how modern receptions of hybridity match up to the lived experience of the creator or owner, how the material was used or perceived, and how the intended audience may have interpreted it. This will allow for a more accurate understanding of how hybrid identities and experiences were displayed through material culture, and how the cultural environment of Roman Egypt allowed for such manipulation of one's image, even in death.

10 UNDERSTANDING ROME BEYOND THE BOUNDARIES OF ITS EMPIRE ROME IN THE CONTEXT OF THE GLOBALIZING WORLD OF ANCIENT AFRO-EURASIA

Tevdovski, Ljuben (Institute of History and Archaeology, Goce Delcev University)

The application of the theory of globalization to the ancient world created dramatic changes in our approach to the research of cultures, nations, cities, and empires of Ancient Afro-Eurasia and beyond. Its contributions in archaeological theory promote strongly the ideas of constant interaction and interconnectedness, and multidirectional flow of ideas and materials throughout wider areas of the ancient world. Rejecting the traditional and pervasive concept of "cultural containers", this emerging methodological model provides unique critique and promising alternatives to various previously proposed or dominant models of approach, such as: imperialism, colonization, acculturation, resistance, or hybridization.

This contribution utilizes the globalization theory and recent advances in archaeological theory and practice that reveal the multidirectional wide-scale flow of materials, ideas, knowledge, and technological know-how in the last millennia BC. It also reconstructs an ancient oikumene of interconnectedness that extended through and related communities, urban centers, and wider areas from the Indian to the Atlantic Ocean.

In such context, I suggest a new understanding of the urban growth and living and the cultural, demographic, and social transformations of the city of Rome through a wider comparative matrix of the urban developments of the globalizing world of Ancient Afro-Eurasia. I hypothesize three phases of the development and transformation of the city of Rome during the Roman imperial times. The first phase of the development of the city from the reign of Augustus to the reign of the Flavians is analyzed through the lenses of "building of a new post-Hellenistic dynastic center". The analyses of the second phase, track the process of "becoming critical center of the post-Hellenistic globalizing world", and extend throughout the second century AD. Finally, the third phase of the hypotheses, exposes a marginalized urban core on the fringes of the globalized post-Hellenistic world as early as the third century AD.

11 THE SUNK COST OF ROMAN SHIPWRECKS: A NEW VOLUMETRIC APPROACH TO QUANTITATIVE ANALYSIS OF AMPHORA CARGOES

Bellviure, Joel (University of Oxford)

The cargoes of amphora-carrying ships have long been assessed by using minimum vessel count (MVC) methods. This paper argues that all quantifications derived from a MVC analysis are heavily biased as a result of the variations

in volume among the different types of Roman amphorae. Instead, this work argues for a more realistic approach to quantifying seaborne products by digitally extracting volumetric information from 2D representations of these individual containers. This results in the creation of "sunk cost" tables, which, in turn, can be analysed from a financial point of view by using literary evidence and price lists from the period. This approach corrects distortions caused by MVC analyses, revealing that, despite fewer olive oil amphorae being stowed in Roman vessels, olive oil was often more significant than other cargoes. The analysis uses evidence from Ostia and Rome, as well as Mediterranean shipwrecks, to reshape the debate over the long-term evolution of trade in the main products stored in amphorae: wine, olive oil, and fish sauces. It is suggested that changes in containerisation in the third century AD did not necessarily correlate with a decrease in the commercialisation of the respective products and that a decrease in the size of wine amphorae may be better explained by the popularisation of barrels.

514 APPLYING ARCHAEOLOGICAL RESEARCH SOFTWARE ENGINEERING AS LITTLE MINIONS: STATISTICAL & COMPUTATIONAL APPROACHES TO DAILY ARCHAEOLOGICAL TASKS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Thiery, Florian (Leibniz-Zentrum für Archäologie (LEIZA); NFDI4Objects) - Schneider, Agnes (Leiden University, Faculty of Archaeology, Digital Archaeology Research Group; PhD Candidate) - Fricke, Fabian (Deutsches Archäologisches Institut (DAI); NFDI4Objects) - Allison, Jim (Brigham Young University) - Stefan, Daria (Technische Universität Wien; Master Student)

Session format: Regular session

Nowadays computer applications as well as statistical and computational approaches constitute a big part of the toolbox of every archaeologist, as they open tremendous possibilities for all research. These can be ready-to-use (proprietary) software applications but also "Little Minions" (self-scripted tools) or research software (e.g. implementation of statistic algorithms in R, Python), which are written by researchers. Both, research software and research data are part of Computational Archaeology and play an important role in up-to-date archaeological research. Optimally research data (and software) is FAIR(4RS) – Findable, Accessible, Interoperable, Re-usable (for Research Software) – and reproducible of which other users can benefit from or even develop further. The increasing number of topics and papers at the international and national chapters of the CAA show manifold applications but also implications. Working Groups like the SIG SSLA (<https://sslarch.github.io>) or the "Little Minions" (<https://littleminions.link>) also deal with Computational Archaeology and are building a community.

Several initiatives, such as the German National Research Data Infrastructure (NFDI) – especially NFDI4Objects – or the European Open Science Cloud (EOSC), engage with this topic to strengthen the position of Computational Archaeologists and Research Software Engineers, highlight the scientific merit of their work, and ensure researchers receive credit for computational approaches, software development, as well as for writing papers.

To support this, this session invites contributions dealing with various aspects of Computational Archaeology, but not limited to:

- treating source code/software as research data
- presenting a "Little Minion"
- discussing challenges in Computational Archaeology
- advancing new algorithms and statistical/computational analysis methods
- (critical) use of AI, discussing pitfalls and complications
- addressing the divide between FAIR(4RS) principles and practices
- incorporating FAIR(4RS) principles into the teaching curriculum
- discussing approaches concerning problems and solutions to legacy data and software
- making complex statistical and computational methods accessible to main-stream archaeology.

ABSTRACTS

1 STATISTICS AREN'T A "BLACK BOX" - USING FAIR-RS TO MODEL ARCHAEOLOGICAL DATA

Fricke, Fabian (Deutsches Archäologisches Institut)

The definition of proxies, in the form of artifact types, has been one of the core methods of archaeology from the very beginning of our discipline. The emergence of the use of scientific, i.e. mostly metric, data has made it necessary to

classify them into groups and subgroups. Various approaches, some more and some less statistical, have been and are being pursued for this purpose. The emergence of genetic data in particular has given new impetus to more complex statistical data processing in archaeology.

However, this boost has also created the need to adapt new working methods that take into account the special requirements of good scientific practice in dealing with such methods. In the practice of archaeological work, more complex statistical methods, such as cluster, correspondence or principal component analysis, are all too often regarded as “black boxes” into which data is fed and results extracted. The specifics and functionality of these tools are rarely questioned.

In the following presentation, I would like to use Late Bronze Age data to illustrate three points.

1. How the free-and-open-source statistical environment R can be used to model archaeometallurgical proxy groups.
2. How different statistical processes can interact with each other.
3. How the FAIR principles should be used to comply with good scientific practice.

2 IMAGE MATCHING FOR SEMI-AUTOMATED DIE STUDIES AND THEIR VISUALISATION TO EVALUATE AND TO IMPROVE THE DATA QUALITY

Gampe, Sebastian (University of Frankfurt) - Deligio, Chrisowalandis (University of Frankfurt) - Tolle, Karsten (University of Frankfurt) - Steiner, Alina (University of Frankfurt) - Möller, Markus (RGK - Romano-Germanic Commission DAI) - von Nicolai, Caroline (University of Leipzig)

Ancient coins were produced in large quantities using several unique handmade dies. Coins produced with the same dies are very likely to be produced within a small time and geographic distance. To understand the order of production and their geographical distribution it is necessary to find coins produced with the same die. A die can be replaced for one side for several reasons, usually during the minting process, as the upper die wears out more quickly and needs to be replaced sooner. In this case, a new die is used, which makes it possible to create links between groups of dies. A die study that analyses such links is a common but also very time consuming manual task in numismatics. The challenge to find the die links is getting more complicated the more coins you have. With the approach of linking existing resources by linked open data (e.g. based on Nomisma.org), the amount of coins to be analysed in a die study is increasing. Therefore, tools are needed to support the domain experts. In our previous project, “ClareNet” (Classifications and Representations for Networks)*1, we developed a tool based on an image matching algorithm ORB*2 and used Orange*3 in order to visualise the results. For the Celtic hoard find of Le Câtillon II, which contains 70.000 coins, our results were very promising. It is important to note that our approach keeps the human in the loop. We are currently trying to further improve the process of creating such a die study. The aim of this paper is to show how such a computer-based die study can be done and visualised, and further, how it can be used to improve the data quality, finding mistakes, and lastly to prepare the data for deeper analysis.

3 A STATISTICAL ANALYSIS OF REPEATED NAMES AMONG JUDAHITE “PRIVATE” JAR-HANDLE IMPRESSIONS

Levy, Eythan (University of Zurich; University of Bern)

This paper deals with repeated names among the so-called Judahite “private” jar-handle impressions, a widely distributed type of stamps attested on jar handles found all over Judah (southern Levant) in the Iron IIB period (8th century BCE). These stamps usually bear a personal name followed by a patronym. Over 80 years ago, David Diringer noted that this corpus contains many repeated names and concluded that the stamp bearers were part of one extended family, for which he gave a genealogical tree. His ideas did not catch, however, and this pattern of repeated names has since then never been studied in depth. We propose a statistical approach to this problem based on three steps: (1) we define three metrics to quantify the phenomenon of repeated names, (2) we compare the value of these metrics in our corpus and another contemporary corpus of seals and seal impressions, (3) we show that, with a high probability, the pattern of repeated names among the stamped handles cannot be due to mere chance. We then examine the stamped handles more in depth, to characterize the precise pattern of repeated names. We show that most of the repetitions are due to pairs of names occurring as a personal name on one stamp, and as a patronym on another stamp. We show that the statistical significance of this pattern is extremely high and conclude that it most probably points to genealogical relations between the stamp bearers, thus quantitatively vindicating Diringer’s old intuitions. We also propose an updated genealogical tree of the stamp bearers. Our analysis is based on a simple random sampling procedure implemented in the Python programming language. This study opens the way for further future

analyses of names occurring in epigraphic corpora, in order to better assess the relations between the individuals mentioned therein.

4 FROM FAIR PRINCIPLES TO FAIR PRACTICES: ARE WE THERE YET? THE CASE OF ARCHAEO-GEOPHYSICS

Schneider, Agnes (Leiden University; Technische Universität Berlin)

Although since 2004 a huge number of papers have dealt with the semi-automated analysis of archaeological remote sensing datasets, data, code, or even complete workflows are rarely published (exceptions: Niculita 2020, Orengo et al. 2020, Berganzo-Besga et al. 2021, Kazimi and Sester 2023). This is even more so in the case of archaeo-geophysics.

This shows that there is still a long way to go in the implementation of the FAIR (Findable, Accessible, Interoperable and Reusable, Wilkinson et al. 2016) principles and the sustainability of research output. This is a clear deceleration and declaration for research: lacking code, data, open workflows and best practices, researchers spend much time understanding and reconstructing existing models and workflows, sometimes even giving up (Barton et al. 2022; ‘reproducibility crisis’) and often starting from scratch, which has led to a multitude of custom solutions and a lack of transferability and generalisation.

These are the symptoms of the lack of broadly used research standards (Barton et al. 2022). These might exist on local, regional and even international scales, but their implementation often depends on financing and politics, but also on coordination and infrastructure. E.g. for long, the significance of spatial data standards was not recognised in archaeology, which constituted a barrier to sustainable solutions for the future of research data and also for research itself (McKeague et al. 2019).

Regarding archaeo-geophysics, the existing EAC guidelines (Schmidt et al. 2015) do not state how to execute the interpretation specifically, due to the specific character and complexity of the different data types. Exactly because of this, standardised and semantically consistent protocols are needed to develop workflows that can be generalised and transferred to data sets with similar factor influence.

The following presentation proposes a set of desiderata which would facilitate FAIR and sustainable work with archaeo-geophysical data.

5 TAMING TIME: USING CORRESPONDENCE ANALYSIS TO HANDLE RELATIVE CHRONOLOGIES AS GRAPHS

Thiery, Florian (Leibniz-Zentrum für Archäologie (LEIZA)) - Mees, Allard (Leibniz-Zentrum für Archäologie (LEIZA))

“Dated sites” in archaeology are usually not “dated sites”. Most of the temporality of “dated sites” is usually derived from historical assumptions. However, the chronology of these materials is often based on material coming from the manifold of other assumed “dated sites”, thus potentially resulting in a circulus vitiosus. A methodological way out of this dilemma is possible when we enhance the assumed external dating evidence and go back to the factual occurrences and overlaps in the data from the suspected “dated sites” since only these data are free of any temporal interpretations.

As a method, the chronological assumptions used in defining “dated sites” based on archaeological find materials must be deconstructed and restricted to the occurrences and overlaps within and between “find materials” from suspected “dated sites” only to arrive at a relative chronology. This can be achieved by using correspondence analysis and visualising the resulting dimension values on maps recalculated in Hue values. By applying Allen’s interval algebra, including the Alligator and AMT tools, we can fix missing or enhance existing start- or endpoints by adding information about the vagueness/uncertainties.

To cover as many assumed “dated sites” as possible, the Samian Research database with its 250,000 potter’s stamps from all over Europe is used.

It turns out that it is possible to visualise historical development on maps, timelines and graph structures without using historical-chronological assumptions about individual “dated sites”. Simultaneously, this paper demonstrates the application of a different concept of temporality. The development of the Samian consumption patterns in the progressing Southern German Limes and the enrollment of the occupation of Britain appears to be gradual only. Applying the methods above, based on Linked Open Data techniques, enables the FAIRification of these data related to temporality, especially by creating interoperability and reproducibility.

6 LITTLE MINIONS GROWN OLD: REJUVENATING LEGACY SOFTWARE

Allison, James (Brigham Young University)

In recent years, archaeology has slowly moved toward open-science ideals. Researchers and funding agencies are increasingly concerned with sharing data and research software, including the self-scripted tools that archaeologists often create in scripting software languages such as R or Python. Despite significant progress in sharing code, the problem of legacy software has been largely neglected. This paper takes a personal look at the issues around legacy software. During my career I have written a number of software tools for research or teaching that have never been openly available, and which are written in now-outdated formats that make them difficult to reuse. Some of these tools are too specialized or too small to be useful outside of their original context, but others have more potential to be useful to other researchers. As a case study, I focus on one program, originally written in PASCAL in the 1990s, that calculates probability intervals in several different ways for calibrated radiocarbon dates. The program was originally written to show that standard ways of reporting calibrated radiocarbon dates (as often discontinuous probability intervals) often make interpreting dates needlessly complicated, and other ways of reporting calibrated dates using continuous intervals) are equally valid and often preferable. The process of resurrecting this outdated software tool by recoding it into R leads to questions (and some tentative answers) relating to the problems of legacy software tools in archaeology: what are the best ways to make outdated tools useful again? How often should we even care about reviving old software tools? And, how do we decide what to prioritize?

7 GENERATING RDF-GRAPHS WITH SIMPLE CSV FILES - RDFIER

Tolle, Karsten (Goethe University Frankfurt am Main) - Pöpperl, Jan (None)

Your data is stored in a relational database or in a spreadsheet, and you want to generate Resource Description Framework (RDF) data out of it? With the open-source tool RDFier [1], one can easily transform a CSV file into RDF. The main task is to set the column names correctly. This way, the tool can handle different datatypes, languages, and blank nodes, and it also allows the usage of prefixes for abbreviation.

Another reason for the creation of the tool was to provide different ways to model uncertain data in RDF. By adding “^^certainty“ at the end of a column name, one can specify a column as such and can select out of eight different modeling ways that are 100% in RDF. In addition it provides two ways to model it in RDF-Star.

We will present the tool that was generated by Jan Luca Pöpperl in the context of his master’s thesis [2], with some use cases to show its potential.

8 SURVEYER: AN R PACKAGE TO ASSESS CHRONOLOGIES BASED ON ARTEFACT TYPOLOGY

Cortell-Nicolau, Alfredo (University of Cambridge) - Pardo-Gordó, Salvador (Universidad de La Laguna)

Since its inception, and when available, archaeological science has always and increasingly relied on radiocarbon dating to properly identify the chronology of the different assemblages found. However, and besides from its chronological limitations in terms of time range, radiocarbon dating is not always a viable option, nor the most reliable one. Indeed, dates might be affected by the conditions and the reliability in which one specific archaeological deposit has been found. For example, and considering archaeological sites, stratigraphic disturbances might affect the association between the dated proxy and the archaeological assemblage, or the earth acidity (e.g. pH levels) might affect the preservation of datable material. On survey projects, additionally, there is no possibility of dating the assemblage due to the lack of reliable associations.

In this work we present an R package able to help in this problem. We develop a Bayesian Dirichlet-multinomial inferential process in order to produce posterior predictive distributions based on the training set from well-dated and stratified assemblages. Thus, we explore the conditions where radiocarbon dating performs at its best, and use that to produce reliable chronologies for insecure assemblages. Additionally, by combining the potential ¹⁴C information of the insecure assemblages with the artefacts found within them, we provide the opportunity to narrow the confidence intervals involving any specific date, thus increasing their chronological accuracy and resolution.

Finally, we will illustrate with different case studies where the package can be used, and we will provide examples so that users can use it adapt it to their own needs.

9 ARBODAT+ / THE NEW EDITION OF A CLASSIC IN ARCHAEOBOTANICAL DATA RECORDING

Mennenga, Moritz (Lower Saxony Institute for Historical Coastal Research) - Knappe, Carina (Kiel University)

Systematic digital data collection in archaeobotanical research has been carried out in many working groups throughout Europe since 1997 by using ArboDat. This MS Access application, which was developed by Hessen Archäologie,

enables scientists to record important metadata on sites, features and samples. It is also possible to enter the counts of botanical macroremains with various details and to create reports as well as to conduct data analyses. ArboDat has been completely redeveloped since summer 2023. While the basic structure has been retained, fundamental technical changes regarding the backbone of the software have been realized. Furthermore, in order to address weaknesses in the content, a survey was conducted in the community with the aim of highlighting desiderate, but also to localise unnecessary functions.

The development of the new ArboDat+ is being realized as part of the DFG-funded National Research Data Infrastructure (NFDI) and is being carried out in cooperation between the Lower Saxony Institute for Historical Coastal Research in Wilhelmshaven, which has been responsible for ArboDat since 2016, and the Institute of Computer Science at Kiel University. In this talk, ArboDat+ will be presented by giving an overview of its current functions, the survey results and, above all, the status quo of the development of ArboDat+ including all main technical and content-related objectives.

517 BC_BEFORE CHURCH. CULT BUILDINGS IN ANCIENT MEDITERRANEAN EUROPE. SESSION 2: HUT - TEMPLE - CHURCH (XTH BC - IIIRD-IVTH AD)

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Fusco, Ugo (Tor Vergata University of Rome) - Davies, Penelope (University of Texas) - Truffi, Michele (Roma Tre University) - Woodhull, Margaret (University of Colorado, Denver)

Session format: Regular session

In a seminal paper, Christopher Hawkes outlined a “ranking” of possible interpretations derived from archaeological data that judged it virtually impossible to reconstruct the ideology and spiritual life of primitive communities (Hawkes C. 1954, Archeological Theory and Method: Some Suggestions from the Old World, American Anthropologist 56: 156, 158). Fortunately, the study of the relationship between religion and archaeology - particularly our ability to identify evidence for religious activity and associated places of worship at the archaeological level - has advanced considerably in recent decades. Analysis of cult buildings aims to identify various elements with increasing precision, including architectural features, the nature of rites practiced within cult buildings and archaeological indicators that allow their identification, methodologies for the analysis and interpretation of material culture, bioarchaeological evidence for cult offerings, the “ritual” landscape in which a cult building is inserted, and relationships with local geomorphological features.

This session will analyse the evolution of cult buildings from the huts dedicated to this function in settlements of the early first millennium BC, to the emergence and development of the temples that replaced them, and the earliest evidence of Christian cult structures (III-IV century AD).

The session will welcome papers addressing the following themes: theoretical and methodological reflections on the topic of the session, revisionist analysis of previous contexts using new methodologies, and finally, the latest discoveries from ongoing archaeological research.

ABSTRACTS

1 ONCE UPON A... HUT. “SACRED (?) HUTS” BELOW TEMPLES: COMPARISONS BETWEEN ITALY AND GREECE IN THE IRON AGE

Truffi, Michele (Dipartimento di Studi Umanistici - Università degli Studi Roma Tre; Associazione ORTA) - Nomi, Federico (Scuola Superiore Meridionale; Associazione ORTA) - Saltini Semerari, Giulia (Department of Anthropology - University of Michigan; Museum of Anthropological Archaeology - University of Michigan) - Guidi, Alessandro (Dipartimento di Studi Umanistici - Università degli Studi Roma Tre)

A research line related to the history of architecture, notably advanced in the sphere of Greek archaeology, has centred on the origin of temple structures from the Late Geometric period (ca. second half of the 8th century BCE) onwards. This exploration has highlighted potential links to Early Iron Age or, in certain instances, Bronze Age structures. This phenomenon seems akin to what has been identified in various Early Iron Age settlements within the Middle Tyrrhenian region of Italy. More broadly, a noteworthy correlation is observed in both Greece and Italy, where the rise of spaces distinctly designated for cultic purposes aligns with the initial phase of development of the first urban entities.

In 1980, for example, one of us observed the presence of miniature materials datable to the recent phase of the Early Iron Age (8th century BC) in some diachronic votive deposits placed in association with sanctuaries of the Archaic period in Latium, beneath which were Iron Age huts. Consequently, it was hypothesized that these huts served a cultic function preceding the construction of the cult buildings in the historical period.

A comparative analysis is undertaken between the two regions, aiming to scrutinize similarities and differences. The study relies on a thorough assessment of topographical positioning, finds, and potential pre-existing structures.

2 IDENTIFYING EARLY GREEK TEMPLES. PROBLEMS OF METHOD AND DEFINITION

Pierattini, Alessandro (University of Notre Dame)

Greek temples of dressed stone with elaborate columnar orders and a distinctive peripteral layout appear in the archaeological record at the turn of the 6th century BCE. Before then, most temples were built of perishable materials and did not differ substantially from other local architecture. Without distinctive physical features, identification relies on material evidence that may demonstrate a building's function. But what functions did early temples serve? Our success in tracking the early development of sacred architecture depends on our definition of these functions, which should be precise enough to offer clear criteria but comprehensive enough to allow for variation in temple function over time and space.

Twentieth-century scholarship often defined Greek temples retrospectively, focusing on Classical features like the presence of a dominant cult statue, thus capturing only specific aspects or stages of temple development. One prominent scholarly tradition, grounded in the archaeology of cult, traces temples to rulers' dwellings of the Early Iron Age but faces problems related to the scarcity of material evidence and attendant problems of generalization. Considerable new archaeological findings have been made in the last four decades, but our understanding of early Greek temple architecture is limited by problems of method and definition.

This paper reviews narratives of pre-Archaic Greek temple architecture in light of recent discoveries, exposing the methodological flaws inherent in both old and recent discussions. After articulating a comprehensive definition of the temple, it outlines the major changes in the temple's long trajectory of development from the end of the Bronze Age through the early 7th century BCE, showing that temples underwent transformations in function, social significance, meaning, and design. As important, it demonstrates that temples could manifest different meanings and architectural expressions in different places.

3 COMMEMORATIVE DEMOLITION, THE CASE OF FRANCAVILLA MARITTIMA

Kleibrink, Marianne (Groningen Archaeological Institute)

The southern part of the top of the hill 'Timpone della Motta' (280 a.s.l.), named acropolis by one of her excavators, the famous archaeologist Paola Zancani Montuoro, later (1991-2004) investigated by the Groningen Archaeological Institute, gave evidence of the remains of six superimposed sacred buildings (Va, horseshoe-shaped MBA building; Vb, early- 8th c. - BC, sacred apsidal longhouse; Vc, 725 BC, rectangular timber temple; Vd, 650 BC, rectangular temple on stone foundation; Ve, stone temple with terracotta roof; Vf. Late Medieval Chapel).

If this had been Rome or some other place through time constantly contested by those in power, the constant reconstruction of Francavilla Marittima's Athenaion would be less surprising than on a Calabrian hilltop, repeatedly interpreted as marginal to the nearby Greek polis of Sybaris. Now that GIA research has well articulated each phase, these appear moreover to be very different from each other from a material point of view and thus presumably ritually.

Each new phase obliterated the previous one by covering the area before rebuilding. Archaeologically, from phase 2 onwards each period consists of a). burial of the previous phase and b). the assemblages of the phase proper: a very short overview of the main periods will be presented. Related phenomena are the scrapping and melting of dedicated objects, which are more difficult to date. The site of Francavilla Marittima is not unique in this special handling of older phases, because – although in a different way – Incoronata is also such a site, while complete resettlement is postulated for nearby Amendolara.

The extreme care taken before rebuilding and reusing encourages our search for historical and religious reasons. To what extent do we succeed in interpretations without violating the archaeological framework? To answer this question agency theory seems of value.

4 RETHINKING SACRED ON THE TIMPONE DELLA MOTTA SETTLEMENT (FRANCAVILLA MARITTIMA - CS, ITALY)

Altomare, Luciano (Università della Calabria) - Brocato, Paolo (Università della Calabria) - Capparelli, Chiara (Università della Calabria)

The settlement of the Timpone della Motta constitutes in the context of the Oenotrian peopling a strategic site of great importance, also for the contacts with the Greek world and the progressive 'Hellenization' of Sybarite matrix. Therefore, it represents a long-lasting focal point for the emergence and structuring of the sacred in its material and ideological forms. Considerable attention has been given in the history of studies to the findings of the acropolis, which have provided many data, albeit heavily conditioned by illegal excavations. The research conducted by M. W.

Stoop and M. Kleibrink has introduced a wealth of information, determining significant interpretative consequences regarding cult and ritual aspects.

Recent studies have rethinking previous work, focusing for contextual analysis, using up-to-date methodologies, benefiting from new field research that has involved various areas of the settlement. The objective of this intervention is, therefore, to re-examine the interpretative framework outlined so far, also in light of new discoveries, with a contextual stratigraphic approach.

5 FAMILY-HEROES IN INDIGENOUS SOUTH ITALY: LIFE AND DEATH IN "LANDSCAPES OF MEMORY"

Piccioni, Aura (Universität Trier; Università degli Studi di Roma Tor Vergata)

The present paper aims to analyze a phenomenon emerging in the domestic religion of the indigenous south Italy, that is the burial of adult individuals inside of (aristocratic) residences, departing from the Archaic age. At Monte Sannace (BA) probably the 'founder' of the gens inhabiting the house was buried at the end of the 6th c. BC in a very visible way inside the building and received a hero cult.

What is worth considering here is the coexistence of the dead in the same realm of the living, which is very unusual in ancient Italy and gives the house the characteristics of a sanctuary, overwhelming the dichotomy of "places of living/ places of dead" (cf. Remotti 1993; Favole, Ligi 2004, 6), and becoming at the same time "landscape of memory" (cf. Favole, Ligi 2004, 6). In the case of Monte Sannace, for instance, the sema – and the memory of the ancestor – was constantly visible to family and relatives, but at the same time to the visitors entering the house. The separation between 'private' and 'public' inside the house was overwhelmed, also for what concerns religion (cf. Piccioni 2020, with previous literature).

6 CONTEXTUALISING RITUALS. THE ARCHAIC TEMPLE OF S. OMOBONO AS A CASE STUDY FOR INVESTIGATING ARCHAIC ROMAN RELIGION

Timpano, Francesco (Humboldt Universität zu Berlin) - Brocato, Paolo (Università della Calabria)

The study of Roman religion has long been based on a philological approach, essentially determined by the considerable amount of data transmitted by written sources; less attention, on the other hand, has been paid to archaeological evidence, often considered as mere support for these sources. This tendency was also adopted in the case of the Archaic period, a time span rather distant from the earliest written sources on religious topics, from the late Republican period. More recently, however, the qualitative improvement of archaeological data has led to a shift of attention towards the material remains linked to the religious sphere in the ancient world, such as architectural remains of buildings and cultic of sacred sites, as well as stratigraphic sequences and material culture artefacts. As a result, these realia have been culturally contextualised, shedding light on their intrinsic features of first-hand evidences and on their relevance to the sites to which they belong.

With specific regard to the Archaic temple of S. Omobono in Rome, this paper continues this tradition, re-examining newly collected evidence together with crucial archival and publication data from previous excavations, carried out in the 1930s and in the second half of the 20th century, therefore with different methods and intentions. This context-specific analysis will not only better define the features of one of the most significant sites for our knowledge of the city in its early stages, but will also provide a term of comparison for the architecture of cult buildings and aspects of the ritual sphere within the religion of Archaic Rome, a cultural and socio-political context that is still rather obscure.

7 GREEK SANCTUARIES AT OLBIA DE PROVENCE (HYÈRES, VAR): NEW PERSPECTIVES ON ANCIENT EXCAVATIONS

Roure, Réjane (UMR5140-ASM-CNRS-University Paul Valéry Montpellier 3) - Sarrazanas, Clément (University of Picardie (AMiens)) - Serieys, Maeva (Département de Vaucluse-UMR5140-ASM)

Archaeological excavations carried out under the direction of Jacques Coupry at Olbia de Provence in the 1960s uncovered two cult complexes, interpreted as urban sanctuaries, used between the end of the 4th century BC and the middle of the 1st century BC. One was dedicated to Aphrodite, as attested by the discovery of an inscribed stone; the other is located at the end of the main street and appears to be the main sanctuary of the settlement, but the identity of the deity or deities worshipped there is unknown. A research programme carried out in recent years has made it possible to carry out new surveys of the remains, carry out chemical analyses on sets of vases and study the remains of certain ritual practices. All these innovative approaches are shedding new light on the gestures performed in these places, by comparing them with the data contained in the literary sources. The large sanctuary to the west of the site yielded numerous fragments of terracotta figurines, lamps and weights. Its position within the urban layout of the site demonstrates the special place it occupied. The sanctuary dedicated to Aphrodite is located to the north of the site,

next to the ramparts. The block bearing the name of the goddess, written in Greek, was found buried beneath a large fill, on top of which nearly 200 bowls were discovered, turned over against the ground and stacked one on top of the other. Chemical analyses carried out on a sample of these bowls detected substances that had been deposited there more than 2,000 years ago. As Greek religion is also well documented in written sources, cross-analysis of the various existing data will provide a better understanding of these spaces and the practices that took place there.

8 THE CULTUAL BUILDINGS IN VEII FROM THE FOUNDATION OF THE SITE TO THE ROMAN IMPERIAL AGE: A FIRST CRITICAL ASSESSMENT

Fusco, Ugo (Tor Vergata University of Rome)

In recent years, the state of knowledge of the site has made significant leaps forward thanks to the publications of the British School at Rome and the multiyear 'Progetto Veio', started in 1996 from a convention between La Sapienza, University of Rome and the current Soprintendenza Archeologica, Belle Arti e Paesaggio per l'area metropolitana di Roma, la provincia di Viterbo e l'Etruria meridionale. From a topographical point of view, the town of Veii stands on a plateau (h 185) and is skirted by two watercourses, both still active today: the Fosso Valchetta, the ancient Cremera, and the Fosso Piordo. In the context of studies on Veii, a specific and updated analysis of the proposed topic (the cultual buildings) between the early Iron Age and the Roman Period is still lacking. This paper aims to fill this gap, proposing an updated catalog of structures for each historical phase and using an approach that identifies religious spaces considering not only individual structures but a convergence of information: archaeological, epigraphic, topographic, ecological (e.g. springs), literary and historical continuity. These parameters make it possible to propose probabilities of religious attribution (certain, probable, hypothetical).

9 THE SACRED LANDSCAPE OF THE GRAECO-ROMAN PHILADELPHIA (AMMAN) AND ITS CHORA

Burdajewicz, Mariusz (Faculty of Archaeology, University of Warsaw)

In 2023, a new research project of the Faculty of Archaeology, University of Warsaw, was launched at Khirbat Sarah (Khirbat es-Sar) on the western outskirts of Amman in Jordan. The research aims to understand the nature and chronology of that site, which, occupying an excellent strategic position, is topped with a monumental architectural complex with the Iron Age Ammonite tower in its centre. This compound is surrounded by unspecified walls of later periods. Research indicates that the ancient occupation of Khirbat Sarah covers the period from the Ammonite Iron Age to the Middle Islamic period (c. 8th cent. BC - 14th cent. AD).

During the Greco-Roman period, the Ammonite tower was adapted for a temple with the Classical order. An arcaded courtyard was added to it in the 3rd century. At that time, the site was an important religious centre whose monumental character indicates prominence beyond just local.

The present paper examines the sacred complex at Khirbat Sarah from the broader perspective of the process of Hellenization and Romanization of indigenous cults in the Greco-Roman East, especially in Decapolis. Numismatic, epigraphic, and archaeological sources provide information about the religious life in Philadelphia itself and its chora, with two extra-muros temples/sanctuaries in er-Ragib and Khirbat es-Suq, both ca. 12-14 km southeast from the centre of the Roman Philadelphia. The third one, in Khirbat Sarah, is a hybrid structure showing a unique combination of the native architecture rooted in the Iron Age with elements of Classical Greco-Roman temples. It offers a chance to gain new and essential information regarding the sacred landscape of ancient Philadelphia.

10 FOLLOWING HERAKLES. THE ROLE OF THE GOD AS TOPOGRAPHICAL MARKER IN THE ORGANIZATION OF THE LANDSCAPE

Busonera, Roberto (University of Sassari) - Trivelloni, Ilaria (University of Sassari)

There is a common opinion developed around the figure of Hercules that assign to the god a set of roles and functions that qualify him as a cultural hero (Burkert 1992). His peculiarities derive from his semi-divine origin and from a mythological system that requires a figure prepared to come to man's rescue in order to justify his actions in the territory. In this sense, Hercules assumes the role of a mediator and, especially in the Mediterranean basin, reflects the progression of civilisation (Azzena 2008). Through this contribution, focused on case studies distributed in Roman Sardinia and central Italic areas, an emphasis will be placed on his quality as a 'territorial marker' and landscape organiser (Burkert 1992). The investigation on the topography of cult sites, their distribution and diffusion, will emphasise the role of divinity where there is a limit and a boundary. The analysis will also highlight where it becomes necessary to locate and define spaces in which opposing cultures must meet: on the edge of civilised territories, as well as in places of exchange and market. Or, where traditionally opposing economies confront each other (Azzena-Busonera 2019).

Moreover, the topographical functionality of Hercules is also revealed through the frequent connection with a Goddess, which is necessary in a mythological system that in Sardinia, for example, exists in the relationship with the parallel cult of the Sarda Ceres. This duality emerges in the consequent religious, traditional and functional separation

between the mountainous territories, characterised by pastoral activities, and the coastal territories, characterised by agricultural activities. Altogether, the invisible (but extremely concrete) relationships suggest a sacred symbolism of space that may support further interpretations of economic and territorial management and settlement patterns in antiquity.

520 PERSISTING AND CHANGING WORK IDENTITIES FROM THE PREHISTORIC TO THE HELLENISTIC MEDITERRANEAN

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Hochscheid, Helle (University College Roosevelt; Utrecht University) - Brysbaert, Ann (Leiden University; Netherland Institute at Athens) - Gorgues, Alexis (Universite Bordeaux Montaigne)

Session format: Regular session

Markers of identity operate in a fluid continuum both in antiquity and nowadays: each identity is a label we ascribe to ourselves (emic) and others (etic). In the contexts of work and crafting, aspects of class, rank, race, age, gender, job status, religion, and occupation play important roles in how we ourselves, as well as others, shape a person's identity.

Each label or ascription is linked to specific behaviours (e.g. political posture). Moreover, specific feelings are connected to (self-)identity, determining how we behave towards others. Outward behaviours, appearances and accessories are what indicates, out of choice or necessity, whether someone belongs, is weird, or worthy of esteem. A level of judgement is also involved, and while labels have always been part of our judgements and categorization of people's identities, there is far more fluidity and ambiguity in label ascription than we tend to think, both now and in the past.

In archaeology, traditional identities along the lines of, for example, male/female, Greek/foreign, craftsman/landowner, free/enslaved, etc., are not easily determined. People have always had multiple identities, fluid and ambiguous, based on many factors in endlessly varied combinations. This session will address the ways in which ancient craftspeople and labourers shaped their multivalent identities through a range of markers, some chosen, some ascribed by others. Among the topics explored will be:

1. Women's work, from the traditional meaning of this term, to work assumed to be 'male', and everything in between
2. Emic vs. etic views of a person's (work) identity
3. Correlation between local/non-local status, or alternatively, socio-political status of labourers
4. Modern-day constructs of class, power, and wealth applied to ancient craftspeople and their impact on identity formation
5. Ancient identity constructs of (craft) labourers that reverberate in modern society.

ABSTRACTS

1 PERSISTING THROUGH CHANGE. SOCIAL IDENTITIES AND SPACE IN BRONZE AGE AEGEAN CRAFTING

Brysbaert, Ann (Leiden University; Netherlands Institute at Athens)

This paper is concerned with the socio-political and economic status of artisans and workers of a range of professions in the prehistoric Aegean, and specifically in the context of workshops in which both the making of objects and employing of other objects may create fluid levels of human identity in working life. In the relationship of people with their objects in crafting contexts, I will consider two elements: first, I will (re-)introduce an often forgotten agent, that of the space in which workers perform their activities, because these spaces and locations play an essential role in identity formation: via training, via ancestral presence, and via the senses. The contexts of crafting and workshops are very useful arenas to explore aspects of class, race, age, nationality, gender, job, status, religion, and how various occupations were viewed in the past and how that may translate to our perceptions of them now.

Furthermore, Prehistoric identity labels such as man/woman, artisan/landowner, free/enslaved have often been solved by employing the concept of 'social identity' since written evidence is scarce. I will therefore, also discuss whether this concept provides the actual blanket-cover it claims for the range of identities we recognise in the material world that people left behind. Each identity tends to be a label we apply to ourselves and others, but who determines what the label ascription is and who makes up the labels and why? Labels and ascriptions are linked to specific behaviours and specific feelings, often enhanced or barred via our senses. These senses and feelings may irrationally determine how we behave towards others: those who we consider having similar IDs, versus others who don't. Outward behaviour, appearance and accessories may indicate, out of choice or necessity, whether someone belongs or not, is weird, is worth our esteem or not.

2 TECHNICAL SKILL AND IDENTITIES IN THE (WESTERN) MEDITERRANEAN IRON AGE

Gorgues, Alexis (University of Bordeaux Montaigne)

In the archaeological analysis, identities related with the technical sphere are studied and described in a thoroughly etic way. When referring to ancient craftspersons as “goldsmiths” or “potters”, and not considering any other aspects of their “social skin”, we assume that the technical sphere had in the past a taxonomic relevance comparable to the one it has today: i.e. it allows for categorizing people, socially speaking, in relation with their main economic activity. In other words, we colonize the past with our class-society oriented vocabulary. It is particularly true when we deal with Late Prehistoric societies that did not leave written self-descriptions, and in some way, it is almost unavoidable, as we have to name things though ignoring how the people of the past named them.

Yet, this technical skill-related label appears often a bit exclusive of any other consideration, and being a craftsperson is considered as a social status, as is “elite member”, “peasant” or “slave”. This bias brings us to describe, willy-nilly, past societies as dominated by leisure-oriented elites ruling over –among others– persons involved in production, themselves divided between free artisans or peasants or dependant workers.

In this paper, I will try to demonstrate, through specific case-studies, that technical skills could have been displayed and mobilized as an identity marker all throughout the social fabric, from the peak elite to poorer dependant workers. We will first focus on the Western Mediterranean Iron Age (c. 1000-200 BCE), and assess the role of technical skills in relation with identity making and negotiation. We will then discuss the variability of situations around the Mediterranean, and discuss the factors that allowed for fluidity in the relationship between technical skill and social identity or on the contrary, generated rigidity.

3 WORKING EVIDENCE: CHANGE AND CONTINUITY OF WOMEN'S WORK IN ARCHAIC TO HELLENISTIC ATHENS

Hochscheid, Helle (University College Roosevelt; Utrecht University)

Recent scholarship has paid increasing attention to work and professions in the ancient Greek world. However, women have not been considered serious participants in economic activities. Their contributions to domestic work are acknowledged and now more frequently highlighted in museum contexts – yet in research, both the economic value of domestic work, and women’s non-domestic work and craft activities have remained less researched than that of their male counterparts.

This paper will collect and analyse material evidence from workshops to sanctuaries and tombs, as well as the sparse literary and epigraphic texts regarding women’s work, in particular in the context of manufacture in ancient Athens, with some excursions to other parts of the Greek world and comparisons with men’s working lives. This evidence allows for an exploration of the pathways of work in women’s lives from the Archaic to the Hellenistic periods, and the changes that occurred in these over time. More important, however, is the impact of their activities on the status of women who worked, and vice versa, how their status may have determined what work they could, or had to, take on. For instance, women’s civic status or (lack of) freedom would powerfully influence the professional roles that were accessible to them, or forced upon them. Work and status are thus construed as parts of a circle of identification, where both elements are key constituents to the woman’s self-identity.

Through comparisons with other time periods in which women’s work fulfilled major roles in their lives, both socio-economically and in their self-identification, this paper will re-examine the scope and impact of women’s work in Athenian society from the Archaic to the Hellenistic periods.

4 FOLLOWING THE THREADS: WOMEN'S LABOR, WEAVING, AND THE ARCHAEOLOGY OF THE ECONOMY IN CLASSICAL GREECE

Harrington, Katherine (AAAS Fellow)

Penelope, the archetype of the dutiful wife in Homer’s *Odyssey*, weaves by day and picks apart her work at night. Her steadfastness in attending to her work as a ruse to avoid remarriage is celebrated in the text, and the woman at her loom was often used as a symbol of virtuous womanhood in ancient literature. Beyond this symbol, however, the amount of work required to produce textiles by hand and their importance to the functioning of the ancient economy and ancient society has often been ignored. Indeed, many of the types of labor that women did in the ancient world, like care work and food preparation, are often marginalized in wider studies of the ancient economy. Such labor, often done without pay and at home, has been treated as mere background noise, economically unimportant and largely unworthy of analysis. Even women’s labor for the market economy in been has been undervalued.

This paper has two main arguments. The first is that the lack of serious consideration of women’s labor in Classical Greece is the result of the impact of modern attitudes towards domestic labor which persist into the 21st century. Studies of modern European and American society have often shown that women who are partnered with men are responsible for housework, childcare, care for elderly relatives, and various other forms of unpaid labor in domestic

settings at higher rates. Few modern models of the economy consider this unpaid labor, however, and this bleeds into the way we view the ancient economy. Second, I argue for the central role of archaeology in constructing a more gender-balanced history of labor. The places where women lived and worked, the objects they used, the ways they were represented, and the remains of their bodies themselves can illuminate the far-reaching impacts of women’s work.

5 WHO AM I? (SELF-)PRESENTATION OF CRAFTSPEOPLE ON ATTIC FUNERARY MONUMENTS OF THE 4TH CENTURY BC

Massar, Natacha (Royal Museums of Art and History, Brussels)

My presentation will study funerary monuments for craftspeople found in the Ancient Greek world, with a special focus on Athens and Attica in the 4th century BC. Although the mention of the profession was rare on Greek funerary monuments, it did appear on occasion from the mid-6th century BC onwards. In Athens in the 4th century though, for a few decades, it was much more common. This coherent group of documents depicts craftspeople of many different specialties, from the slipper maker to the seer. It includes women and men, most of whom were foreigners.

Funerary monuments are private documents on public display, a memorial to the qualities and, sometimes achievements, of the departed person. Their content was usually chosen by people close to the deceased, either family members or their professional entourage. We can therefore assume that, to some extent, they accurately reflected the way the deceased wanted to be remembered. These funerary monuments provide information about the individual’s status, their family, their origin, their professional activities, their reputation (real or imagined), how they learnt their *techne*. The individual elements also reveal which aspects of their identity were thought to be important to themselves, their family and perhaps their entourage, especially in relation to their work. Often, they combine word and image which provide complementary information. They may be complex, and sometimes subtle, documents, which can say much about *technitai*.

Since these monuments cover a wide range of professional activities, they will also be compared amongst themselves, revealing possible differences in perception or projected image depending on the activity of the deceased. They will also be compared to other sources on specific professions or to funerary monuments from other areas or periods. Finally, the reasons for the large concentration of these documents in late Classical Athens will be examined.

6 TEMPORALITY, WORKSPACES AND IDENTITY: PROPOSAL FOR A 3D-BASED NEW APPROACH

Lefebvre, Marie (Université Bordeaux Montaigne; Association EponArchéo)

Productive spaces –workshops or else–, are places where to work, but also where craftspeople can build and claim their identity. Display of skills, performative aspects of the technical actions, or, on the contrary, confidential or hidden work, in relation to space and time are some of the aspects. A detailed study of such spaces may allow us not only to delve in-depth into ancient techniques, but also to assess a relationship between gestures, time and space. However, the formation of the archaeological record –and the mindset of the archaeologists– often makes that the emphasis is on the space and its structure, rather than on the temporality of its use. This paper will present an attempt, applied to ancient Mediterranean production spaces, to reframe productive activities in space and time. The method I propose to use is 3D methods to formulate hypotheses regarding the organization of production space through time, and to refine them through an iterative process of comparison between the archaeological record and what I would name the “graphic hypothesis”.

In this context, 3D modeling is more than just an illustration: it is an archaeological research instrument that can be used to digitally recreate the dynamic use of a space for productive activities and, therefore, to better understand how they took place in the experienced time of past societies.

By focusing more on the iterative process of graphic experimentation than on the realization of a picture showing a reconstruction, this method offers new analytical perspectives and allow us to re-discuss the traditional etic vision of ancient craftsperson as actors whose identity is frozen in a specific time and place. On the contrary, it allows for a renewed discussion of the context of the technical activity.

522 SOCIETY IN THE MEDIEVAL MEDITERRANEAN (5TH TO THE 12TH CENTURIES) THROUGH ARCHAEOLOGY OF DEATH

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Brufal, Jesús (Universitat Autònoma de Barcelona) - González, Carmen (Universidad de Córdoba) - Palma, Maria de Fátima (Campo Arqueológico de Mértola/CEAACP) - Castellsagué, Guillem (Universitat Autònoma de Barcelona)

Session format: Regular session

Death is omnipresent because it is the end of life for all living creatures, but also because almost all History has been characterised by high mortality rates, which increase further during times of crisis and war. This has been experienced by collective identities and has forged a social memory that has been translated into ideologies and spiritual experiences to prepare us for the afterlife. It has also had a deep repercussion on urban and rural landscapes: the ways in which people died, grieved, were buried and remembered is a reflection, and a consequence, of society's main characteristics. The Medieval Mediterranean provides a very interesting area for addressing these topics, since the Jewish, Islamic and Christian cultures developed different rituals and material expressions related to death and dying that have generated extremely wealthy archaeological evidences -cemeteries, types of tombs, grave goods, monuments, skeletal remains, etcetera. Deathscapes were frequently used uninterruptedly over time, which favours the historic-archaeological analysis of the origins, evolutions and consolidations or disappearance not only of rituals or topographies, but also of beliefs, behaviors and social practices.

We aim to explore the Medieval societies in the Mediterranean (5th to the 12th centuries) through all the aforementioned aspects, creating an opportunity to see larger changes and connections across traditional cultural divides. We would like to examine the materiality of death for a better understanding of the world of the living. This session welcomes papers that offer reflections on the individuals and their larger belonging communities and how they dealt with death; on inhumation rituals, on the role of necropolises as landscape organisers, on the topography of deathscapes and other material manifestations related to death, from monumental architectures and spaces to smaller domestic artefacts, and a large etcetera.

ABSTRACTS

1 DEATH IS COMPLICATED: THE CHRISTIANISATION OF BURIAL PRACTICE IN LATE ANTIQUITY BEYOND DICHOTOMIES

Selsvold, Irene (University of Leicester; University of Gothenburg; University of Oslo)

Late Antiquity is a transition period effectively squeezed between the two historical blocks in the Mediterranean world: Roman society and culture, and the subsequent Medieval/Byzantine societies. In total, this period-in-between-periods covered approximately 500 years between the third and eighth centuries CE. During this time, burial practices changed significantly.

The Christianisation of the Roman Empire, at its most intense around 400 CE, is resilient as the dominant explanation model for these changes. Consequently, a dichotomy has been created where a diverse Roman burial practice was rapidly substituted by an equally monolithic, distinctly Christian, burial practice. However, researchers including Eric Rebillard and Barbara Borg have challenged the dominance of the Church and the Christianisation in this process. How do we proceed from that challenge?

This paper draws on new materialist thinking to embrace complexity in place of dichotomies and universal explanation models in the study of changing burial practices in Late Antiquity and the Early Medieval period. It will highlight some of the complexities of late antique burial practices, and situate them in a world of complex societal changes that reaches beyond the religious transformation. Ultimately, the paper argues that embracing more messy answers to how, where, and why burial practices changed may lead us towards a richer (though not simpler) understanding of late antique and Early Medieval burial practices.

2 LANDSCAPES, STRUCTURES, AND DEPOSITION FORMS - STRATEGIES FOR DEALING WITH THE DEAD AND FORGING IDENTITIES (5TH-8TH CENTURIES)

Arezes, Andreia (FLUP - Faculty of Arts and Humanities - University of Porto; CITCEM - Center for Transdisciplinary Research Culture, Space and Memory)

Ancient Lusitania, a vast territorial expanse in the core of the Iberian Peninsula, was a space of encounter and competition between different human groups in the complex period that spanned the 5th and 8th centuries. Coexisting or

overlapping in time, these groups marked the landscape of the living and the dead with their ways of making, building, and interacting.

Framed by changing political and administrative powers, guided by traditions and beliefs that combined or opposed each other like a mosaic, they resorted to the deposition of their dead and the careful composition of burial contexts as a need felt at various levels, namely also as a strategy of social affirmation, giving visibility to identities that were not necessarily univocal.

This presentation aims to question and discuss funerary practices in the necropolises that extend south of the Tagus in present-day Portuguese territory, paying particular attention to the burial areas that border the Guadiana River and the south coast, facing the Atlantic Ocean. Along this route, and in a detailed look at the architecture, spatial organization, construction, and reuse of funerary devices, as well as the nature of the materials associated with the deceased, I will try to demonstrate the variability of the solutions found and sedimented in the soil. The aim is, therefore, to try to explore and interrogate the web where continental and Mediterranean influences intersected, the potential ancestry exerted by ethnic or family ties and religious affiliation, among other factors and circumstances, and how these were combined or excluded to highlight the construction of the deceased's identity in dialogue with the human community to which he belonged.

3 GRAVE GOODS FOR THE AFTERLIFE BETWEEN THE VTH AND XIITH CENTURIES IN MÉRTOLA'S TERRITORY, PORTUGAL

Gómez-Martínez, Susana (Campo Arqueológico de Mértola / CEAACP; University of Évora) - Rodrigues, Andreia (Campo Arqueológico de Mértola / CEAACP; University of Évora) - Rodrigues, Clara (Campo Arqueológico de Mértola / CEAACP) - Rafael, Lígia (Câmara Municipal de Mértola) - Fernandes, Marco (Campo Arqueológico de Mértola / CEAACP; Universidade de Évora) - Palma, Maria de Fátima (Campo Arqueológico de Mértola / CEAACP; Universidade de Granada) - Lopes, Virgílio (Campo Arqueológico de Mértola / CEAACP)

This presentation aims to interpret and summarize the information gathered in the archaeological interventions of the last 45 years in Mértola concerning the funerary practices between the fifth and twelfth centuries. The village, located in southeast Portugal, has the final navigable stretch of the Guadiana River, which allowed for an intense and regular trade of goods and different cultures with the Mediterranean bay.

The chronological range studied has two different time frames: firstly, the Late Antiquity between the fifth and seventh century, in several necropolises, namely in Mosteiro, in Eixo Comercial, in Achada de São Sebastião and Rossio do Carmo; secondly, the Islamic Period, between the eighth and twelfth centuries, from which we have only discovered the necropolis/almocávar of Rossio do Carmo, which confirms the continued use of the space throughout times.

Regarding burial practices, frequently, the objects that accompany an individual throughout life can also accompany them in death. The most frequent examples of this are the accessories used in clothing and adornment pieces. However, in Late Antiquity, we occasionally find votive offerings associated with the burial practices. In the Islamic period, these offerings were scarce, following religious customs. Nevertheless, archaeological records have proved they exist.

In both periods, the objects are of different types; they have distinct execution techniques and use various materials, such as ceramic, glass or metal/metal alloy.

4 EARLY MEDIEVAL FUNERARY LANDSCAPES: THE CASE OF MATERA

Bruno, Brunella (University of Salento) - Dicanio, Giuseppe (University of Salento)

The city of Matera is in Basilicata, southern Italy, known for its ancient urban nucleus called Sassi, UNESCO world heritage site since 1993. The Sassi district is situated near the Gravina stream, which flows through the Murgia plateau. The major part of the city's architecture is made possible by the easily malleable sedimentary and porous rocks in the region, creating a unique rupestrian landscape. The oldest settlement is on the Civita hill, between the two Sassi districts, Barisano and Caveoso. The city's complete history remains unclear due to the scarcity of information and the continuity of life. In the Late Antique period, Matera was connected to the Via Appia through secondary roads, establishing contact with neighbouring Apulia throughout the Middle Ages, standing between the social and political influence of the Lombards and of the Byzantines. Furthermore, only Early Medieval funerary contexts provide enough evidence for this period.

This paper aims to offer a reconstruction of the Early Medieval funerary landscape of the old settlement of Matera adapting a methodology that may be summarized with the concept of "mortuary geography", to define the interactions between funerary areas and landscape. To study these interactions, it is necessary the aid of a GIS support to run visibility and least cost path analyses, in order to understand the impact of the landscape on the funerary features.

5 ARCHAEOLOGY OF DEATH IN THE ANCIENT ANDALUSIAN DISTRICT OF LLEIDA (8TH-12TH CENTURIES)

Brufal, Jesús (University Autònoma of Barcelona)

The archaeological study of Andalusian necropolises is a long-standing field for understanding Andalusian society during the Early Middle Ages. For this reason, the necropolises in this context, located in the old Andalusian district of Lleida, are the object of study in order to recognise two key features: food and health. Of all the necropolises located and identified, those with Christian rituals stand out, far above the Islamic muqadir. While the Christian necropolises of context V-XI or XII are visible throughout Lleida, the muqadir have only been identified in the cities of Lleida and Balaguer.

Furthermore, of the total number of Christian necropolises, a considerable number still preserve burials, which is relevant for studying the individuals, the burial rituals, the organisation of the necropolis and its location in the ancient Andalusian landscape. Thus, we highlight the necropolis of Santa Coloma in Àger, the Tossal de les Forques in Sentiu de Sió, Tossa de Baix in Rosselló, the Saladar in Cogul, among others. These Christian ritual necropolises have been partially excavated in the 80s of the 20th century with scarce results in the interpretative study. The recovery of the remains in the museums and the restarting of the excavation process are yielding very interesting results on the daily life of Andalusian society in Lleida, which maintained its ideological framework but was perfectly integrated into the social and political dynamics of al-Andalus.

6 EXPLORING CHRISTIAN RURAL COMMUNITIES IN THE SOUTH OF AL-ANDALUS: INSIGHTS ON TÓZAR'S RUPESTRIAN CEMETERY AND OTHER FUNERARY SPACES

Mattei, Luca (University of Granada)

In the historical and social context of al-Andalus, the material evidence left by funerary rituals represents an important archaeological indicator for exploring and understanding the diverse religious tapestry, aiding in comprehending the evolution of Islamization processes in the formation of its society.

This paper presents an investigation into the Mozarabic rupestrian cemetery of Tózar (Granada, Spain), dating from the 10th to 12th centuries. New insights are provided regarding Christian funerary spaces in al-Andalus, as well as the need for more in-depth studies on rock-cut necropolises.

Ancient funerary rituals have helped to identify the religious identity of populations, essential for a better understanding of Andalusian society, particularly the significance of Christian rural communities in the social and commercial dynamics of al-Andalus. The study of the peasant agency within these rural Christian communities, a focal point of the DICRAN project (PID2022-142554NA-I00), also aids in deciphering their productive strategies and active role in shaping agrarian landscapes. This understanding contributes to grasping the dynamics of continuity, adaptation, or change between different societies and environments in the Medieval Mediterranean, the focus of the MED-GREENREV project (ERC SyG Ref. 1011071726).

7 SPACES OF LIFE AND DEATH IN THE LANDSCAPE OF GARB AL-ANDALUS. PRELIMINARY ANALYSIS OF TOPOGRAPHY AND RURAL SETTLEMENTS

Gonzaga, Raquel (University of Coimbra) - Palma, Maria de Fatima (Campo Arqueológico de Mertola; CEAACP)

In the territory of Garb al-Andalus, archaeologists recorded rural settlements lacking burial areas for the use of Medieval Islamic communities. Indeed, the absence of these testimonies may be related to preventive archaeological work that focuses on areas directly affected by projects and ignores those areas that don't constitute an immediate threat. However, each settlement should have its own cemetery area. It is in this systematic absence in the archaeological records that we question the implantation and localization of the rural Islamic necropolis from the 8th to the 12th century.

By cross-referencing information from written sources and the few excavated rural settlements with recorded necropolises, we seek to analyze and understand the preferred spaces for burial areas.

The methodology focuses on reading the historical and Quranic sources and using mapping tools and comparative studies to analyze settlement patterns and spatial distribution. With this method we aim to identify possible cultural patterns in the arrangement between rural settlements and burial areas. This analysis aims to answer several questions related to implantation areas, rituals, social dynamics, and the organization of the rural territory of Garb al-Andalus.

We will present topographies of life and death spaces in the rural landscape, where settlements and necropolises are understood as fundamental organizers of the landscape. This approach has been insufficiently explored and few researchers have dedicated themselves to it.

Through this study, it will be possible to obtain a more comprehensive view of the organization and interactions between the spaces of life and death, contributing to a better understanding of the cultural and social organization of Islamic communities in the rural context of Garb al-Andalus.

8 FUNERARY ARCHAEOLOGY FOR MADINAT QURTUBA: STATE OF THE ARTS, POSSIBILITIES AND NEEDS

González Gutiérrez, Carmen (University of Córdoba)

This paper aims to present the current state of the arts in the study of Muslim cemeteries of Madinat Qurtuba (Córdoba, Spain, 7th to 13th centuries) in comparison to the funerary areas documented from Roman times. This comparative view will show how the multidisciplinary and rigorous study of former Medieval Islamic cemeteries can reveal important aspects of the societies that produced such evidence not only by focusing on funerary architecture, but also by considering bones as an historical source of information. These aspects often relate to the social stratification and conditions of the population and the origins and identities of the deceased, burial typologies, religious practices and beliefs, urban organisation and its spatial evolution, and etcetera. This viewpoint is crucial for analysing medieval Islamic cemeteries in the Iberian Peninsula, which were regulated by the Maliki doctrine, especially when under Umayyad rule (756-1031 CE). According to this doctrine, monumental graves were forbidden and certain types of gravestones were banned as well. Taking Córdoba as a study case and comparing it with other cases in al-Andalus, it will be shown how a better knowledge of Andalusian society should be reached through the study of bones. Finally, this paper also intends to raise consciousness about the relevance and even urgency of these techniques in our case study.

525 EXPLORING DENTAL PATHOLOGIES AND DIET ACROSS TIME AND SPACE: AN INTERDISCIPLINARY APPROACH

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Pedergrana, Antonella (Museo Archeologico dell'Alto Adige) - Seiler, Roger (Institute of Evolutionary Medicine - UZH)

Session format: Regular session

Dental pathologies are a valuable source of information about human dietary habits and overall health throughout history. Methods developed within the fields of paleo-dentistry and bioanthropology are used to identify and document the oral status of prehistoric and historic human populations. Dental parameters such as macro/micro wear are also used to infer the overall diet of individuals. These, applied in combination with methods used in paleodietary reconstructions, such as isotopic, genetic, and proteomic data, contribute to a more thorough understanding of dietary habits associated with oral disease in the past. In particular, dental calculus analysis (DCA) including microscopy, aDNA and ancient proteomics, is an incredibly informative tool to explore both ancient diet and shifts of the oral microbiome.

This session will welcome contributions where the aforementioned methods are applied alone or in combination. Case studies covering various chronologies and geographical locations are welcome and an evolutionary perspective is particularly appreciated.

This session will foster interdisciplinary discussions among scholars, researchers, and practitioners in the fields of anthropology, archaeology, dentistry, and paleopathology with the main aim of reaching a holistic understanding of the interplay of diet and oral paleo-pathologies across time and space.

ABSTRACTS

1 EVOLUTIONARY PERSPECTIVES ON ORAL DISEASE: A HOLISTIC APPROACH

Pedergrana, Antonella (Museo Archeologico dell'Alto Adige)

Oral diseases constitute a significant aspect of human health. Evolutionary perspectives on oral disease can offer valuable insights into their prevalence and distribution across time and space. Understanding the etiology and progression of diseases in past human populations requires consideration of both biological and cultural factors that could contribute variably to disease occurrence and development. Dental anthropology employs a number of different analytical techniques, including paleopathology, radiology, microscopy, isotopic analysis, proteomics, and ancient DNA studies, to unravel the evolution of oral diseases and dietary habits in past populations. While interdisciplinary approaches are being used to address evolutionary questions in paleo-odontological studies, the integration of diverse methodologies into analytical workflows remains a developing area.

Teeth, as widespread remains at archaeological sites and resilient components of the masticatory system, hold paramount importance in deciphering evolutionary patterns of oral disease. Not only do they preserve evidence of the

food consumed, para-masticatory activities, and stressful events that occurred during one's lifetime, but they also retain dental tartar deposits, which function as screenshots of past oral environments.

The addition of multiple lines of evidence to the examination of ancient and historical dental remains is key to reconstructing the use of the masticatory system by human populations in the past. Adopting a holistic perspective that includes several aspects influencing disease development—comprising host-pathogen relationships, behavioural, and environmental factors—promises to uncover the evolutionary determinants of oral diseases.

This contribution aims to touch on the evolutionary implications of oral diseases and advocates a holistic and multi-disciplinary approach to improve data recovery from ancient and historical dental human remains. Drawing from past and current research, it will explore potential future avenues of research, fostering discussions among experts from diverse disciplines and promoting innovation in the study of ancient human dentition.

2 DIGITAL AND CONFOCAL MICROSCOPY: APPLICATIONS TO DIACHRONIC ANALYSIS OF HUMAN DENTAL AND ORAL PATHOLOGIES

Lozano, Marina (IPHES-CERCA. Institut Catala de Paleoeologia Humana i Evolució Social; Facultat de Lletres. Universitat Rovira i Virgili) - Francès-Abellán, Anna (IPHES-CERCA. Institut Catala de Paleoeologia Humana i Evolució Social) - Jiménez-Serrano, Alejandro (Departamento de Antropología, Geografía e Historia. Facultad de Humanidades y Ciencias de la Educación. Universidad de Jaén.) - Sánchez-Barba, Lydia (Laboratorio de Antropología. Departamento de Medicina Legal, Toxicología y Antropología Física. Facultad de Medicina. Universidad de Granada) - Carrión-Méndez, Francisco (Departamento de Prehistoria y Arqueología. Universidad de Granada.) - Gutiérrez-Mesa, Laura (Laboratorio de Antropología. Departamento de Medicina Legal, Toxicología y Antropología Física. Facultad de Medicina. Universidad de Granada) - Borja-Miranda, Erik (Laboratorio de Antropología. Departamento de Medicina Legal, Toxicología y Antropología Física. Facultad de Medicina. Universidad de Granada) - Allué, Ethel (IPHES-CERCA. Institut Catala de Paleoeologia Humana i Evolució Social; Facultat de Lletres. Universitat Rovira i Virgili) - Vergès, Josep (IPHES-CERCA. Institut Catala de Paleoeologia Humana i Evolució Social; Facultat de Lletres. Universitat Rovira i Virgili) - Rubio-Salvador, Ángel (IPHES-CERCA. Institut Catala de Paleoeologia Humana i Evolució Social; Facultat de Lletres. Universitat Rovira i Virgili)

Dental and oral status is a valuable indicator of health, diet, and lifestyle of past populations. The assessment and diagnosis of bucco-dental pathologies has been improved through advances in microscopy applied to external surface observations. However, some of these microscopy analyses are not only expensive but also time-consuming and not always accessible, thus limiting their applicability for scoring dental pathologies specially those of large burial assemblages.

The aim of this contribution is to assess suitability of two types of microscopy (digital and confocal microscopy) to score, describe, and analyze oral and dental pathologies in different human archaeological samples. Also, we show the suitability and reproducibility of these methodology to obtain diachronic information about this topic as it can be applied independently of the chronology of the sample.

Our sample come from three sites with distant chronology. The earliest one is El Mirador Cave (Sierra de Atapuerca, Spain) with a sample of 23 individuals from a Chalcolithic collective burial dated to 3013-2889 cal BC and 2578-2463 cal BC. The second site is Qubbet el-Hawa (QH) (Aswan, Egypt) with 9 individuals coming from the reuse of the tomb in the Late Period (664-332 BC). Finally, 13 individuals from El Saucejo (Sevilla, Spain) and Barranco de Viznar (Granada, Spain) mass graves from the Spanish Civil War (1936-1939).

The identified oral pathologies, disorders, and additional comorbidities along with anomalous dental wear related to non-alimentary uses of teeth has been described. The analysis of some of these pathologies with both types of microscopy allows a more in-depth characterization and improved precision of differential diagnoses. Also, the high-resolution images and data resulting from digital and confocal analyses provide useful information not only for research but also for teaching and outreach dissemination purposes.

3 EVALUATING TISSUE CLEARING PROTOCOL VARIATIONS FOR THE MICROSCOPIC EXAMINATION OF HUMAN DENTAL SPECIMENS

Dönmez, Denis (University of Zurich) - Pedernana, Antonella (University of Zurich) - Seiler, Roger (University of Zurich) - Rühl, Frank (University of Zurich) - Eppenberger, Patrick (University of Zurich)

This study assesses the efficacy of variations in the PEGASOS tissue clearing protocol on the clarity, transparency and microscopic visualization of whole human teeth spanning ancient, historical and recent specimens.

The PEGASOS tissue clearing protocol was originally developed for whole-body imaging in animal studies. Its application to dental tissues, particularly human teeth, marks a novel exploration. Our investigation demonstrates the original protocol's applicability to enhancing the microscopic examination of whole human teeth without necessitating physical sectioning.

Additionally, we investigated modifications to the protocol to determine their effects on visualization depth, leading to varied transparency and dental visibility within different dental layers, including the tooth cementum, dentin and enamel. These findings indicate that a tailored protocol can provide a refined approach to the study of dental micro-morphology and pathology.

Our study underscores the versatility and potential of the PEGASOS tissue clearing technique for the comprehensive examination of human dental specimens, ranging from archaeological finds to contemporary samples. It offers a promising avenue for dental research, facilitating an in-depth understanding of dental morphology and pathology, while avoiding the destructive processes traditionally involved in such analyses.

4 DENTAL PATHOLOGIES IN THE EVIDENCE FOUND IN DJEDKARE'S ROYAL NECROPOLIS AT SAQQARA (EGYPT)

Vymazalová, Hana (Charles University, Faculty of Arts, Czech Institute of Egyptology) - Hashesh, Zeinab (Beni Suef University) - Gabr, Ahmed (Ministry of Tourism and Antiquities, Egypt)

Djedkare's royal cemetery at south Saqqara (Egypt) has been systematically explored since 2010 by the archaeological mission of Charles University (Faculty of Arts, Czech Institute of Egyptology) headed by Mohamed Megahed. This work focuses not only on the pyramid complex of King Djedkare but also on the surrounding cemetery, untouched by earlier excavators. The discovery of several monuments from the late Fifth Dynasty (the middle of the 3rd millennium BCE) has expanded our knowledge of King Djedkare and members of his family and court. At the same time, however, the site has yielded a large amount of evidence from later periods, which shows that the necropolis was continually used for more than two thousand years, at least until the Ptolemaic era (the end of the 1st millennium BCE). Whereas the Fifth-Dynasty evidence includes costly stone-built tombs of the elite, in later periods the site was used by lower classes, burying their dead in mats or wooden coffins placed in the sand around the earlier monuments. The wish to rest in the shadow of the king's pyramid reflects the desire of the later population to connect with the glorious past, the golden age of the pyramid builders. Several hundred such burials have been uncovered at Djedkare's cemetery in recent years. They form a valuable group of evidence attesting to the history of this site as well as to the development of the burial customs and material culture between the middle of the 3rd and the end of the 1st millennium BCE. In addition, they provide the opportunity to study the population of Egypt through human remains, reflecting the quality of life, access to medical care and other such aspects. The paper focuses on selected cases documented during the ongoing anthropological and osteological research of the burials from Djedkare's royal cemetery.

5 CHRONICLES OF DENTAL HEALTH: UNVEILING ANCIENT EGYPTIAN DIETARY PATTERNS THROUGH PALEO-ODONTOLOGY

Seiler, Roger (University of Zurich, Switzerland) - Eppenberger, Patrick (University of Zurich, Switzerland)

This study examined the dental and skeletal remains of 125 people from two adjacent but chronologically and socio-economically separated burial sites at Thutmose III's mortuary temple near Luxor, Egypt, covering the XIth dynasty (2160-1985 BC) and the XXV-XXVIth dynasty (948-525 BC). The earlier burial site mainly consisted of modest burials of persons from a social class engaged in physical labor. In contrast, the later burial site contained tombs with sophisticated architectural patterns, most likely the resting sites of people from the middle social strata, such as priests or mid-ranking Cushite or Saite officials.

We investigated paleo-odontological patterns of dental caries and tooth wear in dentitions and related skeletal structures. We classified both populations into a younger (19-35 years) and an older age group (36 years and above). Significant tooth wear was seen at both locations, particularly in the earlier XIth dynasty. While caries rates were similar in younger individuals at both sites, an increase in caries frequency among older adults in the later XXV-XXVI dynasties indicates distinctive dietary patterns across time and social strata.

Our findings highlight the impact of socioeconomic and environmental changes on dietary patterns, including food processing techniques and carbohydrate availability. Our findings illustrate the intricate relationship between diet, society, and oral health in ancient Egypt, highlighting the dynamic evolution of dietary practices and their health implications across millennia.

6 ORAL PATHOLOGY OF ZAGREB MUMMIES -- REVISITED

Cavka, Mislav (University of Zagreb, School of Medicine; University Hospital Center) - Prenc, Matea (University of Zagreb, School of Dental Medicine; University Hospital Centre Sisters of Mercy, Department of Diagnostic and Interventional Radiology)

Dental paleoradiology provides insights into oral pathologies and procedures in the past. We conducted a paleo-radiological study to re-evaluate the dental status of mummified remains from the Archaeological Museum in Zagreb, which was never done as a separate study. The dental analysis included a CT investigation of 5 whole mummies and 3

mummified heads using an MDCT unit and MRI unit. Several interesting dental features were noticed. Despite the scant evidence of developed oral surgery in ancient Egypt, the lack of third molars could indicate the surgical extraction of teeth. Some teeth were missing part of its anatomical crown which was probably chipped off postmortem. Signs of tooth wear, along with skeletal osteoarthritis changes presume the mummy should be at least 40 years old. Three third molars were not in occlusion and the fourth third molar missing indicating that the head belonged to a younger person, around 20 years old. The other head had all the teeth in occlusion and closed cranial sutures, meaning the person was between 30 and 40 years old. Prognathism of the upper jaw was seen in both head specimens. An accessory tooth behind the lower left canine was found in one specimen. CT scan with 3D reconstruction allows visualization of dental elements with great spatial and contrast resolution and is the paleo-radiological method of choice in the assessment of teeth and jaw. Interesting MR features will be presented as well.

7 STRONGER TEETH, LONGER LIFE? CORRELATION OF PRESENCE AND FREQUENCY OF LEH AND LONGEVITY AT EBA NECROPOLES MOKRIN AND OSTOJIČEVO

Kreckovic Gavrilovic, Marija (University of Belgrade, Faculty of Philosophy) - Petrović, Bojan (University of Novi Sad, Faculty of Medicine) - Stefanović, Sofija (University of Belgrade, Faculty of Philosophy)

Adverse early life conditions have been demonstrated to have a significant impact on later health and longevity outcomes, both in contemporary and archaeological populations. The Developmental Origin of Health and Disease (DOHaD) hypothesis posited a correlation between low birth weight and the onset of cardiovascular disease in later life. Subsequently, researchers have extended the application of the DOHaD hypothesis to archaeological populations, with different degrees of success. The ability of dental enamel to serve as a permanent record of early life physiological stress presents researchers with a potential of research into developmental plasticity and adaptive response when coupled with the data on health and longevity inferred from skeletal remains.

In this paper we use linear enamel hypoplasia (LEH) as a proxy for survived childhood stress on the individuals buried at Early Bronze Age necropolises of Mokrin and Ostojićevo in Northeastern Serbia. We hypothesized that the individuals, who survived childhood stress, as evidenced by the presence and frequency of LEH, will have shorter lifespans on average than the individuals who were not exposed to stress in their childhood. Poor preservation state of the skeletal remains resulted into markedly wide age ranges, which was successfully overcome by statistical modeling of the age variable before the correlation analysis. The results showed some significant relationship between LEH and reduced age at death, as well as different sex-specific patterns related to LEH. Therefore, even though the negative correlation was in most cases weak, the general trend that emerged from the results of this research indicates the existence of adverse effects of early childhood stress on mortality outcomes. Additionally, analysis using the Kvaal technique and Tooth Coronal Index (TCI) for precise age estimation for a number of individuals are underway, and will further our investigation of the correlation between longevity and LEH.

8 NEW INSIGHTS INTO PREHISTORIC AGRICULTURE OF NORTHERN IBERIA FROM THE ANALYSIS OF STARCH GRAINS EMBEDDED IN DENTAL CALCULUS

González-Rabanal, Borja (University of Valladolid; Grupo I+D+i EvoAdapta, Universidad de Cantabria) - Marín-Arroyo, Ana B. (Grupo I+D+i EvoAdapta, Universidad de Cantabria) - Carmona-Ballester, Eduardo (Servicio Territorial de Cultura, Turismo y Deporte de Valladolid, Junta de Castilla y León; Universidad de Burgos) - Gutiérrez-Zugasti, Igor (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria) - Martín, Miguel Ángel (Sociedad Española de Espeleología y Ciencias del Karst) - Ortega, Ana Isabel (CENIEH – Centro Nacional sobre la Evolución Humana) - Straus, Lawrence G. (University of New Mexico; Grupo I+D+i EvoAdapta, Universidad de Cantabria) - Vega Maeso, Cristina () - González Morales, Manuel R. (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria) - Cristiani, Emanuela (Diet and ANcient TEchnology laboratory, Sapienza Università di Roma)

Plant domestication constituted one of the most radical changes of the “Neolithic Revolution”, leading to biological, technological, socioeconomic, and cultural transformations that began in the Near East ca. 12,500 years ago and reached the Mediterranean coasts of Iberia three millennia later. Archaeobotanical studies have revealed that a wide variety of crops were cultivated since the Early Neolithic across Iberia, including cereals (wheat and barley), pulses (pea, lentil, fava bean) and other non-edible plants such as flax or poppy. However, the early stages and development of agriculture in northern Iberia are still little understood, mainly due to the scarcity of carpological data because of old excavations or preservation biases. With the aim of understanding the origin and development of agricultural practices during Late Prehistory, a dental calculus analysis was achieved to ascertain what types of plants were involved in the diet of these farming communities. In particular, starch grains can survive in the ancient dental calculus matrix, being considered a repository of dietary habits of past human groups. In this research, we analysed calculus from 18 individuals buried in 10 funerary caves of coastal and inland areas of the Cantabrian Region (northern Iberia) and dated to the 4th/2nd millennium cal. BC, spanning from the Late Neolithic to the Middle Bronze Age. For the identification of archaeological starch granules, a reference collection of more than 300 modern wild and domestic plants native to

the Mediterranean area and housed at the DANTE laboratory was used for morphological and statistical comparisons in order to provide a potential identification at the species level. Our results support extensive and stable agriculture based on the cultivation of wheat and barley from the Early Neolithic to the Bronze Age when millets were introduced and became major crops, integrated into a mixed farming economy.

9 PROTEOMIC ANALYSIS OF IRON AGE DENTAL CALCULUS PROVIDES INSIGHTS ON SCYTHIAN FOOD SYSTEMS

Pecnik, Jaruschka (Department of Environmental Sciences, University of Basel, Basel, Switzerland; Institute for Evolutionary Medicine, Faculty of Medicine, University of Zurich, Zurich, Switzerland) - Wilkin, Shevan (Department of Environmental Sciences, University of Basel, Basel, Switzerland; Institute for Evolutionary Medicine, Faculty of Medicine, University of Zurich, Zurich, Switzerland; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena, Germany) - Ventresca Miller, Alicia (Department of Anthropology, University of Michigan, Ann Arbor 48109, Michigan, United States; University of Michigan Museum of Anthropological Archaeology, University of Michigan, Michigan, United States; Max Planck Institute for Geoanthropology, Department of Archaeology, Jena, Germany) - Schuenemann, Verena (Department of Environmental Sciences, University of Basel, Basel, Switzerland; Institute for Evolutionary Medicine, Faculty of Medicine, University of Zurich, Zurich, Switzerland; Department of Evolutionary Anthropology, University of Vienna, Vienna, Austria) - Johnson, James (Department of Anthropology, University of Wyoming, Wyoming, United States) - Makhortykh, Sergey (Institute of Archaeology of National Academy of Sciences of Ukraine (NASU), Kyiv, Ukraine) - Litvinova, Ludmilla (Institute of Archaeology of National Academy of Sciences of Ukraine (NASU), Kyiv, Ukraine) - Andruk, Svetlana (Zaporizhzhya National University, Zaporizhzhya, Ukraine) - Toshev, Gennady (Zaporizhzhya National University, Zaporizhzhya, Ukraine) - Krützen, Michael (Department of Evolutionary Anthropology, University of Zurich, Zurich, Switzerland)

Recent genetic and stable isotopic studies of Scythian remains across the Eurasian steppe have significantly reshaped our understanding of these steppe people, challenging the notion of a homogeneous political assembly of nomadic, horse-back warriors from the Iron Age. It is now evident that the Scythians were composed of diverse populations with heterogeneous origins, which possessed complex socio-political structures. Even variations in agro-pastoral subsistence strategies among these populations have been identified, yet the specifics of their dietary intake such as its taxonomic origin from wild or domestic species remain inconclusive. Consequently, a palaeo-proteomic analysis of dental calculus from two Scythian-era populations in the Northern Black Sea region (present-day Ukraine) was conducted. Various dietary proteins and their taxonomic origins were identified, revealing milk, plants, and fish from various species as a part of Scythian food systems. Based on these findings, we suggest that these two agro-pastoral Scythian populations relied especially on ruminant milk and supplemented their subsistence regimes for food resilience in forest-steppe/steppe environments by fishing.

10 EXPLORING ANCIENT DENTAL CALCULUS: UNCOVERING THE DIVERSITY OF ORAL ARCHAEOLOGICAL METHANOBREVIBACTER THROUGH METAGENOMIC ANALYSIS

Granehill, Lena (Institute for Mummy Studies, Eurac Research) - D. Huang, Kun (Helmholtz Centre for Infection Research; CIBIO Department, University of Trento) - Tett, Adrian (CIBIO Department, University of Trento; CUBE - Division of Computational Systems Biology, Centre for Microbiology and Environmental Systems Science, University of Vienna) - Manghi, Paolo (CIBIO Department, University of Trento) - Paladin, Alice (Institute for Mummy Studies, Eurac Research) - O'Sullivan, Niall (Institute for Mummy Studies, Eurac Research) - Rota-Stabelli, Omar (Department of Sustainable Agro-Ecosystems and Bioresources, Fondazione Edmund Mach; Center Agriculture Food Environment, University of Trento) - Segata, Nicola (CIBIO Department, University of Trento) - Zink, Albert (Institute for Mummy Studies, Eurac Research) - Maixner, Frank (Institute for Mummy Studies, Eurac Research)

Dental calculus (mineralised dental plaque) preserves many types of microfossils and biomolecules, including microbial and host DNA, and ancient calculus are thus an important source of information regarding our ancestral human oral microbiome. We used genetic data to taxonomically characterise the dental calculus microbiome from 20 ancient human skeletal remains originating from Trentino-South Tyrol, Italy, dating from the Neolithic (6000–3500 BCE) to the Early Middle Ages (400–1000 CE).

We found a high abundance of the archaeal genus *Methanobrevibacter* in the calculus. However, only a fraction of the sequences showed high similarity to *Methanobrevibacter oralis*, associated with periodontitis and the only described *Methanobrevibacter* species in the human oral microbiome so far. To further investigate the diversity of this genus, we used *de novo* metagenome assembly to reconstruct 11 *Methanobrevibacter* genomes from the ancient calculus samples. Besides the presence of *M. oralis* in one of the samples, our phylogenetic analysis revealed two hitherto uncharacterised oral *Methanobrevibacter* species. The study thus suggested a possible shift in the human oral microbiome member *Methanobrevibacter* over the last millennia.

We now aim to incorporate more recently published dental calculus samples to the analysis which will extend the analysis to an even broader range of geographical locations and time periods. This will allow us to further explore microbial diversity and evolution of this potential dental pathogen over the course of human history.

11 TOWARDS THE CO-EXTRACTION OF PROTEINS AND LIPIDS FROM DENTAL CALCULUS

Mackie, Meaghan (School of Archaeology, University College Dublin; Archaeobiomics, Department of Life Sciences and Systems Biology, University of Turin) - Spiteri, Cynthianne (Archaeobiomics, Department of Life Sciences and Systems Biology, University of Turin; Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, Eberhard Karls Universität Tübingen) - Dal Bello, Federica (Department of Molecular Biotechnology and Health Sciences, University of Turin) - Buckley, Stephen (Department of Archaeology, BioArCh, University of York) - Quagliarello, Andrea (Department of Comparative Biomedicine and Food Science, University of Padua) - Demarchi, Beatrice (Archaeobiomics, Department of Life Sciences and Systems Biology, University of Turin) - Power, Robert (School of Archaeology, University College Dublin)

In the last decade, the examination of ancient dental calculus using proteomics has increasingly become an almost routine analysis to gain direct dietary information of past people, especially for animal products. The extraction of lipid residues and metabolites is less common, but can still provide valuable information on past diet, especially from plant products. Consequently, the two approaches are complementary and necessary to get a more holistic idea of ancient diets. However, current protocols require separate dental calculus samples for each analysis. The co-extraction of proteins and lipids from the same sample of calculus would represent a more sustainable and comparable approach to examine this limited resource. This would allow for a more comprehensive understanding of individuals who consumed and inhaled substances in the past with fewer samples destroyed, leaving the door open for future analyses.

In order to achieve this goal, we have examined different protocols for the sequential extraction of lipids and proteins from the same sample of calculus. Modern and mediaeval calculus were used to determine the effectiveness of different lipid extraction methods and to observe any modifications to the protein yield and composition caused by preceding lipid extraction. Co-extraction of proteins and lipids is shown to be a potentially viable route for maximising information related to individual diet and inhaled materials from a single sample of dental calculus.

531 MAKING CONNECTIONS: TOWARDS ARCHAEOLOGICAL NARRATIVES IN CONTEMPORARY SOCIETY

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Fernie, Kate (CARARE) - Corns, Anthony (Discovery Programme; 5DCulture)

Session format: Regular session

In today's digital age, people have unprecedented access to online content at home and work, transforming the field of archaeology. Advanced digital technologies are now used for recording, analysing, and sharing archaeological and historical content. Sharing archaeological datasets with open licences enhances their value, benefiting society in various ways. This content has a wide range of applications including monitoring the effects of climate and other environmental and human impacts, supporting the creation of narratives which inform education and tourism initiatives, empowering creative industries and creating a sense of ownership and involvement among people in the management of their heritage.

CARARE's mission is to advance professional practice and foster appreciation of the digital archaeological and architectural heritage by creating opportunities for practitioners, researchers and the creative industries to connect with each other, exchange experiences and knowledge, and open access to their datasets via Europeana and research infrastructures. Together with other researchers across Europe, CARARE is participating in the 5DCulture Project which focuses on European 3D digital cultural heritage assets and fostering their re-use. The session aims to unite individuals passionate about creating archaeological narratives in contemporary society by exploring how archaeological datasets can be used for work, research, learning, creating narratives and enjoyment.

Talks can address but are not limited to the following topics:

- Real case examples of reuse of archaeological data in society
- Best practices, standards and strategies for making datasets available for re-use
- Barriers and opportunities for reuse of digital archaeological data
- Methods and approaches to reuse in 3D, XR and AR applications
- Connecting with the education, tourism, creative industry and other sectors
- Working with communities.

ABSTRACTS

1 ARCHAEOLOGY DATA AND NON-ARCHAEOLOGICAL PROFESSIONALS: WHY DO PEOPLE NEED ARCHAEOLOGY?

Lauzikas, Rimvydas (Vilnius University Faculty of Communication) - Jovaišaitė-Blaževičienė, Indrė (Vilnius University Faculty of Communication) - Kelpšienė, Ingrida (Vilnius University Faculty of Communication) - Šuminas, Andrius (Vilnius University Faculty of Communication)

This paper focuses on the intersection of archaeology and non-archaeological audiences, delving into why and how individuals outside the realm of professional archaeology seek access to archaeology data, heritage objects, and associated knowledge and materials.

The research group members decided to adopt the quality-in-use conceptual approach for this study. Quality in use is described as "the degree to which a product or system can be used by specific users to meet their needs to achieve specific goals with effectiveness, efficiency, satisfaction, and freedom from risk in specific contexts of use". The research methodology is based on the SQuaRE model, represented in the ISO/IEC 25000 standards series. The methodological model created consisted of (i) interviews with non-archaeological professionals; (ii) definition of three use cases (use of archaeology data for inspiration, for improvisation, and precise reconstruction of the past reality); (iii) eye tracking experiments; and (iv) after the experiment questionnaire. The research focuses on reusing data from the three types of digital archaeological archives: (i) ADS, as a traditional, CoreTrustSeal accredited archive that holds actual data in the long term; (ii) ARIADNE, as an aggregation portal that holds no data, only metadata, but facilitates resource discovery and points users to data held in repositories and archives; and (iii) AIR as an interactive virtual research environment and reporting platform for organising newly captured archaeological field data and organising it in ways that allow it to be used for collaborative analysis.

The paper presents the results of the research, including the differences (i) in the need for highly precise archaeological data for the different groups of users (ii) in the ways how they access the archaeology data in the different types of digital archaeological archives; and (iii) in the information behaviour of different users.

2 IT IS EXCAVATED AND NOW WHAT? HOW DO WE COMMUNICATE OUR DATA TO THE COMMUNITY?

Tapavicki-Ilic, Milica (Institute of Archaeology Belgrade)

Over the past few decades and with development of new technologies, it has become rather challenging to present the work of archaeologists to the public. Classical (old-fashioned) museums are still there, but open-air museums seem to become more and more attractive, because they allow interaction. A step further is achieved with AR and VR applications that tend to add to the experience of both those interested in our common past and those interested in gaming.

The Institute of Archaeology from Belgrade has been participating in several projects that aimed to explore the possibilities of disseminating archaeologists' research. Among them, there were projects that tended to promote cultural heritage among younger generations, basically millennials, but also those that aimed to connect formal and informal education. On the other side, such projects also involved experts in cultural heritage.

One of the projects provided a cooperation model for cultural heritage by using digital technologies to enhance cultural experiences of several archaeological sites. The target group of this project were all of those young and less young people who like gaming.

Another project promoted cultural heritage and fostered sustainable tourism, since it included sailing along the (Roman) Danube limes as basis for a cultural route. The target group of this project were experts in experimental and experiential archaeology, but also tourist organizations.

3 **ARCHAEOLOGICAL HERITAGE IN 3D AS AN EDUCATIONAL AND RESPONSIBLE DISSEMINATION TOOL: IBERIANS AND THE 5DCULTURE PROJECT**

Sánchez, Alberto (University Research Institute for Iberian Archaeology. University of Jaén. Spain) - Rueda, Carmen (University Research Institute for Iberian Archaeology. University of Jaén. Spain) - Rísquez, Carmen (University Research Institute for Iberian Archaeology. University of Jaén. Spain) - Fuertes, José-Manuel (University Research Institute for Iberian Archaeology. University of Jaén. Spain; Department of Computer Science. University of Jaén. Spain) - Segura, Rafael-Jesús (University Research Institute for Iberian Archaeology. University of Jaén. Spain; Department of Computer Science. University of Jaén. Spain) - Rueda, Antonio-Jesús (University Research Institute for Iberian Archaeology. University of Jaén. Spain; Department of Computer Science. University of Jaén. Spain) - Lucena, Manuel (University Research Institute for Iberian Archaeology. University of Jaén. Spain; Department of Computer Science. University of Jaén. Spain) - Herranz, Ana (University Research Institute for Iberian Archaeology. University of Jaén. Spain) - Moreno, Isabel (University Research Institute for Iberian Archaeology. University of Jaén. Spain) - Cubero, Inmaculada (University Research Institute for Iberian Archaeology. University of Jaén. Spain)

From the University Research Institute for Iberian Archaeology of the University of Jaén (Spain) we are working on a programme of activities that delves into the possibilities offered by digital archaeological heritage from different training and educational perspectives. Currently, within the framework of the European project Deploying and Demonstrating a 3D cultural heritage space (5DCulture) (Digital Europe Program) and the CARARE Network, we develop an extensive research and transfer programme that emphasizes 3D technology as a fundamental tool to get closer to the knowledge of the societies of the past, paying special attention to the Culture of the Iberians (6th-1st BC).

In this proposal we show the approach, actions and innovative resources designed for dissemination on which we have been working from a collaborative framework and with inclusive perspectives. We will present some of our strategies based on the search for technical innovation and new materials that help generate more enriching and direct practices with archaeological heritage and that contribute to universal accessibility through recognized platforms such as Europeana. We will conclude with the presentation of our experiences of educational and social transfer environments aimed at school groups at different levels (primary, secondary and university education) and also for people with special needs or impairments.

4 **VIRTUAL LANDSCAPES AND THEIR COMMUNITIES: DIGITAL HERITAGE FOR PRESERVATION, ENGAGEMENT AND AGENCY**

Cassidy, Catherine Anne (University of St Andrews) - Aitken, Jacquie (Timespan Heritage & Arts Society) - Miller, Alan (University of St Andrews)

Virtual reconstructions of the past serve as portals for connecting audiences with global issues of present and possible futures. Employing immersive technologies augments the opportunities for rich and complex narratives to be told within these virtual environments. As the main case study presented, the Strath of Kildonan in the northeast Highlands of Scotland has been populated from the Neolithic, to the Iron Age, through to Highland Clearances in the 1800s. The area has seen numerous climatic shifts throughout history, demonstrated in three temporal reconstructions of the same valley and coast. As the area is experiencing accelerated change due to the climate crisis, the reconstructions are a tool for connecting locals to their past cultural landscapes. With greater understanding of past environments, practices of people throughout history and issues faced in their own time, Timespan Heritage & Arts Society has begun foundational strategies for greater community agency in constituting heritage of 'national significance', monitoring climate change, and valuing local knowledge in future sustainable planning. As a result, the infrastructure for this process has been repeated by the University of St Andrews research group Open Virtual Worlds in other remote communities in collaboration with local heritage organisations to monitor, preserve, and communicate vulnerable heritage by building associations and empowering remote localities. Visualising scientific datasets from archaeological excavations including historical built heritage, ecology, landscapes, people and their practice from the archaeological record constitutes a nexus for present local communities to address their place in wider societal issues, demonstrating digital heritage as a potential divisive tool in preservation, engagement and agency.

5 **FRAMEWORKS FOR NARRATIVES: TOWARDS INTEROPERABILITY FOR 3D AND OTHER MEDIA**

Fernie, Kate (CARARE) - Alkemade, Henk (CARARE)

Creating narratives using digital technology involves combining digital media (text, images, video, audio and 3D) to create a resource centred around a historical event or an experience. The resource itself does not need to be a highly sophisticated media presentation; a slideshow can provide the framework for an effective digital story. But the process of creating narratives underlines the importance of digital media being FAIR (Findable, Accessible, Interoperable and Reusable).

Today we are in the midst of a drive towards digitisation. In terms of cultural heritage, the European Commission has recommended that all monuments at risk of deterioration or destruction, or which are highly visited should be digitised in 3D. The aim is that, as well as being used by institutions to record and manage archaeological monuments or for outreach, the data be made available in the common European data space for cultural heritage (the data space). This paper will discuss the standards, practices and strategies which support interoperability and which enable FAIR reuse of the data.

CARARE is an accredited aggregator for Europeana and has had a huge impact in contributing a rich diversity of content about the archaeological and architectural heritage including 3D content to the data space. We offer advice and support to organisations and projects who wish to deliver high-quality digital content to the data space, and a member of the expert working group on 3D content in the data space. This work includes looking at the metadata needed for digital media to be Findable; best practices in terms of copyright and access licences to enable Reuse; and the standards for file formats and viewers for 3D media to be Accessible. This focus on Interoperability between 3D and other media types enables their re-use in digital story-telling and narratives.

6 **5DCULTURE: IMPROVING THE QUALITY AND PROMOTING THE REUSE OF 3D CULTURAL HERITAGE DATA**

Corns, Anthony (The Discovery Programme) - Shaw, Robert (The Discovery Programme) - O'Reilly, Rebecca (The Discovery Programme) - Namberi, Siva (The Discovery Programme) - Boyd, Hannah (The Discovery Programme)

5DCulture, a 24-month collaborative project co-funded by the European Union, involves twelve partners across cultural heritage sectors such as archaeology, museums, and fashion. Its goal is to enhance European 3D digital cultural heritage assets in the data space, promoting reuse in education, tourism, and broader cultural and creative sectors for sustainable outcomes. The project focuses on delivering high-quality 3D content by engaging existing datasets from partner collections, emphasizing fashion, archaeology, and architecture. Reuse scenarios, spanning from high-quality to derivatives, are being developed.

The Discovery Programme, with a history of involvement in 3D digital documentation, particularly through projects like 3D-ICONS, recognizes opportunities and challenges in reusing 3D archaeological content. This includes enhancing visitor experiences at archaeological sites and leveraging 3D surrogates across various sectors like tourism, education, gaming, arts, conservation, and heritage management.

This paper discusses the research conducted in this context, introducing an improved processing pipeline to enhance the quality of 3D models of cultural heritage assets, facilitating their increased reuse. It details approaches to refining model geometry, generating and applying enhanced textures, creating rich metadata, and establishing strategies for persistence and archiving.

The paper addresses project deliverables, emphasizing use case pilots in tourism, conservation, and the creative arts sectors. The paper also explored the collaborations the Discovery Programme has with partners in these sectors to deliver enhanced yet practical outputs tailored to diverse user needs and reuse potential.

7 **ENGAGING WITH CLIMATE CHANGE THROUGH INTELLIGENT CHARACTERS IN HISTORIC SCENES**

Miller, Alan (University of St Andrews) - Chapman, Alice (University of St Andrews) - Zhang, Junyu (University of St Andrews) - Cassidy, Catherine Anne (University of St Andrews)

Climate change poses a direct threat to many archaeological sites through coastal erosion and extreme weather. Yet recognition of the value of sites and engagement with their heritage poses the possibility of archaeology becoming a mover in motivating the behaviour required to mitigate against climate change.

Digital reconstruction of archaeological sites poses the possibility of holistic representation of natural and cultural, tangible and intangible, moveable and immovable heritage within immersive environments developed within game engines. The capability of modern computers and graphics cards offer the possibility of large environments modelling artefacts, flora, fauna and people together with animations and interactions.

In this presentation we will report on and discuss the development of authentic characters, based upon archaeological evidence, and their situation within historic scenes.

Further we will discuss the ways that large language models can be used to develop natural language, within the context of informed interactions with historic scenes that will enable interrogation of their relevance to climate past, present and futures, enable personalised and factually correct engagement with the heritage.

Though adding characters and natural language interactions to engagement with archaeology, we aim to increase understanding of the past and influence behaviour for the future.

8 ARCHAEOLOGICAL TOOLS FOR DOCUMENTATION AND COMMUNICATION

Nilsson, Nicholas (Kalmar County Museum)

For 10 years, a digital workflow, IDA - Instant field Documentation and Availability, has been used by Kalmar County Museum's archaeologists. The workflow is completely digital: from surveying, documentation, analysis, and communication. Using a cloud service, data is collected via an app, but this also enables communication of data to colleagues, researchers, and the general public in real time. Not all archaeological data makes sense to communicate. Seeing all the documentation data that an archaeologist fills out can be tiring for a generally interested audience. By using filters, customized maps for the public or other stakeholders can be created. Communication takes place through shared maps or using so-called Story maps, a tool where maps, images, video, and text can interact to create a story about a place and to enable a digital participation from the public and others in the archaeologist's work. By using social media, Instagram, Facebook or websites, this information is shared and communicated in an easy way. By using Story maps for communication, 3D information can also be shared as well as 360 videos and images, which can further enhance a story. As such, Story maps does not only make a valuable tool for communication, it also makes archaeology accessible for people that for different reasons are unable to visit excavation sites physically. It is also possible to adapt the information to reach specific target groups, such as nursing homes, schools, etc. This increases the possibility of reaching out with archaeological information to different groups, which strengthens archaeology's role in society.

9 REIMAGINING PICTISH HERITAGE: INTERACTIVE DIGITAL NARRATIVES AND CONTEMPORARY CONNECTIONS

Pisani, Sharon (University of St Andrews) - Miller, Alan (University of St Andrews) - Hall, Mark (Perth Museum)

In the 'Painting the Picts' project, we remodelled and recoloured two significant Pictish stones, the St Madoes and Inchyra stones, situated within a landscape that has undergone transformative changes over the centuries. This aimed to showcase their interconnectedness integral role within Scotland's broader tapestry of Pictish heritage.

As part of this project, a virtual environment allowed users to virtual walk between the St Madoes and Inchyra stones, illustrating the historical context and the impact of modern development on their environment. The stones are presented within scenes depicting aspects of daily life, from ceremonial practices to communal interactions, bringing the Pictish era to life.

A museum exhibit featuring touchscreens displaying 360 photos of scenes from the virtual environment offers interactive engagement. Visitors can explore the stones in detail and, notably, actively participate in the narrative by recolouring the St Madoes stone from a curated palette before reintegrating it into the digital landscape. This communicates the uncertainties of how the stones were coloured and introduces a personalisation element, where visitors create a personal relationship with their encounter with Pictish archaeology.

While the project showcases the evolving landscape, the use of characters humanises the scene, enabling comparisons between Pictish rituals and contemporary settings, offering insights into the cultural practices of the time. By locating the reconstructed stones within their historical context, multiple modes of engagement are possible: the exhibit connects the stones as they are today with how they looked in the past, augmented reality applications connect today's landscape with the past, and web virtual reality provides access from home or school.

In conclusion, our project aimed to visually explore Pictish heritage and invite active personalised participation and engagement from the public. Through digital technologies, we bridge the gap between the past and the present, fostering renewed appreciation and interest for Pictish history.

10 FROM TRENCH TO TIME TRAVEL: IMMERSIVE 3D-RECONSTRUCTION AS A TOOL FOR PROCESSING AND MEDIATING ARCHAEOLOGICAL DATA

Erkell, Miriam (Arkeologerna SHM) - Lindahl, Mikael (Arkeologerna SHM) - Ekholm, Niklas (Arkeologerna SHM) - Ramirez, Teobaldo (Arkeologerna SHM) - Skredsvik, Andreas (Arkeologerna SHM) - Edqvist, Johanna (Arkeologerna SHM) - Nannmark, Ester (Arkeologerna SHM)

Bridging the gap between digital method development in contract archaeology and the mediation of its results, our project is focused on the reconstruction of the historic city of Gothenburg, Sweden, in the 3D-game engine Unreal Engine 5. The 3D-model presents new possibilities for involving local communities in their history through an immersive environment with easy access to archaeological data, and possibilities of tailoring it to different target groups.

The construction of a railway tunnel through Gothenburg has led to extensive excavations, unearthing the city's history back to its founding in 1621. The tunnel, part of a larger infrastructure project, has led to debate among the citizens of Gothenburg; many criticizing the impact of the massive construction sites on the cityscape. The archaeology undertaken as part of the construction works has, on the other hand, been met with a lot of interest amongst gothenburgians; "softening the blow" of the project itself. Archaeological results have mainly been mediated through public lectures, exhibitions, magazines and online blogposts, all of which have been well received.

As part of a new approach on analyzing and visualizing archaeological data, a VR-compatible 3D-model is now being constructed based on historical records, maps and excavation results. The model has already proven itself useful in public outreach; still images, 360° panorama views and short films can be extracted with ease.

The adaptability, accessibility and diversity of historically accurate 3D-environments facilitate a new kind of archaeological mediation. By sharing the model with local schools, museums and libraries, people can partake in the history of their city by walking through it. Due to the flexibility of the game engine, the model can be adapted to different needs and wants; from professional use, aiding the analysis of spatial relationships, to use in exhibitions or development of educational videogames.

533 FORENSIC ARCHAEOLOGY: THE IMPORTANT ROLE OF ARCHAEOLOGY IN LEGAL AND HUMANITARIAN INVESTIGATIONS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Mickleburgh, Hayley (University of Amsterdam; Forensic Anthropology Center, Texas State University) - Barone, Pier Matteo (Forensic Geoscience Italy; American University of Rome) - Drath, Joanna (Pomeranian Medical University) - Moghaddam, Neghanaz (University Center of Legal Medicine Lausanne-Geneva)

Session format: Regular session

Forensic Archaeology is the application of archaeological theory, methods and techniques to assist in criminal investigations and legal matters. Forensic Archaeology is strongly interdisciplinary, with multiple fields playing a role in recording and collecting evidence to help solve crimes and seek justice. The field has developed as a robust subdiscipline of archaeology, employing approaches and methods such as remote sensing and geophysics for site identification, archaeological excavation and recording of in situ evidence and taphonomic processes. Activities also include humanitarian responses to conflict and human rights abuses, and crimes against archaeological heritage, including looting sites and trafficking artifacts by organized crime or during wars. The rapid development of Forensic Archaeology, encompassing technological advancements, such as the innovative use of digital archaeology, a growing focus on defining detailed and globally accessible protocols, as well as incorporation of criminalistic frameworks to interpret the recovered finds and features, contributes to broadening the horizons of the overarching field of archaeology. This broad scope also highlights forensic archaeologists flexibility to switch between macro and microscale analysis of forensic archaeological evidence. Forensic archaeologists are instrumental in conducting both comprehensive evaluations of crime scenes, and in narrowing the scope of research and analysis to effectively delineate the investigative evidence.

This session aims to shed light on the critical role of Forensic Archaeology in the search, recovery, and of missing persons and decomposed or decomposing human remains, particularly in European casework. It will cover the broad spectrum of approaches and methods used in Forensic Archaeology, from research to sharing knowledge and expertise required for this field. We particularly invite contributions reflecting the interdisciplinary and innovative nature of forensic archaeology as well as those related to the important role of this field in current global conflicts and humanitarian action, and its role within the wider discipline of archaeology.

ABSTRACTS

1 THE PARETO PRINCIPLE IN SEARCH AND RESCUE DURING FORENSIC INVESTIGATIONS: BALANCING EFFICIENCY AND ACCURACY

Barone, Pier Matteo (American University of Rome; Forensic Geoscience Italy; ANCRIM (Associazione Nazionale Criminologi e Criminalisti))

The Pareto Principle, often referred to as the "80/20 Rule," has been a guiding concept in various domains, including business and decision-making processes. In the context of forensic investigations and search and rescue operations, this principle finds intriguing applications that demand a delicate equilibrium between efficiency and accuracy.

In the realm of forensic investigations, a dichotomy emerges. On one hand, providing a mere 20% of the available intelligence can inadvertently yield an overwhelming 80% of false positive outcomes, potentially leading investigations astray and misallocating valuable resources. Conversely, adopting an exhaustive approach by compromising 80% of the crime scene may yield only 20% of the forensic results deemed admissible and valuable during legal proceedings.

This abstract explores the intricate dynamics of the Pareto Principle within the context of search and rescue operations during two forensic cases. It delves into the challenges faced by investigators when deciding on the extent of information to provide, recognizing that excess information can obscure pertinent evidence amidst the noise of false positives. Conversely, insufficient information can hinder effective investigations, potentially overlooking critical clues.

Balancing these two facets requires a nuanced approach that leverages advanced techniques, technology, and expertise. Moreover, it calls for the development of innovative methodologies that optimize the allocation of resources, ensuring that the search for evidence aligns with the objective of delivering accurate, admissible results.

2 REFLECTIONS OF SERVICE: THE SEARCH, RECOVERY, AND IDENTIFICATION OF PRISONERS OF WAR/MISSING IN ACTION (POW/MIA) CASES

Christie, Shaheen (Chronicle Heritage; University of Wisconsin-Milwaukee)

Forensic Archaeology, as a sub-discipline to the overarching discipline of archaeology, contributes to the nuanced evaluation of the formation and transformation of sites, especially in cases when human remains may be present in historic and prehistoric contexts. Those investigations may occur through rigorous interdisciplinary efforts involving academic and industry professionals, early researchers and students, from institutions around the world. In addition to their educational value, research involving the search and recovery of missing individuals contribute social and personal value to those participating in such efforts, including Veterans, volunteers from the local community and the families of the missing, some located thousands of miles away from conflict zones. Although many countries work to recover their war dead, this presentation will reflect on the personal experiences of participating in two historic archaeological recovery projects in western Europe in 2022 and 2023 through strategic partnerships with the Defense POW/MIA Accounting Agency (DPAA). While each of these projects involve the search for and fullest accounting possible of missing service personnel and incident-related materials from airplane crash sites dated to World War II, differences in the project types, incident event, discretionary budgets, project length, procedural requirements and other factors necessitated flexibility and selectivity in the application of archaeological methods and techniques in the field. As a result, project participants discover how to strategize, teach and implement adaptive learning opportunities and best practices alongside innovative techniques to improve in the success of recovery projects in the future. One of the primary benefits of recovery partnership projects with the DPAA is the inclusion of international researchers and students, because such collaborations result in training opportunities and the establishment of similar organizations in foreign countries focused on the recovery of their own unaccounted MIA service members and others lost in recent humanitarian crises and global conflicts.

3 GLOBAL PRACTICE IN FORENSIC ARCHAEOLOGY: CURRENT WORLD TRENDS

Marquez-Grant, Nicholas (Cranfield University)

Forensic Archaeology applies the theory, methods and principles of archaeology to medico-legal and humanitarian contexts. Today, forensic archaeologists work for independent forensic providers, government agencies and NGOs. This paper presents a review of trends in research and practice worldwide in forensic archaeology. The discipline has been in an increase since the 1980s and often now many forensic investigations worldwide will see the involvement of archaeologists. Through an analysis of scholarly publications in the last ten years, as well as interviews with a number of organisations, this talks focuses in particular on recent roles of forensic anthropology including mass disaster investigations where they have assisted in the search, location and recovery of missing individuals. Publications in the discipline have increased in forensic journals as well as capacity building worldwide. In particular, the bulk of the paper will focus on forensic archaeology practice worldwide in particular in human rights investigations of 20th and 21st century contexts.

4 FORENSIC ARCHAEOLOGY AT INTERNATIONAL MECHANISMS SUPPORTED BY THE INTERNATIONAL COMMITTEE OF THE RED CROSS FOR THE SEARCH FOR MISSING PERSONS

Fischer, Patricia (ICRC) - de Abreu e Souza, Rafael (ICRC) - Morcillo Mendez, Maria Dolores (ICRC)

This presentation provides a thorough exploration of the roles, responsibilities, actions and challenges faced by forensic archaeology in the context of International Mechanisms dedicated to the search for individuals missing following armed conflicts supported by the International Committee of the Red Cross (ICRC). Specifically, it sheds light on the impactful contributions of the ICRC's Forensic Unit, which since 2003 has provided humanitarian forensic services to improve processes related to preliminary forensic investigations and fieldwork as part of forensic archaeological actions. The presentation also addresses the Unit's involvement in actively assisting States in fulfilling their obligations under international humanitarian law, with a central focus on delivering answers to the families of the missing, recognizing their right to crucial information about the fate and whereabouts of relatives unaccounted for. The importance of understanding forensic archaeology beyond mere recovery and mass graves is highlighted, stressing its key role in improving search actions, being at the forefront of the response and sometimes closer to families, at the same time that it facilitates link between the various phases of the identification process. Furthermore, it emphasizes the need for forensic archaeologists to have a broader understanding of the potential to improve forensic services within medico-legal systems to better align them with humanitarian needs. Such improvement could involve supporting short-term emergency curation actions on documents, remains, personal and local belongings, medium-term initiatives to

re-establish traceability and infrastructure, and longer-term efforts to promote forensic humanitarian dialogue aimed at to establish stronger relations between authorities and standard operating procedures.

5 ASSUMING THE NARRATIVE: HUMANITARIAN FORENSIC ACTION, MISINFORMATION, AND THE COLOMBIAN INTERNAL CONFLICT

Cawley, William (University of Tennessee)

Forensic archaeology is a critical component of humanitarian forensic action (HFA). Human rights abuse, terror, and crimes against humanity often define the context of HFA implementation and the environment forensic practitioners must navigate. These efforts commonly occur in the aftermath of political turmoil or in the wake of conflict during tenuous periods of transitional justice. Information derived from the context of clandestine graves and human remains can reduce the ambiguity of loss suffered by the loved ones of a missing individual. Families of victims and the disappeared in the context of HFA, however, are not the sole stakeholders of these practices. Political factions, grassroots movements, and media outlets, among others, are also interested in findings derived from forensic archaeology. Despite the humanitarian focus of HFA, these data may be co-opted in the public milieu to promote potentially destabilizing rhetoric in times of delicate peace. Misinformation, propelled by modern social media, is a recognized problem for peacebuilding efforts. As explored in this paper, forensic investigations of human remains re-create the context and crimes committed by perpetrators of violence in the public sphere. Families deserve their 'right to know.' However, the data generated from humanitarian efforts can find a home in non-humanitarian narratives. Those committed to HFA must accept the reality of misinformation, including portrayals of their forensic work, and how these narratives may be co-opted for non-humanitarian purposes. In this paper, the Colombian Internal Conflict provides a firm example of how the findings of forensic practitioners, even those committed to HFA and not involved in judicial processes, must engage with the public via accessible conduits such as social media. Data for this paper are derived from interviews with 45 interlocutors in Colombia between 2022-2023 representing the public, individuals working within transitional justice efforts, and forensic practitioners.

6 THE USE OF CHEMICALS IN THE BURIAL OF VICTIMS OF CONFLICTS IN THE 20TH CENTURY

Kadikinaite, Jovita (Faculty of Medicine, Vilnius University) - Karoblis, Dovydas (Faculty of Chemistry and Geosciences, Vilnius University)

Research on victims of 20th-century conflicts often encounters remains covered with sediments or powders of uncertain origin. Such sediments have been found in the remains of Lithuanian partisans, as well as some individuals of the Polish Armia Krajowa. There are preliminary assumptions (without further chemical investigations or a more detailed historical evaluation) that the above-mentioned materials are lime deposits, and such behavior is interpreted as disrespect towards soldiers from the opposing side. These assumptions were questioned because historical data indicated a different scenario in one case of the Home Army soldiers whose remains were affected by the sediments. Since the idea of the use of different materials leaving the same/similar effects on remains came up, an initial chemical elemental analysis was carried out. The analysis of the first three samples of the above-mentioned sediments from different contexts by scanning electron microscopy and X-ray energy dispersive spectroscopy (SEM-EDX) has already revealed a much more complex picture: the sediments not only contain calcium but also other elements such as magnesium, aluminum, and iodine, which are present in disinfectants (iodine), antiseptics, and fertilizers (aluminum and magnesium sulfates). This study aims to investigate the use of chemicals and the impact of the environment (seasonality, soil composition) on the burial and/or burial of corpses in the 20th century. This would allow a more detailed reconstruction of more complex environmental processes or traces of human activity, and thus the formation of specific chemicals (sediments) on the bones. The study takes into account the circumstances in which the remains were found (mass graves or common burials), as well as the historical context. This topic has not yet been investigated in collaboration between the fields of history, archaeology, and chemistry and is therefore innovative, relevant, and provides important insights for the field.

7 CIVILIANS IN A PRISONER OF WAR CAMP: FORENSIC ARCHAEOLOGY UNRAVELS THE STORY OF STALAG IID'S FORGOTTEN VICTIMS

Drath, Joanna (Pomeranian Medical University) - Jarzęcka-Stąporek, Joanna (Pomeranian Medical University) - Ościłowski, Jarosław (Polish Academy of Sciences) - Kalka, Monika (Pomeranian Medical University) - Popek, Filip (Pomeranian Medical University) - Wołyńska, Marta (Pomeranian Medical University) - Lisman, Dagmara (Pomeranian Medical University) - Zacharczuk, Julia (Pomeranian Medical University) - Parafiniuk, Mirosław (Pomeranian Medical University) - Ossowski, Andrzej (Pomeranian Medical University)

Forensic archaeology is the application of traditional research methods, theories, and excavation techniques to forensic sites and crime scenes. Through an analysis of archaeological data, especially in the form of artifacts, a forensic archaeologist contributes to the process of personal identification and time of death estimation.

Shortly after the outbreak of World War II, in Stargard (then part of Germany), a temporary prisoner of war camp was hastily established. The camp later changed its status to a permanent POW camp, Stalag IID, and it detained soldiers from Poland, France, French colonies in Africa, the Netherlands, Belgium, Serbia, USSR, Italy, and Canada. Following the Warsaw Uprising in 1944, many Polish civilians were deported to Stalag IID.

From 2021, and the subsequent years, archaeological research began on the grounds of the former camp. During the initial survey, a mass burial pit containing 64 bodies was found. Many of the bodies had soldier nametags on them, which facilitated the identification process. Over the following years, two additional burial rows were uncovered, ultimately increasing the total number of individuals to over 300. One grave contained densely arranged bodies of Soviet soldiers, many with their nametags on them. The other burial row contained bodies of the elderly, women, and young children.

To explain the presence of women and children within the confines of the POW camp, two hypotheses were formulated. One suggested that these civilians were indigenous inhabitants of the nearby area, while the alternative hypothesis proposed that the skeletons belonged to families relocated from Warsaw after the Uprising. Based on the personal artifacts recovered from children's graves, the researchers concluded that the latter hypothesis was more plausible.

8 FORENSIC EXCAVATION AT MOUNTJOY PRISON, IRELAND

Harte, Aidan (ARC Forensics Ltd.) - McCullagh, Niamh (ARC Forensics Ltd)

Forensic excavations are currently being undertaken at Mountjoy Prison, Dublin, with the principle aim to locate and recover the remains of a pardoned prisoner executed in 1941. As part of such a sentence, those executed were interred within the grounds of the prison, with no marker or record of where remains lay. This scenario applies to approximately 30 executed in the period 1924 – 1954, all of which are to be recovered and identified (where possible).

The existing legal framework uses the term 'exhumation' – 'The removal of a dead body from the ground after it has been buried'. However, the process necessitates a forensic archaeological approach for several reasons. Firstly, in this instance, the specific burial locations are unknown, with no associated documentation, and so a robust search strategy is needed. Secondly, once discovered, the identity of those within each burial needs to be established, through various methods (Osteoarchaeology, DNA, stratigraphy etc.). Finally, all human remains must be recovered, within an operational prison, and retained for reinterment subsequently.

Current terminology applied in Irish law (i.e. exhumation) seemingly falls short of recognising the forensic archaeological process essential to completing the most extensive forensic excavation undertaken so far on the island of Ireland.

9 DETECTING DIFFERENTIAL CHEMICAL SIGNATURES OF TATTOO INKS ON PORCINE SKIN AND BONE USING PXRF

McCrane, Samantha (University of New Hampshire, Anthropology Department; Forensic Anthropology Identification and Recovery Laboratory) - Fry, Megan (University of Florida, Anthropology Department; C.A. Pound Human Identification Laboratory) - Watanabe, Aldo (University of Florida, Anthropology Department; C.A. Pound Human Identification Laboratory) - Stubblefield, Phoebe (University of Florida, Anthropology Department; C.A. Pound Human Identification Laboratory)

Portable x-ray fluorescence (pXRF) spectrometry is a non-destructive methodology that measures the chemical composition of a sample by x-ray emission, causing different elements to emit characteristic signatures. pXRF is widely utilized in archaeological and forensic samples to help resolve commingling, identify unknown staining, and determine the composition of associated artifacts. In this research project, we test the ability of pXRF to detect minute differences in chemical signatures left by different tattoo inks on porcine skin and bone. Differences in the chemical compositions of tattoo inks is well documented, especially for different colored dyes. Some dyes also contain elements that have been demonstrated to stain bone. For instance, red and orange tattoo dyes often contain iron, while green and blue dyes often contain copper. To explore if these differences would be detectable on decomposing soft tissue, or the bone directly beneath a tattoo, we had licensed technicians apply 1' x 1' tattoos to the anterior surface of pigs feet for seven different colored dyes produced by Eternal Ink (lime green, orange, dark purple, true blue, light red, caramel, and lightning yellow), three commonly utilized brands of black dye (Kirosome, Dynamic, and India Ink), and four Softtap cosmetic dyes (Pecan, Copper, Mahogany, and Blonde). These samples, created in duplicate, were measured by pXRF prior to and after burial for one year in a wooded North Florida environment. After recovery, macroscopic ink staining was evident on some pigs feet samples; other pigs feet samples differed only in chemical signature, or showed no notable differences. These results suggest expanded application for pXRF utilization in forensic identification, to help determine the presence of particular tattoo inks, even after decomposition has removed macroscopic traces, as well as in bioarchaeology where tattoos may be differentially preserved due to taphonomic variables.

538 CONTACTS, MOVEMENTS, MIGRATIONS IN THE VIKING AGE: MARITIME ASPECTS OF THE NORSE EXPANSION INTO THE NORTH ATLANTIC

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Sanmark, Alexandra (University of the Highlands and Islands) - McLeod, Shane (University of the Highlands and Islands) - Lu, Erman (University of Kiel)

Session format: Round table (without formal abstracts)

This session is run by participants of the ongoing research project The Norse and the Sea, which explores the maritime cultural landscape in Scandinavian Scotland (c. AD 790-1350) and addresses the overarching questions of contacts, movements and migrations. This session draws its inspiration from the work of Christer Westerdahl to focus upon the Maritime Cultural Landscape, encompassing places on land that provide clues to sailing routes and navigation. As well as archaeology, both excavations and geophysics, evidence such as placenames, logistics, written sources and early maps will be investigated in an attempt to understand sailing and navigating. Discussion will be guided by short specialist papers on topics such as mental mapping, landing places, navigation, beacons, portages, evidence for Norse raids and migration, the logistics of raiding and migrating by Viking Age ships, the locations of culturally Scandinavian burials, settlements and assembly sites in relation to sailing routes and navigational hazards. The session aims to explore how these various aspects interacted with each other and the navigation strategies employed by the Norse during their successful expansion westwards often in dangerous and unfamiliar waters. Can different strategies designed for particular circumstances be found?

542 MEDIEVAL SENSORIUM: EXPLORING THE ARCHAEOLOGY OF THE SENSES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Dordevic, Zorana (Departament de Història i Arqueologia, Universitat de Barcelona (UB)) - Ćirić, Jasmina (University of Kragujevac, Faculty of Philology and Arts) - Costa-Badia, Xavier (Institut de Recerca en Cultures Medievales (IRCV), Universitat de Barcelona (UB))

Session format: Regular session

In recent decades, the exploration of sensory experiences in the Middle Ages has attracted increasing attention across diverse scientific disciplines. This session is envisioned as a dynamic platform that fosters interdisciplinary dialogues, delving into the multifaceted sensory landscape of the medieval world. The central question addresses how medieval communities perceived, understood, and harnessed their sensory reality. Therefore, this session aims to uncover the intricate interplay of senses within their spatial contexts, the portrayal of sensory experiences in visual arts, and the sensory encounters that enriched the lives of rural and urban medieval communities. It sets out to discuss a wide spectrum of sensory encounters, encompassing both interior and exterior spaces, including those of sacred and secular significance. Particular interest is placed on the methodologies employed for researching the sensory experiences of the medieval world, as well as the presentation of research outcomes. Consequently, contributions that employ cutting-edge technologies to explore and map sensory experiences within historical contexts are warmly welcome. Embracing an interdisciplinary approach, this session promises to illuminate and broaden our understanding of the medieval sensorium and the profound role that the senses played in shaping cultural practices and landscapes of the medieval world.

This session is organized by the CULT-AURAL project, CA19131, and the MAHPA research group, and it is open to everyone.

ABSTRACTS

1 NEUROMEDIEVALISM AND THE SENSORIUM

Wilner, Raquel (University of Bergen)

Neuromedievalism is a relatively new approach to art history and involves applying modern neuroscientific knowledge to expand our understanding of medieval cognition, particularly within the context of art and devotional practice. The central premise of the approach is that neurobiology is largely unchanged when comparing humans in the 21st century and the Middle Ages, despite significant cultural changes. Medieval sensology understood art as an interactive object to activate the senses in the perceiver, in particular the use of sight and how art was a visual aid in prayer. However, neuromedievalism goes beyond this: the activation of senses in medieval art also means cognitive activation. Understanding how art is treated neurologically will grant deeper insight into an artwork's effectiveness and significance in medieval devotion. This does not supplant existing methodology but provides a more expansive contextual understanding of medieval objects and the senses. Recent developments in mirror neuron research shows a range of

medieval applications, for instance how using visual artworks of the cross will facilitate a sense of touch in the devotee, bringing forth a personal connection - or activation of 'inner senses' - to the religious experience. Even art showing someone tasting will activate taste areas of the brain, granting the viewer an experience closely akin to tasting what is shown in the artwork. This paper provides an overview of neuromedievalism as an approach for medieval studies and discusses it within the context of the sensorium.

2 SENSORY ENCOUNTERS: DECODING THE SYMBOLISM OF ST. NICHOLAS CHURCH IN LJUBOTEN

Ciric, Jasmina (University of Kragujevac, Faculty of Philology and Arts)

This paper examines the intersection of embodied cognition and sensory encounters within St. Nicholas Church in Ljuboten, built in 1337 near Skopje, North Macedonia. Central to our analysis is the church's ornamental brickwork, particularly the apse's decorations, which we argue are not merely aesthetic but serve as mediums for immersive, embodied spirituality. Highlighting the role of Danica, a female ktetor, this study delves into the significance of the monogram of her son, Demetrius (Dmitar), concealed within the interior of the west portal. This monogram serves as a critical point for exploring the interplay between material culture and spiritual practice, underscoring the familial and devotional intentions behind the church's architectural embellishments. The inscription not only memorializes Demetrius but also engages the visitor in a sensory dialogue with the divine, transforming the act of entry into a multisensory journey of devotion.

Employing a multidisciplinary methodology that combines art historical analysis with insights from cognitive science, our research reveals how the church's physical and ornamental features engage the senses, facilitating a deeper understanding of religious concepts through visual, tactile, and spatial interactions. The apse's decorative motifs—chess fields, zigzags, and cryptograms—are analyzed as cognitive metaphors that bridge the sacred and the sensory, enriching the medieval sensorium.

This paper contributes to the discourse on medieval sacred spaces by illustrating how the architecture and ornamentation of St. Nicholas Church act as conduits for a sensory-engaged spirituality. In doing so, it underscores the importance of sensory encounters in mediating the divine, situating the church within the broader context of Byzantine and Serbian medieval culture. By focusing on the sensory dimensions of religious experience, this study offers new insights into the cognitive processes underpinning devotion in the medieval Balkans, highlighting the church as a site of multisensory engagement and spiritual communion.

3 SENSORY EXPERIENCES IN MEDIEVAL POETRY OF SAN FRANCESCO D'ASSISI AND JACOPONE DA TODI

Gjorgjievska, Eva (Goce Delcev University)

My presentation aims to analyze the poetic works written by two medieval Italian authors and monks of the 13th century: San Francesco d'Assisi and Jacopone da Todi. The focus will be on the fact that through the genre of the nonliturgical devotional songs, called "lauda", these poets expressed not only their faith in God, but also their overall sensory experience in the real world.

The presentation will approach the two laudas, "Laudes Creaturarum" and "The Lament of the Virgin", firstly from a formal aspect, through an analysis of rhetoric figures that emphasize the sensory experience, and then through a thematic analysis that puts the primacy of pathos and empathy, as a means for achieving an emotional and expressive quality of the poetic discourse.

In the end, we will dwell on the meaning that sensory expression in poetry had in the context of medieval dogmatics, as well as in the cultural space of medieval Italy. We will ask the question whether poetry represents a domain of sublimation of the prohibition in culture, or whether poetry testifies to the sensory perception and expressiveness of culture, which, despite rational religious dogmas, still finds space for the expression of the human sensory experience.

4 ANALYSIS OF THE SENSE PERCEPTION IN THE FRESCO PAINTING OF THE DEČANI MONASTERY

Beuk, Bojana (Aeronautical museum)

This study explores the visual paradigm of art in the Middle Ages as a carrier of narrative media through sensory perception, particularly in the context of religious and ontological representations. The analysis focuses on the frescoes of the Visoki Dečani monastery as an authentic manifestation of written narrative contextualization. In the art of medieval painting, there is a tendency to faithfully depict biblical word, inviting the viewer to participate through sensory perceptions, thus leading to the adoption of an exegetical message interpreted today through phenomenological archaeology. The frescoes of the Visoki Dečani monastery represent a monument of late Byzantine art in Serbia, characterized by a rich oeuvre of painters who merge liturgical word and image into a unique symbiosis aimed at the believer's "co-signing" and full acceptance and understanding of the liturgical word through often personified

representations and abstract painting, which was not an isolated case among Byzantine artists. In our opinion, the perception of specific artistic expression in the Orthodox monastery of Visoki Dečani abounds in sensory sensations and theological-mystical reflections. Through a detailed analysis of various aspects of fresco painting in the monastery, this study contributes to a deeper understanding of the artistic, religious, and cultural elements of the medieval Orthodox tradition and their influence on the perception of spirituality and faith during that period.

5 MEDICAL AND RELIGIOUS CONCEPTS OF THE SENSE OF SMELL IN THE MIDDLE AGES

Ramšak, Mojca (University of Ljubljana)

The author examines the connection between medicine, religion and philosophy using the example of the sense of smell. During the Middle Ages, scholars made significant advances in the understanding of smell by drawing on Greek and Arabic knowledge. This theoretical knowledge was then put into practise by medical writers to improve public health. The sense of smell played an important role in assessing general wellbeing, restoring balance in the body and even treating various diseases. It was widely believed that bad odours could lead to illness, which is why people used perfumes, herbs and incense to mask unpleasant smells and purify the air. Medieval doctors knew the link between odours and disease, which led to changes in cities to prevent the spread of disease. Certain odours reminded city dwellers of the potential dangers posed by smoke, exhaust fumes, stagnant water, and air pollution.

The significance of smells went beyond physical well-being and had a philosophical and spiritual dimension. Religious authors integrated the philosophical and medical knowledge of smell into their teachings, leading to a theology of smell that combined both theological and medical understanding. This theological perspective had a profound influence on popular beliefs and mystical writings. Smells were seen as indications of God's presence and intentions in the supernatural realm, while unpleasant smells were often associated with decay and disease, sometimes even with the presence of demons. Although smells themselves were intangible, they left visible and occasionally tangible signs, such as the smoke produced by incense, and symbolic representations in works of art.

The methodology is based on published sources from the Middle Ages that deal with medical, philosophical and religious concepts related to the sense of smell and the location of the smell organ.

6 PERCEPTIONS OF A "JOURNEY TO THE PAST" IN SOME VIATICAL STORIES ON MOUNT ATHOS

Sourd, Jean-Michel (Aix-Marseille University)

As travellers to Mount Athos have, over the centuries, embarked on a "journey into the past" by residing in the monasteries of the Holy Mountain, one may wonder whether their diverse perspectives on intellectual and social environments were not, to varying degrees, romantic visions of Byzantine civilisation. The travellers transcribed visual experiences into words and expressions, encompassing the art of monasteries such as architecture, frescoes, and icons, as well as the auditory allure of Byzantine chants and prayers, and the olfactory sensations of incense and beeswax, including the perceived sacredness of the landscape that has been preserved throughout the centuries. This symphony of the senses, therefore, generated viatical texts - stories, descriptions, and epistolary exchanges - wherein a shared imagination for the medieval period materialised through language. The travellers' expressions conveyed an ideology shaped by their cultural backgrounds, ranging from passion and self-sacrifice to criticism.

The aim of this paper is to unveil the archaeology of meanings emerging from the narrative evolution of French-speaking viaticum stories at the Holy Mountain of Athos over almost half a millennium. Through textual analyses of French-speaking literature since the 16th century, from botanist Pierre Belon du Mans (1555) and Byzantium enthusiasts like Eugène Mercier (1933) to the spiritual exploration of Jean-Claude Larchet (2022) and the initiatory perspective of Greek language and civilization lover Jacques Lacarrière (1954, 1975), this exploration extends to the sarcasm of journalist-future psychoanalyst Maryse Choisy (1929) and the criticism of Catholic Church Oblate Claude Chevreuil (2008).

7 A VISIBILITY STUDY OF MUR CASTLE'S TERM (10TH AND 11TH CENTURIES) AND ITS PROBLEMS

Melero Pérez, Paula (Universitat de Barcelona)

Mur (Pallars Jussà, Catalonia, Spain) is one of the best-known feudal castles in Catalonia, not only for the archaeological research done over the last decades but also because of the many written sources conserved. These documents allow us to recognize Mur Castle as one of the main strongholds in the border between the County of Pallars and Al-Andalus in the context of the 10th and 11th centuries. Moreover, they enable us to define its territorial jurisdiction and identify the main elements of their surroundings, such as villages or other minor defences. All these data are particularly suitable for a GIS visibility study. This communication will present the results of this GIS study (visibility net), but essentially discuss the different problems, limitations, and not contemplated alternatives that aggravate our distance from the reality of the moment, such as meteorology, vegetation, the difference between see and be seen,

the difference between visibility on the field and visibility results from GIS, and other forms of communication may be used on the defence of a castle term.

8 KNOWING THROUGH LISTENING: EXPLORING MONASTIC AURAL COMMUNITIES IN MEDIEVAL RURAL EUROPE

Costa-Badia, Xavier (University of Barcelona) - Álvarez Morales, Lidia (University of Barcelona) - Dordevic, Zorana (University of Barcelona)

This research introduces a multidisciplinary approach to uncover the rich tapestry of monastic soundscapes in medieval rural Europe. Grounded in the conceptual frameworks of R. Murray Schafer's soundscape theory and Steven Feld's acoustemology, we delve into the nuanced auditory experiences within monastic environments. Our exploration unfolds through three phases: (1) Conceptual Foundations, where we elucidate the terms "soundscape" and "acoustemology" in the medieval monastic context; (2) Identification of Medieval Monastic Soundscape, involving an analysis of monastic regulations and musical instruments to define the auditory elements; and (3) Exploration Methodology, employing historical sources, on-site acoustic measurements, and sound mapping through GIS, interpret the meaning of sounds, capture empirical data, and map dynamic acoustic communities, respectively. The research concludes with a critical discussion on the inherent limitations, such as scarce historical records and interpretative challenges in sound mapping in GIS, aiming to foster a nuanced understanding of medieval monastic auditory dimensions. This multidisciplinary approach contributes to the scholarly discourse on medieval monasticism and serves as a methodological blueprint for researchers exploring historical soundscapes.

544 NEW DIRECTIONS FOR METRIC AND NONMETRIC BIODISTANCE ANALYSIS IN EUROPE AND BEYOND

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Lee, Matthew (Durham University) - Faillace, Katie (Cardiff University) - van Hattum, IJk (Ghent University)

Session format: Regular session

Methods investigating biological relatedness, collectively referred to as Biological Distance (or Biodistance) Analysis, are powerful tools for investigating and reconstructing networks from the intra-cemetery to inter-continental scale. Biodistance analysis has been applied to questions of kinship, regional population affinities, and evolutionary speciation. Many of these methods are built on traditional osteological techniques, including non-metric and metric studies of the cranium and dentition with technological and statistical advances further refining these methods. Recent publications (e.g., Pilloud and Hefner 2016; Scott and Irish 2017; Rathman and Reyes-Centeno 2020, Rathmann, Lismann et al. 2023) demonstrate an active and growing specialist area. Despite this, biodistance analysis is, seemingly, under-utilised in European contexts and institutions. Furthermore, researchers often focus on one data type/analysis when performing biodistance analysis, with the integration of different data types and methods a relatively rare occurrence. Additionally, the constraints imposed by missing data in the osteological record often result in relatively small datasets, which can limit the application of robust statistical methods and occasionally lead to valuable datasets remaining unpublished.

This session aims to address the current state of biodistance analysis in Europe and to develop a network of Europe-based researchers using these methods.

The session welcomes papers from researchers at all levels who use biodistance analysis in their work on European material or in European institutions. The papers can present ongoing research or explore theoretical and methodological issues. Research may focus on one form of analysis (e.g., craniometrics) or multiple forms of analysis (e.g., dental non-metrics and metrics). Papers which also incorporate other forms of data (e.g., biomolecular or artefactual evidence) as supplementary data to the biodistance analysis are also encouraged.

ABSTRACTS

1 EVALUATING THE UTILITY OF CRANIODENTAL METRIC AND NON-METRIC DATA IN BIODISTANCE ANALYSIS

Rathmann, Hannes (Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen; Paleoanthropology, Institute for Archaeological Sciences, Department of Geosciences, University of Tübingen) - Perretti, Silvia (Department of Life Sciences and Biotechnology, University of Ferrara) - Porcu, Valentina (Department of Life Sciences and Biotechnology, University of Ferrara) - Hanihara, Tsunehiko (Department of Anatomy, Kitasato University School of Medicine) - Scott, G. (Department of Anthropology, University of Nevada) - Irish, Joel (Research Centre in Evolutionary Anthropology and Palaeoecology, School of Biological and Environmental Sciences, Liverpool John Moores University; The Centre for the Exploration of the Deep Human Journey, University of the Witwatersrand) - Reyes-Centeno, Hugo (Department of Anthropology, University of Kentucky; William S. Webb Museum of Anthropology, University of Kentucky; DFG Center for Advanced Studies 'Words, Bones, Genes, Tools', University of Tübingen) - Ghiretto, Silvia (Department of Life Sciences and Biotechnology, University of Ferrara) - Harvati, Katerina (Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen; Paleoanthropology, Institute for Archaeological Sciences, Department of Geosciences, University of Tübingen; DFG Center for Advanced Studies 'Words, Bones, Genes, Tools', University of Tübingen)

Biological distance, or biodistance, analysis utilizes skeletal phenotypic data from archaeological human remains to infer genetic relationships across individuals or groups, shedding light on questions about past population structure and history. The primary data types employed are metric and non-metric traits of the cranium and dentition, believed to be highly heritable and to evolve neutrally. However, there is disagreement regarding whether certain craniodental data types preserve neutral genomic signatures more reliably than others. This discrepancy poses a problem, as biodistance investigations based on different data types may yield markedly disparate conclusions. To address this research gap, we systematically tested the relative utility of the four craniodental data types in capturing neutral genomic signatures, employing an extensive genotype:phenotype comparison across modern populations worldwide. Our analysis utilized the largest existing datasets available and accounted for geographically structured environmental variation, population and variable sampling uncertainty, as well as stochastic variation inherent to a neutral model of evolution. Our findings reveal that the four data types capture varying degrees of neutral genomic variation, with the highest signals preserved in dental non-metric traits and cranial metrics, followed by cranial non-metric traits and dental metrics. Importantly, our results indicate that combining the four data types maximizes genotypic coverage compared to using them separately, even with a limited number of phenotypic variables. We hypothesize that this may reflect a lower level of genetic integration through pleiotropy between, as opposed to within, the four data types, effectively forming four distinct modules associated with relatively independent sets of loci. Consequently, we recommend that future biodistance investigations strive for more holistic combined data approaches to enable more robust inferences about past population structure and history. Reference: Rathmann et al. (2023). Inferring human neutral genetic variation from craniodental phenotypes, PNAS Nexus, Volume 2, Issue 7, pgad217, <https://doi.org/10.1093/pnasnexus/pgad217>.

2 WE HAVE NEVER BEEN SO DISTANT: NON-METRIC DENTAL TRAITS IN EURASIAN POPULATIONS FROM THE NEOLITHIC TO THE MIDDLE AGES

Vescovo, Giulia (Department of Environmental and Prevention Sciences, University of Ferrara) - Zedda, Nicoletta (Department of Environmental and Prevention Sciences, University of Ferrara) - Bramanti, Barbara (Department of Environmental and Prevention Sciences, University of Ferrara)

In recent decades, a considerable amount of scientific literature has been published concerning the study of non-metric dental traits to understand the biological relationships between populations and to define the geographical patterns of groups, their history, ancestry, or structure. Especially for Eurasian populations the literature is extensive, and a systematisation of the studies conducted is needed.

The purpose of this study is to provide a comprehensive overview of the scientific research on non-metric dental traits of Eurasian populations from the Neolithic to the Middle Ages.

To perform the analysis, the scientific literature was screened using the main search engines such as PubMed, Web of Sciences, Scopus and Google Scholar, with specific search criteria.

Full-text English, French and Russian original papers on Eurasian populations, studies on different prehistoric and historical periods (Neolithic to Medieval), studies presenting all non-metric dental data with absolute frequencies and percentages, studies with the aim of providing knowledge of the biological relationships between the populations and their ancestry were included.

After evaluation of the articles, 28 studies from 1998 to 2023 were selected, covering territories such as Armenia, Cyprus, Italy, Japan, Siberia, Spain, Thailand. From these articles, metadata were extracted for 33 non-metric dental traits, which were used to perform a meta-analysis applying a Mean Measure of Divergence (MMD). The results show how much the biological distance varies between Eurasian populations from the Neolithic to the Middle Ages.

This systematic review with metanalysis aims to offer a useful tool for future studies on biological relationships between Eurasian populations.

3 EXPLORING THE AVAR PERIOD POPULATION STRUCTURE – A GRAPH THEORETICAL STUDY OF BIOLOGICAL RELATIONSHIPS USING PHENOTYPIC TRAITS

Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University,) - Marcsik, Antónia (Department of Biological Anthropology, University of Szeged) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University)

Biological relatedness among past populations can be estimated by either neutral genetic markers or skeletal traits (such as metric or non-metric characteristics) which reflect them. In our study, we apply phenotypic affinities as a proxy for genetic relations since the neutral model of phenotypic evolution predicts the proportionality of phenotypic and genetic covariances. Although analysis of phenotype traits provides a lower level of detail than ancient DNA data, it is more cost-effective and enables researchers to study the population structure and its shaping factors in a larger sample size.

Based on graph theory, considering the population as nodes and the pairwise biological distances as links, the most relevant relationships can be selected from a saturated graph using the principle of conditional independence. The topology of the pruned graph can be used to calculate the conditional distance which is robust in exploring demographic processes and the impact of spatial factors in the development of population structure.

We test this methodological approach on the Avar Period population due to the abundance of skeletal material and its importance in East-Central European history. The Avars were an Asian-originated tribal federation that conquered and united the whole territory of the Carpathian Basin. We collected cranial measurements of 1899 individuals from 50 sites from Transdanubia and the Great Hungarian Plain.

The results of the community detection algorithms were found to correspond well with the geographical locations of the sites. The spatial analysis suggested the importance of distance in the development of population structure as well as the role of the Danube as a potential barrier that hinders gene flow. The graph-based approach also allows us to investigate inter- and intraregional biological relationships and assess the role of each region in the network.

The research was supported by the National Research, Development and Innovation Office (PD 146612).

4 ROMAN AND ANGLIAN SCORTON, NORTH YORKSHIRE. WHAT CAN DENTAL ANTHROPOLOGY TELL US?

Lee, Matthew (Durham University) - Gowland, Rebecca (Durham University) - Montgomery, Janet (Durham University) - Semple, Sarah (Durham University)

Much debate exists around how the transition between Roman and Early Medieval Britain occurred. Theories derived from historical, archaeological, and biomolecular evidence suggest a range of possibilities, from mass migration to the migration of only a social elite, and/or cultural ideas. However, analyses of Early Medieval England often exclude the complex frontier zone of the North, particularly the area which would become the kingdom of Northumbria, instead focusing on the South and East of England.

Dental morphological and metric data was collected from 44 individuals buried in the late Roman (c. 4th Century AD; n=11) and Anglian (c. 5th – 8th Century AD; n=33) cemeteries excavated at Hollow Bank Quarry, Scorton, North Yorkshire. This data was then examined using the recently published FLEXDIST statistical protocol to explore the possibility of population continuity between the two cemeteries. This talk will include a description of the FLEXDIST protocol followed by a discussion of the results of the analysis, including the possibility of population continuity at Scorton. The relationship between biological similarity and other archaeological evidence from the site, including cultural evidence (e.g. presence of grave goods, burial location) and biomolecular evidence for migration from the site is explored. Additionally, consideration will be given to how clustering algorithms may be fruitfully applied to results gained through the FLEXDIST method.

5 EXPLORING BIODISTANCE IN THE NEOLITHIC MEUSE BASIN: TOOTH CROWN AND ROOT MORPHOLOGY AND THE COMPLEXITY OF COMMINGLED DENTAL REMAINS

van Hattum, IJk (Ghent University) - De Groote, Isabelle (Ghent University) - Irish, Joel (Liverpool John Moores University)

More than 200 collective burials from the Neolithic period were discovered in natural caves and rock shelters within the karst systems of the Belgian Meuse basin. With a lack of known settlement sites and a scarcity of diagnostic archaeological finds, these funerary sites provide the primary source of information about the Neolithic people in the region. Some of the funerary caves date back to the Middle Neolithic (ca. 4300-3700 cal BC), while most belong to the Late and Final Neolithic period (3700 - 2000 cal BC) in Belgium. Most caves contained skeletal remains representing between five to 15 individuals, although rare sites like Burnot and Maurenne yielded remains of 55 to 60 people. The relationship between larger and smaller caves remains unclear, prompting questions as to whether they represent separate groups or a unified Neolithic population. Similarities in material and funerary culture suggest connections between groups in the Meuse basin and contemporary populations in Northern France.

This study explores biological distances between Neolithic groups in the Meuse basin using dental non-metric and metric traits, with preliminary data from sites including Ben Ahin, Grotte de la Faucille, Maurenne de la Cave, and Burnot. Our analysis explores population diversity and provides foundational research for future interregional comparisons, particularly with Northern France. Additionally, we discuss the potentials and pitfalls of studying comingled collections, highlighting the importance of including isolated teeth versus only teeth in gnathic remains for comprehensive analysis. Overall, this research contributes to a deeper understanding of Neolithic populations in the Meuse basin and underscores the potential of the analysis of comingled dental assemblages in biodistance studies.

548 “LAND AHEAD!” ISLANDS-MAINLAND MOBILITY ACROSS THE MEDITERRANEAN IN PREHISTORY

Session theme: 6. The Mediterranean from Within

Session organisers: Gori, Maja (Istituto di Scienze del Patrimonio Culturale | Consiglio Nazionale delle Ricerche) - Arena, Alberta (Österreichische Akademie der Wissenschaften)

Session format: Regular session

Mobility in Mediterranean Prehistory has consistently served as both a recurrent response to social and environmental constraints and a strategy of resilience and cultural integration. Concurrently, it has played a pivotal role in triggering phenomena such as crisis and transformations, the emergence of social complexity and the collapse of societies. However, the tendency to regard the Mediterranean as a unit, adopting thus a macro-scale approach to investigate mobility and emphasizing long distance seaborne connectivity, has often downplayed the significance of small-scale movements in understanding these phenomena. This session stems from the 3-year research project PRIN2020 “Mobility, social integration and culture change in the Mediterranean Bronze Age”, hosted at the Universities of Udine, Catania and CNR. Focused on mobility in the central and eastern Mediterranean during the 3rd and 2nd millennia BCE, the project places particular emphasis on networks linking islands and mainland regions, with a primary focus on movement in the Tyrrhenian, Adriatic-Ionian, and Aegean areas.

We welcome papers focusing on these and other Mediterranean areas and prehistoric epochs, fostering a comparative perspective in exploring mobilities connecting Mediterranean islands with their nearest or farthest mainlands and hinterlands. Indeed, any assessment of seaborne interaction, particularly at short and medium ranges, cannot avoid considering the terrestrial domain. We welcome contributions from both early career and established researchers employing different approaches and methodologies to investigate islands-mainland mobilities in Mediterranean Prehistory (6000-800 BCE).

ABSTRACTS

1 BRIDGING ACROSS THE STRAIT: EBA CERAMIC NETWORKS BETWEEN SOUTHERN ITALY, AEOLIAN ISLANDS AND SICILY

Todaro, Simona (Catania University) - Giacoppo, Flavia (Catania University) - Palio, Orazio (Catania University)

Sicily, due to its strategic position in the center of the Mediterranean, has always represented a crossroads of cultures and a bridge between the East and the West. The first exchanges date back to the Neolithic period, but it is from the end of the 3rd millennium BC that the island became integral part of long-range Aegean exchange networks. In an insular context, however, medium and short-range exchanges (micro-scale) are also of great importance to decipher dynamics of cultural interaction and can be appreciated in particular in aspects of ceramics production.

During the late 3rd millennium BC - mid 2nd millennium BC two classes of pottery appeared in Sicily, which were produced in different technological traditions especially with regard surface finishing. One -known as pottery in Castelluccio style and spread across most part of the island- is characterized by geometric decoration in black on a red/yellow background; the other one -known as Rodi-Tindari-Vallelunga and attested in the north-eastern cusp- is characterized by a particular finishing and pre-firing surface treatment that, together with the angular profile of most shapes, has been usually linked to classes of pottery typical of southern Italy.

This paper aims to investigate human mobility on a small and medium scale by comparing the chaînes opératoires of burnished pottery from Sicily, Aeolian islands and peninsular Italy, so as to clarify whether their evident similarity is apparent or the outcome of a shared know-how. Particular attention will be given to forming and finishing technique, assessed with the confocal laser scanning.

2 MINORITY REPORT: MOBILITY NETWORKS IN THE AEOLIAN ISLANDS DURING THE EARLY BRONZE AGE

Di Renzoni, Andrea (CNR - ISPC) - Bettelli, Marco (CNR - ISPC) - Martinelli, Maria Clara (Parco Archeologico delle Isole Eolie, Museo Luigi Bernabò Brea, Lipari (ME)) - Ferranti, Francesca (CNR - ISPC) - Levi, Sara Tiziana (Dip. di Scienze Chimiche e Geologiche, Un. di Modena e Reggio Emilia; Institute for the Study of the Ancient World, New York University, NY, USA)

By the end of the 3rd millennium BCE, a network of interactions emerged, encompassing the Aegean, central Mediterranean, and Balkans, characterized by intense cultural contacts and, perhaps, the movement of small groups of people.

Sicily and the adjacent islands, particularly the latter, are believed to have played pivotal roles in this context. It has been suggested that small islands served as early centers organizing exchange activities. Within these centers, interactions occurred at various scales, influenced by the historical and cultural specificities of each location. The Aeolian Islands, strategically situated along a major Mediterranean navigational route, emerged as key hubs in the central Mediterranean network. Available data depict the archipelago as involved in a complex network of communication systems, operating at different scales and according to various mobility patterns: (1) interactions among the islands, characterized by a core-periphery model; (2) connections within the lower Tyrrhenian region, likely driven by people moving to and from the islands; (3) participation in the wider Mediterranean network involving the Balkans and Greece; and (4) the involvement in the Mycenaean western expansion, serving as intermediaries between Aegean seafarers and local networks.

This period also corresponds to the Bronze Age phase marked by the highest density of known archaeological sites, spread across six of the seven islands. However, only a few of these sites have been extensively investigated and fully published. Consequently, data concerning the islands of Salina, Panarea, Alicudi, and Ginostra (Stromboli) are largely unavailable, hindering the formulation of comprehensive models.

We present the first results of an ongoing project focused on analyzing legacy data from the Capo Graziano archaeological contexts. The project aims to quantify allochthonous items as a proxy for the varying degrees of involvement of the islands in the aforementioned network, with the goal of refining models used to describe this phenomenon.

3 WIND OF CHANGE. THE SPREAD OF DECORATED POTTERY AMONG CENTRAL MEDITERRANEAN SMALL ISLANDS BETWEEN THE 3RD AND 2ND MILLENNIUM BC

Magri, Alessandra (Italian National Research Council (CNR-ISPC Roma))

During the transition between the 3rd and the 2nd millennium BC large territories and small islands of the Central Mediterranean were involved in supra-regional cultural phenomena, linking distant places through increased human mobility and maritime connections. Differently from previous phases, the interactions expanded beyond the mere circulation of resources and objects, now including widespread sociocultural practices.

This paper attempts to assess the degree of shared cultural elements among insular human groups, starting from the analysis of selected archaeological indicators, such as pottery assemblages, 'special' objects, and funerary traditions. Within the most significant material culture aspects, special emphasis is placed on the presence of incised and impressed pottery that can be examined through a cross-cultural comparative approach, identifying similarities and differences between the decorative systems adopted by different communities.

Although regional and local varieties, during the Early Bronze Age recurring pottery assemblages and a shared 'decorative taste' can be observed across wide-ranging territories, including coastal areas of Sicily, Southern Italy, and the surrounding islands. The origins of this phenomenon point to the 3rd mill. Cetina and Early Helladic III cultural spheres, involving the Balkans and the Peloponnese, with open questions on the modes of transmission of ceramic styles and other related cultural practices, such as specific funerary habits and long-distance exchange of 'prestige' objects.

The Aeolian Islands, Malta and Pantelleria, respectively represented by Capo Graziano, Tarxien Cemetery and Mursia facies, are relevant case studies for exploring these interconnections through the lens of material culture with a focus on insularity, a subject that could be defined as 'Islands Materiality'. Incorporating both first-hand data and published research, and considering the concept of 'community of practice', we find that small islands have actively participated in the development of Central Mediterranean networks, receiving outside influences while also maintaining their distinct and original cultural identities.

4 EXCAVATING THE "LONE CITY OF ŠKAR. ISLAND-MAINLAND MOBILITY IN THE EASTERN ADRIATIC IN THE BRONZE AGE

Gori, Maja (National Research Council of Italy) - Arena, Alberta (Österreichische Akademie der Wissenschaften) - Magri, Alessandra (National Research Council of Italy) - Recchia, Giulia (Sapienza University of Rome) - Vilmercati, Melissa (Sapienza University of Rome)

Škarin Samograd is a karstic cave located at the bottom of a sinkhole, north-east of Šibenik (Central Dalmatia, Croatia) famous for its deposits, ranging from the Neolithic to the Bronze Age. The first extensive excavations at the site were carried out in 1959-61 by Marović, and brought to light an extraordinary archaeological deposit, approximately 7 m thick. Unfortunately, the results of that work remained unpublished, and even if Škarin Samograd is regarded as one of the most significant archaeological sites in the entire Adriatic basin (Govedarica 1989, Forenbaher 2018), the nature and type of its occupation still need to be understood. Given the importance of the site, excavations were resumed under the direction of M. Gori within the project "PRIN 2020 - Mobility, social integration, and cultural change in the Bronze Age Mediterranean", and thanks to the co-financing of MAECI, the Italian Ministry of Foreign Affairs and International Cooperation. What seems to be evident from the published material culture from the cave, is its importance for understanding the relationship between Dalmatia and its islands in the 3rd millennium BC. This paper will present the first results from the new excavations and relate them with the data already available from other contexts, first of all the island of Palagruža, and put them in the wider framework of Bronze Age Adriatic mobility.

The original name of the cave Škarin samograd was erroneously recorded by geologists as Škarin samograd. During the first excavation campaign that took place in July-August 2023 we loosely translated the site name as "the lone city of Škar".

5 INCISED POTTERY OF THE EH III - MH I NORTH-WESTERN PELOPONNESE: REGIONAL INSIGHTS INTO THE CETINA PHENOMENON

Mercogliano, Assunta (Department of Humanities and Cultural Heritage, University of Udine, Italy) - Gazis, Mihalis (Ephorate of Antiquities of Achaia, Greece) - Spiroulas, Andreas (Department of History and Archaeology, University of Ioannina, Greece) - Filis, Konstantinos (Ephorate of Antiquities of Chalcidice and Mount Athos, Greece) - Hein, Anno (Ceramic and Composite Materials Group, Institute of Nanoscience and Nanotechnology, NCSR 'Demokritos', Greece) - Day, Peter (Ceramic and Composite Materials Group, Institute of Nanoscience and Nanotechnology, NCSR 'Demokritos', Greece)

The late 3rd millennium BCE in the Aegean is a time of radical cultural change and disruption, when novel stylistic traits of pottery have often been interpreted as representing the movement of people. While the appearance of both stylistic traits and technological practices from the Eastern Aegean have inspired a range of increasingly sophisticated approaches, the Cetina phenomenon, whose stylistic roots lie in the north-western Balkans, is less intensively studied. Though found at several sites in the Peloponnese during the EH III - MH I periods, the incised pottery in the Cetina tradition is often present as only a small part of the assemblages, prompting the question as to whether these vessels are imported, represent the adoption of specific shapes and decorative elements, or perhaps are the products of an intrusive population element.

We present results of an integrated macroscopic and analytical methodology investigating the provenance and production technology of a range of incised pottery of this period, including Cetina-style pottery, at four sites bordering the Patras-Corinthian Gulf: Trapeza, a settlement located 7 km southwest of Aigion in Eastern Achaia; the site of Keryneia which forms part of the major EBA centre of the Helike area; Lousika to the west of Patras and nearby Teichos Dymaion, the major anchorage on the north-western tip of the Peloponnese.

Petrographic, chemical and microstructural examination of the pottery allows an assessment of the relation of these and other incised ceramics to other components of the assemblage, notably location of production, and the degree to which they are products of the same technological practices as other pottery groups.

The paper considers the role of Achaia in the complex networks at the end of the 3rd millennium BCE, reappraising Adriatic cultural components in the diverse ceramic landscape of the time.

6 PREHISTORIC SEABORNE CONNECTIONS AND MOBILITY DYNAMICS IN THE EASTERN AEGEAN REGION: INSIGHTS FROM CERAMIC ANALYSIS

Menelaou, Sergios (British School at Athens)

As a sensitive marker of technological and socio-economic transformations, pottery can be used as a proxy for investigating developments in social structures, craft practices, human-environment interactions, as well as mobility dynamics and connectivity patterns. Methodological advances in ceramic studies of the last few decades allows for a more precise provenance determination and identification of production sources/locations through integrated, analytical approaches.

With a focus on the geo-cultural region of the eastern Aegean, this paper investigates the *longue durée* shifts in the connectivity of the offshore Greek islands with their peraiai (western Anatolian coastline) and beyond, and assesses how this reflects on pottery transformations. A particular focus is placed on the second half of the third millennium BC, traditionally viewed as a period of extensive innovations, such as the emergence of supra-regional urban centres, the expansion of communications via maritime and in-land routes, and the westward spread of technological novelties. This ceramic phenomenon is characterised by the appearance of new ceramic forms and morphostylistic features, novel traits related to knowledge transfer and the circulation of ideas, across a wide geographical area extending from inner western Anatolia to Mainland Greece. Following a micro-scale analysis of site-specific ceramic assemblages, this cultural phenomenon seems to be inconsistent in its technological attributes and geographical distribution, calling for reconsideration of previous, generalised interpretations of mobility dynamics in the region.

7 THE ROLE OF THE AEGINA BRONZE AGE HARBOR IN THE MINOAN AND MYCENAEAN NETWORKS IN THE EASTERN MEDITERRANEAN

Ferentinos, Georgios (Geology Department, Patras University, Greece; OCEANUS-Lab, Geology Department, Patras University, Greece) - Karali, Lilian (History and Archaeology Department, Kapodistrian University, Athens, Greece) - Gkioni, Maria (OCEANUS-Lab, Geology Department, Patras University, Greece) - Stefanopoulos, Panagiotis (OCEANUS-Lab, Geology Department, Patras University, Greece)

This study reconstructs the configuration and the size of the Bronze Age (BA) Aegina harbor from the Early Helladic (EH) II to the Late Helladic (LH) IIIB and reassess the Aegina's harbor role and the participation of the "Aeginetans" in the BA maritime trade in the Aegean and the eastern Mediterranean through its harbor perspective. The Aegina harbor functioned throughout the EH II - LH IIIB, initially as a naturally sheltered harbor and from Middle Helladic (MH) onwards as a man-made structure to mitigate the environmental impact of wind and waves and offer shipping, docking and anchoring facilities. At present the harbor is submerged and lies at an average depth of about 4.5 m below present sea-level. It is enclosed by two moles and a detached breakwater totaling in length 1,727 m. The enclosed basin covers an area of about 568,500 m² (ca. 57 ha). Therefore, the harbor could be considered to have been the largest harbor in the Aegean and the eastern Mediterranean of that time. Throughout this period the Aegina harbor functioned progressively as a maritime hub in local, regional, and interregional networks. The Aeginetans initiated and operated the Saronic Gulf network, then they interacted with the Minoans and were involved in the Aegean economic space, that interconnected the Greek Mainland, the Aegean islands, Crete, and western Anatolia, and finally they participated in an interregional long-distance system, acting as intermediaries to the Mycenaeans, which included connections between Cyprus, the Levant, Egypt, and Italy.

8 ISLAND ARCHITECTURE ON LAND: THE QUESTION OF EARLY BRONZE AGE INSULAE IN TAVŞANLI HÖYÜK (INLAND WESTERN ANATOLIA)

Naiboglu, Nihan (Istanbul Nisantasi University) - Fidan, Erkan (Bilecik Şeyh Edebali University)

With a size of over 40 ha, Tavşanlı Höyük is one of the largest Bronze Age towns in the western half of Anatolia. Geophysical investigations and archaeological excavations conducted over the past 5 years have revealed interesting results about the Bronze Age occupation of the mound together with its surrounding area. Among the most unexpected findings is the potential presence of an insula in the lower town of Tavşanlı Höyük dating back to the middle of the 3rd millennium BC.

Consisting of long houses adjacent to each other in blocks and divided by regular streets, insulae are the typical settlement plan of the Aegean from the second quarter of the 3rd millennium BC onwards. This plan has no other parallels in Inland Western Anatolia known so far. However, the GPR images from Tavşanlı Höyük revealed a different picture, suggesting that the site represents the easternmost example of a typical Aegean settlement.

To examine the GPR results, a test trench of 10x10 m has been dug right next to the area where GPR was conducted. At a depth of 5 meters, the team unearthed the well-preserved corner of a house, perfectly matching the layout observed in the GPR image. This indicates that the settlement, in fact, consisted of insulae.

The size of the excavated 3rd millennium BC settlements in Inland Western Anatolia varies between 1 to 5 hectares, making Tavşanlı Höyük, with its 40 hectares, the largest settlement in the region with the only known exception of Beycesultan. The paper aims to explore the nature of the architectural connection between Tavşanlı Höyük and the Aegean, as well as to discuss whether the remarkably large size of the settlement had an impact or any kind of advantage on the selection of the insula planning.

549 INTERDISCIPLINARY APPROACHES TO THE MIDDLE PALEOLITHIC RECORD OF THE BALKAN PENINSULA

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Monnier, Gilliane (University of Minnesota) - Pajovic, Goran (National Museum of Montenegro)

Session format: Regular session

Archaeology has always been an interdisciplinary endeavor, incorporating methods and techniques from the natural sciences to assess chronology and reconstruct paleoenvironments. In recent years, rapid advances in the archaeological sciences and in the realm of digital archaeology have yielded a growing number of methodologies allowing us to extract ever-more precise data from the archaeological record. Such data include, but are not limited to, a broad range of geological (geophysical, geochemical, geoarchaeological) and molecular (genetic, proteomic, lipid) data, which can be tightly integrated with the traditional archaeological record (distributions of artifacts, faunal remains, and features) through the spatial resolution afforded by digital imaging and proveniencing methods.

These archaeological science advances have been particularly important in research within the Middle Paleolithic, a period that is key for understanding Neanderthal biological and cultural evolution. The complexity of the archaeological record in such a remote time requires great care in excavation and interpretation, and new archaeological science methods enable us to better assess and control for site formation processes as well as extract data which, previously, was unattainable. This session gathers results from a range of recent applications of interdisciplinary approaches to the Middle Paleolithic of the Balkan peninsula with the goal of documenting Neanderthal occupations in this region. The outcome of this growing body of research helps us contextualize the key role of this region within Neanderthal evolution.

ABSTRACTS

1 RESEARCH ON NEANDERTHAL SETTLEMENT IN THE CENTRAL BALKANS

Mihailovic, Dušan (University of Belgrade - Faculty of Philosophy) - Mihailović, Bojana (National Museum of Serbia) - Majkić, Ana (University of Belgrade - Faculty of Philosophy) - Plavšić Gogić, Senka (University of Belgrade - Faculty of Philosophy) - Dragosavac, Sofija (University of Belgrade - Faculty of Philosophy) - Dimitrijević, Vesna (University of Belgrade - Faculty of Philosophy) - Milošević, Stefan (University of Belgrade - Faculty of Philosophy) - Pajović, Danilo (University of Belgrade - Faculty of Philosophy) - Roksandic, Mirjana (University of Winnipeg)

Recent research into Middle Palaeolithic settlement in the Central Balkans has been systematic. Field surveys of cave and open-air sites have covered the entire expanse of central and eastern Serbia, spanning various topographical and ecological zones. Special attention was given to areas neighbouring sources of raw materials, which were extensively surveyed due to their importance in tool production. During the reconnaissance, more than 100 Paleolithic sites were recorded, of which about 30 were tested. Various geoarchaeological and bioarchaeological methods—including sampling materials for aDNA analysis—were utilized in the investigation of specific sites, notably Velika and Mala Balanica, Pešturina, Šalitrena pećina and Kozja and Mala pećina. The acquired data has offered preliminary insights into the settlement patterns, on-site activities and the technical and economic behaviours of Neanderthal groups inhabiting the region during the Middle and Late Pleistocene.

Funding from the Science Fund of the Republic of Serbia - Programme grant agreement no. 7746827 (NEEMO).

2 LATE NEANDERTHAL OCCUPATION OF BACHO KIRO CAVE (BULGARIA)

Tsanova, Tsenka (Department of Chemistry G. Ciamician, Alma Mater Studiorum, University of Bologna, Italy; Department of Human Origins, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Rezek, Zeljko (Chaire de Paléanthropologie, CIRB, Collège de France, Université PSL, CNRS, INSERM, 75005 Paris, France) - Aldeias, Vera (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve, Campus de Gambelas, Portugal; Department of Human Origins, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Delvigne, Vincent (CNRS, UMR 8068 TEMPS, University of Paris X - Nanterre, Nanterre, France & Service de Préhistoire, University of Liège, Liège, Belgium) - Lauer, Tobias (University of Tübingen, Tübingen, Germany) - McPherron, Shannon (Department of Human Origins, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Slon, Viviane (Department of Evolutionary Genetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; The Dan David Center for Human Evolution and Biohistory Research, Tel Aviv University, Tel Aviv, Israel) - Talamo, Sahra (Department of Chemistry G. Ciamician, Alma Mater Studiorum, University of Bologna, Italy) - Sirakov, Nikolay (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences, Sofia, Bulgaria) - Hublin, Jean-Jacques (Chaire de Paléanthropologie, CIRB, Collège de France, Université PSL, CNRS, INSERM, 75005 Paris, France; Department of Human Origins, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

Bacho Kiro Cave, located on the northern slopes of the Balkan Mountains in central Bulgaria, is one of the reference sites for the Middle-to-Upper Paleolithic transition in Europe. Excavated by D. Garrod and then by B. Ginter and J.K. Kozłowski, ninety and fifty years ago, respectively, it has been best known for the transitional “Bachokirian” lithic industry that we recently reported as an Initial Upper Paleolithic (IUP) associated with the earliest *Homo sapiens* in Europe. Between 2016 and 2021, our excavations also uncovered new lithic and faunal material from the underlying Middle Paleolithic (MP), Layer K (corresponding to layers 12 and 13 of the previous excavation). Here we will report results of this late MP context, compared to the overlying IUP record of Layers I and J but also to other late MP deposits from this geographical region (namely, Temnata, Kozarnika, and Samuiltsa Caves). The OSL date for Layer K is 61 ± 6 ka. However, due to the sediments present in this layer that were likely originating from inside the cave and being redeposited, this OSL age should be regarded as a maximum age. More probable age of Layer K should be constrained between this date and the ^{14}C age of the lower part of the overlying Layer J, which is > 51 ka. The lithic technology is predominantly Levallois, with raw material of local origin very different from the imported flint in the IUP. Bones and lithics were also found in dark colored sediments mixed with charcoal and indicating possible use of fire in the lower part of this layer. The dietary focus was mainly on large-to-medium herbivore species and it involved exploitation of *Bos/Bison*, *Cervidae*, *Equidae*, and *Caprinae*. In addition, mtDNA from the sediment encompasses signals from *Bovidae*, *Cervidae*, *Elephantidae*, *Equidae*, *Felidae*, *Hyaenidae*, *Rhinocerotidae*, *Ursidae* and *Neanderthals*.

3 MULTI-DISCIPLINARY APPROACHES TO THE STUDY OF LATE NEANDERTHALS AT CRVENA STIJENA, MONTENEGRO

Monnier, Gilliane (University of Minnesota) - Tostevin, Gilbert (University of Minnesota) - Pajovic, Goran (National Museum of Montenegro) - Bakovic, Mile (Center for Conservation and Archaeology of Montenegro) - Borovinic, Nikola (Center for Conservation and Archaeology of Montenegro) - Morin, Eugene (Trent University) - Mallol, Carolina (Universidad de la Laguna; Archaeological Micromorphology and Biomarkers Lab) - Boaretto, Elisabetta (Weizmann Institute of Science) - Vidal Matutano, Paloma (Universidad de La Laguna) - Porter, Samantha (University of Minnesota)

The rock shelter of Crvena Stijena in Montenegro preserves a 20-meter-deep sequence of deposits spanning the Middle Paleolithic through the Bronze Age. This continuous record of human occupation makes it one of the most important archaeological sites in the Balkan peninsula. Since 2017, our team has been excavating the late Middle Paleolithic levels, which are characterized by a large and well-preserved faunal assemblage; a comparatively small lithic assemblage composed of a wide variety of raw materials; and extensive evidence of fire use, in the form of stratified layers of charcoal, wood ash, and burnt bone. Site formation processes are complex, hampered by a tectonically active environment which periodically released car-sized boulders from the roof of the shelter into the deposits. We present our main research questions and methodology, as well as results from some of the numerous studies our team has deployed to reconstruct hominin behavior while controlling for site formation processes.

4 ELEMENTS OF NEANDERTHAL FIRE TECHNOLOGY AND CLIMATE FROM A MICROSTRATIGRAPHIC STUDY OF UNIT XXIV AT CRVENA STIJENA, MONTENEGRO

Mallol, Carolina (Universidad de La Laguna) - Jambrić, Enríquez, Margarita (Universidad de La Laguna) - Monnier, Gilliane (University of Minnesota) - Tostevin, Gilbert (University of Minnesota) - Pajović, Goran (National Museum of Montenegro)

Multiproxy microstratigraphic research can provide clues about behavioral and paleoenvironmental aspects of past societies. At Crvena Stijena (Montenegro), a Middle Palaeolithic site under current investigation, lipid biomarker data has informed us about the paleohydrological evolution of the entire sequence, and archaeomagnetism and Raman microspectroscopy have provided useful clues about the formation of Unit XXIV, a rich archaeological stratified deposit with visible combustion residues. Here, we present coupled soil micromorphology and lipid biomarker data from Layer XXIV that reveal elements of fire technology, climate, and some of the taphonomic processes associated with this unit. These data indicate a well-preserved, primary record of recurrent human activity involving fire, syn- and post-depositionally deformed by cryogenic processes. These processes did not obliterate the primary microstratigraphy, which shows a complex sequence including in situ bone and charcoal-rich hearths, ash dumps, and trampled combustion residues. The Layer XXIV microstratigraphic sedimentary record shows great potential to elucidate different aspects of Middle Paleolithic fire technology, human occupation intensity, and human-climate interactions.

5 NEANDERTHAL FAUNAL EXPLOITATION IN THE MIS 5-3 WESTERN BALKAN PENINSULA: ZOOARCHAEOLOGY RESULTS FROM THE EARLY SEQUENCE OF CRVENA STIJENA, MONTENEGRO

Bao, Yige (University of Minnesota) - Collins, Matthew (University of Cambridge; University of Copenhagen) - Morin, Eugène (Trent University) - Munoz-Alegre, Marta (University of Cambridge) - Tostevin, Gilbert (University of Minnesota) - Monnier, Gilliane (University of Minnesota)

The site of Crvena Stijena, situated in Montenegro, features extensive Middle Paleolithic deposits, making it one of the most important sites in Southeast Europe. Research at Crvena Stijena began in the late 1950s. However, the faunal collections from the early excavations have been dispersed or lost, while the later excavations have focused on the most recent Middle Paleolithic layers, leaving the faunal data prior to MIS 3 uncertain. To remedy this problem, vertical excavation of the south and east profiles was carried out in order to produce faunal samples from earlier layers (back to MIS 4 and possibly MIS 5). Unidentifiable bone fragments underwent analysis through ZooMS (Zooarchaeology by Mass Spectrometry), offering preliminary faunal sequence information. By comparing the faunal data from the Crvena Stijena site with the published data from contemporaneous sites in the western Balkan Peninsula, this study provides a forward-looking perspective on the early sequence at the CS site.

6 PLAYING WITH FIRE - A DISCIPLINARY APPROACH AIMED AT RESEARCHING THE FIRE THROUGH THE STUDY OF BURNED LITHICS

Dobos, Adrian (Institute of Archaeology “Vasile Parvan”, Bucharest)

Fire has long been supposed as an essential tool for Late Pleistocene hominins in Europe, but the specifics of its use, particularly in the Upper Paleolithic Balkans, has remained understudied. We report on an experimental research project in which burned lithics were used as proxies for the investigation of the fires which have altered them. Specifically, we study the physical changes occurring at different temperatures and identify patterns that could be correlated with temperatures and duration of open fires.

We used cherts with the same properties as those knapped by the Paleolithic communities from the investigated sites and replicated fire exposure at several temperatures and for different time durations. We examined and quantified the changes occurred to the lithics in terms of color, density, and crazing and found that certain colorations can be correlated to high fire temperature and others to low temperature, crack patterning is indicative of temperature range, and density loss is both dependent of fire temperature and fire duration. Following the same criteria, we applied these results to two Paleolithic sites from Romania; Românești-Dumbrăvița and Bistricioara-Lutărie 3, spanning the proto-Aurignacian to the Epigravettian. These sites have been excavated in the past five years with point-proveniencing. The results indicate that heavy combustion areas were present in the proto-Aurignacian level of Românești, and could only be identified through the properties of the burned lithics, as other features related to fire (charcoal, ashes) have not preserved. At the site of Bistricioara-Lutărie 3, despite of hearth preservation, the use of fire seems scantier.

Our research has implications on fuel economy research in the Upper Paleolithic, as well as on the behavior related to the fire. The research was funded through the CNCS – UEFISCDI grant TE 99/2022.

7 RECENT CONTRIBUTIONS TO LITHIC RAW MATERIAL RESEARCH AT CRVENA STIJENA (MONTENEGRO)

Marojevic, Vasilije (University of Minnesota) - Kilibarda, Zoran (Indiana University Northwest) - Siurek, Alec (Indiana University) - Monnier, Gilliane (University of Minnesota) - Tostevin, Gilbert (University of Minnesota)

Crvena Stijena houses one of the most prominent Neanderthal occupations in SE Europe. The site is located on the border between Montenegro and Bosnia and Herzegovina, in a landscape that geographically and geologically belongs to the Outer Dinarides. This area has been recognized as Europe's most extensive continuous karst landscape, exhibiting a sheer diversity of landforms whose formation predates the onset of Pleistocene glaciations. Even though Crvena Stijena has been an object of anthropological inquiry since its discovery in 1954, it remains unknown how the diverse geological, topographic, and ecological setup of the Outer Dinarides influenced site frequentation and human migratory potential. Here, we discuss recent contributions from an ongoing lithic raw material study that is part of a broader collaborative endeavor to investigate off-site behaviors practiced by Neanderthal groups settling the landscape around Crvena Stijena during MIS 3. The preliminary phase of the project incorporated fieldwork activities conducted in the summers of 2022 and 2023 focused on locating and sampling sources of chert and other knappable raw materials in Western Montenegro within a 50 km radius from Crvena Stijena. We present the spatial distribution of these outcrops and use data from geochemical (XRF) and petrographic studies to discuss their potential utility for prehistoric tool production. We also outline future steps necessary for reconstructing Neanderthal off-site behaviors and addressing anthropologically relevant topics such as lithic raw material procurement taskscape, land use, and the directionality in mobility.

8 THE IMPACT OF SIZE CUTOFFS IN ARTIFACT RECOVERY AND LITHIC ANALYSIS FOR THE MICRO-MOUSTERIAN AT CRVENA STIJENA (MONTENEGRO)

Tostevin, Gilbert (University of Minnesota) - Marojević, Vasilije (University of Minnesota) - Monnier, Gilliane (University of Minnesota)

The term Micro-Mousterian has long been applied across Europe to label Mousterian assemblages characterized by small dimensions. In the Balkan Peninsula, a number of Middle Paleolithic industries have been assigned to the Micro-Mousterian, despite wide technological and typological variation among assemblages. While researchers generally apply the label to Mousterian assemblages composed of smaller-than-average cores, flakes, and retouched tools, opinions about the label's fundamental meaning are widely divergent. Is the Micro-Mousterian the inevitable result of raw materials that do not allow the production of large flakes, due to small package sizes and/or low quality? Does it reflect limited local toolstone availability that encourages extensive resharpening of retouched tools and the prolongation of core use-lives? Or, does it reflect hominins' intentional exploitation of small cutting edges? Within the Balkan Peninsula as well as within the Old World archaeological literature on lithic miniaturization (sensu Pargeter & Shea 2019) in general, each hypothesis may adequately explain a particular assemblage, while other assemblages are best accounted for by a combination of the factors. Yet the predictions for all of these hypotheses are impacted by how archaeologists limit assemblage composition through size cutoffs for both artifact recovery and lithic analysis. How does our understanding of lithic economy change depending on analytical size cutoffs? If one recovers and studies lithic artifact production below 2cm or even 1cm, how does this change our potential identification of a given Mousterian facies in relation to the Micro-Mousterian? To explore this question at the interface between behavioral archaeology & geoarchaeology, we report on the analysis of the Late Middle Paleolithic layers at Crvena Stijena, Montenegro, excavated by a large interdisciplinary team since 2017, using an excavation protocol of 100% flotation and double-redundant recovery of lithic artifacts to a 1mm minimum size limit.

553 ADVANCING PALEOLITHIC INTRA-SITE SPATIAL ANALYSIS: NEW METHODS, APPLICATIONS, AND INTERPRETATION

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Cobo-Sánchez, Lucía (The Interdisciplinary Centre for Archaeology and the Evolution of Human Behavior (ICArEHB), Universidade do Algarve) - Arteaga-Brieba, Andion (Universidad Rovira i Virgili, Departament d'Història i Història de l'Art; Institut Català de Paleoeologia Humana i Evolució Social (IPHES)) - Merino-Pelaz, Amanda (Universidad de Alcalá, Departamento de Historia y Filosofía) - Moclán, Abel (Institute of Evolution in Africa (IDEA)) - Villaescusa, Lucía (Universidad de Alcalá)

Session format: Regular session

The exploration of spatial patterns within Paleolithic sites is a fundamental aspect of archaeological research. It serves as a critical lens through which to explore site utilization and site formation processes. Archaeologists have long employed spatial analysis, but recent advancements in spatial statistics and modeling have significantly enriched their

interpretive potential. This session seeks to address pivotal questions surrounding the detection, analysis, and interpretation of intra-site spatial patterns in Paleolithic contexts, and invites researchers to contribute to a dialogue on recent methodological advancements and diverse applications of intra-site spatial analysis in Paleolithic archaeology.

This session has a dual focus. On the one hand, we aim to explore methodological innovation, and welcome presentations and discussions on new approaches, including GIS analysis, cluster detection, and spatial statistics, among others. The goal is to assess the efficacy, applicability, challenges, and pitfalls of these methodologies in order to foster methodological language consistency and rigorous applications to the archaeological record, alongside inspiring further methodological advancements. On the other hand, we aim to highlight and understand the potential interpretative power and boundaries of spatial analysis in addressing and advancing our understanding of site formation processes, palimpsests, and behaviors in Paleolithic sites.

Additionally, experimental work in the field of spatial analysis is an issue that has been underexplored thus far. Likewise, we have limited knowledge about the spatial patterns resulting from the activities of modern hunter-gatherers. Therefore, experimental, or ethnographic proposals that help us gain a better understanding of past behaviors will be greatly valued.

In summary, this session aims to facilitate knowledge exchange and collaboration among researchers in the field of spatial analysis in Paleolithic archaeology. We anticipate a mix of methodological, experimental, and case study presentations that together will enhance our understanding and methods for analyzing spatial patterns of Paleolithic sites.

ABSTRACTS

1 EVERYTHING EVERYWHERE ALL AT ONCE. THE IMPORTANCE OF MULTIDISCIPLINARY IN PALAEOOLITHIC SPATIAL STUDIES: THE CASE OF COVA GRAN

Sanchez-Romero, Laura (Centre d'Estudis del Patrimoni Arqueologic, Autonomous University of Barcelona; Human Evolution Research Center, University of California, Berkeley) - Benito-Calvo, Alfonso (Centro Nacional de Investigación sobre la Evolución Humana) - Martinez-Moreno, Jorge (Centre d'Estudis del Patrimoni Arqueologic, Autonomous University of Barcelona) - Mora Torcal, Rafael (Centre d'Estudis del Patrimoni Arqueologic, Autonomous University of Barcelona)

Spatial analyses are characterized by the use of multiple and diverse tools to analyze data from all the different disciplines that converge in the study of a site. With these tools and data, spatial studies aim to infer the processes, both cultural and natural, that have intervened in the formation of a deposit and its preservation until the time of its excavation and study. Therefore, both the excavation and data collection in the field, as well as the processing of data from different disciplines and the tools used for their analysis are equally key to spatial studies.

In this sense, the Cova Gran site is an example of the consistency of data collection in the field and its subsequent processing in the laboratory. This is essential to address all following studies, because without a good and careful recording nothing that is done afterwards is valid, since we cannot "re-excavate" and take these data again.

The spatial analysis of level 497D of Cova Gran has allowed us to work with a huge database that includes data from fauna, lithics, hearths, geology and sedimentology, and refitting analysis, which have been integrated to infer the moments of occupation and the activities carried out in the rock shelter. This study, in line with many others, highlights the importance of integrating geostatistical tools along with the rest of the tools used for data analysis interpreting site formation processes. It also focuses on the fact that these statistical data lose certain meaning if they are not supported and contrasted with field data and the data obtained by the other disciplines that are also involved in the analysis of the site.

2 BEYOND LITHOSTRATIGRAPHY: EXPLORING VERTICAL DISTRIBUTION OF ARTIFACTS AS A PROXY FOR FORMATION PROCESSES AT THE UPPER PALAEOOLITHIC SITE OF VALE BOI

Galfi, Jovan (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB)) - Barbieri, Alvisé (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB)) - Gomes, Ana (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB)) - Bicho, Nuno (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB)) - Cascalheira, João (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB))

The interpretation of archaeological materials often relies on their association with lithostratigraphic units. While this association is a vital aspect of any archaeological excavation, the definitive interpretation of these units is only achieved after the excavation has concluded, often differing from the preliminary units identified during the excavation process. This discrepancy poses a challenge to our interpretation of the archaeological materials and significantly impacts our understanding of the human past. Addressing these issues can be done through spatial analysis of the vertical distribution of archaeological materials. Despite the widespread adoption of Total Station for artifact docu-

mentation and the extensive data it generates, the vertical projections of points are rarely used for anything other than plotting them within their litho-stratigraphic units. By examining the vertical variability of artifacts and comparing it with other proxies for site formation (including artifact orientations and geoarchaeological data), we conducted a thorough study of the Terrace area of Vale Boi, a multi-component site located in Southern Portugal. Our approach allowed us to discuss the differences between litho-stratigraphic and density-based horizons and how this impacts site-use interpretations.

3 SPATIAL ORGANIZATION OF THE GRAVETTIAN MAMMOTH HUNTERS' SITES

Wilczynski, Jaroslaw (Institute of Systematics and Evolution of Animals) - Novák, Martin (Institute of Archaeology, Czech Academy of Sciences, Brno) - Händel, Marc (Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna) - Lengyel, Gyorgy (Magyar Nemzeti Múzeum, Budapest) - Matyaszczyk, Lena (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków) - Oszczepalińska, Oliwia (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków) - Oberc, Tomasz (Institute of Archaeology and Ethnology, Polish Academy of Sciences (IAE PAS), Kraków) - Boriová, Sonia (Institute of Archaeology, Czech Academy of Sciences, Brno)

Gravettian layers at loess localities in the Western Carpathian forelands in particular Dolní Věstonice I (Czech Republic) and Kraków Spadzista (Poland), provided assemblages of Late Pleistocene fauna with thousands of bones and teeth of mammoth. According to various studies carried out over the course of more than 100 years, interpretations for the formation of these assemblages range from human transport of body parts and/or skeletal elements from other locations, to hunter-gatherer use of bones and ivory from carcasses of naturally deceased mammoths, and to interpreting the remains as direct consequence of a hunting strategy specialised on mammoth. Therefore, according to the present stage of research, both natural and/or anthropogenic agents may account for the creation of the archaeological sites, which in addition may have seen recurrent human occupations that eventually produced stratified deposits and/or palimpsests of mixed assemblages reflecting many different episodes of activities.

In our lecture, we would like to present the results of fieldwork conducted at Dolní Věstonice I and Kraków Spadzista sites recently, which shed light on the interpretation of these accumulations. For the purposes of our work, we used a dataset obtained from excavations where all artifacts and bones were recorded in three dimensions. We observed refittings of lithic artifacts and bones both horizontally and vertically. We compared the density of artifacts within individual trenches as well as the types of artifacts and bones deposited in specific places. Additionally, we prepared rose diagrams showing azimuths of long axes of long bones and ribs for mammoth bone accumulations. On this basis, we were able to trace the spatial and horizontal distribution of all materials and the post-depositional arrangement of cultural layers, which had a significant impact on the information obtained during excavations.

Acknowledgement: Our research was supported by the ERC Consolidator Grant "MAMBA", reg. nr. 101045245.

4 ASSESSING THE SPATIAL FEATURES OF NEANDERTHAL OCCUPATIONS AT NAVALMAÍLLO ROCK SHELTER (SPAIN): IDENTIFICATION OF A SINGLE-CLUSTER PATTERN THROUGH SPATIAL MODELLING

Moclán, Abel (Institute of Evolution in Africa (IDEA), University of Alcalá de Henares) - Huguet, Rosa (IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Unit associated to CSIC. Geológicas) - Baquedano, Enrique (Archaeological and Paleontological Museum of the Community of Madrid; Institute of Evolution in Africa (IDEA), University of Alcalá de Henares)

Spatial intra-site analyses of Palaeolithic sites are a tool traditionally used inductively to examine the spatial characteristics of human occupations. These approaches often involve a high degree of subjectivity, as the researcher visually analyses the results of spatial tests. However, this method of statistically analysing spatial data is not the standard approach in other fields using spatial analyses. In addition to the typical tests used in Archaeology, spatial modelling is often performed, allowing for a deep analysis of spatial point patterns. These modelling techniques also help to verify if visually made observations indeed hold statistical significance.

In this presentation, we show one of the first archaeological approximations conducted on a Neanderthal site, the Navalmaillo Rock Shelter (Pinilla del Valle, Madrid, Spain). Through various regressions, we analysed the distribution of faunal remains and lithic tools in the F level of the site, considering the spatial distribution of hearths. This has allowed us to statistically demonstrate that the spatial distribution of the level, previously identified as a hunting camp, can be statistically characterized as a 'single-cluster spatial pattern'. This pattern results from a combination of factors, such as the arrangement of hearths and the topography of the shelter.

This aspect holds significant interest in deciphering the spatial behaviours of Neanderthals, showing their remarkable adaptability to the utilized space based on the nature of occupation and its functionality.

5 TRACING THE HUNTER: SPATIAL ANALYSIS OF A KILL-BUTCHERING SITE. THE CASE OF TD10.2-BB, GRAN DOLINA, ATAPUERCA

Arteaga Briebe, Andion (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili (URV), Tarragona, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain) - Cobo-Sánchez, Lucía (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve, Faro, Portugal) - Rodríguez-Hidalgo, Antonio (Consejo Superior de Investigaciones Científicas, Instituto de Arqueología de Mérida (CSIC-Junta de Extremadura), Mérida, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain) - Saladié, Palmira (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili (URV), Tarragona, Spain) - Mosquera, Marina (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili (URV), Tarragona, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain) - Ollé, Andreu (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili (URV), Tarragona, Spain)

In recent years, the field of prehistoric intrasite studies has witnessed a significant increase in spatial geostatistical analyses, offering new perspectives on the spatial organisation of ancient populations. This research explores the application of spatial point pattern analysis to sublevel TD10.2-BB in Gran Dolina site, Atapuerca. Dated to approximately 400 ka., this deposit is characterised as a monospecific bison kill-butcher site, indicative of mass-communal predatory behaviours. The primary aim of this study is to assess the spatial integrity and resolution of the site, and to analyse the spatial imprint of the activities carried out, attempting to ascertain the extent to which it is feasible to discuss a structured use of space.

To achieve this, the research examines the distribution of lithic and faunal assemblages and their spatial correlation, using a comprehensive dataset that includes raw material characterisation, technological analysis, zooarchaeological insights, and taphonomic data, further enriched by including lithic refits. Various analytical tools, such as Kernel density estimation, modified K-function, relative risk, and nearest-neighbour analyses, are employed to address spatial intensity, correlation, and multitype analyses.

The research has delineated distinct activity areas within the site, highlighting a clear spatial segregation between knapping and butchering activities. Additionally, results reveal a consistent pattern of use of the space over different occupation events, interpreted as a pragmatic adaptation to the cavity's physical constraints. This recurrent behaviour suggests an intentional organisation of activities within the available space, even in the absence of anthropogenic structures that typically serve as the backbone of spatial organisation.

Nevertheless, the study confronts interpretative challenges, particularly concerning the lack of positive correlations in areas of high intensity, which exhibit regular patterns. This discrepancy may potentially be attributed to the weak clustering strength within these zones, pointing to a complexity in spatial dynamics not fully captured by the current analytical approaches.

6 NEANDERTHALS INDOORS. CONTRIBUTIONS OF FAUNAL REFITTING TO THE INTRA-SITE SPATIAL ANALYSIS OF LEVEL Q AT ABRIC ROMANÍ

Gabucio, Maria Joana (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA). Zona Educativa 4, Campus Sescelades URV (Edifici W3), 43007, Tarragona, Spain; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002, Tarragona, Spain) - Téllez, Edgar (Centro Nacional de Investigación sobre la Evolución Humana (CENIEH), P.º Sierra de Atapuerca, 3, 09002 Burgos, Spain) - Marín, Juan (Department of Prehistory and Archaeology, Universidad Nacional de Educación a Distancia, UNED, Madrid, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA). In Palaeolithic research, intra-site spatial analysis is a crucial topic as it contributes significantly to the study of both formation processes and human behaviour. Refitting studies are particularly interesting because they provide unequivocal evidence of a direct relationship between several remains. Refits offer spatiotemporal information, linking different areas and demonstrating synchronic or diachronic relationships within the record. However, the time, space and effort required has slowed down their generalisation, especially in the case of bone refits.

This work presents the faunal refitting analysis of level Q (ca. 58 ky BP) at Abric Romaní (Capellades, Catalonia, Spain), a key site to understand Neanderthal behaviour. This analysis includes anatomical and mechanical refits. GIS and geostatistical methods are applied to explore the distribution, density, clustering and orientation of the refits. The zooarchaeological and taphonomic data of the remains are considered. The objectives are: 1) shedding light on the formation processes, 2) determining which connection lines are due to human activity and interpret them, 3) contributing to the interpretation of the occupational dynamics.

The refits identified so far (108 groups, 254 remains, and 163 connecting lines) yield interesting results. Most of the connecting lines are short, especially between the mechanical refits broken when dry, indicating excellent preservation. However, several lines are > 2 m. Some of them link Qa (in situ subassemblage) with Q (subassemblage with evidence of taphonomic remotion), but they are few and < 2.3 m, suggesting that the formation of the travertine platform above the level caused limited short-distance movements. In contrast, connections > 2.3 m between different accumulations correspond to mechanical refits broken when green and, once natural causes are ruled out, may be related to anthropogenic activity. These results are crossed with those from other disciplines to reconstruct the settlement dynamics that gave rise to level Q.

7 STATISTICAL MODELLING FOR QUANTIFYING CLUSTERING IN PALEOLITHIC ASSEMBLAGES: CHARACTERIZING HIGH-DENSITY AREAS OF ABRIC ROMANÍ QA

Merino-Pelaz, Amanda (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili (URV)) - Cobo-Sánchez, Lucía (The Interdisciplinary Centre for Archaeology and the Evolution of Human Behavior (ICArEH), Universidade do Algarve) - Saladié, Palmira (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili (URV); Unit Associated to CSIC, Departamento de Paleobiología. Museo Nacional de Ciencias Naturales) - Chacón, M. Gema (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili (URV); UMR 7194 - Histoire Naturelle de l'Homme Préhistorique (CNRS/MNHN/UPVD), Musée de l'Homme) - Vallverdú, Josep (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili (URV); Unit Associated to CSIC, Departamento de Paleobiología. Museo Nacional de Ciencias Naturales)

The detection of clusters in Paleolithic sites usually relies on visual methods lacking statistical significance (intensity analyses, K-means) or requiring quantified variables for mapping them (Getis-Ord G_i^* , Anselin Local Moran's I). Additionally, mixing high-density areas (where numerous remains accumulate in specific locations) with clusters (where those remains exhibit spatial statistical correlation) is common, complicating accurate clustering characterization within archaeological assemblages.

Fitting spatial data into explicitly formulated models is a robust statistical approach to better understand archaeological patterns. Modelling processes involve creating a representation that approximates the underlying pattern, obtaining several metrics (e.g., cluster strength, sibling probability) that assess its clustering degree. Unlike other methods, no estimation of individual clusters is required, providing a genuine approximation to the clustering of the pattern.

This study quantifies and characterizes clustering at a Neanderthal campsite in Abric Romaní's Qa stratigraphic unit (Spain). The excellent preservation and resolution of this unique settlement make it an ideal candidate. Bones, lithics, and overall patterns are modelled to discern differences among remains. Four fitting methods are tested to optimize modelling for Paleolithic assemblages. Finally, results are compared with other Upper Paleolithic campsites analogous in terms of functionality and preservation to reveal spatial behavior disparities between Neanderthal and Anatomically Modern Human (AMH) hunter-gatherers.

Results indicate a medium to high clustering in Abric Romaní's Qa level. Bones exhibit stronger clustering, and mean distances suggest smaller lithic clusters. Significant differences between Abric Romaní and sites like Pincevent or Etiolles indicate more concentrated and isolated clusters among Upper Paleolithic campsites. This could imply greater structuring of the space among AMHs and differing social organizations between both groups, although it is currently unclear what those differences might entail. While site context and taphonomic processes may affect clustering, results are consistent with previous hypotheses regarding the differences in Neanderthals and AMHs spatial organization.

8 SPATIAL MODELING OF EXPERIMENTAL KNAPPING DISTRIBUTIONS: REFINING THE CHARACTERIZATION OF PALEOLITHIC ACTIVITY AREAS

Cobo-Sánchez, Lucía (The Interdisciplinary Centre for Archaeology and the Evolution of Human Behavior (ICArEH), Universidade do Algarve) - Merino-Pelaz, Amanda (Institut Català de Paleoeologia Humana i Evolució Social (IPHES); Universitat Rovira i Virgili) - Arteaga-Bribea, Andion (Universitat Rovira i Virgili; Institut Català de Paleoeologia Humana i Evolució Social (IPHES))

Understanding spatial distributions of lithic artifacts within Paleolithic sites is essential for interpreting past human behaviors. A major challenge lies in accurately distinguishing between areas of high artifact density and true clusters. This is critical for identifying specific activity areas and their unique spatial signatures in the archaeological record. Our analysis of spatial patterns from experimental knapping aims to establish a reference baseline for precise comparisons with archaeological artifact distributions.

We selected 13 planimetries from published knapping experiments covering a range of raw materials, techniques, and knapper positions. Utilizing the inhomogeneous L-function along with statistical modeling techniques for cluster analysis, we examined spatial distributions to ascertain if high-density areas constitute actual clusters or are more accurately represented within an inhomogeneous Poisson pattern. Subsequently, we conducted a Hierarchical Clustering on Principal Components (HCPC) analysis with the derived cluster parameters to classify and compare experimental outcomes with knapping activity areas in the Upper Paleolithic sites of Etiolles and Pincevent, assessing if these experiments spatially align with archaeological lithic assemblages.

Results reveal that experimental lithic distributions exhibit strong clustering, despite L-functions being unable to capture agglomerative tendencies at short distances. For Etiolles, the delimited knapping areas significantly diverge from the experimental reference sample, aligning more closely with inhomogeneous Poisson patterns, suggesting potential factors not captured in the experiments, such as taphonomic processes or movement of lithics to other areas.

Conversely, the clustering observed at Pincevent resembles that of the experimental data, indicating consistency in knapping practices between the experiments and this site.

This study sets a comparison baseline for identifying knapping areas in archaeological contexts, enhancing intra-site spatial analysis, and advancing our understanding of early human activities. Future research should aim to incorporate greater experimental variability to increase the accuracy and robustness of these analyses.

9 TWO METHODS AND TWO SITES: A COMPARISON OF INTRA-SITE SPATIAL ANALYSIS METHODS AT TWO LATE PLEISTOCENE OPEN-AIR SITES

Clark, Amy (Harvard University)

One of the difficulties with intra-site spatial analysis is that the methods utilized are often site specific. There are numerous reasons for this, including site formation processes, type of features, characteristics of the excavated remains, and the nature of the recorded data. Methods that are tailored to a single site can often be very productive and reveal patterns not otherwise detectable. However, there is also a need for methods which serve to directly compare the spatial patterning at multiple sites. In my own intra-site analysis of open-air Paleolithic sites, I strove to develop methods which could be applied at numerous site types. These methods helped me to understand the formation of spatial patterning through onsite lithic production and use. However, because I was focusing on data pertaining to lithic density and lithic refitting, these methods could not provide information on other types of behaviors. In this presentation, I will contrast my own methods with those developed by Todd Surovell for the terminal Pleistocene site of Barger Gulch in Wyoming. Surovell focused on the relative frequencies of burned artifacts which provided information about hearth use, cleaning, and the existence of structures – very different kinds of information from those yielded by my own methods. To explore the relative merits of these two methods, and to see what they reveal about spatial organization, I apply my methods to Barger Gulch, and Surovell's methods to Landry, a Solutrean site which produced particularly clear results from my own analysis.

10 DEVELOPING STANDARDISED GEOSPATIAL ANALYSIS PROCEDURES: A METHODOLOGICAL FRAMEWORK FROM THE LOWER GALLERY OF LA GARMA (SPAIN)

García-Noriega, Carlos (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC)) - Portero, Rodrigo (University of Salamanca) - Ruiz-Cabanzón, Alba (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC)) - Ontañón, Roberto (International Institute for Prehistoric Research of Cantabria (IIIPC); Prehistory and Archaeology Museum of Cantabria) - Arias, Pablo (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC))

In the digital era, our ability to manage and analyse large volumes of data has increased significantly, allowing for complex computational processes. However, we still face the lack of a standardised and accessible method that offers a uniform system for the collection, management, preservation, and analysis of data, adaptable to any type of research. To address this need, this paper introduces an innovative methodology for the collection and analysis of archaeological geospatial data, with a special focus on the floors of two Palaeolithic structures, I-A and I-C, from the Lower Gallery of La Garma (Cantabria, Spain). The main objective is to establish a methodological guide that integrates advanced digital techniques and open source-based programming, aiming to standardise the collection and analysis of geospatial data, providing tools for the development of customised methods and the automation of analytical processes.

The results include the development of a robust and adaptable method, applicable both in the field and in the laboratory, and designed to meet specific needs in geospatial characterisation, management and analysis. This methodology is presented as an accessible model, integrating advanced in situ spatial analysis techniques such as Ring and Sector analysis, Kernel analysis, Moran I spatial autocorrelation and clustering techniques. The effectiveness and robustness of this method are reinforced by its foundation in open-source software and the support of a large user community, ensuring its sustainability and continuous improvement.

11 3D RECONSTRUCTION AND SPATIAL ANALYSES: AN INTEGRATED APPROACH TO EXPLORE THE PALAEOLOGIC USE OF LIVING SPACE AT SAMBUCCO CAVE (ITALY)

Pizzolo, Giovanna (University of Siena - Department of History and Cultural Heritage) - Tessaro, Carlo (University of Siena - Department of History and Cultural Heritage) - Faraoni, Matteo (University of Ferrara Dipartimento di Studi Umanistici - Sezione di Scienze Preistoriche e Antropologiche) - Galiberti, Attilio (University of Siena - Department of History and Cultural Heritage)

The paper discusses some experiences related to intra-site analysis and 3D reconstruction of the Grotta del Sambucco, a cave inhabited by Man since the Upper Palaeolithic. The cave is located in Massa Marittima (Grosseto District, Central Italy) and is accessible through a central conoid. The cavity was formed due to the collapse of the vault's summit in ancient times opened in a travertine formation. Over the millennia, the conoid has allowed not only the en-

trance of Man but also, by water, of various materials that have formed the whole archaeological deposit, comprising a series of layers, ranging from the Historic period to Prehistory (Neolithic and different phases of Upper Palaeolithic: Gravettian and Epigravettian).

The recording activities of the excavation recently include the acquisition of the vault and base of the cave through three-dimensional documentation. This need had arisen with regard to the development of the intra-site GIS aimed at a contextualisation of the prehistoric paleosurfaces within the cavity.

The integration of features related to different categories of finds and layers in a three-dimensional space has been accomplished. This process allows for the identification of cluster distributions and possible functional focus. The characterisation of these areas can provide greater insight into the human activities that took place in the cave. Moreover, one goal of this integrated approach is to split up, decompose and recombine the archaeological palimpsests in a dynamic way.

In this perspective, we need to reconstruct the internal layouts of the cavity to investigate the dynamic of the hypogeal environment. Such virtual reconstruction, obtained through photogrammetry, allows us to explore the morphological characteristics that set the scene for the interaction between Man and cave during the Upper Palaeolithic. In this way we can set up an integrated system to analyse site formation processes, palimpsests, and Upper Palaeolithic behaviours.

556 EXPLORING ANCIENT SOLUTIONS FOR MODERN CHALLENGES: ARCHAEOLOGICAL INSIGHTS INTO FOOD SYSTEMS AND ADAPTATIONS TO CHANGING ENVIRONMENTS

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Depaermentier, Margaux (Vilnius University, Faculty of History, Department of Archaeology, Lithuania) - Kempf, Michael (University of Basel, Department of Environmental Sciences, Quaternary Geology, Switzerland) - Motuzaite Matuzeviciute Keen, Giedre (Vilnius University, Faculty of History, Department of Archaeology, Lithuania) - Spengler, III, Robert (Max Planck Institute of Geoanthropology)

Session format: Session with presentation of 6 slides in 6 minutes

The world is facing intensified rates of adverse climate and environmental change, population growth, and food insecurity. However, challenges that face us today are not totally new and many past societies have struggled with similar issues. But perspectives from the past remain underutilized. In this context, studying human-environment interactions, subsistence strategies, and human and plant response to changing environmental conditions is the most obvious way for archaeology to contribute to the global quest for sustainable solutions to cope with current challenges.

In this session, we are seeking to put together interdisciplinary studies that investigate past food systems in the light of deteriorating paleoclimatic and paleoenvironmental conditions. We focus on two major directions:

- 1- Which methods, models, and datasets are actually suitable to investigate system changes (i.e., the introduction or abandonment of crops, a shift to new agricultural strategies)?
- 2- What are examples of past system changes and how can these contribute to current debate on food security and adaptation to changing environmental conditions?

Building on these two pillars, we would like to discuss perspectives in interdisciplinary palaeoenvironmental archaeology and archaeobotany.

We appreciate a balance between local, regional, and supraregional studies to integrate various spatial scales into the discussion. Diachronic studies are particularly welcome to investigate transformation processes over time.

ABSTRACTS

1 DOMESTICATING EARTH: RETHINKING THE ORIGINS OF AGRICULTURE

Spengler, Robert (Max Planck Institute of Geoanthropology)

The origins of agriculture have long been depicted as one of the greatest innovations of humanity, a humanist approach that rose to prominence in archaeology during the latter half of the twentieth century. During this time, several push and pull models for the origins of agriculture were developed, all of which were formulated as responses to the question of “why humans invented farming”. Models that rely on ecological principles, protracted processes, and an unconscious role for humans have gradually replaced this conscious view of agriculture. Over the past twenty years, a new array of theories regarding the processes that drove early agriculture have been published. Despite the recognition of an overarching change in views, there has been little discussion about the ways these new views can impact modern plant breeding programs, including attempts at resurrecting lost crops or breeding new crops de novo.

Additionally, the new understanding of early domestication should feed into conservation programs, especially in relationship to anthropogenic-driven evolution or attempts at rewilding ecosystems. In this talk, I will explore some of the assumptions that persist about what early domestication looked like and how these ideas are hindering attempts at making agriculture more sustainable today.

2 THE HOLOCENE CLIMATE AFFECTING ANCIENT CULTURES IN THE STEPPE BELTS OF UKRAINE

Gerasimenko, Natalia (Taras Shevchenko National University of Kyiv)

Material cultures in the steppe of Ukraine were significantly affected by climatic changes, which have been reconstructed based on pollen and soil studies at 27 archaeological sites. The Neolithic developed first (after 8.2 ka) in the west of present-day steppe, which had then a benign environment: broad-leaved woodland on Phaeozems and mesophytic steppe on Chernozems. The heyday of the Trypillia culture (the beginning of the IV M BC) also corresponded to the spread of forest-steppe in the modern steppe under rather humid climate. After 5200 BP, aridification and cooling led to the northward spread of steppe which at the beginning of the III M BC (the driest phase), penetrated even to the west of the modern forest-steppe. The final decline of the Trypillia agriculturalists happened then.

The economies of the Bronze and Early Iron Age were strongly controlled by climate. During the wet phases of 4600-4300 BP and 3500-3000 BP, forest-steppe spread south, steppe was mesophytic, and plant farming existed in the modern dry steppe. During the arid phases of 4200-3600 BP and 2900-2700 BP, xeric steppe with Kashtanozems existed, and only temporary camps of cattle breeders occurred in the modern chernozem grassland. The wet phase of 2700-2300 BP supported the mesophytic steppe of the Scythians and the plant farming of Greek colonies. During the warm arid phase of 2200-1800 BP, grassland and the nomadic Sarmatian tribes spread far north within the modern forest-steppe. The environments of the climatic phases are reconstructed on the maps.

3 THE MODEL AND THE BEAST: ARCHAEOLOGY IN LIGHT OF A SUSTAINABLE FUTURE

Kempf, Michael (University of Basel)

Buzzwords like sustainability are currently everywhere in the sciences, leading to the assumption that we all perfectly know what we are talking about. But the more complex the topic the more simplified the discussion because lack of basic knowledge only leads to simplification and not greater knowledge. In science we are, however, inherently dependent on expert knowledge, particularly in current geopolitical, geoeconomic and geosocial agenda. In such reality, current mega-crisis, like climate changes or the desperate search for a sustainable future found their way into all disciplines across the sciences and the humanities – with growing debate on what each discipline can contribute to the challenges the world is facing. Particularly in archaeology, we are dealing with deep-time and deep-space analyses on various scales with multiproxy datasets. That sounds and often is overwhelming. Ultimately, we subset into subdisciplines, coming from and increasingly merging into the environmental sciences, e.g., bioarchaeology, geoarchaeology, or environmental archaeology. But the boundaries between these subsets are not always clear cut or straightforward. Working with environmental data in archaeology is highly recommended but does not make the entire process a detailed environmental analysis. All too often, environmental data (whatever that actually is) is used as canvas via push-button applications to model a pattern against a background variable. Without understanding the variable's internal noise and variation, however, this becomes a challenging endeavour if conclusions want to be drawn from past socio-environmental variability towards future projections. In this paper, I want to address overarching environmental and economic driving factors that are inherently linked to past socio-cultural development on multiple time and spatial scales and to critically reflect on the contribution of archaeology to the current concept of sustainability.

4 BROOMCORN MILLET, A TAIL OF RAPID DISPERSAL IN HISTORY, ECOLOGICAL ADVANTAGES FOR FOOD SECURITY IN A WORLD OF RISING TEMPERATURES

Zach, Barbara (Max Planck Institut of Geoanthropology, Jena, Germany) - Spengler, Robert (Max Planck Institut of Geoanthropology, Jena, Germany) - Fernandes, Ricardo (Max Planck Institut of Geoanthropology, Jena, Germany; Masaryk University, Brno, Czech; Princeton University, US)

Food security is one of the five fundamental needs of humanity, encompassing access to adequate sustenance, clean water, shelter, clothing, and heating fuel. Throughout history, food storage has been crucial for survival. Cultivating food plants and achieving surplus harvests have played pivotal roles in enhancing food security.

Among the earliest domesticated grass species is broomcorn millet (*Panicum miliaceum*). Archaeobotanical evidence indicates that its cultivation began simultaneously at sites across northern China around 5800 calBC, with full domestication traits, such as increased seed size, evident by 3300 calBC. Yuezhuang in Shandong stands as the oldest site with clearly domesticated broomcorn millet, dating back to 5876-5718 calBC. The emergence of sedentary lifestyles and small-scale villages approximately 6,500-5,000 years ago coincided with the earliest evidence of domesticated crops at sites like Cishan, Dadiwan, and Peiligang.

The rapid dispersal of broomcorn millet from its region of origin in today's North China to Inner Asia to Europe during the Late Bronze Age raises questions. Modelling based on directly dated millet seeds reveals it to be among the quickest dispersing traits in the ancient world. Its spread followed an ecological belt from east to west, diffusing through established farming communities across West Asia and Europe at an average rate of 5.3 km per annum. In contrast, estimates suggest that Neolithic peoples took approximately 4,000 years to disperse from the Fertile Crescent to regions like central Spain and southern Scandinavia by 5,000 years ago.

Unlike wheat, barley, rye, oats, maize, and other grass-derived crops, broomcorn millet exhibits unique ecological demands, thriving in warm, dry climates and poor soils. This specialization facilitated its rapid adoption by developed agricultural communities along its westward expansion, contributing to food security. These ecological advantages hold significant potential in a world grappling with rising temperatures.

5 MOUNTAINS - A LAND OF FARMING? THE EXAMPLE OF CEREAL CROPS IN THE WESTERN ALPS DURING LATE PREHISTORY

Martin, Lucie (University of Geneva, laboratory of Prehistoric Archaeology and Anthropology; University of Savoie Mont-Blanc, UMR 5204 EDYTEM)

Today, cereal crops have almost disappeared from the western Alps, whereas less than 100 years ago they were part of the landscape. Today, the Alps are largely devoted to tourism, and agriculture is largely dominated by livestock farming. With a few exceptions, cereal crops are represented by little more than small fields of rye, set against a backdrop of snow-capped peaks.

And yet, from the appearance of the first Neolithic agropastoral communities in southern Europe, the Alps, including the inner valleys, were occupied and cultivated, even at altitude. Numerous cereals have been found in occupations dating back to 5200-5000 BCE: barley, einkorn, emmer, naked wheat, and later spelt and millet. Far from the clichés of isolated lands unsuitable for agriculture, the mountains were in fact exploited very quickly in this sense, and even early on, with a diversity that has nothing to envy of the large-scale cultivation of the fertile plains.

Archaeobotany and isotopic biochemistry are invaluable tools for addressing both the presence of cereals on alpine occupations and agrarian practices (fertilization and irrigation). Using data from bioarchaeology, this paper will attempt to show that mountain environments offer a very good example of adaptation to sometimes extreme climatic conditions.

With global warming having a major impact on glaciers and the Alpine environment in general, we may well ask ourselves what use these mountain lands should be made for: what if ski slopes (re)became cereal fields?

6 TOWARDS A DIACHRONIC VISION OF CORSICAN CAPRINES HUSBANDRY SYSTEMS

Fabre, Mélanie (National museum of natural History, UMR 7209 AASPE: Archaeozoology, Archaeobotany: Societies, Practices and Environments) - James, Hannah (Research Unit: Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry; Maritime Cultures Research Institute, Dept. of Art Sciences and Archaeology Vrije Universiteit Brussel, Belgium.) - Vigne, Vianney (National Institute for Preventive Archaeological Research – Midi Méditerranée TRACE UMR 5608; TRACE UMR 5608) - Ranché, Christophe (National Institute for Preventive Archaeological Research – Midi Méditerranée TRACE UMR 5608; TRACE UMR 5608) - Istria, Daniel (Aix Marseille Univ, CNRS, LA3M, Aix-en-Provence, France) - Fiorillo, Denis (National museum of natural History, UMR 7209 AASPE: Archaeozoology, Archaeobotany: Societies, Practices and Environments) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry; Maritime Cultures Research Institute, Dept. of Art Sciences and Archaeology Vrije Universiteit Brussel, Belgium.) - Cucchi, Thomas (National museum of natural History, UMR 7209 AASPE: Archaeozoology, Archaeobotany: Societies, Practices and Environments) - Vigne, Jean-Denis (National museum of natural History, UMR 7209 AASPE: Archaeozoology, Archaeobotany: Societies, Practices and Environments) - Balasse, Marie (National museum of natural History, UMR 7209 AASPE: Archaeozoology, Archaeobotany: Societies, Practices and Environments)

Nowadays, the caprine farming system in the Mediterranean island of Corsica is mostly oriented toward sheep milk production. Sedentarized on the coastal plains, this dairy farming is governed by a specific calendar, with most births scheduled for autumn, to provide milk in winter, i.e. out of season. However, the pre-industrial dairy system was characterized by mixed herds of both sheep and goats, with the main birth season in late winter for sheep and autumn for goats, and more importantly: a transhumance between littoral plains and inland mountains. This recent change raises questions about the long-term permanence of so-called traditional zootechnical systems, dependent on socio-economic and environmental factors. This purpose requires a long-term approach, and in this respect, we combined osteological analyses, and isotopic analyses of tooth enamel on two Neolithic sites (Araguina-Sennola and Montlaur, 5th – 3rd cal BC) and two medieval sites (Rostino and Litala, 14th century). The former, construction of caprines mortality profiles, reveals demographic management and production orientation. The latter, the sequential oxygen (seasonal marker), carbon (vegetation marker) and strontium (geological marker) isotope ratios analyses enable us to

respectively determine the birth season, feeding variability and flock mobility from a single tooth sample. Our findings show that while the production orientation and the calendar of births vary according to socio-economic factors, from the Neolithic period to industrialization, livestock farmers have adapted their zootechnical systems to the contrasting climates and landscapes of the Mediterranean thanks to seasonal mobility. A diachronic vision is necessary to encompass the nonlinear, long-term trajectory of husbandry systems in the Mediterranean area. Such an understanding of the adaptation of past pastoral practices can help broaden zootechnical scenarios for adapting livestock farming to current changes, such as the use of transhumance during the summer, which is locally a multi-millennial response to heat.

7 UNRAVELING THE RELATIONSHIP BETWEEN PALEOCLIMATIC CHANGES AND BROOMCORN MILLET CULTIVATION IN NORTH-EASTERN AND CENTRAL EUROPE

Abdrakhmanov, Meirzhan (Vilnius University, Faculty of History, Department of Archaeology) - Jacob, Jérémy (Laboratoire des Sciences du Climat et de l'Environnement) - Pokorný, Petr (Center for Theoretical Study, Charles University & Czech Academy of Sciences) - Gauthier, Caroline (Laboratoire des Sciences du Climat et de l'Environnement) - Motuzaitė Matuzevičiūtė, Giedrė (Vilnius University, Faculty of History, Department of Archaeology)

In recent years, molecular biomarkers have garnered significant attention for their utility in tracing past human land use, particularly in the context of agricultural activities, where conventional methods often yield limited information or are hampered by the absence of settlements and macrobotanical remains. Concurrently, the analysis of sediment records has emerged as a pivotal approach in investigating the intricate correlation between past agricultural practices and climatic conditions. Our methodology is centered on understanding the complex interplay between paleoclimatic conditions and the cultivation of broomcorn millet (*Panicum miliaceum*) in northeastern and central Europe. In this context, the miliacin, a pentacyclic triterpene methyl ethers found abundant in broomcorn millet, can serve as a tracer of its cultivation.

We seek to address the three main questions regarding the insights gleaned, or limitations encountered, from miliacin in sediments:

1. What insights can be derived from miliacin records about the timing and intensity of millet cultivation?
2. Can we correlate the millet cultivation fluctuations and paleoclimatic conditions throughout different historical periods?
3. What are the limitations and challenges associated with reconstructing past climate conditions and their relation to millet cultivation?

Understanding the past environmental conditions under which millet was cultivated and subsequently abandoned could offer valuable insights into the ongoing discourse about future sustainable agriculture in the face of predicted global climate change.

8 POLYCULTURE OF CEREALS IN VILLAMAGNA (MARCHE REGION, ITALY): A RESILIENT CHOICE AT THE DAWN OF THE LATE ANTIQUE

Carmenati, Riccardo (University of Macerata) - Fiorentino, Girolamo (University of Salento) - Perna, Roberto (University of Macerata)

The Roman villa of Villamagna, in the Marche region (central Italy) at few kilometres from the Roman colony of Pol-lentia-Urbs Salvia, is one of the most investigated historical regional contexts for archaeobotanical analyses. More than twenty-six thousand macroremains were analysed covering a long period between the 1st century BC and the 7th century AD.

The study of seeds and fruits has highlighted a marked change in cereal crops cultivation since the beginning of the 5th century AD: until the 4th century AD we find mainly *Triticum* and *Hordeum* but, from about 420, *miliaceae* caryopses are prevalents.

The cross-study of archaeological context and archaeobotanical data, allow us to insert the area of Villamagna and central Piceno within the cultural context of northern Italy during the roman and Late Antique periods, where polyculture of cereals and the massive presence of caryopsis of *Setaria* and *Panicum* are attested.

The adaptive and resilient strategy adopted at Villamagna in the 5th century AD can be tentatively associated also to the LALIA climate variation, but we need further isotopic analysis.

9 FOOD SECURITY THROUGH CROP DIVERSIFICATION: FRUIT AND NUT CULTIVATION IN MEDIEVAL CENTRAL ASIA

Mir Makhamad, Basira (Domestication and Anthropogenic Evolution Research Group, Max Planck Institute for Geoanthropology, Department of Archaeology; Ancient Oriental Studies Department, Friedrich Schiller University) - Spengler III, Robert (Domestication and Anthropogenic Evolution Research Group, Max Planck Institute for Geoanthropology, Department of Archaeology)

Central Asia encompasses nearly 4 million hectares of diverse ecosystems, serving as a crucial germplasm reservoir for many local nut and fruit crops and their progenitors. This region serves as a center of origin and harbors remarkable genetic diversity for at least eight economically significant fruit and nut species, thus boasting highly diverse gene pools of global significance. Intensive arboriculture in Central Asia appears to have started in the foothills, particularly in the foothills, as early as the end of the first millennium CE, characterized by a dry climate in southern Central Asia. Available paleoenvironmental studies indicate that a marked decrease in precipitation began in the second half of the first millennium CE and reached its lowest point in the tenth to eleventh centuries CE. Concurrently, archaeobotanical data suggests that agricultural diversification began in the region as early as the fifth century CE, characterized by significant arboriculture development; however, the proliferation of the most variable crops occurred during the tenth century CE. Crop diversification correlates with urbanization, large-scale trade, and the development of political hierarchies. However, this discussion seeks to broaden the temporal perspective, discussing crop diversification as a response to environmental changes. It is plausible, that faced with dwindling precipitation and other environmental stressors, communities turned to cultivating an array of long-generation perennials and more diverse annual crops. This diversification expanded dietary options and bolsters food security amidst challenging conditions.

10 QUINOA AND THE POLITICS OF THE NEGLECTED AND UNDER-UTILIZED CROP

McDonell, Emma (University of Tennessee, Chattanooga)

During an era of growing concern about the impact of global climate change on food supply, agricultural development agencies have turned their attention to so called “neglected and under-utilized species” (NUS) as key tools for adapting regional food systems to climate extremes. The NUS discourse, which began developing in the 1980s, was initially based on a critique of the green revolution development paradigm and its reliance on only a small number of crop species. NUS proponents advocated for more research on the many crop varieties that had been excluded from agricultural research and that had potential to help solve development problems. While the NUS discourse began as an alternative development paradigm, today some of the most powerful international development institutions, from the World Bank to the UN Food and Agriculture Organization, now promote NUS as climate change adaptation tools. This paper traces the historical construction of quinoa as an NUS and the conflicting visions of quinoa’s development potential. Exploring the historical development of a powerful socio-technical network surrounding quinoa, the tensions between different ideas about what proper “utilization” might look like, and the ways the quinoa boom and bust revealed contradictions between different visions of quinoa’s future, this paper offers a critical reflection on the role of NUS. It argues that while these species certainly offer useful tools for adapting agricultural systems, we should not see them as simply as technical solutions, and instead need to foreground questions of power and access.

11 LONG-LIVED LANDSCAPE MANAGEMENT IN THE LAKE TITICACA BASIN, BOLIVIA

Hastorf, Christine (University of California Berkeley) - Bruno, Maria (Desert Research Institute) - Capriles, José (Pennsylvania State University)

The Andean high plain is a cool, steppe location of early domestication and residence. There, both important plants, such as the potato and quinoa were domesticated as well as the camelids, llama and alpaca. Once the Holocene began, plants, animals and people moved in, to reside in the diverse lake shore/valley zone. Topographic, archaeological and ecological investigation at the early monumental center of Chiripa, Bolivia by the Taraco Archaeological Project sheds new light onto a complex palimpsest of long-term management and interaction with the surrounding area, especially the lake and its marshes. A multidecadal-scale lake-level reconstruction for the southern basin lake (Wiñaymarka) based on diatoms, situates the sequence of interaction, that allow us to track the resident’s interactions with changing wetlands, springs, lake and terrestrial resources as people settled on the landscape and became farmers, herders and fisherfolk. We present this complex landscape by examining several hydraulic features modified by generations of Chiripa residents on the lakeshore, streams, and raised-fields in addition to the evidence for fishing and agriculture throughout the pre-hispanic time frame. This evidence reveals a dynamic history of lake engagement, from the first settlement up to the present-day Chiripa residents.

"TAKE ME TO THE PAST": NEW CIRCULAR FOOD SYSTEMS FOR AN AGRICULTURAL TRANSITION FROM HISTORICAL INSIGHTS

Teira-Brión, Andrés (University of Oxford) - Groba, Mercedes (EIT Food; University of St. Andrews)

Farmers have always tried to maximise the use of available resources. Although over time there have been advances in technology, the evolution of farming techniques and even changes in the labour force, either products, by-products or waste have been incorporated into the food system.

Historical food systems broke down with the advent of market agriculture. The circular model transitioned to a linear production-consumption-waste model. A model that requires high inputs of fertiliser, pesticides, herbicides, and irrigation to ensure high yields. From the circularity of production, we move to the circularity of profit. The control of the production chain, with the sale of patented seeds and the crops within established distribution circuits, was intended to ensure customer loyalty and guarantee revenues. However, linear production has harmful consequences, such as soil pollution, depletion of water resources, loss of biodiversity, effects on the climate and, moreover, endangers food security on a planet that is growing out of control.

In the past, the cultivation of local crops - landraces - and the management of wild plants, reduced uncertainty in greater flexibility in food supply, reduced uncertainty in the production of surpluses and opened a window for the use of diverse landscapes/seasons. The recovery and breeding of landraces, together with practices to maintain soil health, can address the pressing concerns of food-security, sustainable agriculture and the EU's policies aimed at achieving climate neutrality by 2050, by improving and reducing the impact on ecosystems and increasing alternative plant-based products on the markets. Through this presentation, we aim to identify some challenges of circular production models and explore basic solutions to enhance urban-rural integration through food supply chains.

PAST, PRESENT AND FUTURE FARMING SYSTEMS: A PERSPECTIVE FROM THE CROPREVIVE PROJECT

McClatchie, Meriel (University College Dublin) - Collins, Adam (University College Dublin) - Negrão, Sónia (University College Dublin) - Vargas Sielfeld, Sofia (University College Dublin)

The CROPREVIVE project is examining the extensive archaeological evidence for farming in ancient Ireland and merging findings with data from modern farming systems to help plan for the future. The project focuses on three crops that were popular in the past, but have fallen from favour in Ireland: emmer wheat, rye and peas. These crops have great potential because they are nutrient-dense, suited to European climates and environments, and viable for sustainable production. The project aims to determine how these crops became underutilised, and how they can be revived. This requires interdisciplinary and intersectoral collaboration and consultation, working with archaeologists, farmers, seed merchants, agronomists, economists, food processors and producers, and state agencies. The Croprevive project is mapping where and in what circumstances these crops were successfully grown and continue to be grown, and where they have disappeared. This is intended to help farmers learn what was grown in their area beyond community memory, enable farmers to foster a reconnection with these 'lost' crops and encourage more sustainable farming practices into the future. The CROPREVIVE project is funded by the Irish Research Council Coalesce Scheme. For further information, see the project website, <https://www.ucd.ie/archaeology/research/croprevive/>.

EXPLORING THE SPREAD OF MILLET TOWARDS NORTHERN EUROPE

Pospieszny, Lukasz (University of Gdansk; University of Bristol) - Depaermentier, Margaux (Vilnius University) - Kolaczek, Piotr (Adam Mickiewicz University) - Kempf, Michael (University of Basel; Vilnius University) - Motuzaitė Matuzeviciute, Giedre (Vilnius University)

Millet is receiving increasing attention in research focused on past, current, and future contexts. Besides being a highly nutritious and healthy crop, millet is drought-resistant, salt-tolerant, heat-tolerant, and has better water use efficiency than most crops cultivated in Europe. It is therefore considered a well-suited crop to adapt to changing climatic conditions and to meet the food requirements of an ever-growing population. In current agricultural and food sciences across Europe, the focus is on the southern regions. This study aims to integrate Northern European regions into this discussion and provide new perspectives on the spread of millet and its possible (re-)introduction further north. To achieve this, the ERC-funded project "MILWAYS – Past & Future Millet Foodways" combines various approaches to explore the introduction processes of millet in Northern Europe, starting from Poland in the Middle Bronze Age (15th century BC). By using carbon and nitrogen stable isotope measurements in human bone and dentine collagen, paired with radiocarbon dates and compared with the distribution of radiocarbon dated charred millet grains, we can track the spread of millet consumption and/or cultivation with high temporal resolution and on the long-term perspective. Isotope data derived from dentine and dental enamel of these Middle Bronze Age societies and the archaeological context further highlight the socio-cultural background of millet spread and (non-)adaptation. Moreover, the integration of multivariate environmental and climatic records into the analyses enables tracking potential correlations between changes in climate and the environment and transformations in prehistoric subsistence

strategies. The combination of multiple proxies not only produce new insights into millet dispersal across Bronze Age Europe but also forms the basis for modeling potential areas that are or will be suitable for millet cultivation under present and future climatic conditions.

NEW FRONTIERS IN STABLE ISOTOPE RESEARCH OF BIOARCHAEOLOGICAL REMAINS: PROGRESS AND PITFALLS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Soncin, Silvia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) centre, Sapienza Università di Roma, Rome, Italy) - Coccozza, Carlo (Department of Archaeology, Max Planck Institute of Geoanthropology, Jena, Germany) - Fernandes, Ricardo (Department of Archaeology, Max Planck Institute of Geoanthropology, Jena, Germany; Faculty of Archaeology, University of Warsaw, Warsaw, Poland; Faculty of Arts, Masaryk University, Brno, Czech Republic; Climate Change and History Research Initiative, Princeton University, Princeton, USA) - Craig, Oliver (BioArCh, Department of Archaeology, University of York, York, UK) - Tafuri, Mary Anne (University of Rome La Sapienza)

Session format: Session with keynote presentation and discussion

Stable isotope analysis on bioarchaeological remains is a powerful tool offering unprecedented insights into lifeways, economies, and environmental living conditions of ancient human populations. Advancements in analytical protocols and mass spectrometry, coupled with reduced costs of analysis, have increased awareness of isotopic proxies in archaeology. However, following exponential growth there is now increasing recognition of their inherent interpretative limitations.

As a result, isotopic research has necessitated venturing into new avenues of investigation. For example, compound-specific stable isotopes of collagen amino acids have proven effective in delineating the contributions of various dietary sources at a high resolution, mitigating well-known constraints associated with bulk analysis. Calcium and zinc stable isotopes measured in tooth enamel or bone bioapatite offer a valid alternative to detect specific food components. The meta-analysis of large volumes of isotopic measurements enhanced by advanced modelling tools, have enabled the exploration of past dynamics at different spatio-temporal scales. These examples represent just a glimpse of the ongoing developments in this evolving field.

Although great leaps have been made methodologically, it is essential to acknowledge that these novel techniques introduce new uncertainties, primarily due to our limited understanding of their fundamental mechanisms and the scarcity of comparative data. Additionally, the high costs and lengthy analysis times, coupled with a lack of readily available analytical facilities, pose considerable challenges.

In this session, we aim to promote a fruitful dialogue among archaeologists who are applying innovative isotopic approaches to address old and new archaeological questions. We aim not only to learn from successful applications but also to provide a platform for addressing emerging challenges associated with these new methodologies. This will foster a meaningful discussion regarding the past and future of the archaeological stable isotope research.

ABSTRACTS

COMPOUND SPECIFIC ISOTOPE ANALYSIS OF AMINO ACIDS FROM HUMAN BONE COLLAGEN: WHY BOTHER?

Craig, Oliver (BioArCh, University of York)

It has been three decades since the first stable isotope study of amino acids from ancient human bone collagen was published. Such compound specific isotope analyses (CSIA) have promised much. In theory, amino acids can be traced to dietary components with much greater certainty than bulk protein offering more detailed insights into ancient diets. Yet, in practice, it is noticeable that CSIA has not seen the meteoric rise that early proponents predicted and the approach has yet to find routine application. This is partly due to the longer analysis times, higher costs and requirements for specialist instrumentation and expertise. Indeed, some have questioned whether the investment justifies the reward. Does CSIA really provide information above and beyond what can already be easily obtained through bulk isotopes?

Here, I will outline some of the reasons why I think it is worth 'bothering' with this technique. Drawing upon a range of case studies, mainly focused on coastal populations with partial aquatic diets, I will show how isotope variation at the amino acid level, at the very least, provides greater certainty to our estimations. Furthermore, in certain cases, I argue that interpretations based on bulk collagen not only lack resolution needed to address the research question posed, but are misleading. I will propose a strategy for the most efficient deployment of CSIA so that major gains can

be quickly made, and outline where our theoretical knowledge, for example regarding metabolism, is still lacking and should be the focus for further study.

2 HIGH-RESOLUTION DIETARY RECONSTRUCTION OF PREHISTORIC POPULATIONS FROM KOREA USING COMPOUND-SPECIFIC STABLE ISOTOPE ANALYSIS

Choy, Kyungcheol (Department of Anthropology, Hanyang University ERICA) - Yun, Hee Young (Department of Marine Sciences and Convergence Engineering, Hanyang University ERICA) - Fuller, Benjamin (Department of Archaeology and Heritage Studies, School of Culture and Society, Aarhus University) - Mannino, Marcello (3Department of Archaeology and Heritage Studies, School of Culture and Society, Aarhus University)

In the last decades, bulk carbon and nitrogen stable isotope ratio analyses have become a common method to investigate dietary patterns and subsistence activities in ancient populations. Despite their importance for reconstructing palaeodiets, bulk isotopic results have limitations in dietary interpretations when various complex diets were consumed. Recently, compound-specific stable isotope analysis of amino acids (CSIA-AA) is applied to reconstruct more accurate dietary patterns and trophic position in past populations. Here CSIA-AA is applied to human (n=32) and animal (n=17) remains from the Mumun and Imdang archaeological sites in South Korea to reconstruct more accurately dietary sources in these prehistoric populations. The Mumun sites are all from the Middle Mumun Period (535-635 BC) and the Imdang site is from the Proto-Three Kingdoms Period (BC 80 - 394 AD). Along with CSIA-AA, the Bayesian mixing model MixSIAR is used to estimate the proportional contribution of different food sources for each individual. Results of estimated trophic positions (TP) show that Imdang people obtained dietary sources from both terrestrial and aquatic sources. All EAA proxies revealed that there is a different dietary pattern at Mumun and Imdang. The MixSIAR model output revealed that the Mumun humans had a high contribution from C4 plants. On the other hand, the Imdang humans consumed foods from diverse sources, mainly from terrestrial and marine animals. Our study demonstrates that all EAA proxies using CSIA-AA provide us with more detailed information on palaeodiets in ancient populations than bulk studies alone.

3 DIFFERENCES IN AMINO ACID CARBON ISOTOPE VALUES OF DOMESTIC AND WILD FAUNA, BUT HOW DO WE EXPLAIN THEM?

Smith, Colin (Laboratorio de Evolución Humana, Universidad de Burgos, Spain; Department of Archaeology and History, La Trobe University, Australia) - Crombie, Maddison (Department of Archaeology and History, La Trobe University, Australia; School of Geography, Earth and Atmospheric Sciences, The University of Melbourne, Australia) - Iriarte, Eneko (Laboratorio de Evolución Humana, Universidad de Burgos, Spain) - Valdiosera, Cristina (Laboratorio de Evolución Humana, Universidad de Burgos, Spain; Department of Archaeology and History, La Trobe University, Australia) - Galindo, Marian (Centro Mixto UCM-ISCIII de Evolución y Comportamiento Humanos, Spain) - de Gaspar-Simón, Ignacio (Departamento de Anatomía y Embriología, Universidad Complutense de Madrid, Spain) - Arsuaga, Juan Luis (Centro Mixto UCM-ISCIII de Evolución y Comportamiento Humanos, Spain; Departamento de Paleontología, Universidad Complutense de Madrid, Spain.) - Carretero, José-Miguel (Laboratorio de Evolución Humana, Universidad de Burgos, Spain)

There is a growing body of work using bulk stable isotope analysis specifically to investigate past animal management and feeding practices, as this can help us to infer aspects of ancient economic systems, resource availability, landscape use, attitudes towards animals and concepts such as wild and domestic animals. But can single compound specific approaches help with this research?

While contextualising some data from the Spanish Holocene site of the El Portalón de Cueva Mayor from the Sierra de Atapuerca, we noticed some unusual patterns in ^{13}C values of some amino acids obtained using LC-IRMS. Following this data driven approach, we cautiously propose some amino acid indicators that could potentially be used to differentiate wild and domestic fauna in some instances. We will also speculate on some explanations for the observed phenomena.

Compound specific stable isotope analysis of amino acids might be a useful path forward in this area, but it is a technically challenging endeavour, requiring advanced equipment and skills and determined approaches to data processing. We will discuss the advantages and disadvantages of this approach as well as perspectives on other aspects of research design that might improve stable isotope applications to archaeozoological research.

4 ISOMEMO: ADVANCING GLOBAL ISOTOPIC DATA THROUGH COLLABORATION AND INNOVATION

Fernandes, Ricardo (Max Planck Institute of Geoanthropology) - Hixon, Sean (Oregon State University) - Cocozza, Carlo (Max Planck Institute of Geoanthropology)

IsoMemo is a global network of autonomous isotopic data communities facilitating collaboration and data integration across various disciplines, including archaeology. Developed under the ethos of decentralization, IsoMemo adheres

to a distributive model where all partner databases are treated with parity, fostering an inclusive and equitable knowledge-sharing environment. This presentation will present recent and ongoing developments in the initiative.

Significant emphasis is placed on balancing the need for standardized isotopic data representation against the specific metadata requirements of each partner database. This has involved multi-tiered quality control measures and extensive dialogue with partner databases, ensuring high-quality, accurate, and comprehensive isotopic data sets.

IsoMemo's global scale carries profound implications for isotopic research, bridging geographical and disciplinary divides to make isotopic data universally accessible. This entailed the development of advanced software platforms, providing a variety of isotopic modelling tools that further the scientific analysis and interpretation of the integrated data.

The presentation will also highlight ongoing research projects relying on broad partner isotopic databases, reinforcing the significant potential of such a globally integrated isotopic network.

5 A BAYESIAN 'BIG ISOTOPIC DATA' CONTRIBUTION TO THE SOCIO-ECONOMIC IMPACT OF ROMANISATION

Cocozza, Carlo (Max Planck Institute of Geoanthropology; Ludwig-Maximilians-Universität München; Università della Campania) - Formichella, Giulia (Sapienza università di Roma) - Soncin, Silvia (Sapienza università di Roma) - Tafuri, Mary Anne (Sapienza università di Roma) - Lubritto, Carmine (Università della Campania) - Fernandes, Ricardo (Max Planck Institute of Geoanthropology; University of Warsaw; Masaryk University; Princeton University)

Isotopes have emerged as a crucial tool unraveling the complexities of ancient climates, lifeways, economies, and migratory patterns. Their efficacy significantly enhances when compiled into comprehensive databases, facilitating researchers in conducting robust comparative analyses and meta-analyses across different epochs and geographical areas. In our presentation, we pursue a 'Big Isotopic Data' approach to investigate the effects of Romanisation—a transformative process that generated profound cultural and economic shifts across the Roman Empire. Despite being a subject of extensive scholarly studies for many years, Romanisation continues to be a topic for debate and exploration.

By employing stable isotope data recovered from Isotopia and CIMA—two comprehensive isotopic databases for Antiquity and Medieval Europe and the Mediterranean—and using Bayesian models (<https://isomemoapp.com/>), we explore spatiotemporal shifts in food production, trade networks and dietary habits within the Roman Empire.

Our results suggest a large availability and consumption of wheat and terrestrial proteins, as well as marine resources, among communities incorporated into the empire. This trend seemingly diminishes during periods of crises and the empire's eventual decline. This points to the significant role that the cohesive socio-economic structure of the Roman Empire played in the subsistence practices of its inhabitants and how disruptions in political and economic stability impacted these practices. Our research also emphasizes the potential of re-using extensive isotopic datasets and merging these with archaeological and historical records through Bayesian analysis for identifying broad-scale human societal trends. This approach enhances the comprehension of complex historical transformations.

6 WHAT ARE WE MISSING? BIG DATA APPROACH TO ISOTOPIC DATA IN PREHISTORIC MEDITERRANEAN

Farese, Martina (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAReA) Centre, Sapienza University of Rome, Rome, Italy) - Soncin, Silvia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAReA) Centre, Sapienza University of Rome, Rome, Italy) - Tafuri, Mary Anne (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAReA) Centre, Sapienza University of Rome, Rome, Italy)

Biological (human, animal and plant) remains represent an excellent proxy to answer archaeological questions on the cultural, social and economic evolution that interested our ancestors. Through the analysis of isotopic data, in particular, we are able to obtain direct information on time periods for which written sources are not present. Over the past 30 years, more than 300 studies dealing with stable isotope analysis in Mediterranean Prehistory have been published. However, many data gaps still need to be addressed, both time- and space-wise.

In this study, we focus on the use of Big Data approaches to frame and contextualise these gaps. A database has been built by collating isotopic data ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{34}\text{S}$, $\delta^{18}\text{O}$ and $^{37}\text{Sr}/^{36}\text{Sr}$) available in the literature, obtained from archaeological sites encompassing the whole Mediterranean and dating from the beginning of the Neolithic to the end of the Iron Age (ca. 6000 - 600 BCE). This database - the Mediterranean Archive of Isotopic dAta (MAIA) - is now available in open access through the Pandora platform. By including 25,417 isotopic data (from human, animal and plant remains), MAIA allows us to investigate the state of isotopic research in the Mediterranean basin at a glance. It is possible to immediately pinpoint areas, like the Northern African shore, as well as time periods, like the Late Neolithic/Copper Age, lacking data. Even though we are aware that considerable factors can affect the investigation of

specific areas and materials, with this study, we want to promote isotopic research in those marginal areas as it would significantly improve our understanding of prehistoric lifeways.

7 INSIGHTS INTO HUSBANDRY PRACTICES USING STABLE ISOTOPES AND ZOOMS AT PHOENICIAN TAVIRA BETWEEN 8TH - 5TH CENTURY BCE

Paladugu, Roshan (Max Planck Institute for Evolutionary Anthropology) - Covaneiro, Jaqueline (Município de Tavira) - Cavaco, Sandra (Município de Tavira) - de Sousa, Elisa (Universidade de Lisboa) - Arruda, Ana (Universidade de Lisboa) - Warinner, Christina (Harvard University; Max Planck Institute for Evolutionary Anthropology) - Barrocas Dias, Cristina (Universidade de Évora)

Phoenician colonization of the Iberian Peninsula started in the 9th century BCE, with commercial activities and mineral resources being widely accepted as the main driving forces. The city of Tavira, located on the right bank of the Gilão River on the Southern Portuguese coastline, was a crucial urban nucleus and part of the Phoenician network during the 1st millennium BCE. While importing food and other manufactured products from other regions of the Mediterranean, Tavira was also a centre of commercial activities, including metallurgy and fishing. The animal husbandry at Tavira has received very little attention. The faunal remains of this study originate from two localities: antigo Parque de Festas and Travessa dos Pelames. Zooarchaeological analysis revealed that ovicaprids, cattle and pigs were the domesticated taxa. Red deer and rabbits are the only wild mammalian fauna recovered. The bird remains primarily consist of chicken bones. Zooarchaeology through Mass Spectrometry (ZooMS) was used to increase the taxonomic resolution of the traditional zooarchaeological analyses. Goats were more abundant than sheep amongst ovicaprids. Cattle and pigs were the next most species. Based on stable carbon and nitrogen isotope data, ovicaprids and cattle seem to be on a diet of vegetation enriched by artificial manuring. Pigs have stable carbon and nitrogen isotope values similar to cattle due to an herbivorous diet, a departure from the omnivorous diet reported in the Neolithic and Chalcolithic Periods. The differences from stable isotope data of domesticated fauna suggest a diverse management strategy for different species based on their economic importance and capitalizing on animal byproducts such as wool and dairy products.

8 ISOTOPIC EVIDENCE FOR NURSING, WEANING, AND CHILDHOOD DIETS AT A GREEK SICILIAN COLONY (7-5TH C. BCE)

Reitsema, Laurie (University of Georgia) - Gancz, Abigail (Pennsylvania State University) - Kyle, Britney (University of Northern Colorado) - Vassallo, Stefano (Soprintendenza BBCCAA di Palermo)

This study reconstructs aspects of weaning using stable nitrogen isotope ratios from bone collagen in order to investigate diversity in child rearing at a multicultural ancient Greek Sicilian city, Himera (7-5th centuries BCE). Fifty subadults under age 10 years and 26 adult females yielded nitrogen isotope ratios that were analyzed using the Weaning Age Reconstruction with Nitrogen Isotope Analysis (WARN) R statistical package, an approximate Bayesian computation model that deals explicitly with the problem of variable bone turnover rates in subadults.

Nitrogen isotopic enrichment of all young infants suggest breastfeeding was the normative practice for early infant care at Himera. Results suggest initiation of supplemental feeding around 3 months and cessation of weaning around 3.5-4 years. The total breastfeeding period at Himera, upwards of 3 years, is longer than the recommendations of ancient authors, longer than what is documented in ancient wet nurse contracts, and slightly longer than other Classical and Hellenistic Greek cities. Despite the general trends identified by quantitative modeling, there is considerable variability among subadults at Himera, suggesting coexistence of multiple childrearing practices.

Overall, the evidence points to some shared childrearing tendencies among ancient Greek cities, but also illuminates variability suggestive of the coexistence of multiple practices, which we discuss in the context of cultural hybridity in classical antiquity. We also discuss how different approaches to translating age-at-death ranges into single numbers influences results of quantitative models such as WARN, and the consilience between quantitative models for weaning chronologies and research questions that emphasize variation over generalization.

9 SULPHUR ISOTOPES IN BIOARCHAEOLOGY: NAVIGATING CHALLENGES AND EXPANDING INSIGHTS THROUGH THE CASE OF SLOVENIA

Leskovar, Tamara (Centre for interdisciplinary Research in Archaeology, Department of Archaeology) - Poročnik, Doris (Department of Environmental Sciences, Jožef Stefan Institute, Slovenia) - Ogrinc, Nives (Department of Environmental Sciences, Jožef Stefan Institute, Slovenia) - Snoeck, Christophe (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Belgium) - T. Gerritzen, Carina (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel, Brussels, Belgium) - Goderis, Steven (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel, Brussels, Belgium) - Toškan, Borut (Institute of Archaeology, ZRC SAZU, Slovenia) - Črešnar, Matija (Centre for interdisciplinary Research in Archaeology, Department of Archaeology)

Sulphur isotopes are increasingly becoming integral to bioarchaeological investigations. However, when compared to the extensive studies employing isotopic analyses of carbon, nitrogen, strontium, and oxygen, sulphur lags behind, likely due to the challenges associated with its measurement and the complexity of interpreting the obtained results.

Despite the proven benefits of multi-isotope analyses, there exists a common practice of artificially categorizing elements into two groups: “dietary” and “migration and mobility.” In this context, sulphur emerges as an amphibious element. Though measured from collagen and employing methodological procedures same or similar to those for carbon and nitrogen, the results can serve as indicators for both dietary habits and migration/mobility patterns. Consequently, assigning sulphur isotope values to either dietary differences or migration and mobility poses a significant challenge.

The inclusion of sulphur isotopes in our multi-isotope research on archaeological animal and human remains originating from geologically and geographically diverse Slovenia has raised numerous questions. Through the presentation of our results, we aim to shed light on the encountered challenges and initiate a dialogue on potential solutions. By addressing these complexities, we hope to contribute to a more comprehensive understanding of sulphur isotope analysis in bioarchaeological studies.

10 UNRAVELLING PAST AGRICULTURAL SYSTEMS IN ARID ENVIRONMENTS: ADVANCES AND LIMITS IN ISOTOPIC ANALYSIS AND MODELLING

Varalli, Alessandra (CASEs-Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra. Barcelona. Spain; Aix Marseille Univ, CNRS, Minist Culture, LAM-PEA, Aix-en-Provence, France) - D'Agostini, Francesca (CASEs-Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra. Barcelona. Spain) - Jiménez Arteaga, Carolina (CASEs-Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra. Barcelona. Spain) - Heidgen, Shaddai (CASEs-Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra. Barcelona. Spain) - Bouchaud, Charlene (Archéozoologie, Archéobotanique: Sociétés, Pratiques et Environnements (AASPE, UMR 7209), Muséum National d'Histoire Naturelle, CNRS, France) - Antonites, Annie (National Museum of Natural History, Pretoria, Republic of South Africa) - Lucarini, Giulio (Institute of Heritage Science, National Research Council of Italy, Rome, Italy; Department of Asian, African, and Mediterranean Studies, University of Naples L'Orientale, Naples, Italy) - Usai, Donatella (Istituto Italiano per l'Africa e l'Oriente, Roma; Centro Studi Sudanese e Sub-Sahariani, Treviso, Italy) - Madella, Marco (CASEs - Culture, Archaeology and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra. Barcelona, Spain; ICREA - Catalan Institution for Research and Advanced Studies. Barcelona, Spain; Department of Geography, Archaeology and Environmental Studies, University of Witwatersrand, Johannesburg, South Africa) - Lancelotti, Carla (CASEs - Culture, Archaeology and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra. Barcelona, Spain; ICREA - Catalan Institution for Research and Advanced Studies. Barcelona, Spain)

Since prehistoric times, C4 plants like millets have been widely cultivated in arid environments, serving as a crucial foodstuff for communities facing challenging environmental conditions, and playing a key role in local economies. However, the agricultural strategies employed for cultivating these plants remain unclear. Traditionally, ensuring water supply through methods like river floods or maintaining consistent water sources has been considered crucial for arid-region farming. Nevertheless, contemporary examples reveal successful rain-fed cultivation systems, where crops thrive solely on natural rainfall, even in hyper-arid environments. Our research aims to shed light on agricultural practices for C4 crop cultivation, with a specific emphasis on water management. Isotope analysis has emerged as a powerful tool for estimating past plant water levels in archaeobotanical remains.

We analyzed carbon and nitrogen stable isotopes of grains from various experimental and archaeological C4 plant species, notably pearl millet (*Pennisetum glaucum*), sorghum (*Sorghum bicolor*) and different small panicoids. Regarding the experimental samples, we selected grains from over 500 millet plants cultivated under controlled hydric conditions. These modern samples allowed us to develop a model for interpreting stable isotope values of archaeological remains. As for the archaeological assemblage, we selected grains from diachronic sites in Egypt (Farafra), Paki-

stan (Bando Qubo, Taloor Je Bhatt), Sudan (Al-Khiday, Mouweis), and South Africa (Schroda, Mutamba). The results demonstrate the feasibility of reconstructing water management practices and changes in handling through stable isotopes, offering an innovative perspective in interpreting archaeological sites. Quantifying these practices not only has the potential to reshape our understanding of human adaptation and agriculture but also emphasizes the necessity of incorporating plant isotopic analysis as a crucial proxy in archaeology. This approach deepens our understanding of past socio-economic dynamics and human-environment interactions across various spatio-temporal scales.

11 RECONSTRUCTING SUBSISTENCE STRATEGIES OF THE NEOLITHIC COMMUNITY IN THE SOUTHERN ARABIA – CHALLENGES OF A BIOAPATITE APPROACH

Danielisova, Alzbeta (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Šneberger, Jiří (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Daněček, David (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Maiorano, Maria (Goethe University Frankfurt) - Arppe, Laura (Finnish Museum of Natural History LUOMUS, University of Helsinki) - Garba, Roman (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic; Nuclear Physics Institute of the CAS, Prague)

The Neolithic period in South Arabia is characterised by high population movement along the coast and complex cultural and technological innovations. However, despite the growing number of Neolithic sites, little has been done to elucidate dietary trends during this period. Conventionally, the subsistence of local communities is being interpreted as relying on a combined hunter-fisher-gatherer economy with a growing importance of local pastoralism. However, the arid conditions in central Arabia present obstacles to collagen preservation, impeding the analysis of local diets through stable isotopes.

During the recent archaeological campaigns in the coastal alluvial plain of south-central Oman a unique megalithic burial structure was excavated that contained evidence of long-term burial activities of a large local community. Radiocarbon dating places the period of collective burials between 5000 and 4600 cal. BCE. The comprehensive analysis of the burial community involved provenance assessments using strontium and oxygen isotopes, along with an analysis of local subsistence strategies. To overcome the limitations caused by no collagen preservation, our approach involved isotopic ($\delta^{13}\text{C}$, $\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$) and concentration (Sr, Ba, Ca) analysis of enamel bioapatite. The primary objective was to evaluate the feasibility of this combined methodology in assessing the coastal Neolithic communities' reliance on marine resources. Comparisons were conducted with published bioapatite data from sedentary agricultural communities in a similar region. This paper contributes to an ongoing project focused on understanding the long-term socio-economic development of communities in Arabia.

12 ISOTOPE ANALYSES ON DIET AND MOBILITY IN NORTHERN ITALY

Tykot, Robert (University of South Florida) - Vianello, Andrea (University of South Florida) - Eck, Christopher (FEMA) - Maxwell, Ashley (Washburn University)

For >30 years, stable isotope research has been done on human remains from Italy, representing different time periods and geographic areas, yet the actual number of sites/individuals is quite limited by time and geographic areas, especially north of Rome. In addition, when interpreting results and drawing conclusions, e.g. about similarities/differences, there are limitations when comparing several important issues. In particular, there is significant variation in the baseline values of the food being consumed, due to natural/geographic variability, and especially human involvement in agricultural fields and animal foddering.

New C, N, O, and Sr isotope studies have been done in northern Italy, including for neolithic sites in the Po Valley, Early Medieval & Langobard sites in the Veneto, and others in Ravenna. Analyses were conducted at the University of South Florida, using well-established sample preparation methods, allowing more detailed interpretation of plants and animals in the diet. It appears that in all time periods seafood was rarely a dietary staple, if consumed at all, even in coastal zones. Freshwater fish, however, were important in some locations near rivers, especially in Roman times. Millet, a C4 plant, was of minimal use in the Neolithic, but more widely spread by the Bronze Age, and especially important in northern Italy in post-Roman times. There also seems to have been negligible differences based on status prior to Roman times, while sex-based differences also appears to develop with more complex labor patterns.

Mobility has also become an important aspect of dietary studies, with strontium isotope analyses used to address seasonal patterns in animal husbandry, long-distance cultural migration, and international movement due to military activities. The combined multi-method and interdisciplinary studies of zooarchaeology and macrobotanical finds, pollen and phytolith studies, ceramic residues, and osteoarchaeological analyses are critical for our best understanding of the past.

13 LASER ABLATION ANALYSIS OF LOW STRONTIUM BIOAPATITES: WARNINGS AND OPPORTUNITIES

Rogers, Bryony (Department of Archaeology, Durham University; School of Earth Sciences, University of Bristol) - Horstwood, Matthew (NEIF, British Geological Survey) - Pashley, Vanessa (NEIF, British Geological Survey) - Nowell, Geoff (Arthur Holmes Laboratory, Department of Earth Sciences, Durham University)

Using strontium isotope ($87\text{Sr}/86\text{Sr}$) analysis in low strontium concentration bioapatite samples (i.e. human and animal tooth enamel) to assess mobility and provenance is becoming increasingly common in the literature. The use of laser ablation MC-ICP-MS can reduce the complexity of sample preparation, cost of analysis and increase the speed of data acquisition and therefore sample throughput. However, this in-situ analytical approach is usually accompanied by a sacrifice in the precision, accuracy, and reproducibility, and can increase the bias of the acquired data. In regions of high biosphere strontium isotope variability this increased uncertainty and decreased level of accuracy of LA-MC-ICP-MS Sr isotope data can often be tolerated whilst still enabling useful interpretations. However, in regions with low biosphere strontium isotope variability the tolerance for imprecision is much lower. Here we address the question: 'how low can we go?' with current instrumentation. Additionally, we look forward to the potential opportunities for laser ablation strontium isotope analysis of low concentration tooth enamel using newer instruments with mass filters and/or collision cells which are becoming more widely available.

14 BEYOND MIGRATIONS: THE USE OF $87\text{Sr}/86\text{Sr}$ VALUES IN RESEARCH ON DIET AND SUBSISTENCE

Soltysiak, Arkadiusz (University of Warsaw)

Due to its variability in bedrock and water sources, $87\text{Sr}/86\text{Sr}$ values in human tissues (mainly enamel) are used by bioarchaeologists to identify non-local individuals at the cemeteries. As strontium isoscape maps are available now for many regions and new Bayesian tools have been recently introduced, in some cases also probable directions of migration may be identified. However, there is also growing awareness that strontium in human tissues does not come directly from bedrock, but indirectly through consumed food and water, and therefore $87\text{Sr}/86\text{Sr}$ values reflect the origin of subsistence resources and not the residence of humans themselves.

This observation is bad for provenance studies but good for research on food exchange in past human populations. There is a growing number of studies that exploit this potential, especially through the combination of $87\text{Sr}/86\text{Sr}$ values and light stable isotopes ($\delta^{13}\text{C}$, $\delta^{15}\text{C}$, $\delta^{34}\text{S}$) that are routinely used as proxies for diet. In this paper, some examples of such research will be presented, covering the Near East and Mediterranean where relatively abundant textual and archaeological context sometimes enables reliable distinction between the migration of humans and food importing.

15 EXPLORING NEOLITHIC OVICAPRINE HUSBANDRY THROUGH STABLE ISOTOPE ANALYSES AT THE SITE OF EL PORTALÓN DE CUEVA MAYOR (ATAPUERCA, BURGOS)

Antolinos-Díaz, Juan Antonio (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos, 09001, Burgos, Spain.) - Smith, Colin (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos, 09001, Burgos, Spain.; Dept. Archaeology and History, La Trobe University, Melbourne, VIC, 3086, Australia.) - Galindo-Pellicena, Maria Angeles (Centro Mixto UCM-ISCI III de Evolución y Comportamiento Humanos, Spain.) - Carretero, José-Miguel (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos, 09001, Burgos, Spain.) - Iriarte, Eneko (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos, 09001, Burgos, Spain.) - Pérez-Romero, Amalia (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos) - Valdósera, Cristina (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos)

Stable isotope analyses have proven to be a valuable method in researching livestock management during prehistoric times. However, there are few studies focused on Neolithic ovicaprine management in the Iberian Peninsula, despite this being a period when, groups of farmers and herders introduced new resource management dynamics, e.g. secondary products from sheep (*Ovis aries*) and goats (*Capra hircus*). The Neolithic layers from the site of El Portalón de Cueva Mayor (Sierra de Atapuerca, Burgos) exhibit a record of nearly 2500 years of livestock management (ca.7400-5000 cal BP) containing abundant well preserved bones and teeth from livestock. This long record, together with the sites geographical location, helps us to understand the process of implementation and expansion of animal husbandry across Europe, and the Iberian Peninsula.

Through the analysis of enamel oxygen (^{18}O) and carbon (^{13}C) stable isotope sequences in dental series (first, second, and third lower molars) combined with zooarchaeological analysis, we infer the seasonal management of births

and livestock management for meat or secondary products such as milk. Additionally, this study is complemented with the analysis of carbon (13C), nitrogen (15N), and sulfur (34S) stable isotope ratios in bone collagen, providing further information concerning their diet and mobility.

The isotopic results suggest an anthropogenic management of the birth season, a diet based on uniform locally sourced plants and overall low mobility for the ovicaprines. This would imply a sophisticated sheep and goat husbandry in the Iberian hinterland during the Neolithic period compared to other taxa. As a result, diverse animal resources would be available for a year-round cave occupation.

16 THE USE OF NEODYMIUM ISOTOPES IN HUMAN MOBILITY STUDIES: TESTING A POTENTIAL NEW TOOL

Rosselet-Christ, Déborah (Archaeology of Africa & Anthropology Laboratory, University of Geneva, Switzerland) - Chiaradia, Massimo (Department of Earth Sciences, University of Geneva, Switzerland) - Desideri, Jocelyne (Archaeology of Africa & Anthropology Laboratory, University of Geneva, Switzerland)

The use of isotope geochemistry to study past population mobility has been a well-established tool for several decades. Until recently, analyses have been able to differentiate 'local' and 'non-local' individuals, and the emergence of models and isoscapes has even made it possible to determine the regions of origin of these 'non-local' individuals. The use of strontium, carbon, oxygen and, more recently, sulphur isotopes has proved successful, but only when the 'homogeneity' of the environment allows it. In mountainous regions, and especially in the Alps, the complexity of the outcropping rock formations and the biotopes associated with different altitudes mean that the values are extremely heterogeneous, and the notion of an isotopically similar environment can be extremely difficult to define. For example, a "non-local" value may be characteristic of a place that is only a few kilometers or up to 100 kilometers away, making it impossible to discuss its origin.

As part of the Swiss National Research Fund project "Towards a renewed vision of the early alpine agro-pastoral societies", we are trying to refine our interpretations of the mobility of these populations by adding the study of the neodymium isotopes. Neodymium isotopes have been used for many years as process tracers in geology and have recently been tested in forensic cases. In our project, we combine it with 87Sr/86Sr, $\delta^{13}C$ and $\delta^{18}O$ analyses and test it on dental and bone tissues of human and animal remains of archaeological and modern origin. The study is still ongoing, but we have already been able to establish novel sampling and analysis protocols, and the initial results are promising. The use of neodymium isotopes has enabled us to obtain a new range of environmental values and has added to the interpretations of past population mobility.

17 RECONSTRUCTING WATER MANAGEMENT WITH SILICON STABLE ISOTOPES: RESULTS OF IN SITU ANALYSIS IN SORGHUM PHYTOLITHS AND THEIR SIGNIFICANCE FOR ARCHAEOLOGY

D'Agostini, Francesca (CASEs – Culture, Archaeology and Socio-Ecological Dynamics Research Group, Universitat Pompeu Fabra, Barcelona, Spain) - Frick, Daniel A. (Institute of Geosciences, Kiel University, Kiel, Germany) - Varalli, Alessandra (CASEs – Culture, Archaeology and Socio-Ecological Dynamics Research Group, Universitat Pompeu Fabra, Barcelona, Spain; LAMPEA, Aix-Marseille Université, CNRS, Ministère de la Culture, Aix-en-Provence, France) - Madella, Marco (CASEs – Culture, Archaeology and Socio-Ecological Dynamics Research Group, Universitat Pompeu Fabra, Barcelona, Spain; ICREA – Catalan Institution for Research and Advanced Studies, Barcelona, Spain; Department of Geography, Archaeology and Environmental Studies, University of Witwatersrand, Johannesburg, South Africa) - Lancelotti, Carla (CASEs – Culture, Archaeology and Socio-Ecological Dynamics Research Group, Universitat Pompeu Fabra, Barcelona, Spain; ICREA – Catalan Institution for Research and Advanced Studies, Barcelona, Spain.)

Phytoliths, plant microremains whose formation is directly associated to the cells where they originated, have been identified as proxies for foodways and agricultural practices. Because of the occurrence of their deposition, phytoliths have been also suggested as a potential indicator of environmental conditions during plant development and consequently of agricultural management. In this framework silicon stable isotope analysis of phytoliths has emerged as a pivotal method for elucidating the mechanisms behind phytolith formation. In this paper we present preliminary results on the analysis of silicon stable isotopes on phytoliths of *Sorghum bicolor* L.Moench, aiming at better understanding phytolith deposition in relation with plant water availability, especially in agricultural arid contexts.

Sorghum was grown in lysimeters under different water regimes. Plants were watered according to their transpiration rate to simulate different conditions: from water abundance to extreme water stress. Phytoliths were extracted from leaves and chaff and analysed by femtosecond laser ablation multi-collector inductively coupled plasma-mass spectrometry (fsLA-MC-ICP-MS). This method allows the measurement of individual phytoliths thus increasing the interpretation potential. We analysed 24 samples for bulk (i.e., clusters of phytoliths) and for specific morphotypes within silica skeletons for a total of 717 data points of bulliforms, elongates and stomata phytoliths. Preliminary results suggest significant differences among morphotypes and plant parts and water treatment. Indeed the outcomes

revealed that the $\delta^{30}Si$ of elongates of sorghum chaff and leaf blades, as well as the stomata in the leaves, varies between plants cultivated in well-watered and water-scarce conditions, emphasising the potential use in interpreting the context of origin regarding both environmental conditions and water agricultural handling for agriculture. Simultaneously, these promising results on distinct morphotypes pave the way for the utilisation of stable silicon isotopes in studies aimed at understanding the environment in which societies of the past developed.

559 THE MEDITERRANEAN(S) IN TRANSITION: GLOBAL PERMANENCE(S), MATERIAL CULTURE(S), AND RESILIENCE BETWEEN 5TH AND 10TH CENTURY AD

Session theme: 6. The Mediterranean from Within

Session organisers: Pini, Nicolo (CReA-Patrimoine – Université libre de Bruxelles (ULB); FNRS) - Marchand, Julie (Royal Museums of Art and History, Brussels (KMKG-MRAH); CReA-Patrimoine – Université Libre de Bruxelles (ULB)) - Carabia, Alessandro (University of Birmingham, Centre for Byzantine, Ottoman and Modern Greek Studies)

Session format: Session with keynote presentation and discussion

The peoples and cultures of the Mediterranean are often compared on the basis of their geographical origin, whether Eastern or Western. Especially for the period between the 5th and 10th centuries, this comparison is mainly based on political distinctions and often ignores material aspects. But are identities around the *mare nostrum* really based on political boundaries, or should we seek regional specificities using different interpretative media? In particular, the distinction between the Western and Eastern Mediterranean appears to be particularly marked in the scholarly debate and attempts to bring together evidence from these "two worlds" are rare and not systematic.

The questions that arise then are: can we still speak of a single Mediterranean during Late Antiquity and Early Medieval times? Are East and West following completely different trajectories? Is it possible to compare their respective historical processes and material cultures? Or can some common features be identified, despite regional particularisms? Is trade global or does it mutate according to political factors affecting local identities? To this sense, different forms of resilience and adaptation and the potential development of one or more transitional cultures are fundamental interpretative keys.

In this Call for Papers, we invite scholars and archaeologists to bridge the scholarly division between East and West and present research focusing on material evidence from the 5th until the 10th century AD from all around the Mediterranean.

ABSTRACTS

1 ECONOMICS AND SOCIETY IN EARLY MEDIEVAL GREECE: THE CHANGING FACE OF CORINTH

Valente, Rossana (Università degli Studi di Roma Tre; Scuola Archeologica Italiana ad Atene)

This paper aims to provide an overview on diverse perspectives of research on the emergence of Medieval cities in the Eastern Mediterranean world, with major focus on the case of Corinth (Greece). The archaeological evidence at the core of this paper have been brought to light by the excavations conducted by the American School of Classical Studies at Athens since 1896.

The traditional focus of the archaeological investigation has been on the core of the ancient city – the area of the Forum – and was driven by major interests in the literary texts pertaining to the historical reconstruction of the Antique urban topography. This has led to the conclusion that there was a major disruption and abandonment of the city from the sixth century onwards. The archaeological evidence from the Roman forum seemed to support this vision, since it ceased to maintain its previous political and economic significance and the core of the Late Roman city was reduced in size due to the pressure of socio-economic transformations.

However, over the last few decades, systematic excavations in Ancient Corinth have significantly improved the current understanding of the development and typology of the urban topography of this city, which underwent significant changes since Late Antiquity.

On the basis of new and unpublished dataset put in context with archival documentation, this paper aims to propose an alternative and more articulated historical reconstruction of the urban topography and socio-economic structure of Corinth from Late Antiquity to the Medieval period, in order to discuss how diverse forms of urbanization may have taken place beyond the perimeter defined by the Late Antique city walls.

2 SURVIVAL AND ADAPTATION: BATH-GYMNASIUM COMPLEXES IN LATE ANTIQUE ASIA MINOR

Kalfa-Atakli, Basak (Cankaya University)

The Bath-Gymnasium complex, unique to Asia Minor, represents a fusion of Eastern and Western influences, blending Greek gymnasia with Roman baths. Introduced as a building typology by Fikret Yegül in the 1970s over the case of Sardis, these structures embodied the geographical and cultural complexities of their context.

This study aims to revisit Bath-Gymnasium complexes, focusing on their evolution during the transitional period of Late Antiquity. While the bathing sections persisted into the Eastern Roman Empire, ancillary spaces such as palaestrae and colonnades underwent adaptations to meet changing societal needs. Encroachments by artisanal workshops and squatters often led to subdivisions or dismantling for reuse in other constructions, further shaping their architectural legacy.

Despite their prevalence in Asia Minor, Bath-Gymnasium complexes are often overlooked in scholarly discourse. This paper seeks to rectify this oversight by revisiting this rare and understudied building typology, particularly focusing on its evolution through the transitional period of Late Antiquity. By examining the interactions between architecture, society, and culture, the paper aims to enrich our understanding of Asia Minor's architectural heritage and its significance in the broader Mediterranean context.

Furthermore, through an architectural and conservation lens, this study aims to contribute to a deeper understanding of the dynamic nature of Late Antique society in Asia Minor and the multifaceted roles of Bath-Gymnasium complexes within it.

3 WEAK LINKS: SOME REFLECTIONS ON TRADE AND CRISIS ACROSS THE TYRRHENIAN AND AEGEAN GRAIN ROUTES IN THE 6TH-7TH CENTURIES

Carabia, Alessandro (University of Birmingham)

By the end of Late Antiquity, the Tyrrhenian and Aegean sea routes might look like two very different and separated trade systems. However, Deligiannakis's 2016 book on the Dodecanese and East Aegean islands shows the existence of different connection points.

Undoubtedly, it isn't easy to compare the two Mediterranean areas from the point of view of trade volumes and the consequential richness of local societies. It is possible to discuss some general trends which affected the two sea routes and the plethora of settlements and people whose lives revolved around or were impacted by their existence. Both networks were indeed connecting production centres (North Africa and Egypt) with consumerist capitals (Rome and Constantinople); both partially extended beyond those destinations (Provence and Gaul on one side and the Danube frontier on the other); furthermore, the success of several communities occupying the network's links was entangled with "their structural integration" in the network itself.

The fact that the crisis of both these systems between the late 6th and the early 7th centuries produced some similar effects (even if on different scales) is relevant in understanding how communities heavily dependent on a single source for their sustainability might react when faced with the sudden reduction of that source. By comparing some of the weakest links of these networks (Liguria and the Aegean islands), this paper will seek to outline the reaction of "vulnerable" communities to a crisis.

4 NOUVELLES DONNÉES SUR LA REPRISE DU COMMERCE DANS LA MÉDITERRANÉE CENTRALE ALTO-MÉDIÉVALE : ARCHÉOLOGIE ET ARCHÉOMÉTRIE DES ÉPAVES PROVENÇALES

Richarte-Manfredi, Catherine (INRAP - National Institute for Preventive Archaeological Research; CIHAM UMR 5648)

La contribution proposée, envisagée de manière pluridisciplinaire, repose sur des travaux archéométriques à la croisée d'études historiques, archéologiques et économiques portant sur le commerce en Méditerranée occidentale entre la fin du IXe et le début du Xe siècle de notre ère. Si, celle-ci prend pour base documentaire un ensemble d'épaves du haut Moyen Âge retrouvées le long des côtes de la Provence, la nature du fret (conteneurs et denrées) suggère quant à elle, un approvisionnement pour ces navires à des points réguliers et le parcours de véritables circuits marchands. Les résultats novateurs de cette enquête impliquent l'existence de réseaux méditerranéens actifs durant le premier Moyen Âge et invalident l'hypothèse de submersions résultant des conflits ou de la seule piraterie, dont les références historiographiques durant les IXe et le Xe siècles mentionnent essentiellement les conflits opposant les Latins, Byzantins et Musulmans dans le bassin méditerranéen, mais dans une moindre mesure les activités commerciales.

Communication en français / pptx en anglais.

5 EARLY MEDIAEVAL HANDMADE POTTERY WITHIN BYZANTIUM'S EAST AND WEST. SOME PRELIMINARY REMARKS OF AN ANALYTICAL STUDY FROM GREECE AND CYPRUS

Vasileiou, Theodore (University of Cyprus)

Historically, the transition from the Late Antique to the Early Middle Ages in the Mediterranean broadly appears disparate in the archaeological literature, with a clear east-west geographical distinction. Following, comparisons and associations of material culture(s) within this framework have shaped our archaeological perception. However, such an approach also seems seminal on a smaller scale. Even within the Eastern Mediterranean, the "Byzantine world", east-west dichotomies persist, mainly attributed to political particularities, invasions, disasters, and population movements. One aspect of material culture where such a dichotomy is evident is the emergence of handmade pottery in Early mediaeval Byzantium. Recently, several studies have moved away from established culture-historical narratives and shifted our perception of this pottery to issues of "shared" local responses to global phenomena.

By sharing this viewpoint, this study offers some preliminary remarks and aims to contribute to the ongoing discussion of handmade pottery technology and production in the Eastern Mediterranean through an analytical approach. Two archaeologically distinct pottery groups have been included; samples recorded as "Slavic ware" from the Greek west and handmade vessels from Cyprus (east). Moving further from a typological viewpoint and through an object-oriented laboratory-based approach (ceramic petrography and pXRF analysis), this study goals a) to initially explore compositionally and technologically the assemblages in an intra-site level b) compare aspects of western/eastern handmade pottery chaîne opératoire(s) within the Byzantine territories, and c) argue whether the analytical profile of these groups could infer common responses to broader new conditions pressing Byzantine Early Mediaeval communities.

6 THE "ROMANISATION" OF EGYPTIAN POTTERY: A NEW INSIGHT ON LATE ROMAN PRODUCTIONS

Marchand, Julie (ULB & RMAH, Brussels)

In 2000, Sheila McNally and Ivančica Schrunk published an important article about Rome's impact on the Egyptian pottery industry. The assumption is that Rome, particularly through its military, disseminated a new type of ceramic, the sigillata, to its outlying provinces. Egyptian potters quickly copied and adapted these new red slip forms to produce a local repertoire, which would also spread: this phenomenon, one of many, is part of the Romanisation of Egyptian material culture. In this analysis, a large series of diagrams illustrate the evolution of types, imported from East, West and North Africa, alongside the Egyptians.

More than 20 years later, new data is available and new stratigraphic material has been published, allowing us to go further than the authors' conclusions. Beyond the changes in types, the diagrams illustrate above all the political phenomena that shook the Mediterranean until the 10th century, as well as the trends that developed there. By examining a corpus of Egyptian tableware (sigillata) and amphorae, this paper seeks to review the impact of Rome on ceramic production in a reconsidered Mediterranean historical and economic context. Since Egypt is just one example, this paper examines the unity of Mediterranean production and trade between the 5th and 10th centuries.

7 THE ARCHAEOLOGICAL EXPLORATION OF LATE ANTIQUITY: TRACING TRAJECTORIES IN THE LEVANT

Dolci, Jacopo (University of Nottingham)

The concept of Late Antiquity has been at the centre of historical discussions for at least half a century, with its chronology fiercely debated. As time progresses, reaching an agreement and harmonizing historical models with ever-changing archaeological evidence becomes increasingly complicated. This paper addresses and reviews the theoretical aspects of research related to Late Antiquity and the late antique Levant. It provides an overview of the origins and evolution of the Late Antiquity concept, as well as the role of archaeological research in shaping it. The paper examines crucial turning points in the historiographical debate and focuses on state-of-the-art research in the Levant. Supporting a regional approach to Late Antiquity, it delves into the length and nature of Late Antiquity in the Levant. This allows for a discussion on the pivotal role of cities between the fourth and eighth centuries, particularly in retaining urban monumentality (e.g., churches, mosques, palaces) and in continuing to apply orthogonality (e.g., Sergiopolis, Anjar). The archaeological reassessment suggests a different trajectory for the late antique Eastern and Western Mediterranean. Specifically, it highlights a prolonged Late Antiquity in the Levant that extends into the eighth century, making the region unique within the former Roman Empire.

566 MULTIPLE SCALES IN THE MANIFESTATIONS OF THE ISLAMIC

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Carvajal Lopez, Jose (Incipit-CSIC) - Shingiray, Irina (University of Oxford) - Hernández Robles, Alicia (University of Granada) - Zivkovic, Jelena (The Cyprus Institute)

Session format: Regular session

The question of scale is all too often left outside when scholars, and particularly archaeologists, deal with Islam. Different attitudes to Islam, often qualified in terms of orthodoxy/heterodoxy, seem to apply when focusing on complex networks across territories (e.g. trade partnerships vs law schools), political entities (states and tribal confederations), on medium to small communities (cities to neighbourhoods and villages, tribal groups) or on individual attitudes (where factors like ethnicity, gender or socioeconomic class complicate matters).

In this session we aim to discuss the materiality of multiscalar manifestations of Islamic societies, and how they generate sociocultural variation. The weaving of the different scales creates spaces where innovation and originality are more frequent. Scales here are understood in different dimensions: time and space. Time scales include événements vs conjunctures vs longue durée, space scales encompass the local, the regional and the global and combinations of space and time allow for more nuances: e.g. seasonality in a site vs conjunctural transformations in a state, events in a transregional network vs long term changes in urban layout.

We invite colleagues to present case studies where materiality of Islamic/Islamicate societies is informative of how relations across different scales affect the cultural manifestations of Islam. There are classical examples, like the influence of the border phenomenon in small communities, or the effects of connectivity across vast expanses of space in the development of urban or rural communities. But we would also like to see innovative perspectives, perhaps emphasizing the influence from the bottom (small scale) to the top (large scale): how did changes in local ceramic traditions, for example, relate to larger networks of trade and contact? How did the development in the materiality of the fringe societies, or even of intersectionality, in Islam impact the core Islamic societies of their time?

ABSTRACTS

1 THREADING AND WEAVING MULTISCALAR FIELDS IN ISLAM: SOME EXAMPLES IN CERAMICS

Carvajal Lopez, Jose (Incipit-CSIC)

One of the key concepts about Islamization is connectivity. Islam expanded very fast over extensive territories, and time proved that it can find its way into the most diverse cultural backgrounds. In this paper, which I propose to offer as presentation of the session, I suggest that Islam managed to become threaded and interwoven with different fields of reality.

I will offer some examples of thinking across interrelated fields of different scales in Islamic societies, with a system of concepts in which I will differentiate between interwoven fields and threaded fields. The general aim is to present a set of concepts useful to describe historical changes in Islam and that at the same time overcome the limits of a quantitative idea of "connectivity" in search of meaning in the connections themselves.

To explore these ideas I will revisit some early Islamic assemblages of archaeological ceramics that I have looked at in the past and that I know very well: the assemblages of the Vega of Granada, in Spain, and of the archaeological site of Yughbi, in Qatar. In this presentation I will show how these Islamic assemblages can be looked at at different scales, and how the meaning of "woven" and "threaded" scales affect our understanding of them.

2 EARLY ISLAMIC ISBILYA (SEVILLE) - HOW TO RECOGNIZE THE ISLAMIC?

Mateos-Orozco, Ana (University of Seville)

Seville is considered one of the most relevant cities in the first moments of al Andalus. It is continuously mentioned in written sources about the conquest and the following years. Even though its relevance and the number of publications about the Late Antique city, the early Islamic period seems to have vanished generating a gap in the research that has led to the continuous non-identification of this period through the archaeological record. That is due to a varied casuistry: a very diverse material record resulting from a polyedric and complex Islamisation process; lack of information and material parallels for the 7th to the 9th century and consequently the impossibility of identification without stratigraphy; the prevalence of commercial archaeology in the urban layout and associated with this is the absence of studies of materials deposited in museums; and finally, the popularity and impact on the city of other historical moments, like the Almohad Empire or Rome.

In this work, we present an overview of the city of Seville during the Early Islamic period reviewing different archaeological interventions, using a georeferenced database that also allows us to observe urban planning issues, and finally focusing on the Mosque of Ibn Adabbas, the first main mosque built in the year 214H/829AD. The intervention in

the mosque and its results allow us to analyse different factors like ceramics and other objects, building materials, architecture, and the location of the mosque in the urban design of the city. Understanding the place from a micro to a macro scale. The building as a mosque is a reflection itself of Islam, and at the same time, the analysis of those single factors gives us an insight into different aspects of the early Islamic city, reconstructing the process of Islamization of Ispali into the new madina, Isbilya.

3 FROM SUBURBAN TO INLAND SPACES: ASSESSING MULTISCALAR APPROACHES IN ISLAMIC ARCHAEOLOGY OF WESTERN SICILY

Castrorao Barba, Angelo (Escuela de Estudios Árabes, Consejo Superior de Investigaciones Científicas (EEA, CSIC))

This paper explores the Islamic archaeology of Western Sicily, traversing from the suburban landscapes to the inland regions, with a focal analysis on recent research in the suburbs of Madīnat Šiqilliya/Balerm (Palermo) and the rural landscapes of Qurliyūn (Corleone). The aim is to assess multiscalar approaches for a deeper understanding of the varied socio-cultural dynamics prevalent during the Islamic period in these distinct areas.

Employing an interdisciplinary methodology, this study integrates the analysis of archaeological findings, historical records, environmental and spatial data to unravel the complex dynamics of Western Sicily under the Islamic rule across different scales. In the suburban area of Madīnat Šiqilliya/Balerm, recent excavations have highlighted an increase in occupation, illuminating the material culture and everyday life of Islamic communities in this area.

Extending the investigation to the inland area of Sicani Mountains, the territory of Qurliyūn (Corleone) reveals the complexity of Islamic settlement patterns in terms of continuity, resilience, and change, in relation to the Roman and Byzantine periods. This is particularly evident also on a site-based scale of the excavation in Contrada Castro, where a distinct sequence of occupation crucially spans the transitional phase from the Byzantine to the Islamic period.

Through a multiscalar perspective, the paper aims to contribute to a nuanced understanding of the Islamic archaeological footprint in Western Sicily, emphasizing the different scales of changes between phenomena of continuity, change and innovation.

4 WHAT DEATH TELLS ABOUT LIFE: FUNERARY MATERIAL EXPRESSIONS IN THE MEDIEVAL HORN OF AFRICA

Gómez, Carolina (Incipit - Institute of Heritage Sciences)

The funerary practices of a human group often tell us more about the living than about the dead themselves. In the case of the Horn of Africa, the arrival of Islam in medieval times produced a series of changes in the social, political, cultural and, of course, religious dynamics of the region. Not all the changes that take place in this period have the same relationship with the introduction of this new religion in the area or are not so clearly an effect of this process, but most of them share a common characteristic: they are embodied in material expressions and, therefore, can be documented through archaeological methodology.

In this communication, I will focus on one of these material expressions: funerary structures and practices. The aim, therefore, is to describe their main modifications with respect to the pre-medieval period, as these are a reflection of how the communities of the Horn of Africa underwent a process of progressive Islamisation without totally abandoning their pre-existing cultural identity. A typological proposal of the new forms of burial that appeared between the 13th and 16th centuries will also be presented. Thus, the study of the changes in medieval funerary material culture in this area allows us to construct narratives about the interaction between various factors such as Islam, the state, sedentarisation, etc. and to characterise whether this interaction occurs in the same way at different scales (within a specific human group, regionally, at the state level, etc.). This interaction results in a series of material expressions that are the fruit of the hybridisation of all these factors and which will be the subject of analysis in this presentation.

5 LOST IN THE IN-BETWEEN. THE FUSION BETWEEN LOCAL CULTURE AND ISLAMIC IMPERIAL INFLUENCES ON THE RANIA PLAIN IN IRAQI KURDISTAN

Németh, Fruzsina (Eötvös Loránd University, Doctoral School of History)

The regions inhabited by Kurds still exhibit diverse cultural characteristics, which have emerged from centuries of influence from Islamic empires and a blend of local traditions. The Zagros ranges acted as a natural buffer between the borders of the great Islamic empires, while the local population played a mediating and synthesizing role among these cultural entities.

Islamization of the region commenced in the 7th century. The new religion and its associated socio-cultural framework initially took root in the larger cities of the area and the lowland areas to the west. Despite this, the population largely adhered to its former religion until the Abbasid period, and it was not until the 12th century that the Muslim

population became dominant in the region. The valleys, concealed between mountain ranges, were geographically and politically distinct, occupying a peripheral role.

This dichotomy has engendered two parallel narratives in the region. The settled population of the cities and their environs became integrated into the orthodox Sunni Muslim branch. Local religious centers soon sprouted, becoming part of the extensive religious-cultural system of the Islamic world. Rural areas, on the other hand, retained their former beliefs and customs, paving the way for the emergence of syncretic religious traditions.

Historical-ethnographical research has frequently explored the religious composition of the Kurds and the interrelationships between various branches of beliefs. From an archaeological perspective, I aim to address several questions: How did Islamic religion and culture emerge and manifest in the everyday life of the population in the mountainous parts of the area? How closely linked were the more Islamized western regions to the more secluded eastern regions? Was the culture of isolated valleys more localized or heavily influenced by external Muslim factors? Can archaeological remains provide insights into what Muslim identity meant to the inhabitants of specific areas?

6 THE INTERSECTION OF ISLAM AND NOMAD CART TECHNOLOGY IN QIPCHAQ AND MONGOL PERIOD BURIALS IN THE WESTERN EURASIAN STEPPE

Shingiray, Irina (University of Oxford)

Mobility and travel defined the lifestyle of the medieval Eurasian pastoral nomads. These activities were the means by which nomads were able to unite, maintain, and command large political confederations keeping them interconnected at different scales. It was made possible by transport animals and nomadic carts. While medieval nomads of the Eurasian Steppe are often praised for their 'horse culture,' it is rarely mentioned that they were also a remarkable 'cart culture.' Nomads used their carts in everyday life, in seasonal migrations, in war, trade, rites of passage, for personal conveyance, and for burial and ancestral practices. When nomads of the Western Eurasian Steppe embraced Islam, their technologies of mobility and nomadic Muslim practices produced a peculiar intersectionality which is manifested in nomadic burial rites during the Qipchaq and Mongol periods, especially during the 12th-14th centuries.

In this presentation, I will discuss several archaeological cases, as examples, where we find the aforementioned intersection in a ritual context of Islamic funerary rites and nomad cart technology. These data derived from a corpus of kurgan burials in the Pontic-Caspian Steppe. I will argue that such archaeological evidence on par with textual and visual data demonstrate that carts played a paramount role at different scales of nomadic connectivity and power during that time period. I will focus mainly on personal carts, their technology, and their wide range of uses. Serving as portable private spaces, carts were a medium for cultural and personal expression, through which vital concerns and concepts were communicated, e.g., identities, protective magic, and aesthetics of movement and a mobile way of life. I will also argue that this cart culture encouraged personal mobility of nomads of different ages, genders, and states of health, and thus contributed to social inclusivity and participation in the political life in the steppe.

7 MULTI-SCALAR APPROACH TO THE STUDY OF CRAFTS IN THE OTTOMAN EMPIRE: LOCAL PRACTICES IN THE IMPERIAL NETWORK

Živkovic, Jelena (The Cyprus Institute)

The place of crafts in the economy and society of the Ottoman Empire has been thoroughly discussed in historiography. This resulted in the definition of craft production modes that are expected to be representative of the Empire, although the available/studied archival documents usually concern major cities only. For archaeology, the proposed dichotomy between urban and rural economies is particularly relevant because it assumes differences in craft organization, social relations between artisans and links with the state that should manifest on the macro-scale.

This paper aims to offer an archaeological view on this dichotomy by using three case studies of micro-scale craft practices in the Ottoman Balkans and the Eastern Mediterranean developed between the 15th and 19th centuries. The focus is on the common pottery production studied by interdisciplinary methods that combine archaeology and materials science. Three case studies are embedded into different historical, environmental and cultural settings, representative of a large city in the core of the Empire (Thessaloniki), medium-size town on the Danubian frontier (Belgrade) and island villages (Cyprus). The paper will compare patterns of ceramic production technologies in those places for the observation of potential differences that will be discussed in the context of macro-scale network of the Ottoman Empire.

8 ALL THINGS SMALL AND SMALLER. A SCALE-PERSPECTIVE OF THE STUDY OF ISLAMICATE MEDIEVAL GLASS

Hernández Robles, Alicia (University of Granada) - Govantes-Edwards, David (University of Cordoba) - Velo Gala, Almudena (Research Unit VICARTE, NOVA University of Lisbon) - González Ballesteros, José Ángel (ARHIS Research Group, University of Murcia)

Dubbed by Kristiansen as the "third science revolution" archaeology has in these opening decades of the 21st millennium fully embraced archaeometric techniques, which are by now part of pretty much every archaeological project worth its salt. However, why these techniques are used, and how they are incorporated into the project's broader theoretical stance is seldom considered or, at least, made explicit, and this is beginning to cause some discomfort among a growing number of archaeologists.

This presentation takes data from a sample of 12th-13th-century glass from the urban site of San Esteban, Murcia (Spain), analyzed for major, minor, and trace elements, to illustrate the radical differences that the scale of observation can make for the interpretation of the data as evidence for past craft practices. The results of the analysis are observed locally and in a broader pan-Islamicate perspective, both of which are transversally affected by what we could call a meta-perspective: the harder we squeeze the archaeological material for chemical data (major elements: > 1% wt. %; minor elements: 1%-0.1% wt. %; trace elements: <0.1 wt. %) the further we move from the power of observation of the actual medieval glassmakers, a fact that is rarely taken into account in the interpretation.

9 MADE ELSEWHERE: WHAT DO IMPORTS REVEAL ABOUT THE EVOLUTION OF CULTURAL PRACTICES IN AL-ULA (HEJAZ) DURING THE ISLAMIC PERIOD?

Pellegrino, Maria Paola (Archaios) - Tourtet, Francelin (Archaios; Freie Universität Berlin) - Furstos, Cassandra (Archaios) - Guedeau, Nolwenn (UMR 7298 LA3M; Islamic Archaeology Unit, BIGS-OAS, Bonn University) - Kanhoush, Yasmin (Archaios; UMR 5133 Archéorient) - Charbonnier, Julien (Archaios)

As evidenced by the survey conducted in the framework of the Al-Ula Cultural Oasis Project (led by Archaios, funded and steered by the French Agency for AIUla Development on behalf of the Royal Commission for AIUla), the Al-Ula region (Hejaz, Kingdom of Saudi Arabia), has been continuously settled for at least 3,000 years. Material remains (pottery, glass artifacts, tobacco pipes, stone vessels, coins etc.) of non-local origin collected during the UCOP survey and dated from the Early Islamic to the Late Ottoman period (7th - 20th centuries CE) provide evidence of contacts with neighboring regions (e.g. Egypt, the Levant, and Mesopotamia) as well as more distant ones (e.g., Eastern Asia, Europe). Quantifying the imported objects and tracing their provenance along with possible maritime and overland routes to Al-Ula contributes to investigating the relations between this oasis and the "outer world" in a diachronic perspective. Through the analysis of imported artifacts, this article will also shed light on related cultural practices in local Arabian societies, such as tobacco, coffee, and tea consumption.

10 MULTISCALE MANIFESTATIONS OF ISLAMIC CULTURE IN THE HISTORY OF UKRAINE: CURRENT THEORETICAL AND METHODOLOGICAL APPROACHES

Biliaieva, Svitlana (Institute of Archaeology of National Academy of sciences of Ukraine)

The geopolitical position of the territory of Ukraine as a transition zone (vast Steppe, numerous rivers and seas) opens great possibilities for the movement of various peoples and a variety of multiscale manifestations in their materiality, especially when it comes to their interactions with Islamic culture. The most significant material manifestations of Islam in Ukraine were associated with the polyethnic nomadic populations who inhabited that region during a lengthy period: from the arrival of the Turk tribes (the Seljuks, the Kipchaks) to the Mongol invasion and the Crimean Khanate, and lastly, to the Ottoman invasion and co-existence of Ukrainian and Ottoman societies from the end of the XVth to the end of the XVIIIth centuries. In the Russian Imperial and Soviet historiography of the XIXth-XXth centuries, Islamic culture was often interpreted as a negative phenomenon, and its hostility towards Slavonic society was emphasized. This theoretical position prevented an objective evaluation and appreciation of the real place of Islamic culture in Ukraine. In the post-Soviet period, during the last decades of the XXth and the beginning of the XXIst century, this situation has changed, as new methodological approaches in archaeological investigations have allowed us to focus on numerous monuments influenced by Islam in Ukrainian culture at various scales. The major task of the current investigation in this field is the creation of a model of material examples and manifestations of Islamic culture in Ukraine spanning the periods of pre-Islamic and Islamic culture and its co-existence with Ukrainian societies. The present database of archaeological artifacts includes information about different kinds of materialities: social, economic, cultural, religious, ethnic, etc., the study of which can provide a new understanding of Islamic culture and how it operated at multiple scales in the history of Ukraine.

11 ACTS OF ART(E)FACTS : VIKING AGE MANIFESTATIONS OF HOLY ISLAMIC INSCRIPTIONS IN THE TEXTILE ART

Larsson, Annika (Uppsala University; The Society for Textile Archaeology & Culture Studies) - Pallin, Karolina (The Society for Textile Archaeology & Culture Studies) - Guennoun, Mohamed (The Society for Textile Archaeology & Culture Studies)

We suggest that a rich Scandinavian heritage of Islamic expressions in artistic crafts, stretching back in time to the Golden Age of Islamic Art, is represented in almost all textile art preserved from the contemporary pre-Christian Viking Age. Starting from the religious Square Kufic expressions preserved in Scandinavian folk art textiles, we can trace Islamic manifestations in time and space that did not care about either geographical or cultural boundaries of today.

Already in 1958 the Swedish ethnologist Sigfrid Svensson studied the connection between folk costume and fashion. He claimed that ancient details in folk costumes reflect historical symbols from a certain period of social and economic prosperity when the fashion was not only favored by the elite but was more general. Anna-Maja Nylén argued in 1974, as a complement to this explanatory model, that the phenomenon is evident in a rich range of folk art textiles and costume details associated with long-lived ceremonial traditions, such as weddings and funerals – which is the exact opposite to the everyday tools and craft techniques that due to poverty has been preserved within the folk culture.

Thus, according to this model, the Scandinavian heritage of Islamic expressions of Square Kufic patterns in folk art textiles should reflect a certain époque in history when Islamic manifestations were socially integrated. Through amounts of archaeological textile finds all over Scandinavia, the phenomenon can be traced to the Viking Age. Shortly thereafter, the Square Kufic expressions were abandoned in their Islamic homelands, and there is therefore no reason to connect these patterns to a second boom of Oriental patterns which, in the form of Turkish floral motifs, was integrated into the Western fashion in the 18th century.

In conclusion, we will show examples not only from Scandinavia but also from Russia and Mexico.

12 THEATRE OF ASPENDOS AND ITS ENVIRONS UNDER SELJUK CONTROL: OBSERVATIONS BASED ON FERNAND BRAUDEL'S THREE PLANES OF HISTORICAL TIME

Akture, Zeynep (Izmir Institute of Technology)

Seventh-century Arab invasions are widely accepted to have started the Anatolian Middle Ages which are characterized by ethnic plurality. Yet, popular narratives on medieval Anatolia rather highlight “Turkification” and “Islamization”, through the arrival first of Muslim Turkoman tribes and then of Seljuk conquerors in the eleventh century. This grand narrative has long overshadowed the multiscalar material manifestations of the incomers’ interactions with the vast and diversified cultural landscapes of Anatolia that lend themselves to an analysis based on Braudel’s three timescales (of events, conjunctures, and the *longue durée*). This formulation enables framing, in the same picture, exceptional people such as the Seljuk Sultan Alā ad-Dīn Kayqubād I (1188-1237) and his unique residences in several locations, the settlement and communication networks he and his successors transformed to channel trade through Anatolia in a period when Constantinople was under Latin control, and the (still) nomadic Turkomans.

This proposed paper attempts to construct such a picture from a number of scholarly research outcomes on and around the Roman Theatre of Aspendos in Antalya province along the Mediterranean coast which is one of the best preserved of its kind. The inspiration has been Turkish Ministry of Culture and Tourism’s official website where this good state of preservation is attributed to thirteenth-century Seljuk sultans’ preservationist policy of repair and reuse as a caravanserai, pavilion, or palace, according to different interpretations. Unfortunately, traces of this adaptive reuse (including tiles decorating a masjid installed in the stage building well into the 1930s) were almost totally removed to restore the “grandeur” of the Roman Theatre. Echoing undocumented removal of the medieval layers also in other popular archaeological sites including Ephesus, this enables discussing, among concluding remarks, the contribution of archaeological research and interventions in the loss of granularity in our current vision of Early Islamic traces in Anatolia.

569 UNEARTHING THE ECHOES OF VIOLENCE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Casimiro, Tania (FCSH-UNL) - Santos, Joel (University of Leicester)

Session format: Regular session

The archaeology of violence is a multidisciplinary field that seeks to understand and contextualize the myriad expressions of human aggression and conflict throughout history. By adopting an archaeological lens, we can delve deeper into the past, unraveling the layers of violence and understanding how it shaped human societies. Examining both the physical and non-physical dimensions of violence in the archaeological record permits a more nuanced understanding of the complexities surrounding aggression. There are different ways to analyse violence, and different societies

observe and deal with different scales of violence, emphasizing the need to investigate and interpret the material remnants of violence to reconstruct the complex narratives of past societies.

This session aims to explore how archaeology can study the motivations, technologies, strategies, and consequences of violent acts. By examining the physical evidence left behind by acts of aggression, we can discern patterns of social organization, inequality, and power dynamics within different societies, unveiling a rich tapestry of human experiences, stretching far beyond physical confrontations and discussing symbolic and structural violence. Such studies not only contribute to a deeper understanding of the past but also help us reflect on contemporary issues related to violence and conflict, but also the way that archaeologists see themselves as agents in the construction of past narratives and how violence is sometimes used by, against and within our community.

ABSTRACTS

1 VIOLENT DEATHS INTEGRATED IN THE CEMETERY AT NEOLITHIC KADRUKA-23 (UPPER NUBIA)

Sellier, Pascal (CNRS, UMR7206 Eco-Anthropologie; Dpt ABBA Anthropologie Biologique et Bio-Archéologie) - Aoudia, Louiza (Centre National de la Recherche Préhistorique, Anthropologique et Historique (CNRPAH); UMR7206, Dpt ABBA Anthropologie Biologique et Bio-Archéologie)

In the the Kadruka-23 burial ground in Upper-Nubia (Sudan, Northern State, Dongola Reach) 172 buried individuals have been excavated since 2014 by the MaFSàK (Mission archéologique Franco-Soudanaise à Kadruka). Organized as a genuine cemetery, the burials are dated from the second quarter of the 5th Millenium BCE. The overall mortality profile is pointing to a natural, “attritional” mortality: The burial-ground includes every age-group and both sexes, without any kind of selection, and is consistent with a typical ancient mortality profile. Yet three of the buried individuals are showing clear marks of violence. Two women and one man, all middle-aged, show perimortem fractures and they died because of blunt-force traumas related to interpersonal or organised violence. Those lethal blows are located on the cranium (several blows in one case), inside the pelvis (inner part of the ilium of os coxae), and inside the abdomen (reaching the last thoracic vertebrae and damaging abdominal aorta). In all the cases, we can reconstruct the edge of the blunt instrument which seems to have been a stone hand axe very similar to those that can be found in tombs as grave goods, but probably hafted at the end of a long shaft, like a pike. As far as funerary practices are concerned, those three assaulted individuals are fully integrated within the cemetery, with the same grave-goods and burial practices as all the others. All that is asking a question about those three subjects as being (or not part) of the group.

2 THE DEHUMANIZING VIOLENCE INDEX: AN OLD WORLD/NEW WORLD COMPARISON OF OVERKILL IN ARCHAEOLOGICAL CONTEXTS

Moriarty, Paul (University of Wisconsin-Milwaukee)

Extreme forms of violent behavior appear in various cultural contexts throughout human history. This study compares so-called “overkill” sites from the late Central European Neolithic and the Pueblo Period of the American Southwest to develop a systematic approach to distinguishing between the levels of violence exhibited in overkill assemblages, compare and define possible motivations and choices for extreme violent behavior, and determine whether the purposeful use of extreme violence in temporally and spatially distant cultures has predictive value today. The skeletal data from six overkill sites, three from each geographic context, were compared by means of an ordinal index, the Dehumanizing Violence Index (DVI), that incorporates variables across age and sex categories, including injury and trauma types and locations, evidence for perimortem torture and mutilation, and systematic extreme processing of the body. Although some overkill sites in the geographically and temporally distant contexts compared here appear similar in the treatment of victims, there are clear distinctions in local expression. Resource unpredictability during times of climatic instability was revealed as a strong predictive indicator for the manifestation of extreme violence, with outsider groups often serving as the main targets of such treatment.

3 STRUCTURAL VIOLENCE IN ANCIENT ATHENS – A BIOARCHAEOLOGICAL APPROACH

Liedl, Hannah (Department of Archaeology, Durham University) - Gowland, Rebecca (Department of Archaeology, Durham University) - Buikstra, Jane (School of Human Evolution and Social Change, Arizona State University)

There are different forms of violence, from direct inter-personal attacks (e.g. warfare) to systematic oppression and exploitation, resulting in structural inequalities that cause harm. This form of structural violence prevents equal access to basic needs and places individuals in circumstances of elevated bodily and psychological risks. Structural violence is harder to identify in archaeological settings than direct violence but has been the focus of increased bioarchaeological study in recent years.

Classical Athens is considered the first example of a democratic society that was built on equality. However, access to political participation was highly restricted, and Athenian society was far from a classless egalitarian system. During the Archaic and Classical period, Athens relied heavily on forced labour and enslavement for its development and prosperity. Historical evidence for the lives of those of lower socio-economic status remains scarce in comparison to the elite. Bioarchaeological research has the potential to fill this gap. The human remains excavated from the cemetery at Phaleron, Athens, hold potential for exploring the lives of those ancient Greek people whom history has forgotten. The simplicity of pit graves, the lack of burial organisation, and limited amounts of grave goods, as well as the presence of several mass burials containing shackled individuals indicates people of low socio-economic status, including potential convicts and/or enslaved individuals. Analysis of their skeletal remains, when integrated with the contextual and historical data for this period, provides a new line of evidence to investigate structural violence in Archaic and Classical Athens.

4 **UNEARTHING THE VICTIMS OF THE FIRST BATTLE OF THE FIRST JEWISH REVOLT AGAINST ROME**

Aviam, Mordechai (Kinneret Institute for Galilean Archaeology, Kinneret College)

In the summer of 67 CE, the first battle between the Roman army, 4 legions led by future emperors Vespasian and Titus, took place at the small, fortified Jewish town in the Galilee named Yodfat (Jotapata). The town was besieged for 47 days, and finally conquered. The Jewish commander was Josephus Flavius, who fell into Roman hand at the end of the siege, and later wrote a detailed report of the battle.

His description displayed a lot of casualties in the actual battle on the walls, during the heavy bombardment by the catapult, but mainly a heavy and cruel massacre of civilians after the conquest.

During the years, most scholars rejected Josephus' disruption and some even suggested that it is all from his imagination.

The town was excavated by the author from 1992-1997, and in 2022-2023. During the excavations we found many human bones in the debris, on the floors but mainly buried as mass grave of gathered bones in cisterns and caves, some of which carry heavy marks of violence.

5 **THE MILITARY HOSPITAL AND CEMETERY OF SÃO JORGE CASTLE (LISBON): THE MATERIALITY OF VIOLENCE**

Henriques, Susana (CIDEHUS)

At the end of the 16th century (1580) the brothers of the Hospitaller Order of Saint João de Deus arrived in Lisbon with the Spanish Armada. Historical documents refer that six brothers went to the city castle in order to cure soldiers. In 1592, during the Iberian Union (1580-1640), a Military Hospital at Lisbon Castle began its administrative and care service under the regulations of the aforementioned religious order. During the Portuguese Restoration War (1640-1668) the geographical location of the Military Hospital of São Jorge Castle although strategic, was not in the battlefield front. Recently an archaeological excavation identified the first military hospital of São Jorge Castle which was partially annulled to give place to the hospital cemetery.

This presentation aims to pursue an analytical view of this specific archaeological context and explore its relationship with the concept of violence and the materiality of violence: Firstly, is it possible to access a Military Hospital as part of the materiality of violence? Secondly, even though not at the battlefield during the Restoration War, what role did this institution play during this conflict? Can we acknowledge the loss of individuality in the militaries buried at the hospital cemetery as violence? What meanings can we give to the materiality or lack of materiality of violence found at this site? Lastly, are there any historical documents about this hospital that can be considered materiality of violence?

Literature says that even though most violence present in human societies is considered a deviant behavior in certain occasions, like maintaining social, economic and political stability is seen as necessary as it was during the Iberian Union and the Portuguese Restoration War. How can we debate this archaeological context as part of the materiality of violence in its relation to the conflicts between Portugal and Spain?

6 **THE FINAL ACT OF THE "SPANISH ULCERA", VITORIA, 1813. ARCHAEOLOGY, HISTORY AND MEMORY**

Carrasco Gómez, Pablo (University of Barcelona) - Martín, Gorka (University of the Basque Country)

The Spanish War of Independence, also known as Peninsular War (1808-1814), was a crucial conflict in the recent history of Spain. The Napoleonic invasion was characterized by high levels of violence including battles and activities of rearguard violence: executions, tortures, and crimes against civilians. It is considered as the beginning of the Contem-

porary Era in Spain. What is more, the war started one of the most conflictive phases of the recent Spanish history, with a large succession of civil wars.

Many specialists had studied the Peninsular War from written sources. However, little attention had been paid to the material remains of the conflict. In this oral presentation we expose the primary results of the first archaeological campaign of Vitoria battlefield. Dated in 1813, this battle and the subsequent allied victory, lead to the end of the French supremacy in the Peninsula. We aim to provide new insights of the battle by presenting the results of the archaeological surveys in one of the battlefield sectors. Additionally, the study of the battlefield includes an exhaustive spatial analysis. The presentation will also highlight the role of this historical event in Spanish and European history. For that reason, we analyzed the impact of the centenary commemoration, the monument that has been built for this occasion, and the historical reenactments.

7 **NOT A PLACE FOR US. HOSTILE ARCHITECTURE AS SYSTEMIC VIOLENCE**

Bucchioni, Marianna (University of Bologna)

Hostile architecture is a strategy of violence through which urban planning or private realities inhabiting the fabric of the cities prevent a certain section of society (deemed unseemly) from freely using urban space.

The shapes of hostile architecture are varied in their form and purpose, and their presence in cities is centuries old: from punched arches or deflectors that prevent people from approaching and urinating on a certain corner, to single-seat, sit-stand or tube-shaped benches, to spikes that arise in the vicinity of shops, banks, administrative buildings, to steep walls that prevent people from leaning on a surface.

Hostile architecture manipulates, along with configuration, the intentions and meanings of the cities we inhabit, together with being a material agent of social exclusion on the basis of income, which is a systemic violence typical of western capitalist society. The presented paper intends to highlight this phenomenon together with the normalisation of this kind of materiality in cities' landscape and in citizens' perceptions. Diachronic examples of hostile architecture (from the 19th century to the present) recorded in three different European cities (Turin - Italy, Barcelona - Spain - and Lisbon - Portugal) will be presented.

8 **SILENT AGONY - EXPLORING THE HIDDEN VIOLENCE OF SOCIAL ISOLATION AND LONELINESS**

Santos, Joel (University of Leicester) - Casimiro, Tania (CFE-HTC Nova University of Lisbon) - Agosto, Frederico (UNIARQ - Center for Archaeology of the University of Lisbon; CFUL - Center of Philosophy of the University of Lisbon; FCT - Foundation for Science and Technology)

This paper delves into the pervasive yet often overlooked forms of violence inflicted upon individuals subjected to social isolation and the resultant feelings of profound loneliness. Beyond physical harm, the emotional and psychological toll of enforced isolation can be deeply damaging, constituting a form of silent aggression. This research seeks to shed light on the various dimensions of violence embedded in the solitary experience, examining its impact on mental health, emotional well-being, and overall human flourishing.

Drawing from psychological, sociological, and obviously archaeological perspectives, our paper investigates the intricate ways in which isolation operates as a catalyst for the erosion of self-worth, social connectedness, and cognitive stability. By exploring empirical evidence coming from some Portuguese case studies, such as the lives of Portuguese nuns in the modern age and the lives of Portuguese elderly that live alone in their houses, and framed by a strong theoretical framework, we aim to unveil the hidden dynamics of this nuanced violence and its implications for individual and societal health.

71 **DEBATING BEST PRACTICES AND NEW APPROACHES FOR A SUSTAINABLE STUDY OF ROCK ART**

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Gallinaro, Marina (Dipartimento Scienze dell'Antichità) - Radchenko, Simon (University of Stavanger) - Bonneau, Adelphine (Department of Chemistry, University of Sherbrooke) - Cucci, Costanza (Istituto di Fisica Applicata N. Carrara Consiglio Nazionale delle Ricerche (CNR-IFAC) Firenze) - Domingo Sanz, Ines (ICREA, Secció de Prehistòria i Arqueologia, Universitat de Barcelona)

Session format: Regular session

Over the past ten years, there has been a significant increase in scientific approaches to study rock art. This has led to an improved understanding of this critical area of cultural heritage, which provides a glimpse into the ancient visual and symbolic world of ancient humans. Thanks to the progressive adoption of advanced digital imaging methods and physicochemical and isotopic analysis, the role of rock art in archaeological and anthropological debates is changing. However, there is still a dearth of commonly accepted experimental protocols for in-field campaigns, alongside a

lack of reference material databases to facilitate data interpretation. Thus, many challenges persist regarding data recording, documentation, dating, and reconstruction of production processes, even due to the endangered state of preservation of engraved and painted motifs and the supporting rocks. Critical in this sense is the need to perform accurate analyses, including physicochemical and microbiological ones, with a sustainable approach guaranteeing the accuracy of results and preservation of rock art.

The main objective of this session is to bring together researchers exploring innovative methods, including non-invasive and micro-invasive techniques, for studying any form of rock art. This includes methods like photogrammetry, microtopography, portable spectroscopic techniques, multi- and hyper-spectral imaging, metagenomics, proteomics, and Artificial Intelligence algorithms for data processing. The session is open to scholars worldwide interested in the field with no restrictions of time or place. The focus will be to identify and assess novel and/or improved technologies, tools, and techniques offering new insights into motif identification, techno-functional analysis, and physicochemical and biochemical characterization. The session will also provide an opportunity to discuss protocols and best practices for a reliable and sustainable study of rock art.

ABSTRACTS

1 ECHOES OF A REVOLUTION-DIALOGUES BETWEEN THEORY AND PRACTICE IN THE STUDY OF THE LATE PREHISTORIC ART IN THE CÔA VALLEY

Alves, Lara (CEAACP | University of Coimbra (Portugal)) - Rivas, Teresa (University of Vigo (Spain)) - Caetano, Vera (CEAACP | University of Coimbra (Portugal)) - Ramírez, Fernando (Rock art Conservation (Spain)) - Reis, Mário (Côa Park Foundation. CEAACP | University of Coimbra (Portugal)) - Pozo-Antonio, Santiago (University of Vigo (Spain)) - Martins, Andrea (UNIARQ | University of Lisbon (Portugal)) - Castro, Pablo (University of Vigo)

In the mid/late 1990s, new approaches to rock art addressed the long biography of sites, inciting dialogues between past and present and the exchange of ideas between Archaeology, Social Anthropology and Anthropology of Art, thus stimulating new ways of thinking our study object. Refusing the excessive centrality of the analysis of motifs, these approaches impelled researchers to look at everything else around them: to the backdrop, the rock, to the way in which motifs were arranged and interacted with the surface, to the architecture of the place, the landscape and to related archaeological contexts. Rock art started to be studied in the symbiotic relationship between art and rock, thus providing full meaning to the concept. This was also the time when new digital recording techniques started to be used in rock art research. For some, these were not only a means of enhancing visualization but also a means of transmitting and illustrating theoretical and interpretative hypotheses.

Over the last 3 years, a research was carried out in the Côa valley aiming to study the rock art traditions succeeding the well-known Upper Palaeolithic Art cycles. The LandCRAFT project applied a multi-proxy interdisciplinary approach to the long biography of rock art sites, from the moment of their creation to the present-day. The research strategy was designed to promote a continuous exchange of knowledge from the multiple scientific areas involved and guided by specific research questions of mutual interest to the teams working on rock art recording, conservation and physicochemical analysis. Research conveyed the analysis of pigments, of accretions that developed on the surface after the rock art was produced and the geological backdrop, using non-invasive, micro-invasive and portable spectroscopic techniques. Also, a protocol was established for the digital recording of extremely faint and near-invisible prehistoric rock paintings with ground-breaking results.

2 PORTABLE REFLECTANCE HYPERSPECTRAL IMAGING FOR NON-INVASIVE INVESTIGATIONS OF ROCK ART

Cucci, Costanza (CNR-IFAC) - Picollo, Marcello (CNR-IFAC) - Bekele, Tadele (Ethiopian Heritage Authority) - Gallinaro, Marina (Dipartimento Scienze dell' Antichità - Università di Roma "La Sapienza")

Reflectance Hyper-Spectral Imaging (HSI) is today a well-established technique that is widely applied in the field of Cultural Heritage for both non-invasive diagnostics and documentation of polychrome surfaces. HSI provides at once spectroscopic and spatial information on the imaged surface, thus enabling not only pigments and materials identification, but also visual representation of their distribution on the surface, through false color maps and elaborated images, which can highlight details not visible to the naked eye. Although so far HSI has been mainly applied to the investigation of museum objects (paintings, manuscripts, etc.), the recent availability of portable HSI cameras has encouraged exploring novel approaches based on remote-sensing modes to extend HSI applications outdoors, such as archaeological contexts, including rock art sites. However, application of HSI technique to rock paintings is technically challenging and requires experimentation in-field.

This paper aims to discuss the current state of HSI applications to rock art studies, from initial approaches to recent experiments carried out with compact HSI cameras, pointing to the need to improve the accuracy and resolution of

non-invasive techniques to better understand the pigments used in rock art and gain a deeper understanding of the cultural and historical significance of these artworks.

The focus is on the preliminary results of recent experiments carried out in contexts of different rock art traditions in southern Italy (Ranaldi rock-shelter) and southern Ethiopia (Borana zone).

3 TAPHART: AN EXPERIMENTAL APPROACH TO THE IMPACT OF WIND EROSION AND MARINE AEROSOL DEGRADATION ON COASTAL ROCK ART SITES

da Rosa, Neemias (UMR5199 PACEA - University of Bordeaux (France)) - d'Errico, Francesco (UMR5199 PACEA - University of Bordeaux (France); Centre National de la Recherche Scientifique - CNRS (France); Centre for Early Sapiens Behaviour - SapienCE, Department of Archaeology, History, Cultural Studies, and Religion, University of Bergen (Norway)) - Maguregui, Maite (Department of Analytical Chemistry, University of the Basque Country (Spain)) - Wiesinger, Florian (Institute of Solar Research, German Aerospace Center (Germany)) - Fiore, Danae (Consejo Nacional de Investigaciones Científicas y Técnicas - CONICET (Argentina)) - Queffelec, Alain (UMR5199 PACEA - University of Bordeaux (France); Centre National de la Recherche Scientifique - CNRS (France)) - Courtenay, Lloyd (UMR5199 PACEA - University of Bordeaux (France)) - Caruso, Francesco (Department of Analytical Chemistry, University of the Basque Country (Spain)) - van Niekerk, Karen (Centre for Early Sapiens Behaviour - SapienCE, Department of Archaeology, History, Cultural Studies, and Religion, University of Bergen (Norway); Archaeology Division, School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand (South Africa)) - Henshilwood, Christopher (Centre for Early Sapiens Behaviour - SapienCE, Department of Archaeology, History, Cultural Studies, and Religion, University of Bergen (Norway); Evolutionary Studies Institute, University of the Witwatersrand (South Africa))

The production of painted images is generally considered a hallmark of cultural and cognitive modernity. Through its study, archaeologists attempt to explore how prehistoric populations shared social conventions, beliefs, and identities that were paramount in the creation and maintenance of their cultures. Conducting rock art research in sites located in coastal areas, however, is a challenging endeavour, mainly due to preservation problems allegedly related to the action of wind and marine aerosol. Despite the apparent relevance of these agents, their impact on the taphonomy of prehistoric paintings has not been systematically studied, and the extent of their influence on the preservation of coastal rock art remains largely unknown. In this paper, we delve into this fundamental issue and present the preliminary results of accelerated ageing experiments conducted within the scope of the MSCA TaphArt project. Employing wind tunnels with particle injection and a climatic chamber, we simulated the effects of wind erosion and marine aerosol degradation on a set of experimental paintings produced on calcarenite with different pictorial recipes. The deterioration process observed in the experiments was recorded through confocal microscopy, micro EDXRF mapping, and hyperspectral imaging, with the collected data being modelled through artificial intelligence techniques to determine how long and under which environmental conditions rock art paintings can survive these taphonomic phenomena. Building on the findings of this study and taking as reference the archaeological and paleoenvironmental context of Blombos Cave, we discuss whether the apparent absence of rock art paintings in coastal Middle Stone Age sites of southern Africa is more likely the product of cultural choices, or the result of a taphonomic bias introduced by time-dependent destructive processes.

4 MICROARCHAEOLOGICAL METHODOLOGY FOR THE CHARACTERISATION AND IDENTIFICATION OF RELATIVE SEQUENCES BETWEEN ROCK PAINTINGS

Ruiz-López, Juan (Universidad de Castilla-La Mancha) - Muñoz-Soto, Camila (Universidad de Castilla-La Mancha, Fac. de Ciencias de la Educación y Humanidades; Université Paris 1 Panthéon-Sorbonne, ED112, UMR 8068 TEMPS) - Amer-Veny, Josep Lluíz (Universidad de Castilla-La Mancha, Fac. de Ciencias de la Educación y Humanidades) - Hernáiz-Prieto, Paula (IIIPC Universidad de Cantabria)

The determination of the relative seriation in a rock art panel is one of the basic procedures on which the temporal ordering between phases of a style, or between different rock art styles, has been based. These sequences are usually based on the analysis of overlaps, either through direct observations, often with the naked eye, or by means of thin slices of samples taken from the paintings, which involves a deterioration that is not always ethically acceptable. The additive nature of paintings makes it difficult to determine the seriation. This is a consequence of the thinness of the pictorial layers, their degree of transparency or density, the low chromatic contrast, and their preservation. Despite the intrinsic difficulties in defining these superimpositions, this is a key task that requires its own methodology.

In this paper we present an innovative microarchaeological methodology designed to determine the superimposition seriation between rock paintings. This cutting-edge methodology is based on basic archaeological principles such as surface distribution, texture, or stratigraphic arrangement, and relies on non-invasive or microinvasive procedures. Thus, hyperspectral imaging, microphotography, particle analysis, and LIBS (Laser Induced Breakdown Spectroscopy) technology are combined to define pictorial phases and the seriation in a rock art panel. From these procedures, an

accurate approximation can be made of the spatial distribution of phases on a panel and the agency associated with the action of superimposition. The results obtained so far, in assemblages with Levantine art in the Iberian Peninsula, Spain, demonstrate the viability of this microarchaeological methodology, and its capacity to obtain consistent explanations in contexts of open-air rock art.

5 TRACING THE PAINT: HYPERSPECTRAL CHARACTERISATION OF LEVANTINE ART. THE CASE OF THE SIERRA DE LAS CUERDAS

Hernaiz Prieto, Paula (Universidad de Cantabria.; Instituto Internacional de Investigaciones Prehistóricas de Cantabria) - Ruiz López, Juan (Universidad de Castilla-La Mancha)

Stylistic variability is a common phenomenon in rock art. Given that it responds to cultural and chronological factors, its analysis is an unavoidable task. One of the graphic expressions which is particularly affected by this problem is Levantine art. This has traditionally been divided into a series of regional nuclei, based on shared stylistic characteristics. However, in order to approach a dimension as complex as this, it is necessary to address the intrinsic characteristics of this materiality, and of the social practice through which it is defined.

In this sense, the techniques of photography and analysis of hyperspectral images are an ideal tool to address this issue. It is a non-invasive technique that makes it possible to characterise the painting according to the spectral behaviour of the colouring matter. By classifying the figures on the basis of their spectral signature, we can read the panels and shelters at different levels: study the distribution of the figures on the panels, map the pictorial phases, identify patterns that allow us to connect shelters and, finally, make a first approximation to the diachronic process of the construction of a panel.

We present here the preliminary results of a case study focused on the Levantine art nucleus located in the Sierra de las Cuerdas, (Cuenca, Spain) which some researchers have connected to the Albarraçín nucleus (Teruel, Spain). We are currently carrying out a research with which we intend to find common patterns between both nuclei in their materiality, analysed through hyperspectral techniques and analysis, allowing us to defend or reject this connection.

6 NOT TOO MUCH, NOT TOO LITTLE: STRATEGIES FOR SELECTING RELEVANT SAMPLES FOR ART DATING

Vandeveld, Ségolène (Laboratory of Climate and Environment Sciences (LSCE UMR8212); Université du Québec à Chicoutimi) - Bonneau, Adelphine (Université de Sherbrooke) - Bédard, L. Paul (Université du Québec à Chicoutimi) - Langevin, Erik (Université du Québec à Chicoutimi)

The degradation of open-air rock art sites, sometimes accelerated by climate change or by poor choices made in the past to preserve them, makes their study urgent and crucial. However, this sense of urgency must not allow us to disregard these, sometimes sacred, sites and to sample more than needed: we cannot destroy without conscience in the name of conservation. Limiting the invasive impact of our analyses on ornate sites is therefore a central point. This can also sometimes mean that it is better to take enough material to be able to carry out the analyses envisaged, rather than taking too little, and ultimately damaging the site for nothing. Areas in the process being eroded (i.e. wall crumbling) and destined to be altered in the short term may also be preferred for sampling. But most importantly, the site must first and foremost be well known, and the methods tested and optimized for the type of site studied, before any invasive actions are undertaken.

We will present a case study of two rock art sites on the Canadian Shield (in the province of Quebec, Canada) that we are studying to determine the age of artworks, in order to link them to the history of Canada's First Nations. In this presentation, we will outline the complementary strategies we are developing to overcome the limitations that currently prevent us from dating these sites or understanding their creation temporalities. We will therefore discuss the need for sampling, the size of samples, the order in which to carry out the analyses to optimize the protocol and alter the samples as little as possible, and finally the conservation and accessibility of the samples.

7 THE SAN ARTISTS' PALETTE: AN UPDATE

Bonneau, Adelphine (Université de Sherbrooke) - Green, Dawn (University of Cape Town) - Pearce, David (Rock Art Research Institute, University of the Witwatersrand)

For over 10 years, a joint international research project has been investigating rock paintings created by San people in southern Africa, with an emphasis on pigment procurement and processing. Through detailed multi-analytical characterization and color preparation experiments, initial results were published for a valley in Lesotho and sites in the Eastern Cape. This presentation will unveil new findings from sites in the Stormberg district, the Maloti-Drakensberg, and from two painted slabs currently exhibited at the Iziko Museum in Cape Town. The previously established protocol, which relied on optical and electron microscopy, Raman and FTIR spectroscopies, has been enhanced with micro-XRD, providing an even more comprehensive understanding of the paintings. Furthermore, comparisons with

coloring materials from 19th and 20th-century Europe shed light on recipes that may have originated from European rather than local sources. Finally, previously undocumented types of coloring materials have been identified, enriching the palette used by the artists.

8 SUPERPOSITIONS AND SUPERIMPOSITIONS IN NORDIC BRONZE AGE ROCK ART: ADDITIVE PROCESSES AND MARITIME RITUALITY IN WESTERN BOHUSLÄN (CA. 1700-500 BC)

Moyano Di Carlo, Julián (University of Gothenburg, Dept. of Historical Studies) - Horn, Christian (University of Gothenburg, Dept. of Historical Studies) - Ling, Johan (University of Gothenburg, Dept. of Historical Studies) - Liebl, Carina (University of Gothenburg, Dept. of Earth Science) - Peternell, Mark (University of Gothenburg, Dept. of Earth Science) - Green, Ashely (University of Gothenburg, Dept. of Historical Studies) - Meijer, Ellen (University of Gothenburg, Dept. of Historical Studies) - Lindhé, Cecilia (University of Gothenburg, Dept. of Literature, History of Ideas, and Religion)

The overlap of figures on Nordic Bronze Age rock art panels has traditionally been used to analyze transformations and define chronological sequences. However, the reason why carvers initially overlapped figures remains unclear. Following the paper by Gunn and colleagues (2022), "Superpositions and superimpositions in rock art studies: Reading the rock face at Pundawar Manbur, Kimberley, northwest Australia", we distinguish between superpositions (the overlay of one thing on another) and superimpositions (the intended and meaningful rework of previous figures or features). The goal of this paper is to use this distinction to explore and understand the distribution and meaning of superpositions in the region. To achieve this, we examined 14 large panels in central and northern Bohuslän (Sweden), which were documented using non-invasive archaeological and geological techniques. The rocks were scanned with high-resolution 3D technology (SfM and OLS) and explored with image-enhancing techniques like digital frottage or vRTI. Additionally, we applied non-destructive ultrasonic soundwave techniques to characterize the Bohus granite and investigate the near-surface structure. From the analysis, it seems as though the geological properties of the rocks cannot account for all the superpositions in the panels. Moreover, the statistical analysis shows that superpositions in the region concentrate in specific panels and show clear associations between specific motifs such as ships, humans, and cupmarks. Furthermore, the exploration of high-resolution documentation suggests that some of these superimpositions targeted specific parts of figures, maybe as a part of apotropaic maritime rituals in connection with (long-distance) sailing activities. We conclude that the distribution and type of superimpositions support the idea that panels were created by additive processes involving several generations of carvers, who did not discard previous carving events but kept them alive for future generations.

9 EACH SITE HAS ITS METHOD: DEBATING BEST PRACTICES FOR STUDYING ROCK ART, CASE STUDIES IN THE ALPS AND ITALY

Arcà, Andrea (Footsteps of Man archaeological society; S.Va.P.A. - Société Valdôtaine d'Archéologie et Préhistoire) - Sigari, Dario (MUSE-Museo delle Scienze di Trento; Università degli Studi di Ferrara; Coimbra University, Geosciences Center)

Rock Art researchers and professionals are often asked what the best method of documentation can be. Besides an unavoidable scientific, archaeological, and multidisciplinary approach, involving both the humanities and the hard sciences, field experiences show that rather than a 'method', it is better to refer to an operational chain that considers the use of a series of techniques (photographic and meta-photographic documentation, iconographic tracing, 3D modelling, interactive virtualisation, etc.) and a rich toolbox. These include manual and digital tools to process numerical and textual data and to create reliable two-dimensional, three-dimensional, and environmental reproductions.

Starting from important and differentiated case studies faced by the authors, relating to open-air and cave petroglyphs, under-shelter paintings, portable art, and even dubious or fake engravings, it becomes clear that for each site a specific operational chain is required. In other words, it is necessary choosing each time the most appropriate tools, taking into account several parameters: for instance, the environmental context, geomorphological conditions, the petrography of the lithic supports, the engraving and painting techniques, the preservation status of the iconic finds, and even the communication needs.

Conversely, we recognise as unifying elements: the opportunity to proceed with expertise and accuracy, the need to produce graphic and visual recordings – for which iconographic tracing is the fundamental tool – the cataloguing of surfaces and figures, the archaeological study, and the dissemination activities including scientific publications and communications aimed at valorisation. Underlying everything is the comprehensive sharing of data, to enable/facilitate the study of the iconic elements even without autopsy observation, which in the field of rock art is often challenging and problematic.

10 STRUCTURE FROM MOTION, CHAOS FROM NUMBERS, KNOWLEDGE FROM ELSEWHERE. METHODOLOGICAL AWARENESS ABOUT PHOTOGRAMMETRY FOR ROCK ART RESEARCH

Radchenko, Simon (University of Stavanger)

Photogrammetry became as trivial for rock art research practice as the statement of its triviality is a banal opening for the texts on the topic. As the variation in hardware, software, and research tasks increased, a whole spectrum of applying the SfM method to the study of ancient art — from “Black Box” to the incredibly accurate self-adjusted toolkits — emerged. Evidently, this is positive news for a community of rock art scholars: by utilizing digital methods, we all fostered the rapid methodological and conceptual development of our field that happened in the last decade.

However, as we routinize the tool, the details and technicalities of its use get shaded and disappear from the discourse. In other words, the more we “just put 3D models in use,” the less time we spend thinking through their crucial parameters, such as accuracy, precision, and how they affect our research results. In the same way, the more we use established software solutions, the less control we have over the quality of our data.

As I aim to show in this talk, the use of 3D modeling in rock art research came to a level when all these details might affect the scientific outcomes of research. By going through the overview of these basic concepts, I'll show how they interact with the specific software solutions and, more importantly, with our research questions. Finally, I'll introduce a case study to reveal the interdisciplinary perspectives of photogrammetry when applied with relevant control over the data quality. This study of the engraving technology through the detailed analysis of the 3D modeled surfaces outlines the peculiarities of one of the rock art research development lines I invite to discuss and approach.

11 USING BIG DATA TO STUDY ROCK ART: A PIPE DREAM OR A PROMISING FIELD?

Lahaye, Romain (University of Sherbrooke; University Paris 1 Panthéon-Sorbonne) - Bonneau, Adelphine (University of Sherbrooke)

Technological advances now make it possible to produce extremely accurate 3D models and redrawings while improvements in digital imagery, and even more so hyperspectral analysis, are revealing more and more features that were previously invisible to the naked eye.

The constant improvement of these different techniques is providing more and more data, to the point where it is becoming difficult to relate them all. In other words, there is a gap between the generation of ever-increasing amounts of data on the one hand, and the exploitation, linking and interpretation of this data on the other.

This goes hand in hand with the credo of the archaeological discipline, which has always been to accumulate as much data as possible in the hope that technical and technological advances will one day make it possible to use it. But what if the time had finally come to serialise this vast amount of disparate information and use it in a holistic way?

If the time has indeed come to create multiscale databases in the style of Geographic Information Systems (GIS), we propose that they should now be developed in the form of PostgreSQL/post-GIS databases. Instead of connecting fragmented site data at map scale, the different data (3D models and redrawings, information from image enhancement and hyperspectral imagery, surface conditions and areas of alteration, physico-chemical sampling sites, etc.) will be available at different scales (panels, sites, regions, etc.). By combining all these data, the aim is to create the most accurate databases possible, which can be accessed and modified by all specialists. This requires the harmonisation of data formats and a collegial agreement on the standards and broad choices to be made.

12 CONNECTING PEOPLE TO PLACE: A GIS BASED SPATIAL AND CONTEXTUAL ANALYSIS OF PREHISTORIC ROCK ART IN BRITISH AND IRISH LANDSCAPES

O'Neill, Kaitlin (University of York)

This study examines the potential role of geographic information systems (GIS) and highly detailed three-dimensional modelling software as a means of both visualizing and contextualising the landscape alteration and socialisation of Neolithic and Bronze Age open-air rock art landscapes in Britain and Ireland.

In conjunction with environmental and excavation records, GIS was used in this research to simulate potential palaeoenvironmental conditions at rock art sites to examine the use patterns and placement of rock art in these landscapes. Three-dimensional modelling and palaeoenvironmental reconstruction in GIS are avenues that have not been widely explored but have the potential to profoundly impact understandings of the ways space was shaped.

Through this methodology, the viability of three-dimensional modelling in GIS as a means of providing an immersive look into the environmental alterations made by ancient peoples at these sites was assessed. The findings provided insight into a pattern targeting or emphasis on specific features in the landscape which may have assisted in the development of Neolithic and Bronze Age trade and social networks.

Additionally, the impact that visualized palaeoenvironments have on modern archaeological interpretations of sites was examined. These findings provided insights into the shortcomings of ancient landscape analysis through a modern

lens and ways this methodology can be used, in conjunction with other technologies, to create a comprehensive understanding of both the physical and social landscape changes at these sites over time.

13 ONE STEP FURTHER IN GIS APPLICATIONS TO ROCK ART ANALYSIS

Sanchez-Hernandez, Alfredo (Universitat Jaume I. Pre-EINA Research Group) - Roman, Dídac (Universitat Jaume I. Pre-EINA Research Group) - Domingo, Inés (ICREA; Universitat de Barcelona)

Over the last few decades, archaeology has increasingly implemented Geographic Information Systems (GIS) tools to develop new methods of analysis and expand the possibilities for studying several aspects of the archaeological record. Furthermore, GIS can be applied to other areas related to archaeological heritage at various scales (zoning of protected areas, conservation, risk assessment, etc.).

Regarding rock art, GIS has primarily been used to analyse how human groups have perceived and used the landscape through multi-scale analysis, and occasionally to define and delimit protected areas.

GIS offers a wide range of possibilities, including tools for topographical analysis, closely linked to Digital Elevation Models (DEMs). DEMs generated through photogrammetry have been used for years in other research areas to monitor the effects of geomorphological phenomena related to topography and for other purposes, such as quantifying the effects of moisture or the sublimation of snow-covered surfaces. GIS DEM analysis has primarily been used in rock art research for mapping territories and analysing local topographies. However, these tools have also been combined with 3D models to improve the visualisation of painted motifs and even to monitor potential physical changes in the rock surface. Recently, some researchers have tested the application of DEM analysis to enhance the visualisation of engraved rock art.

The aim of this presentation is to go one step further and introduce other potential applications of GIS in research on prehistoric art (specifically Levantine Art) and its surroundings. This will be achieved through topographical analysis of Digital Elevation Models generated from photogrammetric documentation.

575 ABANDONMENT AND OPPORTUNITIES? RESPONSES TO THE LATE MEDIEVAL DESERTION

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Nettet, Therese (Museums of Sogn og Fjordane) - Heinonen, Tuuli (University of Helsinki)

Session format: Regular session

In recent studies of the late medieval crisis, new methods and source materials have been introduced, and new theoretical frameworks have been applied. Moving away from the traditional deterministic point of view, researchers are now interested in studying the resilience and complexities of settlements, communities, and subsistence strategies, identifying reasons for survival and seized opportunities, or failure and desertion. Approaches include interdisciplinary macro-level surveys with sources ranging from historical records to scientific data. This has brought the research on the late medieval crisis forward and offered a glimpse into a diverse period.

This session wishes to follow up on last year's EAA session “Reshaping medieval desertion in Europe”. We ask for papers with human-level perspectives, that address either one of the following themes or connect the two:

- 1) Experiences connected to leaving home and a way of life. What can the archaeological record tell us about people's actions and decisions when abandoning a place?
- 2) How did others perceive abandoned places? Who reused these sites and how?

We are interested in different strategies connected to abandonment and re-settlement and how these are manifested in the archaeological material depending, for instance, on different cultural and social spheres, and different settlement types such as a farm, a village, a small town, or a town plot. We also welcome examples that include long-term studies, including the 16th and 17th centuries that can provide information on the later life histories of people who had to leave their homes for different reasons.

We ask for papers that emphasize a human-level approach. The aim is to illustrate different responses to the crisis, focusing on agency, resilience, or mentalities, for example, to highlight further the complexity of the period shown in large-scale studies.

1 AFTER THE FIRE. HOW DID TOWNSPEOPLE IN MEDIEVAL NORWAY ACT IN THE AFTERMATH OF SUDDEN CATASTROPHIC INCIDENTS?

Hansen, Gitte (University Museum of Bergen, University of Bergen, Norway)

The medieval town Bergen in western Norway was hit by large scale fires time and again throughout the Middle Ages. Archaeologists have characterized the archaeology of Bergen as favored by a 'Pompeii-situation', where fire-layers lay as blankets of charcoal and ashes across the devastated settlement, preserving the moment of destruction - and waiting for archaeologists to uncover and harvest the fruit. The actual archaeological sources, however, tell a story of intense activity in the aftermath of fires. So the fire-layers are far from intact and the material records are far from undisturbed by medieval hands. The paper explores how medieval townspeople from different levels of society handled the situation after sudden catastrophic destruction. From the perspective of property-owners and -users it explores how valuables were salvaged and who went into the ruins. From a methodological perspective the paper explores what specter of material culture we, as archaeologists, can expect to find, or not to find, in ruins after unexpected catastrophic incidents.

2 HOW DOES A TOWN DIE? THE PUZZLING FATE OF MEDIEVAL GUTENWERD

Predovnik, Katarina (University of Ljubljana, Faculty of Arts, Department of Archaeology)

In 1473, the small market town of Gutenwerd in the historic Margraviate of Carniola was attacked and burned to the ground by Ottoman troops raiding the border provinces of the Holy Roman Empire. According to a contemporary report, more than 3,000 people sought refuge in the town and were either slaughtered or taken into captivity by the Ottomans. This disastrous event resulted in the complete abandonment of the town. The once settled area reverted to farming and the only building still standing on the site today is the former parish church of St. Nicholas.

The narrative of the catastrophic, sudden end of the town has dominated the understanding of Gutenwerd's history until recently. It was not even questioned by the archaeologists Vinko Šribar and Vida Stare, who excavated parts of the site from 1967 to 1984. Since 2021, A new research programme has been underway, which includes the documentary and scientific analyses of the legacy archaeological data and some 14.000 finds kept at the Slovene National Museum, but also fieldwork, such as field walking, geophysical prospection, ALS and coring. One of the aims of the current research programme is to question the interpretative framework that has shaped previous research on Gutenwerd. As the evidence for the continuation of life in Gutenwerd after 1473 accumulates, the concept of catastrophe loses significance. In order to understand the fate and afterlife of Gutenwerd and to explain the present landscape with its resilient features, it is far more useful to focus on the gradual processes of settlement contraction and restructuration.

3 ECHOES OF LIFE: CHALLENGING THE 'STOPPED LIFE' NARRATIVE FOR CZECH MEDIEVAL DESERTIONS

Holata, Lukáš (University of South Bohemia)

Long-term historical and archaeological investigations into deserted medieval settlements have yielded a robust database comprising thousands of sites. Many of them are preserved beneath woodland cover. Traditionally, these environments have been seen as empty spaces, prompting a deep-rooted narrative of 'stopped life'; the burnt layers overlaying the destruction of rural homesteads then tempted the perception of these places as 'zones of destruction.' Both evoke that something extremely negative happened that led to a place becoming abandoned.

However, holistic landscape-scale analyses integrating archaeological, geoarchaeological, and paleoenvironmental data have demonstrated that the traditional perception is completely wrong. Evidence of the survival of settlements in shrunken form into the later period has been obtained alongside numerous and varied activities and exploitations even after the villages' disappearance. So, the areas of deserted villages were full of life, offering new opportunities.

These findings paint a vivid picture of life persisting beyond the perceived desertions, offering new insights into resource diversification and community resilience. Ultimately, this research underscores the extraordinary adaptability of rural communities and the dynamic evolution of landscapes, challenging conventional narratives and revealing a more nuanced understanding of medieval desertion.

4 RESILIENCE AND SETTLEMENT DESERTION - AN EXAMPLE FROM SOUTHERN FINLAND

Heinonen, Tuuli (University of Helsinki)

It is often difficult to determine the reasons behind desertion of rural settlement sites in the Middle Ages, as these have rarely been documented in written sources. This is especially true for Finland, where only a small number of

medieval written documents have been preserved. However, the early modern written records provide plenty of examples of the difficulties the farmers faced. When the historical sources are combined with archaeological records, it is possible to study the different ways that rural inhabitants responded to challenges. In this paper, I will discuss rural resilience and settlement desertion using the case of Mäkylä, a small village located in southern Finland, as an example. In the Middle Ages, the village was inhabited by freeholders, who owned their farms. In the 16th century, the villagers faced several difficulties, but survived many of these. However, by the early 17th century the village was deserted. In this paper, using historical and archaeological records, I will consider the reasons why the villagers could survive some of the challenges and what finally caused the village to be abandoned.

5 EXPERIENCES OF ABANDONMENT AND ABANDONED RURAL LANDSCAPES

Nesset, Therese (Musea i Sogn og Fjordane)

The traditional textbook narrative of the late medieval abandonment process in Norway is the abandonment of farms due to the demographic crisis, which led to available resource areas for the survivors, who then utilised these areas for grazing and gathering fodder. Most farms became re-settled during the 16th and 17th centuries, and some farms did not. Historical research has widely discussed the reasons for the demographic crisis and its societal effects. In addition to, for example, climate change and the over-use of natural resources, research suggests that one-third to two-thirds of the Norwegian population died of the Black Death and the following waves of pest epidemics during the late Middle Ages. This was also a period of political unrest.

In this paper, archaeological and palaeobotanical sources from three farms with different social and geographic conditions within western Norway will be used to discuss the experience of abandonment and what came after at these specific sites. With recent archaeological and interdisciplinary research on this period as a backdrop, and from the actors' perspectives, the aim is to look at examples of abandonment and discuss different responses to the late medieval crisis, how the abandoned farms were later perceived, and the character of the following human activities (or the lack of them) at the sites. What affected people's responses to the challenges of the period, and how is this manifested in the source material from the farms? What ideas can be identified that are connected to the abandoned settlement and the surrounding agrarian landscape?

577 FOLLOWING THE RIVER: FLOWSCAPES AS CLUSTERS OF COMMUNICATION IN THE ANCIENT MEDITERRANEAN WORLD

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Franceschini, Mariachiara (Albert-Ludwigs-Universität Freiburg, Abteilung Klassische Archäologie) - Abbondanzieri, Elisa (Sapienza Università di Roma, Dipartimento di Scienze dell'Antichità)

Session format: Regular session

Considering communication routes as networks of multiscalar interaction, rivers play a crucial role in facilitating the penetration of people, goods, technologies, and ideas into the inland regions.

Regardless of river length, navigability, catchment area dimensions, and seasonal character as well as environmental changes rivers and river valleys offer optimal conditions for mobility even in challenging landscapes. Thus, rivers create flowscapes, forms of socio-natural networks, linking environmental and natural factors with the social and historical background.

By changing perspective and putting rivers at the centre of research, the inland regions not only animate themselves with a network of fluid movements, but this also opens up the possibility of considering clusters of communication at a wider range and scale, offering multiscalar interaction from the small and fragmented local landscape, to the wider Mediterranean. Rivers provide for a rhizomatic and branching penetration of the landscape, enhancing lively interactions and cultural exchanges, thus being fluid, nonlinear boundaries, and elements of social unity and integration rather than static borders.

This session approaches riverine landscapes from a diachronic perspective - from the Bronze Age to the Middle Ages - highlighting transversal and constant dynamics in different periods and environments in the Mediterranean area.

Papers are welcome that address the topic from different angles regarding:

- riverine landscapes as networks of multiscalar interactions, affecting ancient communities at the social and historical level;
- rivers as ways of exchange and transit of goods, technologies, and ideas - thus flowscape as a promoter of the economy of inland regions;
- rivers as inter- and transcultural elements, affecting the ways of integration and cooperation between different communities;
- river ways as dialectic clusters with both environmental and social implications.

1 THE FORTRESS OF ROFALCO IN THE TERRITORY OF VULCI. AN ETRUSCAN HUB ON THE OLPETA VALLEY IN THE MID-REPUBLICAN PERIOD

Abbondanzieri, Elisa (Sapienza Università di Roma, Dipartimento Scienze delle Antichità) - Cerasuolo, Orlando (Parco Archeologico di Cerveteri e Tarquinia) - Freixas Roig, Tania (Grup de Recerca en Arqueologia Protohistòrica - Universitat de Barcelona) - Papa, Chiara Martina (Sapienza Università di Roma, Dipartimento Scienze delle Antichità) - Pulcinelli, Luca (Soprintendenza Archeologia Belle Arti e Paesaggio dell'Umbria) - Sabbatini, Martina (Università degli Studi di Torino) - Somma, Lorenzo (Independent researcher) - Valerio, Marta (Università degli Studi di Torino; Université Paul Valéry-Montpellier 3)

Rofalco is an Etruscan fortress located at the north-east border of the territory of Vulci. The settlement was established in the second half of the 4th century BC and was subsequently destroyed during the Roman occupation of Vulci around 280 BC. Rofalco stands out as one of the most strategically significant sites discovered in southern Etruria, dominating the Olpeta Valley along the natural route between Vulci and Volsinii.

Despite its military nature, excavations at Rofalco have uncovered a significant quantity of pottery vessels used for storing food (including domestic amphorae, dolia, honey pots, and vases for breeding dormice), as well as evidence related to textile production. Together with the discovery of several stone weights for scales, a bronze ingot, and a coin these archaeological finds point to a bustling economic activity that was conducted within the settlement.

Therefore, thanks to the long-term excavation project and the good preservation of archaeological evidence, Rofalco serves as an ideal case study to analyze various social-economic aspects. Starting with a synchronic analysis of the material culture, this paper aims depict the key role of Rofalco in managing the economy within the internal area of Vulci during the mid-Republican period, specifically focusing on its location along the Olpeta River towards Bolsena Lake and Volsinii.

2 NEW APPROACHES TO THE ETRUSCAN RIVERINE LANDSCAPE OF THE FIORA AND PAGLIA VALLEY

Franceschini, Mariachiara (Albert-Ludwigs-Universität Freiburg)

Rivers in antiquity have mostly been considered static entities from the point of view of the ancient communities. People living in riverine landscapes have used rivers by exploiting and modifying them to enhance production, communication, and trade. Rivers are thus perceived as resources and means for controlling and exploiting the landscape. However, a new perspective is needed to better understand the role of rivers from a broader environmental viewpoint that will highlight the fluid entanglement of ancient communities and riverine landscapes, and the effectancy of rivers themselves on human activities, beliefs, and ideas. Based on recent environmental and anthropological studies on the materiality of water, I propose a new methodological approach. By examining the relationship of different archaeological key factors (such as infrastructures, settlements, and sepulchral and cult places) with rivers, I aim to elaborate a more comprehensive analysis of human interactions with the landscape and hydrography, emphasizing the importance of rivers as catalysts for social and cultural changes. The valley of the Fiora and Paglia in the Etruscan landscape will serve as an example to highlight how rivers shaped different aspects of the lives of the nearby communities and both their actions in and perceptions of the landscape.

3 ALONG THE NERA RIVER. THE SITE OF MARATTA BASSA IN TERNI DURING THE ORIENTALIZING PERIOD

Sabina, Nicolò (Sapienza Università di Roma) - Materazzi, Filippo (Sapienza Università di Roma)

The 116-km-long Nera River is one of the main waterways of central Italy and the main tributary by flow of the Tiber River. Because of its extension through the Apennines, it has always been a fundamental route of communication between the two sides of the peninsula. Along its banks developed, during the first millennium BC, the pre-Roman center of Terni, which, after the discovery of necropolis in the late 19th and early 20th centuries, is now experiencing a new season of systematic research thanks to the Interamna Nahars Project, coordinated by the chair of pre-roman Italy of the Department of Science of Antiquities of Sapienza University of Rome, in collaboration with the Soprintendenza Archeologia Belle Arti e Paesaggio dell'Umbria and the Direzione Regionale Musei Umbria, and financed by the CARIT Foundation.

The purpose of this contribution is to provide an alternative perspective on the relations between pre-roman Terni and the multiple neighbouring centers, highlighting the importance of the Nera as the main communication route.

After providing a brief overview of the main sites along the water network of the Terni valley, attention is directed towards the site of Maratta Bassa, located near the Nera and investigated during the late 1990s and early 2000s. The

analysis focuses on its apparently isolated location and proposes a reinterpretation of the Orientalizing phase through a preliminary reexamination of the findings, which indicate the existence of an extremely dynamic reality. Terni during the Orientalizing period appears not only receptive to external influences but also seems to disseminate typical elements of its own material culture to neighbouring districts. Hence, it is necessary to reevaluate Terni's relations through a new perspective, emphasizing mutual exchanges stimulated by the presence of the Nera, not one-way but multidirectional.

4 AFFLUENT TRIBUTARIES? THE CHIANI RIVER (ANCIENT CLANIS), ITALY

Alcock, Susan (University of Oklahoma) - Bizzarri, Claudio (CEE Orvieto) - Williams, Joey (University of Oklahoma)

Much attention has rightly been paid to the Tiber River and its place in the evolution of Rome and its imperial networks. Yet other rivers fed the Tiber and extended the city's reach into the Italian peninsula. The Chiani River (ancient Clanis), a tributary to the Paglia River (itself a tributary to the Tiber), was in antiquity navigable, running in relative parallel with the Via Cassia. This Paglia-Chiani 'flowscape' is currently under broader diachronic examination, through the work of (among others) Dr. Jacopo Tabolli at San Casciano dei Bagni.

Since 2023, the University of Oklahoma has been working at Pian de Mealla, near Ficulie in Umbria. Findings at the site, previously explored in the 19th century, point to a villa complex close to the banks of the Chiani, with clear signs of 1st and 2nd century CE occupation, agricultural production, and religious dedication.

This paper will present results of this work within a more general analysis of the networks and infrastructure of the Chiani river corridor in the early imperial period. Conditions of settlement, economy, and ritual will all be brought into play – not least in the riverine dynamics of local versus imperial initiatives and of local versus external actors.

5 THE URBS OF AMITERNUM AND THE ATERNUM FLUMEN BASIN. LIDAR ANALYSIS OF THE ARCHAEOLOGICAL SITE AND ITS FLUVIAL CONTEXT

Lagóstena, Lázaro (Universidad de Cádiz) - López-Medina, María (Universidad de Almería) - Rondán-Sevilla, Isabel (Universidad de Cádiz) - Aragón-Núñez, Enrique (Universidad de Almería) - Molina-Vidal, Jaime (Universidad de Alicante)

The ancient urbs of Amiternum, near to present-day L'Aquila, is closely linked to the Aternum flumen basin, being, together with Ostia-Aternum (Pescara) and Teate Marrucinorum (Chieti), one of the main urban centers of this river valley of Abruzzo region. Although important public buildings from the Roman Imperial period are known, such as the Amphitheater and the Theater, as well as other private places, much of the urban planning of Amiternum is still unknown to us. On the other hand, the environment of the city on the banks of the Aterno river is occupied by thick riverside vegetation, in addition to being located next to a flood plain whose sediments make it difficult to understand the urban organization with respect to the paleochannels of the ancient river. In the framework of two ongoing research projects (Excavations and non-invasive archaeology in Amiternum (L'Aquila, Italy): ancient building systems in areas of high seismicity and AQVIVERGIA: Society-environment interaction in river basins: conceptualization and praxis) LiDAR flights have been carried out over the site and its surroundings. In this communication we advance the results of these non-invasive surveys focusing on the problem of ancient urbanism, its relationship with the river and the fluvial basin as the main route of communication in the region.

6 FROM ROME TO THE PORT OF VERDUN-SUR-LE-DOUBS (BURGUNDY, FRANCE): TWO CENTURIES OF TRADE AT THE END OF THE IRON AGE

Taillandier, Valérie (InSitu Archeologie SA; UMR 6249 Chrono-Environnement) - Perruche, Rebecca (DRAC SRA Bourgogne Franche-Comté; UMR 6249 Chrono-Environnement) - Olmer, Fabienne (UMR 7299 Centre Camille Jullian) - Rolland, Joëlle (UMR 8215 Trajectoires) - Barral, Philippe (University of Franche-Comté; UMR 6249 Chrono-Environnement) - Deblois, Mathilde (University of Franche-Comté) - Hamon, Emmanuel (University of Franche-Comté; UMR 6249 Chrono-Environnement) - Thivet, Matthieu (University of Franche-Comté; UMR 6249 Chrono-Environnement)

The Late Iron Age Settlement of Verdun-sur-le-Doubs "Petit Chauvort" is located downstream of the confluence of the Saône and Doubs rivers.

It was established within a meander of the Saône during the 2nd century BC and its occupation is attested until the beginning of the 1st century BC. It was not founded ex nihilo, as there is evidence of a first settlement north of this meander between the 6th and 5th centuries BC.

Its location at the confluence of these two rivers as well as at the crossroads of land routes in the La Tène area made it a strategic location for trade and exchange between the Mediterranean and the inland regions.

Excavations which have been carried out since the late 1960s and are still ongoing have revealed evidence of the import or export of foodstuffs, especially Italian wine, manufactured goods, raw materials, but also exogenous currencies and maybe slaves.

However, this settlement is not only an important trading centre but also a major centre for the production of hand-craft. The products made from the processing of imported raw materials (raw glass, iron ore, soft black rock) are then sent back on the trade routes.

The aim of this paper is to bring the agglomeration of Verdun-sur-le-Doubs back into the limelight as a market and craft centre and to show how its geographical location between the two banks of the river contributed to its development and its reach over medium and long distances.

7 RIVERSCAPE GEOGRAPHY AND SETTLEMENT CLUSTERS IN WESTERN ANATOLIA DURING THE LATE BRONZE AGE

Köknar, Nuray Nisan (University of Cyprus)

Western Anatolia lies in modern Turkey, in the north, south of the Marmara Sea and the Dardanelles, comprises a coastal and an inland section along the eastern part of the Aegean Sea, down to Kaş, Antalya in the south on the coast. The inland of Western Anatolia extends from Bursa and the Eskişehir in the north, down to Manisa and Afyon-karahisar in the middle-east of the inland section. The Bakır Çay (Kaikos), and the Gediz (Hermos), Küçük Menderes (Kaystros), and Büyük Menderes (Maeander) Rivers cross the inland of Western Anatolia and flow to the Aegean Sea. This research aims to map the effects of riverscapes and their geomorphology in the alluvial plains on the coast and the inland sites that shaped culture and interaction between the settlements in Western Anatolia during the Late Bronze Age. One of the main topographical parts of the region is the river valleys in the western lowlands, and the alluvial plains in the eastern highlands. Many connected rivers, creeks, and water channels caused the formation and reformation of settlement patterns by changing the extent of alluvial plains and river valleys during the Middle and Late Bronze Age. The Geographical Information System (GIS) is applied to test and interpret the data from the littoral and inland sites in this research. Viewshed and Least Cost Path analyses results reveal the modes of coastal and inland connectivity and settlement patterns by the rivers during the Late Bronze Age.

8 THE LOWER ANDARAX RIVER BASIN AS THE AXIS OF THE TERRITORIAL ORGANISATION OF THE CIVITAS URCI (ALMERÍA, SPAIN)

López-Medina, María-Juana (University of Almería) - Aragón-Núñez, Enrique (University of Almería) - Rondán-Sevilla, Isabel (University of Cádiz)

The identity of the historical landscape is defined by the cultural characteristics of human intervention in the territory. The Roman presence in present-day Almería has shaped the spatial organisation and management of its occupation based on its landscape characteristics, among other issues, defining the different settlement mechanisms in each historical phase. The present paper analyses the occupation of the current province of Almería during the Roman period in general and specifically the case study of the so-called civitas of Urci (El Chucho, Benahadux) together with the binomial that it generates with the lower basin of the Andarax river, which allows us to identify a particularly robust distribution pattern compared to the rest of the territory, but also variable in time. This conjunction of Urci with its river allows us to approach the socio-economic realities that will enable us to ensure critical resources (lead, lapis specularis, purpura, salted fish, salt), to materialise the territorial management during the Roman presence in the study area. Our contribution, therefore, is based on the analysis of archaeological evidence and its integration into the historical framework (from literary and epigraphic sources), in addition to the incorporation of new data obtained through the application of non-invasive techniques in the context of the Aqvivergia project. In this sense, the results obtained using GIS and Social Network Analysis tools allow us to evaluate the implications of processes that operate at multiple levels in the interaction of the Andarax river landscape and help better characterise the settlement and occupation patterns of the Almería territory.

9 NEVER CHANGE A FLOWING SYSTEM? WHEN THE GUADALETE RIVER BECAME "ROMAN"

Lehmann, Janine (Kiel University)

Rivers are the routes connecting land and sea, making them also important instruments of territorial exploitation. The control of rivers can result in new ways of communication and abruptly change of existing structures. However, the ancient flowscape along the river Guadalete in southern Spain is characterized by a certain continuity, which will be focussed in this lecture. Although the region was already part of the Imperium Romanum after the Second Punic War, the settlement pattern indicates no major intervention on the initiative of the new rulers. Already in Phoenician times, the founding of Agadir (today Cádiz) at the estuary created an important hub for maritime trade, which opened up new routes of communication. The rest of the landscape along the river was dominated by hilltop settlements (oppida). Contrary to a rather common practice of transferring such settlements to the plain and near rivers in the course

of the Roman occupation, these oppida remained with a long history. The Roman "restraint" in a conquered area raises several questions: Were the infrastructural conditions and connectivities along the Guadalete simply adopted, as there was no need for change and what already existed was considered suitable? Or to put it another way: What role did the "Roman Impact" play, i.e. which clusters of communication can be identified before and after the Roman conquest? Using selected case studies in the Guadalete river valley, the aim is to determine which specific developments can be identified at the micro level and how a river shaped as an active element the landscape from a diachronic perspective.

10 URBAN NETWORK AND COMMUNICATION DURING ANTIQUITY IN THE GUADALETE RIVER BASIN (CÁDIZ, SPAIN)

Rondán, Isabel (University of Cadiz) - Aragón-Núñez, Enrique (University of Almería)

The management and control of ancient communities over river basins are an essential part of these societies' urban implantation and communication networks. In our work, we analyse this duality, hydrological basin, and urban and communication networks through the case of the basin or sub-basin of the Guadalete, the main river of the province of Cadiz, Spain. The historical analysis and study of the Guadalete river basin from the perspective of territorial cohesion and connection in ancient times involves the relationship with the two most relevant geostrategic areas in this Territory: the mouth and paleo-estuary of the Guadalquivir River and the Atlantic front through the Strait of Gibraltar. Our methodological approach is based on the territorial analysis at a macro scale using Digital Terrain Models, spatial calculations from urban nodes and network analysis, focusing on the double connection of the Guadalete and its basin with the mouth of the Baetis River, the lacus Ligustinus, and the frentum Gaditanum.

579 DIGITAL APPROACHES IN TEXTILE ARCHAEOLOGY FROM THE FIELD TO THE MUSEUM

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Gleba, Margarita (University of Padua) - Yvanez, Elsa (University of Copenhagen) - Shaheen, Islam (Sapienza University of Rome) - Lukesova, Hana (University of Bergen)

Session format: Workshop

Organised by the EAA Community for Textile Archaeology and Conservation, the proposed workshop focuses on digital approaches in imaging, documenting, analysing, curating and digital reconstruction of archaeological textiles. Some advances in the field of computer sciences which have contributed to a boost in cultural heritage research represented by regular conferences such as Archiving, are only beginning to make their way into textile studies. Archaeological textile research takes place in different contexts: studying textiles in the field is often vastly different from a museum, and our practices need to answer different challenges. Harnessing the power of digital tools, this workshop will help in formulating different strategies for better and more sustainable quality research in all settings. The workshop thus aims to explore new technologies, strategies, policies, as well as methodologies through collecting examples of good practice. The workshop goal is to bridge the gaps in current practices by adopting, whenever possible, standardised protocols and by adhering to the international standards of the International Council of Museums (ICOM) International Committee for Documentation Conceptual Reference Model. These practices should respect the current norms in Digital Humanities regarding data standards, data management and FAIR (Findable, Accessible, Interoperable, and Reusable) principles.

The workshop will include mini-talks on case studies divided into three main themes:

1. Archaeological textile documentation: including developing protocols for quick documentation using digital tools when time is of the essence; portable microscopy; 3D scanning; computed tomography scanning; multispectral imaging; Reflectance Transformation Imaging; and other techniques;
2. Archaeological textile and textile tool databases;
3. Digital reconstruction of archaeological textiles.

The final session will involve working groups consisting of diverse representatives in the field of textile research and conservation, which will address specific questions, followed by a discussion of recommendations presented by each group and further planning of ComTex activities.

588 STUDIES OF MIGRATION PERIOD AND EARLY MEDIEVAL POPULATIONS: INTEGRATING NATURAL SCIENCES AND HUMANITIES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Palmowski, Valerie (University of Bonn) - Sasso, Stefania (University of Tartu) - Gneccchi-Ruscione, Guido (Max Planck Institute for Evolutionary Anthropology) - Lacher, Laura (Max Planck Institute for Evolutionary Anthropology) - Moilanen, Ulla (University of Helsinki)

Session format: Regular session

The Migration and Early Medieval Period are characterized by changes in the demographic, economic, political and sociocultural landscapes of Europe. Since the last decade, bioarchaeological studies, especially of (stable) isotopes and ancient genomics, have yielded fresh insights into diets, kinship, lifeways, and mobilities, among other things. This body of data laid a foundation for comparative studies of skeletal remains, material culture, burial practices, and texts, which are suitable to detect patterns of correlation at various scales, thus offering a reflection of the intricate networks and dynamics characterising this time of transitions. However, the combination of diverse approaches, methodologies, and sources has become increasingly complex and revealed the need for promoting more interdisciplinary communication as well as a careful re-evaluation of comparative approaches and data set collection.

This session aims to bring together researchers working with biomolecular methods (isotopes, aDNA), and material as well as immaterial culture (artefacts, archaeological features, texts) to discuss and develop new directions of research together. Methodological considerations are emphasised, also including the establishment of data standards as basis of big data comparative studies and the (re-)use of master narratives to frame the dynamic processes of these periods.

Furthermore, the session opens a dialogue to identify challenges across linguistic, institutional, and geo-political borders, and how to tackle them in the future. We invite researchers from all spectrums of (bio-)archaeology and history to submit contributions, so we can connect perspectives of the natural sciences and the humanities, and reflect on the synergy and challenges of such endeavours.

ABSTRACTS

1 AN ARCHEOGENETIC ANALYSIS OF LATE ANTIQUE SITES AT THE BORDER OF LONGOBARD AND BYZANTINE TERRITORIES IN CENTRAL ITALY

D'Atanasio, Eugenia (Institute of Molecular Biology and Pathology, CNR) - Ravasini, Francesco (Dept. of Biology and Biotechnology "Charles Darwin", Sapienza University of Rome) - Risi, Flavia (Dept. of Biology and Biotechnology "Charles Darwin", Sapienza University of Rome) - Mei, Oscar (Dept. of Communication Sciences, Humanities and International Studies, University of Urbino) - Delpino, Chiara (Superintendence Archaeology, Fine Arts and Landscape for the Provinces of Frosinone, Latina and Rieti, Ministry of Cultural Heritage) - Niinemäe, Helja (Institute of Genomics, University of Tartu) - Metspalu, Mait (Institute of Genomics, University of Tartu) - Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge) - Manzi, Giorgio (Dept. of Environmental Biology, Sapienza University of Rome) - Trombetta, Beniamino (Dept. of Biology and Biotechnology "Charles Darwin", Sapienza University of Rome)

The period from the 5th to the 8th centuries (cc.) CE, also referred to as Late Antiquity or Migration Period, was characterized by political instability, socio-economic changes and massive migrations of people in Western Europe and, in particular, in the Italian peninsula. In order to understand the impact of such events on the Italian population, we perform an archeogenetic analysis on a total of 32 individuals from two sites in the modern Marche region in central Italy: Fossombrone (21 individuals) and Castel Trosino (11 individuals). The former site represents a funerary area of the Roman city of Forum Sempronii (5th-6th cc. CE), that was one of the main centers of the Exarchate of Ravenna, under the rule of the Eastern Roman (Byzantine) Empire. The latter site (6th-8th cc. CE) was part of the Duchy of Spoleto, in the Longobardia minor, and is characterized by four chronological layers corresponding to different Longobard generations, possibly the residence of the families of military leaders, according to the archaeological interpretations. Both sites were located in strategic positions in their territory and have been the theater of different peaceful and belligerent interactions between Romans/Byzantines, Goths and Longobards, representing excellent case-studies to unveil the population dynamics of this period under a genetic perspective.

2 DIETARY CHANGES DUE TO THE COLLAPSE OF THE WESTERN ROMAN EMPIRE: A CASE STUDY FROM NORTHERN ITALY (4TH-7TH CENTURIES)

Schmidtova, Dominika (Department of Archaeology and Museology, Masaryk University, Arna Nováka 1/1, 602 00 Brno, Czech Republic; Max Planck Institute of the Geoanthropology, Kahlaische Str, 10, 07745 Jena, Germany) - Vyskočilová, Gabriela (Department of Chemistry, Masaryk University, Kotlářská 267/2, 611 37 Brno, Czech Republic) - Kočergina, Julie (Czech Geological Survey, Geologická 6 152 00 Prague 5, Czech Republic) - Čejková, Bohuslava (Czech Geological Survey, Geologická 6 152 00 Prague 5, Czech Republic) - Garbaras, Andrius (Center for Physical Sciences and Technology Sauletekio av. 3, LT-10257 Vilnius, Lithuania) - Klontza, Věra (Department of Archaeology and Museology, Masaryk University, Arna Nováka 1/1, 602 00 Brno, Czech Republic) - Hukelová, Zuzana (Institute of Archaeology of the Slovak Academy of Sciences, Akademická 2, 949 21 Nitra, Slovakia) - Gil, Joan (Department of Archaeology, University of Hradec Králové, Rokitanského 62/26, 500 03 Hradec Králové, Czech Republic) - Manzelli, Valentina (Soprintendenza Archeologia Belle Arti e Paesaggio per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara) - Fernandes, Ricardo (Max Planck Institute of the Geoanthropology, Kahlaische Str, 10, 07745 Jena, Germany; Department of Archaeology and Museology, Masaryk University, Arna Nováka 1/1, 602 00 Brno, Czech Republic; Climate Change and History Research Initiative, Princeton University, USA)

The decline of the Western Roman Empire was a historical period marked by political and economic instability that influenced various aspects of society. The primary objective is to determine whether these social changes were reflected in human lifeways, specifically examining their impact on the dietary habits of the populations in northern Italy.

To conduct an analysis of dietary shifts, we sampled three different populations buried in distinct urban cemeteries in Imola for stable isotope analysis. Studied grave contexts are approximately dated from the 4th to the 7th century, spanning the period before and after the collapse of the Western Roman Empire. Through stable isotope analysis of carbon and nitrogen, our aim is to unveil insights into the dietary practices and adaptations made by these communities during this transformative period.

This paper contributes to a broader understanding of social change following the collapse of the Roman Empire. Furthermore, the results from the Imola cemeteries will be contextualized within the results from the broader geographical area, providing a comprehensive view of dietary trends during this pivotal moment in history.

3 MULTIDISCIPLINARY BIO-ARCHAEOLOGICAL APPROACH TO STUDY THE POPULATION TRANSFORMATIONS DURING THE MIGRATION PERIOD IN THE EASTERN CARPATHIAN BASIN

Traverso, Luca (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103, Leipzig, Germany) - Rácz, Zsófia (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, 1088, Budapest, Hungary) - Knipper, Corina (Curt Engelhorn Center for Archaeometry gGmbH, 68159 Mannheim, Germany) - Gneccchi-Ruscione, Guido (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103, Leipzig, Germany; Department of Archaeology and Museology, Faculty of Arts, Masaryk University, 60200, Brno, Czech Republic) - Faragó, Norbert (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, 1088, Budapest, Hungary) - Hajnal, Zsuzsanna (MNM NRI, Régi Régészeti Gyűjteményi Osztály) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103, Leipzig, Germany) - Vida, Tivadar (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, 1088, Budapest, Hungary; Institute of Archaeology, HUN-REN Research Centre for the Humanities, 1097, Budapest, Hungary) - Hofmanová, Zuzana (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103, Leipzig, Germany; Department of Archaeology and Museology, Faculty of Arts, Masaryk University, 60200, Brno, Czech Republic)

Archaeological and historical sources describe a relatively stable scenario in the Tisza region at the beginning of the first millennium, with four centuries of continuous presence of "Sarmatian" communities reported in Roman written sources as in archaeological finds.

With the beginning of the 5th century, the fall of the Western Roman Empire and the extension of the Hunnic influence to this region, two centuries of power instability are reported in historical sources. This is also reflected in changes in settlement structure and burial tradition, but it is questionable whether the changes from the Sarmatian period were mostly cultural or involved a significant change in genetic structure.

In particular, during both the 5th and 6th century, the ethnonym "Gepid" appears for the first time to describe one of the populations in this region. This term was used to identify one of the "Germanic" peoples that allied with Attila during the Hunnic empire in Europe, but also to denote the kingdom at the Eastern part of the Carpathian Basin that played an important role between the centuries, appearing in both the history of the Eastern Roman Empire and of the Langobards Kingdom in the Eastern part of the Carpathian Basin.

A comprehensive analysis of these transition periods through a deep sampling of entire cemeteries in the frame of the HistoGenes project is presented, combining genome-wide analyses of more than 500 individuals with isotopic and archaeological analysis of the sites.

Multiple lines of evidence point at an increase in short- and long-scale mobility, emerging also from an increase in genetic diversity, highlighting a compound scenario of continuity and discontinuity.

Thanks to the sampling strategy, these observations emerge both as overall patterns and single stories of burials and cemeteries, narrowing the distance between large-scale and small-scale events in the history of this region.

4 SOCIAL ORGANIZATION AND MARRIAGE STRATEGIES IN AVAR-PERIOD COMMUNITIES

Rácz, Zsófia (Institute of Archaeological Sciences, ELTE – Eötvös Loránd University) - Gneccchi-Ruscione, Guido (Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Traverso, Luca (Max Planck Institute for Evolutionary Anthropology) - Szeniczey, Tamás (Department of Biological Anthropology, ELTE – Eötvös Loránd University) - Takács, Balázs (Institute of Archaeological Sciences, ELTE – Eötvös Loránd University) - Faragó, Norbert (Institute of Archaeological Sciences, ELTE – Eötvös Loránd University) - Samu, Levente (Institute of Archaeological Sciences, ELTE – Eötvös Loránd University) - Hajdu, Tamás (Department of Biological Anthropology, ELTE – Eötvös Loránd University) - Vida, Tivadar (Institute of Archaeological Sciences, ELTE – Eötvös Loránd University) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

In a previous study, we reported on the archeogenomic analyses of four fully sampled Avar-period cemeteries from Hungary (Rákóczi-falva, Hajdúnánás, Kunszállás, and Kunpeszér). These analyses provided an opportunity to study social organization in the Carpathian Basin between the sixth and ninth centuries. We discovered that these communities of Eastern Steppe and Pontic Steppe origin were structured in a very similar way: there was a strong patrilineal kinship structure with female exogamy and patrilocality, and levirate unions and multiple reproductive partnerings were common. Moreover, we found that exogamous females were crucial in connecting the various patrilineal lines both within and between sites.

Here we will try to broaden our horizon by investigating further sites in the Great Hungarian Plain. Firstly, we examine how the data from previously published studies using smaller sample sizes (and not focusing on social organization) fit into this picture. On the other hand, data from a recently studied population (Tiszabura) from the same region, but with European genetic background will be compared with the earlier ones. Attention would also be paid to exceptional cases that differ from general patterns (e.g. exogamous males, matrilineages) and to changes over time. The analysis of archaeological data can shed light on the question of how the characteristics of social organization are related to other cultural features in Avar-period communities.

Our research is part of the HistoGenes ERC Synergy project. The physical anthropological study was supported by the Bolyai Scholarship of the Hungarian Academy of Sciences and by the National Research, Development and Innovation Fund.

5 UNVEILING THE SOCIAL AND GENETIC LANDSCAPES OF THE AVAR PERIOD SOUTHERN-TRANSDANUBIA: A MULTIDISCIPLINARY STUDY OF THE KÖLKED-FEKETEKAPU CEMETERY

Gyuris, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary; Department of Genetics, ELTE-Eötvös Loránd University, Budapest) - Hajnal, Zsuzsanna (Hungarian National Museum) - Szeniczey, Tamás (ELTE Department of Biological Anthropology, ELTE-Eötvös Loránd University, Budapest) - Jakab, Kristóf (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Koncz, István (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Mende, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary)

The Kölked-Feketekapu cemetery, with its more than 1300 graves, stands as one of the most significant burial sites from the Avar Period in the Carpathian Basin. This archaeological site encompasses a variety of grave groups, ranging from large cemeteries to smaller, household related burials. Used between the mid 6th and late 8th centuries AD, the site shows various cultural influences, reflecting the dynamic historical milieu of the Early Medieval period. The presence of Late Antique, Merovingian, and Eastern nomadic cultural elements underscores the site's importance and prompts a reevaluation of social structures within this diverse context. Wide-scale ancient DNA (aDNA) analysis offers unprecedented opportunity to investigate the relationship between social and biological kinship through the examination of large pedigrees and the identification of more distant genetic relations via IBD (identity by descent) sharing analysis. In pursuit of these insights, approximately 350 human DNA samples have been sequenced from

Kölked, targeting 1.2 million polymorphic sites. Our multidisciplinary research aims to resolve questions around the founding of the site and the impact of the later newcomers on the life of the community. By exploring the connections among different sections of the cemetery, we intend to unveil the complex nature of interactions among individuals of varying cultural and biological backgrounds. This investigation into the cemetery's social and kinship dynamics not only shed light on the local social structure but also contributes to a broader understanding of the historical transformations within the wider period and region.

6 PEOPLE FROM THE EARLY-MEDIEVAL ARCHAEOLOGICAL SITE NITRA-ŠINDOLKA, SLOVAKIA

Krošláková, Mária (Institute of Archaeology, Slovak Academy of Sciences) - Ruttkay, Matej (Institute of Archaeology, Slovak Academy of Sciences)

Archaeological human skeletons provide direct evidence of how our ancestors lived, what their physical features were, what lifestyle they led, and what health issues they had to face. Yet, without a multidisciplinary approach, the image remains incomplete and the lives of neither individuals nor populations are understood at their full potential. The presentation deals with the population of Nitra-Šindolka (Slovakia). The small early-medieval burial ground discovered in 2004 has been dated to the 9th century, or the 9th – 10th century. At the time, Nitra was an important power center related to Great Moravia. Twenty-one graves from the archaeological site Nitra-Šindolka were osteologically analyzed and evaluated within the archaeological and historical contexts. By connecting the pieces of information from the three disciplines, the relations between individuals inhumated at the cemetery were estimated. The synthesis of osteological, archaeological, and historical data provides a good ground for ongoing genetic research aimed at unraveling interactions of European populations at the mentioned historical period.

7 GENETIC MAKEUP AND CHANGE IN THE MEDIAEVAL COMMUNITIES OF THE CARPATHIAN BASIN

Szeifert, Bea (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Gerber, Dániel (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Csáky, Veronika (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Gyuris, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest, Hungary) - Jakab, Kristóf (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Szőke, Béla (Institute of Archaeology, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Mende, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Sinika, Vitalij (Pridnestrovian State University named after T. G. Shevchenko, Tiraspol, Moldova) - Türk, Attila (Institute of Archaeological Sciences, Faculty of Humanities and Social Sciences, Pázmány Péter Catholic University, Budapest, Hungary; Hungarian Prehistory Researchgroup, HUN-REN Research Centre for the Humanities, Budapest, Hungary) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities, Budapest, Hungary)

Despite its eventful history, Transdanubia in the Carpathian Basin (CB) has been underrepresented in mediaeval genetic research. The analysis of the region's communities is important to describe the area's population structure prior to the arrival of the Hungarians and to understand their genetic and cultural impacts during the 10-11th centuries AD. Moreover, the delineation of the Hungarian conquerors' diverse origins and population structure is still to be achieved.

Here we present whole genome level data for 103 individuals (6-11th c. AD) from today's Western Hungary for general description of population events in the area in the studied period, supplemented with 50 individuals connected to the Hungarian conquerors from the CB and the so-called Etelköz region in the Dniester Valley (present-day Ukraine and Moldova). The latter is believed to be the early Hungarians' last settlement area before their arrival into the CB. In addition to standard population genomic methods we applied IBD analysis as well to reveal possible distant biological relatedness within our dataset throughout the studied period and region. Radiocarbon dating was employed to enhance the classification of poorly documented but valuable graves.

Our results delineate the CB's general population structure and its changes in the Middle Ages. We show the re-organisation processes predominantly associated with the 10th century Hungarian conquest period, as well as the dynamics of spread and admixture of Hungarian conquerors-related ancestry. We reveal significant links between the communities in the CB and Etelköz as well as the Ural region. The population makeup in Etelköz is a mixture of various distant and local elements, which is consistent with the assumed melting process taking place in this area of the early Hungarians' migration.

Our results contribute to our understanding of the Carpathian Basin's genetic history and the role of the populations of the Etelköz region in its context.

8 BETWEEN DIVERSITY AND HOMOGENEITY – THE ARCHAEOLOGICAL AND GENETIC ASPECTS OF MÉNFŐCSANAK-BEVÁSÁRLÓKÖZPONT (HUNGARY) DURING THE 7TH CENTURY

Blay, Adrienn (Eötvös Loránd University) - Samu, Levente (Eötvös Loránd University) - Tian, Yijie (Stony Brook University) - Koncz, István (Eötvös Loránd University) - Vyas, Deven (Stony Brook University) - Tomka, Péter (Rómer Flóris Museum, Győr) - Vida, Tivadar (Eötvös Loránd University) - Geary, Patrick (Institute for Advanced Study, Princeton) - Veeramah, Krishna (Stony Brook University)

With the arrival of the Avars to the Carpathian Basin and Pannonia in 568 AD started a new political era in the Middle-Danube region. A new power- and ruling structure was established, which also had his specific economic system. The new circumstances necessarily influenced the local population as well. There were communities, which were able to adapt themselves to the new social order and also prosper. The various communities – especially on the territory of the former province Pannonia – could have very specific material culture and burial customs, including and representing several cultural influences.

We have chosen one archaeological site called Ménfőcsanak-Bevásárlóközpont from the territory of the Little Hungarian Plain, Hungary to study this period and their specific local communities. The material remains of the community buried here during the 7th century is very diverse. Based on the network of artefacts there was a highly diverse group of people, who had connections both inside and outside the Carpathian Basin. The genetic analysis of the site can help us to understand the social pattern which helped the community to maintain itself and prosper in the Avar period. It may also help us to understand better the long-distance connections of the community. The presentation will focus on the correspondence between pedigrees and archaeological material.

9 ARCHAEOGENETIC INVESTIGATIONS RECONSTRUCT MOBILITY OF CENTRAL EUROPEAN POPULATIONS REPRESENTED BY THE RHINELAND REGION DURING THE MIGRATION PERIOD

Lacher, Laura (Max-Planck Institute for evolutionary Anthropology) - Nieveler, Elke (Landesmuseum Bonn) - Schmauder, Michael (Landesmuseum Bonn; University of Bonn) - Pääffgen, Bernd (Ludwig-Maximilians University Munich) - Krause, Johannes (Max-Planck Institute for evolutionary Anthropology; Friedrich-Schiller University Jena) - Schiffels, Stephan (Max-Planck Institute for evolutionary Anthropology)

The political and sociocultural changes during the Migration Period and the Early Middle Ages in Europe have been the focus of investigations in cultural sciences for many decades. However, even though historical and archaeological sources can provide insights into cultural processes, reconstructing individual mobility and group-based migration is still challenging. For a few years now, archaeogenetic studies have started contributing to detangle the complex dynamics present during this time and especially tackling questions of mobility and migration. Here, we study genetic data from 122 individuals from the Rhineland region in northwestern Germany close to Cologne. By employing high resolution genetic datasets of both modern and ancient DNA as well as new computational methods and visualization techniques, we gain new insights with respect to mobility and migration. Generally, we find patterns of individual-level mobility to be highly dependent on the temporal and archaeological context. Specifically, we observe individuals with ancestry from South-Eastern Europe, which could indicate movements of people in association with the political changes accompanying the collapse of the Roman Empire. Furthermore these connections seem to be temporally asynchronous between sites, potentially corresponding to different political structures within sites. The study promises new insights into the transformation process of the late Roman province of Germania II into the Early Medieval Francia rhinensis.

10 LIFE AND DEATH IN THE MEDIEVAL VILLAGE OF VILVENICH: AN ANTHROPOLOGICAL AND BIOMOLECULAR APPROACH

Pathé, Leonie (Bonn Center for ArchaeoSciences (BoCAS), Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität Bonn; Vor- und Frühgeschichtliche Archäologie, Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität Bonn) - Rüniger, Torsten (Vor- und Frühgeschichtliche Archäologie, Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität Bonn) - Toso, Alice (Bonn Center for ArchaeoSciences (BoCAS), Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität Bonn)

The history of large cities in medieval Germany is well-known, but the social and economic structures of rural settlements are poorly understood in regions like the Rhineland, where the presence of Loess sediments significantly hinders the preservation of any organic material.

The skeletal assemblage (9th and 12th c.) here presented was recovered in Vilvenich, a medieval village located between Cologne and Aachen and provides the unique opportunity to study human remains using anthropological and isotopic methods to contribute to local history. The combined application of these methods can determine environmental stressors and dietary consumption, helping to reconstruct past environments, dietary practices, and health

profiles of past populations. However, not many studies have comprehensively assessed pathologies and nutritional habits in rural medieval communities. Correspondingly, this project addresses a gap in the current knowledge and will provide additional insights into the population of Vilvenich and this specific region, a continuously inhabited area of the Rhineland from Roman times to the Middle Ages.

This research study presents preliminary results that combine data from biological and health profiles with isotopic analysis of $\delta^{13}C$, $\delta^{15}N$ and $\delta^{34}S$ ratios of a selected group of individuals. The aim is to explore 1) the lifeways and health conditions in medieval Vilvenich, and 2) their correlation with their nutritional status and practices.

Skeletal remains provide a direct connection between archaeological sites and the surrounding environment, as well as with material finds such as artefacts and grave goods. Each individual, with their unique biological profile, contributes to reconstructing a more comprehensive picture of past lifeways and helps identify patterns of diversity in age, sex, diet, health, and development.

11 RATHER PIGS THAN FISH – THE DIET OF THE EARLY MONASTIC COMMUNITY ON THE ISLAND OF REICHENAU IN LAKE CONSTANCE

Lehn, Christine (Institute of Legal Medicine, Ludwig-Maximilians-University of Munich, Germany) - Trixl, Simon (State Office for Cultural Heritage Management Baden-Württemberg, Osteological Department, Archaeozoology) - Alterauge, Amelie (Institute for Pre- and Protohistory and Medieval Archaeology, University of Tübingen)

Monasteries are traditionally regarded as the main consumers of fish in the Middle Ages. In order to test this hypothesis, we investigated early medieval monks' diet and specific living conditions on Reichenau Island, Lake Constance, Germany, by means of an interdisciplinary approach, including physical anthropology, radiocarbon dating, archaeozoology and stable isotope analyses on 12 selected burials from a cemetery at Reichenau-Mittelzell. The human remains were characterized by exclusively male sex, advanced age at death, elevated body height and good nutritional status, suggesting a monastic background. Based on radiocarbon dating, the burials were determined to originate from the 7th or 8th centuries AD. This time frame would align with the foundation of Reichenau Abbey in 724 AD, potentially even earlier. Our stable isotope investigations on potential food animals revealed that fish was of little importance for the nutrition of the individuals. They covered their caloric needs rather through a terrestrial-based diet, containing a considerable amount of animal proteins, especially from pigs, as revealed by the archaeozoological analyses of animal remains recovered in and around the graves. The individuals may have belonged to an early – likely monastic – population on Reichenau Island.

12 COMMUNITY FORMATION IN THE EARLY MEDIEVAL NETHERLANDS: AN INTEGRATED BIOARCHAEOLOGICAL CASE STUDY NEAR NIJMEGEN

Altena, Eveline (Leiden University Medical Center) - Kootker, Lisette (Vrije Universiteit Amsterdam) - Olalde, Iñigo (University of the Basque Country UPV/EHU; Harvard Medical School; Ikerbasque—Basque Foundation of Science) - van der Linde, Constance (Fysisch antropologisch onderzoeksbureau Tot op het Bot) - Hendriks, Joep (Nijmegen municipality) - Theuvs, Frans (Leiden University) - Reich, David (Harvard Medical School; Broad Institute of MIT and Harvard; Harvard University; Howard Hughes Medical Institute)

We present a multidisciplinary study on a 6th century Merovingian cemetery in Lent, just north of the former Roman city Nijmegen, the Netherlands. The Late Roman Netherlands was characterized by economic, political, and social instability. Consequently, the transition period from the Roman era to the Early Middle Ages, also known as the Migration period, was marked by substantial depopulation of large parts of the country. To understand how new communities were formed in the Netherlands in the early stages of the newly emerging early medieval society, we applied an integrated bioarchaeological approach (archaeology, osteology, isotopes, and genetics) on the more than 50 inhumed individuals, with the aim to reconstruct the demography, kinship ties, genetic ancestry and mobility patterns of this population, and ultimately the social structure of the community that used this cemetery.

Our results indicate a scenario wherein a heterogeneous group of people, both in terms of geographic origin and genetic ancestry, coalesced into a rural community in Lent, and founded new families amongst each other. We observed relatively few close kinships within this cohort, juxtaposed with abundant distant kinship ties. This suggests that rather than large families traveling together, the migration comprised smaller groups from specific communities, possibly already connected prior to their relocation. Furthermore, distant kinships can also be traced further into Europe, with notable concentrations in specific regions, including contemporary Italy, Hungary, Germany, and Great Britain. These observations reveal intricate mobility patterns and social networks among Early Medieval Europeans.

13 WHAT ISOTOPES HAVE TO OFFER IN MIGRATION PERIOD STUDIES IN SWEDEN?**Anagnostou, Eirini (Stockholm University)**

The end of the Migration period in Sweden is marked by vital changes in the archaeological record (e.g. settlement and farm abandonments, burial declines etc.). Those changes have been interpreted in various ways, and an ongoing debate in the Swedish archaeological research about what caused these changes has been going on, from the early 20th century until our days. Recent studies have suggested that a long-lasting cold event, which was caused by several volcanic eruptions and referred to as the AD 536 event or Fimbulwinter or Late Antique Little Ice Age (LALIA), was the prime cause for the observed changes in the archaeological record in the middle of the 1st millennium AD in the region of Sweden. The suggested impact of this climatic event includes crop failure and spread of diseases, which leads to famine, population decline and settlement abandonments. Therefore, the dependence of arable farming could be a crucial factor in increasing vulnerability for these populations. However, whether or not this climatic event had a major impact on Swedish societies remains undetermined. Stable isotope analysis is a unique tool for investigating diet, movement, and climate. It can provide us with the missing link to better understand the Migration period and what caused the significant changes at that period in Sweden. In this presentation, I will talk about my PhD project, the changes that occurred in the middle of the first millennium AD, the debate around the role of the climate in the observed changes, and I will discuss what isotopic studies could offer in the studies of this period. Furthermore, some preliminary isotope results will be presented.

14 VIKING AGE BIOARCHAEOLOGY – STATE OF RESEARCH AND POSSIBLE FUTURE PERSPECTIVES**Palmowski, Valerie (University of Bonn)**

The Viking Age recently is a focus of international archaeological debates as well as the public interest. Modern reconstructions of Viking Age life have been rewritten and complemented within the last decades, and especially since the 2010s, in which bioarchaeological results were and still are accumulated in unprecedented extend. Using the toolkit of the natural sciences, new perspectives on mobilities and exchange, identities and kinship, as well as diets and subsistence strategies among others were explored.

Due to the nature of the subject, research is being practiced in joint projects of an increasingly connected international scientific community across institutional, geographical and / or linguistic borders – A welcome modern reflection of the manifold networks of the Viking Age with its trans-European and proto-global phenomena. Comparative studies of burial practices, material culture, texts, and skeletal remains have been applied to detect correlation patterns. Sex, age, health, stature, genetic and isotopic signatures are used to identify particular groups within Viking Age societies and explain individual find contexts. The combination of various approaches and sources, as well as the synthesis of the different research traditions of the natural sciences and the humanities, however, remain a complex process.

Based on data from the author's PhD, examples of both successful comparative approaches as well as open questions and challenges regarding the reconstruction of diets, identities and mobilities between Viking Age Hedeby, Gotland and Gnezdovo are presented. Archaeological data (objects from graves, grave constructions) as well as osteological data and isotope analyses ($^{87}\text{Sr}/^{86}\text{Sr}$ measured in tooth enamel, $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ measured in bone collagen) are combined to offer multifaceted results. By including a selection of data from recent publications, new developments and possible future perspectives of Viking Age Bioarchaeology are presented.

15 SEX DETERMINATION OF CHILD SKELETAL REMAINS: AN INTEGRATIVE APPROACH**Ivarsson-Aalders, Marieke (Stockholm University)**

Traditionally, Viking Age (c. 750 – 1050 CE) societies have been regarded as heavily dominated by men. Marginalised groups (e.g. women, children, the elderly, and the disabled) either played inferior roles, or were left out altogether in many representations of Viking Age society. However, research in the last decade has seen a shift towards more nuanced studies focussing on gender, ethnicity, and intersectionality. This presentation focuses on one of these marginalised groups, namely the children, and aims to demonstrate how the analysis of ancient DNA can enhance archaeological narratives as well as osteological methods. Even though the last two decades have seen an increase in studies regarding children and childhood during the Viking Age, in-depth analyses of the lives of young boys and girls remain complicated due to the problematic nature of sex determination of child skeletal remains. Eighty-nine individuals of the Ihre grave field on the Swedish island of Gotland, located in the Baltic Sea, are included in this study. Through the analysis of mortuary profiles (i.e. burials, burial expressions, burial practices and burial assemblages) and skeletal remains, archaeological and osteological sex are compared with biological sex confirmed by genomics. The results are interpreted in relation to the archaeological narrative and the implications for osteological methods of sex determination of child skeletal remains are discussed. Furthermore, opportunities and challenges will be highlighted as well as suggestions for future research.

16 A FRESH LOOK INTO THE MEROVINGIAN PERIOD INHUMATION GRAVES IN FINLAND**Moilanen, Ulla (University of Turku)**

The first Iron Age inhumation cemeteries appeared in Southwestern Finland in the Merovingian Period (550 - 800 CE), during the early phase of it. The burial customs in these cemeteries were significantly different from those in the surrounding areas, where cremation was the most common way of handling the dead until the end of the Viking Age (800 - 1050 CE). The Finnish Merovingian Period inhumation cemeteries were mainly excavated in the early and mid-20th century, and the excavated material has been stored in museum collections ever since. What is this material like and how well is it suited for modern scientific research methods? Is it possible to approach the graves from new perspectives, or is it most useful to approach them with traditional humanistic methods? In this paper, I will introduce the material and discuss the problems encountered when studying the graves, and also the preliminary results obtained so far.

591 BEYOND THE WALLS. INTERROGATING THE WIDER LANDSCAPES OF IRON AGE COMMUNITIES IN TEMPERATE EUROPE**Session theme: 1. The Material Record: Current Trends and Future Directions****Session organisers: Parcero-Oubiña, César (Instituto de Ciencias del Patrimonio (INCIPIT), Consejo Superior de Investigaciones Científicas (CSIC)) - Moore, Tom (University of Durham) - González-Álvarez, David (Instituto de Ciencias del Patrimonio (INCIPIT), Consejo Superior de Investigaciones Científicas (CSIC))****Session format: Regular session**

Iron Age landscapes in most of temperate Europe are characterised by the spatially dominant and persistent presence of fortified sites. Built as landmarks to organize the landscape, their imposing visibility has made them the prevalent focus of archaeological research for some time. However, Iron Age landscapes consisted of much more than that. Advances in fieldwork methods have allowed an increasing availability of data about many other types of elements beyond the hillforts, many of which have been under-researched: open settlements, agrarian structures, linear earth-works, complex settlement patterns, routeways, specialised craft-making centres. Challenges remain, however, to (1) better characterize the diversity of the rural Iron Age archaeological record and (2) understand the interpretive implications of the vast amount of new evidence that has been collected in recent decades.

The aim of this session is to reflect on these topics. Papers are welcome that address (1) methodologies to better characterise and understand off-site archaeological record, (2) discuss social interpretations of such evidence and/or (3) present regional case studies from across temperate Europe.

ABSTRACTS**1 IRON AGE ON THE SURFACE. INVESTIGATING THE RURAL LANDSCAPE OF THE IRON AGE WITH NON-DESTRUCTIVE METHODS ALONG THE VÁLI-VÍZ (HUNGARY)****Gergácz, Rebeka (Hungarian National Museum; Eötvös Loránd University) - Czajlik, Zoltán (Eötvös Loránd University) - Rupnik, László (Eötvös Loránd University)**

When discussing the Iron Age, many people think of fortified settlements as well as fascinating princely burials. While these sites are important, a more comprehensive understanding of Iron Age life requires expanding research efforts to include as much information as possible about the surrounding hinterland. Fortunately, in the 21st century, there is a growing focus on rural landscapes, with researchers employing both destructive and non-destructive methods to gather data.

As part of this trend, a new project in Hungary has recently launched with the aim of investigating Early and Late Iron Age rural settlement patterns using topographical research methods. The targeted area is along a stream, Váli-víz in Northeast Transdanubia, Hungary, which seems ideally suited for prehistoric habitation. Despite being relatively unexplored, ongoing fieldwork has already uncovered several new Iron Age sites, greatly enhancing our understanding of the area's protohistory.

What makes the research particularly intriguing is the absence of any previously known fortified settlements from the Iron Age in the explored region. Consequently, the study is not centred on the surrounding areas of one or more specific central settlements, but rather on a network of rural unenclosed settlements throughout the flatlands. In this presentation, we will explore the potential of non-destructive methods for rural landscape studies and showcase the first findings of the research project.

2 IRON AGE SETTLEMENTS BEYOND THE WALLS: NEW PERSPECTIVES FROM NORTHERN BRITAIN

McDonald, Sophie (SUERC (University of Glasgow)) - Hardwick, Ian (University of Edinburgh) - Fernández-Götz, Manuel (University of Edinburgh) - Hamilton, Derek (SUERC (University of Glasgow)) - Cowley, Dave (Historic Environment Scotland)

Hillforts have traditionally characterised our view of Iron Age communities in northern Britain, with over a thousand fortified sites of the period having been identified in northern England and Scotland. However, Iron Age settlement patterns were much more complex and included a large number of small, rural sites. In this paper we will present evidence for these rural settlements derived from the Leverhulme-funded project “Beyond Walls: Reassessing Iron Age and Roman Encounters in Northern Britain”, which has been running from 2021 to 2024. In particular, we will focus on how the analysis of LIDAR data has led to the discovery of numerous small sites, which represented farmsteads and hamlets where the majority of the Iron Age population would have lived. We will also present evidence on how palaeoenvironmental data can contribute to our broader understanding of settlement landscapes in this northern frontier zone during the period of Roman presence there.

3 ASSESSING ARCHAEOLOGICAL TRACES BEYOND THE WALLS OF THE HILLFORTS IN NW IBERIA: PRELIMINARY RESULTS FROM THE HINTERLAND PROJECT

González-Álvarez, David (Institute of Heritage Sciences (INCIPIIT), CSIC) - Parcero-Oubiña, César (Institute of Heritage Sciences (INCIPIIT), CSIC)

Archaeological research on Iron Age landscapes in the North-West of the Iberian Peninsula has witnessed a remarkable impulse in the last decades. Nowadays, we have a much better knowledge of what happened within the limits of the castros – the fortified settlements that constitute the vast majority of sites from that period. However, we still know very little of what happened beyond the walls and ditches demarcating those sites, and how Iron Age communities shaped the lands surrounding those fortified hilltop sites. The HINTERLAND project aims to identify and characterise the archaeological traits of human activity around the hillforts in order to adequately address the forms of production and reproduction of those Iron Age communities, in addition to approaching the monumentalization processes shaping social and political landscapes during the First millennium BC.

Our ongoing investigations rely on non-invasive methods for archaeological prospection, including ground-truthing throughout excavations at a handful of representative case studies. This paper presents the preliminary results of the project, including the discovery of new sites and hundreds of traits with potential archaeological interest in the vicinity of already-known hillforts. We also describe the outcomes of detailed investigations conducted on the ground deploying various survey methods and techniques. As a result, the project is contributing to assessing the potential of survey methods to discover and analyse off-site archaeological remains from the Iron Age in rural landscapes of NW Iberia. Also, the outcomes of the HINTERLAND project emphasise the need to review the policies of heritage management in the surroundings of hillforts beyond their currently visible limits of walls and ramparts.

4 THE MICRO-REGION OF BALTINAVA HILLFORTS (LATVIA): LANDSCAPE, SPACE AND CONNECTIONS

Meinerts, Janis (Latvian Academy of Culture) - Urtāns, Juris (Latvian Academy of Culture)

Since the mid-19th century hillforts have been one of the most popular topics of archaeological research. Although many hillforts have been excavated, paradoxically they have rarely been interpreted in context with the surrounding landscape and other archaeological sites. The research done by the team of researchers from the Latvian Academy of Culture during the IDEUM project (Landscapes of Identities: History, Culture, and Environment, No. VPP-LE-TONIKA-2021/1-0008) tries to bridge the gap between hillforts, their surrounding archaeological landscape and folklore narratives.

The IDEUM project chose a micro-region (apr. 7x2 km) centred around the four hillforts in Baltinava parish in Eastern Latvia for an in-depth case study. The steps taken included a thorough mapping of all the known archaeological evidence in a 15-20 km range around the micro-region in a GIS database. Together with LIDAR data, this database was later used in a series of fieldwalking expeditions that resulted in several newly discovered archaeological sites. In the summer of 2023, small scale excavations and series of drillings were made in all four hillforts to ascertain their dating and the cultural affiliation of the inhabitants. Information obtained from the excavations, including 14C dates, provide anchorage points for interpreting other archaeological sites in the micro-region to reconstruct the ancient archaeological landscape and understand the settlement dynamics.

The reconstructed archaeological landscape and spatial structure of the micro-region in the Iron Age show it as a densely populated, hierarchical landscape, in which several nodal points of chronologically contemporary habitation and use can be discerned. Furthermore, certain zones within the micro region can be connected to burial practises

and sacredness, although the latter’s precise meaning is hard to interpret. In a regional context, the micro-region of Baltinava hillforts, with its long habitation history and dense population, can be viewed as a regional central place.

5 MONUMENTALITY AND LANDSCAPE: EXPLORING THE ROLE OF MONUMENTAL EARTHWORKS IN LATER PREHISTORIC BRITAIN

Moore, Tom (Durham University, Department of Archaeology) - Harris, Barney (Bournemouth University) - Reynolds, Andrew (University College London)

Monumental linear earthworks are found across many parts of Europe, defining communities, channelling movement and inscribing the landscape. Yet our understanding of the roles of these features remains dominated by interpretive frameworks grounded in antiquarian traditions. Our recent Leverhulme funded Monumentality and Landscape project has sought to reassess these monuments. The project has recorded over 700 such earthworks across Britain and, while dating of most remains poor, current evidence points to peaks of their construction in the first millennium BC and mid-first millennium AD. Despite their prevalence, and scale of many Late Bronze Age and Iron Age examples, recent discussions have, however, been relatively quiet on the significance of these features for understanding social and landscape organisation. Using the evidence from the MAL project and focused on several case studies, this paper will explore the important role monument linears had in shaping movement through Iron Age landscapes and as displays of changing forms of power.

6 UNDERSTANDING THE DUERO VALLEY OPPIDA THROUGH THE POLITICAL LANDSCAPE

García Sánchez, Jesús (ArchaeologyHub.CSIC)

The Duero river valley, central Spain, is characterized during the Late Iron Age by the massive presence of fortified large hillforts, often termed oppida in the archaeological literature. One of the main characteristics of this settlement pattern is the control of large void spaces from the oppida, thus the absence of a secondary settlement site network between the Early Iron Age (8-6th cent. AD) until the beginning of Roman presence in the area (2-1 cent. AD).

Despite research on these oppida has been slowly ongoing during the last decades there is a lack on research in the countryside.

This paper tackles the landscape, as political and archaeological entity, in which the fortified sites reflect elements of social organization, control of resources and warfare against other oppida-based groups. Will use methods such as field survey (Castarreño, Sasamón), geopropection and analysis of other proxies of social organization as the well-known Late Iron Age necropolis of key-sites (Villamorón).

7 ANCHORING ECONOMIC AND SOCIAL STRUCTURES OF RURAL COMMUNITIES (PARIS REGION, 5TH-1ST CENT. BCE)

Qatreuvre, Carole (Christian-Albrecht Universität zu Kiel (DE); CNRS UMR 8546 Aoroc (FR))

Thanks to ongoing construction projects, vast areas of the Paris region (France) have been systematically excavated by archaeologists in the last 30 years. The abundant Iron Age sites they documented encompass all kinds of remains of human occupation, from well-established settlements to “simple” linear features. My current research addresses this wealth of information in a synthetic way, to make sense of past land use and to chart social, economic, or even political processes in rural La Tène communities of the Paris region.

Mostly based on unpublished archaeological reports, my dataset includes all archaeological features dated to the Second Iron Age, from settlements and necropolises to isolated structures. Many of these isolated structures are listed as “secondary facilities”, for which no residential function can be identified. They are used on a more or less frequent basis, and thus contribute to the continuous use of the landscape: storage structures and sheds, land parcels, roads, etc. In order to fully appreciate their diversity, the classification of settlements and secondary facilities relies on correspondence analyses and clustering methods. These statistical tools effectively reveals several unsuspected types of sites for the Paris region such as villages, redistribution centers as well as different levels of agrarian structures.

Spatial analysis then connects all the components of the human landscape. Traditional distribution maps are supplemented with contextual profiles. These profiles highlight the evolution of specific combinations of sites and features and help characterize social and economic structures. New phenomena are identified, such as the higher complexity of territorial development South of Paris throughout the whole period, the resilience of rural communities in the 4th century BCE in the face of general depopulation in Gaul or the shift from community-based to aristocratic management of agricultural products in the 3rd century BCE.

8 TERRITORIALIZATION, HUMAN MOBILITY, AND SOCIAL INEQUALITIES IN NE IBERIA DURING THE IRON AGE: ISOTOPIC ANALYSIS FROM ULLASTRET (GIRONA, SPAIN)

de la Fuente Seoane, Rubén (Unitat d'Antropologia Biològica, Universitat Autònoma de Barcelona) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, University of Tübingen) - Nieto-Espinet, Ariadna (Grup d'Investigació Prehistòrica (GIP), Universitat de Lleida) - Subirà, M. Eulàlia (Unitat d'Antropologia Biològica, Universitat Autònoma de Barcelona)

In the late first millennium BC, the societies of NE Iberia underwent rapid transformations due to their interaction with Mediterranean groups and their exchange networks. The archaeological record reflects incipient processes of territorialisation and the emergence of social inequalities through the appearance of fortified settlements, presence of iron weapons, as well as an increase in structures for the accumulation of agricultural surplus. However, the adoption of cremation as the funerary ritual which complicates the understanding of the biological characteristics and social structure of Iron age human communities.

Archaeological finds such as the nailed heads from Ullastret not only reflect a unique symbolic practice in the Iberian world, but also represents an exceptional opportunity to analyse the human communities of this period and their interactions. According to some authors, these could have been either protective relics from ancestors or war trophies of foreign enemies. But who were these people really, and what relationship did they have with the territory?

This paper provides new data to understand how interactions between human communities linked to the territory of the NE Iberia were articulated during a period characterized by strong local territorialisation. This has been possible thanks to the analysis of three nailed skulls from the Ullastret site, with a multiproxy approach combining physical anthropology, $\delta^{18}O$ and $87Sr/86Sr$ isotope analysis. The integration of the anthropological and isotopic data of individuals and their correlation with the results obtained from the archaeozoological remains and the local baseline has provided valuable information on the degree of connectivity and the impact of mobility on local Iron Age communities.

592 DECISION-MAKING AND ASSESSING AND ARTICULATING ARCHAEOLOGICAL SIGNIFICANCE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Verschuur, Marjolein (Cultural Heritage Agency of the Netherlands; European Archaeological Council) - Hjaltalin, Thor (The Cultural Heritage Agency of Iceland; European Archaeological Council)

Session format: Regular session

The Europae Archaeologiae Consilium (EAC) has done extensive work on assessing and articulating significance. Significance is a primary consideration in heritage management and informs decisions about what will be considered an archaeological heritage resource worthy of protection, conservation, and management. By summing up specific values, significance gives a statement about why a site or a monument should be the subject of preservation and conservation (or not) and guides management action. The assessment of significance is thus a key tool which shapes the material archaeological record, and forms a basis for subsequent actions and interactions with archaeological heritage.

Significance itself is a dynamic concept that changes over time. Significance places relative values on the material record and is by its very nature subjective. Archaeological heritage benefits society in many different ways, and assessing significance should take into account a wide range of different values. It should be a reflective and critical process that allows more voices to be heard.

These developing considerations operate within international, national and regional legislative frameworks that may not accommodate these multiple voices, and in the face of many economic, societal and other pressures on archaeological heritage. The huge growth in techniques available to detect, record and interpret individual sites and monuments and wider archaeological landscapes also presents data-based challenges to heritage management agencies and all archaeologists charged with assessing archaeological significance.

The complex process of assessing archaeological significance provides the foundation for all decision-making in heritage management. Understanding and exploring it is vital to questions such as why we preserve archaeology, how we articulate the relationship between past and present, and how archaeological heritage can benefit society.

Aim of the session is to share the EAC results and to share experiences and good examples. We invite speakers to present their own research regarding this theme.

ABSTRACTS

1 ARTICULATING SIGNIFICANCE OF ARCHAEOLOGICAL SITES

Hjaltalin, Thor (EAC; Cultural Heritage Agency of Iceland)

The EAC working group on articulating significance of archaeological sites is one of three groups that started following the "Making Choices" survey which was sent out to the EAC member states. The results of the survey, which was published in 2017 has helped to identify areas in which EAC could help to develop guidance in archaeological heritage management to improve consistency and transparency. The working group on significance's main objective is to provide guidance on articulation of significance of heritage assets to ensure that the values of each site are clearly articulated when needed. The aim of the group is to give a comprehensive discussion on the philosophical problems heritage managers are facing when dealing with significance of sites and to give a good overview of methods used for evaluating significance in different countries of Europe. We hope that the ideas and different systems described will be useful for caretakers of sites and even give some useful guidelines and serve as a working tool for decision-making when change management is required, or because of other reasons. Traditions differ somewhat between countries in Europe when evaluating significance of sites and in the presentation structure and outcome of the project will be discussed, comparison of different approaches and questions asked like; are all cultural remains equally valuable and if not, what makes the difference? Can remains have more value in some regions than others and can the value of a site change in time – be less or more important for the public or even archaeologists? The aim of the group is to give a comprehensive discussion on the philosophical problem we are facing when dealing with the significance of sites and try to find a common ground and useful guidelines and working tool for decision-making.

2 OUTSTANDING UNIVERSAL VALUE IN WORLD HERITAGE – A USEFUL COMPARATIVE RESOURCE FOR THE ASSESSMENT OF HERITAGE SIGNIFICANCE AT NATIONAL LEVEL

Gowen Larsen, Margaret (University College Dublin)

Outstanding Universal Value (OUV) in UNESCO World Heritage (WH) is the conceptual standard used to determine the global heritage significance of properties that are inscribed on the WH List. The UNESCO Convention Concerning the Protection of the World Cultural and Natural Heritage (1972) was devised as a global treaty because "...parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage of mankind as a whole". OUV is thus legally recognised as an international standard for heritage, that is inclusive of all other heritage values around the world. The Convention does not define OUV. That task was left to the elected representatives of the Convention's States Parties on the WH Committee. Article 11.5 however states that the definition of OUV will be determined by criteria. The Convention's Operational Guidelines set out these criteria and define OUV as "...cultural and/or natural significance which is so exceptional as to transcend national boundaries and to be of common importance for present and future generations of all humanity. As such, the permanent protection of this heritage is of the highest importance to the international community as a whole....(Op. G., Para 49). The guidelines have developed from 28 paragraphs in 1977 to 290 paragraphs in 2021, seeking to cater for an increasingly plural understanding of heritage values globally, from state to local community level. Despite geopolitical dynamics in decision-making associated with the inscription of properties on the World Heritage List and concerns about credibility and governance, this paper identifies some of the general concepts and technical principles of used in the definition and assessment of OUV that may be usefully integrated into the assessment of archaeological heritage significance at national level.

3 MOUNTAINS OF MEANING. ADDRESSING ARCHAEOLOGICAL SIGNIFICANCE IN AUSTRIA

Picker, Andreas (Federal Monuments Authority Austria)

Within the framework of the EAC's working group on significance, members of the Austrian Federal Monuments Authority have re-evaluated the country's approaches on assessing the significance of archaeological monuments. In doing so, some new criteria of evaluation were explored and the question was raised, whether it is possible to define sites of highest significance in Austria. Case studies range from the lowlands along the Danube to the Alpine mountaintops, and it has become clear that these monuments represent many (metaphorical) layers of meaning that make up their significance.

The Austrian Monument Protection Act (in existence since 1923) emphasizes the constitutive process of expert opinion and assessment. Not the monuments significance alone, but the arguable public interest in its preservation constitutes the protection status legally. The only requirements given by the law are the "significance criteria" (does the monument possess historical, artistic or other cultural meaning?) and the "evaluation criteria" (does the monument contribute to the quantity, diversity and distribution of the country's cultural heritage?).

Arguably, the term used in this context may be understood as the object's "meaning", rather than its "value" or "importance". With full respect for the monuments' (often ambiguous) semantics, we took a closer look at a possible framework for assessment criteria applicable to a larger number of objects. In this paper the possibilities (and short-comings) of such an approach will be explored. Can significance be based on a ranking by evaluation? Is this data even quantifiable? What insights can a relative qualitative analysis reveal?

Even if we assess "mountains of meaning" regarding our sites and monuments, it may be argued that the objects' individuality and diversity are what make them significant.

4 **BACK TO THE FUTURE. RECOGNISING AND ASSESSING THE SIGNIFICANCE OF THE ARCHAEOLOGICAL HERITAGE AT DIFFERENT TIMES**

Makowska, Agnieszka (National Institute of Cultural Heritage (Poland))

Usually, the starting point for assessing anything, including the significance of an archaeological sites, is what it means to the person making the assessment, here and now. The title of the well-known film in the heading announces an attempt to see the archaeological heritage through the eyes of people living in different times - contemporaries, our great-grandparents and not-so-distant descendants. We can only hypothesise what reality will be like in 50 years, what the technical possibilities will be and what will be important to people then. This article aims to show that it is still worth trying. As we are only the custodians of what we have inherited from the past, we need to focus on strategies to preserve more than just a representative sample of the heritage. By noting the differences in the perception of the archaeological heritage in Poland today and 70 years ago, I will try to put forward theses on the needs of future generations. My approach is to consider both the voice of the public and the archaeological community, drawing on the results of recent surveys and archival information. The results of this 'time travel' are intended to support heritage decision making. The key is that such decisions should be based on knowledge gained at a much earlier stage. Therefore, the systematic identification of the archaeological heritage by non-invasive or low-invasive prospection methods is crucial.

5 **MECHANISM FOR LONG TERM PRESERVATION BY INVESTMENT-LED ARCHAEOLOGY IN HUNGARY**

Koller, Melinda (Hungarian National Museum) - Wollák, Katalin (heritage expert)

The process of archaeological site assessment is particularly important in the context of the excavations managed by the investment. The different categories of protection and other legal statuses theoretically ensure the protection and in situ preservation of sites of high importance. However, no new scheduling process has been carried out in the last seven years, despite the fact that the mapping of archaeological potential, which is part of the preliminary archaeological impact assessment required for major projects, may reveal new sites of high archaeological significance worthy of preservation. Avoiding such sites through the investment is only possible with certain compromises.

The contribution presents, through two case studies, the tools used to assess registered (non-protected) important sites and the steps taken to reconcile the values of the different actors in order to achieve long-term preservation.

The first example describes the ranking of thousands of tumuli in Hungary dating from the Copper Age to the Roman period. They stand next to streams, ancient roads, along historical and occasionally still existing borders. These archaeological and natural phenomena, which are often visible in the landscape, are not just grave mounds, but archaeological and historical values that are associated with historical legends, folk traditions, and beliefs. The second example concerns a built heritage feature (medieval church) in a wooded area, not visible on the surface, where a water supply system was to be built. The local community has been involved in the survey and considers it important to preserve the church in situ, which dates to the 14th and 15th centuries. In this case, the long-term conservation objective is to ensure the scientific investigation of the undisturbed site.

6 **MANAGING SIGNIFICANCE IN ENGLISH TOWNS - STAYING, LEAVING AND ARRIVING**

Allen, Tim (Historic England)

In articulating significance as part of designation and planning processes heritage professionals and others with a voice in the system weave assets out of the values people hold for the material world. Significance falls between the diffuse world of socially constructed values and the relative worth asserted communally as importance - significance is where the alchemy happens. In writing about significance, one is drawn to ask whose and which values for place are to be articulated and given precedence in producing a rational and structured text to support public decision making. People leave, people stay, people arrive, archetypes and stereotypes frame how we ascribe sophistication, authenticity and legitimacy to these voices. The ideas of the Italian anthropologist Vito Teti offer an opportunity to place the biographies of a community at the centre in understanding how they construct discourse about heritage and conservation and new development. As Teti observes - home is transformed (perhaps as much) for those who stay-on as for those

who leave or arrive. The towns of the English Midland counties have a rich architectural and archaeological heritage. Through case studies in Midlands town this paper explores how to construct significance that is richer and more attuned to the individually situated experiences and memories of dwelling in a place.

7 **VALUES OF THE ARCHAEOLOGICAL HERITAGE LANDSCAPE IN SWEDEN**

Nelson, Matthew (Linnaeus University)

In this paper I'm looking at how different values of landscape, heritage and contract archaeology relate in what I call the archaeological heritage landscape, using the theoretical concept of critical heritage studies. This is done with the aim of showing how the practice could be used in a more beneficial way for strengthening heritage work and becoming a valuable resource for the wider society. By looking at previous research from an interdisciplinary viewpoint together with conducting a survey directed towards the county administrative boards in Sweden, I analyze the concept and values of contract archaeology and the archaeological heritage landscape to get a better understanding for how multivocal perceptions and evaluations are formed and the underpinning dynamics. I also look for deficiencies in, and forces that impact on, the often-polarized view on contract archaeology in Sweden and how this heritage-making process can compromise diverging views while becoming more relevant for the wider current society. I furthermore argue for improving the awareness among colleagues for the potential beneficial or negative impacts contract archaeology might have on society, both for the values of the archaeological heritage landscape and for cultural and economic effects. I conclude that the view and values of the archaeological heritage landscape must improve recognition of a wider array of subjective values beyond antiquarian and economic perspectives, and instead be more attuned to for instance identity or community interests, together with the understanding that the landscape values are dynamic and always changing.

8 **A CRITICAL ANALYSIS OF THE "ARCHAEOLOGICAL ZONES" DEFINITION PROCESS IN FRANCE: THE ZONES OF PRESUMPTION OF ARCHAEOLOGICAL PRESCRIPTION**

Duval, Mélanie (EDYTEM CNRS USMB) - Gauchon, Christophe (EDYTEM CNRS USMB)

The aim of this paper is to present the first results of a research project that has begun in January 2024 on the construction of a form of zoning specific to France: the zones of presumption of archaeological prescription (les zones de présomptions de prescription archéologique). These zones delimit areas within which, depending on the development projects envisaged, the French State, through the Prefectures and the Regional Archaeological Services, may request a prescription for archaeological diagnosis, which may in return lead to modifications to the development projects.

The objective of this research project is to analyse the factors involved in defining the spatial extent of these zones. To what extent is the definition of these zones the result of the state of knowledge at a given time (archaeological map), other pre-existing protection measures and the stakeholders involved in the zoning process (government departments, INRAP, CNRS, universities, local authority departments, voluntary associations)?

On the basis of initial semi-directive interviews and analysis of the grey literature (administrative documents), it emerges that these types of archaeological zoning are strongly constrained by the areas in which they are located. In return, this analysis of this type of zoning provides information on the way in which the archaeological value attributed to an area, over and above the archaeological characteristics of the site (type of site, period, state of conservation) is a function of territorial contexts and the interplay of multi-scalar stakeholders.

593 **WHITHER EVOLUTIONARY ARCHAEOLOGY?**

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Bortolini, Eugenio (Dept. of Cultural Heritage, University of Bologna, Italy) - Crema, Enrico (Dept. of Archaeology, University of Cambridge, United Kingdom)

Session format: Round table (without formal abstracts)

Since the mid-1980s Cultural Evolutionary Theory (Boyd and Richerson 1985) has ignited and fueled the cross-pollination between biological and social sciences at a global scale, often leading to the emergence of well-established subfields and research agenda. The impact of cultural evolutionary theory on the social sciences has been mixed. On the one hand, it shed light on the variety of social learning processes underpinning change in the frequency of past and present cultural traits, on the diffusion of culture and behaviour over time and space, on the impact of such mechanisms on the differential persistence of subsistence strategies as well as social, economic, and political responses. It helped introduce concepts of uncertainty, data quality, and lack of resolution in archaeological assemblages.

On the other hand, the success of Evolutionary Archaeology (i.e. the application of this framework to the study of material culture and its links to biological, social, demographic, and environmental processes; e.g. Shennan 2008) is nowhere close to what is being achieved by evolutionary anthropology. Although a number of active practitioners exist, its impact on the broader field has not achieved what was initially envisioned. Most archaeologists are simply

not aware of its underlying theoretical framework, and at worst Evolutionary Archaeology is still confused with some modern form of Spencerian social Darwinism. This round table will reflect on why after at least three decades, Evolutionary Archaeology failed to reach its initial goals, whether its primary contribution will be forever limited to the introduction of few theoretical concepts and statistical methods, whether it needs radical rethinking or rebranding, and whether all this matters.

594 "ALL ROADS LEAD TO THE SOUTH", FACING THE EUROPEAN PALAEOOLITHIC FROM THE SOUTH OF THE IBERIAN PENINSULA

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Medina-Alcaide, M^a Ángeles (University of Bordeaux, UMR CNRS 5199 PACEA; University of Cordoba, Department of History, HUM-781) - Bernal Gómez, Marco Antonio ("Paleomagina" Research Centre) - Nabais, Mariana (IPHES-CERCA - Institut Català de Paleoecologia Humana i Evolució Social; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Rodríguez Castro, Eva (University of Cordoba, Department of History)

Session format: Regular session

The south of the Iberian Peninsula has geographical and physical singularities that must not have gone unnoticed by the human groups that inhabited this European region thousands of years ago (wide climatic and landscape biodiversity, extensive coastal strip that combines the Mediterranean and Atlantic slopes, proximity to the African continent, mild climate in adverse periods, etc.). Studies on archaeopaleontological Pleistocene sites in the region are currently proliferating, either through the re-study of known sites or through the discovery of new sites. Together, these are favoring new readings for a comprehensive and updated understanding of Palaeolithic activity in this unique region. In this context, reaching out between southern Portugal and southern Spain, and welcoming other regions of southern Europe with similar characteristics and problems, we propose this session with the aim of increasing and actualizing the knowledge of Palaeolithic settlement in this geographical area.

We welcome oral communications on the following topics related to Palaeolithic sites in Southern Europe, in particular in the South of the Iberian Peninsula:

- Re-study of classical sites, through interdisciplinarity and new technologies.
- New sites and recent discoveries, looking beyond the tip of the iceberg.
- Regional identity? Readings beyond a position of marginal periphery.

ABSTRACTS

1 BARRANCO LEÓN, A 1.4 MA HUMAN GATHERING SPOT IN SOUTHERN EUROPE

Solano García, José (University of Granada) - Yravedra, José (Universidad Complutense de Madrid) - Tilton, Stefania (Institut Català de Paleoecologia Humana i Evolució Social) - Sánchez-Bandera, Christian (Institut Català de Paleoecologia Humana i Evolució Social) - Ochando, Juan (Universidad de Murcia) - Serrano, Alexia (Universidad de Granada) - Herránz, Darío (Universidad de Granada) - González-Quñones, Juan (Universidad de Granada) - Barsky, Deborah (Institut Català de Paleoecologia Humana i Evolució Social) - Jiménez-Arenas, Juan (Universidad de Granada)

Barranco León (Guadix-Baza basin, Spain) is a key archaeological site for the knowledge of the first inhabitants of Southwest Eurasia during the Early Pleistocene. It has not only yielded a deciduous lower hominid molar but also boasts an exceptionally rich collection of faunal and lithic remains and a fertile palynological record. Recent research has led to the development of new interpretative models regarding the formation of the site, the behaviour of hominins and carnivores, and the reconstruction of a new climatic and environmental framework for the Guadix-Baza basin.

Our studies point to a typically Mediterranean climate, albeit slightly warmer, specifically in winter, and more humid, in a lakeside margin area where we have discerned different instances of activity, both primary and secondary. The convergence and recurrence of agents and biological activity suggest that we are dealing with a hotspot for resource provisioning for different biotic agents, among which hominins and canids (*Canis mosbachensis*) played a prominent role.

Until recently, it was believed that humans had a much more passive and dependent behaviour, relying on external agents such as large carnivores in a hostile environment, where they would make quick incursions to obtain resources. However, our results suggest a much more complex scenario of interaction and flexibility with the environment, with more organized and multifunctional groups. Humans played a more important role than previously thought.

2 REVISITING THE ACHEULEAN OCCUPATIONS OF VALE DO FORNO (LOWER TAGUS, ALPIARÇA, PORTUGAL)

Ferreira, Carlos (UNIARQ - Centre for Archaeology of the University of Lisbon) - Raposo, Luís (ICOM - International Council of Museums) - Cunha-Ribeiro, João Pedro (UNIARQ - Centre for Archaeology of the University of Lisbon) - Méndez-Quintas, Eduardo (GEAAT - Grupo de Estudos de Arqueología, Antigüidade e Território, University of Vigo; UNIARQ - Centre for Archaeology of the University of Lisbon)

Fluvial archives play a crucial role in comprehending human behaviour in the Iberian Peninsula during the Middle Pleistocene and, specifically, in discussing the technological and chronological trends of the Iberian Acheulean techno-complex. In the Iberian Atlantic Margin, work carried out during the 1940s by Georges Zbysewski and Henri Breuil in the Lower Tagus Valley led to the identification of several Acheulean archaeological horizons. Amongst the areas surveyed by these researchers, Vale do Forno, located near Alpiarça (Santarém, Portugal), stood out for having a significant concentration of Acheulean assemblages in a rich stratigraphic section that quickly became a key reference in subsequent research. After these earlier reports, the study of the Acheulean occupations of Vale do Forno entered a new stage in the last two decades of the 20th century, as a result of archaeological research directed by Luís Raposo. Specifically, this led to the identification and excavation of three main sites - Vale do Forno 1, 3 and 8 - chronologically framed between MIS 9-6, that became classical references of the Acheulean techno-complex in the current Portuguese territory and were proposed (based on typological assumptions) to reflect an evolutionary trend within the Iberian Acheulean.

Since 2021, initially as part of a master's thesis and now in the framework of a PhD project, we have been conducting a systematic revision of Vale do Forno Acheulean sites, based on new theoretical and methodological assumptions in line with current trends in the characterisation of Acheulean assemblages. In this work, we present updated data concerning the above-mentioned sites, discussing the evolutionary perspective previously suggested, and highlighting the potential of this classical area of Portuguese archaeology for studying the human occupations of the second half of the Middle Pleistocene in the westernmost part of Europe.

3 THE LAST ACHEULEANS OF WESTERN IBERIA: THE ARCHAEOLOGICAL SITE OF ENTRADA DO VALE DA SERRA (ALMONDA KARST SYSTEM, PORTUGAL)

Varanda, Alexandre (UNIARQ) - Souto, Pedro (Paleoalmonda) - Rodrigues, Filipa (UNIARQ; Municipio de Torres Novas) - Zilhão, João (UNIARQ) - Deschamps, Marianne (TRACES - CNRS 5608; UNIARQ)

For a long time, the study of the Iberian Acheulean was constrained by the sites' lack of reliable dating. However, during the last decade, the number of age measurements available for Acheulean sites has grown considerably. We now know that the technocomplex minimally spans the MIS 12 to MIS 6 interval. The Entrada do Vale da Serra is one such dated site: it belongs in the last stage of the regional Acheulean.

Located deep inside the underground course of the Almonda river, the site was discovered in 1989 and the finds were collected in the course of fieldwork conducted between 1989 and 1991. The site consists of an enormous éboulis cone and the associated, fluviially remobilized deposits. The sedimentary accumulation results from the collapse of a sinkhole via a shaft that once connected the river with the ground surface, ca. 50 m above. Dating of animal bone retrieved on the éboulis cone shows that cluttering-up of the shaft occurred sometime after 30,000 BP.

The lithic assemblage includes handaxes and the fauna includes a molar fragment of *Elephas antiquus*. Assignment of the assemblage to the Acheulean is supported by the U-series dating of associated horse teeth to between 170,000 and 136,000 years ago, among the latest occurrences of the technocomplex in the Iberian Peninsula.

Despite a bad surface and edges preservation and small missing items, due to the fluvial context of the finds, the lithic assemblage (including several handaxes, cores and flakes) is homogenous and its composition is giving an interesting overview of the MIS 6's last Acheulean's technological background in the southwestern Atlantic fringe of Europe.

4 NEANDERTHAL OCCUPATION IN LA SIMA CAVE (SEVILLE, SPAIN): GEOARCHAEOLOGICAL INTERPRETATION THROUGH PHYSICAL-CHEMICAL ANALYSIS OF SEDIMENT

Medina Luque, Eusebio Jesús (Universidad de Córdoba) - Caro Gómez, José Antonio (Universidad de Córdoba) - Álvarez García, Genaro (Sociedad Espeleológica Geos (Exploraciones e Investigaciones Subterráneas)) - Recio Espejo, José Manuel (Universidad de Córdoba) - Borja Barrera, César (Universidad de Sevilla) - Díaz del Olmo, Fernando (Universidad de Sevilla) - Riquelme Cantal, José Antonio (Universidad de Córdoba) - Garrido Anguita, Juan Manuel (Universidad de Córdoba) - Cañete Gómez, Marta (Universidad de Córdoba)

The physico-chemical analysis of a sedimentary profile in the La Sima cave (Constantina, Seville, Spain) is carried out. The results reinforce its usefulness in geoarchaeological studies and support findings from previous archaeological research, since parameters such loss on ignition, phosphorus and magnetic susceptibility reveal the degree of

anthropization in karst environments. On the other hand, pH (H₂O), granulometry, total carbonates and electrical conductivity offer valuable information about the natural processes occurring within the karstic environment.

The stratigraphy of the site is composed of 6 geoarchaeological units (GU) with a thickness of 4m. GU.1 and GU.2 represent a modern phase of spoliation, GU.3 a natural fill, while GU.4 and GU.5 exhibit numerous Mousterian lithic industries, faunal remains and evidence of ephemeral burning structures, dated to the Upper Pleistocene (ca. 45 ka). Finally, GU.6 shows evidence of alternating use either as a hyena den or as a short-term human habitat.

It is concluded that the sequence in the stratigraphic fill follows a uniform trend in most of the parameters analysed. However, alterations are observed at the base of GU.4 and GU.5, interpreted as indicative of a phase of stability in the natural dynamics of the cave, favouring occupation by Neanderthal human groups.

Within UGA.5, which hosts Middle Palaeolithic hearths and other archaeological artefacts, increases in parameters such as loss on ignition (4,33%), phosphorus (23,6 P₂O₅ mg/100g) and magnetic susceptibility (9067 X 10⁻⁹ m³/kg), high values influenced by anthropogenic actions, are recorded.

5 CURRENT WORK AND RESEARCH DIRECTIONS ON THE EARLY UPPER PALAEOLITHIC SITE OF COVA FORADADA (XÀBIA, ALICANTE, SPAIN)

Fernández-López de Pablo, Javier (I.U. I en Arqueologia y Patrimonio Histórico (INAPH), University of Alicante) - Casabó i Bernad, Josep (Generalitat Valenciana) - Gómez-Puche, Magdalena (I.U. I en Arqueologia y Patrimonio Histórico (INAPH), University of Alicante) - Mayor Benadero, Alejandro (I.U. I en Arqueologia y Patrimonio Histórico (INAPH), University of Alicante) - Montero-Buch, Oriol (I.U. I en Arqueologia y Patrimonio Histórico (INAPH), University of Alicante) - Moya Ruiz, Raquel (I.U. I en Arqueologia y Patrimonio Histórico (INAPH), University of Alicante) - Romero, Alejandro (Rameta)

Over the past decade, the chronology of human dispersals South to the Ebro Valley and subsequent population dynamics during the Early Upper Palaeolithic (EUP) have been subject of an intense debate. This paper introduces on-going work on a classic Early Upper Palaeolithic (EUP) site, Cova Foradada cave (Xàbia, Alicante, Spain), excavated by Josep Casabó from 1992 to 2003. Our research aims to create a multi-proxy record of high chronological resolution for this important site. The first phase of this project involves the revision of old excavations to better understand site formation processes as well as the chronological boundaries and cultural taxonomy of the EUP occupations. Particularly, this translates to (i) the archaeostratigraphic analysis of archaeological features and lithic artifacts; (ii) the definition of raw material units for conducting and lithic taphonomic studies intra-site spatial analysis; and (iii) the revision of the chronostratigraphic sequence based on an updated AMS radiocarbon dating program.

We expect our work will improve our current understanding on EUP cultural and population dynamics in the Central Mediterranean region of Iberia and beyond, allowing a better synchronization between archaeological and paleoclimate proxies.

6 RETHINKING LAMINAR KNAPPING DURING THE EARLY UPPER PALAEOLITHIC IN THE CENTRAL IBERIAN MEDITERRANEAN BASIN

Martínez-Alfaro, Álvaro (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Vadillo Conesa, Margarita (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Bel, Miguel Ángel (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; UNIARQ-Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras de Lisboa, Universidade de Lisboa) - Sanchis, Alfred (Museu de Prehistòria de València, Servei d'Investigació Prehistòrica, Diputació de València) - Villaverde, Valentín (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Eixea, Aleix (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

Aurignacian and Gravettian sites in the Valencian region have been the subject of re-evaluation and new fieldwork in recent years. Over and beyond the question of the timing of the start of the Upper Palaeolithic in central and southern Iberia, the features of the lithic techno-typology have been precisely defined. These reveal differences in regional trajectory and a common substrate in relation to other areas like northern Iberia or the Aquitaine Basin.

The laminar knapping process is defined by various methods, the main schemes being determined from prismatic and carinated cores. Moreover, the bipolar knapping is present in numerous sites with different frequencies, and is consistently seen across time. The bipolar method has long been considered expeditious and opportunistic, but it may reveal an adaptation to local raw materials to obtain blanks with specific morphometric characteristics. In this regard, we focus the study on bipolar laminar cores, blanks and anvils. The main objective is to define a reduction method often not identified in the assemblages or confused with pieces used with a bipolar dynamic. We present an approach that combines data from technological analysis, experimentation and use-wear analysis from Cova Foradada (Oliva, Valencia). The first archaeological activities date back to 1975 and 2013, and in 2023 we began a new fieldwork phase. Here, we present the results from the latest field seasons including a review of the previous assemblages. In the same way, we have considered other key regional sequences such as Cova de les Malladetes (Barx, Valencia), Cova de les

Cendres (Teulada-Moraira, Alicante) and Abric de la Ratlla del Bubo (Crevillent, Alicante). All this will allow us to establish a characterisation of the laminar technology during the Early Upper Palaeolithic in the Valencian region.

7 LITHIC TECHNOLOGICAL VARIABILITY DURING THE EARLY-UPPER PALAEOLITHIC IN SOUTHERN IBERIAN PENINSULA: THE CASE OF LA BOJA ROCKSHELTER (MURCIA, SPAIN)

Gomes, Luís (UNIARQ - Centro de Arqueologia da Universidade de Lisboa; Paleoalmonda - Associação de Estudos Científicos)

La Boja rockshelter is an archaeological site in the Rambla Perea valley, part of the Mula river basin. It preserves a 6m thick deposit encompassing dozens of Middle and Upper Palaeolithic occupation surfaces defined by a high density of knapped flints associated with hearths. The 1.5m thick pre-Solutrean Upper Palaeolithic sequence (levels OH20/IL4-OH12a) revealed over eleven occupation events ranging from the Evolved Aurignacian to the Late Gravettian. The chronometric data derived from this sequence, one that yielded the earliest unambiguous dates for the Aurignacian (37.5 kyr cal BP) and Gravettian (31.0 kyr cal BP) technocomplexes in southeastern Spain, is coherent with the typologically diagnostic lithic remains. This factor sustains the high integrity of the deposit and calibrates the on-site occupation sequencing, making La Boja a key-site for understanding the Early Upper Palaeolithic (EUP) techno-typological variability in Southeastern Spain and elsewhere in the Iberian Peninsula.

With the purpose of contributing to the discussion of the regional and supra-regional EUP technological variability and historical transformation of the lithic systems, we aimed at reconstructing the chaînes-opératoires at each occupation level of La Boja's EUP sequence through a techno-typological and taphonomical analysis aided by systematic lithic refitting. The results reflect major differences in lithic reduction systems between different techno-cultural phases, corroborating the techno-cultural occupation sequence originally proposed. Furthermore, distinct, functionally complementary lithic reduction sequences were identified within most of the occupation phases (often corresponding to potentially contemporaneous activity loci), which furthers our understanding of the variability of on-site knapping activities and lithic resource management. Finally, both the technological and typological analysis agree with the hypothesis of a progressive transition between the EUP technocomplexes, sustaining a local, slow-paced transition, in line to what has been proposed for other regions of southwestern Europe.

8 THE GRAVETTIAN OCCUPATION OF THE CUEVA DEL ARCO (MURCIA, SPAIN) THROUGH LITHIC TECHNOLOGY AND COPROLITE ANALYSIS

Sánchez Martínez, Noelia (University of Murcia, Prehistory Area) - Ochando, Juan (Department of Plant Biology (Botany Area), Faculty of Biology, University of Murcia; Sapienza University of Rome, Department of Environmental Biology) - Carrión, José S. (Department of Plant Biology (Botany Area), Faculty of Biology, University of Murcia) - Martín-Lerma, Ignacio (University of Murcia, Prehistory Area) - Román, Dídac (University Jaume I de Castelló)

The Cueva del Arco (Cieza, Murcia) is a site where several occupations belonging to the Upper Pleistocene and early Holocene have been located. The remains from the Early Gravettian period are particularly interesting, including a group of lithic tools and five coprolites. In this paper we will focus on the results obtained after the technological study of the lithic industry and the palynological analysis of the coprolites, as well as the initial interpretation of the site.

We have analysed 681 lithic pieces, through which we have been able to make a first approximation to the management of the raw materials, as well as to determine the main objective, development, methods and techniques of the knapping. We have also analysed the preparation and morphology of the cores, the conditioning techniques and the characteristics of the pieces extracted. This information has made it possible to study the operational chain in depth.

The analysis of the coprolites has allowed us to extend the information on the plant context in the environment. There is a notable diversity of tree species, accompanied by shrubs and grasses, with an abundant representation of mainly Mediterranean taxa and xerothermophytes. It has been possible to reconstruct the palaeoecological environment of the site, with the presence of steppes or open areas, accompanied by coniferous forests (mainly Pinus and Juniperus). Furthermore, the species identified indicate that the climatic conditions at the time were not excessively severe.

With the presentation of these results, we can learn more about the Gravettian occupation of the Cueva del Arco and the palaeoenvironment in which its inhabitants lived. It also allows us to place it in the context of the southeast of the Iberian Peninsula, making it possible to establish comparisons with contemporary sites in terms of adaptation to the environment and management of lithic resources.

9 LITHIC TECHNOLOGY AT THE END OF UPPER PALAEOLITHIC: CUEVA DE NERJA (MARO-NERJA, MÁLAGA, SPAIN)

Vadillo Conesa, Margarita (Universitat de València) - Aura Tortosa, J.Emili (Universitat de València)

Cueva de Nerja is a coastal site located in the south-east of the Iberian Peninsula (Maro-Nerja, Málaga, Spain). It is a large cave in which rich archaeological deposits are preserved in its external chambers: Vestibule, Mine and Torca

chambers. The calibrated 14C datings of the three chambers place the stratigraphic sequence of Cueva de Nerja between the end of the upper Pleistocene and the middle Holocene, from 30 to 3.5 ka cal BP, covering recent moments of the Pleniglacial, much of the Late Glacial (GS 3, GS 2, GI 1 and GS 1) and the Holocene (Jordá Pardo & Aura Tortosa, 2006, 2008, 2009; Aura Tortosa & Jordá Pardo, 2014). The data used in this study resulted from the project led by prof. F. Jordá Cerdá (Universidad de Salamanca) between 1979 and 1987 on the Epipalaeolithic occupations of the Vestibule chamber, layer NV4.

Between the end of the Pleistocene and the beginning of the Holocene, no major changes have been observed in the objectives of the productions, being the bladelets the supports on which mainly backed pieces will be configured. The application of the technological reading in sites of similar chronology in other regions, such as that in the central area of the Iberian Mediterranean region (Vadillo & Aura, 2020), indicates that this perspective allows us to appreciate changes that are not so evident at the typological level. The objectives of the review of the lithic assemblage associated with these moments is to obtain information on the technologies developed by the southern Iberia palaeolithic-epipalaeolithic groups. The scarce regional data available on this aspect make this study relevant.

10 THE PORTILLO CAVE, A NEW MAGDALENIAN ARCHAEOLOGICAL SITE IN THE HIGH GUADALQUIVIR (BEDMAR, JAÉN)

Bernal, Marco (Centro Paleomágina)

The Portillo Cave is a new site of Magdalenian occupation that provides new information on the last groups of hunter-gatherers of the late Upper Palaeolithic inland of the southern peninsular. The site can be interpreted as a bivouac, a place of sporadic occupation, frequented as a refuge and oriented towards a high mountain hunting economy, where the hunter-gatherer groups left a record of their domestic and economic activities at different times of recurrent seasonal occupation.

The lithic assemblages they produced were oriented towards hunting, due to the presence of points and backed bladelets used as projectiles, and end scrapers for working meat, skin and wood. The fauna brought into the cave in the greatest proportion was ibex and rabbit, with the presence of a high level of fracturing and signs of rubefaction. The cave space was structured by hearths and an abundance of lithic and faunal remains were documented around them. These hearths occupied the central place in the cave, where groups of Magdalenian hunters and gatherers sat down to carry out their domestic and social activities. With the presence of marine malacofauna species, we can interpret that these communities either came from the coast on a seasonal basis or exchanged inland products for marine products with the coastal communities somewhere between the inland and the coast. They handled and used ochre, they had different types of ornaments.

The climate in which the groups or bands that occupied the Portillo Cave lived corresponded to a Mediterranean climate according to anthracological and zooarchaeological studies.

In short, the Portillo Cave has become one more piece of information in the mosaic that is gradually being formed of the last groups of Magdalenian hunter-gatherers from the late Upper Palaeolithic inland of the southern peninsular.

11 NAVARRO CAVE (MALAGA, SPAIN): AN EXCEPTIONAL SITE WITH PALAEOLOGICAL ART IN SOUTH OF IBERIAN PENINSULA

Medina-Alcaide, M^a Ángeles (Université de Bordeaux - PACEA UMR 5199) - Ferrier, Catherine (Université de Bordeaux - PACEA UMR 5199) - Torres, Antonio (University of Cantabria - IIIIPC) - Rodríguez, Eva (University of Cordoba, Department of History (Prehistory section)) - Intxaurbe, Iñaki (Department of Geology, UPV/EHU) - Arriolabengoa, Martin (Department of Geology, UPV/EHU) - Romero, Antonio J. (University of Basque Country (UPV/EHU)) - López, Antonio (LabCertis company) - Garate, Diego (University of Cantabria - IIIIPC) - Sanchidrián, José Luis (University of Cordoba, Department of History (Prehistory section))

The Navarro Cave (Malaga, Spain) is one of the best-preserved caves with Palaeolithic Art in the Iberian Peninsula and southern Europe. Despite this, it is still largely unknown to the general public and to the scientific community. A yellow aurochs, with Gravettian and Solutrean techno-stylistic conventions, clouds of dots, strokes and other simple signs in red and black, decorate a small room today full of whimsical eccentric and fistulous stalagmites. In 2023, we have initiated an interdisciplinary project for the comprehensive re-study and its virtual dissemination. In the framework of 30th EAA Annual Meeting - Rome, Italy we will present the first results of this subterranean scientific activity. In particular, this includes a geomorphological and topographical approach, that it has characterize an origin of the cave as "Flank-margin-cave", as well as different anthropic modifications of subterranean spaces (fractures, speleothems movements and structures). Besides, we will present the results of the survey made below the main rock art panel, together with hundreds of combustion and lighting remains located in surface or semi surface in the paleo floor, and new C14-AMS dating, among others available interdisciplinary analysis of this exceptional prehistoric subterranean context (microsedimentology, anthracology, SIG, etc.). All this will be evaluated within the geographical, palaeoenvironmental and chrono-cultural particularities of the southernmost part of Europe in the Iberian Peninsula.

12 ARCHAEOLOGICAL DISCOVERIES IN NERJA CAVE: NEW PALAEOLOGICAL ROCK ART AND INTERDISCIPLINARY STUDY OF THE INTERNAL-ARCHAEOLOGICAL-CONTEXT

Rodríguez Castro, Eva (Universidad de Córdoba, Department of History (Prehistory section)) - Medina Alcaide, M^a Ángeles (Université de Bordeaux - PACEA UMR 5199) - Torres Riesgo, Antonio J. (University of Cantabria - IIIIPC) - López, Antonio (LabCertis company) - Vandeveld, Ségolène (Université Paris-Saclay - Laboratoire des Sciences du Climat et de L'Environnement, LSCE/IPSL, CEA-CNRS-UVSQ) - Pons-Branchu, Edwidge (Université Paris-Saclay - Laboratoire des Sciences du Climat et de L'Environnement, LSCE/IPSL, CEA-CNRS-UVSQ) - Valladas, Hélène (Université Paris-Saclay - Laboratoire des Sciences du Climat et de L'Environnement, LSCE/IPSL, CEA-CNRS-UVSQ) - Sanchidrián Torti, José Luis (Universidad de Córdoba, Department of History (Prehistory section))

The Nerja Cave (Málaga, Spain) is one of the reference sites in the South Iberian Peninsula for studying Upper Palaeolithic societies. In the rooms closest to the exterior, there is an extensive and widely known archaeological deposit with remains dating between the Gravettian and the Copper Age. The cave also has an outstanding collection of prehistoric art, with parietal graphic representations from different stages of the Upper Palaeolithic and Holocene chronologies. In recent years and within the framework of the current General Research Project, we are especially focusing on the study of the so-called "Internal-Archaeological-Context" through an innovative and interdisciplinary approach, as well as developing a re-reading of the rock art based on new methods. At the 30th Annual Meeting of the EAA in Rome, Italy, we present the latest advances of this project, including new units of figurative Palaeolithic art, the expansion of the prehistoric cave occupation through Bayesian analysis of C14-AMS dating of remains associated with different cave lightning systems, the study of the visit recurrence via interdisciplinary analysis of soot levels present in stalagmites, among other aspects regarding the symbolic Palaeolithic activity in this underground environment.

13 THE FUTURE OF THE PAST: SCIENTIFIC VIRTUAL REALITY FOR PALEOLITHIC ROCK ART EXPERIENCE IN THE SOUTH OF THE IBERIAN PENINSULA

Torres Riesgo, Antonio (University of Cantabria) - Garate, Diego (University of Cantabria) - Medina-Alcaide, María (University of Bordeaux; UMR CNRS 5199 PACEA) - Sanchidrián, José (University of Córdoba) - Intxaurbe, Iñaki (University of the Basque Country) - Arriolabengoa, Martin (University of the Basque Country) - Liñán, Cristina (University of Málaga; Nerja Cave Foundation)

The Nerja and Navarro Caves (South of the Iberian Peninsula) have been used to carry out a scientific virtual reconstruction of the contexts of Paleolithic rock art creation within the framework of the project "Scientific virtual reality for the study and dissemination of the scenarios of artistic creation in Palaeolithic caves (RealCaveART)," led by D. Garate.

This type of reconstruction begins with a high-resolution 3D virtualization using Structure from Motion and laser scanning. The resulting 3D models are modified based on existing scientific knowledge to approximate historical reality as closely as possible. Thus, the geomorphological alterations of the cavity have been taken into account, and modern anthropic alterations have been removed. Additionally, the lighting conditions for the creation and/or frequentation of rock art have been recreated based on the analysis of the Internal Archaeological Context, anthracological studies, and an experimental program on lighting systems used during the Upper Paleolithic.

The inclusion of these modified 3D models and the creation of an interactive space in the Unreal Engine 5 graphics engine allow for the creation of digital environments that faithfully reconstruct the cave as it was at a specific moment in the past based on available scientific data, thus achieving an immersive and multisensory real-time experience.

As a result, we have developed a highly versatile tool as a support and means of disseminating the most up-to-date scientific information, which also serves for the generation of historical knowledge by allowing researchers to observe firsthand and collectively the current state of scientific knowledge of a rock art site.

595 THE LIVING HERITAGE: ARCHAEOLOGICAL CULTURAL ROUTES IN THE CONTEXT OF CULTURAL TOURISM NETWORKS

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Rakvin, Marta (University of Zagreb Faculty of Humanities and Social Sciences; Iron Age Danube Route Association) - Balen, Jacqueline (Archaeological Museum in Zagreb; Iron Age Danube Route Association) - Vougioukas, Manos (Pafos Regional Board of Tourism; European Cultural Tourism Network (ECTN))

Session format: Regular session

Archaeological heritage hides a huge potential for the development of cultural tourism. Managed in the right way, it can be transformed into a sustainable cultural resource capable of creating added value to the communities which live in its vicinity. However, successful incorporation of archaeological heritage into cultural tourism flows is hindered

by a number of obstacles. Although they are highly specific to every region and site in question, the usual common denominator that binds them is the inability to achieve long term sustainability on a local level. Practice has shown that cultural heritage monuments are often not the only reason why tourists visit a certain location. Therefore, it is important to fit archaeological heritage into the broader tourist experience that a certain region provides and to develop necessary infrastructure that visitors might need. In order to do so, strategic coordination, as well as the development of strong network of compatible partners and stakeholders from complementary fields is needed on local, national and transnational level. One of the more successful approaches of joining cultural heritage, local communities, cultural tourism and sustainable heritage management are the cultural routes, particularly cultural routes operating under the aegis of the Council of Europe.

This session looks to address various ways in which archaeological cultural routes can build, or take part in, strong long-term partner and stakeholder networks, develop tools and approaches capable of creating sustainable cultural tourism products, as well as the issues that arise from undertaking these tasks. The session aims to bring together experts from various fields and disciplines, dedicated to presentation and promotion of archaeological heritage and those dealing with sustainable cultural tourism development, to discuss theoretical models, approaches and examples of good practices in developing new cultural tourism products based on archaeological heritage and creating added value for local communities.

ABSTRACTS

1 DUST OFF THE PAST - REVITALIZING ROMAN HERITAGE

Abonyi, Zsanett (Budapesti Történeti Múzeum/ Budapest History Museum)

The archaeological park of the Aquincum Museum covers almost 7 hectares, but there are many other Roman remains to be found along the Danube near Budapest. Despite its size and age, the institution is located in a less touristic area of the city, which is perceived as a remote and inaccessible place. In order to create a coherent picture of the Roman heritage of ours for foreign and domestic tourists, and even local residents, the museum offers a wide range of programmes, from full-day bus tours across the city to huge cultural festivals among the ruins of Aquincum.

The primary audience for archaeological sites nowadays is families, but their needs have changed. With rare exceptions, there is a desire to be entertained and relaxed rather than to learn. These groups have little needs for lengthy explanations; they want more action in a shorter amount of time with significantly less energy involved. The Aquincum Museum has the same problem as Roman archaeological parks in general, namely that its visitors find it difficult to make sense of the wall remains and the labyrinthine ruins and they refuse to accept having to figure out what they are supposed to see from the stone pits on their own. So, when we want to put together a tourist or cultural offer, one of our challenges is to include the fact that Aquincum is much more than ruins, although this is not an easy task.

The mission of our museum is to present the heritage that has been handed down to us in an experiential way, while interpreting the past without giving up authenticity. This is how we can build a working cultural tourism product closely linked to the archaeological heritage that creates value and connectivity for communities.

2 IN SEARCH OF THE MODEL FOR SUSTAINABLE DEVELOPMENT AND MANAGEMENT OF ROMAN BONONIA - THE CULTURAL HERITAGE IN MODERN VIDIN

Dimitrov, Zdravko (National Archaeological Institute with Museum)

Vidin is one of the most beautiful towns along the Danube. All cruise routes on the river pass here, from Germany to the mouth. The city has a huge cultural and historical heritage. The tourist flow is serious and almost continuous. But the most important emphasis for the development of the modern city is the proper management of cultural heritage monuments.

Vidin was built on the ruins of Roman Bononia, medieval Bulgarian Bdin (capital of Vidin Kingdom) and Ottoman fortress.

For 10 years now, Roman Bononia has been studied under a special work program, through regular archaeological excavations, supported by the Municipality of Vidin. Over 100 meters and two huge towers of the fortification have been uncovered. Excavations are planned for the entire northern wall of Bononia with the aim of a future archaeological park here to join the touristic Baba Vida Castle and nowadays riverside park.

That is why the aim of the proposed paper is to look for ways of stable development of the revealed cultural values after the excavations have been carried out. We would like to discuss with new partners from European countries what successful practices and approaches could be used. Certainly, the potential of the archaeological monuments from as many as three eras in Vidin (antiquity, medieval and Ottoman) are among the best.

It is extremely important the newly discovered archaeological heritage to be carefully directed to new life within the modern city.

The useful experience of similar cases from other European cities rich in cultural heritage can and should be used. Revitalizing archeology in modern urban environment is challenge. That is why the discussions and exchange of experience are of utmost importance for the future correct and sustainable management of the archaeological monuments, which will have strong effect on the development of modern Vidin.

3 CHALLENGES IN DEVELOPING UNDERWATER ARCHAEOLOGICAL HERITAGE INTO TOURISM PRODUCTS IN THE BALTIC SEA COUNTRIES

Roio, Maili (Muinsuskaitseamet)

The potential of archaeological heritage for the development of tourist attractions is great in Sea countries, it remains underrated. Often, the challenge lies in the perception of tourism developers who consider archaeology unattractive, focusing instead on other directions. However, local communities and museums show significant interest in developing archaeological attractions. Over the past decade, the Estonian National Heritage Board has actively participated in and initiated several international projects aiming to develop tourism related to underwater archaeological heritage in the Baltic Sea region. While the development of archaeological trails poses a challenge, the tourism development of underwater archaeological heritage requires even greater consistency and dedication.

In this presentation, I will share our experiences and challenges in developing archaeological tourism based on two examples. Firstly, in the northern part of the Baltic Sea, the development of historic shipwrecks as tourism attractions within the framework of two international projects. Secondly, the utilization of Stone Age settlements submerged in Lake Peipsi in collaboration with the local community to enhance the region's attractiveness. Archaeological findings have added approximately 8000 years to the local settlement history, deserving thorough presentation and interpretation. This also contributes to new knowledge about the formation of the Peipsi paleolandscapes and the entire historical background of the northern coast of Peipsi. This is valuable material that has been little introduced, published, and exhibited, and it has been underutilized for heritage tourism development.

4 DEBUNKING THE DA VINCI CODE: FINDING A BALANCE BETWEEN FACT AND FICTION AT HERITAGE SITES

Rinehart Macrae, Grace (University College Dublin; The Humanities Guild)

The Aude region in southwestern France is a battleground between medieval heretics, and modern tourists. Popular literature has only added to the issue, and now with the rise of social media and the ease of spreading misinformation, the heritage and history of the region has become muddled with fiction and hoax. This has caused damage to the built heritage and archaeology of the region, and led to a rise in conspiracy theorists and esoteric pseudoscientists claiming the history and archaeology for their own purposes. Since the publication of pieces like Holy Blood, Holy Grail and the Da Vinci Code, the line between fact and fiction has grown thin in spite of increased academic effort in putting forth historical and archaeological works. In 1965, excavations in the commune of Rennes-le-Château, the village which produced the original legend from which these fictions draw their fact, were banned. This stemmed from the multitude of treasure hunters who believed there were great stores of gold and riches to be discovered. Some of the most extreme acts of destruction involved breaking a church altar, and disrupting graves. Now modern day visitors come for the legends and romanticised versions of the Cathars and the Holy Grail, mixing myths and the history of a brutal genocide with esoteric assumptions, making it difficult for casual observers to tell fact from fiction. I seek to discuss the difficulty in presenting history to an audience to compete with myth, the challenge in deciphering a history riddled with fiction and conspiracy when traditional archaeology is banned, and our role as archaeologists in debunking these conspiracy theories.

5 APPLICATIONS OF VIRTUAL REALITY IN ARCHAEOLOGY AND CULTURAL HERITAGE

Vasilyan, Viktorya (Institute of Archaeology and Ethnography NAS RA; American University of Armenia)

In the last two decades, the use of digital technologies in the study, management and use of cultural heritage has reached enormous proportions, which in turn has led to the formation of a new interdisciplinary discipline, "virtual archaeology". "Virtual archaeology" is today considered one of the most promising scientific directions of the common European scientific and educational area. The purpose of this project is to introduce this new scientific direction in Armenia through the introduction of the latest methods and tools, the creation of a new research unit / center or laboratory / for the study of historical and cultural heritage, museumization, popularization, management and, especially, for touristic purposes.

In the context of the current geopolitical changes, we think it is important to emphasize how the virtual reality database can save the archaeological heritage. Just considering the wars and earthquakes that destroy our cultural heritage that has stood for millennia. On July 14, 2021, the American University of Armenia (AUA) signed a memorandum with the Institute of Archaeology and Ethnography of the National Academy of Sciences of Armenia. This project

began on the basis of a new archaeological and ethnographic project initiated by the late Professor Grigory Areshian. This project was designed to collect aerial images (drone and 3D orthophotos) of 100 archaeological sites in Armenia and create a comprehensive online database, which would include an accurate scientific description of the sites, as well as aerial videos, animations, virtual reconstructions, maps, photographs of the monuments (<https://ama100.am/en>). The project was implemented by specialists of Archaeology and Ethnography of the National Academy of Sciences of the Republic of Armenia. The project manager is the head of Scientific Organizational Department at the Institute of Archaeology and Ethnography, AUA lecturer, Ph.D. Viktorya Vasilyan.

6 NEW SKILLS FOR NEW TIMES: ARCHAEOLOGICAL HERITAGE PRESENTATION CHALLENGES IN LIGHT OF THE USE OF NEW TECHNOLOGIES

Rakvin, Marta (Iron Age Danube Route Association; University of Zagreb Faculty of Humanities and Social Sciences) - Balen, Jacqueline (Archaeological Museum in Zagreb; Iron Age Danube Route Association) - Šćukanec Reznicek, Porin (Iron Age Danube Route Association; Archaeological Museum in Zagreb)

During recent years we have witnessed an increase of new cultural heritage reconstructions and presentations using digital technologies (such virtual and augmented reality, different gamification tools...etc). These are particularly beneficial for archaeological heritage reconstructions and presentations, where they are often used for reuniting archaeological contexts (finds with sites and landscapes), with impressive and immersive effects for the visitors. In this way, new technologies are vital for creating new engaging and effective ways of awareness-raising and promotion of cultural heritage of a region, with the long-term consequences of attracting more visitors and creating added value to the local communities by integrating it into wider cultural tourism flows.

However, the development processes of such reconstructions and presentations are not always an easy task, as they involve close collaboration between experts stemming from very different backgrounds. As they are not proficient in the use of tools needed to keep pace with the constantly changing and competitive market, heritage experts often lack digital and transversal skills, especially in the field of technological innovation.

In this paper, we will tackle some of the most common challenges archaeological heritage professionals are dealing with in different stages of reconstructions and presentations development based on the experiences gathered in the Virtual Archaeological eLandscapes project.

In addition, we will present possible approaches to finding common solutions through the example of the Next Routes project partnership consisting of cultural routes of the Council of Europe. The project's objective is to upskill digital competencies of the cultural routes' staff through the implementation of an innovative toolkit based on gamification elements and to provide cultural routes with gamified solutions to improve their visibility in an engaging and effective way.

7 HERITAGE UTOPIAS? A CASE STUDY OF SUSTAINABLE CULTURAL ROUTE DEVELOPMENT IN NORTHERN NORWAY

Bentsen, Silje (Nordland County Council; University of the Witwatersrand) - Storsletten, Vivi Marie (Nord University) - Jakobsen, Ove (Nord University)

The cultural route "Fotefar mot nord" ("Trails to the North") was established in 1993-1998 to showcase 10 000 years of life in Northern Norway. Important keywords were cultural tourism, heritage management, and local development, and one important aim was to improve the knowledge and protection of the included sites. The route spans approximately 1800 km from north to south, encompassing hunter-gatherer-fisher sites, Iron Age burial mounds, Sami heritage, fishing villages, mines and industrial sites, museums, and World War 2 memorials. The four northernmost county councils and the Sami Parliament of Norway have since 2019 collaborated on revitalizing the route, aiming to improve visitor management, sustainability, and added value for local communities. Five pilot projects were selected in 2023, each project including one or more sites. To promote community-led development of sites along the route, each pilot was offered a utopia workshop. These workshops include a presentation on sustainability and utopia, value mapping, and a brainstorming session where participants discuss ideas for developing the site and the area.

Further development of communication methods and information material were essential to many of the participants and included in several ideas proposed at the workshops. Proposed activities at the sites included markets and plays, in addition to various forms of maintenance activities. Some of the ideas could not be implemented due to time and financial constraints. Nevertheless, the workshops proved productive for a sustainable development of the cultural route.

8 THERE ARE NO LIMITS HERE... LIVING HERITAGE ROUTES AS AN EXAMPLE OF CREATIVITY AND IMAGINATION IN CULTURE TOURISM

Chowaniec, Roksana (University of Warsaw) - Anđelković Grašar, Jelena (Institute of Archaeology, Belgrade, Serbia)

Living heritage is medium of historical-archaeological studies, interpretation and is characterized by some features that make it one of most powerful forms of communicating knowledge about past – it engages all senses, exists beyond academic archaeological and historical knowledge and offers a different insight by investigating, interpreting and discovering life in past. Although heritage is increasingly moving to digital world, cultural routes offer enormous opportunities for its promotion as well as for development of tourism in region/regions. Presentation focuses on few examples, from two different countries, Serbia and Poland, but all show how living heritage creates huge potential for the development of cultural tourism and education. These trails show how traditional and modern methods of communicating cultural heritage can be combined and how they have influenced development of tourism in areas through which they pass. These examples include: Piast Route – a sightseeing trail leading from one archaeological/historical site of Greater Poland and Kujawy to another, awarded in 2012 with Polish Tourism Organisation's certificate for the best tourist product, as it's unique and of exceptional importance for Polish heritage; Trail of the Eagles' Nests in SW Poland, a marked trail along a chain of 25 medieval castles; and Itinerarium Romanum Serbiae – Road of Roman Emperors in Serbia – a large, state-run touristic, but also socio-economically sustainable project that combines science and culture with modern research. It aims to revive and connect ancient Roman roads, many of which correspond to today's transportation links, as well as birth and death places of Roman emperors, 18 of whom were born on territory of present-day Serbia. This extensive heritage of Roman past is important to be recognised also in terms of Danube route, and so it's positioned as part of Danube Limes, Serbian section, at this moment on the UNESCO tentative list.

9 THE 'ARGONAUTICA CULTURAL ROUTE', AS A CATALYST FOR SUSTAINABLE CULTURAL TOURISM DEVELOPMENT AND PROMOTION

Vougioukas, Manos (European Cultural Tourism Network (ECTN); Argonautica Network)

A Cultural Route is developed, based on archaeological heritage, geomorphology, intangible heritage of traditions, ancient Greek theatre, poetry and literature, as well as visual and performing arts in several countries along the Argonautica Route.

The Argonautic expedition dating back to 1200 BC is the oldest legendary long-distance maritime journey in the world ever, covering several countries, seas, rivers, cities, places, referred to:

- in ancient Greek theatre tragedy 'Media' by Euripides, in 4th century BC
- in poetry 'Argonautica' by Apollonius Rhodius 250 BC, Orpheus 6th century BC and Pindar
- depicted at paintings and frescos of the Renaissance, also in modern art.

The mission of Jason and the Argonauts from Iolkos, present day City of Volos in Greece, to Colchis, present day Kutaisi in Georgia, to bring back the golden fleece has inspired several works of art, including poetry, literature, pottery, theatre, opera, paintings, sculptures, cinema, documentaries, music and publications.

Although a lot of attention has been given to the outbound journey from Iolkos to Colchis, the return journey of the Argonauts has not been given the exposure it deserves. This is despite the fact that the return journey accounted for over three quarters of the overall journey.

The return of the Argonauts from Georgia through Danube to the Mediterranean has left a cultural footprint in several places: Jason is considered to be the founder of Ljubljana, capital of Slovenia, there is legacy at the Dalmatian coast, Istria peninsula, in Croatia, as well as in Marseille in the south of France.

Tours operate in Georgia and a new museum is in progress in Volos, Greece.

The Argonautica Route can be a catalyst for sustainable cultural tourism development and promotion at the Black Sea, along the Danube river, the Adriatic and Aegean Seas destinations, also in celebrating ancient maritime heritage.

10 DIONYSIAN ARCHAEOLOGY: NAXOS ISLAND'S ALL-SEASON MYSTIQUE EXPLORED THROUGH ARCHAEOLOGICAL AND CARNIVAL TOURS

Anevlavis, Emmanouil (University of Patras) - Anevlavi, Vasiliki (Austrian Archaeological Institute/Austrian Academy of Sciences) - Argyropoulou, Maria (University of Patras) - Chatzopoulou, Evi (University of Patras)

The appeal of Greek islands extends far beyond the sun-soaked summer months, with their rich cultural heritage providing an all-season fascination. Drawing theories from Archaeology, Anthropology and Tourism, this study aims to unlock the secrets of Naxos Island by seamlessly weaving together its archaeological treasures, ethnography, intangible heritage, and mythological roots. The carnival, organised on the island, immerses participants in a three-day tourist experience, including an archaeological and cultural tour. Therefore, our focus is on the enigmatic deity of Dionysus through learning the complete history of Naxos.

Exploring Naxos reveals ancient Dionysos representations, merging history, artefacts, and island traditions. A holistic tour reveals the coexistence of past and present, exploring the vibrant carnival season on the island with Dionysos as a guide. Combining living heritage and archaeology, visitors uncover mythological aspects tied to the ancient marble quarries, Dionysos temple at Iria, and Apollon temple at Palatia. Days begin with ancient quarries, leading to a myth-themed parade on the first carnival day. The second day features the Dionysos sanctuary and an evening interactive dance parade. The final day includes a morning tour of the Apollon temple, delving into the Dionysos-Ariadne myth, culminating in the city's carnival parade, and concluding the three-day festivities.

This study results in proposals to the island's local community and tourism operators to highlight the archaeological and cultural routes and intangible cultural heritage, such as living heritage. In partnership with local authorities, a comprehensive guidebook for tourists is proposed to be produced, including detailed maps, captivating myths, and insightful archaeological details. Our research concludes with the importance of bridging the gap between academia and the lived experiences of the local community through a well-designed and organised archaeological and tourist experience. This tour promises an enhancing journey through time, inviting participants to witness the living legacy of Dionysos.

11 "HALLSTATT DAYS" - A SMALL FESTIVAL OF REVIVED HISTORY WITH GREAT POTENTIAL AND CHALLENGES

Rupert, Kristin (Zlatni Papuk Tourist Board)

In Early Iron Age, Kaptol (eastern Croatia, Slavonia) was princely center accompanied by elite burials and prestigious goods from distant areas. This means that it was an important trading center at the crossroads of traffic routes. Considering its great historical importance, many activities of popularization of archaeological heritage are carried out in this area. One of the ways is the organization of "Hallstatt Days.

Hallstatt days" is a festival of revived history, which aims to popularize archeology and the Kaptol archaeological site. It is based on the presentation of the daily lifestyle of the people who lived in this area about 2,500 years ago. It is organized every year on the third weekend in June as part of the Kaptol Municipality Day and the European Archeology Days in cooperation with the Archaeological Museum in Zagreb, the Department of Archeology of the Faculty Humanities and Social Sciences, University of Zagreb, the Center for Prehistoric Research, the Municipality of Kaptol, Iron Age Danube Route Association and the Zlatni Papuk Tourist Board. This presentation will discuss the origin of the idea of organizing a festival and its implementation in the local tourist offer. The importance of cooperation with local producers who tie their brand to the cultural heritage of their homeland will be highlighted. Cooperation with the local community in the organization of this activity will also be presented, as well as cooperation with local schools in the popularization of archaeological heritage. "Hallstatt Days" will be placed in the context of the functioning of the Cultural Route of the Council of Europe "Iron Age Danube Route," as a project of partner institutions from Croatia, as a tourist product based on archaeological heritage.

12 COMMUNICATION, CULTURAL HERITAGE AND SPORT. FONDAZIONE MONT'E PRAMA, DINAMO BANCO DI SARDEGNA, CAGLIARI CALCIO: TOGETHER FOR CULTURE IN SARDINIA (ITALY)

Camedda, Nicoletta (Fondazione Mont'e Prama) - Mureddu, Maria (Fondazione Mont'e Prama) - Orri, Ilaria (Fondazione Mont'e Prama) - Becciu, Marica (Fondazione Mont'e Prama) - Fadda, Sara (Fondazione Mont'e Prama) - Pitzalis, Matteo (Fondazione Mont'e Prama) - Murru, Giorgio Franco (Fondazione Mont'e Prama) - Muroni, Anthony (Fondazione Mont'e Prama)

The aim of the Fondazione Mont'e Prama, based in Cabras (Sardinia, Italy) is to promote the cultural heritage of the Archaeological Natural Parc of the Sinis Peninsula, in central-west Sardinia. The strategy, in almost three years of activity since the creation of the Foundation, has been based mainly on enhancing the system of communication, through multimedia channels, live conferences and events. An aspect of originality is the partnership established with the two main Sardinian sport societies: Dinamo Banco di Sardegna and Cagliari Calcio, engaged respectively in basketball and soccer.

Sport and culture represent the perfect combination for the promotion of Sardinia, and they have a great potential in the engagement of the public of the youngest. The collaboration started in October 2022: since then the Fondazione Mont'e Prama followed the teams during their national and European matches, giving lectures in cultural institutions, presenting the sites managed by the Foundation and general aspects of Sardinian archaeology. The great outcome obtained by the joint activities during the 2022/2023 season encouraged the renovation of the partnership during the following 2023/2024 annuality.

The brand of the Foundation, present as a sponsor in the uniforms of the two teams, and the events held in presence and shared through social media, brought the archaeological heritage of the Sinis Peninsula in prestigious cities of Italy and Europe, from Rome to Turin, from Napoli to Trento, from Szczecin to Athens, from Dijon to Malaga, contributing to the expansion of the target and increasing the number of visitors of the sites.

597 MIGRATION AND THE MAKING OF THE ANCIENT GREEK WORLD

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Mac Sweeney, Naoise (University of Vienna) - Mokrišová, Jana (University of Cambridge)

Session format: Regular session

The ancient Greek world by 500 BCE was a culturally integrated but geographically dispersed entity, comprising over a thousand autonomous communities scattered across the Mediterranean and the Black Sea. Migration was evidently crucial in its formation. But what was the nature and the scale of this migration? Who was moving, over what kinds of distances, and how often? To date, these questions been usually been approached either from the perspective of 'Greek colonisation', or from a perspective based on trade and cultural interaction. Both approaches, however, focus long distance movements, privileging inter-regional migration as key for understanding cultural and social change.

In contrast, this session considers to the role of local and regional migration in the making of the ancient Greek world, arguing that these smaller scale mobilities were much more important than has hitherto been assumed. In particular, it presents the work of MIGMAG (Migration and the Making of the Ancient Greek World), a project based at the University of Vienna and funded by the European Research Council, 2020-25. The project assesses evidence from five case-study regions: three traditionally associated with Greek 'colonisation', each of which developed along its own unique trajectory (Ionia, Cilicia, and Calabria); one on the Greek mainland that diverged from traditional models of polis formation (East Lokris); and one usually associated with Phoenician colonisation (western Sardinia). In some of these regions, long-distance migration has been used to explain urbanisation and state formation, while in others the same phenomena have traditionally been explained as internal developments involving regional mobilities. The work of the MIGMAG project demonstrates that in each case, a complex mix of multi-scalar mobilities was responsible for community formation.

ABSTRACTS

1 RETHINKING SYNOIKISMOS: EAST LOKRIS

Kopanaki, Eleni (University of Vienna)

Narratives of community formation in early Greece tend to focus on "the rise of the polis" and especially the concept of synoikismos (coming to live together). Models of dispersed vs nucleated settlements, internal colonization, emerging state-ness, and coalescence under first-order settlements are widely discussed, with particular reliance on the cases of Attica, Boeotia, and Argolis. However, another way to better understand the role of short-distance mobilities in the making of early Greek communities is to look beyond the usual suspects, incorporate alternative views and, to date, sidelined evidence in the discussion. By broadening our view, we can see that synoikimos worked differently in different parts of the early Greek world.

This paper discusses the diversity of synoikismos-type processes, touching briefly on all five MIGMAG case-study regions, but focusing on the poorly understood and seemingly anomalous case of East Lokris in Central Greece. Archaeological research in the region has largely been carried out from the 1970s onwards by the Greek Archaeological Service. An updated compilation of the accumulated evidence sheds new light on the character and development of the local communities. East Lokris diverges from the canon not only due to its development into an ethnos-state, as other scholars have well-highlighted before, but also because the processes involved in community formation over time seem to not slot neatly with the known archaeological models. The study of changing regional settlement patterns, as deduced from signs of habitation (mostly grave finds), together with evidence of landscape use, suggest a gradual, decentralized infill of the area and the co-existence of different types of settlement. On the other hand, site-based studies speak of dynamic communities, changing degrees of mortuary variability, and evidence of local and regional cult spaces. Is synoikismos the best way for us to model community formation on the Greek mainland?

2 RETHINKING APOIKISM: IONIA

Mokrišová, Jana (University of Cambridge)

The formation of Greek communities beyond the 'homeland' of the Aegean has traditionally been described in terms of apoikismos – a permanent settling "away from home" by long-distance migrants. This term has traditionally been used both of settlements founded in the 'migration era' of the 11th-10th centuries as well as in the later 'colonial' period of the 9th-6th centuries BCE. While the modern terminology of 'colonisation' has been comprehensively critiqued over the last four decades, more still needs to be done to complexify and unpick the ancient Greek concept of apoikismos. This paper considers the variety of apoikistic movements across the five MIGMAG case study regions, focusing on Ionia. The Early Iron Age is traditionally considered a time of heightened movement into Ionia, with the process often labelled as the 'Ionian Migration'. The Ionian Migration is not the only long-distance migration envisioned to have taken place at the dawn of the first millennium BCE, however, but the Aeolian and subsequent

Dorian migrations into southwestern Anatolia do not usually receive as much prominence in scholarship. This paper will explore the meaning and appropriateness of the term apoikismos for the Ionian case study, and will touch upon the artificial dichotomies that the term often introduces (Greeks versus non-Greeks, urban versus rural). It will do so by considering archaeological evidence for settlement continuity and change from the last stages of the Late Bronze Age to the Archaic period (1250 – 500 BCE). Combining settlement data from major Ionian sites as well as from archaeological surveys and landscape studies will allow to critically explore the hypothesis that Ionia experienced increased immigration in the coastal areas and that these areas were significantly different than settlements further inland. Is apoikismos the best way for us to model community formation in the Greek world beyond the ‘homeland’?

3 RETHINKING URBANISATION: MAGNA GRAECIA AND SICILY

Quondam, Francesco (Universität Wien)

The formation of non-Greek communities in the early 1st millennium BCE Mediterranean is often seen through the prism of urbanisation. The term is used to describe the formation of larger and more populous communities, replacing traditional and smaller-scale forms of spatial and social organisation typical of the 2nd millennium BCE. Processes of urbanisation are used to explain the development of the first territorial states of the Archaic period, all centered on the city-state model.

This paper will explore a range of processes considered under ‘urbanisation’, with reference to all five MIGMAG case study regions but focusing particularly on Magna Graecia and Sicily.

In peninsular Italy urbanisation is particularly well documented in the mid-Tyrrhenian district, as well as in Bologna and further north in the Veneto region: in all these areas the archaeological record in fact allows us to recognize a stage of formation commonly referred to as proto-urban, intermediate between the organization by villages and the flourishing of the Archaic city-states.

In southern Italy and Sicily in contrast the evidence for proto-urban developments is very scanty, while full development in an urban direction is actually believed to coincide with the arrival of Greek migrants and the foundation of Greek poleis between the late 8th and 6th centuries BCE.

This perspective does not, however, take due account of the processual dimension in the establishment of these communities. Drawing on the examination of case-studies from Magna Graecia and Sicily, this paper aims to address in a diachronic and processual perspective the emergence of the first ‘urban’ models in Southern Italy. The analysis will concern both ‘intrinsic’ parameters such as the size and density of the early poleis as well as their relationship with the surrounding territory, with the final aim of better defining the key features of urbanisation in the area.

4 RETHINKING THE GREEK-BARBARIAN DIVIDE: A NEW LOOK AT THE TEXTUAL SOURCES

Hansen, Clara Maria (University of Vienna)

Were the formation processes of Greek communities fundamentally different from the formation of non-Greek communities? Complementing the three archaeologically-focused papers that precede it, this paper considers and questions the dichotomy between the formation of ancient Greek and ‘Barbarian’ communities as depicted in ancient textual sources. The paper is based on a comprehensive analysis of primary texts written by over 180 ancient authors, including works by Herodotus, Thucydides, and others, using both qualitative and quantitative methods, and considering patterns in terminology and vocabulary, as well as theme and motifs. It emerges that neither the formation of ‘Greek’ communities nor the formation of ‘Barbarian’ communities were as homogenous as these terms indicate, and both types of communities are described in the literary texts as forming different types of communities through different processes. Although this paper will touch on all five of the MIGMAG study regions and other areas of broader Greek Archaic world, a special focus will be placed on the island of Sicily, where Greeks are said to have interacted with both the indigenous groups (Sikels) as well as Phoenician settlers.

5 BIG QUESTIONS – SMALL SOLUTIONS, OR ANY SOLUTIONS AT ALL?

Bernegger, Bettina (Universität Wien)

This paper focusses on the methodological issues that arise in multiscalar, database-rooted projects like MIGMAG. How to conduct work processes to obtain research results is crucial to every academic project and forms the backbone of scientific investigations. A good methodological framework is in theory a tool for research success, but in reality, researchers are constantly faced with unreliability, fragmentariness, constrictions or just different levels of comparability in archaeological datasets. With MIGMAG, all these issues and more are actively at work in one major database, that was created as an easy-to-administer tool to not only collect information, but also to analyse and compare it while doing so. The aim of this database is ultimately to build bridges between epigraphic and written sources, archaeobotanical and archaeological datasets. Rather than presenting results of this data-combination, this paper will focus on the hidden struggles of how to even try to bring together different datasets – from the Bronze Age to Hellenistic times in five completely different regions around the Mediterranean – in a comparable fashion. Highlighting

the methodological problems that databased archaeological projects are confronted with in their workflows, the paper focusses on discussing options for improving the archaeological digital skillset and solution-finding processes that are necessary for modern archaeological research. In this, the paper also aims to serve as a discussion opener for other similarly conducted projects and future projects to come.

6 MIGRATION AND THE MAKING OF THE GREEK WORLD: THE WORK OF THE MIGMAG PROJECT

Mac Sweeney, Naoise (Universität Wien)

The premise of the MIGMAG project is that migration is acknowledged to have been a crucial factor in the creation of the ancient Greek world, but that previous conceptual models for this migration – whether as ‘Greek colonisation’ or as ‘trade with indigenous interaction’ – are insufficient. Papers in this session will set out the workings of the MIGMAG project (Bernegger); explain key findings of the project concerning the foundation of individual settlements, whether through models of urbanisation (Quondam), apoikism (Mokrišová), or sunoikism (Kopanaki); and consider how these individual settlements developed either Greek or non-Greek identities (Hansen). In this concluding paper, I will pull together the various threads of the project, zooming out to consider what our results concerning the formation of individual communities tell us about the making of the ancient Greek world as a whole. From our work at a more micro level, wider patterns emerge and larger conclusions can be drawn.

598 THE ARCHAEOBOTANY OF CITIES AND URBAN LANDSCAPES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Riso, Federica (Istitut Català de Arqueologia Classica, Tarragona) - Livarda, Alexandra (Istitut Català de Arqueologia Classica, Tarragona) - Mueller-Bieniek, Aldona (University of Warsaw) - Rovira, Núria (Université Paul Valéry - Montpellier) - Vandorpe, Patricia (Istitut Català de Arqueologia Classica, Tarragona)

Session format: Regular session

Urban centres are focal points of multicultural, interactions and connections. They are dynamic sites, oftentimes the driving forces of changes of broader socio-economic settings. Their archaeological context is usually altered by cultural processes associated with their development, which poses a series of difficulties in disentangling the taphonomic processes of their archaeological assemblages. Archaeobotanists are increasingly aware of the potential of urban contexts, as large concentrations of organic material are being recovered, representing important archives for different types of environmental and cultural data. Urban archaeobotany focuses on the analysis plant materials from these environments and includes the examination of both macro-remains (seeds, wood, and other visible parts), and micro-remains (pollen, phytoliths and starch). The archaeobotany of urban centres and landscapes can shed light on a multitude of aspects, from the dietary habits of their inhabitants to trade, exchange, urbanisation, infrastructure development and environmental and sustainability issues.

This session offers the opportunity to discuss all aspects of scientific research related to the archaeobotany of urban centres, stimulating further development in this field. Detailed analyses of archaeobotanical remains and palaeoenvironmental data of urban centres have the potential to significantly improve our understanding of their origins, socio-economic, political and religious functions, but also of their relationship with other types of settlements and their agency in the creation of connections between all these different types of sites, between individuals and societies.

Topics that will be considered, include (but are not limited to):

- how and why the urban environment and/or local ecosystems have changed over time
- how and why people in urban settings managed and utilized plant resources for food and fodder
- insights into trade networks and the exchange of plant products within or between urban centres and other types of sites
- urban identities through the study of food plant remains.

ABSTRACTS

1 MORTUARY FEASTING PRACTICE IN THE FIRST URBAN CENTER IN THE NORTH LOESS PLATEAU, CHINA

He, Yahui (Stanford University)

During the late Neolithic period in the Yellow River region (ca. 5,000-4,000 cal. BP), a significant wave of urbanization unfolded, marked by the rapid development of settlement hierarchies, social stratification, and interregional interactions, which laid the foundation for the emergence of early state-level political structures. This period also witnessed the proliferation of sophisticated pottery types, notably vessels used for alcohol consumption and serving

purposes, including pitchers and cups, in north China. However, the role of pottery assemblages, plant exploitation, and related feasting practices in mediating and shaping socio-political dynamics within mortuary contexts in the northern Loess Plateau region remains largely unexplored. This study presents a microbotanical study of plants from elite mortuary contexts at the Shimao site in this region, to shed light on the plant composition and related feasting practices that shaped the social relationships, political structures, and urbanization processes in the region during the 5th millennium BP.

2 URBAN AGRO-ECOLOGY IN A POST-HITTITE WORLD: NEW EVIDENCE FROM THE CITY OF HATTUŞA

Diffey, Charlotte (University of Oxford)

The Hittite capital city of Hattuša was, at its peak, one of the largest Late Bronze Age cities in the Eastern Mediterranean and stood as the bureaucratic and symbolic heart of a flourishing empire. The city was first established in 1650 BC and is thought to have covered an estimated area of 1.8 km² with a population of c. 40-50,000 at its peak. Excavations at the site in 1999 by the Deutsches Archäologisches Institut recovered an unparalleled assemblage of exceptionally well-preserved plant material from this period. This included hundreds of tonnes of charred cereal grain found within the large underground silo complex, and analysis of this material has already provided a wealth of information about LBA large-scale extensive urban agro-systems (Diffey et al. 2020).

The Hittite empire finally collapsed during the 12th century BC, contemporary with the breakdown of several other states in the Eastern Mediterranean region, and the city of Hattuša was largely abandoned. Limited occupation at the site did continue through the Iron Age, however, although a lack of empirical evidence has prevented any examination of agricultural management during this period. This paper will present the archaeobotanical analysis of charred plant material recovered from Büyükkaya, another part of Hattuša located to the north of the city. Samples taken from this area extend chronologically from the Late Bronze Age to the Middle Iron Age and cover a range of contexts both domestic and administrative. This study has combined primary archaeobotanical analysis alongside the use of crop stable isotope analysis and functional weed ecology. The high-resolution record this provides, both spatially and temporally, has presented a unique opportunity to investigate urban agricultural practice and food procurement during the 2nd – 1st millenniums BC, including the period of the cities' collapse.

3 THE URBAN LANDSCAPE OF REGGIO EMILIA AS SHOWN BY PALYNOLOGY (I-XVI CENTURY A.D.; NORTHERN ITALY)

Furia, Elisa (Doctorate in Evolutionary Biology and Ecology, University of Rome Tor Vergata, Rome, Italy; Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università di Modena e Reggio Emilia, Modena, Italy) - Capurso, Annalisa (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara, Settore Archeologia, Bologna, Italy) - Cremaschi, Mauro (Department of Earth Science "A. Desio", University of Milano, Milano, Italy) - Travaglini, Alessandro (Laboratory of aerobiology, Department of Biology, University of Rome Tor Vergata, Rome, Italy) - Mercuri, Anna Maria (Laboratorio di Palinologia e Paleobotanica, Dipartimento Scienze Vita, Università di Modena e Reggio Emilia, Modena, Italy)

Archaeopalynology is an important instrument in reconstructing changes in vegetation, and in understanding how both climate and anthropic influence shaped landscapes. When considering urban deposits, it can be hard to disentangle anthropic pressure, always present in urban contexts, from climatic influence whose effects can be partially masked by human actions. To deepen our understanding of the evolution of urban areas we selected two sites located in the city centre of Reggio Emilia: Vittoria Park (24 samples) and San Prospero square (40 samples). In the first site, near the northwestern edge of the Roman town, the area was used for productive and later residential purposes (I B.C.-III A.D.); in San Prospero square, in the heart of the Roman town, a ditch and a burial ground dated to the early Medieval period, and, below layers of debris, there were residential structures from the early Imperial age. Pollen samples cover a period from around the I-II century A.D. to around the XVI century A.D. The data obtained describe a mostly open area, with low percentages of arboreal pollen (mean 14%) and oak woods, kept open during all the analysed periods. Some plants important for edible fruits are recorded, like *Castanea*, *Juglans* and *Vitis*. Most of the environmental changes were connected to the availability of water, while anthropic influence was constant during the analysed period. The main land use seems to have oscillated between cereal fields and pastoralism. This reconstruction allows for a better understanding of how citizens used the town centre of Reggio Emilia in the past and how the landscape around the town was shaped by anthropic and climatic influences.

4 AN ARCHAEOBOTANICAL EXPLORATION OF URBAN FOOD PRACTICES THROUGH TIME IN ROMAN ITALY

Riso, Federica (Istitut Català de Arqueologia Classica) - Livarda, Alexandra (Istitut Català de Arqueologia Classica, Tarragona)

This study employs one of the most extensive archaeobotanical datasets available for Roman Italy to shed new light into urban foodways. The study period ranges between 500 BC and 500 AD in an attempt to trace changes and continuities through time. The talk starts by discussing the nature of the archaeobotanical evidence, assessing any biases from the sampling and recovery of the ancient plant remains in the field to their laboratory processing, as well as the impact of taphonomy. Taking into account the identified gaps in the dataset we offer a discussion of dietary habits, in relation to food plants, across a variety of urban centres through the different phases of the Roman Empire until its final demise. Geographical location is first considered and then contextual information in order to highlight spatial, social and economic factors involved in the observed food plant choices. The urban foodways are discussed in the light of the local and 'global' commercial network under the Roman Empire and the acquisition, assimilation or rejection of new tastes. Patterns, cultural preferences and potential changes in the plant repertoire are finally discussed by comparing urban, with rural and religious sites.

5 SAMPLING URBAN SITES FOR ARCHAEOBOTANY: INSIGHTS FROM TARQUINIA (ITALY)

Schmidt, Frijda (University of Cambridge) - Marras, Gianbattista (University of Cambridge) - Marzullo, Matilde (University of Milan) - Motta, Laura (University of Michigan) - Gaveriaux, Fanny (Independent researcher) - Stoddart, Simon (University of Cambridge)

A recent intensification of archaeobotanical research at the Etruscan urban centre Tarquinia has produced a rich charred assemblage of over 30,000 vegetal plant remains, but simultaneously also revealed a series of issues about how to sample and interpret results from the yet rarely explored urban sediment formation processes of the Mediterranean. The site of Tarquinia was first inhabited during the Late Bronze Age and developed within a few centuries into an urban centre and seat of power over a large hinterland, until it was abandoned after the Roman conquest in the early Middle Ages.

Such long occupation sequences offer unique possibilities to track in-situ developments of farming practices, crop exploitation and foodways from a village to city economy, a process that in the Etruscan sphere, but also wider Italy, is yet poorly understood from an agricultural perspective. In search of such opportunities, the archaeological reality had to be confronted with a reworking of deposits with ambiguous formation histories, residuality and chronological uncertainty caused by phases of monumentalisation and reconstruction. Drawing on the archaeobotanical record combined with insights from micromorphology and material culture, this paper will discuss the nature of these deposits, the implications for subsistence reconstruction, and possible future pathways for urban sampling.

6 LATTARA: A MULTISECULAR HISTORY OF CROP PRODUCTION IN A SOUTHERN GAUL PORT BETWEEN THE IRON AGE AND THE ROMAN ERA

Rovira, Núria (University Paul Valéry-Montpellier 3, ASM UMR5140, Montpellier, France) - Alonso, Natàlia (University of Lleida, ARQHISTEC-GIP, Lleida, Spain) - Steiner, Bigna L. (Integrative Prähistorische und Naturwissenschaftliche Archäologie-IPNA-, Basel, Switzerland) - Tillier, Margaux (Ipsosfacto Scoop., Arles, France)

The port of Lattara (Lattes, France) was founded in the late 6th century BCE and actively occupied until at least the 2nd century CE. It was a crossroads of varied influences and exchanges between the Gauls and several Mediterranean societies including the Etruscans, Greeks, Iberians and Romans. If numerous archaeological remains bear witness to all these contacts and interactions, what about plants and plant products? Can we see any differences between crops cultivated during the Late Iron Age and those of the Early Empire? What about imports? Are we only finding derived products (wine, oil) or are new plants also being introduced? How are inhabitants exploiting the environment around the city from an agricultural point of view? These questions are among the main ones that we wish to address here. In addition, we will not only try to characterize the crop production of the inhabitants of Lattara over time, but also their access to these resources: are there differences between the inhabitants of the city?

Thus, in this communication we intend to present a synthesis of the archaeobotanical data currently available for the different phases of occupation of the city from its foundation to its abandonment in order to answer the questions addressed below. The basis of our work will be made up of the results obtained by the study of archaeological seeds and fruits remains, found in carbonized and waterlogged contexts. Since the beginning of the 1990s and until today, more than 800 samples, corresponding to approximately 450,000 seeds and fruits remains, have been studied in various publications (e.g. Buxó 1992, 1999, 2003; Alonso & Rovira 2010, 2016; Rovira & Alonso 2010, 2017; Steiner et al. 2020; Rovira et al. in press), doctoral theses (Pinaud-Querrac'h 2021; Tillier 2023) and master's theses (Roux 2018; Guizard 2021).

7 PLANT LANDSCAPE AND PLANT USES IN THE ANCIENT CITY OF LA CARIDAD (CAMINREAL, TERUEL, NE SPAIN)

Alcolea, Marta (University of Zaragoza) - Benedí, Nerea (University of Zaragoza) - Ezquerro, Beatriz (Museum of Teruel) - Vicente, Jaime (Museum of Teruel) - Herrero-Otal, María (Autonomous University of Barcelona) - Tarongi, Miguel (CNRS-ISEM) - Azuara, Sara (Museum of Teruel)

In this work we present preliminary results of the archaeobotanical analyses carried out in the ancient city of La Caridad (Caminreal, Teruel, NE Spain). Archaeological fieldwork at the site led by the Museum of Teruel began in 1984 and continues to this day. The name of the city in ancient times is unknown. The archaeological remains have allowed to place its foundation towards the last quarter of the 2nd century BC and its destruction during the Sertorian War, around the year 74 BC corresponding to a very short occupation of the city. The reliability of its archaeological documentation and the buildings morphology of make it the best example to illustrate the redefinition of place after local indigenous elites tried to adopt the Roman lifestyle on the edge of Celtiberia. The violent destruction on the city has allowed abundant archaeological material to be recovered among ruins and has favored the preservation of plant macro-remains (charcoal, wood, seeds and plant fibers). Preliminary results of the archaeobotanical analyses allow an approach to different aspects of daily life in this urban center concerning construction of buildings, management of the urban environment, artisanal and agricultural activities, as well as paleoenvironmental information in the central sector of the Ebro valley during the Roman climate optimum.

8 DIGGING IN THE WELLS: FOOD AND TRADE RELATIONS IN ROMAN GUISSONA

Baniou, Theoni (Landscape Archaeology Research Group (GIAP), Catalan Institute of Classical Archaeology (ICAC), Tarragona, Spain; University of Rovira i Virgili) - Livarda, Alexandra (Landscape Archaeology Research Group (GIAP), Catalan Institute of Classical Archaeology (ICAC), Tarragona, Spain; University of Rovira i Virgili) - Vadorpe, Patricia (Landscape Archaeology Research Group (GIAP), Catalan Institute of Classical Archaeology (ICAC), Tarragona, Spain) - Romani, Núria (Serra Hünter Fellow, Autonomous University of Barcelona, Spain)

The Roman city of Guissona (Ileso, Catalonia, Spain) was one of the main towns in the inland region in the north-east of the Iberian Peninsula, as its geographical location allowed the control of the link between the interior and the coast. The site is of great importance as it is one of the few, not only in the region but also in the Mediterranean, where archaeobotanical remains have been preserved under waterlogged conditions. In total, five wells have been identified and excavated. They were in use in different periods and located in different contexts (residential neighbourhood, domus, inn, garden area next to the public baths). So far, two wells have been fully studied, while two others are under study and will be discussed in this presentation. In particular, the results from the well associated with the inn (first half of the 1st century AD - late 2nd century AD/ early 3rd century AD) and the well which was located in the garden area of the public baths (1st c. ACE) will be discussed. The archaeobotanical analyses of these wells allowed us to reconstruct both the environment of the surrounding area and the dietary habits of the inhabitants of Roman Guissona. To conclude, trade relations between the different regions of the Roman Empire, as demonstrated by archaeobotanical finds, will be explored.

9 WALNUTS, PINE NUTS AND DOGS. STUDY OF ANCIENT RITES IN A ROMAN VILLA OF BARCELONA THROUGH BIOARCHAEOLOGY

Tarongi, Miguel (Universitat de Lleida; ISEM-UMR 5554, University of Montpellier, CNRS) - Triay, Vanesa (Atics SL) - Esqué, Miriam (Atics SL) - Bianco, Sabrina (Catalan Institute of Human Paleoeology and Social Evolution (IPHES-CERCA)) - Nadal, Jordi (SERP- IAUB. Department of History and Archaeology. University of Barcelona) - Miró, Carme (SERP- IAUB. Department of History and Archaeology. University of Barcelona) - Riera, Santiago (SERP- IAUB. Department of History and Archaeology. University of Barcelona)

New bioarchaeological studies are being carried out in the present-day Barcelona in the framework of PaleoBarcino project. The results obtained to date have great potential for understanding urban plant and animal resources, land management, agricultural activity and food processing around the colony of Barcino (Barcelona) as well as the ritual significance of some organic products in the religious beliefs of the city's inhabitants through time.

The archaeological intervention motivated by the urbanization of the surroundings of the former Can Batlló factory revealed the pars rustica of the Roman villa of Nostra Senyora del Port, which was in part documented in 1984, just few meters away. Notably, a small ritual structure dated to the first half of the 2nd c. CE was found, along with remarkable remains of food offerings, votive ceramics, combustion areas and a ritual well. From the late 2nd c. CE, the area was occupied by a small necropolis which seems in continuity with the previous ritual function of the space.

In the present work, we aimed to study and to interpret the numerous bioarchaeological remains recovered at Can Batlló excavation, which have an outstanding ritual significance.

In fact, we documented a large concentration of whole walnuts and pine nuts - not consumed or neither fragmented - deposited on a wooden structure interpreted as a table. Remains of two dogs resulted remarkable, together with other cereal and fruit species identified in various areas of the ritual building which were found to be common also in others ritual spaces around Roman Barcino.

These data are very relevant because shed light on the organic products involved in Roman rituals in the Mediterranean area. This topic is still scarcely explored up to date, in part due to the lack of established protocols in organic remains sampling in many urban archaeological excavations.

10 FOOD PLANTS AND SOCIAL DYNAMICS IN THE URBAN SETTLEMENTS OF THE NORTHERN ROMAN PROVINCES

Vadorpe, Patricia (Institut Català d'Arqueologia Clàssica) - Livarda, Alexandra (Institut Català d'Arqueologia Clàssica)

This talk will explore how cultivation, trade and consumption of food plants shaped the urban landscape of Roman Germania. Roman Germania includes the provinces of Germania superior and Germania inferior. Both provinces were characterized by a highly militarised zone of which the northern and eastern border (to Germania Magna) was secured by the limes, forts and legionary camps. The military presence had a major impact on the infrastructure, social dynamics and development of the area, and is also reflected in the range of food plants found.

By examining archaeobotanical evidence, we will outline the variety of crops grown, traded, and consumed in the urban centres of Roman Germania from the Early to the Late Roman period. We will place the spectrum of food plants found in these urban contexts in a broader framework by comparing it with those food plants observed in the military and rural settlements that existed in their surroundings. In doing so, we hope to shed light on dietary preferences of urban dwellers, rural communities, and military people, and the socio-economic factors that influenced these food consumption patterns.

11 ARCHAEOBOTANICAL PRELIMINARY RESULTS FROM THE HOLY SEPULCHER BASILICA (JERUSALEM, ISRAEL)

Cerafoli, Eleonora (Department of Environmental Biology, La Sapienza University, Rome; Department of Earth Sciences, La Sapienza University, Rome) - Moricca, Claudia (Department of Environmental Biology, La Sapienza University, Rome) - Masi, Alessia (Department of Environmental Biology, La Sapienza University, Rome) - Sadori, Laura (Department of Environmental Biology, La Sapienza University, Rome) - Stasolla, Francesca (Department of Classics, La Sapienza University, Rome)

With its 6000 years long history, the city of Jerusalem sparks particular interest for archaeobotanical studies. Throughout the millennia it was the scenery of many events, starting from the first settlement dated to the Chalcolithic, the Roman conquest and the foundation of Aelia Capitolina, the Crusades, the Mamluk conquest, until modern times. Currently, a new archaeological campaign is underway inside the Holy Sepulcher Basilica. Built by Constantine the Great about 326 AD, it replaced the area where the written sources recall the pre-existent Jupiter/Venus roman temple. Over the years, it underwent destruction and rebuilding cycles due to wars, earthquakes, and fires. The excavation is led by Sapienza University of Rome, as part of a project licensed by the Israel Antiquities Authority and requested by the Communities that have custody of the Holy Sepulchre. Although archaeobotanical studies were previously carried out within the city of Jerusalem, this is the first time an investigation has been carried out in a site that presents a very broad time span (from the medium Iron Age to the modern period) and considers multiple archaeobotanical proxies. Macro-remains recovered so far belong to four excavated areas inside the Basilica. The carpological assemblage shows the presence from both wild and cultivated plants with cereals and seed/fruit remains among which *Ficus carica* is the most abundant. Two loci revealed to be very rich in wood charcoals, ca. 20% of them being twigs, with numerous fragments of *Quercus evergreen*, *Rhamnus/Phillyrea* and *Olea europaea*. The study of pollen, although in low concentration and scarce preservation state, revealed a large amount of *Cichorioideae*, followed by *Asterioideae* and *Chenopodiaceae*. The study is still ongoing and will uncover both the plant usage and the vegetation history of the city through the millennia.

12 TO THE LOO! FRAMING PLANT DIET IN STUDIES OF THE ARCHAEOBOTANICAL REMAINS FROM LATRINES IN THE MEDIEVAL IBERIAN PENINSULA

Losilla, Nicolás (Departamento de Historia Medieval y Ciencias y Técnicas Historiográficas. Universidad de Granada) - Ros, Jérôme (Institut des Sciences de l'Evolution, CNRS, Université de Montpellier, France) - Pastor, Thierry (Institut des Sciences de l'Evolution, CNRS, Université de Montpellier, France) - Gilotte, Sophie (Ciham-UMR 5648, CNRS, Université de Montpellier, France) - García-Contreras, Guillermo (Departamento de Historia Medieval y Ciencias y Técnicas Historiográficas. Universidad de Granada) - Kirchner, Helena (Universidad Autónoma de Barcelona) - Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - Pluskowski, Aleks (Department of Archaeology, University of Reading)

Latrines and cesspits have been the most useful architectural resource used in societies without sewage facilities. In these cavities drilled in the ground, at a certain distance from the water table to avoid contamination, urban populations have deposited both organic and inorganic remains resulting from their daily activities. These small dumps have become very important points of information for archaeologists to learn about the practices and diets of past societies.

In the present study, we have collated archaeobotanical materials identified in different latrines and cesspits from medieval contexts in the Iberian Peninsula (Catalonia, Andalusia, Extremadura), within the research framework of the MEDGREENREV REF. 101071726 funded by the Europe Research Council within the Synergy Grants programme. By focusing on the hundreds of thousands of archaeobotanical remains, we can discern the discards of culinary and food consumption processes within medieval urban societies. These results make it possible to draw up a list of the main consumed plants, but also to detect the presence of rare introduced taxa, potentially due to the privileged status of the sites' inhabitants. Each case study is unique, as each population has different agricultural, trading and gathering capacities, and this summary will highlight the similarities and differences between the sites and regions.

13 PLANT DIVERSITY AMONG CHRISTIAN, MUSLIM AND JEWISH COMMUNITIES IN URBAN SITES IN MEDIEVAL IBERIA

Peralta-Gómez, Antonio (Spanish National Research Council; MEMOLab-Laboratory of Biocultural Archaeology, University of Granada) - Peña-Chocarro, Leonor (Spanish National Research Council)

Medieval Iberian food and agriculture have been discussed at length in academic publications using mainly written sources. However, despite the enormous advances of medieval archaeology over the past decades, plant remains from medieval sites are rather scarce limiting our understanding of many aspects of the life of medieval communities. Archaeological excavations in recent decades have changed perceptions of the more significant role of plants in medieval economy. As part of an on-going ERC project (ERC-AdG101054883), MEDAPP (Medieval Appetites: food plants in multicultural Iberia (500-1100 CE)), we are studying archaeobotanical samples from numerous medieval sites among which there are several urban sites. Contexts such as latrines, rubbish dumps and domestic spaces have provided a wealth of information.

By analyzing plant remains from several urban sites distributed in northern (León, Basque Country) and southern Iberia (Córdoba, Almería), we investigate the role of plants in the diet and economy of the population inhabiting Iberia (Christian, Islamic and Jewish communities) and explore agricultural practices. These different contexts offer the possibility of comparing agricultural practices and dietary habits from different cultural groups. Moreover, the presence of novel crops such as Citrus fruits, rice, pearl millet among others provides information on trade and exchanges with distant places.

14 MEDIEVAL STRONGHOLDS AND TOWNS FROM THE TERRITORY OF TODAY'S POLAND - TOWN FOUNDATION AND ARCHAEOBOTANICAL DATA

Mueller-Bieniek, Aldona (Uniwersytet Warszawski)

In the studied area the first towns appeared in 13th century AD, however some urban-like settlements were known from the earlier, prehistoric times too. Most of the prehistoric buildings were constructed from wood thus their remains are usually not well preserved in the landscape. Towns that appeared during the Middle Ages, still exist, while several strongholds were abandoned. However long-lasting urban settlement usually strongly influenced the archaeological layers. Nevertheless, it is still possible to find areas of the town with preserved, intact layers of ancient sediment.

Several archaeobotanical assemblages derived from medieval strongholds and towns have been studied till now. Their direct comparison is difficult because of differences in sampling strategies, diverse types of fossilisation, and also diversity of historical and environmental backgrounds.

The aim of the research is to track selected plant taxa that were economically and probably culturally important and usually well preserved in archaeobotanical samples. In the studies of medieval Krakow it has already been observed

that proso millet (*Panicum miliaceum*) lost its importance after the city foundation under Magdeburg law. Was it a local phenomenon? Was it due to new city laws and perhaps related to maintaining order? Or maybe it was more related to a change in food preferences? While millet remains are usually well preserved and identifiable as charred, waterlogged and mineralized, tracking of other plants such as rye, wheat or peas is not so clear.

15 URBAN WASTE FROM THE MEDIEVAL RIVER SENNE IN BRUSSELS (BELGIUM)

Speleers, Lien (Royal Belgian Institute of Natural Sciences, OD Earth and History of Life) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, OD Earth and History of Life) - Deforce, Koen (Royal Belgian Institute of Natural Sciences, OD Earth and History of Life; Ghent University, Department of Archaeology, Belgium) - Ghesquière, Valérie (Art & History Museum – urban.brussels, Belgium) - Timmermans, Jullie (Art & History Museum – urban.brussels, Belgium) - Van Schepdael, Nina (Royal Belgian Institute of Natural Sciences, OD Earth and History of Life) - Vrydaghs, Luc (Archaeology, Environmental Changes & Geo-Chemistry Research Group, Vrije Universiteit Brussel, Belgium) - Devos, Yannick (Archaeology, Environmental Changes & Geo-Chemistry Research Group, Vrije Universiteit Brussel, Belgium)

The river Senne has disappeared from the urban landscape since it was vaulted over in the 19th century, but it played a crucial role in the origin and economic development of the medieval city. In 2019 the remains of the medieval port on the river Senne were brought to light during a large excavation (nearly 6000m²) in the city centre of Brussels. Besides the discovery of a 12th-13th century bank reinforcement and an impressive stone quay wall (mainly 14th-15th century), meters thick excellently preserved waterlogged fluvial deposits from different phases of the river were excavated. These layers, dating between the 10th and 15th century, were extensively sampled for archaeobotanical (macrobotanical remains, pollen and phytoliths), archaeozoological and geoarchaeological studies.

In this presentation we will discuss the results of the interdisciplinary study of these numerous samples, with a main focus on the plant remains. The assemblages consist of a mixture of naturally deposited material from the vegetation in the Senne valley and waste dumped in the river. Indeed, as urbanisation intensified, the river became used as an open sewer in which all kinds of refuse were disposed of. Thanks to the interdisciplinary approach and comparison with assemblages from several other sites in Brussels diverse types of waste could be distinguished, including artisanal (e.g. textile working and dyeing), domestic and consumption waste as well as remains of fuel and human and animal excrements. The exceptional diversity of the plant material (>300 taxa) recovered from this fluvial urban context and its perfect preservation offer a unique insight into various aspects of daily life in the city.

16 THE DIACHRONIC CHANGES OF CEREAL ISOTOPIC VALUES FROM VILNIUS CITY BETWEEN 14-18TH CENTURIES

Karaliute, Ruta (Lithuanian Institute of History) - Motuzaitė Matuzevičiūtė, Giedrė (Vilnius University; Lithuanian Institute of History)

A successful development and growth of cities depends on sufficient provision of calories to its residents. While urban units are primarily associated with merchantry, trade and crafts, farming and horticulture also took place within city limits across Europe. The continuous growth of population in cities inevitably led to land degradation and crop failure. In addition, climatic oscillations could also play a significant role in changes in crop repertoire over the time. Therefore, an inauspicious natural conditions and soil degradation had to be resolved through long-term agrarian strategies by: a) switching to more resistant crops; b) crop rotation; c) using additional fertilization and maintaining sufficient water. While some of agricultural changes can be identified with archaeobotanical investigation, the use of manure and irrigation maintenance may be confirmed by chemical analysis of cereal grain and weeds.

Northern European city Vilnius, a capital of former Grand Duchy of Lithuania, raised up as an urban entity in challenging period of transition from Medieval Warm Period to the Little Ice Age. By analyzing the ratio of carbon and nitrogen isotope on barley together with thorough archaeobotanical research, we aim to investigate the diachronic agrarian transformation and motives behind it that led to population growth in the medieval Vilnius city. Moreover, this study provides additional knowledge on people relationship with environment under a process of urbanization.

17 THE MIXING BOWL: WATERLOGGED PLANT FOODS IN RIVERSIDE LISBON EARLY MODERN PERIOD ARCHAEOLOGICAL SITES

Rodrigues, Mariana (NOVA University of Lisbon) - Bettencourt, José (NOVA University of Lisbon) - Tereso, João (CIBIO – Research Centre in Biodiversity and Genetic Resources - InBIO Associate Laboratory) - Freire, Dulce (University of Coimbra) - Mendes da Silva, Inês (ERA Arqueologia SA)

The Lisbon riverside in the Early Modern Period suffered major development due to the expansion of Portugal's maritime activity, including intercontinental travels. Tagus River's north bank was filled with ports, piers, markets, storage facilities, and shipyards. Ships brought new products from every corner of the globe and took others to the most varied destinations. At this time the city transformed into a mixing bowl of cultures, nationalities, new foods, resources,

materials, and objects. This resulted in the formation of rich riverside archaeological contexts, dozens of which were excavated in the last decades. In these excavations, a wide range of structures were identified, including abandoned ships, storage structures, piers, etc., and various finds were retrieved, among them, plant materials.

In this paper, we'll discuss the analyses of such plant materials, regarding four archaeological sites, namely, Boqueirão do Duro, Avenida 24 de Julho, EDP I, and EDP II (all excavated by ERA Arqueologia SA in cooperation with CHAM – Centre for the Humanities). These contexts are but a glimpse of the boiling mixture of experiences occurring in Early Modern Period Lisbon. Its study is essential to aid in our comprehension of existing social, economic, and cultural structures. The preliminary results of the archaeobotanical study in course show the presence of plant species from different geographical origins, with diverse uses. Among the species identified, we have coconut, sugarcane, and cacao, a debutant in Portuguese Early Modern Period archaeological contexts. Those results bring interesting hypotheses about food production, commercial routes, onboard feeding, the introduction of different food plants in Early Modern Age Europe, and more.

This work is supported by FCT (Foundation for Science and Technology), CHAM (Centre for the Humanities), BI-OPOLIS Association, and CEIS20 (Centre for Interdisciplinary Studies of the University of Coimbra).

600 CHURCHES AS RESOURCES FOR SOCIETY? CO-CREATING KNOWLEDGE AND CAPTURING SOCIAL VALUE

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Pickles, Thomas (University of Chester) - Chavarria Arnau, Alejandra (University of Padua) - Foster, Sally (University of Stirling)

Session format: Regular session

Across Europe churches have been enduring local institutions, representing a source of information about the past as well as a paradigmatic instance of archaeological heritage in society. Christianity is a global faith, practised locally: churches have been engines for the construction of local Christian identities through interactions between a global faith and local social conditions. Christian worship has involved communal participation: churches have been foci for local projections of wealth or social standing, or the exertion of power over local communities. Churches often received land to support the work of clergy and gifts from members of the local community, making them unusually wealthy and long-lived institutions. Churches have thereby become the focus for local settlements and drivers of economic development. The result is that churches always present key evidence for the history of local communities. Yet church buildings and monuments often represent a burden: they are expensive to maintain; they are sometimes sites of worship under ecclesiastical ownership, and sometimes no longer used; the responsibility for them is distributed between national heritage organisations, ecclesiastical bodies, charitable organisations, and local communities. To secure their future, it is necessary to promote an appreciation of them as resources for society. This session is inspired by work for the pan-European project *Corpus Architecturae Religiosae Europaeae* (CARE) in Italy, Britain, and Ireland, where we have collaborated with a range of stakeholders to generate new knowledge and understanding of early medieval churches. This session seeks to share the ways in which the collaboration of different stakeholders – academics, policy makers, educators, charities, members of local communities etc - is tapping new understandings of churches and harnessing appreciation of contemporary social value to bring public benefits. What strategies, such as co-production of resources, are being adopted to bring about such transformations, and what difference are they making?

ABSTRACTS

1 THE WIKICARE PLATFORM AND THE COLLABORATIVE CATALOGUING OF EARLY MEDIEVAL CHURCHES: FROM RESEARCH TO SOCIAL VALUE

Chavarria, Alexandra (Dipartimento dei Beni Culturali Università degli Studi di Padova)

The aim of the project CARE (*Corpus of Medieval European Christian Churches*), initiated in 2001, has been to catalog Italian churches from the 4th to the 10th centuries, providing accurate, uniform, and updated information on the early medieval ecclesiastical architectural heritage through the use of a common vocabulary and the sharing of methods, tools, and research themes. This has two implications: on one hand, to study and compare the phenomenon of Christianization and the creation of church networks at a European level with its political, economic, social, and obviously ideological-cultural consequences; on the other hand, to delve into the characteristics and developments of a series of artistic forms (in architecture, sculpture, painting, and more) up to the modern era, at a time when religious art constituted the main, if not the only, artistic form that has come down to us. CARE also aims to foster a debate that, through the standardization of the scientific glossary and census practices, offers an important stimulus for comparing realities that are geographically distant, both nationally and within Europe.

Within this project, the WikiCARE-Italy platform, developed since 2010, has not only promoted but also facilitated the development of a scientific community with similar research interests focused on the study of Christian meeting places. In this presentation, after describing the state of the research of the project and the information that has been included in the platform in recent years, I will reflect on the future prospects of WikiCARE, considering its potential from the perspective of wider sharing of research, mostly for educators as well as tourism experts.

2 EARLY CHRISTIAN CHURCHES AND LANDSCAPES (ECCLES) – CO-CREATING A WEB RESOURCE WITH STRATEGIC, EDUCATIONAL AND INFRASTRUCTURAL STAKEHOLDERS

Pickles, Thomas (University of Chester)

Within the pan-European network, *Corpus Architecturae Religiosae Europaeae* (CARE), Tom Pickles (Chester), Sally Foster (Stirling), and Tomás Ó Carragáin (Cork) have been devising a public web resource to present the evidence for churches before AD 1100 in Britain and Ireland. The role of churches as resources for society has been central to this work. To ensure the web resource meets the needs of all those with an interest in early medieval churches, they have pursued a process of co-creation with three types of stakeholders – strategic (policy makers), educational (using churches for education), and infrastructural (responsible for on-site presentation). This process has involved investigating how early medieval churches are resources for society, especially in education, and the social value people place on early medieval churches, especially those who care for and use such churches. This paper will outline the process and explore some of the results – the way the web resource has been adapted to meet stakeholder requirements, the way the Pilot Data has been adjusted to make it useful to different groups, and the resources which have been co-created with stakeholders for teaching at Primary and Secondary Schools and presenting early medieval churches to the public.

3 ARCHAEOLOGICAL RESEARCH, MONUMENT MANAGEMENT, AND PUBLIC RESPONSE CONCERNING THE PRE-ROMANESQUE CHURCHES IN MORAVIA (CZ)

Poláček, Lumír (Institute of Archaeology of the Czech Academy of Sciences, Brno)

The pre-Romanesque sacral architecture associated with the existence of the 9th-century power-political formation of the Western Slavs in the territory of present-day Moravia and southwestern Slovakia represents a small but coherent group of buildings. It contains the remains of around twenty churches situated mainly on the territory of three power centres: Staré Město – Uherské Hradiště, Mikulčice–Kopčany, and Pohansko near Břeclav. Most of the churches were discovered in the late 20th century and they went on to become one of the mainstays of the newly, sometimes uncritically, formed image of the Great Moravian Empire as a cultural “competitor” of the Frankish and Byzantine empires. Most of the churches were preserved in the form of archaeologically documented building foundations, which determines the possibilities of further research, heritage care, and interaction with the public. The remains of the buildings are to varying degrees owned and managed by state, regional, or municipal institutions, only rarely by the church or parastatal companies. The current form of research and heritage presentation of the churches is very diverse and depends on the circumstances; the optimum being the ownership and management by a single museum entity and archaeological research carried out by a specialised scientific institution (Mikulčice). However, there are other models and strategies with their advantages and disadvantages. In general, the 9th-century sacral architecture of the *Mojmírid* Moravia is an important part of local and national identities, both Czech (Moravian) and Slovak.

4 ENGLISH CHURCHYARDS: FROM LANDSCAPES OF MEMORY TO LANDSCAPES OF MEANING

Mytum, Harold (University of Liverpool)

Mortuary monuments inside and outside churches form a category of material culture easily accessible to the public both physically and emotionally, especially when they can read biographical details of those commemorated. Holy Trinity Church's Castle Street burial ground in Hull is a case study of an ongoing reinstatement programme following partial loss of the site to a road improvement scheme; here, innovative conservation and interpretation links the church to the burial ground, the dead to the living, the past to the present. Unlike some closed churchyards in English towns, this will be more than a ‘green lung’ but also a place of heritage value. In contrast to major schemes, low-cost investment in the rural churchyard can bring these often-underappreciated places into local awareness as a heritage asset. Graveyard memorials considered as cultural heritage can be combined with the natural heritage to create a holistic approach to managing, appreciating, and interpreting the churchyard. Involvement in recording and managing churchyards offers many social benefits for community members.

5 AUGMENTED REALITY, VIRTUAL REALITY, AND SOCIAL VALUE - RECONSTRUCTING ST JOHN'S CHURCH, CHESTER, TO INCREASE AWARENESS AND ACCESSIBILITY

Wilson, Katherine (University of Chester)

A key problem for churches in Britain is declining participation, sometimes resulting in difficulties maintaining churches and a growing number of redundant churches. For medieval churches, whose original function, form and fittings may have been quite different from what is visible today, it can be a particular challenge to communicate the significance of the church beyond its members, maintain a sense of its social value, and attract visitors. Within Chester, the two most important religious communities with outstanding medieval churches were St Werburgh's, now Chester Cathedral, and St John's. Whereas Chester Cathedral remains a collegiate church central to the civic identity of the city and a major, international tourist destination, St John's is struggling to remain open. To address this context, as part of a major UKRI AHRC funded project, Mobility of Objects Across Boundaries 1000-1700, we worked with Martin Moss of Dextra Visual, to create an Augmented Reality interactive 3D reconstruction of St John's and then a fully immersive Virtual Reality experience. This paper will explore the response to the use of the AR reconstruction in an exhibition at the Grosvenor Museum and Chester Cathedral as well as on the project website, and the user-testing of the VR experience.

6 CULINARY HERITAGE OF THE CISTERCIANS: WHEN FOOD HISTORY OPENS UP NEW WAYS TO RELATE TO MONASTIC SITES

Brauer, Michael (Department of History, University of Salzburg)

The Cistercians, a monastic order that profoundly shaped the religious and cultural landscape of medieval Europe, have rarely been analysed from the perspective of food history. This is partly due to the strict asceticism of the founding period, which saw food as a worldly danger to the pursuit of a religious life. In later centuries, however, Cistercian cuisine did not follow such strict rules. In the current EU Creative Europe project "Culinary Heritage of the Cistercians in Central Europe", three partner institutions in Germany, the Czech Republic and Austria are working with the network CISTERSCAPES (Cistercian Landscapes Connecting Europe), which includes numerous monastic sites in Central Europe. Within the network, some monastic sites still host living monastic communities, while others are cultural heritage sites under the supervision of district administrations. The paper will address the following points: 1. What were the general food trends in the Cistercian Order over the centuries (according to preliminary findings) and how can they be reconstructed today? 2. How can the scientific results be transformed into events that attract a wider public? 3. What is the role of culinary heritage in opening up new ways of relating to monastic sites, and which stakeholders are (or should be) involved in this process?

613 MAKING THE MOST OF WHAT WE'VE GOT: ACTIVATING MUSEUM COLLECTIONS, MONUMENTS AND BUILT HERITAGE

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Ebert, Bettina (Museum of Archaeology, University of Stavanger) - Mooney, Dawn (Museum of Archaeology, University of Stavanger) - Hollund, Hege (Museum of Archaeology, University of Stavanger) - Walser, Joe (National Museum of Iceland) - Mödlinger, Marianne (Università degli Studi di Genova)

Session format: Regular session

The archaeological record is a non-renewable resource. Material cultural heritage in public or private ownership, be it artefacts and ecofacts in museum collections or historic buildings and monuments, represents a huge archive of source material with enormous potential for improving our understanding of the past. However, these archives are often preserved as inactive matter rather than being actively incorporated into research programs. In the face of the so-called "curation crisis" and widespread funding cuts within the heritage sector, it is vital that we demonstrate the continuing research value of material cultural heritage and its relevance in the modern world. At the same time, a drive to conduct "sustainable archaeology", avoiding excavation unless a site is threatened by development or by environmental change, means that there is an increasing need to consider how new techniques and novel approaches can derive new information from existing collections.

In this session, we invite case studies using museum collection material, historic monuments and built heritage to explore traces of past human activity at all scales, from biomolecules to artworks, buildings and cultural landscapes. We also welcome papers exploring how archaeology as a discipline can better integrate studies of archived material and built heritage, especially so-called orphaned or legacy collections. We welcome interdisciplinary perspectives, especially those that bridge the humanities and sciences, and the material and the theoretical, as well as studies that demonstrate how knowledge of the past can contribute to current societal issues.

ABSTRACTS

1 FUTURE PRESERVATION OF PAST LIFE: MAKING THE MOST OF THE BIOARCHAEOLOGICAL ARCHIVE

Hollund, Hege (University of Stavanger)

The remains of ancient past life, plants, animals, and humans, often appear unrecognizable, brown, and fragmented, sometimes leaving just a stain or a microscopic trace in the soil. Why and how should we care for this type of material for future research?

In the study of past humans, few finds are more telling than human remains themselves. Bones and teeth have always provided important evidence for archaeologists, but have recently become increasingly more valuable with the advent of new methods such as ancient DNA and protein analyses. Such biomolecules tell the stories of individuals and populations through time. Unfortunately, the material is sensitive to decay and contamination which may compromise analyses. It is thus important to understand the complicated mechanisms responsible for the degradation, or preservation, of biological remains. These are complex materials entangled within the intricacies of the environment for hundreds or thousands of years. Furthermore, biomolecules are invisible to the naked eye. What factors determine the preservation of archaeological biological remains at various levels, macroscopic, microscopic, and molecular, in- and ex-situ?

To investigate this question, the Future Past project (2021-2025) carried out an excavation, and installed environmental monitoring in an urban medieval cemetery in Stavanger, Norway. The conditions of the freshly excavated remains are then compared to the skeletal remains already in the museum collections. The project combines traditional archaeology with environmental science and molecular biology, using state of the art methods to analyse both the material and environmental conditions.

This presentation will report the preliminary results of the project as well as provide a brief introduction into the background of the project, also discussing its conception within the institution, which has long standing traditions of interdisciplinary work and collaboration.

2 OLD BONES, NEW PROSPECTS: RESEARCH AND PRESERVATION OF IDENTIFIED SKELETONISED INDIVIDUALS FROM HISTORICAL ICELAND

Walser, Joe (National Museum of Iceland) - Ómarsdóttir-Sesseljudóttir, Freyja (National Museum of Iceland) - Konráðsdóttir, Hrönn (National Museum of Iceland)

In 1954 an excavation at the Bishopric of Skálholt, a site with over a thousand years of history, culture, and service to the local and greater community yielded a wide range of artefacts and human remains, including those of known identity. Among the individuals was the first bishop of Iceland, Páll Jónsson, who perished in AD 1211, and numerous other unknown and known-identity men, women, and children from the site. The known identity individuals were thereafter interred into wooden chests and placed within a crypt in the basement of the church. The National Museum of Iceland requested access to the remains for the purpose of conservation and research in 2020. The conditions in the crypt were poor for skeletal preservation, which can be clearly seen when comparing the images of the remains at the time they were excavated and the condition the remains are in today. Following our initial assessment, we have started a research and preservation collaboration with Skálholt and several scientific/academic institutions, aimed at investigating both historical and modern scientific questions relevant to Icelandic archaeology using modern technologies (e.g. ancient DNA, isotope analyses, AMS dating) and methods that were not available at the time of the excavation. It is uncertain what will become of the remains following this project, both practically and preservation wise, which may even be reburied. Thus, we intend to carefully document and digitally preserve these remains alongside our research objectives using photography, mould and cast making, and most importantly, 3D scanning. This presentation aims to discuss the archaeology of Skálholt, preservation of the named individuals, the 3D scanning work and osteological research, as well as set the stage for the upcoming archaeological science phase of the project.

3 DIFFERENT ROLES AND DIFFERENT PERSPECTIVES? VALUES AND PRACTICES OF USING LEGACY COLLECTIONS IN ESTONIA

Torv, Mari (Archaeology Department, Institute of History and Archaeology, University of Tartu)

The establishment of archaeological collections in mid-19th-century Estonia has laid the foundation for a rich heritage spanning over 150 years. These collections have played a crucial role in highlighting various aspects of past societies. In the past, collections were mainly used for non-destructive purposes like measurements and drawings of objects. However, with the advent of the 3rd scientific revolution, there has been a shift towards destructive sampling of legacy collections. Although the larger archaeological collections have set guidelines for their use, the challenges of destructive sampling have not been anticipated in depth.

Despite guidelines established by larger archaeological collections for their use, the challenges posed by destructive sampling were not thoroughly anticipated. The project “PaleoMIX: Nurturing Heritage Science with Novel Bioarchaeological Methods in the Eastern Baltics” has identified these challenges, emphasizing the need for a collaborative approach to adapting to evolving scientific practices and finding sustainable solutions for heritage use.

In this paper, I will delve into destructive sampling of ancient materials from legacy collections, specifically examining the roles and responsibilities of both researchers and collection holders. Using case studies from Estonia, I aim to explore the delicate balance between current research interests and the preservation of archaeological collections, ensuring their significance for future generations.

4 **NEW ASPECTS OF ANCIENT EGYPTIAN FLAX THAT WAS NAPPING FOR MORE THAN 150 YEARS IN A MUSEUM COLLECTION IN BERLIN**

Karg, Sabine (Free University of Berlin, Germany)

Flax seeds and capsules covering a wide chronological period (3000 BC-100 AD) are kept in the collection of the Botanical Museum at the Free University of Berlin. The desiccated preserved flax remains were collected at the end of the 19th century by Georg Schweinfurth, a German pioneer of archaeobotany and textile archaeology.

In order to determine whether ancient Egyptians had already selected and cultivated very specialized flax types according to their purpose for textile or oil production, respectively, we compared the finds from this Museum collection with nearly 3000 diverse genebank accessions kept at the Plant Gene Resources of Canada (PGRC). The main result was that fibre flax was most probably already cultivated during the the 3rd millennium BC, whereas in later periods an intermediate flax and/or oil type was in use. This example of the use of museum collections by archaeobotanists and genebank curators shows how our knowledge about ancient usage of plants can be expanded.

5 **UNVEILING PARCHMENT PRODUCTION PRACTICES FROM LARGE-SCALE ANALYSIS OF MALDI-TOF DATA**

Rodriguez Palomo, Ismael (University of Cambridge) - Viñas Carón, Laura (University of Copenhagen) - Nair, Bharath (University of Cambridge) - Fiddymnt, Sarah (University of Cambridge) - Collins, Matthew (University of Cambridge; University of Copenhagen)

Parchment is a secondary product derived mainly from sheep, goat and calf skin. It was the main writing material used in Europe in the Middle Ages. The animal skin was dehaired and soaked in an alkaline Ca(OH)₂ solution (lime), and then stretched. Each piece of manuscript is folded into a bifolium and several of these nested together comprise a quire. Quires are subsequently sewn into bindings, manuscripts or codices. Sometimes, bifolia were reused by cutting, turning and removing the text, forming a palimpsest, which would contain parchment from a variety of sources. Parchment was a limited and expensive resource that required high-level craftsmanship. In turn, the choice of the animals and the traces left in the final product by these technological practices can be analysed, unveiling differences in production techniques and the quality of the product between quires, manuscripts and collections. These can give us insights into husbandry practices, livestock economy, choices and supply chains and trade. Biocodicology tries precisely to study the biological information from parchment to address these questions. ZooMS has been used to identify the species from which parchment is derived by identifying certain species-specific collagen markers in MALDI-TOF. Several studies have analysed large collections of manuscripts to this end. In this presentation, I will describe other data analysis techniques that have been able to extract novel information from the same MALDI-TOF spectra that can be traced back to production practices, such as differences in the liming process, surface treatment, or how palimpsests are constructed from different sources. Specifically, the extent of deamidation of the peptides, which can be estimated from MALDI-TOF data, is related to the liming process. In a different type of analysis, quires and manuscripts can be clustered by their MALDI-TOF “peptidic profile” and novel markers identified.

6 **THE ULTIMATE PROXY DATA? THE SIGNIFICANT RESEARCH VALUE OF RADIOCARBON DATABASES**

Solheim, Steinar (Museum of Cultural History University of Oslo) - Loftsgarden, Kjetil (Museum of Cultural History University of Oslo)

To understand the development of pre-modern and present societies, we need to adopt a long-term perspective. This requires archaeological data that can be compared across time and space. One of few such datasets is radiocarbon dates, data that have an unprecedented potential for comparative research on topics such as paleodemography and land use intensification.

In this paper we present the largest collected database of radiocarbon dates from Norway, containing data from archaeological sites from the Mesolithic to the Medieval period. The database is generated over a period of five years

and is composed of over 14,000 dates from more than 2,000 archaeological sites from numerous excavations conducted by the Museum of Cultural History over several decades.

The range of sites containing radiocarbon dated samples, and the ever-increasing quantity, means that this data has a significant research value as a growing and sustainable source for knowledge production that can be reused when aggregated and made openly available. This database increases the availability and reusability of radiocarbon dates providing improved potential for increased understanding of the past through research and cultural heritage management.

Here we address:

- o How collation of radiocarbon data can provide new knowledge using proper methods.
- o How this radiocarbon database is integrated into both archaeological cultural heritage management and research.
- o How the database/data is used in dates as data-approaches.
- o How the data from the database is used to address different research questions and integrated into a range of scientific papers focusing on different chronological periods as well as comparing different regions.

7 **GREEN HERITAGE AND THE BUILT ENVIRONMENT: RECOGNIZING AND PROTECTING LOCAL DISTINCTIVENESS IN A MEDITERRANEAN URBAN SETTING**

Zaro, Gregory (University of Maine) - Blaće, Ante (University of Zadar) - Baraka Perica, Josipa (University of Zadar) - Jurković Pešić, Filipa (University of Zadar)

In the Mediterranean, many ancient and historic cities reflect rapid urban expansion into the modern era, often replacing what has traditionally been a mosaic of green spaces – that is, plough fields, orchards, vineyards, forests, and grasslands – with a more homogenized landcover of industrial, commercial, and residential spaces. Although largely unrecognized by local residents and visitors alike, legacies of this “green heritage,” including Roman centuriation, drystone walls and cairns, or surviving groves, may still be reflected in scattered field plots, unkept green spaces, and even within the complex arrangement of streets and alleyways around the city. Unfortunately, these reflections of past land use are also regularly ignored by historic preservation or conservation efforts, which tend to focus on historic urban nuclei and the array of architectural monuments they contain. In this paper, we explore the legacies of built heritage, or green heritage, within the 3,000-year-old city of Zadar along Croatia’s Adriatic coast. Utilizing a GIS software, our approach combines data from archaeology, historic aerial imagery, cadastral maps, and contemporary city plans to illustrate the ways in which ancient and historic patterns of land use continue to shape the city’s urban spatial organization today. Documentation and protection of these land use legacies within the contemporary city would serve as a valuable archive of information about Zadar’s millennial-scale past, while also helping to promote an often-overlooked aspect of its locally distinctive character.

8 **MEDIEVAL MYSTERIES: REDISCOVERING LOST KNOWLEDGE AND SKILLS FOR A SUSTAINABLE FUTURE**

Ebert, Bettina (Museum of Archaeology, University of Stavanger)

This paper argues the case for taking a closer look at our medieval built heritage, as there is significant potential for new knowledge hidden within historic stone walls. What can be learnt from medieval craftspeople to help preserve our architectural stone heritage in an uncertain future? Medieval northern European churches are at increased risk of damage due to climate change, and forgotten historic materials and techniques may provide the key to preserving this cultural heritage.

An interdisciplinary research team is currently undertaking pioneering research on the medieval use of wood tar as stone adhesive in cathedral construction and repair as part of the project Sticking Stones, funded by the Research Council of Norway. The technique of using wood tar to attach stone blocks appears to have been widespread in medieval northern Europe, with evidence currently recorded in Norway, Germany and the United Kingdom. Yet, this craft has been forgotten over the centuries despite being in clear view on numerous medieval stone churches.

Intangible heritage and embodied knowledge are key concepts in understanding the craft skills behind these wood tar repairs, in conjunction with comprehensive material characterization of historic samples. In relearning these long-forgotten practices, new adhesive formulations based on medieval recipes can be created and tested for future use. The rediscovery of wood tar as stone adhesive presents a novel solution for modern heritage preservation in the form of alternative sustainable conservation adhesives based on historic techniques.

9 THE STONES OF NIDAROS CATHEDRAL – REDISCOVERING MEDIEVAL STONE GLUE

Hauglid, Kjartan (Norsk institutt for kulturminneforskning (NIKU))

The Trondheim Cathedral Restoration Workshop's stone collection (lapidary) was established in 1869. It consists of building stones that initially belonged to Trondheim's cathedral or other medieval churches. Several examples of building stones have been glued together, and others contain visible bolts. Subject to confirmation by analysis, the glue is likely to be tar-based and is very durable, even in a cold and wet Norwegian climate. Previously, it was assumed that some of these stones originated from 19th century restoration work. However, modern investigations as part of the research project Sticking Stones, financed by the Research Council of Norway, show that some stones were already reworked with adhesives as part of the construction process in the Middle Ages.

The extensive stone collection of the Trondheim Cathedral's Restoration Workshop is a significant source of material that has been studied and explored to a minimal extent. Deeper investigations of the stone adhesive will improve our knowledge and understanding of building stone restoration. Exploring the medieval stones of the Trondheim Cathedral Restoration Workshop may, in the scope of the Sticking Stones project, lead to the rediscovery of an adhesive that can replace the synthetic polyester or epoxy resin used today for medieval stone building restoration.

10 HOW CAN WE ACTIVATE FORGOTTEN MONUMENTAL CHANNELS BUILT BY KING FREDERIK II IN NORTHERN ZEALAND, DENMARK?

Aarsleff, Esben (Museum Nordsjælland)

In AD 1572 King Frederik II of Denmark ordered the construction of two water channels that would lead the water from two inland lakes into the lake around his castle at Frederiksborg thereby securing a constant water level. The channels were 7–8 km long, small by international standards, but rather large by Danish standards. Since there are only small natural differences in elevation, the bottom levels of the channels could be precisely measured by water engineers of the time.

The channels are known under one name as “Frederik II's channel” or the “Swedish ditch. The latter refers to a local legend saying that Swedish prisoners of war dug the channels or, more likely, that Swedish prisoners of war cleansed the channels in the 18th century.

Today the channels are forgotten and only partially preserved. In 2024 the Museum of Northern Zealand, Denmark, carried out archaeological excavations of the channels to investigate their construction. Concurrent research on the historical archives shed further light on the channels from a written perspective. The combined effort has shown that the channels were part of a greater story in which Frederik II transformed parts of the local landscape to improve the royal castle and its surroundings. On a smaller scale we have increased our knowledge regarding the construction of the channels from the excavations, but how do we engage the new results and create a better understanding of them in the present landscape and among the public?

The paper will present the results from the 2024 campaign both in the field and the archives, as well as some insight into how we envisage the future preservation of the channels.

11 RETHINKING ARCHAEOLOGICAL CONTEXT THROUGH ANCIENT ART COLLECTIONS: THE SCULPTURAL FURNISHING OF THE SO-CALLED CASSIO'S VILLA IN TIVOLI

Santarelli, Chiara (Sapienza Università di Roma)

Museums exhibit numerous Roman sculptures which are valued as treasures and celebrated from their aesthetic appeal. However, some of these pieces have an unknown provenance and are often detached fragments; consequently, the potential to fully grasp their importance and fit them into their original context is limited. Nonetheless, close analysis of these elements affords us the opportunity to develop our understanding of their function in the Roman world. Rather than just pieces of decorative art, we ought to think of these objects as archaeologically vital. By establishing a connection between the objects and their archaeological context our knowledge of the past can be enriched. This can prove to be particularly helpful when the objects' original contexts are no longer accessible or have been obliterated with no further investigations being carried out.

This paper intends to examine a group of marble statues discovered in the so-called Cassio's Villa, near Tivoli, during the 1700s. Indeed, the Villa has not been the subject of further archaeological excavations, and today it lies in a state of abandonment. The only useful information to outline the history of the site comes precisely from the sculptural furnishings found in situ, which are now scattered across international museum collections including the Vatican Museums, the British Museum and The Royal Palace of Stockholm. The study of these sculptural furnishings provided valuable insights into architectural remains, helping define archaeological phases of the site, as well as formulating hypotheses about the building plan and identifying where the marble decorations were originally displayed throughout the Villa. Therefore, this study contributes to a sustainable approach in archaeology and sheds light on a site that has been neglected for too long.

12 THE BRONZE STATUE OF ST. PETER ON THE TOP OF THE TRAJAN COLUMN

Rinaldi, Federica (Parco archeologico del Colosseo) - Pujia, Angelica (Parco archeologico del Colosseo) - Rivaroli, Laura (freelance)

The statue of St. Peter on the apex of Trajan's Column in Rome, Italy was installed in the 16th century by Pope Sixtus V to replace the statue of the Roman emperor Trajan, which had already been lost several centuries before. The statue is a monumental bronze, standing at a height of 40 metres above ground level and exposed to the elements – and therefore difficult, if not impossible, to maintain. Thanks to a grant from the government of the country Romania, starting in summer 2024 it will be possible to install a scaffold and proceed with the restoration of the statue, curbing the phenomena of degradation. The entire restoration intervention will be conducted with the best methodology currently in use for the restoration of copper alloy (bronze) monuments exposed outdoors, and will be documented in all its phases through photographic, graphic and textual documentation. Starting with the visual analysis of the monument, it is possible to proceed with a restoration program aimed at improving the general preservation condition of all metal elements.

13 DOCUMENTATION AND ANALYSES OF 11TH-12TH CENTURY BRONZE AND BRASS DOORS

Mödlinger, Marianne (Universität Salzburg, Austria) - Utz, Judith (Universität Salzburg, Austria) - Martin, Fera (Novetus, Austria) - Ghiara, Giorgia (Politecnico Torino, Italy)

Around 30 copper alloy doors from the 11th and 12th centuries have survived to the present day, forming the only preserved assemblage of large medieval bronzes. Most of the doors are located in Italy. The doors were made either entirely of metal or with single metal plates attached to a wooden base. Some of these metal plates have inlays containing various materials, often depicting religious iconography (e.g. saints, Biblical events). Previous research on the art and cultural history of doors has not thoroughly investigated the production process and the interaction between the material and the iconography.

This presentation will discuss the first results of the three-year FWF-funded research project at IMAREAL (University of Salzburg). The doors have been fully documented with high resolution images and 3D scanning. They have also undergone non-destructive analysis (XRF) that determined their chemical composition, wood type, and time period of the support materials used on selected doors. This data reveals the materials and techniques used, as well as information about the craftsmen, artists, and patrons involved in the manufacturing process. Comprehensive material analyses conducted on all of the doors on site has answered numerous questions, for the first time, about historic door production and material selection.

14 HISTORICAL ARCHAEOLOGY IN COLLECTIONS: NAVIGATING CHALLENGES AND EMBRACING OPPORTUNITIES

Connor, Kimberley (Stanford University)

Legacy collections from modern sites, particularly those from the nineteenth and twentieth centuries, present unique challenges in the midst of the ‘curation crisis’. This paper discusses insights gleaned from two case studies: the Hyde Park Barracks in Sydney, Australia, and the Market Street Chinatown Archaeological Project collection from San Jose, USA. It focuses on food and dining at the two sites using glass containers and tablewares from the Market Street Chinatown (1866-1887) and multi-material analysis from the Female Immigration Depot at Hyde Park Barracks (1848-1887) including glass, ceramics, metal, botanical, and faunal remains primarily recovered from underfloor occupation deposits.

Both collections pose significant challenges due to their sheer scale, origins in salvage excavations, and choices made in curation since the 1980s. Despite these challenges, both collections serve as invaluable resources for archaeological research. They provide rich datasets for addressing fundamental as well as emerging research questions, while also facilitating meaningful engagement with active descendant communities. In an era of uncertainty surrounding heritage institutions and academic archaeology, this paper explores the opportunities that emerge from re-assessing historical collections. By harnessing the potential of collections from the recent past, researchers can not only advance scholarly understanding, but develop innovative teaching methods, and foster public engagement. These examples underscore the value of re-evaluating historical legacy collections for understanding the past and communicating the importance of archaeology in the present.

15 THE HISTORY OF THE CITY OF TREPOL, FOUND IN MUSEUM BOXES

Videiko, Mariia (Kyiv Borys Grinchenko University)

The ancient city of Trepol, Ukraine, is first mentioned in chronicles from the 11th century AD. In 2018, I began work on a project to get a complete picture of its medieval history within a few years. However, first the COVID-19 pandemic in 2020, and then in 2022 the ongoing Russian invasion of Ukraine, stopped the archaeological excavations indefi-

nately. This led to the idea of studying the collections of the regional museum. Working with inventory books, and then the items mentioned in them from the territory of the city, gave interesting results: about a thousand objects with a connection to modern streets and estates were discovered. These include building materials, ceramics, and metal objects, which cover the period from the 11th to the 17th century AD inclusive. It was possible to map the distribution of these finds across the territory of the ancient city at different time periods.

Brick finds belonged to a church and a castle built in the 16th century, the existence of which was previously known only from documents. Ceramic vessels testified to the continuous existence of the city – including finds from the 14th century, which were absent from the documentary record. Finds of numerous kiln tile fragments from the 17th century showed the wealth of the inhabitants of the fortified part of the city, which according to documents numbered up to a hundred houses. Findings of jewelry and ecclesiastical items showed that the townspeople were already wealthy in the 11th and 12th centuries. Bronze artifacts indicate the likely presence of people from Scandinavia in the city and its surrounding region in the 11th century. The study of museum collections has not only revealed separate pages from the history of Trepol, but also indicated possible directions for future archaeological excavations.

16 THE 99%: THE AMERICAS COLLECTION AT THE BRITISH MUSEUM

Zborover, Danny (British Museum)

Amassed over three centuries, the Americas collection at the British Museum comprises about 100,000 objects. Like with many such large museums around the world, less than 1% has ever been on display. While objects for exhibitions and loans are routinely drawn from the various storage facilities, more recently these transformed into dynamic loci where community members, curators, scholars, artists, students, and the public at large can directly engage with the collection. The opportunity to closely observe, manually handle, measure, photograph, and share unobstructed space with preselected objects makes each encounter meaningful, ranging from the analytical to the reflexive to the emotive, oftentimes within the same visit. In tandem, digital platforms are being developed to enhance the visibility and accessibility to the collection, most crucially aimed at under-represented groups such as Indigenous peoples and communities of origin. Along with a growing emphasis on provenance studies and collection histories, these in-person and virtual engagements with cultural belongings are critical for exposing past injustices and offer an alternative museological discourse to repatriation, where this still remains an unviable option. The resulting multivocality feeds directly into more nuanced documentation, exhibitions, and acquisitions, and charts new ways in which cultural heritage can be activated and made useful to diverse audiences.

17 STAYING WITH THE OBJECTS. UNEARTHING THE POTENTIAL OF MUSEUMS' COLLECTIONS

Cosic, Natalija (Shared Conservation Department, MuHO)

Since the turn of the century, an increasing theme in heritage studies has been the future of heritage and the reevaluation of assumptions about its preservation for forthcoming generations. Despite the critical importance of these debates, numerous challenges for the heritage in museums exist and persist in the present. Drawing upon Donna Haraway's conceptual framework of "Staying with Trouble" and "kin-making", in this paper I advocate for interdisciplinary collaboration in managing collections.

Discussions revolving around the curator crisis have highlighted the imperative for responsible archaeological research and the efficient management of the extensive findings in post-excavation phases. The results from prior studies I conducted on archaeological heritage in Serbian museums have unveiled a fundamental challenge stemming from the assumption that all disciplines involved in object processing share an identical ontological understanding of the physical remains from the past. Combined with an uncritical approach to collecting and acquisitions, the practice has led to overcrowded storage facilities and a lack of collection overview. This, in return, prevents the core idea of research, preservation, and meaningful usage. I have seen similar difficulties since relocating to Vestland in Norway, even though the issue is management in museums with various collections and levels of complexities (e.g. cultural history items or contemporary art objects). This is not a unique predicament, as both UNESCO and ICCROM have previously identified (2011) the global issue of inadequate collection accessibility and packed depots.

I intend to present a decision-making model in development that explores innovative solutions for dealing with overcrowded storage areas and processing collections in museums while considering their contextual significance. The model lies at the intersection of conservation, heritage, and museum studies, and it is grounded in interactive learning and scenario-based approaches. Rather than handing definitive answers, it empowers stakeholders and all participants to arrive at decisions collaboratively.

18 MORE THAN STONE. BUILDING AND VISUALISING OBJECT BIOGRAPHIES FOR THE WILLENDORF II COLLECTION AT THE NATURAL HISTORY MUSEUM VIENNA

Posch, Caroline (Naturhistorisches Museum Wien) - Winkler, Viola (Naturhistorisches Museum Wien) - Filzwieser, Roland (Vienna Institute for Archaeological Science (VIAS)) - Eichert, Stefan (Naturhistorisches Museum Wien) - Brodtmann, Nikola (Naturhistorisches Museum Wien) - Haider, Anna (Naturhistorisches Museum Wien) - Posch, Celestine (Naturhistorisches Museum Wien) - Richards, Nina (Austrian Centre for Digital Humanities and Cultural Heritage)

One of the most famous objects in the Natural History Museum Vienna (NHMW) is the figurine known as the "Venus of Willendorf". The object inspired countless scientific articles, books, and treatises, as well as art projects, commercials, and awareness campaigns addressing e.g. obesity, body positivity, or breast cancer. However, for everyday museum visitors, the object stands alone, and it proves difficult to link the figurine with its archaeologically equally significant site of origin, Willendorf II. In this regard, the Venus is one of the examples in which a famous museum object overshadows its original context, at the expense of the underlying complexity of the respective item as well as related artefacts.

To address these issues, the Venus of Willendorf and the site Willendorf II were selected as one of five case studies of the bITEM project (Beyond the Item - Biographies and Itineraries of Cultural Heritage Objects in Museums and beyond). The project aims to combine "object biographies" and "actor network theory" to digitally map object itineraries as networks in CIDOC CRM (International Committee on Documentation - Conceptual Reference Model), based on the framework of OpenAtlas (<https://openatlas.eu/>). This will be realised as holistically as possible, connecting actors, related material things, digitized images and archival texts, 3D models, timelines, story maps, events, and places from the beginning of an object's existence to the present. These itineraries will be visualised in a freely accessible web application based on the FAIR principles on the bITEM homepage after the conclusion of data collection (<https://bitem.at/about>).

Through bITEM, a look beyond items such as the Venus of Willendorf is provided for the scientific community and the broader public, visualising its complex object history, strands of research questions, and interpretations of the last 115 years, as well as the rich archaeological collection of the site Willendorf II.

19 ACTIVATING THE INACTIVE THROUGH NEW TECHNOLOGIES: GIVING THE HISTORIC PLASTER CASTS OF THE NATIONAL MUSEUM OF IRELAND A NEW LIFE

Bevivino, Michael Ann (The Discovery Programme; University College Dublin School of Art History and Cultural Policy) - Shaw, Robert (The Discovery Programme)

How do you revive a historic museum collection? How do you make a historic collection relevant to today – especially when that collection consists of large, unwieldy and fragile objects?

This paper will consider these questions by looking at the National Museum of Ireland (NMI)'s significant collection of historic plaster casts of European sculpture. The collection, originally the centrepiece of the Dublin museum, lay dormant and relatively unknown for a number of years until recent efforts to revive it through popular exhibitions in Japan and Dublin.

Two interlinked projects are currently seeking to further bring these important objects to academic and public attention by using an innovative technological approach that bridges the humanities and sciences. Recognised as potential 'snapshots' of the original monuments when the casts were taken (some almost 200 years ago), a number of casts and moulds have been recorded via the most up-to-date technologies, including laser scanning and photogrammetry. Using highly detailed 3D models of the original monuments, it has been possible to compare the casts to the originals on a sub-millimetre level. This study yielded some very interesting results, including a deeper understanding and appreciation of the work of the artisans who created the casts.

An integral part of the recent projects is the dissemination of their results to a wide audience, including the local community where some of the original monuments can be found. This was originally intended to be through an exhibition that was to take place 'in real life' in the local museum; however the COVID pandemic required a shift in approach, resulting in an online digital exhibition instead. This paper will conclude by looking at the benefits of bringing this collection online in an innovative and user-friendly manner which brings the historic plaster casts firmly into the 21st century.

20 PHOTARCH - AN IMAGE OF THE PAST

Lindskog, Daniel (PHOTARCH)

Whenever an artefact is discovered it's either put on display in a museum or, more likely, put in a box and stored in an archive. Whichever the case, a photograph is taken. Often with different equipment and with different lighting condi-

tions, resulting in differently looking images. What if we did things differently? What if we used the same method, not just in one museum or in one archive, but in all of them.

The PHOTARCH is a method that, when spread wide enough, will result in a cohesively looking database of all things past, where the image, along with its metadata is free from copyright, free to publish and free for all to use.

This presentation will look at a trial run where the project explores three archives in three museums and sets out to make new images of the objects in a uniform style. By making the images in a style that allows for easy comparison, the artefacts are seen in a new light and made available to the public at the same time. It adds a piece to the big picture that is an artwork of all works of art within archaeology.

This project shows what can be done with three collections, displaying them as a whole, while asking the question: what would an image of everything look like? It's a suggestion of a standard of documenting artefacts in the future but also re-documenting what we already have in our collections to make our archives more accessible.

21 THE FIRST OPEN ACCESS DIGITAL ARCHAEOLOGICAL COLLECTION OF A STATE MUSEUM IN TÜRKIYE: DIGITIZATION OF JULIOPOLIS AND BUILDING ITS HERITAGE

Dolmus, Muhammed (Koç University Vehbi Koç Ankara Studies Research Center (KU VEKAM); Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Büyükkarakaya, Ali (Human Behavioral Ecology and Archaeometry laboratory (IDEA lab); Hacettepe University, Department of Anthropology) - Sertalp, Evren (Human Behavioral Ecology and Archaeometry laboratory (IDEA lab); Hacettepe University, Faculty of Communication, Department of Radio, TV and Cinema)

The Ancient City of Juliopolis, on the sacred Pilgrim's Road on the border of Galatia and Bithynia in the historical lands of Anatolia has hosted historical wealth dating back centuries, showing traces of the Hellenistic, Roman and Byzantine Periods. Today, a significant part of the ancient city, located 122 km away from Ankara, is submerged under the waters of the Saryar Dam, which was built in the 1950s. The ancient city came to light again following the excavations carried out by the Museum of Anatolian Civilizations in 2009. Bringing together the Museum of Anatolian Civilizations, Hacettepe University and Koç University VEKAM, the Juliopolis Project started to create a Digital Archaeology Archive (DAA) in 2019. The collaboration sought to bring global visibility to the ancient city and overcome limitations in access to the artifacts and immovable

heritage unearthed in these comprehensive excavations. This project has essentially enabled the creation of a useful, contemporary database for the finds or cultural heritage, and an open-access digital archive for preserving digital files. A standard database was also created by digitizing all documentation, artifact images, tombs, and artifact cards in the museum. At the same time, this project established inter-disciplinary collaboration, including specialists in bioarchaeology, geoarchaeology, numismatics, dendrochronology and social anthropology, ensuring that Juliopolis City is effectively researched, complex information is simplified and that everything is publically available through open access. The digitized wealth of Juliopolis is the pioneer of open-access archaeological collections in Türkiye. This study aims to explain how the project and the Juliopolis DAA works towards making the ancient city visible as valuable cultural heritage beyond its "passive" position in the Museum.

22 THE SOPHISTICATION OF THE BENAHOARITAS OF LA PALMA, CANARY ISLANDS (C.II-XV AD) THROUGH A UNIQUE OBJECT (PHOTOGRAMMETRY AND MULTISPECTRAL IMAGING)

Fumero, Emilio (University of La Laguna) - Rodríguez-Caraballo, Selene (University of La Laguna) - Álvarez-Rodríguez, Nuria (Museo Arqueológico Benahorita (La Palma)) - Pais-Pais, Jorge (Museo Arqueológico Benahorita (La Palma))

The Canary Islands remained isolated from the time of their settlement around the start of the first millennium AD until the arrival of the first Europeans in the 14th century. As a result, we find cultural and material developments that, although based on the same cultural substratum, differ greatly over the more than a thousand years that these societies have existed on the islands. The island of La Palma is a clear example of this variation, being one of the islands that showed the greatest level of sophistication in various types of craft production: ceramics, lithics, bone and, of course, textiles. This textile production using animal materials is usually related to the funerary world.

This proposal focuses on the treatment given to a completely exceptional piece even for the archaeological record of this island. It is a portion of dragon tree (*Dracaena draco*) trunk covered with a total of five leather bands sewn together. This object is housed in the island's archaeological museum, and was provided by a private donation. The object and its elements were documented in as much detail as possible, including 3D modelling using photogrammetry, detailed photography of the piece and its various parts, and UV photography. Following this recording, samples were taken for radiocarbon dating and to determine the animal provenance of the hides using ZooMS.

In the absence of the results of these molecular analyses, the uniqueness of the piece and the detailed graphic documentation have made it possible to determine some aspects of the original production and subsequent conservation, in addition to preserving all the macroscopic information before compromising its integrity through sampling.

23 DIALOGUES BETWEEN ANCIENT WESTERN ASIA AND US. UNTOLD STORIES FROM ITALIAN COLLECTIONS AND ARCHIVES: THE DIWA PROJECT

Alaura, Silvia (CNR - Consiglio Nazionale delle Ricerche, Istituto di Scienze del Patrimonio Culturale, Roma) - Catagnoti, Amalia (Università degli Studi di Firenze) - Conti, Claudia (CNR, Istituto di Scienze del Patrimonio Culturale, Milano) - Damiano, Rossana (Università degli Studi di Torino) - de Martino, Stefano (Università degli Studi di Torino) - Devecchi, Elena (Università degli Studi di Torino) - Felli, Candida (Università degli Studi di Firenze) - Pedrazzi, Tatiana (CNR, Istituto di Scienze del Patrimonio Culturale, Milano) - Peyronel, Luca (Università degli Studi di Milano)

The project "Dialogues between ancient Western Asia and us. Untold stories from Italian collections and archives" (DiWA), recently financed by the Italian Ministry of University and Research (MUR) and Next Generation EU, is aimed at the study, enhancement and communication of the collections of Western Asian artefacts and related archives housed in two of the most important Italian museums: the Museo Archeologico Nazionale di Firenze (MAF) and the Museo di Antichità - Musei Reali di Torino (MAT).

DiWA is a transdisciplinary project involving historians, archaeologists, and philologists of ancient Western Asia, as well as experts in non-invasive diagnostics as applied to cultural heritage, virtual museums, public archaeology, and cultural heritage communication. The project uses cutting-edge technology (e.g. Raman Spectroscopy, X-Ray Fluorescence, infrared spectroscopy - ER-FTIR) to establish and implement an innovative model for managing artefacts such as cylinder seals and cuneiform tablets in museum collections. We adopt a holistic approach to the preservation and value-enhancement of cultural heritage according to some of the major aims of contemporary museums.

The goal of the DiWA project is to characterize the Western Asia collections housed in Florence and Turin as free spaces for dialogue between past and present, and between countries and cultures. It harnesses the full potential of cross-cultural heritage as a driver of sustainable innovation, realized through engagement with society and citizens, as well as through improved documentation and promotion. DiWA's innovative results will contribute to integration and societal cohesion by providing better, wider, and more equal access to Western Asian cultural heritage in Italy. Moreover, it will foster a pattern of cultural inclusion that enhances the integrative potential of cultural heritage in multi-cultural societies.

24 WHISPERS OF CARIBBEAN ISLES: INCLUSIVE NARRATIVES FOR REDISCOVERING MAA'S PRE-COLUMBIAN ARCHAEOLOGY COLLECTIONS

Lobo Guerrero Arenas, Jimena (University of Cambridge) - Antczak, Oliver (University of Cambridge)

The Whispers of Caribbean Isles project, conducted at the Museum of Archaeology and Anthropology (MAA), University of Cambridge, aimed to activate museum archaeology collections by engaging contemporary Caribbean communities through innovative methods. Focused on Trinidad and Tobago's archaeology collection at MAA, the project sought to deepen connections between existing collections and stakeholder communities locally and abroad. Two key working groups, one from diaspora communities in Cambridge and another in the Caribbean, collaborated in unpacking materials at MAA facilitated by a digital platform. This paper presents workshop results on reapproaching Indigenous pasts, fostering inclusive narratives of memory and identity, and developing a pilot digital platform for sustained community dialogue. Furthermore, it explores discussions ignited by the project on decolonizing practices and the nature of pre-Columbian Caribbean collections. Through its collaborative approaches, the Whispers of Caribbean Isles project endeavoured to amplify Caribbean voices, unveil untold narratives, and foster a more inclusive understanding of the region's rich cultural heritage. We aim to show how studies like this contribute to the broader discourse on community engagement in museum archaeology and underscore the importance of collaborative initiatives in promoting cultural inclusivity and representation.

25 THE PROVENANCE RELIABILITY INDEX: SPOTLIGHTING THE IMPACT OF OBJECT HISTORIES ON OUR UNDERSTANDINGS OF THE ANCIENT WORLD

Neill, Liz (Boston University)

Provenance: literally, from where a thing comes. At times considered secondary to the aesthetic value of an artwork or a secret to be hidden away in restricted files, particularly in museums outside of objects' countries of origin, object histories have become more widely discussed in recent decades. Major museums have hired staff to ensure their collections are up to date, particularly those with paintings of WWII-era provenance. Every museum object has its own history. The professional standard for ancient art is a pre-1970 history, in accordance with the 1970 UNESCO

Convention: a binary checkbox that glosses over earlier histories and can mask 20th- or 21st-century antiquities trafficking. Hundreds of years of the antiquities trade have left us with many intermediate shades of gray. The Provenance Reliability Index provides a basic framework to research and analyze these earlier object histories and a constructive way to interpret collections that do not meet the current standard. This fuzziness in the dataset is not a bug, but a feature: when we consider what types of geographical data we have, we can find more ways to analyze, preserve, and exhibit ancient art in the future while acknowledging the complex history (and present) of the field.

615 ARCHAEOLOGY OF ARCHAEOLOGY?

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: van Wijngaarden, Gert (University of Amsterdam) - Clare, Lee (Deutsches Archäologisches Institut, Istanbul) - Waagen, Jitte (University of Amsterdam)

Session format: Session with keynote presentation and discussion

Many excavators have to deal with the remains of older excavations at their site of research. Spoil heaps and old trenches, as well as archival documentation and photographs, all testify of the activities of former archaeologists. In this session, we will discuss the extent to which these remains can be used to inform us about the epistemology of archaeological research.

We will present the 'Archaeology of Archaeology' approach, which is being developed at the University of Amsterdam. This approach aims to understand better how the excavations at ancient Troy in Turkey have functioned as research contexts in which knowledge has been produced.

The current geography of a place such as ancient Troy in Turkey is determined at least as much by the archaeological activities over a period of more than 150 years as by ancient habitation. The remains that testify of the activities of previous excavators can be investigated archaeologically. For example, old trenches can be re-investigated to review documentation methods. Excavation can be done in old dumps to study collection practices. There are additional possibilities using innovative technologies.

By now, archaeology has a long history and can itself be investigated archaeologically. In this session we aim to discuss how the remains of older excavations can serve to shed light on the process of archaeology. In particular, on the basis of best practices, we hope to begin to formulate methodologies and guidelines to arrive at a diverse toolkit for this new field of archaeology of archaeology. The possibility to publish the session's papers will be considered.

ABSTRACTS

1 ARCHAEOLOGY OF ARCHAEOLOGY AT ANCIENT TROY: THE AMSTERDAM TROY PROJECT (2018-2022)

van Wijngaarden, Gert (University of Amsterdam)

Troy is one of the most well-known sites in archaeology. Systematic excavations have been conducted at the site in Turkey from the 1860's up to the present day. Because of the fame of Troy, these researches, led by enigmatic directors such as Heinrich Schliemann, Wilhelm Dörpfeld, Carl Blegen and Manfred Korfmann, can be considered exemplary for Mediterranean field archaeology as a whole. Therefore, Troy is an ideal site to study the development of archaeological field practice.

The many excavations have had a great impact on the topography of the site. The exposed archaeological remains are surrounded by extensive spoil heaps, and interspersed with caved-in trenches, exposed sections, walkways and such. Since 2018, we have been studying these remains archaeologically in the framework of the Amsterdam Troy Project. We made trenches in dumps from different excavation campaigns to determine what was not collected, in order to compare this with registered and published finds. We have re-excavated filled-in trenches to study archaeological features, and are comparing our findings with what was documented and published. The aim of these researches is to assess what the effects of excavation practices are on the knowledge produced about a site.

In this paper, we will present the backgrounds and methodology of our approach. In addition, we will show some of the first results of our research. The hope is that we can continue to develop the approach of archaeology of archaeology.

2 DUMPS AND DITCHES – PRISMS OF ARCHAEOLOGICAL PRACTICE AT KALAUREIA IN GREECE

Berg, Ingrid (Uppsala University)

In the summer of 1894, two philologists from Uppsala University conducted the first Swedish excavation in Greece. On the island of Kalauria (Poros), they worked together with a local workforce in the Sanctuary of Poseidon. In 1997, the Swedish Institute in Athens resumed the excavations which are still on-going.

Archaeological excavations leave traces behind and change the cultural landscape. In fact, it produces a heritage site that alters the perception of place and potential for land use. The dumps and ditches left behind at Kalauria not only have the potential of informing us about methodology and collecting, but are in themselves monuments of archaeological heritage and part of the history of the site. By analysing remains of archaeological practice as cultural features, I approach the history of archaeology as our professional heritage. Informed by perspectives from critical heritage studies, the dumps and ditches from 1894 reveals how archaeology functioned as a cultural and social practice in the late 19th century. The archaeology of classical archaeology thus becomes a history of class, race and power hidden among the ruins of antiquity.

3 THE ARCHAEOLOGY OF ARCHAEOLOGY AT TEL AKKO, ISRAEL

Killebrew, Ann E. (The Pennsylvania State University) - Skinner, Jane C. (The Pennsylvania State University)

In this paper, we present approaches and techniques to investigate, reconstruct, and publish the largely unpublished large-scale excavations at Tel Akko/Akka, a major second and first millennia BCE maritime center on the central Levantine coast, directed by Moshe Dothan from 1973–1989. As with all excavations, the research questions and methodologies are major factors in determining the outcome and production of knowledge. Understanding these components, especially of legacy excavations, as well as the methods and personality of the excavator ("excavating the excavator") are essential in our attempts to uncover the epistemology of the 20th century Tel Akko excavations. To provide insights into the production of knowledge of the original expedition, the renewed excavations at Tel Akko (2010–2019), co-directed by Ann E. Killebrew and Michal Artzy, utilized several approaches. These include digitally preserving and archiving the original field documentation and photos; organization/standardization of varied field recording systems and archaeological terminology by means of a Filemaker database; resurveying the visible archaeological remains via photogrammetry and Geographic Information Science; and re-excavating Dothan's trenches and excavating adjacent unexamined areas of Tel Akko. These previously unexposed units provide a rigorous stratigraphic control for the site and allow us to apply 21st century collection techniques that can be used to assess quality and compare with the Dothan archival material.

4 REDISCOVERING ROMAN MALTA. THE MELITE CIVITAS ROMANA PROJECT AT THE DOMVS ROMANA OF RABAT (MALTA)

Tanasi, Davide (University of South Florida) - Cardona, David (Heritage Malta) - Lowe, Benedict (University of North Alabama) - Brown, Robert (Intercontinental Archaeology) - Wilkinson, Andrew (Intercontinental Archaeology)

After Malta's inclusion to the Roman territories in 218 BCE the Islands go through a cultural transformation that is epitomized in the late Republican domus built in the main town of Melite (modern Rabat and Mdina). This house provides the most emblematic example of Romanitas in Malta and was likely connected with a Roman of high rank. Its remains were cleared in 1881 under the watchful eye of A.A. Caruana, with a major new impetus in excavation carried out by Sir T. Zammit between 1920 and 1925. The two, have left us with an expanse of exposed ruins with very little, or no, stratigraphy, and an even less clear understanding of the standing walls and structures. This is exacerbated by the fact that further trenches have been excavated beyond the present site limits, trenches which have since been lost and are thus completely misunderstood. Since 2019, the site has been at the center of the research project Melite Civitas Romana, which is reassessing all the evidence using modern technologies and conducting new archaeological excavations. Although the overall aim of the project is to investigate untouched remains, the first few years of the project are inevitably concentrated at understanding the structures resulting from the 1881 and 1920s excavations, locating the old trenches, and trying to tie old and new data together to help us comprehend part of the Roman town of Melite. This paper will outline the difficulties encountered in marrying the written data, past interpretations with what is present on site. It will also present new results in this respect, including the examination of baulks and stratigraphic sections from Zammit's time, and the discovery of new structures alongside new contexts which have, for the first time, offered a new perspective on the Roman and Late Roman history of Melite.

5 BUILDING ON ARCHAEOLOGY OF THE 1930S AND 1960S: REINVESTIGATING THE TOWN ABOVE THE SANCTUARY OF HERA, PERACHORA

Lupack, Susan (Macquarie University) - Skuse, Matthew (British School at Athens) - Kassimi, Panagiota (Ephoreia of Antiquities of the Corinthia) - Sobotkova, Adela (Aarhus University) - Ross, Shawn (Macquarie University) - Weissova, Barbora (Bilkent University)

The 8th–2nd century BCE Sanctuary of Hera at the tip of the Perachora Peninsula was initially excavated in the 1930s by Payne of the British School at Athens. Payne and then Dunbabin, who continued Payne's work, also investigated the town located above the sanctuary in an area called the Upper Plain. There they found evidence for what they interpreted as a 'substantial town' with its large structures (e.g., Dunbabin's House is 23x13 m) and extensive

waterworks. In the 1960s, Tomlinson reinitiated work there, excavating both within the sanctuary's temenos and in the Upper Plain. Tomlinson's estimation of the Upper Plain's settlement was radically different from his predecessors', characterising it as 'a scatter of houses'.

The Perachora Peninsula Archaeological Project is currently conducting intensive surface survey, legacy data verification, Lidar, and drone photogrammetry over this town. A necessary part of our work has been questioning Payne and Tomlinson's diametrically opposed interpretations and the likely motivations for their (perhaps) over- and underestimating the significance of the town. Researching the respective projects within the BSA archives and documenting the changes the structures have undergone since they were excavated have also been key for this project.

We were also intrigued to learn that Payne had used a certain area for pot-washing and ceramic analysis. We conducted total pick-ups in five squares and found that one produced an extremely high concentration of sherds – nearly 20,000 – most of which represented small cups and pouring vessels. This sample will give a quantitatively (by nearly 10x) clearer view of the sanctuary's pottery than has been previously available. It may also give a qualitatively clearer view, as previous analysis of the sanctuary's ceramics addressed selectively chosen assemblages. This collection thus provides an alternative view of the sanctuary's religious practices to those presented in the past.

6 ALL THE THINGS LEFT BEHIND – THE REMNANTS OF THE H. HAUPTMANN AND K. SCHMIDT EXCAVATIONS IN THE URFA-REGION, TÜRKIYE

Kinzel, Moritz (German Archaeological Institute Istanbul)

Each year when returning to our excavation house at the outskirts of Şanlıurfa, we are welcomed by the long history of our excavation house furniture and equipment; reaching as far back as to the 1960ies excavations by Hauptmann in the Keban Dam area. Since then, each year leftovers of the field seasons have added - layer by layer - to the dig house stratigraphy. For sure from time to time someone might clean out spaces and shelves to re-organise it, but there are always traces of the past left. Is an excavation house – archaeologically speaking - a midden, a storage, a knowledge container or a ritual place where we donate and deposit things to our ancestors? However, recently we had the chance to dig even deeper into the heritage of the earlier excavation days. In cooperation with the Şanlıurfa Museum we started to re-do the inventory of the find boxes from the Harald Hauptmann excavations along the Euphrates. Besides the registered, packed and boxed archaeological finds, we also came across a number of items that offer insights into the archaeology of archaeology and the things archaeologist leave behind. In other words, the future past is now. The contribution will present some of the “finds”, their context and what they may tell about us as archaeologists.

7 THE CONTRIBUTION OF STATE-OF-THE-ART TECHNOLOGY TO THE ARCHAEOLOGY OF ARCHAEOLOGY APPROACH, A CASE STUDY AT TROY

Lanjouw, Tijm (University of Amsterdam) - Walsh, Alicia (University of Amsterdam) - Waagen, Jitte (University of Amsterdam)

The Archaeology of Archaeology approach deals with archaeologically researching complex and long-excavated archaeological sites to understand better the strategy and motives of previous excavators and facilitate re-evaluation and re-interpretation of their results. On the one hand, this allows new perspectives on the archaeological narratives about the past, while on the other hand, this potentially helps the modern archaeologist to appreciate how social, ethical, political, and theoretical context can be a determinant of the archaeological process, and better explain narratives emerging from historical archaeological activity at a site. One of the methods to engage with archaeologically researching archaeology is to apply modern digital techniques. The archaeological laboratory of the site can be meticulously documented by scanners and drones equipped with a whole range of sensors, creating highly detailed 3D surface models of the site. These can be used to better understand the current archaeological topography of sites as they are now but are also suitable for creating an environment to study old documentation. In this presentation, a few preliminary results of such applications will be shared in relation to the work of the University of Amsterdam and the 4D Research Lab at the ancient site of Troy, Turkey in which we have re-examined the various stages of its excavation throughout the last one and a half centuries. One approach has been to digitize and geolocate old photographs of the site and the excavations back into a 3D environment, and subsequently use projection mapping and virtual modeling to match their contents on the current topography or recognize changes in the landscape that were not documented in excavation reports. This can lead to new insights as to the state of the site in various moments in the past and understand how archaeological actions in the past shaped its modern topography.

8 (RE)CONSTRUCTED POTS AT TROY: THE LOCAL POTTERY MENDERS FROM THE UNIVERSITY OF CINCINNATI EXPEDITION TO THE TROAD

Kramer, Jeffrey (University of Cincinnati)

Carl W. Blegen, Marion Rawson, and John L. Caskey published scores of whole or nearly whole vessels in the four double-volumes documenting their excavations at Troy from 1932-1938. Yet only a single paragraph in Troy I hints at how these vessels were mended – a small group of local workers were tasked from 1934 until the end of the expedition in 1938 to find joins between pottery sherds and then restore, as completely as possible, these whole or mostly whole vessels.

In this paper, I redress this omission by identifying these local workers via records from the Troy collection in the Archives and Special Collections of the Department of Classics at the University of Cincinnati. This collection includes extensive financial records for each season listing every expense, including costs of labor and even the supplies used in the mending process. Supplementing the financial records is information from Carl W. Blegen's Director's Notebooks and unpublished photographs of the excavation. The photographs in particular allow us to fully visualize the workers, even when the precise identification of a worker cannot be fully ascertained. Finally, we also can reconstruct the environment in which they worked.

As I demonstrate, the study of archival records – even at a site as thoroughly investigated as Troy – can reveal new information about both a site and those who worked there. Moreover, an analysis of the pottery menders emphasizes the nexus between the examination of such a crucial aspect of material culture – pottery – and those who unearthed and reconstructed it.

9 BUILDING ON BLEGEN: LEGACY DATA FROM MYCENAEAN ZYGOURIES

Hilker, Sarah (University of North Carolina at Chapel Hill)

Beginning in the 1910s, Carl Blegen excavated at a number of sites across Greece. The American School of Classical Studies at Athens/Corinth retains many of his excavation diaries as well as much of the preserved pottery from his early excavations in the Corinthia. Although Blegen published (1921, 1928) the results of his work at Korakou and Zygouries, a wealth of untapped information remains a century later in storerooms in Ancient Corinth.

The larger project, Zygouries: the “Potter's Shop” in Context, involves examining preserved but unpublished Late Helladic (Mycenaean) sherd material in conjunction with the field notebooks by Blegen, J. P. Harland, and J. Donald Young. The pottery under study comes from throughout the site, not just from the so-called Potter's Shop, which has been better studied (Blegen 1928, Shear 1986, Thomas 1992) on account of the preserved architecture and large number of associated mendable vessels. Ultimately, the goal is to develop and publish a more nuanced understanding of Zygouries' development into a Mycenaean settlement with palatial connections.

In this paper, I discuss the challenges of the project and my methodology for dealing with this legacy data. This includes correlating different trench naming systems, developing digital composite plans based on unpublished notebook and archival drawings, reconstructing stratigraphy where possible, reconciling preservation bias, and identifying meaningful data despite said preservation bias. While I focus on Blegen's work at Zygouries and my methodology for revisiting this particular legacy material, I will also briefly contextualize his approach at Zygouries within his other work, particularly at Korakou, where he excavated several years before Zygouries. Lastly, I touch upon the differences between the three excavators' notebooks, particularly as they relate to reconstructing the excavation progress, architecture, contexts, and stratigraphy.

10 ARCHAEOLOGY OF ARCHAEOLOGY: THE CASE OF GIACOMO BONI

van Kampen, Iefke (Museo dell'Agro Veientano) - Rathje, Annette (Emeritus Associate Professor University of Copenhagen)

Giacomo Boni (1859-1925) for many years excavated at the heart of ancient Rome, at the Forum and Palatine (1898-1915). His work has been subject of much attention, in the first place for the important results obtained and the many monuments brought to light, but also because of his methods and original ways of proceeding. In recent years (2021-2022) a huge exhibition has been dedicated to Giacomo Boni, l'Alba della modernità (the Dawn of Modern Age), attempting to make a new evaluation of the famous excavator, putting him into the context of his time. The preparation of the exhibition has been the pretext to elaborate a new museum display of the Antiquarium del Foro, but has left also traces inside the archaeological site: totems with historic photographs of the excavation days, meant to signal the sites involved in the temporary exhibition, are now probably meant to stay and help the visitor to connect what is left with the moment of its discovery. Our contribution aims at making a new evaluation of the state of the art and allows to compare the archaeology of archaeology of yet another important archaeological area besides Troy. Also in our case we are bound to study archival material and the very finds in order to reconstruct excavations, besides

the excavations of older excavations (e.g. Einar Gjerstad excavating again at the same sites of Boni's excavations). The authors in particular refer to their study of Boni's excavation at the Sepolcreto arcaico site.

11 **ARCHAEOLOGY OF AN ARCHIVE – OPPORTUNITIES AND CHALLENGES. THE THECLA BASILICA IN MERIAMLIK AS A CASE STUDY**

Krampe, Magdalena (Albert-Ludwigs-University Freiburg)

Research on Cilicia (Asia Minor), in particular Meriamlik and Korykos, is still largely based on the works of Samuel Guyer (1879–1950) and Ernst Herzfeld (1879–1948), who traveled through Cilicia in 1907 while carrying out several small-scale excavations. The results, however, were only published 23 years later in one volume. Findings of Guyer's previous journey through Cilicia in 1906, which include recordings of approximately 100 churches, are unpublished.

Notes, numerous photos and sketches of both expeditions, as well as the excavation records, are relevant sources for my dissertation, which raises questions both on research as well as on architectural history.

In a case study, I will demonstrate how archival materials can provide new insights not only in terms of research history, but also for archaeology in general. Although Guyer and Herzfeld documented the incorporation of an "Armenian" church into the 5th century Thecla Basilica in Meriamlik – once the largest church in Cilicia –, they did not question the later incorporation's structure and function, as their focus was clearly on the earlier monumental basilica. Based on references in sketchbooks, the actively used sacred space may have remained consistent: The "Armenian" church, although seemingly smaller on the first glance, might have encompassed the entire area of the former basilica. Archival material offers the sole opportunity for further insight, as it seems likely that later investigations on the 5th century basilica removed and thereby destroyed most remains of the "Armenian" church.

Consequently, my aim is not only to present the material itself, but also to demonstrate the extent to which archival materials enable new archaeological findings. Questions on specific limitations of such an approach are necessarily part of the discussion.

12 **APPROACHING THE ARCHAEOLOGY OF ARCHAEOLOGY AT GÖBEKLI TEPE, ŞANLIURFA, SOUTHEAST TÜRKIYE**

Clare, Lee (German Archaeological Institute, Istanbul Department)

Despite its comparatively short excavation history, the Early (Pre-Pottery) Neolithic site of Göbekli Tepe (Şanlıurfa, Southeast Türkiye) has become a focal point not only of academic concern but also of ever-increasing esoteric interest, including various conspiracy theories, since fieldwork began there in 1995. The current popularity of this World Heritage Site has emerged from the entanglement of these two key areas, also culminating in the formulation of such descriptive terms of the archaeological remains as the "World's First Temples" and the "Zero Point in Time". In this paper, we illuminate the processes leading to this development over the last three decades, emphasising the roles played by archaeologists and the media. Furthermore, we highlight the role of past excavation and find collection strategies in previous interpretations and the difficulties encountered when revising what has become a securely anchored paradigm relating to site formation and function of this enigmatic Early Holocene site.

616 **WHOSE HERITAGE? MIGRATION AND HERITAGE: PROBLEM OR OPPORTUNITY?**

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Viragos, Gabor (EAA Heritage Advisory Committee; Hungarian National Museum) - Demoul, Jean-Paul (EAA Community on Archaeological Legislation and Organisation; Institut Universitaire de France & Université de Paris)

Session format: Discussion session (with formal abstracts)

The movement of people has been part of European history from the earliest migration into Europe out of Africa millennia ago to the present. Taking the long-term view that archaeologists possess, we are all representatives of immigrant communities. And yet, today, migration is declared across Europe to be a 'problem' requiring 'solutions'. Such rhetoric feeds into and supports community division and fear of others who are different. While transphobia, homophobia, islamophobia and antisemitism grab the headlines within countries, there are also existing European populations also treated as 'outsiders' that nobody notices.

The attitude towards the various forms of migration within and from outside Europe is at root a cultural phenomenon – it is not natural but created. Heritage management has often argued that sites and archaeological cultures are important for local and regional identities. Does it thereby also share in the rejection of people with other origins and identities? This is equally true for long standing ("historical") national minorities in present-day countries and "new" migrants (even if the border has moved, not the persons). And what of the heritages of those who are entering Europe from other parts of the world? Is the idea of European heritage an exclusive one, or one that seeks to incorporate new

elements (and perhaps we can remember how much the heritage of individual communities is in itself borrowed from elsewhere, often the result of the colonisation of other parts of the globe)? Should we – as workers on heritage – be concerned with migration at all?

This session seeks contributions which address these and other related questions. The session consist of the presentation of formal papers and their wider discussion, also involving commentators drawn from the EAA Heritage Advisory Committee and Community on Archaeological Legislation and Organisation.

ABSTRACTS

1 **VARIATIONS FOR PEOPLE AND HERITAGE: INDIGENOUS AND IMMIGRANT - LOCAL AND IMPORTED**

Viragos, Gabor (Hungarian National Museum (Magyar Nemzeti Múzeum); EAA Heritage Advisory Committee)

Culture – and tangible heritage as a significant part of it – is enormously important for Europe, giving a solid base to its present functioning, human-social behaviour and future development. Europe as a whole, but also its nations and states, are closely reliant on cultural heritage and therefore also strongly committed to it. Because of historical reasons, the states of Europe were based for a long time on traditions, ethnicity and cultures. As migration became a very hot issue in Europe (both the incoming and the intra-European one), most of Europe, and particularly the urban zones, is now inhabited by a multi-ethnic and multi-cultural population. The conflicts arise mostly from the cultural shock caused by facing other cultures locally. People growing up or living in a culture different from the one their parents lived in or from the one the majority of the surrounding people live in, have a different sense of personal and collective belonging. Consequently, their relationship with the locally accessible cultural heritage is different. Because of the constant and growing need of the developed countries to replace the aging workforce with immigrants, the changes in state-borders in the 20th century and the various forms of mobility (education, Foreign Service, military or religious mission, tourism, etc.), the present societies, identities, built environment and historical basis of the European community are challenged. What are the various impacts of this situation on cultural artefacts, buildings, sites and landscapes, and what is the impact of this cultural heritage on the local non-native population or on the social groups otherwise not committed to this heritage? This interaction involves the questions of migration, racism, nationalism on the one, and archaeology, listed monuments and historical landscape on the other side. The objective is to encounter the possible major scenarios of this relationship.

2 **ARCHAEOLOGICAL HERITAGE MANAGEMENT AND LOCAL HISTORY - WHOSE PAST IS AT STAKE HERE?**

Fries, Jana (Niedersächsisches Landesamt für Denkmalpflege)

This paper is following the line of enquiry as to why and how archaeologists use narratives that claim or imply supposed population continuities since prehistoric times in their public relations work. Looking at the day-to-day work of heritage management, it is a popular reasoning to woo politicians, the local population or the media into supporting a preventive excavation, claiming that it yields potentially sensational results concerning the history of the respective municipality or the local landscape. In archaeological research, we also often refer to the importance of our local work especially for the people of the region or the next village. It is often implied that there have been continuities in the way of life or landscape use since prehistoric times. The assumption that the ancestors of today's population already lived there is also sometimes stated, sometimes implied, by non-archaeologists and experts alike.

In my paper I will address the question of the effects of such assumptions on our work. How do they affect people with roots outside the region, the country or the continent? What political narratives do they serve? What preconceptions of the general public do we reinforce when we emphasize these continuities? Why do we rely on continuities at all to emphasize the importance of our work? Do we consider the history of a site as less relevant to those whose ancestors did not live in the region? The paper is intended to raise questions and start a discussion rather than provide answers.

3 **CHALLENGING "SENSE OF SPACE/PLACE". MIGRATION, NEWCOMERS AND ADVOCACY FOR DE-HERITAGIZATION PROCESSES**

Calaon, Diego (Ca' Foscari University - Venice) - Monica, Calcagno (Ca' Foscari University - Venice) - Magnini, Luigi (Ca' Foscari University - Venice)

Today's migration trends are challenging for those working in heritage fields, such as archaeologists, architects, and policymakers who deal with landscapes and historic sites. Archaeology often focuses on how past human movements have created rich, interconnected cultures. These connections are central to our understanding of history and are celebrated as part of our cultural heritage.

Yet, when it comes to managing and preserving this heritage, there's a tendency to see modern migration as a problem. This perspective suggests that migrants might threaten cultural heritage, and over-emphasizes the need to protect a so-called "local identity" by integrating newcomers and educating them about this heritage. As a result, when archaeologists move from research to the role of preservation, they often end up supporting a narrow view of heritage that resists change, aiming to keep historic sites "pure" and unchanged, and potentially missing out on the natural evolution of cultural sites through new influences.

This approach can unintentionally fuel social tensions in our globally connected world. This paper questions whether the traditional method of preserving artefacts and sites just because they're old is still the right approach in today's world, which is facing challenges like overpopulation and climate change. As archaeologists we are celebrating people's movements, as Cultural Heritage managers we advocate "authenticity" as proxy to divide and segregates "identities".

We'll discuss alternative ways to consider heritage in multicultural and migratory settings by looking at examples from Venice and its surrounding lagoon. Considering Faro Convention principles, the goal is to find approaches that can ease social tensions by embracing the evolving nature of cultural heritage in these diverse communities.

617 FROM LOTS OF DATA TO BIG DATA: STRATEGIES FOR QUALITY, REUSABILITY, AND ACCESSIBILITY OF DATABASES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Schjerven, Noline (University of Gothenburg) - Dahlberg, Fredrik (University of Gothenburg) - Bilotti, Giacomo (Christian-Albrechts-Universität zu Kiel)

Session format: Regular session

In this session, we aim to explore the use of databases in managing the increasing volume of information produced in the field of archaeology. As we transition from dealing with "Lots of Data" to grappling with the ever more present concept of "Big Data" and the challenges that follows, one of the key challenges is the integration of legacy data with the continuous influx of new information. This task is not only about managing the volume of data, but also to ensure the quality, relevance, and accessibility of the data.

By building on the principles of FAIR – Findability, Accessibility, Interoperability and Reusability as described in Wilkinson et al. (2016), it ensures that data is not only accumulated but also effectively utilized and shared. Currently, the time and effort involved in understanding the semantics of various databases is overwhelming, however, the field of archaeology strives to adapt to new technologies by stepping into transdisciplinary collaborations.

Key questions

- What strategies can be employed to ensure the quality and relevance of data in databases?
- How can we effectively integrate new information with legacy data without compromising data integrity?
- What are the challenges in transitioning from traditional datasets to Big Data, and how can they be addressed?
- What setbacks have been encountered in the process of data management, and what lessons can be learned from them?
- How can the use of databases assist in shaping our field and the archaeological discourse?

We want to look into the principles of FAIR, and the different strategies for its implementation in databases. We welcome presentations from organizations and projects that are currently battling these issues. We want to hear about your innovative solutions, insights, and your setbacks. Our aim is to foster mutual learning and cultivate improved practices through sharing experiences.

ABSTRACTS

1 MODERN PATHWAYS TO MOBILITY NEW APPROACHES TO MOBILITY AND CONNECTIVITY IN ARCHAEOLOGY IN THE LIGHT OF BIG DATA

Schjerven, Noline (Department of Historical Studies, University of Gothenburg) - Dahlberg, Fredrik (Department of Historical Studies, University of Gothenburg)

This article explores contemporary perspectives on mobility and connectivity in archaeology, leveraging the transformative potential of ever more present Big Data and its use and role within the field of archaeology. Examining the evolving landscape shaped by technological advancements, the study delves into novel methodologies and analytical frameworks. The investigation builds upon the so called ongoing Third Science Revolution in archaeology, as elucidated by scholars like Kristiansen and Olsen, emphasizing the central role of Big Data in this potential paradigm shift. The paper presents a curated selection of case studies that showcase the intersection of archaeology with themes of mobility and connectivity, utilizing the potential concept of Big Data as a key analytical tool. Furthermore, the

article addresses implicit connotations associated with Big Data use, emphasizing the principles of FAIR and CAIR for context-specific applications. By offering fresh insights and perspectives, this article contributes to the ongoing discourse, paving the way for enhanced understanding and the potential application, development and use of word 'Big Data' in archaeological research on mobility and connectivity.

2 ESCAPING THE PAST: THE NEED TO UPLIFT DATA QUALITY AND STANDARDS IN ARCHAEOLOGY

D'Aprix, Michael (University College London)

Issues on 'Big Data' and 'Legacy Data' in archaeology are debated without recognizing where the discipline sits in terms of data production and what tools are used in that data production. Archaeology is deeply fragmented at every level – with methods, theories, philosophies, and standards varying at the highest level between countries down to the most granular level of individual archaeologists.

This results in an unmanageable variation in data production from different methods using different systems and tools to collect different types of data. To complicate the issue, many archaeological companies and organizations are desperately behind in adaptation of technologies that might improve data quality and promote modern data standards. This can be seen in the UK where the tendering process prevents meaningful funding into research and development that could uplift data quality and standards leaving companies to rely on methods 15-20 years out of date.

The first step in overcoming this hurdle is understanding the state of the discipline. The last large scale studies on the state of archaeology occurred over a decade ago, to simply determine how many archaeologists there were in Europe (Aitchison et al., 2014). Other technology-specific studies focused on tools like GIS but included troubling statistics, even at the time of research (De Roo et al., 2013).

The second step is using knowledge about the status of our discipline to move away from methods that continue to produce what should be 'Legacy Data'. Many archaeologists around the world still utilize tools from the early 2000s. AutoCAD, custom Access Databases, and paper recording dominate the methodological process despite better tools existing.

It is urgent that we understand the reality of archaeology and move beyond these out-of-date processes and stop adding data to an already unmanageable pile of 'Legacy Data'.

3 THE BIAD STANDARDS: RECOMMENDATIONS FOR ARCHAEOLOGICAL DATA PUBLICATION AND INSIGHTS FROM THE BIG INTERDISCIPLINARY ARCHAEOLOGICAL DATABASE

Reiter, Samantha (National Museum of Denmark) - Staniuk, Robert (University College London) - Kolar, Jan (University College London) - Agerkov Rose, Helene (University of Gothenburg) - Bulatovic, Jelena (University of Gothenburg) - Ryabogina, N. (University of Gothenburg) - Speciale, Claudia (University of Gothenburg; Catalan Institute of Human Paleoeology and Social Evolution (IPHES)) - Kristiansen, Kristian (University of Gothenburg) - Thomas, Mark (University College London) - Timpson, Adrian (University College London)

This paper presents a series of recommendations for the publication of archaeological data to facilitate efficient databasing. These recommendations were collated by data experts who mined thousands of publications for different types of archaeological data (funerary practices, AMS dating, stable isotopes, zooarchaeology, archaeobotany, aDNA, pathologies, etc.) during the construction of the Big Interdisciplinary Archaeological Database (BIAD). We also include data harmonisation vocabularies utilised for the integration of data from different recording systems. Starting from some case studies from published literature that we present, these recommendations initiate a move towards creating a unified and integrated framework for all types of archaeological data to ultimately sit within a single relational structure. We aim at creating a collaborative environment among the scholars collecting Big Data. Finally, we anticipate that use of the BIAD Standards will increase the visibility, usability and longevity of published data and also increase the citations of those publications from which said data is drawn.

4 GRAPPLING WITH BIG HERITAGE DATA: REFLECTIONS ON THE MODELLING OF HETEROGENEOUS HERITAGE INFORMATION FROM THE MAHSA AND MAEASAM PROJECTS

Lander, Faye (Origins-Centre, University of the Witwatersrand) - Project, Mapping Africa's Endangered Archaeological Sites and Monuments (MAEASaM) (McDonald Institute for Archaeological Research, University of Cambridge, UK) - Project, Mapping Archaeological Heritage of South Asia (MAHSA) (McDonald Institute for Archaeological Research, University of Cambridge, UK)

The Mapping Archaeological Heritage in South Asia and Mapping Africa's Endangered Archaeological Sites and Monuments projects work within different geographic regions of South Asia and Africa, dealing with large volumes of published (and unpublished) archaeological sites and monuments records. This paper explores the work and challenges of the two projects in digitising, modelling, re-interpreting, linking, and re-using non-digital archaeological data into

a structured and standardised digital format so that it may become findable, accessible, interoperable and reusable (FAIR). All these data follow the same or similar data standards and recording methodologies, and will be published in publicly accessible databases using the Arches platform.

Both projects, working with different partners, are compiling existing data through legacy records (archival records, published documents, reports, and surveys) as well as newly created data in the form of field documentation, remote sensing surveys, historical map analysis and automated site detection methods.

Retaining context while delivering standardised usable data is a key challenge, and the meanings of the original source and context are inevitably subject to re-interpretation during this process. Different heritage stakeholders, each bring their own expectations of data use, management, and accessibility, in addition to navigating the post-colonial spaces in which they operate. To ensure usability, use case scenarios have been identified and are being developed with project collaborators and database end-users. We explore some of the interventions we have used to grapple with the challenges we have encountered while dealing with heterogeneous archaeological big data.

5 (RE)CONNECTING SCATTERED FRAGMENTS. SETTING THE FOUNDATION FOR A DATA BASE COMBINING ROMAN STONE ARCHITECTURE AND ITS HISTORY OF STUDY

Rensinghoff, Berenike (Philipps-Universität Marburg) - Deicke, Aline (Philipps-Universität Marburg; Akademie der Wissenschaften und der Literatur Mainz) - Rösler, Katja (Römisch-Germanische Kommission)

Starting in 2023, the long term project “disiecta membra. Stone Architecture and Urbanism in Roman Germany” is scheduled to run for 24 years, gathering data on Roman stone architecture, the actors and the history of knowledge associated with its study. This big complex data set is intended to serve as a basis not only for qualitative research but aims to enable and encourage quantitative analysis and research via other computational approaches.

To ensure that the data is easy to evaluate by the scientific community, we use existing structures of proven data repositories. From them, we evaluate and incorporate various edition concepts, norm data, and thesauri in exchange with the multi-disciplinary network NFDI4Objects. Because of that the project is currently focusing on laying a solid foundation in the form of a flexible, open source data base built on a carefully conceptualized, expandable data model structuring the project domain and in exchange with the scientists using it. Thus, it is necessary to first create a conceptual data model by building on the CIDOC CRM and its compatible models as a foundational ontology.

The data is going to be recorded in a no code database and gradually published to iDAI.world, esp. iDAI.objects / Arachne, as well as to Propylaeum-VITAE. The database fulfills several requirements: it (a) is a project database, therefore it must record “field” data of archaeological objects, (b) links the object data with data on historical actors and their practices recorded from publications and in archives, hence crossing traditionally separate research data structures, and (c) is designed in such a way that data can be exported in various formats depending on the desired publication output, e.g., in long established data collections with already large data inventories, as RDF for integration into the semantic web, or even in print publications.

6 COMPUTATIONAL APPROACHES TO A SUSTAINABLE HERITAGE MANAGEMENT IN CENTRAL ASIA

Nebbia, Marco (Institute of Archaeology, University College London) - Jorayev, Gai (Institute of Archaeology, University College London) - Pang, Rui (Institute of Archaeology, University College London) - Voyakin, Dmitry (International Centre for Central Asian Studies, Uzbekistan) - Abdelrazek, Mahmoud (ARC Research Data Group, University College London) - Alvey, Bryan (Cultural Heritage Information Consultants) - Williams, Tim (Institute of Archaeology, University College London)

The Central Asian Archaeological Landscape (CAAL) project is building a geo-spatial inventory of archaeological resources for Central Asia. Funded by the Arcadia Fund, CAAL is developing a two-platform system that addresses the needs of the end users. The graph database Arches platform, developed by the Getty Conservation Institute, is being employed for its powerful semantic search engine and multi-lingual capabilities, while an object-based relational PostGIS database is implemented because of its analytical functionalities and interoperability with other software packages.

In this paper, we present the challenges of populating the database systems with data coming from 6 national inventories, several national and international research projects, digitised archival materials, digitally-born datasets (e.g., UAV outputs, satellite imagery), remote sensing mapping, and field survey data. This paper will discuss the solutions adopted in order to integrate the over 85,000 records, the challenges encountered in the mitigation across a spectrum of data sources, the solutions to overcome data inconsistency, variable gaps in information, and the multi-voicedness of different institutions and teams who are populating the database. We also present some applications of the data to cultural heritage risk assessment and archaeological research. The project adopts a FAIR approach to the data and here we will discuss the principles followed to develop a sustainable data system, which has already been adopted by two countries as their new digital national inventory. Co-design and use of the database are major aspects, and

we will present several other issues including ones for which we have not yet found solutions. We believe that a wider discussion with other projects in this session will be beneficial to all.

7 RE-WORKING OF THE NUMISMATIC DATABASE OF THE NIETULISKO MAŁE HOARD APPLYING INTERNATIONAL STANDARDS AND RTI DOCUMENTATION

Zajac, Barbara (National Museum in Krakow, Poland) - Ostrowski, Wojciech (Jagiellonian University, Institute of Archaeology, Poland; Warsaw University of Technology, Poland) - Bodzek, Jarosław (Jagiellonian University, Institute of Archaeology, Poland) - Sochacki, Grzegorz (Jagiellonian University, Institute of Archaeology, Poland) - Wilk, Łukasz (Warsaw University of Technology, Poland) - Zachar, Paulina (Warsaw University of Technology, Poland) - Modrzewski, Jakub (Warsaw University of Technology, Poland)

Databases are a solid foundation for modern numismatic research, widely used nowadays. During a recent project which applied big data methods and cloud processing to the digitalization and dissemination ca. 2,800 coins from the hoard from Nietulisko Małe, Ostrowiec County technical investigation need to focus not only providing new imagery and migrating the old databases but also on re-working the database to be created in accordance to international standards and FAIR principles.

The database was done with a view to adapting it to modern standards. It is one of the largest deposits discovered in Poland, which has not been properly published yet. For this work, that will be the basis for future research in numismatics, it was important to implement RTI (Reflectance Transformation Imaging) documentation for these coins - one of the best methods of coin archiving. It would facilitate numismatic research, especially with coins that are illegible or in a bad state of preservation.

RTI needs around 30 images, means that the final documentation will be the taking of over 180,000 images with different light positions. It was decided to build a solution using big data and cloud computing. This raises the question of archiving and sharing this type of data in accordance with FAIR, but is this justified when no one will probably ever be interested in it? The very use and sharing of RTI technology also raises some questions - it is relatively easy to share and display this type of imagery in a local database, but how to share this type of data within Linked Open Data - if there is no clear FAIR-compliant standard for its storage, and even less so for its display. The aim of the presentation is to answer the above questions.

8 LEGACY COINS: MAKING ROMAN COINS OF THE PAST COMPATIBLE WITH THE FUTURE

Welte, Micheline (Austrian Archaeological Institute) - Burkhart, Karl (Austrian Archaeological Institute) - Schwaiger, Helmut (Austrian Archaeological Institute)

For many years, the Austrian Archaeological Institute (OeAI) hosted an online Roman coin database known as dF-MRÖ; however, the database was not being realised to its full potential and a decision was made to update it in order to more closely adhere to modern data standards. Thus, OeAI.COIN was envisioned - a database to host the OeAI legacy coin collection in a modernized and interoperable format with Linked Open Data, which would allow for the standardized import of future coin collections, while adhering to the FAIR Principles of data management and employing links to specialist authority databases and ontologies, such as NOMISMA.

In the process of the coin database's transformation into OeAI.COIN, a variety of issues cropped up that involved difficulties in adapting the previous dataset to more modern standards. There was a lack of standardization of the data, low quality photos, redundant information, as well as ambiguous and non-standardized vocabulary to name just a few. In addition, the potential to include 3D data was not available. The OeAI will discuss its attempt at preparing its archaeological legacy collections for the future.

9 CHANGES IN HUMAN-PLANT INTERACTIONS IN CENTRAL ITALY OVER TIME: COLLECTION AND COMPARISON OF PUBLISHED AND UNPUBLISHED ARCHAEOBOTANICAL DATA

Moricca, Claudia (Department of Environmental Biology, Sapienza University of Rome) - Florenzano, Assunta (Department of Life Sciences, University of Modena and Reggio Emilia) - Mercuri, Anna (Department of Life Sciences, University of Modena and Reggio Emilia) - Sadori, Laura (Department of Environmental Biology, Sapienza University of Rome)

Recent advancements in the field of archaeobotany have significantly enhanced our understanding of the historical interactions between humans and plants in Italy. This includes insights into ancient diets, resource selection, introduction of allochthonous economic plants, and their ceremonial applications. Despite the diffusion of archaeobotanical research, accessing this information remains challenging due to its dispersion across various scientific papers and archaeological reports, with the latter being particularly difficult to obtain. Moreover, this data is typically restricted to isolated findings or specific sites, which complicates the assembly of a comprehensive historical perspective.

The establishment of the Botanical Record of Archaeobotany Italian Network (BRAIN) in 2015 marks a significant stride towards consolidating information about historical human-plant relations across Italy. This collaborative network and database compiles an extensive inventory of archaeological sites, detailing their specific locations, chronological context, culture, and the array of archaeobotanical research carried out, complete with bibliographic citations. This database is regularly enriched with the latest scholarly contributions.

Within the scope of the PNRR PE5 CHANGES Spoke 8 and CN5 NBFC Spoke 3 projects, this study introduces a georeferenced instrument designed to synthesize and compare data on plant macro-remains from archaeological and historical sites. This tool collates findings from both published sources within BRAIN and unpublished studies, standardizing the information and categorizing it chronologically. Currently focusing on central Italy, the initiative is set to expand and encompass the entire nation. By employing this newly formulated dataset, the process of reconstructing past dietary patterns and tracking the introduction of new species from the Neolithic period to the present becomes more feasible and direct. Consequently, this will enhance our ability to trace traditional plant uses in the past, including trade and importation showing origins and proliferation of archaeophytes and neophytes throughout the Italian Peninsula.

10 TRANSPARENT INTEGRATION AND REUSE OF LARGE ARCHAEOLOGICAL DATASETS: A CASE STUDY FROM NEOLITHIC AND BRONZE AGE SOUTHERN SCANDINAVIA

Bilotti, Giacomo (Kiel University)

The exponential growth of data accessibility presents archaeologists with an unprecedented resource. The amount of open databases and datasets, ranging from simple spreadsheets to complex architectural assemblages, significantly expands the horizons of archaeological research. However, numerous archaeological sites from commercial archaeology excavations are continuously flowing into regional and national databases. Despite their potential, these datasets often remain underutilised in scholarly research due to challenges related to data homogeneity and reusability.

This paper explores the potential and issues of this vast source of data for archaeologists, especially in terms of modelling. Here, I use Neolithic and Bronze Age societies in southern Sweden and Denmark as a case study, showing how diverse and large-scale datasets can be effectively combined, tackling common issues such as data uncertainty and the need for homogenisation. I argue for the necessity of a straightforward and transparent methodology to effectively integrate legacy data into our models (e.g. consistent use of regular expressions), enabling straightforward adaptation or replication by the academic community as new data emerges or old projects conclude.

The approach presented here is fully documented and accessible in a dedicated GitLab repository, written using R, a well-known and open-source programming language and software environment for statistical computing. While acknowledging the limitations inherent in these data sources, the paper also proposes potential solutions for their effective use and integration into archaeological research.

11 VISUALIZING ARCHAEOLOGICAL DATA - SMALL PROJECTS, BIG PROBLEMS

Molander, Paula (Rio Kulturlandskapet; Gothenburg University)

Utilizing digital tools for the visualization of archaeological information, notably through web-based interactive maps, is an effective strategy for engaging with the general public as well as professionals in the archaeological field. However, what challenges might arise when developing interactive web maps intended for public consumption?

Archaeological data can be labour-intensive to effectively manage and present visually. The process of extracting and compiling data, in large volumes, is often complicated, with the available data being highly diverse and often originating from a variety of sources. Furthermore, ensuring accessibility for the general public puts different demands on the format of visualization than if only created for professionals.

This paper discusses two instances where the objective was to present archaeological data to a general audience using interactive web maps. Open-source tools such as QGIS and Leaflet were employed in both cases, ensuring method reusability. The goal is to identify common challenges encountered by professionals when creating visual formats for large volumes of varied data, regardless of project size or ambitions, and to discuss potential opportunities and solutions for these issues.

12 IMPLEMENTING DATA MANAGEMENT STRATEGY BASED ON AGILE SCRUM METHODOLOGY WITHIN THE AL-ULA CULTURAL PROJECT (UCOP)

Leschallier de Lisle, Anne (ARCHAIOS) - Gourret, Gaël (ARCHAIOS) - Charbonnier, Julien (ARCHAIOS) - Kanhoush, Yasmin (ARCHAIOS; ARCHEORIENT UMR 5133)

Within the framework of the Al-Ula Cultural Oasis Project (UCOP) – carried out by Archaios, funded and steered by the French Agency for AIUla Development on behalf of the Royal Commission for AIUla – a large-scale comprehensive survey of over 4000 hectares of gardens has been conducted between 2019 and 2023, resulting in the

recording of over 16,000 archaeological structures. The purpose of the survey was understanding the evolution of Al-Ula oasis, located in the northern Hejaz region (Kingdom of Saudi Arabia).

As the survey progressed, the volume of data increased and the empirical knowledge of the structures developed, prompting us to migrate towards a more detailed recording and upgrading of the database. Gradually, a data management strategy was implemented within the project to address the many challenges of quality, relevance, and accessibility of data, which are at the core of the forthcoming analysis and diachronic understanding of the oasis.

Selected tools and methods of a well-known IT project management framework (Agile, SCRUM) were tested and adapted in an unprecedented way to support the UCOP's data management. The experience of data management for a project of such magnitude led us to carry out a retrospective on the setbacks encountered but also the successes achieved, by significantly improving the quality and relevance of the data. It forms a solid background of guidelines and new approaches to apply within archaeological projects.

This paper will examine how specific tools and techniques of Agile methodology can enhance data management, playing a major technical support role in research.

626 MERC FORUM. STANDING RUINED BUILDINGS IN LARGE CITIES: A BURDEN OR A RESOURCE FOR SOCIETY?

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Lorans, Elisabeth (University of Tours) - Citter, Carlo (University of Siena)

Session format: MERC forum

This forum, inspired by the location of the EAA conference in Rome, the Eternal City, seeks to confront the ways large European cities deal nowadays with important remains of ancient buildings preserved above ground level and analyse whether they are seen, both by the local authorities and by the local population, as a burden or on the contrary as a resource (with possible changes from one to the other point of view). By the term “ancient buildings”, we do not refer only to classical Antiquity but also to major medieval and post-medieval ruined architectural remains which are part of the contemporary townscape and may still frame it. The forum will be based on the presentation of three European case studies, selected by MERC committee, providing a diversity of situations and supporting a general discussion afterwards, in which all EAA members can participate. Case studies will be presented by three archaeologists:

- Riccardo Santangeli Valenzani (University of Rome3): Rome and its monuments: two centuries of history
- Çiğdem Özkan Aygün (Technical University of Istanbul) How to turn the historical structures into a resource. Who should benefit? What are the limits to adaptive reuse?
- Jeroen Bouwmeester (Dutch ministry of Education, Culture and Science-Cultural Heritage Agency), Crossing borders: urban archaeology in the 21st century.

ABSTRACTS

1 HOW TO TURN THE HISTORICAL STRUCTURES INTO A RESOURCE? WHO SHOULD BENEFIT AND WHAT ARE THE LIMITS TO ADAPTIVE REUSE?

Çiğdem Özkan Aygün (Technical University of Istanbul)

Istanbul is a time capsule with numerous protected and unprotected examples of a great range of building types belonging to the Byzantine and Ottoman civilizations.

Apart from well known structures like Topkapı Palace, Hagia Sophia, Süleymaniye Mosque and Blue Mosque, there are unique examples of vernacular architecture like the timber houses in the Süleymaniye and Zeyrek quarters. The protection and conservation of those sites is not clearly regulated. The shared responsibilities of national government (The Ministry of Culture and Tourism General Directorate of Cultural Assets and Museums, General Directorate of Pious Foundation) and local administrations together with the several state institutions makes the issue more complex and confusing. The overlaps and vacancies about the responsibilities of different institutions creates a risk for the protection of those structures. The perception of the local people about those more vulnerable structures, to see them as a burden or resource becomes the key issue for the future.

2 ROME AND ITS MONUMENTS: TWO CENTURIES OF HISTORY

Riccardo Santangeli Valenzani (University of Rome3)

Every historical period has considered the theme of the relationship between cities and their monumental heritage in the light of the prevailing ideological superstructure. My paper aims to analyze the transformation of this relationship in Rome, from the Unification of Italy to the present day: from the destructions carried out in the 19th century during

the works to adapt Rome to its new role as capital of the Kingdom, to the exaltation of Romanity in the Fascist era, with the consequent destruction of all those archaeological realities that were not propagandistically and ideologically usable by the Regime, up to the experience of Urban Archaeology in recent decades.

3 CROSSING BORDERS: URBAN ARCHAEOLOGY IN THE 21ST CENTURY

Jeroen Bouwmeester (Dutch ministry of Education, Culture and Science-Cultural Heritage Agency)

The position of archaeology, and urban archaeology in particular, has changed radically in recent decades. This is due to the changing place of heritage in society. The Malta Convention and the FARO Convention are the result. Archaeology is within society, or at least it should be and not a distant academic field. But how do you do that? Covering an underground wall with a sheet of glass and a sign next to it is not always enough. Archaeology, or rather the past, has to be experienced. Participation, and there are many ways of doing this, can be very empowering. Heritage can contribute to important social tasks. In my lecture, after a short introduction, I would like to take you on a voyage of discovery through a number of examples in the Netherlands and abroad.

627 MORE THAN FIRE: INVESTIGATING PYRE TECHNOLOGY IN EXPERIMENTAL AND ARCHAEOLOGICAL CREMATIONS FOR UNDERSTANDING THE BURNING CONDITIONS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Stamataki, Elisavet (Vrije Universiteit Brussel) - Fülöp, Kristóf (HUN-REN Research Centre for the Humanities, Institute of Archaeology) - Magno, Giovanni (Morgagni Museum of Human Anatomy - University Museums Centre CAM, University of Padua)

Session format: Regular session

Cremation was the dominant funerary rite in many regions on the European continent from the Late Bronze Age to the Roman period (ca. 1300 BCE-300 AD). As a result, cremated human remains are commonly found in archaeological contexts. The role and the use of fire in funerary archaeology have mostly been linked to the ability of fire to transform the human body into burnt bones and ashes. Beyond its practical purposes, fire in the mortuary context has also been seen as a symbolic means of elaborating or extending the ritual process, enabling a new kind of interaction between the living participants in cremation and the deceased. However, due to the destructive nature of fire and the lack of written sources from the Bronze and Iron Ages, it is extremely difficult to investigate how cremation was performed in past societies. Assessing the variability in cremation conditions over time and space is crucial for understanding the various attitudes of ancient communities towards death and the different methods for managing and treating the deceased. Therefore, it is necessary to turn to other types of evidence to further investigate the burning conditions (e.g., ignition, temperature, fuel, duration, pyre structure, and size, pyre goods, body position, location of the pyre in the environment, extinguishing methods, seasonality, etc.), such as experimental archaeology, archaeological sciences, macroscopic analysis, and ethnographic information.

This session aims to bridge the gap between macroscopic and scientific analysis of burnt human remains and experimental archaeology for understanding pyre technology as well as body and pyre management in ancient societies in which cremation was the main funerary practice. In this session, we welcome presentations from experimental archaeology on pyrotechnology, archaeological sciences, macroscopic analysis, anthracology, and new approach techniques on cremated bones from all chronological periods and without geographical limitation.

ABSTRACTS

1 TRANSFORMING BODIES: THE SIGNIFICANCE OF PYRE TECHNOLOGIES IN THE TRANSFORMATION OF THE HUMAN BODY BASED ON THREE OPEN-AIR CREMATION EXPERIMENTS

Fülöp, Kristóf (HUN-REN Research Centre for the Humanities Institute of Archaeology, Hungary) - Chatzikonstantinou, Ioannis (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Chronaki, Sotiria (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Gucsi, László (HUN-REN Research Centre for the Humanities Institute of Archaeology, Hungary) - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece)

With the appearance of cremation, a significant change took place in the chaîne opératoire of funerals as fire became the central element of the ritual. The use of fire reflects a new perception of the self and the afterlife, giving rise to different body management and treatments before, during, and after cremation.

In our presentation, we focus on the middle phase of this transformation process utilizing experimental methods to gain a better understanding of burning characteristics. Based on three open-air cremation experiments conducted in 2017-2018 (ÚNKP project, Hungary) and 2023 (TEFRA project, Crete), we investigate how pyre technology directly or indirectly influences burning conditions. Among the many factors, the location and weather, the size and structure of the pyre, the ignition technique, the temperature, and the extinguishing method are involved in the analysis. All these technological elements essentially determine the transformation of the human body resulting in charred and calcined bones. Therefore, understanding their characteristics and often invisible interconnections is crucial for the complex analysis of archaeological cremated bones and the reconstruction of former pyre technologies.

2 EXPERIMENTAL CREMATION AS A RECONSTRUCTION OF ANCIENT VENETI RITUALS

Magno, Giovanni (Morgagni Museum of Human Anatomy - University of Padua) - Stamataki, Elisavet (Vrije Universiteit Brussel)

Five open-air experimental pyres were made to reconstruct the funerary cremation rites of Ancient Veneti population, correlating the results with historical, archaeological, paleobotanical and anthropological data from known Bronze and Iron Age contexts in the Veneto region (Italy). Temperature variation and effects of fire on bones and soft tissue were carefully monitored during the cremation process. Furthermore, it has been addressed the various ways of fire extinguishing, including the potential use of wine during the conclusive phases of the cremation, as per ancient funerary customs.

Preliminary analysis on the correlation between burning process and extinguishing damage, bone colors and structural alterations were made through using Photometric Scanner Imaging (PSI), and Fourier Transform Infrared (FTIR) spectroscopy. First results showed some differences in the crystalline state attained, reflected by significant differences in color evaluated by the reflectance measurements using the Photometric Scanner, which could have been correlated to different extinguishing procedures.

A new complete analysis on the bones with modern state-of-the-art analytical techniques are planned to shed a new light on how cremation rituals were performed and how these differences may affect the structural and chemical composition of bones combining FTIR and PSI methods with carbon and oxygen isotope analysis.

3 EXPLORING PYROTECHNOLOGICAL DYNAMICS: INSIGHTS FROM EXPERIMENTAL AND ZOOARCHAEOLOGICAL ANALYSIS OF BURNT SKELETAL REMAINS

Chronaki, Sotiria (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Chatzikonstantinou, Ioannis (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Kadi, Domniki (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece)

Experimental pyres can contribute in several ways to the reconstruction and interpretation of past human activities involving combustion processes. Identifying thermal alterations in burnt bones derived from experiments can provide valuable insights into the differential use of fire associated with human and animal remains in funerary, ritual, and domestic contexts. In the current presentation, the diverse burning conditions of skeletal remains will be examined under the premise of zooarchaeology. Burnt faunal remains from the earliest sanctuary in northern Greece (Poseidi, Chalcidice), where the use of fire for ritual and non-ritual purposes is attested, were compared macroscopically with burnt bones from various experiments in Greece. The comparison of experimental and zooarchaeological data can enrich our knowledge of pyrotechnics and its dynamics in skeletal manipulation. This research contributes to the broader discussion of the effects of fire on bones, considering factors such as fire intensity and temperature, duration of burning events, proximity of the body to the fire, and the state of decomposition of the burned remains (dry, fleshed, or semi-fleshed) at the time of burning.

4 THE AEGEAN SPARKS: INTERDISCIPLINARY EXPLORATION OF FIRE USE IN EXPERIMENTAL AND PREHISTORIC ARCHAEOLOGICAL CONTEXTS CONTAINING SKELETAL REMAINS

Chatzikonstantinou, Ioannis (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Chronaki, Sotiria (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Fülöp, Kristóf (HUN-REN Research Centre for the Humanities Institute of Archaeology, Hungary) - Kadi, Domniki (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Stamataki, Elisavet (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Belgium) - Papathanasiou, Vasso (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Kiriati, Evangelia (Fitch Laboratory, British School at Athens, Greece) - Snoeck, Christophe (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Belgium) - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece)

The use of fire in the treatment and conceptualization of the deceased is a complex and diverse social process comprising multiple intellectual pathways. Fire can transform a detectable individual into a set of scattered material remains, while negotiating and defining personhoods, identities, relationships, and funerary beliefs. Critical interpretation of the diverse use of fire in human bones is provided by the systematic macroscopic study of burnt human bones from prehistoric Aegean bone assemblages, the application of innovative infrared and isotopic analyses, and the parallel comparison with new experimental data. This talk presents some of the first results of the complex macroscopic, analytical, and interdisciplinary study of thermal alterations from different sites dating from the Mesolithic (9500-9000 BP) to the Early Iron Age (8th c BCE) carried out in the framework of the TEFRA project. The archaeological data are compared with modern experiments taken place in Greece in order to gain more information about the burning conditions in the prehistoric Aegean.

5 CREMATION IN THE FUNERAL RITE OF THE ANDRONOVO CULTURE: EVIDENCE AND EXPERIMENT (BASED OF THE BRONZE AGE LISAKOVSK SITE, KAZAKHSTAN)

Usmanova, Emma (Buketov Karaganda State University, Margulan Archaeological Institute, Kazakhstan Kazakhstan;)

Cremation was presented in the rituals of the steppe Eurasian cultures of the Bronze Age. There were several stages: preparing the deceased for burning; combustion process; collection of cremated bones; disposition of cremated remains. About 180 burials were opened at the Lisakovsk burial site. Of these 40% contain cremated bones. In the Andronovo burials of the middle 2nd millennium BC the fourth stage of the cremation was recorded as bones placed at the bottom of the grave. As known cases when the cremated human bones mixed with cremated animal bones. The size of the cremated burial corresponded to the size of the inhumated burial. Apparently, the dead body was exposed to fire for a long time. Cremated bones look like fragments measuring 2-3 cm. How did the cremation of the dead body take place in the conditions of the steppe landscape, where wood resources were limited? To understand the cremation process, an experiment was conducted on burning a pig corpse. Combustible materials known to the Andronovo inhabitants were used in the experiment. These were dry dung fuel, branches, felt. A corpse wrapped in felt creates a "candle" effect when burned, providing a long process to destroy. The experiment demonstrated that the slow burning of corpse inside a felt cocoon contributes to the destruction of bones and flesh. The approximate combustion temperature was about 300 degrees. The pig corpse, wrapped in felt, was laid on branches, covered with dry dung fuel and set on fire. The burning process until the flesh was destroyed about 14 hours. The burnt fragments bones were destroyed into cremated fragments up to 3 cm size. The result of the experiment indicates the existence of a similar method of cremation of the deceased in the funeral rite of the Andronovo society.

6 THE EFFECTS OF FUNERARY PRACTICE AND THE BURNING SCENARIO ON SCIENTIFIC INTERPRETATIONS OF BURNED BONE

Monetti, Lisa (Drew University)

Heat-induced changes to bone include alterations to the morphology, colour, and chemistry of skeletal elements. The propagation of fractures on the surface of bone is often observed but an exact cause is not definitively understood. This presentation will investigate the fracture pattern known as patina wherein many small fractures propagate on the surface of burned bone, lacking the energy to break the bone into smaller fragments, but still leaving it noticeably changed, nevertheless. These multidirectional intersecting fractures will be considered not just as a heat-induced change, but rather as the result of interconnections of funerary practice, pyre technology, decomposition of the corpse, and the actions of the living prior to and during the cremation funeral. This presentation will argue that practice, memory, and decompositional changes influence how the skeleton is burned and how we interpret it, in this case using patina as an example.

Experimental archaeology allows for a more holistic investigation into the ways practice, identity, and institutional influence may have affected the ultimate appearance of cremated bone fragments. This presentation will also highlight the need for our ideas of experimental cremation to expand into the interdisciplinary space, taking into account a broad definition of the funeral, considering the timeline of decomposition, and experimenting with materials beyond bone and tissue.

7 TWO CREMATION EXPERIMENTS IN OLD UPPSALA, SWEDEN. OSTEOLOGICAL OBSERVATIONS AND REFLECTIONS ON SOOTINESS, SPATIAL DISTRIBUTION AND FRAGMENTATION

Prata, Sofia (Stiftelsen Societas Archaeologica Upsaliensis) - Sjöling, Emma (Stiftelsen Societas Archaeologica Upsaliensis)

Even though cremation graves are frequently excavated in Sweden, the pyre site is rarely identified. However, in the last decades, several Late Iron Age graves containing clear traces of pyre sites have been excavated, leading to more knowledge but also new questions, some of which could be tested experimentally. We have had the opportunity to participate in two cremation experiments where different animals, food and artefact replicas were cremated. In this paper we are focusing on the osteological part of the experiments. The primary purpose was to investigate the result of direct human influence versus natural processes related to cremation and burial practices. Within this, a variety of relevant issues can be accommodated. In the experiments we focused on the following questions: What affects whether the bones become sooty or non-sooty after the cremation? How does the collapse of the pyre construction affect the spatial distribution of the bones? How does the cremation process affect the fragmentation of the bones? The results and their implications on the archaeological interpretations will be presented together with other observations made during the experiments. The overall aim of this presentations is to convey how the cremation experiments and the study of pyre sites have progressed our understanding of cremation and burial practices.

8 MANAGING FIRE AND BONES: OSTEOARCHAEOLOGICAL EVIDENCE FROM EARLY IRON AGE CENTRAL MACEDONIA, GREECE

Papathanasiou, Vasso (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) - Lioutas, Asterios (Ministry of Culture, Greece) - Misailidou-Despotidou, Vasiliki (Ministry of Culture, Greece)

The exposure of the body to fire causes various chemical and structural changes such as discoloration, warping, shrinkage and fracturing of the bones. The examination of these alterations can offer valuable insights into the technology and conditions of cremation process (e.g. temperature, duration, pre-combustion state of bones). Cremation as a means of treating the dead body has a long history in the region of Macedonia, Greece, during prehistoric and protohistoric times. Evidence so far, indicates that cremation appears as early as the Late Neolithic and continued to be applied during the Bronze Age. The practice of cremation becomes more intense during the Iron Age and there is an increase in the number of cemeteries with deposits of burnt human remains; however only a few osteological studies have been carried out so far. The aim of this paper is to present some preliminary results of the ongoing osteological study of cremated bones from two cemeteries, Polichni and Nea Philadelphia, in central Macedonia. Both cemeteries have yielded a significant number of secondary cremation deposits dating back to the Early Iron Age (11th-8th c. BCE). One of the main axes of this research is a thorough macroscopic examination of the thermal alterations of cremated human remains, with a view to understanding the burning conditions and the manipulation of the deceased through fire. These data will be correlated with specific variables, including the biological sex and age of the individuals, as well as the type of cremation deposits (single versus double burials). In addition, the integration of archaeological evidence will further contribute to elucidate social and cultural aspects of this multi-layered practice.

9 BIOLOGICAL AND CULTURAL INSIGHTS FROM CREMATION PRACTICES: A MULTIDISCIPLINARY APPROACH AT EL TORREJÓN DE GÁTOVA

Alapont, Llorenç (Universitat de València) - Burriel, Josep Maria (Museu Arqueològic de Moncada) - Ruiz, Juan José (Fundación Antonia Clavel) - Martí Bonmatí, Luís (Instituto de Investigación Sanitaria La Fe Valencia) - Ginés Cárdenas, Sonia (Instituto de Investigación Sanitaria La Fe Valencia) - Penadés Blasco, Ana (Instituto de Investigación Sanitaria La Fe Valencia) - Gallelo, Gianni (Universitat de València) - Fababuj, Francisco (Independent researcher) - Sabater, Ana (Independent researcher) - Granel, Paula (Independent researcher)

The site of El Torrejón de Gátova, spanning from the 6th century BCE to the 1st century BCE, holds significant archaeological importance in the ancient Edetania territory of the eastern Iberian Peninsula. This location, strategically situated, witnessed colonial contact and exchange during the mid-6th century BCE, as indicated by the presence of sumptuous objects and the construction of extravagant elite funerary enclosures housing cremations. These collective tombs, unparalleled in Iberian culture, suggest a potential paradigm shift in the society's cremation funerary

practices. The ongoing excavation process of one such enclosure has revealed a chamber containing eight cremations, alongside various burnt objects like silver libation vessels, buckles, fibulae, and jewellery items.

This multidisciplinary study employs methods enabling comprehensive analysis of the cremation practice, yielding essential biological data and insights into the cultural significance of accompanying objects. In contrast to inhumations, interpreting cremated remains relies heavily on fragmentary evidence and contextual analysis. This research, focusing on eight Iron Age urns from El Torrejón de Gátova, combines archaeological techniques with bioanthropology, computed tomography, archaeobotany, zooarchaeology, and X-Ray Fluorescence analyses. Through CT scans and micro-excavation, the study reveals distinct depositional pathways for bones and offerings within the urns, shedding light on cremation processes and funerary practices. Multi-element geochemistry and bioarchaeological analyses provide further insights into the Iron Age environment, cremation rituals, bone gathering practices, and final funerary deposition patterns. This comprehensive approach enhances our understanding of burial rites and societal dynamics in ancient Iberian Peninsula.

10 FIRE AND STONE: A UNIQUE CREMATION MEGALITHIC TOMB IN IBERIA

Becerra Fuelle, Paula (University of Granada) - Aranda Jiménez, Gonzalo (University of Granada) - Díaz-Zorita Bonilla, Marta (University of Tübingen) - Vilchez Suárez, Miriam (University of Granada) - Robles Carrasco, Sonia (University of Granada) - Sánchez Romero, Margarita (University of Granada)

Iberian megalithic funerary rituals are characterized by multi-depositional events creating complex palimpsests. This is the case of southeastern Iberia, one of the classical Iberian megalithic regions. Archaeological fieldwork undertaken in 2023 at Los Milanes site (Abla, Almería), revealed a necropolis composed of at least 18 tholoi or tombs with circular chambers covered by false vaults. The excavation of Tomb 8 showed an unknown funerary ritual that consisted of thousands of cremated bone remains. The bone assemblage, currently under analysis, is made of highly fragmented human remains with clear thermal alteration. The macroscopic characteristics of the human bones showed all types of coloration ranging from brownish to chalky white and a wide range of heat induced fractures including patina and warping. The cremated bones belong to different anatomical regions including even small bones, such as sesamoid bones, feet phalanges or carpal bones from at least a minimum number of 16 individuals. The absence of ash and charcoal associated to the cremated bones suggests that the funerary chamber was not where the pyre was located. Currently, the pre-burning conditions and heat induced features are being explored through a set of bioarchaeological analyses, which allow us to interpret the original position of the corpses and/or skeletons in the pyres and to reconstruct the paleodemographic profile of this population. Other additional techniques such as SEM or FTIR would also be applied to understand the cremation process.

The analysis of this assemblage from Los Milanes throughout bioarchaeological methods is key to understand the complexity and the wide variety of funerary practices that were taken place at megalithic monuments.

11 SPECTROSCOPIC AND ISOTOPIC STUDY OF INTENSITY OF FIRING OF CREMATED HUMAN REMAINS FROM ROMAN BURIALS FROM HADRIAN'S WALL, UK

Mays, Simon (Historic England) - Schulting, Rick (University of Oxford) - Pouncett, John (University of Oxford) - Snoeck, Christophe (Vrije Universiteit Brussel) - Wilmott, Tony (Historic England)

Study of cremation burials from a two-phase, 2nd-3rd century AD Roman cemetery serving a fort and associated civilian settlement at Birdoswald, Hadrian's Wall, indicated greater frequency of structural nails as finds in later phase burials. This may relate to greater use of scrap wood as fuel in pyres in later burials. In order to test the hypothesis that this apparent alteration in fueling resulted in differences in firing intensity of the human remains, seven parameters relating to conditions of firing were analysed: $\delta^{13}\text{C}$, $\delta^{18}\text{O}$, infra-red splitting factor (IRSF), type A+B carbonate: type B carbonate ratio (C/C), hydroxyl: phosphate ratio (OH/P), type B carbonate: phosphate index (BPI), and cyanamide: phosphate ratio (CN/P). IRSF, C/C, OH/P, BPI and CN/P were collected using FTIR in absorbance mode; $\delta^{13}\text{C}$, $\delta^{18}\text{O}$ using isotope ratio mass spectrometry. Bone fragments from a total of 30 burials were analysed. Multivariate statistical analyses of the results indicate a statistically significant difference between phases. The pattern of differences suggest that it was later phase burials that may have been subjected to less intense firing. These results are discussed in the light of the above-mentioned evidence for changes in fueling of pyres, and in the light of palaeo-environmental evidence for depletion of woodlands in the region of Hadrian's Wall in the Roman period.

12 UNVEILING THE FIERY PAST: INSIGHTS INTO THE CREMATION PRACTICES AT GALLO-ROMAN TIENEN USING CARBON AND OXYGEN ISOTOPE ANALYSIS AND FTIR-ATR

Frère, Anneminne (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Pleinlaan 2, 1050 Brussels, Belgium; Brussels Research Centre on Innovation in Learning and Diversity, Vrije Universiteit Brussel, Brussels, Belgium) - Stamataki, Elisavet (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Pleinlaan 2, 1050 Brussels, Belgium) - Legrand, Emma M. (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Pleinlaan 2, 1050 Brussels, Belgium) - Martens, Marleen (Flanders Heritage Agency, Havenlaan 88/5, 1000 Brussels, Belgium) - De Mulder, Guy (Department of Archaeology, Ghent University, Sint-Pietersnieuwstraat 35, 9000 Ghent, Belgium) - De Backer, Free (Brussels Research Centre on Innovation in Learning and Diversity, Vrije Universiteit Brussel, Brussels, Belgium) - Snoeck, Christophe (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel, Pleinlaan 2, 1050 Brussels, Belgium)

During the Roman Period (ca. 52 BCE - 406 AD), cremation was the main funerary practice in the Belgian region, characterised by an increase in the number of cremation burials. This is illustrated by the findings in Tienen, where the largest Gallo-Roman cemetery of the Low Countries was discovered with >1400 cremation deposits. These findings were already analysed for strontium isotopes and concentrations to investigate population dynamics. However, information on the way cremation was performed is lacking, despite the site's potential for unique insights due to the large amount of cremated remains, the coexistence of diverse types of cremation deposits, the quantity of grave goods and the different chronological phases of use.

The aim of this study is to use state-of-the-art analytical techniques such as Fourier Transform Infrared Spectroscopy in Attenuated Total Reflectance mode (FTIR-ATR) and carbon and oxygen isotope analyses to gain more insights into the pyre technology and body treatment at the Gallo-Roman cemetery of Tienen (1-4th c.AD). Furthermore, the existence of variations in cremation conditions across the different chronological phases, deposit types, and the amount and/or type of grave goods were also investigated. For this reason, a total of 146 fully calcined diaphyses of long bones were analysed. Initial results indicate a high degree of homogeneity in burning conditions at the cemetery of Tienen, confirming the assumption that there was little socio-economic variety at the vicus of Tienen during the Roman period. Finally, the infrared and isotopic data of Tienen were compared with the data of five neighbouring Gallo-Roman cemeteries to enhance the understanding of the way cremation was performed in Belgium during the Roman period.

13 JOURNEY THROUGH AGES: TRACKING STRONTIUM SHIFTS ACROSS ADULT LIFE STAGES

Waltenberger, Lukas (University of Vienna; Austrian Academy of Sciences) - Fritzl, Michaela (Austrian Academy of Sciences) - Skerjanz, Hannah (Austrian Academy of Sciences) - Verdianu, Domnika (Austrian Academy of Sciences) - Rebay-Salisbury, Katharina (University of Vienna; Austrian Academy of Sciences)

Strontium isotopes are commonly used to study mobility in archaeological case studies and are linked to strontium ratios in different geological zones. Specifically, strontium ratios reflect the origin of food sources of single individuals. Especially for cremated remains with their limits, reconstructing people's osteobiographies, strontium provides valuable additional information on mobility during the life course in prehistory. We combined strontium isotope analysis with state-of-the-art age-at-death estimation of Late Bronze Age cremated remains originated from the Traisen-valley in Austria. Using tooth cementum analysis, we could significantly improve the age-at-death estimation as root fragments could be regularly recovered from cremated remains, but a morphological age-at-death estimation is imprecise due to a lack of diagnostic elements. Especially individuals over 40 years are usually underrepresented in urn fields. By assigning adult individuals to age groups based on TCA results, we analyze differences in the trends of strontium intake over their lifetimes and highlight the underrepresented group of late mature and senile individuals in the Late Bronze Age.

14 EXPLORING ELEMENTAL DYNAMICS IN CREMATED BONE: A GEOCHEMICAL EXPLORATION USING EXPERIMENTAL ARCHAEOLOGY

Vegh, Emese (AMGC, Vrije Universiteit Brussel) - Kaskes, Pim (Laboratoire G-Time, Université Libre de Bruxelles) - Boonants, Tom (AMGC, Vrije Universiteit Brussel) - Goderis, Steven (AMGC, Vrije Universiteit Brussel) - Snoeck, Christophe (AMGC, Vrije Universiteit Brussel)

The crystal structure of cremated bones recovered from archaeological sites is thought to be chemically stable after burial. Yet, understanding the persistence of elemental composition post-cremation and burial remains incomplete, potentially involving exchanges with the environment and leaching of endogenous trace elements. A *Bos taurus* femur was sectioned and burnt at controlled temperatures (250-700°C) and subsequently subjected to a simulated burial solution (comprising K, Mg, Al, Sr, Ba, Zn, Cl, Na at 10 ppm and Fe, Zr, Si, Ce, S, Mn at 1 ppm). The research aims to replicate potential post-burning elemental introduction processes using experimental archaeology. Major and trace element concentrations pre- and post-burning and pre- and post-doping were determined using micro-X-ray fluo-

rescence (μ XRF) high-resolution element mapping and linescans (25 or 200 μ m resolution from the inner trabecular surface towards the outer bone cortex), as well as bulk inductively coupled plasma mass spectrometry (ICP-MS). These measurements were repeated following standard pretreatments procedures typically applied in preparation of the analysis of cremated bones for ^{14}C dating and isotopic studies. Elemental mobility was simulated with a diffusion-advection model. Preliminary results indicate stability in major elements (Ca and P) in bone. Bone burnt up to 600°C displays uptake in Al, Mn, Zn, Sr, and Ba, not observed at 700°C. Conversely, Mg and Cl show an inverted pattern, while K and S demonstrate a tendency to leach out of bone. Thus, cremated bones not reaching calcination lack chemical stability, showing uptake and leaching of specific elements.

629 LIVING THROUGH CRISIS: URBAN HOUSEHOLD ARCHAEOLOGIES IN THE MEDIEVAL WORLD

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Jervis, Ben (University of Leicester) - Haase, Kirstine (Museum Odense) - Radohs, Luisa (Albert-Ludwigs-Universität Freiburg) - Morton, Benjamin (University of Leicester)

Session format: Regular session

The household offers a scale of analysis on persistence and change appropriate to understanding the variability of lived experiences in the medieval world. It offers a contrast to studies of towns and cities at the scale of the settlement, which are necessarily prone to degrees of generalisation and abstraction. Households are sites of consumption, social production, economic activity and care, which provide a window into the social relations constitutive of urban life. Urban households are heterogeneous, with varying economic bases, levels of wealth and demographic composition. As such, their study allows for the development of a nuanced understanding of how urban communities lived through the crises and turbulence of the Middle Ages, and, by extension, the complexity and diversity of urban lived experiences.

The aim of this session is to develop a comparative, household-scale approach to urban life in the medieval World (broadly conceived as the period c500-1600). Specifically, we wish to explore issues such as:

How do experiences of urbanity vary within and between households?

How did households experience and act on moments of crisis or change?

How do households contribute to the sustenance of the wider fabric of medieval urbanism?

How do the actions of households shape wider neighbourhoods, communities, and settlements, and how are they shaped by their wider social relations?

Contributions which explore a range of evidence including, but not limited to, material culture, buildings, environmental remains and historical sources are welcome, and contributions which explore households in an explicitly comparative sense are particularly encouraged. The session is a collaboration between 2 research projects; ENDURE: Urban Life in a Time of Crisis (which explores urban lifeways in later medieval England) and Consequences of Crisis (which explores the consequences of crisis on towns in later medieval Scandinavia).

ABSTRACTS

1 INTRODUCTION: HOUSEHOLDS AND CRISIS IN MEDIEVAL TOWNS

Jervis, Ben (School of Archaeology & Ancient History, University of Leicester)

In setting the scene for this session, this contribution will briefly define the term household in relation to the medieval urban contexts and explore some ideas of how urban communities, particularly in England, lived through, anticipated and dealt with moments of crisis.

Households can take a range of measures to anticipate, and seek to prevent, crisis. These may range from growing food to ensure sustenance to digging channels or raising ground levels to prevent flooding. These anticipatory actions can be understood as resilience building at the domestic scale, providing insights into the kinds of potential crises which households perceived, and what elements of their lives they sought to protect. Such actions can have wider consequences, representing trade-offs between different priorities and being potential sources of dispute and tension between neighbours or communities. Furthermore, some crises may not have been anticipated, or have been worsened by measures to prevent other kinds of event.

This paper introduces the session through an exploration of the anticipatory action taken by households in medieval English small towns, based on a national survey of excavation data from these settlements. It will explore the kinds of anticipatory actions taken by households, examine how this action varies contextually and considers its consequences for the persistence of urban lifeways through the turbulent period of the later 14th and early 15th centuries.

2 THE BUILT ENVIRONMENT AND ITS ROLE IN SHAPING HOUSEHOLDS AND COMMUNITIES IN LATE MEDIEVAL ENGLISH TOWNS

Morton, Benjamin (Cardiff University; University of Leicester)

Traditionally, studies examining the houses of ordinary medieval households have focused on understanding forms and methods of construction and how buildings reflect the social standing and wealth of their inhabitants. This approach that sees historic buildings as simply illustrative of past economic and social conditions has been challenged in studies adopting a social constructivist perspective, such as those inspired by structuralism (see, for example, Austin and Thomas 1990) and post-structuralism (see, for example, Johnson 2010, Giles 2007 and Mileson 2015). Those who have adopted this theoretical perspective have primarily focused on rural households and communities, as well as high-status and public buildings in towns.

This paper explores how the houses of ordinary town dwellers in small towns shaped household and community experiences, social practices and identity in late medieval urban communities. A series of case studies of individual towns across England will examine how variations in house size, layout and positioning within plots shaped social practices and identities within these urban communities. The built environment of these towns will not simply be seen as an adjunct to their economic and social history but as an essential factor in accounting for changes on a household and community scale. This study uses evidence derived from standing buildings, topography and archaeological excavations.

The following questions are examined:

- How did the built environment change in response to the economic and social conditions of the late medieval period in the case study towns?
- What was the extent to which earlier medieval material and social conditions within the towns shaped these changes?
- What was the effect of these changes in the built environment on social practices and identities within households and communities?

3 INDUSTRIALISED HORTICULTURE & FOOD SECURITY: ADAPTING URBAN GARDEN SPACE FUNCTIONALITIES THROUGH CRISIS IN MEDIEVAL ENGLAND

Evetts, Kate (University of Leicester)

Studying households illuminates aspects of economic activity, production, consumption, social interaction, and individual pursuits of urban life. Gardens, defined here as urban open spaces within housing plots, play into all of these aspects, being places of utility and beauty no matter the scale. However, garden spaces and features are often not considered in depth within urban archaeology as open spaces are typically under-theorised compared to the built elements of urban landscapes. Yet, gardens must have been important spaces for medieval people, whether for industrial, dietetic, or recreational use, as they ultimately take away space from houses within plots. Therefore, urban garden spaces can reveal aspects of varied experiences of urbanity that have previously been overlooked.

This paper investigates townspeople's responses to the various political, agricultural, and health crises of the medieval period (c.1200-1600 CE), with particular focus on those of the fourteenth century. This is achieved through an assessment of archaeobotanical, cartographic, architectural, and artefactual data from the case study town of Huntingdon, Cambridgeshire, UK. Evidence for changing land use, including agricultural practices, industrial activity, and abandonment, is critically appraised to illuminate the decisions and performances of urban life made by inhabitants and landowners at the time of crisis. Ultimately, this paper highlights the potential of assessing evidence of change within urban garden spaces in informing on the endurance of town communities in the wake of the famine, war, and disease of fourteenth century England.

4 PERIPHERAL URBAN HOUSEHOLDS IN THE MEDIEVAL CITY OF CAHOKIA, NORTH AMERICA

Baltus, Melissa (University of Toledo) - Baires, Sarah (Eastern Connecticut State University)

Households offer a unique window into individualized patterns of social relations as they shape communities through daily practice. Our research focuses on neighborhood communities located on the physical periphery of North America's largest Medieval City, Cahokia (1050 - 1400 CE), located in the Mississippi River floodplain dubbed the American Bottom. We investigate domestic households and related community buildings and spaces to understand how persons located on the margins participated in place-making during the critical moments of city emergence and reorganization. The research presented is derived from two seasons of field work at Cahokia using non-invasive geophysical survey methods and targeted excavation of domestic features to understand how communities, at the domestic level, chose to participate in the process of city creation and/or dissolution. We compare size, style, and organization of houses over time to describe neighborhood dynamics and timing (founding, reorganization, dissolution). We also compare access to key materials and evidence for participation in practices that are central to Cahokian structuring principles and ideologies to determine how connected peripheral communities were to the core of the

city. Our data are preliminary and speak to the dynamics of social change on the edges of a densely populated urban environment, as well as to the contributions of peripheral neighborhoods to the success or decline of a city.

5 LIVING IN STRALSUND'S QUARTIER 17- COMPARATIVE STUDIES OF HOUSEHOLDS IN A LATE MEDIEVAL QUARTER OF A NORTH GERMAN TRADING TOWN

Radohs, Luisa (University of Freiburg)

During the reconstruction of the area Quartier 17 in the Hanseatic town of Stralsund (northeastern Germany), extensive rescue excavations were carried out in 2007-2008 and 2010-2011. The archaeological investigation of an almost complete urban quarter with 30 plots provides deep insights into the genesis and development of a central residential area of the medieval trading town.

For the paper, selected plots of Quartier 17 were analysed comparatively for the 13th and 14th centuries according to a uniform scheme that includes the find material, the spatial organisation of the plots, building types, layouts and materials, the plot size and its positioning within the overall urban topography. The approach enables a classification of the parcels through material culture and thus an archaeological description of the variance and diversity of households in this urban neighbourhood. It opens up for analyses of lifestyle, occupation, consumption and, through the diachronic perspective, the temporal development of individual plots in a central quarter of medieval Stralsund.

6 ACTIVITIES, FUNCTIONS AND INNER STRUCTURES OF HOMESTEADS AT THE EARLY MEDIAEVAL STRONGHOLD POHANSKO (CZECH REPUBLIC)

Příšáková, Michaela (Department of Archaeology and Museology, Faculty of Arts, Masaryk University, Czech Republic) - Adameková, Katarína (Institute of Archaeology, Czech Academy of Sciences, Czech Republic) - Dresler, Petr (Department of Archaeology and Museology, Faculty of Arts, Masaryk University, Czech Republic)

The Early Mediaeval stronghold Pohansko (9th – 10th century), one of the Great Moravian centres, has a very specific inner structure consisting of at least 20 homesteads out of which 8 have been archaeologically excavated. Most of them are more or less of rectangular shape, however they vary in size, function and layout. When examining Early Mediaeval strongholds in the Central Europe, the built-up area within them seems to be without firmly set urban planning rules. The urban plan of the stronghold at Pohansko indicates that this may not have always been the case.

The homestead consists of sunken-floored houses of various functions, features built on the original surface, possibly of timber construction, hearths and in some cases graves and preserved parts of palisade trenches. Some of them were associated with crafts such as specialized blacksmithing or non-ferrous metal production, non-specialized home textile production, as well as carpentry, cooperage and pottery manufacture. In addition, the number of finds of agricultural tools and large osteological assemblages also implies an agricultural and breeding function.

Here, we will compare the excavated evidence with the results of geophysical and geochemical prospections to describe similarities and differences between homesteads, considering their function and spatial distribution on the site. We will describe their internal structure, together with open spaces, waste management inside the homestead and spatial distribution of the finds and we will address the issue of homestead recognition.

7 HOUSES AND POTTERY. A RECENTLY EXCAVATED HOUSE OF MADĪNA BALAGHĪ (BALAGUER, CATALONIA, SPAIN)

Alcolea, Guillem (Universitat Autònoma de Barcelona) - Granell, Helena (Universitat Autònoma de Barcelona) - Padilla, Andrea (Universitat Autònoma de Barcelona)

The archaeological site of Pla d'Almatà (Balaguer, Lleida, NE of Spain) is the deserted city of Madīna Balaghī, located in the so-called Upper Frontier of Al-Andalus. Its 27 hectares are delimited by a wall to the west and east and by River Segre cliffs to the east and south of it. Islamic occupation of Balaguer can be traced back to the beginnings of the 8th century and continued until the start of the 12th century. The settlement fell under the rule of count Ermengol VI of Urgell in 1105, after a long siege, that resulted in the expulsion of muslim population. The city was not reoccupied and, therefore, it became an exceptional archeological site. Between 2004 and 2009 four houses were excavated and since 2023 the excavation of another house is being carried out. This paper presents the architectural study and the ceramics recovered from this house. The aim is to identify the function of each part of the house through the study of the distribution of the ceramics and fireplaces. Finally, the presence of a stratigraphic layer of carbons and ashes with burnt ceramics under the tiles of a collapsed roof constitute an evidence of a fire at the moment of abandonment.

631 "A DAY WITHOUT POTTERY IS A DAY WASTED" - POTTERY TECHNOLOGY AND MANUFACTURE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Hall, Derek (Independent Researcher) - Witte, Frauke (Museum Sønderjylland) - Brorsson, Torbjorn (KKS-Kontoret for Keramiska Studier) - Roeser, Christian (LVR-LandesMuseum Bonn)

Session format: Regular session

The creation of fired clay pottery vessels was a vital and widespread process across medieval and post-medieval Europe and many different distinctive styles were produced. This session aims to discuss and consider the various methods of pottery production that were in use. It will look into how the different types of kiln in use come into being. Is it possible to identify external influences and if so, where are they coming from. It can be argued that it was Roman influence that introduced technology such as the use of updraught kilns in the firing process. But in those parts of Northern Europe where there was little, or no such influence are we looking at a much later development with an unknown place of origin.

Did the making of specific wares like stoneware spread from a single production centre or was it invented individually across Europe? Is it possible to identify the transfer of techniques, for example the transfer of tin-glaze technology from the Mediterranean to the Netherlands, England and southern Germany, and understand the causes of that process? Are similar things happening elsewhere in Europe? In Northern Europe it would appear that the wheel-throwing of pottery was introduced in the 12th Century primarily by German potters who brought that technique with them. Is it possible to identify when local potters adopted that technique and if so where in particular.

The organisers would welcome papers that highlight ceramic craft, transfer of technology and innovation from both a macro and micro perspective from across medieval and post-medieval Europe. The main point of interest for this session is whether it was the movement of people or the transfer of ideas and technology that changed pottery production practices throughout Europe.

ABSTRACTS

1 POTTERY FROM THE CASTLE OF CASERTAVECCHIA: A FIRST ANALYSIS

Napolitano, Salvatore (Università degli Studi della Campania) - Sordillo, Valerio (Università degli studi della Campania "Luigi Vanvitelli") - Ianniello, Veronica (Università degli Studi della Campania Luigi Vanvitelli)

The castle of Casertavecchia, a fortress located on the north-eastern edge of the current town, stands out on a crag of Mount Tifata which overlooks the Terra di Lavoro plain (Caserta) from the north.

Over the last century the castle has been the subject of numerous restoration interventions, first of all an intervention in 1972 by the Civil Protection of the municipality of Caserta. During these non-archaeological operations, a significant number of artefacts linked to the life of the fortified complex were found, including iron elements such as nails and clasps, fragments of molded tuff and a significant quantity of ceramic fragments.

Two bases of protomajolica bowls stand out for their conservation, a class widely attested in the Mediterranean and southern Italy. The decoration, very common in the contexts of Campania in general, is represented by a brown spiral on the bottom of the bowl.

Another class of pottery present is the painted glazed one. Particularly noteworthy is a base decorated with a concentric circle motif that is very common in Campania contexts.

The discovery of these two classes of ceramics, albeit not in a stratigraphic sense, allowed us to include the castle of Casertavecchia in the distribution network of these artefacts in the late medieval contexts of Campania.

Together with these sporadic finds, the contribution offers a preliminary analysis of the first clay finds that emerged during the archaeological research launched in 2021 by the University of Campania "Luigi Vanvitelli", focusing on common ceramics without coating.

This contribution presents itself as a first examination of the consumption of ceramics in the castle, especially with regard to the stratigraphic contexts relating to the final phases of the monument, the latter to be placed in the years between the end of the 15th and the beginning of the 16th century.

2 'WHERE HAVE ALL THE KILNS GONE?' POTTERY MANUFACTURE IN MEDIEVAL SCOTLAND

Hall, Derek (Independent Consultant)

Since its Renaissance in the 1990's due to the availability of targeted research funding the study of Scotland's medieval pottery industry has allowed us to understand what was being made for daily use across the country. However, we are still in the situation where we only have five excavated production sites at Stenhouse, Falkirk Council, Colstoun,

East Lothian, Rattray, Aberdeenshire, Throsk, Stirlingshire and Roslin in Midlothian. Ranging in date from the late 12th through to the 17th/18th centuries all these sites have largely been found by chance. It seems clear from the extensive excavation work that has now been carried out in Scotland's medieval burghs that pottery manufacture was not taking place within their confines largely due to fire risk and/or availability of space. This paper will use the excavated sites to consider what we currently know about the kiln types in use, firing methods, clay exploitation and the pottery workshops. Consideration will then be given as to how to track down more production sites and seek the funding required for that fieldwork. A short overview of apparent external influences on Scottish pottery design and manufacture will also be given.

3 NO ROMANS – NO POTTERY CIVILIZATION!?

Witte, Frauke (Museum of Southern Jutland, Denmark)

The influence of the Roman Empire can only be seen marginally in Scandinavia, and not at all in the styles or types of local medieval ceramics. The first wheel thrown pottery from Denmark dates to 725-760 AD. But it was not until the 12th century AD that the fast-turning potter's wheel came into general use. Around 1200 the evolution from black fired pots to red fired glazed jugs began. The oldest medieval kiln so far from Denmark is C14-dated to 1020-1160 AD. Vertical and horizontal kiln types are both found in the following centuries.

In the early 15th century, the High Medieval tradition of pottery making in the Danish region disappears and a completely new type of pottery emerges with a new firing technique and new vessel shapes, techniques and decorations. This 'younger redware' is probably modelled on Dutch pottery. In the Netherlands, it first appears in the early 14th century, while production did not spread to Denmark until just over a century later. As yet, no pottery kilns have been found that can be linked to this new production in the 15th century. However, production did not take place in the same place as the production of the high medieval glazed jugs, nor did it take place in the same way. It is reasonable to imagine that the production of ceramics moved to the cities, where we have the first kiln finds, although they are a good 100 years younger.

The significant technical and formal difference between High Medieval and Late Medieval domestic pottery in Denmark suggests that there is no continuity between the two productions. Immigrant potters may have played a decisive role here.

4 THE ORIGINS OF FAIENCE PRODUCTION IN ALSACE : JEAN-HENRI WACHENFELD'S WORKSHOP IN STRASBOURG IN 1720

Arnold, Elise (Archéologie Alsace) - Minot, Florent (Archéologie Alsace) - Wendling, Jean-Michel (independent researcher)

Excavations carried out in 2020 at the 1, rue de la Question in Strasbourg (France), unearthed the poorly preserved remains of a potter's kiln from the modern era. Thanks to archival documents, this kiln - and the few production failures that were found on site - could be attributed with certainty to the potter Johann Heinrich Wachenfeld. Wachenfeld came to Strasbourg in 1719 from Bavaria. Back there, he worked for a short period of time in the city of Ansbach as a painter and faience maker. His goal in Strasbourg was to set up a faience factory whose production techniques were unknown in Alsace at the time. Shortly afterwards, he joined forces with Charles-François Hannong, to whom he seems to have passed on the techniques that would later make Hannong's Strasbourg faience works such a success.

Thus, the unfinished ceramics discovered during the excavations (a jug and a few fragments of biscuit plates) represent the very first attempts at producing faience in Alsace. The particular type of jug, produced in the purest Nuremberg faience style of the early 18th century, leaves little doubt as to the identity of its maker, identified by the archives as Johann Heinrich Wachenfeld. The documents also enable us to retrace the requests made to the city of Strasbourg by the potter to set up his workshop. They also detail the various attempts to build the kiln, the technology of which was clearly still poorly mastered.

Field discoveries combined with archival documents have enabled us to demonstrate, quite exceptionally, that the techniques for producing faience vessels arrived in Alsace from southern Germany, thanks to the knowledge and movement of a single man.

5 TECHNOLOGY AND DISTRIBUTION OF POST-MEDIEVAL CERAMICS FROM THE BAY OF CÁDIZ (SPAIN)

Ruiz-Gil, José-Antonio (Universidad de Cádiz)

Starting in the 13th century, a set of port structures of a military, fishing and commercial nature were consolidated in the Bay of Cádiz. From this moment on, the Islamic ceramics produced locally were complemented by other productions that came, mainly from Valencia in Spain. From the end of the 15th century the Bay of Cádiz will supplement the hegemonic role of Seville. From the ceramic point of view, it is observed in the productions of Seville, Liguria and

Tuscany, and to a lesser extent the Rhineland stoneware from Flanders, all of which are registered in the distribution centre of Cádiz. During the 17th century, Cádiz became the head of American trade, where we found Spanish ceramics, mainly from Seville, that imitated Italian ones and even Chinese porcelains. During the 80 years of peninsular unity, majolica from Lisbon and ceramics from Estremoz were very common. From Cádiz, both Ligurian or Montelupo majolicas and marbled and sgraffito no tin majolicas from Pisa are traded. Without forgetting the decorations in cobalt blue on tin white of the Nederland. During the 18th century, the Islamic tradition of glazing was clearly replaced by porcelain ceramics that imitated Chinese tableware. This ceramic was imitated in Seville during the 19th century. The complement this time will come from stoneware bottles made in Germany. At a Micro level, the data from the Cádiz distribution centre speak of the movement of people through commerce, not so much the transfer of ideas and technology. Not so at a macro level, since these ceramics always have production-supplying centres that do speak to us about innovation and technological transfer, such as that produced in Italy and taken to Seville or to Flanders. And from here to Lisbon. Or in medieval times from Malaga to Valencia.

6 PATRIX – MATRIX – TILE. A “FRAGMENTARY” INSIGHT INTO TRADE CONNECTIONS AND ROUTES

Wegner, Martina (Archaeological Heritage Office of Saxony)

From 2004 to 2006, excavations were carried out in the suburb of Leipzig, Saxony, prior to the construction of the “Wilhelm-Leuschner-Platz” S-Bahn station. A number of waste pits from several potteries from the 16th/17th century were uncovered. In addition to ceramic vessels, they also contained several thousand fragments of stove ceramics. These include not only relief tiles, but also their ceramic positive and negative moulds, some of outstanding quality. Many of the tile motifs, which are based on contemporary woodcuts, are known both regionally and supra-regionally. The finds from Leipzig were 3D-scanned at the Archaeological Heritage Office of Saxony. The highly detailed 3D models were used for image documentation and also for comparison with finds from other sites that had the same images. The initial question was along which route the motifs spread, i.e. which pottery was the one that created the motif and which took it over, and which of the products – positive or negative moulds or tiles – were sold. For this purpose moulds from other pottery waste were also 3D-scanned. As a result, the 3D models confirm an elaborate multi-part production process for stove tiles using primary and secondary moulds. However, the lack of objects suitable for 3D scanning and comparison limits reliable information on the trade route of the pottery products. Nevertheless, the examples shown are intended to draw attention to the importance of a differentiated and precise view when analysing relief stove ceramics. The widespread motifs not only provide us with insights into past zeitgeist, trends and fashions, but in the best case even reflect individual trade relationships. Another unanswered question is whether the products were traded via the potters themselves or via middlemen. In any case, the potteries of the important trade fair city of Leipzig must have played an important supra-regional role.

7 THE EMERGENCE AND ESTABLISHMENT OF A MEDIEVAL POTTERY PRODUCTION IN SCANDINAVIA

Bronsson, Torbjörn (Ceramic Studies) - Johansson, Erik (Department of Archaeology and Ancient History, Lund University)

Northern Europe has often been considered an outpost and it was an area where innovation came later than the rest of the Western world. In Scandinavia and Finland, it started around 4500 BC. making vessels from clay and this craft has usually been considered a home craft.

South of the Baltic Sea, the ceramic craft was already in the Viking age mainly a professional craft, but despite this, the Nordics chose to still make the vessels based on the same methods as they did during the Neolithic. Only at the end of the 12th century are there the first indications that the pottery craft changed, and the first traces are of wheel thrown pottery, glazes and pottery kilns. Why did this happen at this time and why not earlier?

Different studies of thin section and ICP-MA/ES have showed that it is possible to identify where and when a professional pottery production started in different parts of Scandinavia.

We will also present a case study based on pXRF analysis of 400 diagnostic sherds of redware and greyware from the period 1150-1350 found in Lund, Sweden. Using chemical analysis in combination with traditional ceramic analysis and rim form analysis, we want to discuss the emergence and establishment of the glazed redware production in Scania. The questions we want to address are: When was the Scanian production established? From where came the influence or competence? What did the organization of the Scanian pottery craft look like?

8 CLAY AND CHANGE: CHARACTERIZATION OF CERAMIC PRODUCTION IN MEDIEVAL AND MODERN TIMES IN FARO DE LIMANES, ASTURIAS, SPAIN

Piñera, Francisco (Universidad Nacional de Educación a Distancia UNED. Departamento de Prehistoria y Arqueología. Programa "Severo Ochoa" de Ayudas Predoctorales del Principado de Asturias)

Faro de Limanes, Principado de Asturias, Spain is one of the most important pottery centers in the northwest of the Iberian Peninsula for medieval and modern times, with activity from the 11th century to the present. In medieval times, only black wares were produced, which responded, above all, to forms related to the preparation and storage of food. In modern times, tin-lead glazed, white lead glazed wares and honey-glazed wares productions are added, dedicated to food consumption. These pieces appear in large quantities and in a multitude of archaeological contexts, reaching a notable dispersion throughout the northern Iberian Peninsula

Our proposal entails the multidisciplinary study of Faro de Limanes and its ceramic productions, combining traditional archaeological and ceramic analyses with archaeometric techniques and Digital Humanities. Ceramics from Faro de Limanes have been examined in numerous archaeological contexts with well-defined chronologies, including pieces from the production center itself. For the first time, a chrono-typological approach is presented alongside a technological characterization based on archaeometric analyses for its entire ceramic repertoire from the 11th century to the 18th century.

Analyzing this long-operational production center provides a unique opportunity to observe diverse technological changes and evolutions in production methods reflected in its pieces. Adaptations in the ceramics of Faro de Limanes mirror the dynamics of the societies that created and utilized them, capturing the nuances of their developments and transformations over time.

9 LATE MEDIEVAL POTTERY FROM BENEVENTO CONTEXTS

Cammarota, Claudio (Università della Campania "Luigi Vanvitelli")

The present paper focuses on a survey of late medieval tableware pottery from excavations conducted in the Benevento town and the surrounding area, dating back to the first fifteen years of the 2000s. The study was conducted by the team of medieval archaeologists from the Department of Humanities and Cultural Heritage (DiLBeC) of the University of Campania, who have been conducting research in Benevento for some time with the aim of reconstructing the material history and identifying the transformations of the city during the Middle Ages. The data obtained from the macroscopic analysis made it possible to identify the main characteristics of the finds, most of which may have been produced locally. Of particular interest are the productions covered with tin and lead-based vitreous coatings. The study of the ceramics, in addition to providing chronological references useful for dating the archaeological layers, has allowed us to understand social, economic and cultural aspects of the communities to which they belonged.

10 EVOLUTION OF POTTERY PRODUCTION IN MEDIEVAL FLANDERS: TRACING CULTURAL INFLUENCES AND TECHNOLOGY TRANSFERS (8TH-14TH CENTURY)

De Groot, Koen (Flanders Heritage Agency)

Excavations and studies in the last decade have revealed a lot of new data and insights into local and regional pottery production and consumption between the 8th and 14th centuries in Flanders. There is a clear technical shift from the Carolingian period onwards in both fabrics and forms that is clearly part of a broader cultural evolution. Broader general trends as well as direct influence play a role in this. For example, there is some indication that itinerant potters were active. The acculturation of international trends is also clearly observable in subsequent centuries and can recently be demonstrated in newly discovered production sites.

Influence and technological transfers in Flanders occurred from various surrounding European regions, both south and east, from northern France, the central Meuse valley to the Rhine region. Some of these technological transfers formed the starting point for important innovations in local productions that continue to have a significant impact until many centuries later. The lecture aims to give an overview of the broad outlines and important turning points between the 8th and 14th centuries, highlighting the many new data from recent research.

11 EIGHTEENTH CENTURY TILES FOUND AT SAINT-JEAN-DU-DÉSERT, MARSEILLE, FRANCE

Abel, Véronique (INRAP - National Institute for Preventive Archaeological Research)

Monograph study about me hundreds of tiles from the same archaeological context in the Marseille region. Beside an eclectic iconography, this group attests hitherto unknown technical innovations. Thanks to this archaeological excavation a new kind of production, until now unknown for this period and not recorded in the texts, has come to light.

The half pan carré tiles with painted decoration reveal a technical ability which is not completely obscured by the fact that these are "second rate" objects. Even if the simple hand-painted floral or geometric designs do not attest great painterly talent, their number and variety are indications of a well-established production. Later due to a lack of qualified craftsmen, or the means to pay them, the manufacturers moved towards mechanical systems for the more complex decorations. The impression of hand painted decoration is maintained either by chance or intent. This discovery would point to an hypothetical although possible transfer of technology between faience craftsmen and those of other trades.

12 POTTERY OF WESTERN ORIGIN AND THEIR INFLUENCE IN CENTRAL TRANS-DANUBIA (HUNGARY) IN THE LATE MIDDLE AGES

Kovács, Bianka (HUN-REN Research Centre for the Humanities)

Based on archaeological finds and written sources, a significant amount of western pottery arrived in the western half of the Carpathian Basin in the Late Middle Ages, which also had an impact on local pottery. Primarily we can count on the arrival of two major groups: graphitic ceramics and tableware. In my paper, I would like to present my latest results about these western originated groups of ceramics and their effect on the local production in Central Transdanubia.

Graphite ware was a common pottery type used in the western Danube Region during the Middle Ages, and this was also used in large quantities in the medieval Kingdom of Hungary. This pottery was mainly imported from the Austrian provinces, but researchers count also some local production. Furthermore, the strong influence of these imported goods on local, non-graphitic pottery is evident. The western forms were imitated by local potters in the 14th-16th century from local clays, which burns to yellow or red. These ceramics were partially made in Central Transdanubia, around the Vértes and Gerecse mountains. Several excavated pottery kilns and traces of workshops are known in this area. Tableware also shows that local potters imitated products from abroad, especially cups, which made it possible to lower classes to imitate the higher classes.

Based on the types and forms of pottery products, the western part of the Kingdom of Hungary, including Central Transdanubia, was connected to the western, Austrian-Moravian areas in the Late Middle Ages. From the look at the transport, the Danube played a central, mediating role in the trade of the studied region, and perhaps also played a role in technology transfer. Western pottery arrived on the river and on other trade routes had a powerful effect on local potters.

13 ANALYZING THE FIRING PROCESS IN LEAD GLAZES FROM THE 14TH TO THE 17TH CENTURIES FROM BARCELONA, CATALONIA

Peix Visiedo, Judith (University of Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona)) - Coso Álvarez, Júlia (University of Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona)) - Buxeda i Garrigós, Jaume (University of Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona)) - Madrid i Fernández, Marisol (University of Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona))

This study aims to analyse reactions occurring during the firing process of glazed ceramics from the modern period (14th-17th centuries) produced in Barcelona, Catalonia. The glazing process was expected to involve a double-firing procedure, which consisted of the application of the glaze on the ceramic body after the first firing phase, in a biscuit ceramic. This practice aimed to mitigate problems such as bubbling, particularly in calcareous ceramics, caused by the release of carbon dioxide during the biscuit firing, as well as other difficulties related to shrinkage and porosities.

By examining some samples from Barcelona using a Scanning Electron Microscope (SEM-BS-EDS), the development of a significant interaction layer at the interphase, between the clay body and the glaze, can be identified. This layer is characterised by the growth of newly formed feldspar and lead crystals, which could be attributed to a single firing process. It is known that the arrival of ceramics from other regions (Valencia or Italy) influenced the shapes and decorations of Barcelona's ceramics. Potter's treatise recovered in those countries specified the use of a double firing, a practice corroborated by the SEM study.

However, a slow cooling during the second firing may also have eased the development of crystalline phases. To explore this further, some samples from Barcelona showing no interphase interaction have undergone refiring using three different cooling rates (100 °C, 45 °C and 10 °C per hour). The specimens have been observed using SEM to focus on several features including glaze thickness, chemical diffusion of elements between the clay and the glaze, and changes in crystal presence within the interphase. This analysis aimed to determine if the cooling rate could have influenced the development of these reactions and potters from Barcelona might have adopted the double firing process influenced by potter from Valencia or Italy.

14 POTTERY PRODUCTION AND TECHNOLOGICAL CHANGE IN THE KINGDOM OF SEVILLE (15TH-18TH CENTURIES): AN ARCHAEOMETRIC APPROACH

Coso Alvarez, Júlia (Universitat de Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona)) - Buxeda i Garrigós, Jaume (Universitat de Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona)) - Madrid i Fernández, Marisol (Universitat de Barcelona; GRACPE (Research Group on Archaeology of Complex Societies and Processes of Social Change); IAUB (Institute of Archaeology of the University of Barcelona))

This study presents the first archaeometric characterization of pottery production from the Kingdom of Seville, focusing on previously understudied regions outside its capital, an area often forgotten. Through the integration of archaeological and archaeometric data, we illuminate a complex landscape of pottery workshops located in the current provinces of Cádiz and Huelva, in the southern Spain.

In this study, four workshops have been characterized using a combination of complementary techniques: X-ray fluorescence (XRF) for chemical characterization, X-ray diffraction (XRD) for mineral characterization, and scanning electron microscope (SEM-EDX) for microstructural studies. The results have enabled us to identify part of the ceramic production from the Kingdom of Seville and their techniques of manufacture.

Our research reveals distinct production patterns according to the chronology of the workshops, and verifies that the production of the Kingdom would not be completely assimilated to that of its capital.

In this sense, this study has provided a better understanding of this complicated scenario and underscores the need for further investigation into other areas and chronologies to provide a comprehensive view of ceramic productions in this territory.

15 THE POTTER OR THERE AND BACK AGAIN - MIGRATION OF RHENISH POTTERS AS A DRIVING FACTOR IN TECHNOLOGY TRANSFER

Röser, Christian (LVR-LandesMuseum Bonn)

For a series of ceramic phenomena, it can be stated that these did not only occur once at a production site, but that they became part of craft traditions and spread across regions and beyond. But whether these products were imitations made by local craftsmen following the paragons of circulating wares or whether the ideas and the knowledge spread to new places through the mobility of individuals can hardly be answered a priori solely on the basis of the preserved objects.

However, archival sources from the Early Modern Period document the personal migration of potters of the Rhenish tradition in many cases and can be correlated with the changing production ranges at their respective places of residence. Despite all remaining uncertainties, this provides valid evidence for the influence of migration on the transfer of technology and ideas in the pottery industry. In conjunction with socio-cultural push and pull factors, these sources unveil a perspective on the economic constraints and the realities of potters' lives that has which has hardly been considered so far. Furthermore, this allows to outline a reference model to explain the process of technology transfer and to facilitate a reliable assignment of the craft tradition on the basis of specific features, be it related to the findings of archaeological sites (especially the kiln construction) or to the objects.

632 MULTISCALAR METHODS FOR STUDYING ANCIENT LANDSCAPE DEVELOPMENTS AND SETTLEMENT DYNAMICS IN THE CLASSICAL WORLD BETWEEN ARCHAEOLOGY AND HERITAGE MANAGEMENT

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Ippoliti, Mattia (Sapienza Università di Roma) - Casarotto, Anita (University of Groningen; Koninklijk Nederlands Instituut Rome) - Zamora, Mar (Universidad Autónoma de Madrid)

Session format: Regular session

This session invites papers aimed at reconstructing changing urban/rural landscapes and settlement patterns of the ancient Mediterranean. The focus is on layered contexts tackled from a multiscalar, diachronic perspective in archaeology or cultural heritage management. We especially welcome contributions that deal with territorial reconstruction and evolution based on field survey data using GIS spatial analysis and remote sensing for land use, population and socio-economic mapping and modeling. Also important to this session are the ways of integrating data and analyses into today's society as cultural heritage.

The palimpsest concept is used to define the urban or rural landscape, and explain its complex layered structure. The Mediterranean is one of the most archaeological data-dense landscapes, which allows for comparative studies of

multiscalar interactions between regions, cities, settlement patterns, buildings and objects. Based on mapped legacy and new data, various methodological approaches are applied to reconstruct the temporal and spatial evolution of the landscape and its historical narratives. Landscapes are both contexts and systems of contexts. This allows for analysis at different scales to reconstruct and narrate stories, but also changing landscapes in modern spatial planning. The session theme will be the methods of mapping and analyzing old and new data in stratified landscapes to produce 1. scientific research that investigates, at different scales, the urban and rural landscapes of the ancient Classical World and 2. heritage maps for policy makers that support territorial monitoring of cultural resources in sustainable spatial planning. Particular attention will be given to the relationship between the heritage stories of places and monuments and their historical, archaeological, topographical, social, cultural, ecological and natural contexts.

To sum up, this session is for papers dealing with:

- the use of territorial analysis for socio-economic reconstructions
- the ways of integrating ancient changing landscapes into today's society, as cultural heritage.

ABSTRACTS

1 LANDSCAPE STRATIGRAPHY AND MULTISCALAR ANALYSIS. THE COUNTRYSIDE OF ROME AND ANCIENT LATIUM

Ippoliti, Mattia (Sapienza Università di Roma)

Landscape is both a layered reality and a container of stratigraphies that can therefore be analyzed both as a context and as a system of contexts. In order to be able to identify, analyze, and understand the processes that have characterized the history of ancient landscapes, it is therefore necessary to apply a multiscalar approach that allows reconstructing and narrating histories and microhistories. Such an approach requires the consideration of all the different sources of information and all the available data; to do so, it is necessary to develop techniques for the management and critical analysis of legacy data that allow their integration with current databases. By analyzing with continuous changes of scale from both a synchronic and diachronic perspective all the available data, it is possible to break down and recompose the stratigraphy of the landscape, which is in turn composed of the stratigraphies of all the places and monuments it contains. This stratigraphic and multiscalar perspective will be applied to the analysis of the countryside of Rome and ancient Latium. The contexts of this territory will be the case study to test the possibility of using spatial analysis to reconstruct historical, demographic and cultural phenomena. Thus, a possible diachronic reading of the occupation, organization and exploitation of the ancient countryside will be proposed through the analysis of the rural settlements that populated it between antiquity and the early Middle Ages.

2 VISUAL PERCEPTION OF CHANGING LANDSCAPES OF THE ROMAN WORLD

Zamora, Mar (Universidad Autónoma de Madrid)

Historical and archaeological landscapes evolve creating new landscapes always in change, since landscape is dynamic. Our image of those landscapes also changes.

In this paper we think about the visual perception of roman cities of Hispania (and their monuments) throughout the years, changed landscapes from the ancient world to the present days that produce a rich array of realities from different points of view:

- Cities considered as visual references in the surrounding landscape (mostly analysed using GIS), since the city was one of the axes of territorial structure in the ancient roman world.
- Visual perception of archaeological remains on the field, including drawings and paintings.
- Representation of roman cities in historical cartography.
- Image of archaeological landscape in literature (novels and travel books).
- As Heritage landscapes.

In summary, considering that architecture is one of the most lasting archaeological remains of the ancient world, we would like to approach the visual impact of these buildings and cities in the surrounding landscape, the images of these landscapes given by travellers, cartographers, or writers, among others. Some case study will be considered.

3 **CHANGING LATIUM: AN EXPERIMENTAL ASSESSMENT OF LEGACY AND SURVEY DATA FOR AN ARCHAEOLOGICAL HISTORY OF CHANGING LANDSCAPES AND HERITAGE MANAGEMENT**

Della Seta, Tommaso (Rijksuniversiteit Groningen/University of Groningen; Sapienza Università di Roma) - De Palis, Paolo (Sapienza Università di Roma)

“Progetto Lazio Antico” (www.lazioantico.it) is a collaboration between Sapienza University (Rome) and the Regione Lazio. The project aims at reconstructing the archaeological history of ancient Latium from the left bank of the Tiber to the southern limits of the modern region, from the Late Bronze Age to Late Antiquity. Project members collect information and archaeological data from a range of available sources to create a database with a clear taxonomy allowing different sources of information to communicate. The project is closely connected with the international Rome Hinterland Project that aims at making data from archaeological surveys comparable (see comparativesurvey-archaeology.org/consortium/).

In our paper we will comment on the development of legacy data concerning rural settlement patterns and their archaeological history in Latium Vetus and Adiectum, arguing that a new step is needed to assess the reliability of the data, in two intersected ways: a site falsification assessment, to evaluate the reliability of each topographical datum point, and to verify site data coming from the older topographical surveys; and a pattern falsification assessment, to evaluate the amount and quality of information each territory holds, taking into account the quality of the sources and the distribution of the available data. This procedure will help to assess a robust delineation of rural development over time.

To illustrate our approach we employ a case study in which we have carried out a pattern falsification assessment (Satricum) and one which has been tested for site falsification issues (Upper Latina Valley).

4 **THE EVOLUTION OF LANDSCAPE AND SETTLEMENT TRANSFORMATIONS IN THE 18TH MUNICIPIUM OF ROME'S SUBURBIUM: A WEIGHTED AVERAGE ANALYSIS**

Peloso, Elisa (Sapienza Università di Roma) - Fabbri, Sara (Perugia Università)

The aim of this paper is to reconstruct the evolution of the landscape in the 18th Municipium of the Suburbium of Rome between the 8th century B.C. and the 7th century A.D.

This will be based on the analysis of a detailed and extensive documentary dossier of the surveys carried out between 1993 and 2003 as part of the project ‘Archaeology of the Suburbium of Rome’ by the Department of Classical Archaeology of the University of Rome ‘La Sapienza’, under the scientific direction of Andrea Carandini.

The method of weighted averaging was chosen for analysing the pottery in order to estimate in a statistically reliable way the amount of pottery in each of the topographic units over a given period, taking into account the approximate or exact date of each of the fragments collected.

The method used produces graphs that make it possible to understand the evolution of the settlement in the XVIII Municipium, based on the distribution of wares in the area by chronological phases, through the processing of data on a GIS platform.

The comparison between the graphs produced with weighted averages and those related to the evolution of the landscape allows for the examination, for example, of settlement changes linked to main historical events, visible in the evolution of the topographical units, as reflected in the changes in the attestation curves of the main ceramic classes. It is possible to determine whether periods of peak development in the number of TUs are associated with periods of particular dynamism in production and trade, or whether periods of decline in the number of TUs are associated with a decline in the quantity of products.

5 **AN ARCHAEOGEOGRAPHICAL APPROACH OF THE TERRITORY OF GROSSETO (ITALY). THE PARCEDES PROJECT**

Grosso, Simone (Université Paris 1 Pantheon Sorbonne; SDAVO)

The territory surrounding the city of Grosseto (Tuscany, Italy), occupied since the prehistory, can be divided into two distinct zones: to the west, an alluvial and originally marshy plan, dedicated to the cereal cultivation; to the east, a hilly area dedicated to pasture and transhumance. Thanks to a project on agrarian landscapes, PARCEDES, funded by the French “Agence Nationale de Recherche”, we have worked on these areas to understand the history of these two different rural landscapes and their anthropisation. Specifically, one of the aims of this project, is to reconstruct the evolutions of these two different realities from an archaeogeographical point of view thanks a diachronic and multi-scalar approach and to compare them from the point of view of the agrarian morphology, legal possession, agricultural exploitation in a longue durée chronological perspective (from the late roman period to the 20 th century). To reconstruct the palimpsest of these territories and their changes, the creation of a carte compilée or archaeogeographical map in a WebGis space which gathers within it archaeological, geological, geographical, and historical data has been neces-

sary. The georeferencing and vectorisation of the 19 th -century cadastre, combined with the study of the real estate registry and the comparison with ancient sources and archaeological data, allowed to gain a precise spatial outlook of the land ownership and to identify its main transformations between the Late Antiquity (Papacy and nobility) and the modern age (local church, nobility, and privates). On the other hand, both the visual and the automatic analysis of the cadastral forms of land parcels and micro-toponyms made it possible to obtain more informations on the relationship between legal land tenure and the paleo environmental characteristics of the place, especially about the processes of land reclamation in the lowlands.

6 **SOCIAL STATUS AND IMPERIAL ALLEGIANCE: URBAN TRANSFORMATION IN SOUTHERN ETRURIA UNDER AUGUSTUS**

Cattaneo, Matteo (Sapienza Università di Roma)

While the development of urban networks and the expansion of towns are often regarded as defining Roman culture, specifying precisely what constituted a city in antiquity and determining its “Roman” characteristics remains challenging. Nonetheless, from the late Republican period onward, a common suite of public buildings, clearly influenced by Rome, was constructed in most of the cities of Roman Italy—temples, theatres, amphitheatres, baths, and basilicas reshaped these urban landscapes. Combining different sources of evidence, including archaeological excavations, non-invasive surveys, and inscriptions, the evolution of these urban spaces can be observed, shedding light on social organisation and the development of Roman identity within these communities. This transformative process, varying in its precise timing and expression, reached its peak in the early decades of the first century AD.

Drawing on an ongoing PhD project at Sapienza Università di Roma, this paper focuses on three cities in southern Etruria: Falerii, Lucus Feroniae, and Veii. Despite their diverse origins, these cities each experienced significant changes to their urban form and fabric during the Augustan era. Rather than centrally directed by the emperor, the archaeological and epigraphical evidence suggests that the primary drivers behind these changes were members of the local elites and the emerging Augustan aristocracy. For instance, the Nonii Asprenates at Falerii, the Volusii Saturnini at Lucus Feroniae, and the Herenni Picentes at Veii played pivotal roles in these developments with the objective of advancing their social status and reaffirming their loyalty to the new regime. The analysis of the buildings and of the interactions with each other within the urban landscape allows the definition of settlement patterns for each of these cities and displays their complex and multi-layered structure. Moreover, it provides further studies on interactions between cities on regional scale.

7 **THE ARCHAEOLOGICAL MAP OF THE UPPER TAMMARO VALLEY BETWEEN ARCHAEOLOGY AND HERITAGE MANAGEMENT**

Cerbone, Oriana (Univeristy of Salerno)

The rural landscape taken into account in this paper is the upper valley of the Tammara river (Benevento, Campania region, South Italy) from the IV BC to the VI century AD. This territorial context is a rural area that has recently received attention from Italian and European development plans as it is at risk of environmental, social and economic marginalization.

This territory is characterized by several human occupations, remains of ancient roads connected to the Via Appia, and transhumance routes, some of them still in use today.

The study of the landscape and its transformations is carried out through the tools of historical-archaeological research, in order to be able to formulate reconstructive hypotheses on the development and territorial occupation in ancient times.

The knowledge of the ancient heritage is necessary in order to be able to implement strategies to safeguard the cultural heritage of marginal areas and to promote new forms of valorisation capable of supporting projects for rural development. The working methodology involved the creation and implementation of an archaeological territorial information system based on the correct positioning and analysis of the information collected. The territorial system was developed using a QGis web-oriented architecture, which manages cartographic and descriptive data-sets. Its basic logic is from detail to general and conversely. The elements collected are helping to define a new archaeological map through which to elaborate various themes on a chronological-typological basis.

The results of this study can be used for planning the development of the territory, implementing policies for the protection of cultural heritage, and supporting the various stakeholders in shared decisions and informed policies. The archaeological map therefore becomes a Decision Support System (DSS) and a territorial governance tool.

8 MAPPING ANCIENT LILYBAEUM. INTEGRATING DIFFERENT SPATIAL LEVELS AND DIACHRONIC PERSPECTIVES IN A 2D WEBGIS

Güngör, Aylin (University of Hamburg) - Seifert, Martina (University of Hamburg) - Griffo, Maria Grazia (Parco Archeologico di Lilibeo-Marsala) - LoBrutto, Mauro (University of Palermo) - Mandruzzato, Antonella (University of Palermo) - Occhipinti, Anna (Parco Archeologico di Lilibeo-Marsala) - Schwenn, Fabian (University of Hamburg) - Thiele-O'Sullivan, Nils (University of Hamburg)

The DFG-funded project "Lilybaeum. Principles of Urban Development" is a collaborative project between the University of Hamburg, the University of Palermo and the Archaeological Park of Marsala, Sicily. Since 2017, the team from both universities work on the archaeological map of ancient Lilibeo/Lilybaeum. A topographic map of all the known archaeological areas in a WebGIS is still a desideratum up to the present date.

The research focuses on the ancient city plan in different time phases, using new survey data as well as mapped legacy data to reconstruct the city's development over time and space and its historical narratives. The archaeological map unites all archaeological sites and remains with georeferenced data in one map for the first time, allowing not only the identification of different urban functional areas and respective buildings in the different phases, but also allows reviewing the research narrative of a differentiable cityscape. The remote sensing methods used make it possible to reconstruct changes of the urban settlement. This helps to define the urban landscape and explain its complex layers. The long process of data collection and analysis will serve the future qualitative description of Lilybaeum within the supra-regional network of Sicilian cities.

Questions of space and time are essential when creating an archaeological map. One of the main problems is the visualisation of relatively chronological data as well as complex multidimensional areas. The project has developed several strategies and solutions that will be discussed in the context of digital strategies. In particular, integration and presentation in geographic information systems through the combination of 2D and 3D methods offers solutions for complex multidimensional structures in areas such as necropolises. In addition, "the codified survey" has been developed as a new standardised method which meets the needs of practice by providing a systematic approach to address finds.

9 EXPLORING THE STRATIFIED LANDSCAPE OF WESTERN MEGARIS: THE ETHNOARCHAEOLOGICAL EXPLORATION OF AN ANCIENT GREEK CHORA

Farinetti, Emeri (RomaTreUniversity) - Anelli, Dario (University of Pavia)

The Western Megaris Archaeological Landscape Project (WeMALP) aims to reconstruct the long-term landscape history of Western Megaris, Greece. The research examines the rural land use over time, investigates the relationships between Megara and the countryside, and sheds light on the historical significance of the natural bridge connecting Attica and Corinthia. To achieve these goals, we conduct intensive systematic artifact surface surveys, architectural surveys, low-altitude drone photogrammetry, and remote sensing, all integrated into a digitally oriented workflow. Field data are critically interlaced with existing legacy data within a dynamic GIS environment.

This paper seeks to illustrate our multiscale approach. Along with settlement history, by studying the responses that the terrain offers to the research on landscape evolution over time, we can analyse, for instance, mobility systems that served as the physical link corresponding to cultural relationships between the ancient city, their harbours, and surrounding communities, traversing cultivated fields and mountainous landscapes.

We also explore changes in land use patterns over time. In particular, our ethnoarchaeological approach focuses on the material traces of recent human activities, including rural vernacular architecture associated with long-lasting wine production in the area. They are a valuable testimony to the territorial organization in ownership of individual family groups, which often replicates that of the classical period, as well as the original use as vineyards of areas employed otherwise today.

By using these small rural structures as vehicle of communication, deeply rooted in local culture and intertwined with familial and historical significance, we engage in community activities aimed at exploring the awareness of local communities of their rural heritage, understanding their perceptions of the landscape, as well as their cultural connections with neighbouring communities. In this way, we engage with the landscape of collective memory that has shaped, and continues to influence, the identity of every rural society.

637 UNVEILING EURASIA'S PREHISTORIC TECHNIQUES THROUGH USE-WEAR ANALYSIS: A CROSS-CULTURAL EXPLORATION

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Chen, Hong (School of Art and Archaeology, Zhejiang University of China) - Li, Weiya (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; University of Science and Technology of China) - Mickaël, Baillet (School of Art and Archaeology, Zhejiang University of China; Faculty of Archaeology, Leiden University) - Xue, Liping (School of Art and Archaeology, Zhejiang University of China)

Session format: Regular session

Prehistoric techniques reflect the daily lives, economic activities, and social structures of ancient communities. This proposal aims to explore the significant role of use-wear analysis in understanding prehistoric techniques in the Eurasian context. Use-wear analysis, a pivotal tool in archaeological research, has the potential to uncover valuable insights into the technological advancements and cultural practices of early Eurasian societies. Despite its application in archaeology, there remains a noticeable gap in communication among researchers from the East and West.

This session will provide a platform for researchers, especially traceologists, presenting the progression of tool-making practices and technological innovations across different regions of Eurasia during prehistoric times. We also welcome studies that demonstrate the developments in use-wear analysis techniques, including experimental archaeology, microscopy, and other cutting-edge methodologies, and their application in deciphering the functional and symbolic aspects of prehistoric tools. By bringing together a diverse group of scholars from various fields of archaeology and related disciplines, our goal is to encourage interdisciplinary collaboration and facilitate the exchange of knowledge and methodologies for interpreting the use-wear patterns on prehistoric artifacts across Eurasia.

ABSTRACTS

1 THE SURVIVAL OF THE PERISHABLE. UP GROUND STONE TOOLS INFORM ABOUT IDENTIFICATION AND CHARACTERIZATION OF BEHAVIORALLY RELEVANT PLANT TRANSFORMATIVE POTENTIAL

Longo, Laura (Ca' Foscari University of Venice) - Cagnato, Clarissa (Ca' Foscari University of Venice) - Veronese, Mauro (University of Padua) - Sorrentino, Giusi (Ca' Foscari University of Venice) - Parisatto, Matteo (Ca' Foscari University of Venice) - Birarda, Giovanni (Elettra Sincrotrone Trieste (Basovizza, Italy)) - Vaccari, Lisa (Elettra Sincrotrone Trieste (Basovizza, Italy)) - Longo, Elena (Elettra Sincrotrone Trieste (Basovizza, Italy)) - Marcomini, Antonio (Ca' Foscari University of Venice) - Badetti, Elena (Ca' Foscari University of Venice)

Material culture production, namely artefacts, represents the tangible expression of human activities, and it is regarded as a powerful archive and a rich repository providing evidences for complex conceptual knowledge since it responds to cultural and environmental constraints over time. However, only durable artifacts are surviving the millennial scale, and stone tools are less susceptible to destruction than biogenic remains; therefore, they typically offer the best evidence of the humans' ability to survive in a variety of habitats. The present work is reasoning about non-flaked industry – ground stones tools (GST) – used to mechanically transform plants. Yet, data about GST intentional use for plant processing, either to obtain calorific food or for other economical purposes, are scattered and even more rare are the residues of plants still adhering to the utilized areas. The broad range of different part of plants processed by modern humans is informative of their transformative capacity to convert a wide range of biotic resources even beyond dietary purposes. Through test cases we present the analytical strategy: imaging which included different resolution microscopes – optical, in both reflected and transmitted light, polarized; Confocal and SEM (operated in FEG and thermionic modality) and microCTscan with the aid of synchrotron light, and chemoprofiling of the residues by applying non-invasive spectroscopic techniques like microFTIR (with the aid of synchrotron light) and RAMAN. We will also call for raising awareness on the criticalities underpinning the mining of micro and nanoscale data and also the great potential of disclosing the role of ground stone tools as bioarchives, intelligently used by Homo sapiens to exploit the resources of the relevant environment.

The presented study is based on GSTs used by early waves of Homo sapiens during the MIS 3 (60-25 ka) colonization across the Eurasian steppe.

2 ABOUT DESIGN, USE, AND HAFTING OF CHÂTELPERRONIAN POINTS AND KNIVES. A COMBINATION OF USE-WEAR, RESIDUES, MORPHO-FUNCTIONAL ANALYSIS AND EXPERIMENTAL APPROACH

BAILLET, Mickael (School of Art and Archaeology, Zhejiang University, China; Faculty of Archaeology, Leiden University, The Netherlands) - **Aleo, Alessandro** (Faculty of Mechanical Engineering, Delft University of Technology, The Netherlands)

At the far west of Eurasia, during the so-called Middle to Upper Palaeolithic transition, several techno-complexes potentially made by Neanderthals or Homo Sapiens, such as Châtelperronian, Jerzmanowician, Uluzzian, Neronian, were dominated by lithic points. Preliminary studies have demonstrated that these tools were used both as projectile points and knives for butchery, with projectile points being hafted, while the knives were probably hand-held. However, the data are still too scarce to state the differences in tool design between both tool types. The question of tools and hafting designing of hunting weapons and butchery knives could be crucial to better distinguish between the specificity of both Neandertal and H. Sapiens techno-complexes during this pivotal period.

We therefore approached this question by way of a traceological, residue, and morpho-functional analysis, but also experimental archaeology, applied to two Châtelperronian lithic assemblages from Morín Cave (Cantabria, Spain) and Canaule II (Dordogne, France). Our results show that projectile points, identified through impact fractures, are mostly manufactured on regular blanks with reduced thickness and straight profile. Micro-polishes and residues on the proximal and backed portion of the points demonstrate that they were sometimes hafted with adhesives. Knives, identified through macro-scarring and micro-polish, are often manufactured on irregular blanks with uneven thickness. They always exhibit a retouched back facilitating prehension. Rarely, some knives are made on regular blanks and display hafting polish on the proximal part, but also possible impact fracture on the distal part, suggesting that they were used alternatively as knives and projectiles.

These data tend to demonstrate a specialization in the selection, use, and hafting of projectile points and, on the contrary, a certain degree of variability in the selection, use, and prehension of butchery knives. Thus, the concept of Châtelperronian backed blades, besides being ambivalent, appears to be quite flexible.

3 DECONSTRUCTING LITHICS: INTEGRATING TECHNOLOGICAL, DESIGN AND FUNCTIONAL APPROACHES TO THE LITHIC INDUSTRIES FROM YAHUAI CAVE, GUANGXI PROVINCE, SOUTH CHINA

Chen, Hong (School of Art and Archaeology, Zhejiang University) - **Li, Yao** (School of Art and Archaeology, Zhejiang University) - **Xie, Guangmao** (Guangxi Institute of Cultural Relics Protection and Archaeology)

The Cobble-tool industry, Hoabinhian techno-complex and lithic miniaturization were three cultural phenomena which merged together in Lingnan region from the upper Paleolithic to late Neolithic. Many scholars had carried out both technological and typological analysis of these lithic industries, and succeeded in identifying technological trends between different sites. However, not enough attention has been paid to lithic design, utilization and equipment manage.

In this paper, we combined microwear analysis and techno-functional method to investigate the design and utilization strategies of stone tools unearthed from the Yuhai Cave in Guangxi Province, which dates back to 45–4ka. The lithic assemblage composed of cobble tools, sausage slices and miniaturized lithics shows a kind of rough style from typological perspective. However, after analyzing, we found some forms were intentional chosen or designed and the lithics were efficiently used, as shown below:

1) Prehistorical human take advantage of the natural morphology of the stone tools. They always chose some flakes with a sharp edge at one side and a blunt facet at opposite side to form suitable transformative and prehensive module. 2) Prehistoric humans permutated and combined techno-functional modules flexibly to produce predetermined but not standardized tools, although the retouch is partial and minimal. 3) Lithics were efficiently utilized. Various kinds of processed materials were involved, which suggests that lithics could apply to a variety of subsistence activities.

The techno-economic system of prehistoric humans at Yuhai Cave seems to be a good balance between minimal technical investment and high efficiency and planning. This behavior follows the principle of least effort, and reflects the cultural adaptation at this pivotal period.

4 THE USE-WEAR ANALYSIS OF DOLOMITE MICROBLADE AT SHUIDONGGOU LOCALITY 12

Zeng, Chenru (Wuhan University) - **Gao, Xing** (Institute of Vertebrate Paleontology and Paleoanthropology; University of Chinese Academy of Sciences)

Shuidonggou locality 12(SDG12) is a Late Paleolithic site characterized by microblade technology. Dolomite is the primary lithic raw material at the site, and functional studies of dolomite microblades can help us understand the be-

havior of ancient humans and explore functions of the site. Experimental archaeology and use-wear analysis are the main methods used in this paper for functional studies. To compare microscopic use-wear, experiments were conducted on dolomite microblade pressing, heat treatment (250°C-350°C), and bone handle inlay to obtain dolomite microblade specimens. Thirty groups of dolomite flakes (n=17) and microblades (n=52) were thus divided for tool-use experiments and micro-use-wear observation. Dolomite microblades unearthed from SDG12(n=296) were then observed and compared with the results of experiments and corresponding observations. It was indicated that ancient humans in Shuidonggou may have skillfully produced and used microblades in daily activities such as meat-cutting and wood/bone tool manufacturing between 10500 and 10200 cal BP. Combined with analytical results of lithic technology, zooarchaeology, fire use and paleo-environment reconstruction, this paper provides new evidence on the gradual decrease in human's mobility and shift to a sedentary life.

5 ASSESSING THE APPLICATION OF DIGITAL 3D MICROSCOPE FOR FUNCTIONAL ANALYSIS ON SHELL TOOLS: A COMPLEMENTARY APPROACH

Tumung, Laxmi (Instituto Internacional de Investigaciones Prehistóricas de Cantabria. (Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander), Universidad de Cantabria. Edificio Interfacultativo, Avda. Los Castros 52, 39005, Santander, Spain; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona educacional 4, Campus Sescelades URV (Edif. W3), 43007 Tarragona, Spain) - **Chaniotaki, Evangelia** (Sezione di Scienze Preistoriche e Antropologiche, Dipartimento di Studi Umanistici, Università degli Studi di Ferrara, C.so Ercole I d'Este, 32 - 44121 Ferrara, Italy) - **Ollé, Andreu** (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona educacional 4, Campus Sescelades URV (Edif. W3), 43007 Tarragona, Spain; Dept. Història i historia de l'Art, Universitat Rovira i Virgili. Fac. de Lletres, Avinguda Catalunya 35, 43002 Tarragona, Spain)

Functional analysis (combining wear and residue analyses) has become a potent approach to understanding past human activities. For decades, this field has developed its methods and techniques to better interpret the function of ancient artifacts but still requires some more advancement to improve the reliability and repeatability of the analysis, especially for shell tools. In the past decades, researchers have shown the importance of Optical Microscopy and Scanning Electron Microscopy to investigate the functionality of the tool. Recently, 3D Digital Microscopy has become common among traceologists to analyze (stone, bone, and shell tools) surfaces for functional analysis. Here, we propose to examine for the first time the advantages and disadvantages of 3D Digital Microscopy, focusing mainly on the fully automatized Hirox KH-8700 model. The results obtained from the analysis of the experimental shell tools (both non-retouched and retouched) show that digital microscopes have significant benefits for analyzing wear and residue traces. It offers high magnifications compared to OM and allows quick 3D modeling and profiling of the surfaces. Automatic stacking and stitching combined with a wide range of magnifications are powerful for describing the distribution and organization of traces. Also, the possibility to connect different light sources allows the highlighting of different types of features on different raw materials. Our results confirm the effectiveness of this technique for the qualitative description of use-wear and residues, both as a stand-alone microscope and as a complement to OM and SEM. This leads us to propose its systematic incorporation into shell use-wear studies and to explore its suitability for quantitative assessments.

6 TRACING MIDDLE BRONZE AGE DAGGER BIOGRAPHIES IN MAINLAND GREECE, CRETE, AND CYPRUS

Tripodi, Paolo (Ludwig-Maximilians-Universität München (LMU))

In recent years, traceology has emerged as a potent methodology for uncovering the intricate meanings of human artefacts used for various tasks by prehistoric communities, representing significant progress in archaeological research. Nevertheless, discernible disparities endure among some geographical contexts adopting this methodology, noticeable between Northern, Continental, and Eastern European countries. Specifically, in the eastern Mediterranean, the predominant approach to artefact analysis continues to be grounded in typo-chronological methods. Daggers have consistently captivated both archaeologists and museum enthusiasts worldwide, emerging as intriguing and multifaceted artefacts. These dual-purpose objects, serving as both tools and weapons, boast a rich historical record spanning an important part of human civilisation. Despite ongoing discussions regarding the precise roles and significance of daggers in prehistoric communities, their enigmatic nature continues to attract and spark curiosity among academics. Traceology applied to daggers of the Middle Bronze Age may indeed answer some of the questions raised about the functionality of these objects.

This paper endeavours to address these differences by “bridging the gaps” and presenting preliminary findings from my PhD, which focuses on Middle Bronze Age metal daggers from funerary contexts in mainland Greece, Crete, and Cyprus, via the lens of use-wear analysis. This study aims to provide compelling insights into the biographies and potential functions of these artefacts within prehistoric communities in the Aegean and Eastern Mediterranean during

the Middle Bronze Age by combining macroscopic and microscopic examinations, as well as integrating results from experimental archaeology with existing literature.

7 EXPERIMENTAL ARCHAEOLOGY AND USE-WEAR ANALYSIS BASED ON THE TORTOISE SHELLS FROM TAIJISI SITE

Lu, Yongming (Zhejiang University)

Tortoise shell, as a type of oracle bones, was an important instrument in the divination rituals of the Shang and Zhou dynasties. However, for a long time, the study of inscriptions on the oracle bones has been greatly developed, while the study of the bones themselves is relatively lacking, especially a series of preparations taken to make tortoise shells suitable for the divination. According to literature research, tortoise shells usually need to undergo specific processing procedures before the divination, including drilling, chiseling, burning and other key steps. However, there is a lack of verification and research on these specific processing procedures. This project aims to reconstruct the processing procedures by drilling, chiseling and burning modern tortoise shells in the simulation experiments. Meanwhile, combining with the use-wear analysis, to compare the traces on the experimental specimens with those on archaeological specimens excavated from the Taijisi Site, in order to deduce the tools, methods and sequence of the tortoise shells' processing. This would provide some help for further discussion of divination techniques in early Chinese societies and the culture, conceptual, political interaction and social organization structure revealed behind the divination techniques.

8 AN EXPERIMENTAL INVESTIGATION OF THE GROUND STONE KNIVES AND SICKLES IN SOUTH CHINA DURING THE LATE NEOLITHIC AND BRONZE AGE

Xue, Liping (School of Art and Archaeology, Zhejiang University, Hangzhou, China) - Chen, Hong (School of Art and Archaeology, Zhejiang University, Hangzhou, China) - Chen, Minghui (Zhejiang Provincial Institute of Cultural Relics and Archaeology, Hangzhou, China)

Ground stone knives and sickles were important implements in the Lower Yangtze River Region during the Late Neolithic and Bronze Age. Previous studies had suggested that harvesting gramineous plants such as rice was probably one of their functions, but there is very few empirical evidence of whether these tools were used and how. In this study, a set of replicative experiments were carried out to examine their effectiveness as harvesting tools and use-wear analysis was adopted to determine the multi-stage formation process of the use-wear traces on tool's surface. The results showed that the knives and sickles were efficient for rice harvesting when used in proper working motions. The use-wear patterns generated by rice harvesting are dominated by bright domed polish linked in reticulated patches often accompanied by fine striations. The distribution of the polish and its morphological characteristics are influenced by working motion, use intensity, and the nature of the stone raw material in varying degrees. The results of our study provide significant reference data and images for deciphering the functions of stone knives and sickles in archaeological records, which are crucial for investigating the development of rice farming agriculture in the Lower Yangtze River Region during the Late Neolithic and Bronze Age.

9 A PRELIMINARY TECHNO-FUNCTIONAL ANALYSIS OF LIANGZHU CULTURE DRILLS FROM ZHONGJIACUN SITE IN SOUTH CHINA

Guo, Yunhao (Zhejiang University)

Given the continued emphasis on the rich and magnificent material culture characteristic of the Liangzhu period, other objects that occupied a secondary place within the Liangzhu culture technical system, such as the most of chipped-stone tools were made of chert, remain understudied in technological and functional terms. We have approached this problem by conducting a techno-functional analysis of the chipped-stone tools from the Zhongjiacun site, which are mainly composed of flakes, with drills being the main tool type. Our results suggest that among different types of tools, the drills and the some flakes show clear patterns of design and use. The former was functionally specialized for drilling activities on mineral material, likely for making holes in perforated ground-stone tools (probably the perforated ground-stone tools and jade, emblematic tools of the Liangzhu culture); the latter were probably expedient tools dedicated to scraping hard organic material (probably within secondary activities). There is a scarcity of analyses of the use-wear and design of the rare chipped stone tools from some of the Liangzhu culture workshop sites specializing in the manufacture of perforated ground stone tools. Therefore, the study of chipped stone tools from the Zhongjiacun site is important for discussing the organization of the different lithic production systems of the Liangzhu culture, as well as the function of different sites in the Liangzhu area.

10 FROM LIGHT TO DARK: TRACEOLOGICAL INVESTIGATION TO UNDERSTAND THE NEOLITHIC OCCUPATION AT MORA CAVORSO

Petrinelli Pannocchia, Cristiana (University of Pisa) - Vassanelli, Alice (Department of Civilizations and Forms of Knowledge, University of Pisa) - Lunardi, Anna (independent researcher) - Rolfo, Mario (Department of History, Humanities and Society, University of Rome "Tor Vergata")

The Mora Cavorso Cave is situated in the karst complex of the Upper Aniene River Valley, on the slopes of the Simbruini Mountains (Western Latium, Central Italy). The cave comprises two main chambers and an impervious conduit that leads into a series of internal rooms and ravines. The investigations revealed a complex stratigraphy from the Upper Paleolithic to the Bronze Age.

A discontinuous level pertaining to the Neolithic period was discovered in the deposit, which includes funerary depositions in its innermost part dated to the 6th millennium B.C. (Rolfo et al., 2009, 2010; Silvestri et al., 2020).

This communication presents the traceological investigation of Neolithic lithic tools and personal ornament assemblages collected in the cave, to reconstruct their technology and functional properties. The objective is to understand the behavioural patterns of the site during the Neolithic period, also through the spatial analysis of the acquired data.

The data indicates differences in the techno-typological composition of the tools and ornaments, as well as in their use, showing variations in the utilization of the cave between the early and late Neolithic.

11 THE ZHANGJIASHAN SITE AS A WORKSHOP FOR MAKING KNAPPED STONE TOOLS FOR JADE PRODUCTION: AN USE-WEAR PERSPECTIVE

Ning, Yuxin (Zhejiang University)

The Zhangjiashan Site, situated within the ancient city of Liangzhu, is primarily distinguished by the prevalence of flint knapping tools, with stone drills accounting for a large proportion. Use-wear analysis is an effective method for determining the function of stone tools. By comparing archaeological artifacts with experimental ones and observing them under low and high magnifications, researchers can glean insights into the technological organization and even the social distribution of the site. Use-wear analysis of the flint knapping tools at the Zhangjiashan Site reveals their primary use in crafting jade tools, with stone drills specifically employed for drilling holes in jade artifacts. A comprehensive study of the types and functions of stone tools indicates that the Zhangjiashan Site functioned as a workshop for knapping stone tools for jade production. In contrast to neighboring workshop sites where finished and semi-finished jade artifacts alongside a limited number of knapping stones have been discovered, the Zhangjiashan Site is unique in its exclusive focus on knapping stone tool production, devoid of any jade items. This reflects a division of jade productive specialization, demonstrating the high level of specialization in handicraft industries within the ancient city of Liangzhu. This exemplifies the refinement of the jade crafting industrial system, bearing significant socio-economic implications, and also provides an important reference for the study of specialization in handicraft industries during the Neolithic period.

638 SYMBOLISM AND SOCIETY DURING THE LATE PREHISTORY OF WESTERN EUROPE: MEGALITHS AND HYPOGEA AS CASE STUDIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Cicilloni, Riccardo (University of Cagliari, Italy) - Spanedda, Liliana (Universidad de Granada, Spain) - Rodríguez Rellán, Carlos (Universidad de Granada, Spain)

Session format: Regular session

During the Late Prehistory of Western Europe, two distinct types of graves seem to have emerged nearly simultaneously: megalithic burials, which were notably more common, and rock-cut tombs. These sepulchers are widespread across most Central and Western European countries, with particular prevalence in the Iberian Peninsula, France, the Italian Peninsula, and Mediterranean islands like the Balearic Islands, Sardinia, and Sicily.

Despite considerable debate, the relationship between these two phenomena, namely the hypogean (rock-cut) and the megalithic (epigeous) burials, remains poorly understood. Both forms of funerary expression carry rich symbolic elements. These encompass aspects such as the placement of the deceased and their grave-goods; their structural attributes and the presence of diverse artistic representations inside them; their geographical positioning and their associations with both the surrounding landscape and other sites and monuments; and most importantly, the interplay between megaliths and hypogea.

An integrated examination of these phenomena offers the potential to enhance our comprehension of the prehistoric societies that constructed and utilized megalithic burials and rock-cut tombs. Therefore, we aim to investigate the features of these monuments that may relate to the realms of symbolism and culture, serving as a means to approach

the attributes and level of social complexity within the human groups responsible for their construction. We welcome both archaeological case studies and ethnographic approaches as they offer valuable opportunities for further analysis of these phenomena.

ABSTRACTS

1 ALL TOO HUMAN: ANTHROPOMORPHIC REPRESENTATIONS IN THE GALICIAN MEGALITHIC TOMBS

Valcarce, Ramón (University of Santiago de Compostela; CISPAC) - Ramírez, Fernando (University of Vigo)

Stone-made human figurines, usually very schematic, are found in several Galician passage graves dating back to the earlier 4th millennium BCE. They occur in front of the access to the corridor and may number in the dozens. In the last decades, research has reported a growing number of megaliths, too, where one or more uprights (in at least one case a capstone too) are roughly shaped in such a way that they resemble a human outline. Moreover, the slabs that make up the chamber and corridor of passage-graves have been decorated by painting and carving. That decoration consists of abstract motifs (wavy lines, chevrons, and geometric patterns), while figurative designs and, namely, human images are very rare. The latter are a more usual feature among the painted passage-graves located further south, in the Portuguese region of Beira. We shall examine the context and implications of the occurrence of those anthropomorphic representations.

2 ANÁLISIS DE LOS OBJETOS DE ADORNO PERSONAL DE ÉPOCA CAMPANIFORME HALLADOS EN CONTEXTOS FUNERARIOS DE ANDALUCÍA (ESPAÑA) Y CERDEÑA (ITALIA)

Pau, Claudia (Universidad de Granada)

En este trabajo se estudian los objetos de adorno personal hallados en importantes contextos funerarios de Andalucía (necrópolis megalíticas de Los Millares, Santa Fe de Mondújar y del río Gor) y de Cerdeña (hipogeo de Padru Jossu (Sanluri) y sepultura hipogeo-megalítica de Bingia e' Monti (Gonnostramatza).

Se ha realizado un estudio tipológico de los artefactos. Sono stati analizzati morfologicamente e morfometricamente, prendendo in considerazione alcuni parametri fondamentali come le perforazioni, la lunghezza, la larghezza e la sezione. Gli artefatti sono stati disegnati, fotografati e scannerizzati, raccolti in gruppi e questi, a sua volta, divisi in sottogruppi, tipi e sottotipi.

Se han individuado las materias primas. Los objetos en materia dura animal se han examinado macro y microscópicamente y se han realizado comparaciones con colecciones privadas y públicas de hueso de varias especies de animales. La nomenclatura de los artefactos en material malacológico se ha homogenizado con la base de datos CLEMAN. Sobre el material pétreo se han empleado técnicas no destructivas que han permitido distinguir con criterios diagnósticos las diferentes materias primas gracias a observaciones colorimétricas y microscópicas, completadas con análisis XRF, PIXE-PIGE, RAMAN y SEM. Se ha realizado un análisis traceológico detallado de los artefactos con lupa binocular, microscopio óptico y el SEM (microscopio electrónico de barrido) para identificar las huellas tecnológicas y de uso, acompañados de pruebas experimentales. Se ha propuesto el posible significado de los objetos de adorno, realizando estudios etnográficos.

Objetivo principal del presente trabajo es individuar similitudes y diferencias entre los objetos encontrados en las diferentes tipologías de estructuras funerarias y en las dos áreas geográfica. Además, partiendo desde el estudio de estos importantes artefactos de ajuar, obtener mayores informaciones sobre el ritual funerario en particular y sobre el fenómeno Campaniforme, más en general.

3 ROCK-CUT TOMBS, DOLMENS, CAVES AND THOLOI WITHIN THE PORTUGUESE ESTREMADURA: REVISITING ERMEGEIRA AND OTHER TOMBS IN THE TORRES VEDRAS REGION

van Calker, Daniel (UNIARQ - Centro de Arqueologia da Universidade de Lisboa) - Silva, Inês Sofia (Faculdade de Letras da Universidade de Lisboa) - Silva, Ana Maria (CIAS - Centro de Investigação em Antropologia e Saúde; UNIARQ - Centro de Arqueologia da Universidade de Lisboa; CEF - Centre for Functional Ecology) - Sousa, Ana Catarina (UNIARQ - Centro de Arqueologia da Universidade de Lisboa)

Portuguese Estremadura holds a diverse array of tombs from the 4th and 3rd millennia BCE. Initially, natural caves served as collective burial spaces, dating back to the early 4th millennium. From the second quarter of the 4th millennium onwards, dolmens and rock-cut tombs start being built and utilized. The 3rd millennium saw the emergence of tholoi alongside continued use of existing burial structures. Despite efforts at chronological phasing (Boaventura,

2011), the interconnection of various megalithic traditions in the landscape remains unclear due to old excavations and limited radiocarbon dating.

An in-depth overview of the Torres Vedras municipality highlights the polymorphic character of Neolithic and Chalcolithic funerary structures within the broader scope of Megalithism, understood as complex set of magical-religious practices (Gonçalves, 2003). The dolmen-type structures are currently absent from the region, but rock-cut tombs are abundant. Notwithstanding old excavations, the authors are developing new approaches for this area: fieldwork and absolute dating. In Torres Vedras, rock-cut tombs exhibit diverse solutions regarding architecture and chronology. A noteworthy site features the contiguous construction of an artificial cave and a tholos, in the Cabeço da Arruda necropolis – possibly augmented by a nearby orthostatic monument.

This presentation focuses on new data related to the Ermegeira hypogaeum, discovered accidentally in 1939, with a summary excavation led by Manuel Heleno, Director of the Ethnological Museum. Due to the fragmentary nature of the findings, the two gold earrings recovered, typologically classified as “basket shaped ornaments” (Comendador & Armbruster, 2019), are nearly the only known element from this tomb. This discussion will cover a comprehensive review of the monument, exploring votive goods, anthropological remains, and the first radiocarbon dates. Challenging the prevailing patterns for rock-cut tombs in the region, the data suggests a single occupation phase in the second half of the 3rd millennium BCE.

4 FEELS LIKE HOME? ARCHITECTURAL SYMBOLISM IN THE DOMUS DE JANAS OF SARDINIA (ITALY)

Lilley, Kirsty (University of Edinburgh) - Robin, Guillaume (University of Edinburgh)

The domus de janas tombs of pre-Nuragic (c. 4400-2300 BC) Sardinia represent one of the most elaborate iterations of rock-cut burial monuments in the prehistoric Mediterranean. Around 3600 tombs are known across the island, where they occur in cemeteries and in isolation, and are, predominantly, akin to those of later prehistoric Europe. However, a significant minority (c. 490) deviate from this pattern, and are embellished with a range of architectural, representational, and abstract art. The tombs' symbolic ornamentation is unique for this period in the Mediterranean, and therefore offers key insights into pre-Nuragic socio-cultural environments.

The motifs present within the tombs have a long history of study, and scholars have proposed interpretations ranging from religious or cultic significance to representational/realistic depictions. However, a subset of the symbols employed is often overlooked, and has only rarely been discussed: the architectural art – including ‘sagging’ roofs and beams, pillars and pilasters, false doors, and arguably bull’s horns (bucrania) – which earned the domus de janas or ‘houses of the fairies’ their local name. In some cases, the tombs recreate entire structural interiors, yet are carved underground in stone.

But why was it important for pre-Nuragic communities to reference architecture in their burial monuments? What was the symbolic significance of buildings, and what types of structures were they? This paper presents updated distributions and diversities of ‘house-like’ tombs, and compares it with data from selected contemporary settlements, including the newly-excavated sites of Punta Ferulusu (Bonorva) and Monte Mannu (Ossi), and wider contexts. In doing so, it explores possible social and cultural motivations for architectural elaboration, and the relationship between above- and below-ground structures.

5 ENCLOSURES AND STONE CIRCLES OF PREHISTORIC SARDINIA IN RELATION TO THE MEGALITHIC TOMBS AND FUNERARY HYPOGEA

Marcialis, Paolo (Universidad de Granada) - de Martini, Maria Giovanna (Freelance)

Sardinia is well known to scholars for the high diffusion of megalithic sites in prehistory: menhirs, dolmen tombs, funerary circles have been the subject of important studies in recent decades. Less known, however, are the stone circles and enclosures with probable uses linked to worship or funerary rituals, widespread throughout the island. For over a decade, the writers have been carrying out research aimed at cataloging and studying these megalithic constructions. This contribution presents a series of enclosures and stone circles which, due to their characteristics and their proximity to areas of dolmenic, hypogean necropolises or with the presence of menhirs and menhir statues, could have been used for particular rituals linked to depositions in the period Neolithic and Eneolithic. These are works that do not contain remains of tombs or mounds within them, which have variable dimensions and shapes and whose delimitation is made up of stone blocks of a predominantly globular shape, sometimes with the presence of cupels or other intentional signs. Since the unpublished sites have not been the subject of archaeological excavation investigations, the analysis is mainly based on the study of comparisons in extra-insular areas, the construction characteristics, the position of the sites and the presence of elements of a cultic nature.

6 A LOOK AT THE MORPHOTYOLOGY OF COPPER AGE BETILES IN IBERIA. ON THE LOS MILLARES ASSEMBLAGES

Dorado-Alejos, Alberto (Lab. of Archaeometry, Department of Prehistory and Archaeology, University of Granada) - Quero Díaz, Ada (Lab. of Archaeometry, Department of Prehistory and Archaeology, University of Granada) - Núñez Caravaca, Helena Adriana (Lab. of Archaeometry, Department of Prehistory and Archaeology, University of Granada) - Pérez l'Huillier, Daniel (Lab. of Archaeometry, Department of Prehistory and Archaeology, University of Granada) - Maldonado Ruiz, Alexis (University of Santiago de Compostela | Visiting Research Fellow, Leiden University.) - Castillo Gallego, Francisco Javier (Department of Prehistory and Archaeology, University of Granada) - Pinillos de la Granja, Paula (Department of Prehistory and Archaeology, University of Granada) - Basso Rial, Ricardo (University Institute of Research in Archaeology and Heritage, University of Alicante | Visiting Research Fellow Department of Prehistory and Archaeology, University of Granada) - García Martínez, Victoria (Department of Prehistory and Archaeology, University of Granada) - Cámara Serrano, Juan Antonio (Department of Prehistory and Archaeology, University of Granada)

Anthropomorphic figures called “betilos” present a large distribution in Iberia, but variations in shape and decoration can be traced depending on the different societies that produce them. In any case, their presence in necropolis areas allows us to relate these artefacts to specific funerary and symbolic practices, which must have constituted a certain ‘Iberian norm’ as they were found in different areas. In this way, their production was probably linked to common beliefs that we can try to decipher by studying their production processes, taking into account that both concrete shapes and specific raw material could be intrinsically linked to the territories in which they were produced and, usually, used. The aim of the present study is the morphometric characterisation -based on the analysis of their shapes and sizes- of these symbolic items in order to identify the formal patterns that define the “betilos” in their large area of distribution in Southern Iberia during the Copper Age. For this aim items from Los Millares necropolis -which is the main focus of this study as it includes some analytical data-, Hidalgo Dolmen, Palacio Megalithic Complex, Dolmen de Dombate, Mina de Parxubeira and A Cova da Moura are analysed. It's supposed that formal features of these items can provide a chance for the identification of large cultural groups that could constitute the areas of influence of relevant sites such as Valencina de la Concepción, Los Millares or Zambujal, for example. The results allow us to point out, for the moment, the existence of three large groupings that help to decipher differential technical knowledge but with shared symbolic patterns, as shown by the use of these “betilos” at the entrance of the corridors. The proposed morphotypological approach is intended to be a useful tool for the identification, recording and interpretation of new “betilos”.

7 THE COASTAL MEGALITH SITE OF PIETRA TARA, PALERMO. THE CULT SYSTEM OF THE UPPER ZONE. FIRST ANALYSIS OF THE ACROPOLIS

Mercadante, Francesca (Studio GeoArchPa Palermo) - Cabrero Correo, Carolina (Department of Prehistory and Archaeology, University of Granada)

The coastal megalith site of Pietra Tara is located on the northernmost side of western Sicily, on Monte Gallo, Palermo, in front of the Tyrrhenian Sea. It appears to be the only known site in Sicily with megalithic/cyclopean constructions, still intact, with landslide carbonate blocks, adapted to menhirs. To facilitate the study, the area was indicated in two portions: Lower Zone, from the coastline up to 60 meters above sea level, and Upper Zone, from 60 meters above sea level, up to under the cliff of Monte. The funerary architecture is widespread and connected with the structures of the entire site, mainly with the intramural dolmen hypogea. Starting from the altitude mt. 50 above sea level the slope becomes steep (30-40% slope), has some hilltops, with accumulation of stone material along the steep slopes. In July 2023, a lidar drone flight was carried out over the entire area, which highlighted a small acropolis in the Upper Zone with megalithic constructions, with partially ruined megaliths and mounds. The acropolis has architectural spatial characteristics different from the underlying Zone B, it has a polygonal closure made up of cyclopean blocks, with double-faced walls, with a first ovoid shed environment leaning against the ZA.1 megalith. Furthermore, at higher altitudes there are two pseudo-rectangular rooms cutting into a thick wall. In the first instance it could be argued that we are in the presence of a secluded area, whose architectural system, formed by the two megaliths, (ZA.2 and ZA.3) appears as the entrance to a cult/funerary place with the presence of mounds, in which the Megalith ZA.2 takes on the condition of an “anthropomorphic Monolith”, as a reference to the female Goddess, while the second ZA.3, behind it, acts as a funerary hypogeum. The cult/funerary system is flanked by terraces with shed structures

643 THE EXPERIENCE OF STONE II: SCULPTING COMPARATIVE PHENOMENOLOGIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Smith, Christina (Durham University) - D'Alisera, Alexander (Boston College)

Session format: Regular session

The Experience of Stone hits Rome! Building upon the success of last year's all-day panel, this session offers explorations into the phenomenology of stone sculpture and monuments, stone artefacts, stone buildings, and natural landscapes of stone. In the words of Maurice Merleau-Ponty, 'The body is our general medium for having a world.' Centred on EAA 2024's theme 'persisting with change', this session explores how stone constructs (and is mediated by) a viewer's sensorial experience. Phenomenology offers a way for thinking about the affective presence of stone, stone monuments, and natural stonescapes, and proves particularly important for periods and places where the textual record is scant.

We invite scholars of all time periods, geographies, and disciplines—but especially archaeologists, historians, and art historians working from the prehistoric to medieval periods—to contribute papers exploring comparative phenomenologies of stone. Papers that examine geographically or temporally cross-border case-studies are particularly welcome. Possible subjects include, but are not limited to: comparative stonescapes; reuse of hewn or sculptured stone; epigraphy through changing viewership; sculpting memory; textual references to the experience of stone; stone and empire; agentive stone; the application of viewsheds in spatial analysis; a theology of stone; multi-media stone monuments; and, landscape archaeology. As with last year's panel, this session aims to offer a forum through which history, archaeology, and other disciplines may continue to develop further scholarly discourse and collaboration.

ABSTRACTS

1 PERSISTENCE OR CHANGE? THE USE OF STONE IN THE ROOFING SYSTEMS OF ROMANESQUE CHURCHES OF NORTHERN ITALY (11TH-12TH CENTURIES)

Passuello, Angelo (Marie Skłodowska-Curie Postdoctoral Fellow - University of Cyprus (Archaeological Research Unit))

Some structural systems assumed a fundamental importance in the formulation of the architectural language of sacred space in the Middle Ages. Chief among them was the emergence of varied roofing solutions that decisively conditioned the internal spatiality and also assumed a key role in shaping the external form of ecclesiastical buildings, since the entire design would be affected by the shape that the roof was meant to have.

This paper will present the first results of the Cataloguing Medieval Roofs (CaMeRoofs) project, funded by the European Commission under the Marie Skłodowska-Curie Actions, which I am carrying out at the Archaeological Research Unit of the University of Cyprus.

According to a common view, Romanesque architecture drew inspiration from the great Roman basilicas by making stone roofs and giving up the wooden ceilings of early Christian origin. The experience of stone, therefore, would be quintessential for the development of the spatial concept typical of Romanesque churches. Nevertheless, was this truly the case?

This paper, in line with the conference's main theme, “Persisting with Change”, will consider some examples of Northern Italian churches (regions of Veneto, Lombardy, Piedmont, Emilia Romagna) with a view to examining more closely whether it was really the use of stone vaults that acted as a catalyst for change in Romanesque design and construction.

In order to broach this and related questions, the project in question employs an archaeological (and not just an architectural-historical) approach to the study of medieval roofing systems. The aim is to attempt an interpretation of the structural relationship between the churches' roofing and the load-bearing walls, highlighting any discontinuities and design or phase changes (stratigraphic analysis), to identify restorations and modifications, and analyze in detail the construction technologies applied to the stone vaulting.

2 PEARLY STARS, CELESTIAL REFLECTIONS, AND PENDENT VERSE: THE FOUNTAIN OF THE LIONS IN THE GARDEN OF BLISS

Cottignoli, Emilia (Stanford University)

This study explores the stone architecture of the Fountain of the Lions in the Garden of Bliss and its phenomenological, material flux from solid stone to running water. Converging as a center of liquidity, the basin at the center of the fountain becomes a glittering eye in this liquid waterscape as the highest point in reflection of the sky, mirroring the clouds, sun, and moon in its vessel, ingathering the distant sky in the form of reflection. Characterized by the slippage

of the word *ein*, meaning both eye and fountain, the eye takes everything in, holding the clouds, trees, water, and sunlight in its reflections, creating the all-seeing illusion of omniscience and surveillance. Water gurgles, bubbles, and runs, interceding in four rivers like the divine rivers of Paradise, made of water, milk, wine, and honey, that join at the fountain, collect in its basin, and fall from the lips of lions in a strand of watery pearls. Inscribed into the basin itself and throughout the Alhambra, the verses of Ibn Zamrak evoke how water droplets fall like a string of pearls, catching the sunlight in each orb, becoming luminous, shooting stars that complete their arc from lion to floor, where they are extinguished. The poet becomes the stringer of pearls, linking together dewdrops of brilliance through verse, immortalized in the renewal of water that cycles through the fountain and persists in the stone. Strung pearls of words and water resonate with lanterns pendent from golden chains, evoking the Byzantine hanging lamps and polycandelon of the fifth and sixth centuries that informed the iconography of heavenly cities. Baptism through illumination becomes present in the nocturnal space of these church skies, where the lantern glitters like a star, washing the visitor clean in divine light.

3 A PHENOMENOLOGY OF CONSTRUCTION PROCESSES IN ROMAN NORTH AFRICA

Peers, Max (Brown University)

In this paper, I argue that a phenomenological approach is necessary to understand the impact of construction projects on the inhabitants of Roman cities in North Africa. I draw from the rich archaeological material of urban centers in Roman Tunisia, as well as my own experience carving stone as a research practice and hobby.

Roman Tunisia was an important center of building activity in the Roman Imperial Period, and I draw my case studies from sites such as Utica, Uthina, and Thuburbo Majus. I examine the phenomenological differences in the experience of builders and passersby between traditional stone masonry and the addition of new techniques to the architectural repertoire of the Roman period, such as concrete and brick construction.

Scholars have traced the ancient construction process in detail – from work at quarries and tile factories to workshops and construction sites – both in terms of materials and people involved. I build on this scholarship to focus on the sensorial stimuli of urban construction sites and how these would have changed with known architectural developments. A construction site for a brick-faced concrete building would have had a different acoustic profile than one produced by the work of stone masons. The addition of smoking lime kilns for producing mortar would likewise have created new sensorial effects, something surely noticed by the neighbors and passersby to these construction sites.

Augustus claims to have found Rome a city made of brick and left it made of marble. Scholars have devoted attention to the phenomenological differences between finished architectural products in the Roman period, but construction work itself would have been near constant. I argue that a phenomenological analysis of Roman building techniques is necessary to understand how the processes of construction would have shaped the social fabric of cities in Roman North Africa.

4 FROM ST PAUL'S TO SANTA PUDENZIANA: THE AFFECTIVE PRESENCE OF SCULPTURE IN-THE-ROUND, AD 600-1100

Smith, Christina (Durham University)

The Insular world was anything but insular. Ecclesiastical men and women travelled far and wide, taking with them ideas, sketches, books, artefacts, and people. From the Venerable Bede we learn that Benedict Biscop (d. 690), abbot and founder of Wearmouth-Jarrow, made five journeys to Rome alone. Not only were Biscop's continental connections instrumental in furnishing the Northumbrian joint monastery with one of the finest libraries in early medieval Europe, but they also shaped the sculptural landscape and layout of St Peter's and St Paul's.

This paper is interested in the affective presence of free-standing sculpture when it is found within or in proximity to a built environs. This contrasts with monuments in landscape settings, many of which are in isolated settings. By using a series of case-studies from Britain and Italy, this paper compares and contrasts the form and function of early medieval stone sculptures in a built environment—whether that be a building of stone or a structure in wood; a manorial church or a large monastic complex. The themes of approach and access (or lack thereof) are examined with an aim to unpacking different engagement(s) with the sculptures. In all, the paper shows that while many Insular sculptures undoubtedly took inspiration from Christianity's Roman heartland, a class of early medieval Britain's sculptures in-the-round were innovative and unlike their continental counterparts.

5 FLYING VISITS TO THE WORLD OF STONE: ANGELS, DEMONS AND CELESTIAL AIRDROPS ON PICTISH AND IRISH EARLY MEDIEVAL STONE SCULPTURE

King, Michael (Independent)

In early medieval times, stone would have been regarded as the hardest material on earth, a substance that epitomised God's work of Creation, and was found suitable for the carving of timeless images that reflected the progress

of human salvation in the world, beneath the realms of airborne celestial beings. In early medieval Insular art, angels of the air are depicted on stone monuments, on metalwork and in manuscripts, as heavenly worshippers, protectors, messengers and guides, sent to expedite and glorify God's intervention in earthly human affairs. Demonic beings also appear in many forms, particularly on the north sides of stone monuments, facing the northerly source of evil forces as described in Insular early medieval writings. This paper will consider and compare the roles of angelic and demonic visitors to the world, plucked from the air in the imagination of sculptors and 'captured' in stone on Pictish carved monuments and Irish high crosses. In addition, carved depictions of hitherto unidentified winged objects, air-lifted prophets and hell-bound demons will be examined and placed in context, drawing on textual descriptions and pictorial images from both Insular and Continental sources. The emergent themes of the glorification of Christ, the angelic protection, sustenance and guidance of the faithful, and the binding in stone of demonic beings who threaten them, will be explored in conclusion.

6 NEW PHENOMENOLOGICAL APPROACHES TO UNDERGROUND STONESCAPES IN EARLY MEDIEVAL BRITAIN AND IRELAND

D'Alisera, Alexander (Boston College)

Caves dot the landscapes and seascapes of Britain and Ireland. Containing vast corpora of archaeological material from the prehistoric to the medieval, the two islands' undergrounds have granted scholars extraordinary insight into daily premodern life. While natural caves often take precedence in these studies, a number of artificially constructed caves, as well as natural caves with significant human augmentations, also exist across both Britain and Ireland. Taking one British and one Irish site as its shared basis, this paper explores the early medieval curation of artificial and augmented caves through the lens of comparative phenomenology. The British site of focus is an artificial cave in Derbyshire, known as Anchor Cave, and the paper's Irish site is a natural cave with a constructed entrance in County Roscommon, known as the Cave of Crúachain. Both sites bespeak a particular early medieval interest in constructing the space of the underground beyond its natural boundaries. By studying hewn stone with natural stone, this paper seeks to explore the multifaceted ways in which ordinary premodern people altered their landscapes to curate a sense of the underground in both Britain and Ireland's early medieval periods.

7 VIEWING AND CREATING THE PAST IN VIKING AGE STONE SCULPTURE

Stoner, Heidi (Canterbury Christ Church University)

The notion of complex cultural connections that develop and change can be seen in the manner in which sculpted material is presented and considered in the wider Insular world, particularly that of the so-called Viking age. This paper will examine individual sites where the evidence that demonstrates there are multiple phases of sculpture and complex patronage patterns further arguing that the maintenance of sites over the long Viking age demonstrates a conscious continuity and integration rather than a subsequent replacement of networks in place. The case studies selected will consciously not be arranged by national region but posit various scales of approaches to the study of sculptural materials. This study will examine the use of both iconography and inscriptions as ways of establishing cross cultural links that go beyond style. I will examine close links in small regional collections, to connections that form across maritime routeways, to links that might be established by larger church networks that cover the whole region, and beyond the Insular world.

8 THE SEIKILOS STELE: TELLING A STORY WITHOUT CONTEXT

Alliata, Victoria (Independent Researcher)

"There is life in a stone. Any stone that sits in a field or lies on a beach takes on the memory of that place. You can feel that stones have witnessed so many things." Andy Goldsworthy

Now, archaeologists usually do not rely on feelings only. For the study and interpretation of archaeological finds the context is a crucial tessera of the mosaic. This makes it particularly challenging to place an object that has been rediscovered serving as a flowerpot pedestal in a private 19th century household: the so called Seilikos Stele.

This marble stele bears an inscription, an epitaph in ancient Greek, and is perhaps best known for the rare presence of ancient musical notation. Of course, this exceptional find has been discussed by epigraphists and musicologists with a particular focus on the inscription, the notation and its musical interpretation.

However, there has never been an attempt to better understand the stele as part of an environment, its heuristic value, its potential topography and topology, its phenomenological "power". This is true, whether we try to imagine its display in a potential ancient context, or we consider the present experience of visitors of the National Museum of Denmark in Copenhagen, where it is displayed today.

Using the tools provided by different disciplines – mainly history and archaeology – this paper aims to analyse the Seikilos Stele through different theoretical and practical approaches, trying to tell a story through its textual and material dimensions.

9 FROM SILENT BEDROCK TO STONES OF MEANING

Johnson, Andrew (Manx National Heritage)

Ever since the Isle of Man – an island in the Irish Sea – emerged from the Ice Age, its rocks have served as a source of tools, mineral wealth, building material, and as an enduring medium for the making of monuments.

On one hand, rock quarried and eroded from its crags and coastlines has provided boulders and slabs suitable for building prehistoric megalithic tombs, but on the other, sheer geological age has resulted in a raw material that is difficult to work for more intricate purposes.

It is the latter which particularly intrigues, because in spite of this, a sizeable corpus of medieval sculpture has survived to this day as witness to a tradition of memorialisation that lasted several centuries, developing from small, cross-incised grave-markers and ending with intricately carved monuments standing over two metres high. In so doing, these stones have become unique documents of an era for which the Isle of Man is otherwise poorly provided.

These cross-slabs have long been the subject of considerable scholarship, focussing mostly on studies of art styles and inscriptions. Current research is however showing that these memorials performed significant roles as landscape monuments, as well as contributing towards place-making and the formation of centres for newly-created parishes in the twelfth century.

Furthermore, their enduring resilience attracted new uses, experiences and reactions beyond those for which they were originally intended: in a series of case studies they can now be understood as landmarks, as pilgrimage sites and as market crosses, as building stone, and latterly as objects of antiquarian study. Public interest has grown apace, and for well over a century there has been a drive to rescue them from their use as building stone and to gather and display them at parish churches, where they continue to engender considerable community interest.

10 TOUCHSTONE? EXPERIENCING 3D PRINTS OF EARLY MEDIEVAL CARVED MONUMENTS

Kasten, Megan (University of Glasgow)

The vast majority of scholarship about 3d printing in archaeology has primarily revolved around its potential for producing educational handling collections or to facilitate access to museum collections for the visually impaired. The ability to 3D print offers a tactile means of bringing early medieval carved stone to anyone: those with or without access to the original, whether researchers or the general public, though often through an inauthentic tactile medium and at a much smaller scale than the original. But does the physical experience of the 3D print affect our perception of the real thing?

This paper compares the author's experience of early medieval sculpture through three lenses – through the performance of photogrammetric data capture and processing of a stone monument as a digital 'slow looking' method, analysis of the resulting 3D model via a 2D computer screen and a range of computer software to remove its real-life appearance (i.e. remove colour), and tactile interaction with the same 3D model printed in resin. These multi-media experiences of stone monuments will be reflected upon to identify how 3D prints can be best used in different educational settings: alongside the real monument, while viewing the digital model, or as an assemblage of 3d prints in a handling collection.

644 MOBILITY AND TERRITORIALITY IN PRE-ROMAN ITALY: ROUTES, OBJECTS, IDEAS

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Di Fazio, Massimiliano (Università di Pavia) - Stek, Tesse (University of Groningen; KNIR) - Tabolli, Jacopo (Università per Stranieri, Siena) - Riva, Corinna (University College London)

Session format: Regular session

Pre-Roman Italy (i.e. the various communities that populated the Italian peninsula before the Roman conquest) constitutes a fascinating but also contentious field of study. The consistent degree of heterogeneity of ancient Italy often leads to an analytical approach that considers the various peoples/cultures separately (the 'handbook' approach, so to speak), and not as part of a strongly interconnected and dynamic world. One of the possible ways to overcome this ethno-regional approach is to highlight characteristics that enable a transcultural approach, so as to emphasize what connects these communities beyond their differences. As several influential recent studies (e.g. Isayev 2017) have pointed out, one of the most striking features of ancient Italy is its internal mobility. Paradoxically or not, this feature developed alongside the creation of territorially expressed cultural communities as visible in the material culture from the late Bronze age to the Hellenistic period.

This panel aims to take this theme of mobility and territoriality further in three interrelated sections: routes of mobility, movement of ideas, movement of objects. This approach enables us to better appreciate the changeable character and intensity of movement and exchange in ancient Italy. The panel seeks to generate new ideas on the societal circumstances stimulating this dynamism, as well as on the mechanisms of mobility and exchange on the ground. Departing from that basis, the panel aims to investigate the interaction of this enhanced mobility with the development of cultural biographies, socio-political structures as well as cultural and socio-economic networks, and their territorial expressions. Ultimately, we consider the products of these punctuated interactions between people, objects and ideas, and its legacy at the dawn of Roman imperialism.

ABSTRACTS

1 SETTLING THE APENNINES IN THE BRONZE AGE. NEW DATA FROM THE TAPPINO VALLEY AREA

Palazzini, Flavia (Sapienza - Università di Roma; KNIR) - de Neef, Wieke (University of Bamberg) - Stek, Tesse (University of Groningen; KNIR)

Research on mobility and connectivity in protohistoric southern Italy has predominantly focused on coastal communities and their integration into the Late Bronze Age Mediterranean economic and cultural networks (XIV-XII century BC). These routes of commerce and cultural exchange not only spurred technological innovation (e.g. the use of potter's wheel) but also served as catalysts for the emergence of social and economic complexity among indigenous populations. In contrast, coeval inland communities across the Apennines have traditionally been considered rather isolated and secluded due to their exclusion from the Mediterranean-wide exchange networks. However, archaeological evidence suggests that these groups developed alternative, internal connections. Facilitated by mountain routes, these networks established a functional economic organization and cultural dynamism, but its traces are still few and far between.

Recent non-invasive field investigations in the mountainous area surrounding the Tappino River Valley (modern Molise, southern Italy) – including pedestrian surveys, geophysics, and drone imagery – resulted in the discovery of several pre-Samnite sites, ranging in chronology from the Middle Bronze Age (XVIII-XIV century BC) to the VII/VI century BC. The examination of these sites, particularly in a region where previous data were limited, provided a starting point for delving into aspects such as location preference, settlement patterning and the special characteristics and functioning of these sites. Moreover, the analysis of pottery production aided in tracing interactions with neighbouring Apennine communities (notably in Campania, Abruzzo, and Marche), which furthered our understanding of the role of cultural exchange in shaping the region's history.

This paper adopts a multi-scalar approach, moving from individual sites to broader areas and trying to identify similarities that may serve as evidence for connections. We will present the new discoveries and discuss their contribution to our understanding of Bronze Age communities that settled the Apennines before historical times.

2 THE RISE OF EARLY ROME. NETWORKS AND DOMINATION IN CENTRAL ITALY (1050-500 BC)

Fulminante, Francesca (Bristol University; Oxford University; University Roma Tre)

The trajectory of Rome from a small village in Latium vetus to an emerging power in Italy during the first Millennium BC and finally an overarching Empire over the all known world until the collapse by end of the 4th century AD is very well known and often appears almost inevitable and unstoppable. But Why Rome?

By analysing transportation networks in Etruria and Latium (central Italy, 1000-500 BC), my recent book, on which this paper is based, reveals with a grounded and solid quantitative background the favoring factors to the emergence and dominance of this city within these regional networks, which is at the origin of our Western civilization.

Applying traditional Social Network Centrality Measures, existing and tailored-made Efficiency Indexes and Network Science modelling to terrestrial and fluvial transportation systems in central Italy, the book and the paper show how a larger and probably more powerful region, but with an heterarchical regional organization, such as Etruria, in the end was won and dominated by a smaller, but more dynamic and hierarchical Latium vetus.

Further development of this work shows how the terrestrial and the fluvial routes are actually complementary and how their interaction changes through time according different socio-political and economic conditions.

3 **STAPLE RESOURCES MOBILIZATION AND EXCHANGE AT THE URBAN TRANSITION IN CENTRAL ITALY (8TH-6TH C. BCE). THE ISOTOPIC EVIDENCE FROM GABII**

Motta, Laura (University of Michigan)

Resource mobilization plays a crucial role in the transition to urbanized political systems. However, the lack of direct evidence for the movement of crops and livestock has hindered our understanding of urban-rural economic integration, territoriality, and the regional dimension of staple exchange among the closely interacting, autonomous polities of Central Italy during the Iron Age and Archaic period.

Recent excavations at Gabii have yielded an unprecedented amount of archaeobotanical and zooarchaeological remains dating from the 8th to the end of the 6th century BCE. These new datasets are uniquely positioned to provide a material perspective on resource management in these emerging urban centers. A multi-isotope approach, combining strontium, oxygen, carbon, and nitrogen stable isotope analysis of the animal bones and crop remains, has revealed important insights into animal management and farming practices. The integrated isotope analysis has allowed us to discriminate between locally grown and imported staple resources, making it possible to track directly the otherwise invisible choices that were made around herd mobility, pastoral strategies, and crop movement.

The data from Gabii show a persistence of household-level staple economies characterized by diverse animal husbandry and cultivation strategies throughout the period. Animals were raised in the hinterland without evidence of vertical mobility or horizontal transhumance. Most of the staple crops were cultivated in the volcanic soils near the settlement, suggesting that the rural production and the carrying capacity of the immediate hinterlands were sufficient to meet the needs of the population. It remains to be determined to what extent farming and husbandry practices may have been also socio-politically constrained by the territorial reach of the settlement.

4 **THE PROJECT FAMILIES, GENDER, MOBILITY AND INTERCULTURALISM IN THE ETRUSCO-ITALIC NECROPOLIS: CASE STUDIES FROM CAMPANIA AND VENETO. SOME PRELIMINARY CONSIDERATIONS**

Gambacurta, Giovanna (Ca' Foscari University Venice) - Pellegrino, Carmine (Università degli Studi di Salerno) - Cuozzo, Mariassunta (Università degli Studi del Molise)

The paper deals with the research project FaGeMI presented in the context of PRIN 2022.

The research theoretical issues are related to the definition of gender, ethnicity, identity, mobility, intercultural dialectics and hybridization through the analysis of groups of burials belonging to some pre-Roman necropolises in Campania and Veneto in crucial stages of their development (9th-7th century BC).

Routes of mobility, movement of ideas and movement of objects will be examined between these two different areas of ancient Italy.

The archaeological side of the question is controversial, having been the subject of a new debate ever since the late Nineties. From an archaeological point of view, the crux is whether material culture, in some cases, can be a vehicle of ethno-social meanings, and whether these meanings can be understood by archaeological methods, in the absence of other kinds of evidence.

This objective will be pursued on the basis of a shared theoretical platform, with a special focus on mobility and interculturalism, by applying an interdisciplinary protocol of analysis.

Furthermore this project intends to apply some types of scientific analyses such as DNA and strontium analyses to selected groups of burials in order to acquire elements for investigating parental links and mobility that have been suggested from rituals and materials.

For these kinds of analyses, priority will be given to those burials in which the ritual or the material culture suggests an origin from a different cultural environment of any kind. Nevertheless, tests will be carried out also on funerary groups that appear to be more homogeneous, with the aim of identifying also cases that might be "invisible" from the perspective of material culture.

5 **AN INVISIBLE RIVER IN A LANDSCAPE OF VISIBLE MOBILITY: THE RIVER CLANIS**

Tabolli, Jacopo (Università per Stranieri di Siena)

This paper aims at discussing mobility in central Italy during the first millennium BCE while looking at a pre-Roman landmark that despite its disappearance still constitutes a living frontier in central Italy: the River Clanis. According to the ancient Latin sources the Clanis was navigable and originated from the foothills of Chianti; it descended towards the south, before joining the River Paglia, then reaching the Tiber. Along the Clanis, the Etruscan city-states of Orvieto, Chiusi, Cortona and Arezzo were founded in the Iron Age, thus representing the most important waterway of ancient Central Italy, after the Tiber. The narrative account by Tacitus (Ann, I, 76-79) on the floods that affected Rome in 13CE and the consequent plan of inverting its course towards the Arno has remained an open matter of de-

bate. Despite the various theories, it is generally accepted that in the Medieval period the entire Valdichiana – whose toponym derives directly from Clanis – turned into a system of swamps and lakes and constituted the main target for conflicts between the Granducato di Toscana and the Papal State. Despite the landfill promoted by the Lorena family and the agricultural exploitation of the valley, characterized by major contemporary connectivity infrastructures, the land division because of the ancient river is still alive in local perception.

This paper aims at positioning the Clanis for the first time on archaeological maps of Central Italy and to define whether its course could have determined borders and interconnections between the early city states and cultural groups from the Tyrrhenian to the Adriatic sea, considering that the geo-political understanding of this area is still unclear when compared to other parts of central Italy. This will be achieved by moving beyond the various narratives in literature and by considering how regionalism have influenced cultural biographies.

6 **MOBILE MYTHS IN PRE-ROMAN ITALY**

Wright, Parrish (University of South Carolina)

The integration of Greek mythology and heroes in the foundation stories of cities and cultural groups throughout pre-Roman Italy goes beyond "Hellenization. This phenomenon allows us to examine the interconnectedness of cultures and the movement of ideas throughout the peninsula. I argue that the widespread adoption of Greek myths was motivated partially by the desire to establish alliances based on kinship diplomacy, where political and economic partnerships were forged through perceived genealogical connections rooted in mythical narratives (Jones 1999). This approach has been applied fruitfully to Asia Minor (Patterson 2010) and Rome (Prag 2010, Russo 2012), not yet for pre-Roman Italy.

Changes in these relationships appear both textually and archaeologically; for example, Strabo and Cato claim that the Samnites are descended from Spartans through their local deity, Sabus (Strabo 5.4.12, Cato FRH F9, F50), which illustrates how mythical ancestry was leveraged to strengthen military cooperation and mutual interests with the Spartan colony, Taras. In Apulia, sources claim Diomedes as a founder of the Daunians, and dedications found on nearby Adriatic islands inscribed to Diomedes, indicate his role as a mediator. Others connect Diomedes to the enigmatic Daunian stele – providing a Greek story to explain a local practice.

Previous studies have focused on individual ethnic groups (i.e. Samnites, Bruttians, see Maiuro 2014, Bradley & Farnley 2017, Dench 1995), but considering this practice across Italy provides a new way to understand nascent cultural identities through the movement of ancient gods and heroes, such as Heracles, Homeric heroes, Dionysus, etc. Stories traveled across cultural boundaries in various ways: human mobility, storytelling, depictions on temples, reenacted through rituals, votive offerings, or iconography on coins. Mythical connections could facilitate other interactions, including traditional military alliances, hiring mercenaries, facilitating trade, loans, and even interpersonal connections based on a shared understanding of myth and history.

7 **FOLLOW THE WOLF. THE VER SACRUM TRADITION AND THE MOBILITY IN PRE-ROMAN ITALY**

Di Fazio, Massimiliano (University of Pavia)

When we speak of mobility in pre-Roman Italy, there is a myth that comes to the fore: that of the ver sacrum, the tradition according to which a part of a community, in times of famine and distress, had to abandon its home and seek its fortune elsewhere, creating another community, under the guidance of a 'totemic' animal. It has long been debated whether these traditions that we know from literary sources are merely stereotypical accounts that are part of the narrative modes through which ancient ethnography has tried to describe the cultures of ancient Italy, or whether some aspects of these traditions may have a historical background.

My contribution aims first and foremost to reflect on the literary tradition, on the possibilities of recognising historical and archaeological indications of a historicity of the ver sacrum, but also on the use (and sometimes abuse) of the ver sacrum in modern historiography.

Furthermore, the aim is to frame the ver sacrum within a series of issues:

- the historical context, in which the movement of groups was anything but exceptional;
- the factors (economic, social, even climatic) that could determine these movements;
- the outcome of the movements, as an occasion for conflict but also for encounters between different communities, with all that this entails in terms of interaction between cultures and thus of mutual influence, which sometimes ends up undermining our 'ethnic' schemes.

8 ENCLOSING PASTORALISM: PASTORAL MOBILITY AS A SOCIAL CONNECTOR IN PRE-ROMAN CENTRAL ITALY

Cohen, Sheira (Intercollegiate Center for Classical Studies in Rome)

The shepherds and their flocks are ever-present in our image of pre-Roman Italy, but these figures only appear in general terms in the scholarly literature. The lack of clear archaeological evidence and minimal textual references means that pastoral mobility remains an under-discussed and under-theorized phenomenon in studies of Rome and western central Italy more broadly. As a result, pastoral mobility is not integrated into broader discussions of urbanization and community formation. Notions of territoriality and territorial control are instead rooted in sedentary agricultural systems. Rarely are the social or economic implications of seasonal pastoral mobility considered.

Rather than search 'for' the pastoralist, this paper will draw on worldwide ethnographic and historical analogies to explore pastoralism and pastoral mobility as a social connective practice. Pastoralism is more than just an economic behavior; it is a socially-embedded phenomenon. As a social connector between individuals and families, it can support social reproduction through time and social cohesion across space. Comparative examples range from the practice of "stock friendship" in East African cattle herding communities to the socially-embedded trade systems used to form "vertical archipelagos" in pre-Columbian Andean societies. These diverse examples serve to break down subsistence-based binaries between mobile and sedentary ways of life and inspire new ways of looking at old evidence.

This paper will reveal how pastoralism and pastoral mobility are implicated in mechanisms of social cohesion across different scales from the individual to the state. The constant small-scale, stochastic mobilities that characterized Italy's economy would have acted as a central mechanism for connecting diffuse communities across the landscape.

9 CROSSROADS OF ANTIQUITY: INVESTIGATING THE IMPACT OF ROMAN INFRASTRUCTURE ON PRE-ROMAN TRADE IN THE PELIGNA VALLEY

Merola, Antonio (DIRUM, Università di Bari, Italy)

The conventional interpretation of pre-Roman connectivity, often illustrated by the preserved routes "fossilized" by Roman roads, has traditionally depicted these pathways as mediums connecting various cultural facies across the peninsula. However, this model is biased by the knowledge gap between the Roman roads and the pre-Roman (Italic) routes, the former being a proper network of infrastructures and the latter a less structured path (at least in their materiality). Although the Roman phenomenon has trans-regional implications (up to the trans-Mediterranean ones), a re-examination of pre-Roman connectivity is essential, employing new theoretical frameworks to contextualize technological, economic, social, and historical phenomena. (the order is not random).

The goal of this presentation is to analyse the impact of Roman infrastructures within a non-colonized landscape. The case study is the impact of the Roman infrastructures of the Peligna Valley (Abruzzo, Italy), compared to the pre-Roman routes of trade. Reconstructions of the routes will be presented with attention to the material culture in the research area and the possible investigation of the contacts between the different Italian areas. The results of the several spatial analysis suggest an extremely heterogeneous ancient landscape, where each area developed an unique settlement and road system, that it can be read as the different results of the same event: the Roman conquer. Are we perhaps facing various Romanizations happening in the same time and in the same area?

10 FROM THE MOUNTAINS TO SEA AND BACK: TOWARDS A MORE NUANCED UNDERSTANDING OF BURIAL PRACTICES IN SOUTHERN LATIUM

Revello Lami, Martina (Leiden University) - Marazzi, Elena (Università di Pavia) - Di Fazio, Massimiliano (Università di Pavia)

This work seeks to contribute to the debate about the interconnectedness of the pre-Roman world by examining the interplay between mobility, burial practices, and funerary goods traditionally ascribed to the so-called Volscians, an ancient Italic group mentioned in literary sources as fierce adversaries of Rome. Focusing on the recently unearthed necropolis in Pofi, Southern Latium, our research aims to shed light on the nuanced connections between material culture, social structures, and territorial expressions.

The material culture commonly attributed to this group, found both in the hinterland of Lazio and close to the Tyrrhenian coast, presents an intriguing case study. The necropoleis excavated in Frosinone, Pofi and Satricum reveal an incredibly rich funerary record, which offers an unprecedented opportunity to explore the complexities of burial practices of southern Latium in the Archaic and post-Archaic age, emphasizing both similarities and differences across diverse geographical locations, and thus giving an opportunity to reflect on the ethnic labels traditionally used in this area.

Our investigation employs a multidisciplinary approach, integrating survey and excavation data to morpho-typological and materials sciences analyses to gain insights into the cultural biographies of Southern Latium. By exploring the

mobility of objects, people, and ideas within these pre-Roman communities, we aim to disentangle the simplistic correlation between materiality and ethnicity. The outcomes will contribute to a more nuanced understanding of ancient Italy's internal mobility, fostering dialogue on societal patterns, mechanisms of exchange, and the legacy of these interactions on the eve of Roman imperialism.

Through this contribution, we seek to enrich the discourse on transcultural approaches to pre-Roman Italy, emphasizing the need to go beyond the 'handbook' approach and recognize the interconnected and dynamic nature of the ancient Italic world, fostering also discussions on the multifaceted relationships between mobility, material culture, and the societal landscape of pre-Roman Italy.

11 MOBILITY BETWEEN THE LATIAL HINTERLAND AND THE COASTAL AREAS AT THE DAWN OF THE ROMAN EXPANSION: THE CASE OF SATRICUM

Gnade, Marijke (Royal Netherlands Institute in Rome; University of Amsterdam)

The discovery in the 1980s of systematically laid out burial grounds within the boundaries of the urban settlement of pre-Roman Satricum and their subsequent attribution to the Volscians - the historical conquerors of ancient Satricum around circa 500 BC - led to a fundamental debate on the validity of ethno-historical interpretations of material culture. Subsequent discoveries of corresponding graves with identical grave assemblages in the hinterland of Latium (Frosinone, Pofi) provided welcome confirmation of the ethno-cultural interpretation of the material remains in Satricum. Whether the attribution to the specific population group of the Volscians is correct, and whether we should take the sources at their word, is actually not so relevant in this story.

As such, the discoveries constitute silent testimonies of a highly mobilised pre-Roman society in which exchange of material culture and settling in other habitats were common. Material testimonies from earlier times point to similar processes between coast and hinterland albeit less explicitly. Socio-economic considerations in subsequent periods of political instability will have contributed to increased mobility with the inclusion of home-based subsistence economies. During this process, relations with the homeland remained intact as witnessed by the constant exchange of objects between coast and hinterland and vice versa.

In my talk, I will reflect on the dynamics of interaction between the various pre-Roman groups which, in the case of Satricum, had its unmistakable repercussions on the post-archaic settlement resulting in a greatly altered society and subsistence economy.

12 ORANGE IS THE NEW BLACK. FROM HELLENISTIC TO ROMAN FINE WARE IN SOUTHERN ITALY

De Mitri, Carlo (Università del Molise)

The black-gloss ware constitutes the almost exclusive fine tableware used in Italy until the 3rd century BC. Between the 2nd and 1st centuries BC, there is a change in Fine Ware tradition, characterized by the shift from Black to Orange/Red Glazed. Alongside this, there is a notable spread of Mouldmade Ware and the establishment of workshops producing new ceramic classes of Aegean-Oriental tradition in Italy and the western Mediterranean. Through the analysis of case studies, this phenomenon is examined, stemming from the mobility of artisans and the circulation of technical and craft knowledge, facilitated by the geo-political conditions that developed in the late Hellenistic period. The in-depth analysis focuses on two case studies: the Ionian-Adriatic region, paradigmatic for understanding the arrival of new Aegean-Oriental products and the start of new ceramic productions, and the Samnite area, linked to the Tyrrhenian and Apulo-Lucanian sides, to verify the change that took place.

646 EXPLORING TRAUMATIC INJURIES LEADING TO DISABILITY IN THE PRE-ANTIBIOTIC ERA: A MULTIDISCIPLINARY APPROACH

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge, UK) - McKenzie, Catriona (Department of Archaeology, College of Humanities, University of Exeter, Exeter, UK) - Matczak, Magdalena (Institute of Archaeology, Nicolaus Copernicus University, PL; Faculty of History, Adam Mickiewicz University, PL) - Casagrande, Giulia (Department of Classics, Sapienza University of Rome, IT)

Session format: Regular session

This session will examine how individuals and past populations dealt with significant traumatic injuries which resulted in disability in the pre-antibiotic era. The session aims to explore different methodological approaches to help us contextualise traumatic injuries and their ongoing impact on both individuals and communities. We are particularly interested in i) how individuals adapted to their injuries, ii) likely healthcare support from the wider community, iii) material culture that may have assisted with daily tasks post-injury, e.g., protheses and tools, and iv) possible changes in diet following injury. Drawing upon a wide range of evidence, this session will move beyond a detailed description

of traumatic injuries to understand the longer-term impact of the resulting disability on an individual across their life course. We hope to include archaeologists working with documentary evidence, material culture, and biomolecular analyses. Submissions can cover any period and geographical region. We also want to include new approaches to identifying and contextualising traumatic injuries. Theoretical presentations to initiate constructive and creative discussion among researchers working on trauma, disability and care are also welcome.

ABSTRACTS

1 INTRODUCTION TO THE SESSION #646: EXPLORING TRAUMATIC INJURIES LEADING TO DISABILITY IN THE PRE-ANTIBIOTIC ERA: A MULTIDISCIPLINARY APPROACH

Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge) - McKenzie, Catriona (Department of Archaeology, College of Humanities, University of Exeter, Exeter, UK) - Matczak, Magdalena (Institute of Archaeology, Nicolaus Copernicus University, PL) - Casagrande, Giulia (Department of Classics, Sapienza University of Rome, IT)

We can identify the presence of trauma in skeletal remains. However, we still do not know how past individuals and communities coped with significant injuries in pre-antibiotic times. To further this research, a multidisciplinary approach is needed. A bioarchaeological investigation can explore how individuals adapted to their conditions after injury. But, we can also consider care, medical treatments, and/or herbal remedies that may have been used in the aftermath of injury. We can incorporate analysis of archaeological artefacts (including prosthetics) and documentary sources to reveal deep narratives.

This session aims to move forward the study of trauma in the past. A contextualisation of trauma, and its ongoing impact on both individuals and communities, helps us to better understand the lived experience of people with significant injuries. We are particularly interested in (1) how individuals survived open trauma in the pre-antibiotic era, (2) how traumatic injuries impacted an individual's life, and (3) how material culture may have been used to aid resultant disabilities.

This introduction will outline the order in which papers are presented, and establish a focus group among researchers from various disciplines. The ultimate aim is to discuss why the topic of trauma and disability is important, and how it may contribute to a more comprehensive understanding of the everyday lives of people and their communities in the past.

2 TRAUMATIC EVIDENCE AND DISABILITIES IN AN EXCEPTIONAL POPULATION OF THE SW MEDITERRANEAN CHALCOLITHIC: CAMINO DEL MOLINO (MURCIA, SPAIN)

Haber, María (Dpto. Preh., Arq., H. Antigua, H. Medieval y CCyTT Historiograficas. Univ.Murcia) - Díaz, Sonia (University of Valladolid (Spain))

The analysis of evidence of trauma in skeletal remains offers a very important point of view when reconstructing the ways of life of past populations and the interaction of the community with its physical and socio-cultural environment. Forensic anthropology has helped to discern the interpretation of casuistry and the correct identification of ante, peri or postmortem injuries, the type of weapon or the type of violence used. Camino del Molino (Murcia, SE Spain) (2971-2251 years cal. BC, 2sigma) is an exceptional archaeological site due to the number of buried bodies, 1,348 individuals of which 167 were recovered in anatomical articulation. Of the CMOL sample analysed in detail, 26.3% showed cranial trauma and 44.3% post-cranial trauma, which suggests that the prevalence of injuries is very high, as is the prolonged survival of the individuals. This scenario highlights the care in Prehistory, and the combination of archaeological, isotopic, palaeodemographic, palaeopathological and osteometric analyses of a population such as this one allows us to approach the relationship between people in a Chalcolithic context over a long period of time.

3 FROM ONE TRAUMA TO ANOTHER: THE UNIQUE CASE OF VICTIM 2 FROM POMPEII - INSULA DEI CASTI AMANTI

Amoretti, Valeria (Pompeii Archaeological Park) - Sparice, Domenico (Pompeii Archaeological Park; Osservatorio Vesuviano - Istituto Nazionale di Geofisica e Vulcanologia) - Zuchtriegel, Gabriel (Pompeii Archaeological Park)

The site of Pompeii, situated to the south-east of Mount Vesuvius (Naples, Campania, Italy), is known worldwide for having been devastated and entombed during the 79 CE eruption. This event facilitated the preservation of a living city, frozen in time forever, enabling archaeologists to ascertain its final moments. The site is presently the focus of numerous archaeological activities, primarily directed towards conserving the structures susceptible to the lateral pressure of the volcanic material.

In a recent excavation in the so-called 'Insula dei Casti Amanti,' in the central part of the city, a room has been unearthed, revealing the skeletal remains of two individuals. Their traumatic pattern provides insights for reconstructing

the triggering mechanism of the building collapse which possibly resulted from seismic solicitations during the eruption. This implies that their death might not be linked to the effects of volcanic phenomena (accumulation of pumice lapilli or arrival of pyroclastic currents) but rather to the syn-eruptive seismicity.

Both individuals exhibit a high number of peri-mortem fractures. However, the male individual referred to as "Victim n.2" displays an intriguing pattern of healing trauma. Victim number 2 had healed trauma at the rib level and a double fracture with substantial eburnation at both wrists, suggesting that he had survived one or more previous traumas for an extended period. This contribution aims to shed light on the palaeopathological scenario of the residents of Pompeii before the catastrophic eruption and how this might have affected their reactions during the seismic and volcanic event in 79 CE.

4 UNVEILING LIFE'S STRUGGLES: A MULTIDISCIPLINARY APPROACH TO EXPLORE TRAUMA IN THE LONGOBARD PERIOD

Panella, Sofia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Rome, Italy) - Bernardini, Sara (Department of Cultural Heritage, University of Bologna, Bologna, Italy; Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Rome, Italy; Aix Marseille Univ, CNRS, Minist Culture, LAMPEA, Aix-en-Provence, France) - Zeppilli, Carlotta (Department of Life and Environmental Sciences, University of Cagliari, Cagliari, Italy) - Maurizi, Antonio (Department of Biotechnological and Applied Clinical Sciences, University of L'Aquila, L'Aquila, Italy) - Tafuri, Mary Anne (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Rome, Italy) - Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge, Cambridge, United Kingdom)

This talk aims to introduce a ground-breaking approach to investigate in-life dietary changes in skeletal collections presenting healed traumas. In bioarchaeology, there are no methodologies for determining when a trauma has occurred throughout an individual's lifespan. Recently, high resolution sampling of dental tissues for multi-isotope analysis has been increasingly used to investigate short term dietary variations for life-history reconstructions. The analysis of sequential primary and secondary dentin in adult individuals helps to cover a longer time interval in the life-span, from childhood to early adulthood/death according to the teeth analysed. It has been observed that variations in the isotopic signals may also reflect stress events. This raises the question of whether it is possible to detect the stress signal of trauma by imagining a possible change in diet due to the period of recovery. This presentation explores potential dietary changes associated with traumatic events, unrecognisable from the traditional bone analysis, by using a multi-isotope analysis of primary and - when present - secondary dentine of adult individuals. This pilot study is applied to three individuals from the Longobard period showing traumatic injuries. There is an older male skeleton from the necropolis of Povegliano Veronese (VR, northern Italy, end of the 6th - beginning of the 8th C CE), an older male from Selvicciola (VT, central Italy, end of the 4th - beginning of the 8th C CE) and a mature adult male from Castel Trosino (AP, central Italy, 6th - 8th C CE). The choice of these individuals is motivated by the palaeopathological presence of a completely healed trauma, and the availability of complementary isotopic, archaeological and osteological data. The results will show the potential and limit of isotopic analysis on paleopathological case studies, and promote future research by multidisciplinary approach helping shed light in unveiling past lives struggles.

5 DISABILITY OF AN ADULT MALE WITH AMPUTATION OF A LOWER LIMB FROM MEDIEVAL CULMEN, POLAND

Matczak, Magdalena (Institute of Archaeology, Nicolaus Copernicus University in Torun; Faculty of History, Adam Mickiewicz University in Poznan) - Kozłowski, Tomasz (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Chudziak, Wojciech (Institute of Archaeology, Nicolaus Copernicus University in Torun)

The Early Mediaeval (10th-13th century) settlement complex, which was named Culmen in Latin, consisted of a stronghold with the remains of a stone basilica and a cemetery with up to 1,500 graves - one of the largest in Central Europe at that time. In total, 661 skeletons from 653 burials (some of them being multiple burials) were selected for the analysis of disability and diseases in Culmen. The analysis determined eight skeletons that display pathological lesions indicating disability such as amputation, Pott's disease, leprosy, paralysis, osteomyelitis, and multiple myeloma. An amputation, which was identified in the skeleton of a male 40-50 years old at death from grave 41/00, could have a long-term impact on that individual's life. As a result of amputation, the distal parts of the left tibia and fibula were shorter by about 7 cm than the corresponding bones in the right lower limb. Proliferation and remodelling (healing) processes in the tibia and fibula suggest that the male survived amputation and lived with this condition. His other ailments included degenerative joint disease, anaemia and an antemortem fracture of the crown of the upper right medial incisor. The male was the only one individual disabled in the consequence of a specific human activity such as a surgery, punishment or fighting, and the remaining seven ones were disabled due to development of disease. In his advanced age, the male could have considerable problems with sustaining his life as a consequence of amputation and

walking difficulties. It is possible that someone had to support him to satisfy his economic needs. The male was buried in grave with W-E orientation and traces of frame. However, his body was set in atypical manner on the right side in a strongly huddled position, which indicates his other treatment after death than others.

6 **BROKEN BONES AND REMEDIES: A BIOARCHAEOLOGICAL ASSESSMENT OF TRAUMA AND MEDICINE IN MEDIEVAL ICELAND**

Haraldsson, Haraldur (University of Iceland) - Walsler III, Joe (National Museum of Iceland)

Traumatic injuries can alter the way a person utilizes their body, and severe injuries can lead to various forms of different types of bodies. Bodies changed by such events are often viewed as disabled, but myriad circumstances can facilitate debilitating situations or life courses. Humans are creatures that are known to be highly adaptable to their surroundings. Furthermore, they are also quite efficient at adapting to changes in their own bodies, often utilizing their surroundings or parts of it in the process. For this presentation, we will discuss differing types of fractures in the skeletal records from medieval Iceland, including those occurring through accidents, interpersonal violence, and those that may have received treatment versus those that may have not. Additionally, we will discuss the possibility of disabling conditions arising from exposure to volatile gases originating from volcanic activity, since such geothermal activity has been quite common in Iceland's history.

The skeletal trauma record has been bioarchaeologically understudied in Iceland and thus this presentation will provide an overview of medieval trauma cases whilst considering how case studies were analysed in the past and what we can achieve today by applying new methods and technology. We will specifically consider technological applications such as radiography, 3D and CT scanning and theoretical frameworks, such as the use of fictive osteobiographic narrative. Moreover, we will discuss the usage of medicine in historical Iceland and what may have been used in place of antibiotics.

7 **RECLAIMING AGENCY: UNVEILING THE LIVED EXPERIENCE OF DISABILITY IN RURAL TRANSYLVANIA**

Heron, Megan (Florida Atlantic University) - Bethard, Jonathan (University of South Florida) - Nyárádi, Zsolt (Haáz Rezső Múzeum)

Disabled individuals have historically been omitted from the archaeological record, appearing only as liminal figures who retain minimal agency and association. When they do appear, these individuals are misrepresented in an emotional context of despitiness, dread, and despair. Due to this, archaeological analysis overlooks a significant demographic, resulting in an incomplete understanding of the past. Efforts to remedy this omission of the disabled experience require us to examine how bioarchaeologists approach the subject of disability, as well as the theoretical shortcomings associated with integrating the heterogeneity of abilities into analysis.

In this presentation, we display one method for reinserting disabled individuals into the historical record. This analysis exhibits a microhistorical bioarchaeology of caregiving behaviors employed for Burial 150, a disabled adult male excavated from the Bögöz archaeological site (1100-1700) in Mugeni, Romania. Care-giving behaviors are complex and multi-faceted human behaviors that offer rich information into the traditions and values of the society in which care is occurring. Analyzing the lived experience of caring for a traumatically dislocated hip in early modern Transylvania offers as an example for how bioarchaeologists can include disabled individuals as active historical agents worthy of analysis- that the lived disabled experience offers unique insights into archaeological societies that, otherwise, would go unobserved.

8 **THE POWER OF PHYSICAL LIMITATIONS: FOUNDING THE CLASSIC COPAN DYNASTY**

Buikstra, Jane (Arizona State University) - Bell, Ellen (California State University Stanislaus) - Wolf, Katherine (University of West Florida) - Traxler, Loa (University of New Mexico)

This paper develops an osteobiographic narrative within a deeply contextualized study of K'inich Yax K'uk' Mo' who played a central role in the founding of the Maya Copan dynasty during the Early Classic Period (250-600 CE). K'inich Yax K'uk' Mo' survived severe blunt force trauma to the chest, left shoulder, right forearm, and skull, which left him with permanent physical limitations. Information drawn from archaeology, bioarchaeology, and epigraphy is combined with plausible inferences drawn from knowledge of traditional medicinal plants and treatments by the skilled Maya bonesetters to surmise the degree to which he required both short and long-term care.

Over 150 years of archaeological study has characterized Copan was the capital of a Maya state that flourished under the 16 named rulers of the Classic period dynasty (426-822 CE) established by K'inich Yax K'uk' Mo', a foreigner who took power, likely under authority emanating from the central Mexican capital of Teotihuacan. The levels of the Copan Acropolis that date to the time of the dynastic founding include a Central Mexican style talud-tablero building nicknamed "Hunal" that appears to have been the royal residence of K'inich Yax K'uk' Mo' during his life and remodeled as

a shrine containing his tomb upon his death. Objects buried with him point to his royal status, wealth, and foreign ties as he was interred wearing regalia associated with both Maya rulers and Teotihuacan warriors. Our narrative considers his personal history in light of his traumatic injuries, available treatments, and his permanent disability in his role as powerful dynastic founder.

647 **TRAJECTORIES OF AI IN ARCHAEOLOGICAL HERITAGE: GEOGRAPHIES, INNOVATIONS, FUTURE-MAKING, AND (IN)JUSTICES**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Bonacchi, Chiara (University of Edinburgh) - Marras, Anna Maria (Università di Torino) - Rey da Silva, Arturo (University of Edinburgh)

Session format: Regular session

This session aims to discuss applications of Artificial Intelligence (AI) in archaeological heritage research and practice. In the last few years, these applications have increased in number and kind. To name just a few of several possible examples, they have included work to identify looted artefacts, detect unknown heritage sites, decipher ancient languages, facilitate access to heritage, understand visitor experiences at heritage sites, and interpret collections through the recent developments of generative AI. Intergovernmental organisations such as the European Union or UNESCO are starting to define specific regulations and common ethical approaches for AI use in all aspects of life. However, the potential and challenges posed by AI for archaeological heritage research, management and interpretation are yet to be conceptualised and understood fully.

We invite papers that present and discuss past, present, and future (potential) applications of AI within archaeological heritage. Contributions will focus on either or both: (1) methodological innovations and challenges, and (2) the ethical implications of Artificial Intelligence for people and the planet. We welcome reflections on applications of AI within different geo-political contexts, internationally, and within different societal or community contexts (communities of place, interest, practice, etc.).

Our session hopes to provide an arena for debating answers to four questions:

(1) How has the use of AI changed over the past few years, and what futures could AI help to build in the field of archaeological heritage?

(2) What research and practice-based agendas are impacted by and impact the development of AI?

(3) What ethical 'emergencies' should be foregrounded?

(4) What epistemic injustices may derive from the use of AI in archaeological heritage? Through what theoretical lenses can we explore them?

By fostering dialogue on these critical issues, we hope to create a dynamic environment to collectively advance our understanding of AI's role in archaeological heritage.

ABSTRACTS

1 **UNRAVELING THE ROLE OF LARGE LANGUAGE MODELS IN ARCHAEOLOGICAL HERITAGE: APPLICATIONS, CHALLENGES, AND ETHICAL IMPLICATIONS**

Marras, Anna Maria (University of Turin)

This presentation explores the burgeoning role of Large Language Models (LLMs) within the domain of archaeological heritage research and practice. In recent years, the advent of LLMs, such as GPT (Generative Pre-trained Transformer) models, has revolutionized the landscape of natural language processing and textual analysis. From the interpretation of ancient texts to the documentation of cultural heritage, LLMs offer unprecedented opportunities for advancing archaeological knowledge and understanding.

The presentation will offer insights into the diverse applications of LLMs in archaeological heritage, showcasing examples of how these models have been utilized to automate translation tasks, analyze textual datasets, and generate descriptive narratives about archaeological sites and artifacts. Additionally, it will delve into the methodological innovations and challenges associated with integrating LLMs into archaeological research workflows, including issues related to data bias, model interpretability, and reproducibility.

The presentation will address the ethical considerations and dilemmas inherent in the use of LLMs in archaeological heritage, including concerns related to cultural appropriation, intellectual property rights, and the representation of marginalized communities. It will underscore the importance of adopting ethical guidelines and best practices for the responsible deployment of LLMs in archaeological research, ensuring transparency, equity, and respect for diverse cultural perspectives.

2 STORIES TO BE TOLD: PRESERVING EXCAVATION NARRATIVES IN AI/ML DATASETS DOCUMENTATION

Osti, Giulia (University College Dublin)

Web scraping, the act of obtaining data from web resources, is critical to artificial intelligence/machine learning (AI/ML), enabling the creation of comprehensive training sets for model development and refinement. While it can be a powerful tool for collecting big data at scale, it often operates at a superficial level, focusing primarily on the visible content of web pages. This leads to a disconnect from the context of their collection, making the captured data vulnerable to exploitation and misuse. Emerging fields such as critical data studies are beginning to address these issues from a variety of perspectives, and have only recently begun to attract the attention of disciplines concerned with digital cultural heritage, including archaeology.

This contribution proposes an original reverse engineering approach taking as a case study the online photographic archive of the Museo Egizio in Turin, which documents the work of the Italian archaeological missions in Egypt around 1800. The approximately 2,800 photographs and their metadata – which are released in the public domain – have been scraped, explored and re-arranged with Python to fit an AI/ML typical reuse scenario. The presentation stands out for its emphasis on the challenges of preserving contextual information, particularly the narratives of the excavation campaigns that form the backbone of the photographic archive. Drawing on the principles of Collections as Data, this approach uses the 'datasheet' format to document digital heritage datasets, to advance the dialogue on their use by paving the way for the integration of an archaeological documentation perspective.

3 AI'S ROLE IN MANAGING MARINE CULTURAL HERITAGE: CHALLENGES, POTENTIALS, AND ETHICAL CONSIDERATIONS

Rey da Silva, Arturo (University of Edinburgh)

The exponential proliferation of artificial intelligence (AI) across diverse spheres of human behaviour has engendered unforeseeable opportunities globally, spanning scientific endeavours, education, industrial practices, economic dynamics, and mechanisms of global governance. At the same time, deliberations within UNESCO and the broader international community have gravitated towards the formulation of a normative framework addressing the ethical dimensions of AI. The fields of culture preservation and heritage studies have emerged as domains potentially influenced by the advancement of AI technologies. While potential applications have already been explored in terms of identification of archaeological sites, monitoring degradation, or enhancing public awareness, less attention has been devoted to the preservation, governance, and heritage-making processes. Using the case of the marine cultural heritage, increasingly impacted by economic and natural factors such as marine industries, climate change, or coastal urban development, this paper will explore the ethics, challenges, and potentials that AI might bring to its effective management and preservation. The paper will also discuss AI's potential contribution to developing inclusive and participative policies that can improve heritage definitions, public engagement, and its overall governance.

4 GENERATIVE AI FOR HERITAGE INSTITUTIONS: A CASE STUDY OF HISTORIC ENGLAND'S "HAZEL"

Bonacchi, Chiara (University of Edinburgh) - Witte, Jessica (University of Edinburgh)

Despite the increasing number of use cases for generative AI tools in archaeological heritage, researchers have yet to comprehensively examine the potential impacts of these tools in contexts across the sector. This paper contributes to these emerging discussions by presenting a case study of our development of HAZEL, a pilot generative AI tool designed to assist with the writing and communication of heritage guidance literature. Designed collaboratively by University of Edinburgh researchers and Historic England (HE) staff,* HAZEL aids authors in crafting guidance literature while also providing content summaries for diverse audiences. Through a textual analysis of the HE guidance corpus before and after applying HAZEL, we discuss the affordances and constraints of generative AI tools for the writing and communication of best practices in historic environment settings. Additionally, we consider how generative AI could shape knowledge exchange in heritage more broadly and, in turn, authorised heritage discourse (AHD). As such, we argue, critically examining the impact of generative AI on heritage guidance is a crucial prerequisite for ethically implementing these tools at a larger scale.

*HAZEL is a collaborative project involving Dr Jessica Witte (Research Fellow), Dr Chiara Bonacchi (PI), Dr Edmund Lee (Co-PI) and Dr Lisa Brausem (Co-PI).

648 WORKERS OF THE PAST UNITE! LABOUR STUDIES TODAY: A REFLECTION ON THE POTENTIALITIES AND LIMITS OF THE APPROACH

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Tomei, Francesca (IMT School for Advanced Studies Lucca) - Vicenzutto, David (University of Padova) - Halbertsma, Diederik (University of Liverpool) - Politopoulos, Aris (Leiden University)

Session format: Regular session

Studies on labour and energetics are rapidly growing in popularity as a quantitative approach to understanding socio-economics aspects of ancient communities that are not visible in the archaeological record. This popularity is mostly due to its multi-scalar applicability: from a family to a community effort, from the chaîne opératoire of the artefacts to buildings and cities construction and the manipulation of landscapes, energetics can help in shedding light on processes and people in different research scales.

The scholarly literature, however, is still not set on a comprehensive and shared methodology for this approach. Frequently, researchers have been building up their own theoretical framework and methodology, also because the energetic estimates are highly dependent on single case studies and focus on different perspectives (e.g., the natural resources, the landscape, the demography, etc).

Moreover, critics often highlight that the energetic approach produces estimates rather than absolutes and there is always a plethora of variables in the resulting models. Nevertheless, the growing body of labour cost studies demonstrates that - besides its multiscalarity - this approach can help answer important questions arisen in modern archaeological scholarship, like the visibility of social groups that do not appear using traditional research methods or the relationship between labourers, production and the people who control production.

This session aims to bring together contributions which define the state-of-the-art, the potentiality and the limits of this approach, in order to increase the body of knowledge of labour cost studies and investigate new ways forward. Papers should bring a particular focus on their multiscalarity - from individuals to communities, from production processes to landscape transformations, and so on - and the implications of these studies on the historical and social interpretation of past societies. Case studies from prehistory to medieval times from any geographical area are welcome.

ABSTRACTS

1 HOW DOES LABOUR IMPACT THE POPULATION? THE RELEVANCE OF EARTHWORKS IN THE BRONZE AGE FORTIFIED SETTLEMENTS OF NORTHERN ITALY

Vicenzutto, David (Università degli Studi di Padova)

Labour studies aim to measure how impactful any type of work can be on a population, its resources, and the environment. The use of a quantitative approach, capable of measuring the energy effort and/or the labour rate, allows us to establish the magnitude of the impact that a specific labour has on society. However, to gain a deeper understanding of the repercussions of a particular production process, it would be advisable to quantify the elements constituting the context upon which the labour impacts: as mentioned before, population, resources, and environment.

This paper aligns with this research path, seeking to highlight the impact of labour by quantifying the population and thus the workforce available. To illustrate this methodological approach and its potential in the socio-economic reconstruction of communities, several case studies related to fortified settlements of the Bronze Age in Northern Italy will be used. These case studies analysed allow the comparison of population, in terms of the number of individuals, with the energy effort required for the earthworks (ramparts, ditches and channels). The impact of these earthworks on both the entire community and individual households within a settlement will be considered.

2 FROM HOUSEHOLD TO COMMUNITY: THE ENERGETICS OF THE CONSTRUCTION OF AMBITIOUS BUILDINGS IN EARLY MYCENAEAN GREECE

de Raaff, Yannick (Gothenburg University)

The early Mycenaean period on the Greek mainland (ca. 1800-1400 BCE) is witness to the emergence of architectural complexes that exceed previously known domestic structures in terms of size, quality of construction, and labour investment, through which they represent a substantial change to the built environment. I argue that the mobilization, manipulation, and centralization of labour in construction projects played an important role in the transformation of kin-based and relatively undifferentiated Middle Bronze Age societies to the asymmetrical and centralized social formations of the early Mycenaean period.

In this paper, architectural energetics is used to chart the changes in the labour required for the increasingly large structures of the early Mycenaean period. It will be explored at which stage house construction exceeded the capacity of the household, and thus when larger social units would have been required. Central to my discussion are two early elite residences, Mansion I and II of the Menelaion in Laconia. They are key buildings for our understanding of architectural and social developments in the early Mycenaean period. This rubble-built Korridor Haus has been considered a major step in the monumentalisation of the built environment and has at various occasions be considered a proto-palace. Architectural energetics forms a useful method to bypass traditional categorisations of architecture as elite and non-elite residence because it can be tested whether such larger edifices had 'extra-domestic' demands in terms of labor required for their construction - were they constructed by individual households or by communal entities of local scale?

3 PUBLIC WORKS AND COMMUNITY AT THE DAWN OF THE POLIS. THE TEMPLE OF APOLLO IN GORTINA OF CRETE

Bonetto, Jacopo (University of Padova) - Frizzera, Jacopo (University of Padova)

Beginning in 2001, the University of Padua and the Italian Archaeological School of Athens started a research project concerning the sanctuary of Apollo Pythios in the city of Gortina, Crete. Stratigraphic excavation and survey activities since 2013 have focused on the area of the Temple of Apollo, which was unearthed in the late 19th century.

Research at the time recovered a substantial number of legal inscriptions from the Archaic period and led to dating the building between the 7th and 6th centuries B.C. in relation to the concluding stages of the polis formation process.

Work in recent years has investigated stratigraphic deposits not documented to date, which allow a precise dating of the building to the mid-7th century B.C., and has completed a three-dimensional digital survey of every stone element of the massive building, reconstructed as an open-air enclosure measuring 19.8 x 17.6 m.

The survey made possible a detailed analysis of the dimensions of the whole and individual parts, in order to study the structure from the individual block to its entirety.

The data collected, coupled with the knowledge of the territory and the supply basins of the stone material, made it possible to make very precise calculations of the quantities of raw material used, the labor energy lavished for its procurement, and the community's energy effort for the construction of the building.

Through such quantitative assessments it is possible to address the complex issue of the demographic, social and economic structure of Greek communities in the crucial period of formation of complex urban societies.

4 REFLECTIONS ON THE VALUE OF ENERGETICS TO UNDERSTAND RAPID URBANISATION AND LABOUR LOGISTICS IN CLASSICAL GREECE

Fitzjohn, Matthew (University of Liverpool)

Our research explores labour in the Classical city and the value of energetics to unpack the logistics of construction, artisanal labour, as well as the finances of production. Our focus is on Olynthos, a city in northern Greece, that is known from the Demosthenic corpus with a rich history of excavation by David Moore Robinson and a team from Johns Hopkins University, as well as the more recent project (2014-2019), co-sponsored by the BSA and the Greek Archaeological Service, with the Universities of Michigan and Liverpool. Olynthos is an exceptionally good case study for exploring how new, planned housing was constructed in terms of both the planning and financing of the construction work as well as the practicalities and processes by which (and by whom) the building was undertaken. Our research is beginning to reveal the complexity of the construction process across the city, which involved a massive project of brick-making, timber felling, and plastering. This presentation will explore the economic and financial implications of this huge urban growth spurt. We evaluate the use of architectural energetics to explore the costs of constructing a single house and using this data consider the economic and social implications of the construction of all the houses on the north hill of the city. The calculations indicate the logistical complexity and cost associated with building the residential district of a city and indicates that households did not build their own houses, though they might have contributed casual labour. The research contributes to our comprehension of house construction and wider scholarly discussions of specialisation in Classical Greek towns and cities.

5 PAINTING UNDER THE SHADOW OF A PALACE: THE CASE OF THE HOUSE OF THE FRESCOES AT KNOSSOS, CRETE

Georgiopolou, Vasiliki (Leiden University)

Aegean prehistoric paintings have sparked a great interest among archaeologists, art historians and art enthusiasts ever since their discovery. Decorating the walls, mostly, of known palatial buildings, such as Mycenae, Knossos and Tiryns, the naturalistic scenes of humans, animals and plants, in combination with intricate schematic motifs, had

been thought of as evidence of both the delicate taste and the propagandistic efforts of the palatial elite. However, was this how the paintings were perceived by their creators themselves? Viewing the plastered paintings as a mere propagandistic tool deprives them of their material agency, and treats them as ready-made art pieces, and not as human creations. Research on the technology and the energetics of their creation could shed light to these neglected aspects of prehistoric paintings and to the painters themselves.

This paper will attempt to investigate these queries through the study of the decorations of the 'House of the Frescoes', a building situated at the northwest part of the archaeological site of Knossos, in Crete. The 'House of the Frescoes' is a fitting example to investigate the social dynamics between painters, commissioners, common people, and the elite in Prehistoric Crete, due to its proximity to the knossian palatial structure. Initially regarded as the property of an elite that antagonized the palatial elites, the 'House of the Frescoes', was named after the pile of painted plaster found in one of each main rooms. The study of the chaîne opératoire of the paintings will reveal how many people were involved in their manufacture, as well as the needed level of specialization. Finally, by attempting to investigate the building with a bottom-up approach and by posing the painters in the epicenter, new possible interpretations for its function will be reached.

6 A LEATHER TANNING CRAFT IN MEDIEVAL AND POST-MEDIEVAL BRNO, CZECH REPUBLIC

Pribylková, Michala (Archaia Brno, z.ú.; MUNI - Department of Archaeology and Museology) - Ostrý, Ctibor (Brno City Museum) - Antal, Róbert (Institute of Archaeology of the Czech Academy of Sciences)

The paper presents multidisciplinary research in leather tanning craft in medieval and post-medieval Brno, which synthesizes results of the archaeological rescue excavations and historical study of the social-topography of leather craft in Brno.

The main focus is on two tannery complexes excavated in Brno on Koliště Street and Křenová Street. At these sites, a large number of archaeological finds, consisting of wooden structures of production facilities, watercourse modifications serving the needs of the tannery, and tannery waste of organic origin has been preserved.

Firstly, the paper evaluates the result of the excavations, including waste analysis. Afterwards, it presents hypotheses regarding the hypothetical layout of the tannery complex, the influence of the tanning craft on the workers, and the influence of leather tanning activities on its immediate surroundings.

Attention will also be paid to inner structures and relations within tannery guild and trade and their manifestations in settlement strategy of this particular population in Brno. The report will also include a model example of product and raw material logistics within the city of Brno.

7 ENTREPRENEURING WOMEN: LABOUR AND THE LABOUR FORCE OF TEXTILE MANUFACTURE IN CLASSICAL GREECE

Foxhall, Lin (University of Liverpool)

This paper argues that 1) women of all political statuses (free, freed and enslaved) working in domestic settings were predominantly responsible for the manufacture of the textiles and clothing traded and sold commercially for consumer use in classical Greek cities, including luxury products; 2) that specialist textile 'workshops' as physical spaces are very rare, and 3) that consequently the contribution of women's labour to the economies of classical Greek communities has been dramatically underestimated as a result.

Classicists and ancient historians have argued largely on the basis of references to craftspeople in Plato and Aristotle, that in classical Athens numerous male weavers were responsible for producing high-end luxury textiles for the market in workshop settings, while women wove basic, utilitarian textiles in domestic settings for everyday home use. This paradigm is deeply flawed: there is virtually no evidence for textile workshops in any classical Greek city; instead the evidence points to domestic production in household settings by women.

Archaeological, visual and textual for cloth production read 'against the grain' shows the pre-eminent roles of women working in households. Most textile tools appear in residential settings, generally in storage contexts. Although some archaeologists have argued for the presence of 'weaving rooms' in domestic houses in most cases numbers of loom weights found are insufficient to operate a loom, let alone a 'workshop'. Experimental research data published by the Center for Textile research, Copenhagen can be deployed to quantify estimated levels of person-hours needed to supply a city with textiles of all kinds.

The findings of this paper challenge understandings of textile manufacture that remain current, expand our knowledge of women's key, and still undervalued, roles in acquiring household wealth, and highlight the complexity of labour 'specialisation' in classical Greek economies.

8 THE ORGANISATION OF LABOUR IN THE CERAMIC WORKSHOPS OF THE CHORA OF METAPONTO

Tomei, Francesca (University of Liverpool)

The energetic approach quantifies the labour-time cost of human activities and provides a tool to investigate the organisation of labour in building and other production processes. In this study, energetics explores the organisation and seasonality of labour in ceramic production in the rural countryside of Metaponto during the 2nd- 1st centuries BC through the examination of the archaeological data - namely, the structures of the workshops and the ceramic products - of two sites, Sant'Angelo Vecchio and Pantanello 'Tile Works'. Energetics are supported by experimental archaeology and ethnographic data and will help to understand and compare the scale and modes of production of the two workshops and the amount of labour force necessary to carry out some tasks of the productive chain, such as raw material collection, transportation, clay preparation, vessel shaping, and kiln firing. In an ancient rural context, where the economy was based on agriculture, labour was conditioned by the agricultural calendar and most likely labour in craftmaking was seasonal too. Therefore, this study will investigate also the seasonal nature of labour in pottery making according to the agricultural activities, highlighting the interconnectedness of all productive activities in the region, where sites and tasks are intricately linked, fostering a flexible and seasonal labour system in both ancient and modern Mediterranean societies.

650 DISAPPEARED AND FORGOTTEN: NAZI CONCENTRATION SUB-CAMPS, FORCED LABOUR CAMPS, AND OTHER TYPES OF CAMPS AS NEGLECTED ARCHAEOLOGICAL AND HERITAGE SITES

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Vareka, Pavel (University of West Bohemia) - Carr, Gilly (University of Cambridge) - Theune, Claudia (University of Vienna) - Konczewski, Paweł (Wrocław University of Environmental and Life Sciences)

Session format: Regular session

Recent archaeological research focused on concentration and other types of Nazi camps have demonstrated that archaeological approaches and methods not only complement fragmentary historical (written and oral) sources, but also open up new questions connected with the materiality of European dark heritage and totalitarian pasts. The main concentration camps, whose names have become symbols of Nazi atrocities, were supplemented by hundreds of sub-camps, many of which have been forgotten and their exact locations unknown. However, it was the ubiquitous sub-camps, as well as forced labour, and other types of smaller camps, that formed the Nazi "campscape" which was entangled with war infrastructure and logistics. Hundreds of thousands of prisoners and forced labourers who were housed in these locations worked in appalling conditions in war production facilities. Unlike the main concentration camps and Holocaust extermination centres, historical memory formation has often ignored the material remains of smaller camps in the post-war period. Due to the vast number of these sites, most of them lack any kind of memorialization and heritage protection. Additionally, places where mass violence and crimes against humanity took place currently face development and construction activities that erase archaeological evidence of this kind at an alarming rate.

We invite contributors to explore the tangible dark heritage of Nazi concentration sub-camps, forced labour, and other types of neglected sites such as Arbeitserziehungslager, Jugendschutzlager, Polizeihäftlager, Sammellager für Juden or Zigeuner Anhaltelager.

ABSTRACTS

1 TOPOGRAPHY OF MASS EXTERMINATION - INTELLIGENZAKTION, T-4 AND INTERNMENT CAMPS

Kobialka, Dawid (Uniwersytet Łódzki) - González-Ruibal, Alfredo (Heritage Studies of the Spanish National Research Council) - Kostyrko, Mikołaj (Independent researcher) - Czarnik, Michał (Institute of Archaeology, University of Rzeszów) - Wysocka, Joanna (Department of Anthropology Hirsfeld Institute of Immunology and Experimental Therapy, Polish Academy of Sciences) - Kowalczyk, Zuzanna (Faculty of Archaeology, Adam Mickiewicz University in Poznań) - Torlop, Piotr (Independent researcher) - Martínez Barrio, Candela (Independent researcher) - Rennwanz, Joanna (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

The first months of the Second World War in Gdańsk Pomerania, Poland, had a unique historical significance. They were associated with the mass extermination of the local Polish elite, the mentally ill, and representatives of the small Pomeranian Jewish community. The Germans planned these actions before 1 September 1939, and then carried them out systematically. These actions had code names: Intelligenzaktion and T-4. Currently, there are about 400 known

crime scenes from 1939 in Gdańsk Pomerania, and their scale is estimated at approximately 30,000-35,000 human lives. In most cases, the Poles were taken to places of detention - detention centres, prisons, and other buildings used as internment camps. The next stop for imprisoned Poles was usually a mass grave. The material traces of these events and the social memory of them are the subject of a multidisciplinary scientific project entitled "An Archaeology of the Pomeranian Crime of 1939". It examines the broadly understood topography of the mass extermination of 1939 in Gdańsk Pomerania. Internment camps are an important point on the research map and an essential element in understanding the events of 1939. In our presentation, we will focus on the example of Chojnice and its surroundings, where several internment camps operated in the autumn of 1939 - execution sites and mass graves were always nearby.

Acknowledgements

The project is funded by the National Science Centre, Poland (UMO-2021/43/D/HS3/00033).

2 THE FORCED LABOUR CAMPS IN KIRCHBICHL (TYROL) AS PART OF THE UTILISATION OF AUSTRIAN HYDROPOWER FOR THE GERMAN WAR INDUSTRY

Hinterndorfer, Peter (Universität Wien)

In the context of the national socialists' program to ensure the energy supply for the German (armaments) industry, several hydropower plants were built in Austria after its incorporation into the German Reich in March 1938. In Kirchbichl (Tyrol) a run-of-river unit was erected by forced labourers from two consecutive camps, one of which was established directly adjacent to the construction site. Completely demolished in the early 1960s and with no preserved above-ground structures, this former camp was integrated into commemorative discourses only after its archaeological investigation during extension works of the power plant, still operated by a local energy supplier. The excavations carried out in 2014 and 2015 brought up a broad spectrum of materiality from different spheres of activity connected to the operation of the camp and construction site, but also post-war alterations and continued uses.

Using the example of Kirchbichl (Tyrol), this paper aims to discuss the role of forced labour in the enlargement of the electricity industry, how infrastructural remains of the camps can be affected by the expansion and conversion of associated power plants and how the respective companies concerned deal with historical-archaeological investigations into specific parts of their heritage.

3 THE INTERNATIONAL HOLOCAUST REMEMBRANCE ALLIANCE CHARTER FOR SAFEGUARDING SITES: ITS APPLICATION TO NAZI SUBCAMPS EXPLORED

Carr, Gilly (University of Cambridge)

In November 2023, at the Zagreb plenary meeting under the Croatian chairmanship, the International Holocaust Remembrance Alliance adopted the IHRA Charter for Safeguarding Sites. This heritage charter for sites of the Holocaust, genocide of the Roma and other victims of Nazism and collaborators of the Nazis was launched in Brussels in January 2024 as part of the European Commission's marking of Holocaust Memorial Day. The charter has been the result of five years of work by a 14-member team of delegates to the IHRA, chaired and project-managed by the author.

In this paper I explore the application of the new heritage charter to sub-camps, asking whether it offers sufficient protection - and is sufficiently pragmatic - in its approach to sites in the 21st century. Has the time come to accept the loss of many sub-camps or should we, as archaeologists, be activists for every single one? If we accept loss in the face of threats of the 21st century such as war and climate change, what language can we use to make this acceptable?

4 COMPLEX GEOPHYSICAL SURVEY OF THE ROMA INTERNMENT CAMP IN LETY FROM 1942-1943 (CZECH REPUBLIC)

Vágner, Michal (MUNI - Ústav archeologie a muzeologie) - Vařeka, Pavel (University of West Bohemia)

Former Czechoslovakia occupied by Hitler's Germany in 1939-1945 was included in the Nazi plans for the extermination of the Romani and Sinti in Europe. In 1942, all Czech "Gypsies" were interned in camps one of which was established in Lety (South Bohemian Region). In the 1970s, a large-scale industrial pig-farm was built on the very same site of the former camp. Heated public discussion concerning the embarrassing situation in Lety erupted shortly after the Velvet Revolution in 1989 and continued until 2017 when the state finally bought out the pig-farm and a memorial began to be planned here. Archaeology played a key role in locating the camp. In the first phase of the research several geophysical surveys were carried out. The complex survey of the whole site, the results of which are presented in this paper, was carried out in three phases, the last of which was completed after the demolition of the pig-farm in early 2024. The survey combined two methods: ground-penetrating radar and magnetometry. Geophysical measuring revealed nearly complete plan of the camp, located foundations of most buildings, indicated other structures as well as components outside the fenced area such as the headquarters of the guards' unit. This information proved instrumental in planning subsequent archaeological excavations of a sample of the camp area that also tested the accuracy

and information potential of the geophysical methods. The whole camp area located by the archaeological research is currently incorporated into a new memorial of the Roma and Sinti Holocaust which is currently being built in Lety

5 **HIDDEN TOTALITARIAN HERITAGE: NAZI CONCENTRATION SUB-CAMPS, PRISONER OF WAR CAMPS AND LABOUR CAMPS IN THE LOWER SILESIAN FORESTS (POLAND)**

Konczewski, Paweł (Wrocław University of Environmental and Life Science, Department of Anthropology) - Biel, Radosław (Wrocław University of Environmental and Life Science, Department of Anthropology) - Biernacka, Katarzyna (Wrocław University of Environmental and Life Science, Department of Anthropology) - Kwiatkowska, Barbara (Wrocław University of Environmental and Life Science, Department of Anthropology) - Szczurowski, Jacek (Wrocław University of Environmental and Life Science, Department of Anthropology) - Bernacka, Natalia (Wrocław University of Environmental and Life Science, Department of Anthropology) - Gałdyn, Natalia (Wrocław University of Environmental and Life Science, Department of Anthropology) - Sady-Bugajska, Agata (Independent researcher) - Orlicki, Łukasz (Independent researcher)

In 1944, faced by Allied bombing raids in western Germany, the invasion of Normandy and the progress of the Red Army on the eastern front, the Third Reich was forced to reorganise its military economy and logistics. These actions included translocating several dozens of industrial plants into the Lower Silesian Forest mesoregion, where the factories and military bases were expanded. This research focuses on the material remnants of this Nazi camp-economic-military complex as part of a wider landscape of national-socialist repressions. Using archaeological and bioarchaeological methods, the team of the multidisciplinary Polish-Czech project entitled "Bioarchaeology and Landscape Archaeology of the Nationalist-Socialist Repressions: Central-Eastern European Perspective," launched in 2023, ran numerical analyses of terrain models and inventoried, among others, the remains of various camps near villages: Karczmarka, Trzebień, Czyżówek, and in Ruszów. A review of historical sources and botanical analyses of camp flora were also carried out. Trench excavations allowed for a more detailed understanding of camp architecture and provided items used while the camps were operating. It was also possible to gain information on the graves of victims of Nazi repressions and local memory on the "campscapes" in the Lower Silesian Forests mesoregion.

Our research provides crucial input into understanding the mechanisms of Nazi repressions and their multiple ramifications: social, cultural, and ecological. As the trauma of the Second World War is still lingering, this work has a particularly strong social resonance as it discovers and presents the neglected material heritage of the dark past of the 20th century.

Acknowledgements

The project is funded by the National Science Centre, Poland (UMO-2021/43/I/HS3/02072).

6 **THE CAMP AND THE CITY. KL PLASZOW'S HERITAGE IN CONTEMPORARY KRAKOW'S LANDSCAPE**

Karski, Kamil (KL Plaszow Museum)

The German Nazi KL Plaszow, Krakow was established in October 1942. Until January 1944, it was operated as a forced labour camp (ZAL Plaszow) and initially was intended for Jews from the Krakow Ghetto. Soon after the mid-1943 also Jews from the liquidated ghettos and camps in General Government were put in the camp, as well as Poles and Romani families. From mid-1944, it functioned as a transit camp for Slovakian and Hungarian Jews and a temporal place of isolation for Poles arrested in response to the Warsaw Uprising. It is estimated that about 30–35 thousand people were imprisoned in 1943–1945 in ZAL/KL Plaszow, while 6 thousand of people were killed on-site.

Among the peculiarities of the Plaszow camp was its proximity to Krakow. This made it possible to apply prisoners' forced labor in the camp's workshops served for local economy, but also in the numerous sub-camps, work sites, and factories behind the barbed wire of main camp. Over time, the network of KL Plaszow's spatial relationships grew to include sites throughout the Krakow district and further.

With the advance to the new memorial and museum, archaeological research was carried out on the present-day memorial site. Non-invasive and invasive archaeological methods for mapping the 'campscape' were adopted. The next stage of research is studying KL Plaszow's 'spatiality' at different levels. This includes not only the topography of the camp itself but also its sub-camps (almost invisible in the contemporary landscape), human movements/transports/deportations as well as interpretation of artifacts found during previous research. This allows us to consider KL Plaszow's heritage on different scales and meanings.

7 **"VIRTUAL" ARCHAEOLOGY - A VISIT TO THE CONCENTRATION CAMP IN NOVÁ ROLE**

Hlavenka, Pavel (University of West Bohemia, Pilsen) - Vařeka, Pavel (University of West Bohemia, Pilsen)

"Virtual" archaeology, using archival aerial photographs, brings to life in a 3D world places that are inaccessible to conventional archaeology (flooded river areas, denuded spaces, etc.). It reconstructs the world in a way that almost

resembles the time of its reality and allows people to feel the power of the quote "if we do not know the past, we are condemned to repeat it..

The history of the twentieth century is linked to a series of social and military changes. These events are linked by the existence of camps, which have restricted personal freedoms in various ways. Their mission is to eliminate the opposition, making them an unfortunate symbol of the times.

For the University of West Bohemia in Pilsen, this issue is crucial because it believes that preserving history and examining it leads to its non-repetition in the future. Using a progressive method, we make use of archival aerial photographs that capture objects directly from the functional period or shortly after their demise. Thanks to stereophotogrammetric evaluation, we obtain information about their spatial form, which we transform into virtual reality.

We believe that our efforts present the problem to contemporary and future generations who have forgotten the horrors that humans were able to inflict on themselves. Visiting the concentration camps promoted by the media brings different emotions than knowing that there was a similar camp on the hill behind our house.

This presentation has chosen as such a "nearby place" the location north above the town of Nová Role in northwestern Bohemia, where a Nazi concentration camp was established during World War II. The site is inaccessible to the public because it has been covered by a landfill. The project digs it up virtually, transforms it into 3D and presents it in a simple way.

8 **THE WARSAW GHETTO AS A PLACE OF PERSECUTION AND EXTREMATION OF JEWS IN THE LIGHT OF ARCHAEOLOGICAL RESEARCH IN 2021-2022**

Konik, Jacek (Pultusk Academy of Humanities - Vistula University; Museum of Independence in Warsaw)

As a result of the destruction of the war only few remains of the former Warsaw Ghetto have survived. Of what has survived, the most impressive are the few fragments of the former ghetto wall, which in the collective memory perpetuate the image of the ghetto mainly as a place of isolation for Jews before they were deported to extermination camps.

Admittedly, stories about the persecution and extermination of ghetto residents have been documented in historical sources, testimonies of witnesses, but until recently these stories were not supported by material artifacts. That has changed in the past few years thanks to archaeological excavations conducted on the former ghetto site. In my paper I will focus on the research in 2021 - 2022, which I personally directed.

The research examined the remains of the basements of the now defunct buildings on Wałowa Street in Warsaw and at the intersection of Miła Street and Stanisława Dubois Street, in the vicinity of the so-called Anielewicz Bunker - the place of death of the commander of the Jewish Combat Organization. In the course of the research, many artifacts testifying to the Jewish identity of the residents of the buildings were found. The context in which they were found are testimony to the dramatic circumstances of their abandonment and the persecution that afflicted their owners.

In the excavated basements, traces of a bunker were also found, an underground hiding place from the extermination activities of the Nazis. The entire context of the discovery of the remains of the bunker and hideout allows us to hypothesize that it is part of a large complex of underground hiding places known as the Anielewicz bunker. The discovered remains are a shocking material testimony of the struggle to save life in the face of merciless extermination.

9 **ARCHAEOLOGY OF THE HOLÝŠOV (HOLLEISCHEN) CAMP COMPLEX. CONTRIBUTION TO THE STUDY OF THE INTERCONNECTION OF NAZI CAMPSCAPE AND WAR PRODUCTION**

Vareka, Pavel (University of West Bohemia) - Netolický, Petr (University of West Bohemia) - Varekova, Zdenka (University of West Bohemia) - Vagner, Michal (Masaryk University)

The research on the entanglement of the Nazi "campscape" and war production in Bohemia has focused on a small town of Holýšov (Holleischen). Situated 25 km SW from Pilsen it became part of the Third Reich after the annexation of Czechoslovak borderland (Sudetenland) to Nazi Germany. In the beginning of the war, a large ammunition plant was built here that demanded ever-increasing labour force. Gradually, a total of 7 camps were established in Holýšov that housed both forced and prison labourers who were deployed in mass ammunition manufacturing for Luftwaffe. The variety of camps provides a representative sample of the use of forced and slave labour for Nazi war production in occupied Czechoslovakia (Flossenbürg concentration sub-camp, POW camps and forced labour camps). With the use of historical aerial photographs, remote sensing, surface and building archaeology survey the location, plan and structure of individual camps sites have been determined as well as remains of the ammunition factory preserved in forested area. Trial excavations tested different components of the studied complex. Comparative analysis and interpretation of material evidence, archival research and the testimonies of prisoners shed light on the spatial, functional structure and the system of operation that made use of unfree labourers, as well as the living conditions of forced workers and inmates. The heritage protection of these sites, the current state of memorials and the contemporary utilization of the camp areas has been also examined.

THE SONDERLAGER OF STALAG X B SANDBOSTEL - ARCHAEOLOGICAL RESEARCH IN AN EXTERNAL PART OF A PRISONER-OF-WAR CAMP

Luick, Lorenz (University of Hamburg) - Eckert, Lukas (University of Hamburg) - Ehresmann, Andreas (Sandbostel Camp Memorial) - Hesse, Stefan (Office for Archaeology of the District of Rotenburg (Wümme)) - Schumann, Robert (University of Hamburg)

Part of the Stalag X B Sandbostel camp complex in northern Germany was the so-called Sonderlager (special camp). This Sonderlager, approx. 2 km away from the main camp, was part of the camp's internal disciplinary system, in which prisoners who had violated the camp by-laws were transferred to more severe confinement and hard labour in the bog. Towards the end of the war, the Sonderlager also served as a provisional typhus lazarette. In contrast to the history of the main camp, which is being researched both historically and archaeologically and is firmly anchored in regional commemoration work through a memorial site, the Sonderlager has largely been forgotten. Only a former inmate testimonies and a sparse collection of archival documents attest to the existence of the Sonderlager, the exact location of which was no longer known. In recent years, the Sonderlager has become the focus of archaeological research. In addition to the exact localization and reconstruction of the structure of the Sonderlager using geophysical methods, a metal-detector-survey and a small excavation campaign were carried out. The latter in particular yielded a great deal of evidence from the last phase of operation of the camp. It was also possible to prove that it was burnt down after liberation by the British army. The archaeological research has thus succeeded in gaining new insights into the history of the special camp as well as contributing to heritage management and, building on the results, to the memorial's commemorative work outside the fences of the main camp of Stalag X B Sandbostel.

653 INFECTIOUS DISEASE AND HYGIENE IN THE NEOLITHIC AND BRONZE AGE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Civilyte, Agne (Lithuanian institute of history) - Spyrou, Maria (Institute for Archaeological Sciences, University of Tübingen; Max Planck Institute for Evolutionary Anthropology, Leipzig)

Session format: Regular session

Understanding the interlinked histories of humans and infectious disease promises a more comprehensive view of our past. The investigation of infectious diseases in archaeological contexts has gained increasing interest given the numerous open questions with regard to the aetiological agents of past pandemics and the potential influence of human subsistence and sociocultural changes (such as the Neolithic and Bronze Age transitions) on population health. Throughout human history, a number of epidemics and pandemics have been historically recorded or are hypothesized to have occurred, however, a deep understanding of the influence of infectious disease on human societies prior to the availability of textual records is still lacking. In this session, we aim to use a multi-faceted approach that enhances our overall understanding of pathogen presence, diversity and evolution, as well as human responses to infectious disease during prehistory, with special focus on the Neolithic and Bronze Age periods. To create a platform for discussing the interactions between humans and pathogens from a biosocial perspective, we welcome contributions from researchers specialized in paleopathology, bioarcheology, history, and genomics. Specifically, this session will focus on:

1. The identification of infectious diseases in the Neolithic and Bronze Age using a variety of methodological approaches;
2. The determination of drivers of disease emergence and transmission, such as living circumstances, dietary habits, food preparation methods, waste disposal practices, etc.;
3. The exploration of evidence of hygienic treatment and prevention of disease in prehistoric communities;
4. The impact of infectious diseases on the demographic and social development of Neolithic and Bronze Age societies; and
5. The characterization of long-term evolutionary history of pathogens and their association to modern-day diversity, especially for infectious diseases that continue to pose a threat to public health today.

Submission deadline 8th of February 2024.

ABSTRACTS

1 INFECTIOUS DISEASES AND THE SKELETON: NEW APPROACHES TO ANALYSING BONE PHENOTYPES ON THE EXAMPLE OF NEOLITHIC POPULATIONS

Fuchs, Katharina (Kiel University, Germany) - Petiti, Emmanuele (Kiel University, Germany) - Görner, Irina (Hessen Kassel Heritage)

In studying human responses to infectious diseases in the past, paleopathologists are confronted with low specificity of bone symptoms regarding their causative agents and complex, often not fully understood pathophysiology of non-specific skeletal phenotypes.

In this presentation we show how a new data recording protocol for porous cranial lesions enables to (i) analyse the distribution and spectrum of stress- and inflammation-induced phenotypes, (ii) examine their complex pathophysiological pathways, (iii) test for co-occurrences, and (iv) interpret the results within an etiological model by considering the interplay of individual, social, and environmental factors. We focus on three Neolithic populations from Northern and Middle Germany that are of different skeletal preservation and with socioeconomic backgrounds (Sorsum, Ostorf-Tannenwerder, Altendorf; 3200-2900 BCE).

Our results on the disease profiles, which are based on the examination of the respiratory system and the ectocranial and endocranial regions, show high variation both within and between populations. This indicates differences in human responses to inflammatory and physiological stressors, such as pathogens, but also nutrition, hygiene, and housing conditions. For instance, the farmer population of Sorsum more often survived a high inflammatory burden, which may as well be interpreted as a sign of resilience.

We hereby advocate a more standardised, in-depth and interdisciplinary investigation of pathological phenotypes and promote the current discourse on the critical diagnosis and evaluation of established palaeopathological markers (e.g. cribra orbitalia as a symptom of anemia). Taken together, this will ultimately provide a more solid foundation, including for interdisciplinary approaches such as ancient DNA research (pathogens, immune genes), to better understand the interplay of infectious diseases and human evolution in prehistory and beyond.

2 FREQUENCY OF INFECTIOUS AND METABOLIC DISEASES ON OSTEO-DENTAL REMAINS IN NEOLITHIC, COPPER AGE AND BRONZE AGE CONTEXTS IN NORTHERN ITALY

Mateyka, Taylor (University of Bologna) - Capecchi, Elisabetta (University of Bologna) - Cecconi, Viola (Servizio di Bioarcheologia, Museo delle Civiltà, Roma) - Cavazzuti, Claudio (University of Bologna)

The study of infectious and metabolic diseases in ancient populations offers a unique window into the health challenges faced by past civilizations and provides insights into the epidemiological dynamics of human communities over time. The aim of this presentation is to discuss the occurrence and frequency of infectious and metabolic diseases observed in osteological and dental remains spanning various contexts within the Po Plain area, encompassing the period from the Neolithic to the Bronze Age. During the Middle Neolithic, characterized in this region by the Square Mouth Pottery culture, instances of pathological conditions have been identified at archaeological sites such as Parma-Via Guidorossi and Arene Candide cave, revealing individuals affected by tuberculosis among other health indicators including hypoplasia, dental calculus, cribra orbitalia and porotic hyperostosis. At the Neolithic-Copper Age transition, we observe a rising prevalence of dental cavities and calculus among the population, but the lower number of funerary contexts has offered up fewer instances of pathologies. The occurrence of tuberculosis, meningitis, and non-specific lung infections becomes more evident during the Bronze Age, particularly at sites like Olmo di Nogara; additionally, dental conditions persist in the skeletal record. However, the Bronze Age introduces a challenge in the form of cremated remains, complicating the paleopathological analysis due to the removal of pathological traces and lesions through the act of incineration, as seen at Casinalbo and in other similar contexts of the Terramare culture. Nevertheless, leveraging demographic approaches enables us to reconstruct the mortality profiles across age classes and identify episodes of selective mortality potentially related to epidemic episodes. Through the analysis of archaeological and osteological evidence we will establish the prevalence and impact of infectious diseases on these ancient populations over a span of several millennia, as well as reconstruct the health profiles of ancient individuals.

3 OCCURRENCE OF HUMAN SKELETAL REMAINS ON LATE BRONZE AGE SETTLEMENTS FROM SW POLAND

Haluszko, Agata (Institute of Archaeology, Maria Curie-Skłodowska University, Lublin, Poland; Archeolodzy.org Foundation, Świdnica, Poland) - Kanz, Fabian (Center for Forensic Medicine, Medical University of Vienna, Vienna, Austria) - Tangl, Stefan (Karl Donath Laboratory for Hard Tissue and Biomaterial Research, University Clinic of Dentistry, Medical University of Vienna, Vienna, Austria; Austrian Cluster for Tissue Regeneration, Vienna, Austria) - Dobsak, Toni (Karl Donath Laboratory for Hard Tissue and Biomaterial Research, University Clinic of Dentistry, Medical University of Vienna, Vienna, Austria; Austrian Cluster for Tissue Regeneration, Vienna, Austria) - Neumann, Gunnar (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Haak, Wolfgang (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Zółkowski, Grzegorz (Faculty of Mechanical Engineering, Wrocław University of Science and Technology, Wrocław, Poland) - Guziński, Maciej (Department of General and Interventional Radiology and Neuroradiology, Wrocław Medical University, Wrocław, Poland)

The funeral rite of the Lusatian Urnfield culture (LUC) in southwestern Poland was dominated by cremation. Inhumed remains are exceptional even in cemeteries and are mainly found in areas occupied by populations associated with the Upper Silesian-Lesser Poland group of the LUC. Interestingly enough, there are contemporaneous though rare occurrences of human remains within settlements. From this perspective, it seems intriguing to examine these contexts and explore the reasons for placing human corpses or their parts in them.

Finds of human remains in settlements are usually interpreted as the result of conflicts, violence and warfare, manifestations of exceptionalism/exclusion, cults and sacrifices or the disposal of corpses. The interpretation depends on the archaeological, taphonomic and palaeopathological data, but is impeded by the fact that most diseases do not leave any specific lesions on the bones, especially short-term lethal infectious diseases.

Here, we present preliminary research data on human skeletal remains from different contexts at four Late Bronze Age settlements. At one site, the disarticulated remains of approximately nine individuals were found in a ditch surrounding the settlement. At another, bones of two individuals mixed with animal remains were found in a garbage pit. At the remaining two sites, isolated skulls of single individuals were discovered in separate features. Anthropological and tomographic analyzes were carried out as part of the MOUND project (no. 2023/48/C/HS3/00020, financed by the National Science Centre, Poland). To identify bioerosion, eight bone and teeth samples were subjected to detailed histological and taphonomic examination. The aims of these analyses were to exclude possible secondary deposition of single bones and skeletons, to find traces of deposition in a humid environment favouring the growth of bacteria and fungi, as well as to capture other taphonomic processes.

4 A VIRAL PERSPECTIVE ON HUMAN PREHISTORY: THE NEOLITHIZATION AND LATE BRONZE AGE COLLAPSE OF HEPATITIS B VIRUS

Kocher, Arthur (Max Planck Institute for Evolutionary Anthropology; Max Planck Institute of Geoanthropology) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology) - Kühnert, Denise (Max Planck Institute of Geoanthropology; Robert Koch Institute)

Hepatitis B virus (HBV) is today a major threat to global health, causing hundreds of millions of infections around the world. This virus doesn't leave specific marks on skeletal remains, but archaeogenetic evidence has shown that it has been infecting humans for more than 10,000 years and that its current geographical distribution and genetic diversity have been shaped by human migrations and population dynamics across that period. Reciprocally, the evolutionary history of HBV, which is mostly transmitted through mother-to-child and sexual transmission, can provide insights into the (pre)history of its human hosts. I will present the results of a published study in which we reconstructed and analysed large numbers of ancient HBV genomes. Our results unveiled patterns of past viral diversity reflecting known human migrations and demographic events such as those which have been concurrent to the Neolithization process in Europe, but also unexpected findings such as the almost complete collapse of HBV diversity around the end of the 2nd millennium BCE. The latter suggests continental-wide transformation of epidemiological dynamics during that time, for reasons that remain to be explained.

5 ARCHAEOGENETIC STUDIES OF TWO ANCIENT BRUCELLOSIS CASES

Neumann, Gunnar (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Spyrou, Maria (Eberhard Karls Universität Tübingen; Max Planck Institute for Evolutionary Anthropology, Leipzig) - Keller, Marcel (University of Basel; University of Tartu) - Klochko, Viktor (National University of Kyiv-Mohyla Academy) - Koško, Aleksander (Adam Mickiewicz University Poznań) - Šlaus, Mario (Croatian Academy of Sciences and Art, Zagreb) - Włodarczak, Piotr (Instytut Archeologii i Ethnologii PAN, Krakow) - Żurkiewicz, Danuta (Adam Mickiewicz University Poznań) - Haak, Wolfgang (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig)

Brucellosis stands out as one of the most prevalent food-borne zoonotic diseases worldwide, caused by different *Brucella* species. These bacteria exhibit moderate host specificity and are capable of infecting an array of both wild and domesticated animals such as sheep, goat, and cattle. Occasionally, transmission to humans occurs via infected animal products, inhalation of aerosols, or direct contact with the infected animals themselves. In archaeological contexts, diagnosing brucellosis has often relied on specific lesions on bones, however genetic evidence from the past is still scarce.

Here, we present two ancient brucellosis cases uncovered through archaeogenetic analyses in two rather uncommon specimens. Firstly, we identified the cattle-specific *Brucella abortus* as the causative agent for the formation of a calcified nodule which was found in a kurgan burial at the site of Prydnistrynske in modern-day Ukraine. The individual of this burial is associated with the Early Bronze Age Yamnaya culture and was radiocarbon-dated to c. 4,800 yBP. Further, we detected traces of DNA of the goat and sheep-specific *B. melitensis* within the ossified pleura of a medieval burial from Bosnia and Herzegovina.

Benefiting from the excellent preservation of bacterial DNA and minimal environmental contamination in these specimens, we successfully reconstructed high coverage genomes. Based on its phylogenetic placement, the identified ancient *B. abortus* strain groups with one of the earliest diverging *B. abortus* lineages currently circulating. Moreover, employing Bayesian molecular dating, we estimated the divergence time of *B. abortus* from the closely related species of *B. melitensis* to approximately 10,500 yBP, which coincides with the onset of animal domestication in the Fertile Crescent. While shedding light on the evolutionary history of *B. abortus* and *B. melitensis*, this study also emphasizes the potential of calcified tissues as invaluable archaeological sources for investigating ancient pathogens.

6 THE ANTISEPTIC AND ANTIPHLOGISTIC PROPERTIES OF MEDICINAL PLANTS USED SINCE PREHISTORY

Kramer, Axel (Institute for Hygiene and Environment Medicine, University of Greifswald) - Civilyte, Agne (Lithuanian institute of history)

The World Health Organization resolved in 1989 that traditional herbal medicine is of great importance for the health of individuals and communities. They developed guidelines for the evaluation of medicinal plants in 1991.

During archaeological excavation seeds and pollen of medicinal plants are regularly recovered. In addition historical archaeology and folklore can be used to develop methodologies as their application in prehistoric archaeology on the medicinal.

The constant modern search for more effective and/or additional botanical antibiotics in the wide field of geographical biodiversity may make the field incredibly technical and also obscure a slower prehistoric development of ever more effective therapies.

From a medical perspective the most important aspects of practice with respect to public health are focus on community hygiene, the following issues are of particular interest: Disposal of personal and common waste water and garbage, ventilation within human dwellings, practices of personal as well as oral and dental hygiene. To achieve some of these infrastructure solutions people have been using the healing effects of plants and their preparations for thousands of years in various cultures and for a variety of reasons. This is of current importance, because plants used in antiquity can be the starting point for targeted research today.

From the wealth of plants used in prehistory, their use in modern medicine and health care will be analyzed with the special focus on lavender distillate as an example.

654 CENTERING THE OBJECT: BETWEEN PRODUCTION AND CONSUMPTION IN CERAMIC STUDIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Knappett, Carl (University of Toronto) - Paralovo, Elena (Charles University, Prague) - Rosell Garrido, Patricia (Independent researcher; University of Alicante) - Tsuvaltsidis, Aude (Sorbonne Université; Charles University, Prague) - Langohr, Charlotte (F.R.S.-FNRS/UCLouvain)

Session format: Regular session

Ceramic studies have seen very significant progress on two fronts: in analyses of production, on the one hand, with sophisticated archaeometric studies of fabrics and technology; and on the other, in use and consumption, with detailed attention to context and use traces. However, it is unclear where these advances leave the topic of style. It is not as if we can dispense with style; as a method, stylistic analysis can hardly be avoided. We prefer here to position it more productively, given the key work it does in foregrounding the artefact itself as interface between producer and consumer. It obliges us to think not only of how the producer sought to communicate an intended use to a consumer through design, but also of how the consumer interpreted design through use. Our view of style is one that takes account of vessel morphology, surface features and functional affordances in centering the object as a mediator between producers and users. In this way we seek to build a ceramic methodology, adaptable to various traditions, that can holistically incorporate insights concerning both production and consumption practices. Furthermore, by viewing these practices as substantially economic in nature, we also aim to shed light on both structural and agentive dimensions of the ancient craft economy. Specifically, we are interested in interpretations that reckon with the diversity of economic action, particularly the sexual division of labour and the role of marginalised groups in workshop production and household economy. We invite submissions from various scholarly traditions in later prehistory (e.g. Bronze and Iron Ages) and from across the Mediterranean, that present methods for ceramic analysis that expressly seek to balance considerations on both production and consumption practices through object-centred approaches. We particularly welcome papers that aim to articulate perspectives from archaeology, art history and anthropology.

ABSTRACTS

1 STAYING IN-BETWEEN: CERAMIC PERSPECTIVES ON STYLE BASED ON THE STUDY OF MINOAN POTTERY

Mathioudaki, Iro (Associate Researcher Aegis Research Group)

Pottery is one of the most reliable categories of prehistoric material culture. It is both a result of and an active component in the formation of social and cultural relations. It is often seen in duality, as part of the market trend and commodity networks of its producers, or as part of the symbolic and social actions of its consumers. While production is closely related to the economic perspective, and consumption to the social perspective, they are complementary. Style has a profound impact on both. Stylistic standardisation and variability should be studied systematically by quantifying the stylistic attributes of a substantial number of samples. Standards should be used to assess variability and similarity in order to investigate the meaning of the tendency to conform to certain styles. By assessing the quantitative, functional and stylistic parameters of pottery, we gain important clues to the social and cultural dynamics of ceramics. In this paper we use specific case studies from Knossos and Sissi to build on the social perspective of ceramics, positioning them as mediators between users and producers. The methodology involves a re-evaluation of Neopalatial pottery styles towards a patterning of data on typologies with emphasis on intended function, performance characteristics of vessels, proposed object hierarchies and the potentially emblematic character of specific vessels.

2 POSITIONING POTTERY BETWEEN PRODUCER AND CONSUMER AT THE LATE BRONZE AGE WORKSHOP OF PETSAS HOUSE, MYCENAE, GREECE

Shelton, Kim (University of California Berkeley) - Kvapil, Lynne (Butler University)

This paper considers the dynamic relationships between consumers served by the Petsas House workshop and the occupants of the house who rubbed elbows with powerful elites but also ran a pottery workshop that provided implements supporting the needs of varying groups of consumers. Petsas House in the 14th c BCE was positioned between the emergent state that would become the palace at Mycenae and the residents of the surrounding village. Upstairs the inhabitants enjoyed the trappings of the cosmopolitan elites; downstairs was the busy ceramic workshop. By the 13th c, the house had been destroyed in an earthquake and conflagration, and it was never rebuilt.

From the masses of broken pots found in the ruins of the house, first excavated in the early 1950s with renewed excavations beginning in 2000, it appears that the Petsas House workshop produced finely finished vessels adorned with intricate and innovative designs alongside roughly finished undecorated table wares. With an approach that combines

cognitive archaeology and advanced statistical methods, we examine the perception of morphology by contrasting the process of vessel construction with the pot's outward appearance. By deconstructing the building process, we can see pots as potters might have – the sum of related and component parts formed by various hands and completed with a series of technical gestures. This view stands in opposition to the consumer's understanding of the vessel as an object that, in its completed state, was imbued with meaning related to intended or desired use. The pots themselves reveal myriad choices on the part of the potters (highly skilled potters, apprentices, unskilled laborers) who also understood to varying degrees the wants and needs of consumers. The result moves us closer to understanding the operations of the Petsas House workshop within the complex socio-economic world of Late Bronze Age Greece.

3 CERAMIC MEDIA, CHANGE AND ACTIVITY (RE)ARRANGEMENTS: INVESTIGATING SERVING AND CONSUMPTION VESSELS FROM EARLY HELLADIC SETTLEMENTS

Kapsali, Polina (University of Cambridge)

Studies examining changes in ceramic morphology frequently focus on questions about the agency of the producers and users of the respective ceramics. Such questions direct research to the attribution of morphological transformations to shifts in crafting techniques and/or to shifting networks of exchange. This paper, adopting a relational approach, proposes instead that the examination of morphological changes in ceramics entails an exploration of the rearrangement(s) such changes helped to support in specific fields of activity (involving shifts in forms of interpersonal attention, sensorimotor routines and cross-media contiguities). This topic is here explored through ceramics linked with the serving and consumption of food and drinks from settlements in southern and central mainland Greece from the second half of the third millennium BCE. Changes in certain morphological features of these ceramics, such as around the mouth and grips, are explored alongside changes that concern the increasing popularity of ceramic patterned surfaces. It is proposed that ceramics should be primarily examined as media embedded in fields of activity, with reference to which production should also be understood.

4 A VIEW FROM THE TALL GRASS: THE PLACE OF REED DECORATION IN THE LM IA CERAMIC REPERTOIRE IN CRETE

Oddo, Emilia (Tulane University)

At the intersection between production and consumption, ceramic style is one of the most important tools to investigate ancient societies. Stylistic changes or innovations are often linked to broad societal (and technological) developments and have become chronological landmarks. Determining what prompts these changes and the mechanisms that originate them (whether/how they are triggered by the producer or influenced by the consumer) remains challenging. Stylistic analysis can contribute expanding our understanding of the role style played in the community that consumed it.

With the aim to ultimately explore these topics, this paper proposes an analysis of the Minoan reed style, a staple of Neopalatial, and in particular Late Minoan (LM) IA, ceramic production. Considered a chronological marker, reed decorated sherds are routinely employed to distinguish LM IA from earlier assemblages. At a closer look, however, reed decoration appears to have been more than a shift in fashion, in turn affording us the opportunity to delve into the meaning of style itself. Two main factors set this style apart from other Neopalatial decorative styles. First, at the production level, the reed style seems to be following specific decorative rules: a selected shape repertoire, and potentially a fabric preference. Second, from the consumption perspective, reed-decorated pots are not geographically broadly circulated, being chiefly located in central Crete, particularly in the north-central region. Within this region, moreover, contextual data may indicate ritual associations for vessels with reed decoration.

Whether ritual or else, reed decoration represents a specific stylistic choice with a relatively limited chronological and functional span. What regulated this type of production and what does it teach us about style and society?

5 LATE CYPRIOT 'BATHTUBS': A CASE STUDY FROM ERIMI-PITHARKA

Recht, Laerke (University of Graz) - Yamasaki, Mari (PCMA, University of Warsaw) - Clark, Brigid (University of Haifa) - Zeman-Wisniewska, Katarzyna (Cardinal Stefan Wyszyński University, Warsaw)

So-called 'bathtubs', deep oval basins with almost vertical walls and typically with a hole near the base, termed so based on their resemblance to the modern shape, are commonly found in Late Cypriot settlement, including at the site of Erimi-Pitharka in the Kouris Valley in south-central Cyprus. In Cyprus, these objects have been found at many significant sites dating between the 13th and 12th centuries BCE, such as Enkomi, Hala Sultan Tekke, Pyla-Kokkinokremos, Maa-Palaeokastro, Palaepaphos, Kalavassos-Ayios Dhimitrios, Alassa and Erimi-Pitharka. Their use is still not well-understood: more recent interpretations suggest a purpose related to industrial processing, specifically textiles, cooking facilities, or an unspecified cultic function. Here, we make a first attempt at analysing their design (also in comparison with the similar vessels from elsewhere in the Eastern Mediterranean, sometimes known as larnakes) in order to understand function and their impact on the organisation of manufacture. This paper uses examples of these

'bathtubs' from the Late Bronze Age (LC IIC - LC IIIA, c. 1300-1150 BCE) site of Erimi-Pitharka as a starting point. Erimi-Pitharka is a regional settlement with a focus on agricultural production and storage, and with a ceramic record that is dominated by coarse and plain ware vessels. Among these are several examples of bathtubs and pithoi embedded into the bedrock or as part of permanent and semi-permanent installations. The aim is to present a preliminary assessment of the typology, chronology, distribution and function of Late Cypriot 'bathtubs', investigating, on the one hand, their role in production and manufacture, including their relationship to other large vessels such as basins and pithoi; on the other hand, exploring the possible symbolic connection to water and water management within the ritual-practical activities at Erimi-Pitharka and other Late Cypriot settlements.

6 CERAMIC STYLISTIC DIVERSITY IN EARLY GREECE: EXCLUSIVE STYLE(S) AND RITUAL CONTAINERS

Vlachou, Vicky (Aristotle University of Thessaloniki)

Pottery was meant for everyday use, and thus related to all spheres of human activity: domestic, ritual and cultic, funerary. Despite the wide range of shapes, the individual vessel forms remained relatively constant overtime. Potters and painters adapted their products for specific and practical uses that were maintained over time, although continuously evolving to reach the optimum practical shape as perceived by their users. Technical achievements and innovations distinguish regional pottery styles; exclusive pots related to conspicuous consumption, and/or everyday pots serving ritual activities may vary considerably across the EIA Aegean thus revealing complementary and contrasting tastes of the regional clientele.

In this short paper stylistic diversity is approached through the lens of regional pottery production in EIA. Pottery assemblages from selected areas shall serve this approach: large skyphoid kraters of the late 8th century BC from Oropos and Euboea, relief pithoi from the Cyclades of the early 7th century BC and dinner sets with figure decoration of the late 8th/early 7th centuries BC from Laconia. All three cases represent concurrent and specialised pottery productions, appreciated by specific communities, yet demonstrating small impact on other concurrent regional pottery productions. Their exclusive or not character, the technological innovations they introduced and their distinctive style seem to have aimed to their exclusivity, on the part of both producers and consumers in each area.

7 MASS-PRODUCED OR MASS-APPEAL? CORINTHIAN POTTERY PRODUCTION IN THE ARCHAIC PERIOD

Bertram, Haley (University of Cincinnati)

Corinth's aptitude for ceramic production and export in the Archaic period is well-known, but the factors which enabled its long-term success are not well-understood. The standing stylistic narrative hails an artistic peak in the 7th century, followed by a decline toward mass production in the 6th century. This framework overlooks the fact that most ceramics Corinth produced and exported throughout the Archaic period were not standout pieces, but vessels carrying variations on common motifs and decorative schema.

This paper undertakes a close study of Corinthian vessels exported overseas to assess the range of factors that guided Corinth's successful ceramic production and exchange. I compare vessels recovered from the Corinthian colony of Syracuse with those recovered from the colony of Marseille to investigate how different colonial consumers impacted the development of Corinthian pottery: I assess the vessel forms and decorations favored in each colony, and consider how these align with the changes Corinth made in production over time. I argue that the success of the Corinthian ceramic industry was thanks to the wide range of shapes, scales, and generic decoration it produced, which allowed it to be easily and selectively adapted into the cultural framework of any colonial dynamic. This broad appeal was a cornerstone of the Corinthian industry from the 7th century onward, and spurred an array of Corinthianizing wares from western Greek, Etruscan, and local producers, feeding into its broad market and appeal.

By shifting the analytical focus from style to multiple factors of consumption and production, this study demonstrates that we can gain new insight into the various ways potters – Corinthian and others – developed production in response to market demand, and better understand how the broadening contact and exchange in the Archaic period impacted the choices of potters across time and place.

8 FROM RAW CLAY, BACK TO EARTH: TECHNIQUES, FUNCTIONS AND CONSUMPTIONS OF EARLY IRON AGE POTTERY AT INCORONATA

Willborn, Chantal (Rennes 2 University) - Malingre, Léa (Rennes 2 University) - Mandić, Josipa (Aix-Marseille University, Centre Camille Jullian; UMR 6566 CReAAH)

This paper will focus on the locally produced and imported ceramics of the 8th and 7th centuries BC, found at the Oenotrian site of Incoronata (Basilicata, Southern Italy), that welcomed people from the Aegean at the beginning of the 7th century BC. This encounter has left us important archaeological evidence of greco-indigenous interplay, and

among all, the one that concerns the craft area for ceramic productions shared by artisans of both communities. The mixed community phase of the site thus becomes an ideal laboratory for the comprehension of the consumption of both imported and locally crafted ceramics: the indigenous (coarse, impasto and matt-painted ware) and Greek type pottery (gray ware, subgeometric and painted fine ware, coarse ware, and transport vessels) that finds its inspiration among the imported ones.

The paper aims to "center" these vessels as interfaces between different groups (artisans and customers) and communities (foreign and indigenous), as well as as objects that embody a variety of information about these human interactions. By illustrating precise Greek and indigenous pottery case studies from Incoronata and by adopting a cross-cutting technological, morphological, and contextual analysis approach, this paper intends:

(1) to present different phases of ceramic production (from the extraction of clay to the firing of vases) in order to enhance the understanding of craft and technical know-how transmission phenomena in the Iron Age Mediterranean and

(2) to discuss the exploitability of these potteries' properties (shapes, styles, raw material) through the transition from their original purpose (craftsmen's design) to their final destination (customers' perception and consumption), and thus to stress other than the primary functions of the vessels, such as e.g. building material or ceremonial objects, within the greco-indigenous intercommunity ritual sphere at the dawn of the Greek colonization in this region.

9 REVISITING THE POLYCHROME PAINTED POTTERY OF EARLY BRONZE AGE MESOPOTAMIA

Lewis, Michael (Universidade de Coimbra) - Del Bravo, Francesco (Freie Universität Berlin)

The 3rd millennium BCE in north-central Mesopotamia is characterized by the appearance of regionalized, heavily decorated pottery vessels. Polychrome Painted Pottery, often referred to as Scarlet Ware after its distinctive plum-red paint is one of the most characteristic of these regionalized traditions.

Excavated assemblages of Scarlet Ware are largely restricted to central Iraq and western Iran and are typically recovered from specific archaeological settings; funerary contexts and feasting deposits. Despite prior investigation being largely style-orientated and focused on the painted motifs of these vessels, limited archaeometric investigations have demonstrated highly regionalized clay recipes, signifying local production. Indeed, whilst the painted decoration of these vessels follows a specific set of overarching rules, there appears a wide degree of regional variation in the outcome of the designs, indicative of highly individualized choices by the potters.

This presentation will revisit data from Mesopotamian excavations to provide an overview of the Scarlet Ware and highlight the assemblage from ongoing excavations at Kani Shaie, Iraqi-Kurdistan. Here, Scarlet Ware recovered from several contexts include a funerary deposit, as well as a unique feasting deposit enables reconsideration of the regional social milieu.

Our aim is to fully integrate discussion of Scarlet Ware. We will explore stylistic aspects of the vessels, alongside the chaîne opératoire. We will also investigate ideas of household versus specialized production, alongside consumption and depositional practices of these vessels and integrate the findings with contextual, and socio-communal practices. We propose that these vessels allow to reconstruct material culture's role in countering, as much as adapting to shifting social balances during a pivotal period of Mesopotamian cultural realignment. Through this, we believe we will find ourselves at that "interface between style and social structure" (to paraphrase Goody), where material culture conveys, reassigns and, at times, restores community's roles and balances.

10 MATERIAL SEMIOTICS AND FEMALE FIGURINES: CRAFTING POLITICAL ECONOMIES IN THE SOUTHERN LEVANT

Hunziker-Rodewald, Regine (University of Strasbourg) - Aioanei, Andrei (University of Strasbourg)

In the 9th and 8th centuries BCE, the Jordan Valley witnessed the production of a specific group of female clay figurines, embodying the confluence of socio-political and craft economies. Drawing from archaeological findings across sites such as Amman, Tall as-Sa'idiyyah, and Tel Rehov, our paper focuses on how these figurines reflect societal evolution and intricate settlement dynamics. Through a detailed analysis of their morphology, applied crafting techniques, and archaeological context, we uncover their embeddedness in the socio-economic and political tapestries of the era. We argue that their design and dissemination represent deliberate actions by the ancient craft economy to underscore and perpetuate prevalent social and gendered norms. The figurines under review serve as vital intermediaries among economic actors, shaping the political and ideological aspirations concerning collapse and survival. Our research underscores the importance of the figurines, positioning them as critical links between the material and immaterial aspects of socio-economic interactions.

657 TEACHING AND LEARNING ARCHAEOLOGY WITH DIGITAL TOOLS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Waagen, Jitte (University of Amsterdam) - Masriera Esquerra, Clara (Universitat Autònoma de Barcelona) - Feuser, Stefan (University of Bonn) - Wollentz, Gustav (Nordic Centre of Heritage Learning and Creativity AB) - Mickleburgh, Hayley (University of Amsterdam)

Session format: Regular session

In this session we focus on archaeology, education (from pre-school to universities) and digital methods for teaching. As the past is an abstract concept, teaching and learning about the past can be challenging. Various perspectives on the past, as opposed to presenting it as straightforward reconstruction as a result of a set of facts, events, characters and dates, must be stimulated by providing tools that cater for critical evaluation. Such tools should allow for inquiry, problem solving and debating enigmas considering didactic principles, such as that of the 'hands on, minds on, hearts on' perspective. This requires activating methodologies for teaching and learning, for which digital technologies such as Virtual Reality (VR) are often suitable.

Local initiatives on digital methods used for research and teaching in higher education have emerged in several European locations, incorporating cutting-edge 3D and VR technologies. Despite this, there has been a lack of cohesion and cross-linking of knowledge and experiences between these initiatives, meaning that synergistic opportunities are not explored, and local initiatives are unable to make a greater impact.

In this session, we would like to invite papers on theoretical, technical and practical initiatives developed around the idea of teaching, learning and researching the past using digital tools (i.e. VR), and of exploring the relationship between digital/hybrid and analogue pedagogy in archaeological education.

ABSTRACTS

1 EVALUATING VIRTUAL REALITY AS A LEARNING ENVIRONMENT

Waagen, Jitte (University of Amsterdam)

Virtual Reality as a learning environment has seen various experiments in the field of archaeological education. Whereas the advantage of allowing access to remote sites, reconstructed worlds, or inaccessible places appears obvious, there are also prospections of increased learning outcomes. These are then expected from an increased spatial awareness, the stimulation of an active learning attitude, a more comprehensive structuring of learning materials, and so on and so forth. Although in general the often qualitative and small-scale evaluations are on average positive, more systematic evaluations are rare. In the context of the Virtual Past Places project at the University of Amsterdam, executed by the 4D Research Lab, a systematic evaluation programme has been developed and executed for tailor-made Virtual Reality environments for different courses in Humanities disciplines. In total, six environments were created for teaching in Archaeology, Ancient Studies and Art History, around which questionnaires, tests with control groups and focus group discussions have been organized. The aim has been to generate a solid empirical basis for such claims, and to advance good practice for embedding Virtual Reality as learning environments in Humanities education, and Archeology specifically. In this presentation, the tentative outcomes of the Virtual Past Places project will be shared and discussed.

2 UNDERSTANDING ANCIENT WORLDS - THE USE OF VIRTUAL REALITY IN UNIVERSITY TEACHING

Lang, Matthias (BCDH, University of Bonn) - Kluge, Philippe (BCDH, University of Bonn) - Feist, Sabine (Department for Christian Archaeology, University of Bonn) - Feuser, Stefan (Department for Classical Archaeology, University of Bonn)

Excursions to museums and archaeological sites have always been an indispensable didactic tool in archaeology. They allow students to see and understand spaces and objects in their materiality, actual shape and size. Although photographs, plans and maps allow this information to be recorded, they only ever represent a two-dimensional derivative of the three-dimensional shape of the objects or a site. For beginners in particular, these abstractions of material entities are often very difficult to understand, as they presuppose a basic experience of how the material world relates to the two-dimensional derivatives. The opportunity to take part in excursions during your studies is of course usually limited to a few places and students with particularly low financial resources are sometimes at a massive disadvantage compared to more privileged fellow students.

To address this problem, the BCDH and the archaeology departments at the university of Bonn have developed a VR learning platform, which makes archaeological teaching content available in virtual and immersive environments. The virtual twins of the locations offer unimagined possibilities for experimenting and interacting with the spaces

and objects. In addition, current research projects can be anchored in teaching much more easily in this way, as the digital 3D documentation, which is often generic today, can be transferred to this virtual learning environment with comparatively little effort.

So far, five different learning scenarios have been implemented and evaluated in the context of classes in various archaeological sub-disciplines. In addition to the technical background, our contribution will discuss our experiences to date with the use of VR learning scenarios within the. We would also like to encourage and discuss the exchange of existing learning environments and 3D models for teaching.

3 SERIOUS GAMES AND CULTURAL HERITAGE. VIRTUAL REALITY (VR) AND HEAD MOUNTED DISPLAYS (HMD) IN THE MUSEUMISATION OF ROCA DEL BOUS

Roda Gilabert, Xavier (Departament de Prehistòria. Universitat Autònoma de Barcelona; CASEs - Culture, Archaeology, and Socio-Ecological Dynamics group. Departament d'Humanitats. Universitat Pompeu Fabra) - Martínez-Moreno, Jorge (Departament de Prehistòria. Universitat Autònoma de Barcelona) - González Marcén, Paloma (Departament de Prehistòria. Universitat Autònoma de Barcelona) - Mora Torcal, Rafael (Departament de Prehistòria. Universitat Autònoma de Barcelona)

The use of new audio-visual media such as Virtual Reality (VR) and Head Mounted Displays (HMD) is an opportunity to promote the transfer of knowledge about the historical and cultural landscape. The use of these technologies in the dissemination of content related to archaeological sites allows the generation of content suitable for a wide range of users, from researchers to students, and for both scientific and recreational tourism.

This presentation will give an overview of the "Roca dels Bous Inmers" project, a public-private collaboration between the Departament de Prehistòria of the Universitat Autònoma de Barcelona and the digital heritage company DIGIT Enginyeria de Sistemes Audiovisuals S.L. The project is funded by the Spanish Government's State Plan for Scientific, Technical and Innovation Research. This partnership guarantees the transversality of the project and aims to generate new models of integrated heritage management.

The aim is to develop a set of actions (challenges) based on the concept of serious games (hyper-realistic video games) for head-mounted displays. The proposal is based on archaeological data collected during 25 years of work at the Middle Palaeolithic site of Roca del Bous (south-eastern Pyrenees, Spain).

Its development is based on the design of contents that allow the activation of the educational, cultural and tourist proposal and the dissemination of the results of the research project. This proposal renews and extends the content of the current visit model, which has been active since 2010.

Its development will allow not only tangible products (virtual world to visit), but also intangible benefits, such as a stronger link between archaeological heritage and the construction of identities and cultural memories. Finally, it also aims to foster sustainable and inclusive models of cultural tourism and geotourism in rural areas.

4 DIG, STUDY-GAME, REPEAT. AN ARCHAEOLOGICAL SIMULATOR AS A TEACHING TOOL FOR THE DEVELOPMENT OF METHODOLOGICAL SKILLS

Venco, Veronica (University of Sassari) - Magnini, Luigi (Ca' Foscary University Venice) - Milanese, Marco (University of Sassari)

Since the 70s-80s, when archaeology began to look to technology as an aid to research, analysis, interpretation and conservation of archaeological heritage and sites, the theme and potential of virtual three-dimensionality has grown in interest within the scientific community. In recent decades, with the relentless rush of technological progress and the increasing need for remote working, digital has become an integral part of work and research methodologies. In this panorama, educational contexts such as schools (at all levels of education) and museum institutions, have evolved towards a new learning model through various approaches characterised by edutainment. This form of teaching is based on the intersection between education and entertainment also through the use of games (not only digital) and gamification or game-based learning techniques and models. With these considerations in mind, this contribution introduces the project for the development of a digital application capable of simulating an archaeological excavation in most of its characteristics, starting from the removal of layers and their archaeological documentation, to finish with the analysis of the finds. Conceived as a didactic tool for university courses of Methods and Techniques for Archaeological Excavation, the initial development involved the collection of three-dimensional data from two case studies: the first from an Iron Age structure from the Bostel di Rotzo (Vicenza, Italy) and the second from two Late Middle Ages burials from the site of Sant'Antioco di Bisarcio (Sassari, Italy). Through the Game Design Document, two application models were theoretically devised with the same graphic content, but addressed to two different audiences. The first, aimed at university students, envisages the implementation of game elements within it, enabling constant and gradual learning while maintaining a high level of competition with peers. The second is instead aimed at professionals, as an archaeological investigation tool, making the excavation activities virtually repeatable.

5 LOOK CLOSER: UNCOVERING THE AFFORDANCES OF 3D DATA IN LEARNING AND COMMUNICATION

Pantos, Alexis (Museum of Cultural History University of Oslo) - Sztal, Alexandra (Muzeum Narodowe w Lublinie) - Andreassen, Ingvild (Museum of Cultural History University of Oslo) - van Riel, Sjoerd (Museum of Cultural History University of Oslo) - Cyran, Marta (Muzeum Narodowe w Lublinie) - Kimball, Justin (Museum of Cultural History University of Oslo)

Heritage institutions of all sizes have been steadily growing their collection of 3D documentation of heritage objects. Increasingly these data are being made available to both researchers and the public through online repositories. However, as many organizations discovered when publishing their 2D image collections, availability does not necessarily equate to accessibility. While digital literacy, and familiarity with 3D data, is much more commonplace among current generations than ever before, the complexity of these data, range of modes of presentation and multitude of potential use can act as hinderance without additional levels of mediation.

The presentation will draw from recent experiences, including the Heritage Accessible project - an EEA funded partnership between at the Museum of Cultural History in Oslo Norway and the National Museum in Lublin, Poland, as well as the ongoing UI3D project at the Museum of Cultural History. It will argue that 3D data can be an effective means of broadening access of heritage data to communities with otherwise limited access to cultural resources, but that presentation and contextualization are key for ensuring effective learning outcomes and engagement. We will also argue that at their heart many of the challenges faced by the effective use of 3D data are familiar to conventional education and dissemination. We will describe our attempts to mediate some of the current technological barriers of the medium - such as variations in quality, limitations in technology and differences in legislation on the use of digital media in classrooms. We will provide examples of how we have attempted to frame 3D content as a resource that should be embedded within learning activities, focusing on a 'look closer' and creative or playful 'make it your own' ethos. Finally, we will reflect on the wider challenges working across communities with diverse learning needs and access to technology.

6 OLD IDEAS AND NEW WAYS TO RECREATE HISTORY. LITHUANIAN EDUCATION EXPERIENCES

Zilinskaite, Agne (Vilnius University; Association of Lithuanian Archaeology) - Puzariene, Kristina (Centre for Local Land Cognition and Research) - Briedis, Paulius (School of Robotics)

It is acknowledged that integrating archaeological knowledge into teaching programmes significantly improves educational outcomes, broadens students understanding of the past and increases appreciation of archaeological heritage. Therefore, this paper explores the possibilities of integrating archaeological topics into the general curricula of Lithuanian education with the aim to disclose how the virtual space can stimulate interest in heritage sites and how a non-standard way of looking often allows us to discover what narratives or traditional research methods cannot.

Even though the integration of Lithuania's archaeological heritage to education has been advancing over the past decades, there is still no deep tradition of using it for school education purposes. The application of new technologies is often hampered not only by the technological factor: (a) the age and motivation of the pupils (archaeology topics are taught up to grade 8, while IT - in later grades); (b) 30% of the topics freely chosen by the teacher who often limited competence in archaeology or technology; (c) traditional and passive methods are used to present archaeological heritage more often.

The case study of international Erasmus+ 2021-2023 project "ReCreate History through 3D, Game Design and Virtual Reality" will be presented. It aimed to raise the interest of upper grade students (age 15-19) in cultural heritage and develop their creativity by presenting archaeological objects through modern technologies. It was based on the integrative approach where exploring of archaeological heritage is combined with Storytelling and innovative technologies (creation of 3D models using photogrammetry and mini game development with Unreal Engine software). One of the main objectives were to develop and validate the methodological concept of recreating history through these technologies consisting of lesson materials and teacher's guidelines. An intellectual outfit results based on the project developers', teachers' and students' feedback will be analysed as well.

7 DIGGING FOR GAMING. A GAME BASED APPROACH TO THE DAILY LIFE OF ARCHEOLOGICAL RESEARCH

Caloi, Luca (University of Sassari) - Magnini, Luigi (Ca' Foscari University Venice) - Milanese, Marco (University of Sassari)

Gamification is a practice that has brought the attention of the public, the media, and the experts to a set of applications and services based on the principles of play. The world of gaming has always been interlaced with the real one, to the point of becoming an integral part of it. Education itself has made the concept of edutainment widespread and recognized for its ability to generate engagement.

Research and projects related to gamification have multiplied in recent years to promote the teaching of customs and traditions, to increase people's interest in cultural heritage, and to contribute to the creation of new ways of preservation and valorization.

Among this massive production of games and experience it is evident the absence of a product primarily focused on showing and telling the professional archaeological research's reality. For that reason, the purpose of this research project is to create a serious game that conveys the procedures of archaeological fieldwork and the promotion of cultural heritage to the public.

The aim is to create a product with high scientific connotations, which would allow the public to better understand the role of archaeologists in contemporary society. This purpose will be attended by a narrative mechanics approach, in which the users will experience the problematic aspects and the everyday challenges of the archaeological work directly through the gameplay loop. The game also intends to increase awareness of cultural heritage, enabling the users to discover and learn about artifacts and historical contexts that would not be otherwise accessible to the public through collectible information cards.

8 EYE-TRACKING IN ARCHAEOLOGICAL EDUCATION: HOW RESEARCH ON THE VISUAL PERCEPTION OF ARCHAEOLOGICAL REMAINS MAY ENHANCE ARCHAEOLOGICAL TEACHING

Michalik, Tomasz (University of Warsaw) - Zielińska, Dobrochna (University of Warsaw)

In their famous book "Inattention blindness", Arien Mack and Irvin Rock claimed that even if something is completely visible, we may fail to notice it if it is unexpected. However, "looking without seeing", a phenomenon described by Mack and Rock, is only the tip of the iceberg. Many other challenges may arise from the unconscious nature of most visual processes, resulting in limited control over analytical procedures.

Considering the complex nature of vision and its fundamental role in archaeological analyses, in our study we investigated how archaeological studies influence the perception of medieval Nubian paintings. During the study, we tasked students enrolled in the 'Iconography for Archaeologists' course conducted at the University of Warsaw, Poland with analysing four medieval Nubian paintings from the Faras Gallery at the National Museum in Warsaw, both before and after completing the course. Their performance was recorded with eye-tracker (a tool enabling the tracing of patterns of visual attention). We were interested in observing the actual changes in students' visual behaviour in contrast to the verbal knowledge measured usually during the exams.

The study showed an increase in visual sensitivity after the course, especially concerning the clothes, the attributes, and the context of figures depicted in paintings. Moreover, it provided us with insights into the and challenges in the analysis of paintings, serving as a starting point for discussions on enhancing future courses and developing ways to measure the practical effects of archaeological education.

9 OPEN INVESTIGA.EDU - ARCHAEOLOGY REACHES RURAL SCHOOLS WITH DIGITAL MEDIA

Masriera-Esquerria, Clara (Universitat Autònoma de Barcelona) - Bonet-Peláez, Anna (Universitat Autònoma de Barcelona) - González-Marcén, Paloma (Universitat Autònoma de Barcelona) - Pinto-Font, Laura (Universitat Autònoma de Barcelona)

Autonomous University of Barcelona (UAB) has a network of archaeological sites, parks and museums where develops research and teaching (Campus d'Arqueologia i Paleontologia de la UAB). Most of these sites are in rural areas studied by researchers and students from urban areas. To link the territory and the knowledge, we developed the innovative educational program called Investiga.edu that aims to bring the high educational archaeological research to pre-school, primary and secondary school of rural areas around or close archaeological sites.

After having implemented the program for four years, since 2020-2021 school course, with financial support of public administration, there has been an increasing demand from more rural schools. This has led to design an open investiga.edu program, where we are publishing online educational files, providing all the necessary guidelines and resources. These guides are based on the same methodological pillars as all Investiga.edu projects: they propose the investigation of a specific archaeological site following the phases of the scientific method based on activities and challenges that work with real archaeological data and replicate some of the disciplines and techniques of archaeology.

On the other hand, the program also attaches great importance to the visibility of the UAB research teams and their contact with students; for this reason, the educational files incorporate audiovisual capsules starring researchers from different disciplines and research groups.

Currently "Open Investiga.edu" has published two educational guidelines: one on the La Cova de Montanissell site, located at the archaeological site of Coll de Nargó, and another focused on the Cova del Sardo, located in the Aiguestortes National Park and Estany de Sant Maurici.

10 ONLAAH MOOC: ONLINE EDUCATION IN AFRICAN ARCHAEOLOGY AND HERITAGE

Fonseca, Sofia (Teiduma, Consultancy on Heritage and Culture; German Archaeological Institute; ICArEHB, Algarve University)

The rapid advancement in digital technologies has provided unprecedented opportunities for the democratization of education in specialized fields such as archaeology and heritage. The Online Learning on African Archaeology and Heritage (ONLAAH) and its Coursera MOOC on Archaeology and Heritage of Africa, represents a concerted effort to leverage digital platforms to make heritage education accessible, engaging, and effective for a global audience. Developed by the German Archaeological Institute (DAI) in collaboration with several partner institutions and a team of 30 experts in archaeology, anthropology, digital technologies, and heritage studies, ONLAAH aims to bridge the gap between academic knowledge and public interest in African archaeology and heritage.

This presentation will outline the design and implementation of the ONLAAH MOOC, highlighting its curriculum that combines theoretical knowledge with practical case studies, including archaeological projects and community engagement. We will also discuss the challenges encountered during the MOOC's development and delivery.

With over 1000 students enrolled and counting and featuring a special partnership with the Museum of West Africa (MOWAA) in Nigeria for the "Unearth: Discovering Archaeology Together" Community Engagement Project, the ONLAAH MOOC, which launched in May 2023, exemplifies the potential of online learning to transform heritage education into a more inclusive, comprehensive, and engaging experience. By sharing our experiences and insights, we aim to contribute to the broader discourse on digital education in the fields of archaeology and heritage and encourage the development of similar initiatives that can advance our field of research.

11 ARCHAEOLOGICAL EDUCATION THROUGH DIGITAL TOOLS: CHALLENGES, OPPORTUNITIES AND CRITICISMS

Pyrgaki, Marie (1 Dr. Pyrgaki Marie Université Paris I, Panthéon-Sorbonne; 2 Cons. Prof. Hellenic Open University)

This paper explores the integration of digital technologies and approaches that have emerged as valuable resources for enhancing archaeological education. It examines the benefits and challenges of using digital tools and the theoretical frameworks, technical innovations, and practical implementations that bridge the gap between digital and analogue pedagogy.

It focuses on the case study of the Greek Neolithic period where digital technologies are being utilized to improve knowledge dissemination, engage students, and facilitate a comprehensive understanding of the subject matter. This study investigates the specific challenges faced by archaeological education initiatives in understanding and disseminating knowledge about the Greek Neolithic and proposes recommendations for improvement. But the archaeological education initiatives focused on this era often suffer from a lack of cohesion and coordination. This paper highlights the lack of cohesion and cross-linking of knowledge and experiences between different initiatives and the fragmentation that hampers the exploration of synergistic opportunities and limits the potential impact of local initiatives.

In this paper we will explain that while digital tools offer exciting possibilities for archaeological education, thoughtful implementation, critical evaluation, and a balance between tradition and innovation are crucial.

12 NOT JUST ANOTHER BRICK IN THE 3D WALL: BRINGING ACCESSIBLE 3D SCANNING METHODOLOGIES AND DATA MANAGEMENT INTO THE ARCHAEOLOGY CLASSROOM

Montfrooij, Max (Leiden University) - Revello Lami, Martina (Leiden University)

Over the last decades, digital tools for capturing, modelling and visualizing 3D data or virtual assets, have become a well-established practice at all stages of archaeological research, from documentation to public outreach. Increasingly popular amid scholars, museum professionals and field archaeologists, 3D technology has now proven a powerful means for preserving and displaying archaeological heritage sites and collections.

While reliance on virtual assets within archaeological research is growing exponentially, the utilization of sophisticated tools - such as laser scanning and photogrammetric recording methods - is typically confined to specialists operating high-end and costly equipment. Consequently, students face restricted opportunities to engage in 3D asset creation processes and are not familiar with essential guidelines for data management and storage, as well as issues concerning accessibility, quality standards, authenticity and responsible use of 3D virtual assets.

This paper advocates in favor of the incorporation of more affordable and accessible mobile LiDaR laser scanning technology to bridge this gap in our teaching practices. We will share the outcomes of a pilot project conducted at the Faculty of Archaeology of Leiden University, which utilized the LiDAR laser scanner integrated in the latest iPhone 15 Pro. We aimed to develop an accessible 3D scanning workflow that enabled students in a Material Studies seminar to effectively record and visualize archaeological objects. Our findings reveal a strong positive response and increased student interest not only in the scanned objects but in the applied tools. The project also illustrates how hands-on experimentation with user-friendly tools significantly enhances the understanding of relevant technologies, and fos-

ters comprehension of the aforementioned issues affecting 3D asset creation and management. Finally, we explore potential future strategies to more firmly incorporate 3D scanning methods in the archaeological teaching toolkit, drawing on our project's findings, didactical research and developments in the field of 3D creation.

13 MARE CYPRIUM: MULTIMEDIA APPLICATIONS FOR CYPRIOT MARITIME CULTURAL HERITAGE

Secci, Massimiliano (University of Cyprus) - Demesticha, Stella (University of Cyprus) - Katsouri, Irene (University of Cyprus)

Funded by the Honor Frost Foundation (HFF), the Mare Cyprium Project is an attempt to utilise digital archaeology to enhance public outreach. By integrating archaeological data from various ongoing and completed projects into a series of digital multimedia applications (DMAs), a team of the Maritime Archaeological Research Laboratory (MARELab), University of Cyprus (UCY) developed applications that targeted a diversified public. The case studies include artefacts, shipwrecks, harbours, and traditional boats, while the DMAs include 3D and 2D animations, an interactive 3D glossary of shipbuilding terms, a 3D collection of traditional boats. With this project we wanted to explore if an exercise in digital public outreach could successfully combine a high-level archaeological expertise with a functional digital knowledge and achieve to convey knowledge about various aspects of maritime cultural heritage, such as ship iconography and shipbuilding, the importance of stratigraphy, and the threats of looting and disturbance. This paper will critically discuss the general project idea and rationale, the challenges in materializing DMAs concepts and scenarios, and the results, including considerations on the insights derived from the external evaluation.

661 ON FIRE! ANCIENT PYROTECHNOLOGIES IN PRODUCTIVE AND RITUAL EASTERN MEDITERRANEAN AND NEAR EASTERN CONTEXTS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Laneri, Nicola (University of Catania) - Baldi, Johnny (CNRS) - Mendola, Alice (Università di Roma 'La Sapienza')

Session format: Regular session

Fire is a natural element that is the product of an oxidation reaction at high temperatures. With fire hominids started to interface as part of the exploitation of a seasonal natural resource and since then has become a quintessential part of human life. Moreover, the interaction between man and fire is sensorial: heat and light become elements linked to the life of man, who at the end of the Middle and Upper Palaeolithic endowed himself with a technology that guarantees the possibility of transforming elements, primarily food. Fire therefore acquires hybrid characteristics: extremely functional to life, it becomes a cultural element, created by man to satisfy the needs of lighting, heat, defence, cooking, production. Far from a purely physical and natural conceptualization, fire is an agency that intervenes and participates in the construction of the cultural world, a prerogative of the human species alone. The creation of the fire-artifact places its conceptualization within a cultural field, which arises from the creative intent of man in his social context to which he belongs. The monopoly acquired on planet Earth thanks to the long process of domestication of fire results in the creation of pyro-centric cultures capable of synthesizing foods and raw materials for the construction of objects. Indeed, with fire and by the means of fire, the species homo has become properly and metaphorically faber, not only as a creator, but also by developing ever new ways of processing raw foodstuffs, not only by cooking it, but above all by transforming it and producing new aliments.

It is within these premises that the session aims at investigating the use of fire for both productive and ritual purposes in a wide geographical area (i.e., the Eastern Mediterranean and the Near East) from prehistoric times until the first millennium BCE.

ABSTRACTS**1 WHO BY FIRE? HOW THE POTTER BUILT THE KILN AND HOW THE KILN BUILT THE POTTER**

Padovani, Claire (Paris 1 Panthéon Sorbonne)

This paper proposes a phenomenological approach to the artisanal use of fire in Southwest Asia from the late Neolithic period to the early Bronze Age. The emergence of the first kilns for pottery firing occurs in the latter half of the 7th millennium BCE and stands for a significant technological innovation in agropastoral societies at the end of the Neolithic era. Kilns become keystones in the transformation of the ceramic industry by the end of the 3rd millennium BCE. It is commonly acknowledged that kilns, among all firing structures, allow for reaching higher temperatures and achieving a uniform firing atmosphere suitable for limestone clay fabric. However, the pottery firing is a total sensory experience and the choice of the firing structure cannot be solely understood as a functional necessity. The mastery of fire is a lengthy, challenging, and hazardous learning process that varies depending on the firing structures chosen

by the potter. While the potter acts on the fire during the firing process, interviews with present-day potters reveal that the fire remains a feared master. Each firing structure involves a proper expertise, in other words, a technical know-how that may result in the specialisation of the firing operator within the social group. Drawing from archaeological and ethnological data, the aim is to grasp the significance of the firing experience in ancient societies and to make its transformative impact visible and explicit in its entirety. This includes the potter's action on the fire based on the chosen firing structure and the sociocultural aspect of the act of firing impacting both the firing operator and the social group.

2 FEELING THE FIRE. A PERCEPTIVE APPROACH TO THE TECHNO-ORGANISATIONAL COMPLEXITY OF THE POTTER'S WORKSHOPS IN THE EARLY MESOPOTAMIAN STATES

Baldi, Johnny (CNRS UMR 5133 Archéorient)

In the 4th and 3rd millennium BCE Mesopotamia, during the emergence of the early states and empires, ceramic workshops evolved substantially, becoming in some cases actual proto-factories. This was a far from linear process, based on new labour organisational patterns implying major technical innovations in firing structures and methods. In particular, various types of kilns, operating on the basis of different technological principles, are sometimes documented within the same workshops, without their use being in any way attributable to distinct groups of craftspeople or specific ceramic productions. The use of such different facilities and procedures to obtain products with totally similar features by potters who shared not only the same work spaces but also the same technical traditions and operational sequences raises relevant questions concerning cognitive, anthropological and firing cycle adaptations. How could these specialists learn to master different techniques without apparently needing long periods of adjustment or experimentation? What were the material difficulties that arose with the development of new firing procedures and how were they overcome? To address these issues, fieldwork data collected on North- and South-Mesopotamian workshops as part of the international FACT_WORK project were tested through an experimental and sensory approach. The aim is to understand the degree of complexity, distance or proximity of different firing techniques not only from the present-day archaeologist's etic perspective, but also through the past craftspeople's emic perception. The proxy employed for this purpose is the reconstruction of the visual, acoustic or tactile categories that guided their empirical knowledge of materials and privileged technical solutions. On the other hand, a sensory analysis allows for a better understanding of the cognitive steps underlying the evolution of the physical relations entertained by potters with fire as a "co-worker" and, consequently, some major changes in the labour organisation when the early states were appearing.

3 THE OVERLOOKED PYROTECHNOLOGY: A CONSIDERATION OF THE BITUMEN FINDS FROM THE OLD BABYLONIAN MESOPOTAMIAN SITE OF TELL MUHAMMAD

Hinks, Megan (University of Cambridge) - Laneri, Nicola (University of Catania)

The significance of bitumen as a pyrotechnology has often been overshadowed by its more well-known siblings, ceramics and metallurgy. Why is this the case? Like clay and metal ore, bitumen was extracted in its raw form from the earth, processed, combined with other components, and heated before being utilised. Like metal it had transmutative properties that allowed for it to be melted down and reformed. Like clay used for pottery or bricks, it was combined with temper which altered its nature as desired for function. Fundamentally, through fire, bitumen is transformed into a substance that had a wide range of uses.

This overview demonstrates how we can investigate bitumen from a similar perspective as ceramics or metals when it comes to systems of production. Namely, an examination of the bitumen chaîne opératoire using archaeometric techniques, use-analyses, and relationship to other materials. This latter aspect reflects on how other materials form not only an example for our approach to bitumen production studies, but an important part of the discussion.

This paper thus serves as an introduction to the archaeometric methods by which we can examine bitumen as a pyrotechnology that was widespread and multi-functional, with particular consideration of the preliminary bitumen finds from the Old Babylonian site of Tell Muhammad. Attention will be given to the context and use of bitumen at the site, highlighting questions that intended scientific analyses will seek to answer. In doing so, it sets the stage for a forthcoming wider project on bitumen production in southern Mesopotamia and takes steps towards a more rigorous methodological approach to this important but often overlooked substance.

4 FIRE FOR WATER: THE USE OF FIRE ASSOCIATED WITH WATER FACILITIES IN MESOPOTAMIA DURING THE OLD BABYLONIAN PERIOD

Laneri, Nicola (University of Catania)

The use of fire can have multiple purposes among which there was the impermeabilization of vessels, clay pipes for collecting water as well as toilets and other purposes associated with water management. In Ancient Mesopotamia,

fire was also used for disinfecting sewer during the hot summer seasons for protection from diseases. In fact, according to Mesopotamian textual sources, sewers were a source of diseases associated with minor deities and magical rituals (especially nearby gates) were enacted to protect the citizens from being sick.

This contribution will thus present a brief overview of the use of fire associated with water facilities in ancient Mesopotamia and especially during the Old Babylonian Period. In particular, I will use the Old Babylonian site of Tell Muhammad as an example for determining the important role played by fire in association with water through the data emerged during the recent excavations of the Baghdad Urban Archaeological Project.

5 EXPLORING POTTERY FIRING DYNAMICS: INTEGRATING ARCHAEO-METRIC ANALYSES AND EXPERIMENTAL ARCHAEOLOGY

Solard, Baptiste (Archaeometry Research Group, Eberhard Karls University of Tübingen) - Amicone, Silvia (Archaeometry Research Group, Eberhard Karls University of Tübingen; Institute of Archaeology, University College London)

The study of ceramic pyrotechnology is central to understand a wide range of cultural and social behaviours associated to pottery production.

Archaeometric analyses have been crucial amongst the different approaches used to reconstruct ancient ceramic pyrotechnology. Although these studies employ a variety of methods to reconstruct the firing process with a particular focus on the estimation of maximum firing temperatures of ceramics, the full complexity of firing dynamics is often not taken into consideration.

Another major focus of pyrotechnological studies is ancient combustion features, the study of which has enormous potential to gain better insights into a variety of other aspects regarding the firing procedures. However, pyrotechnological installations are rarely targeted for systematic and multi-disciplinary investigations that include both scientific analysis and experimental archaeology.

This paper aims to address pottery firing from a diverse perspective that merges archaeometric analyses and experimental archaeology to the study of both pottery and pyrotechnological installations. To demonstrate the potential of this approach, we combined scientific analyses including ceramic petrography, X-ray powder diffraction (XRPD), fourier-transform infrared spectroscopy (FTIR), and scanning electron microscopy (SEM). These analyses were carried out on both archaeological materials from various archaeological contexts in the Near East and experimental reproductions. The latter were produced in experiments run in the laboratory as well as in the field using different types of pyrotechnological installations. The experiments were accompanied with a detailed program of firing temperature monitoring and integrated observations on atmospheric conditions, soaking time, and duration.

This integrated approach merging archaeometry and experimental archaeology enabled us to collect results useful to discuss the limits and advantages of various scientific analyses. Overall, our work demonstrated the potential of a dedicated methodological framework for studying pottery firing from a technological and social point of view that can be applied to various chronological and cultural contexts.

6 FIRE IN THE HEARTLAND OF CITIES: ILLUMINATING MESOPOTAMIAN NIGHTS

Earley-Spadoni, Tiffany (University of Central Florida)

In the pre-modern world, fire played a crucial role in extending activities beyond daylight hours. However, there has been relatively little scholarly engagement with the anthropology of the night, particularly to understand how the use of fire impacted life after sunset. This presentation explores the cultural perceptions of night, a time when fire became a purifying and protective force that safeguarded ancient peoples from both supernatural enemies and invaders at the city gates.

To comprehend cultural perceptions of night, it is crucial to frame it as a social construct. For instance, Mesopotamian imaginaries such as the night realm of Irkalla both reflected and influenced how individuals related to their world. Examination of this ideational landscape reveals a land characterized by liminality and social inversion. Meanwhile, cuneiform texts from the early first millennium BCE, like the Maqlû "burning" series, indicate an increased connection with supernatural forces at night. The darkest night, during the new moon, became a time for confronting and vanquishing adversaries, including ghosts, demons, and witches, utilizing flames to perform apotropaic rituals. People also employed fire to ward off existential threats through the deployment of fire beacon signaling and night watchers armed with torches. Thus, individuals recognized opportunities to express agency, with fire at their side, over a host of threats lurking in the darkness.

7 BURNING ARSLANTEPE. HEATING, COOKING, FEASTING, AND MUCH MORE DURING THE LATE CHALCOLITHIC PERIOD

Balossi Restelli, Francesca (Sapienza University of Rome)

In Anatolian prehistoric settlements, as probably in the majority of archaeological contexts of Western Asia, all domestic structures are characterized by the presence of a fire, or hearth. This was used daily for purposes that include heating and food preparation, but fire was used in many different occasions and contexts, frequently in relation to craft activities, and in waste and land management. Not all these uses are frequently visible, but another category of fire which is less rare than what one might think is attested in contexts that allow to imagine non-secular events, as ceremonies or rituals.

The paper shall take into consideration domestic and public contexts, in-door and out-door spaces, the traces left by fires, their shapes and sizes, and where possible the types of fuel, to analyse different uses of fire during the Late Chalcolithic (4200-3200 BCE) at the Eastern Anatolian site of Arslantepe (periods VIII-VIA), with the aim of identifying and comparing pyrotechnological behaviours and practices.

8 DETECTING FIRE-AGENCY AND HYBRIDIZATION: A VIEW FROM THE LATE BRONZE AND EARLY IRON AGE SOUTHERN CAUCASUS SETTLEMENT OF TAVA TEPE

Mendola, Alice (La Sapienza University of Rome) - Caggiani, Maria (University of Catania) - Barone, Germana (University of Catania) - Mazzoleni, Paolo (University of Catania)

The transformation of fire from a natural element to a cultural component has granted humankind a privileged condition above the planet Earth, establishing a relationship of co-dependence with the flames. The centrality of fire at productive, aggregational, and ritual levels highlights the demiurgic character of fire, capable of acquiring an agency and assuming an artifact essence. Archaeologically, it specifically becomes an invisible artifact, leaving ambiguous traces macroscopically similar for all its cultural uses. Detecting fire-agency means to render unambiguous the uncertain archaeological dataset of the traces of fire among productive, social-aggregative, and symbolic spheres.

The case study of the Late Bronze Age and Early Iron Age settlement of Tava Tepe, located on the right bank of Kura River in Southern Caucasus, offers the possibility to observe the three above mentioned aspects. In this framework, fire surely represents an instrument for metallurgical technology and a participant in symbolic belief within the so called shrines of the Southern Caucasus, sanctuaries that show the coexistence of production and sacrificial destruction of artifacts, making fire central in these processes. In terms of chronology and material culture, Tava Tepe seems to fit well into this description as it presents the coexistence of markers of production, food preparation and ritual features such as votive depositions affected by flames.

Archaeological examination and results of the main analytical techniques (XRD, FT-IR, Raman, SEM-EDS) experienced on pottery and metallurgical waste of production results of fire action, or presence as vitrified architectures and ash layers from Tava Tepe will be cross-referenced to convert the evidences of scientific analysis into cultural interpretation. Temperatures exposition range, esteemed by means of mineralogical, chemical and micromorphological analysis, will be addressed to identify fire agency and architectures within a context of mingling transformative, social, and symbolic elements in which fire takes on characteristics of hybridization.

9 THE USE OF FIRE IN THE FUNERARY PRACTICES OF THE SOUTHERN CAUCASUS DURING THE PROTOHISTORY

Poulmarc'h, Modwene (Université de Lyon, Archéorient (UMR 5133 CNRS/Université Lyon 2), Maison de l'Orient et de la Méditerranée Jean Pouilloux, Lyon, France)

In the Southern Caucasus, the funerary practices have been diversified since the Neolithic, and the inhumation was largely predominant until the end of the Bronze Age. The oldest case of cremation was discovered at the Neolithic site of Aruchlo in Georgia, but no other cases are known from the entire region until the Iron Age. During the Early Bronze Age, and particularly in the second half of the 4th millennium, fire played an important role in funerary practices, not to reduce a body to ashes but as part of the funerary ritual. During this period, in north-western Azerbaijan, there is a particular group of kurgans, all of which have collective burial sites, the common feature to all these kurgans is that a fire was lit in the funerary chamber at the time of its abandonment. Over the last two decades, excavations of these kurgans have enabled us to better understand, in particular, the depositional processes, the buried population and the use of fire. The aim of this paper is to present all these elements and to discuss the place of fire in funerary practices in the South Caucasus

10 INK INSCRIPTIONS AT BAZEH HUR - A PRELIMINARY REPORT

Cereti, Carlo (Sapienza; UCI) - Labbaf-Khaniki, Meysam (University of Tehran)

The paper will briefly present details about the discovery of a relevant number of Ink inscriptions at the Fire Temple of Bazeh Hur. These inscriptions, discovered in several Field seasons led by Prof. Meysam Labbaf-Khaniki are written in cursive Middle Persian script by several different hands and were likely the work of pilgrim and devotees active in and around the Fire Temple.

Research about the Bazeh Hur complex and Fire Temples is of utmost importance, since it is likely to be one of the most important Zoroastrian Shrines in Khorasan and in the entire eastern half of the Sasanian Empire. Its architecture, inscriptions, ritual chambers provide unique information on the cult of Fire in Late Antiquity and the Early Middle Ages.

According to evidence provided by the ink inscriptions, this temple was certainly active in late Sasanian and early Islamic centuries. Moreover, archaeological data show that the temple was built or enlarged in the early Sasanian period in an area where earlier Parthian buildings stood.

Sasanian Fire Temples and complexes are the most important cultic architectures known to this date to have survived from Pre-Islamic times and Bazeh Hur is certainly one of the most important ones yet to have been discovered.

664 ARCHAEOLOGICAL HERITAGE MANAGEMENT: PROCESSES AND MODELS FOR COMPARISON

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: JIMENEZ AVILA, Javier (Junta de Extremadura, Spain) - Taloni, Maria (Consiglio Nazionale della Ricerca, Italy) - Vlachaki, Anna (Acropolis Museum, Athens, Greece)

Session format: Regular session

In recent decades, the debate on the different models of managing cultural heritage, and in particular archaeological heritage, has increasingly broadened, also because management is no longer, or not only, based on centralised state governance, but is open to so-called collaborative approaches. Such approaches demonstrate the need to also integrate communities and private individuals in management and enhancement processes, either through special forms of partnership or by signing conventions, agreements or memoranda of understanding, or by changing the structure and organisation of state governance (archaeological museums, local authorities for the protection of archaeological heritage, etc.).

The aim of the session is, therefore, to compare the different ways of managing archaeological cultural heritage in different national and regional realities, also in the light of recent and future organisational reforms of central government structures to which the management and conservation of archaeological cultural heritage was delegated in the past.

The comparison between different national and local realities should highlight, not only on a theoretical level, but also through the presentation of concrete case studies, the strengths and weaknesses of the various approaches and create an interdisciplinary and international debate that unites the scientific community of archaeologists.

The identification of good practices applicable to common problems in different contexts or the need for context-specific solutions should lead to the creation of shared knowledge and management models that are more and more necessary in an increasingly interconnected world of cultural heritage management and enhancement.

Papers for this session may include, but are not limited to:

- Description and discussion of different processes and models for archaeological heritage management both at national and more local levels.
- Impact of different processes and models on the management of archaeological heritage.
- Future challenges and opportunities in the management of archaeological heritage.

ABSTRACTS

1 COMMON DIFFICULTIES AND DIFFERENT CONTEXTS: COMPARING ARCHAEOLOGICAL HERITAGE MANAGEMENT IN TWO WORLD HERITAGE SITES IN SPAIN

Corpas, Nekbet (Universidad Complutense de Madrid)

Drawing on two World Heritage sites in Spain, this communication addresses weaknesses and opportunities in managing archaeological heritage. It particularly focuses on participation of multiple stakeholders. Based on interviews and text sources, this communication explores the solutions given to these issues and associated weakness as well

as proposes ways forward in archaeological heritage management. The experience of Las Médulas, a World Heritage landscape resulting from Roman mining activities and in the heart of a modern ex-mining area, show a case study in a rural area affected by a process of depopulation. The current management system in this cultural landscape is based on the existence of different governmental tiers (local/regional) and also a foundation made up of the main governmental stakeholders. This management system has not catered for the needs of local populations inhabiting this landscape. In fact, the management of the site has exacerbated social tension. A different case is that of Alcalá de Henares, a World Heritage city. As a historic urban landscape, this site counts on a civic council as an advisory entity for municipal government to promote cooperation. Yet, it has not been a space for problem-solving in management. Both sites show limitations regarding how to engage populations in decision-making for archaeological heritage and disputes as to how to allocate land uses and distribute associated benefits and drawbacks. Yet, this communication considers different options to deal with these challenges. More specifically, it reflects upon the necessity to introduce strategies to address these disputes collaboratively when there are different concerns of stakeholders in archaeological heritage management.

2 **STACKING HERITAGE: NEW APPROACHES TO THE CULTURAL MANAGEMENT SERVICES AT IPHES (INSTITUT CATALÀ DE PALEOECOLOGIA HUMANA I EVOLUCIÓ SOCIAL)**

Hernando-Folch, Laura (IPHES) - Brià-Casarramona, Judit (IPHES)

Archaeologists and paleontologists have the responsibility to safeguard the specimens and artifacts discovered during excavations, ensuring proper care as materials are unearthed and collections grow. This document outlines the IPHES collection service and its working mechanisms, including ongoing considerations for potential improvements. Emphasis is placed on the critical necessity of implementing and adapting new technologies to effectively cater to the requirements of both research programs and investigators. The collection service is divided into two rooms. Room 1 houses the experimental Lithotech and Technotech, along with the archaeo-paleontological collection containing items such as bones, lithics, coals, coprolites, ceramics, and plant pseudomorphs spanning from the Pliocene (3 million years ago) to the Bronze Age (10,000 BC). Room 2 is designated as a temporary warehouse for materials from new campaigns and it fulfills additional functions, including serving as a storage space for samples requiring consolidation and restoration by the Conservation Unit. The service is presently undergoing a set of infrastructure modifications. Firstly, substantial bookshelves have been acquired to accommodate oversized materials currently lacking space in Room 1, situated in inadequate areas. Secondly, a modernization initiative for collection services commenced this year with the introduction of a Lithotech, along with its associated database named LithIPHES, and a forthcoming comprehensive relational database known as ARSYS DB (Archaeological System Database). Because traditional collections in museums and other institutions adhere to a methodology established by private collections two centuries ago, significant adjustments need to be suggested and implemented. Analog technologies, once effective for organizing small individual collections in the past, are now wholly ineffective in contemporary organizational settings. Even more sophisticated programs, like Microsoft Excel, prove impractical for handling extensive collections. At IPHES, these innovative methods have already been implemented with favorable outcomes, allowing researchers and institutions to benefit from well-organized materials and information.

3 **A GLIMPSE OF ITALY: THE MANAGEMENT OF ARCHAEOLOGICAL HERITAGE BETWEEN NEW REFORMS AND OLD PROBLEMS**

Taloni, Maria (National Research Council of Italy - Institute of Heritage Science) - Leopardi, Laura (Interdepartmental Research Centre "DigiLab" - Sapienza University of Rome) - Malatesta, Saverio (Interdepartmental Research Centre "DigiLab" - Sapienza University of Rome)

The Italian archaeological heritage is unique not only in term of quality and quantity, but also for his complex system of management that is the results of his history. The most obvious peculiarity is the mixture of state, church and local authority ownership and management: this compartmentalisation has led to numerous difficulties in identifying the respective competences and responsibilities, all too often resulting in inaction or, worse, neglect.

Ideally, on one hand, this would be integrated management based on a collaborative approach between State/Municipality/private sector, with fair burden-sharing, taking into account the strengths and weaknesses of each actor. On the other hand, by a coexistence based on a constructive and balanced dialectic between protection itself, valorisation and fruition, which cannot be separated according to the dictates of article 1 of the Cultural Heritage and Landscape Code, and not by a dichotomous division as has often been the case, especially in the concrete application of recent reforms of the state system of cultural heritage.

These reforms, which in the last ten years have characterised the organisation of the state system (and not only) of protection, management and valorisation of cultural heritage, will also be analysed in the light of the new constitutional reform on differentiated autonomy through the examination of some casestudies, focused on archaeological heritage, to highlight their consequences, both in terms of old criticalities and new opportunities.

The aim of this study is also the realisation of a joint project with the Interdepartmental Research Centre "DigiLab" - Sapienza University of Rome, which, starting from a historical examination, will come to understand, through the analysis of data including economic and human resources management data, the effectiveness and efficiency of the current system so as to orient decisions on the basis of a scientific analysis of the status quo.

4 **SOME ASPECTS OF ILLEGAL ANTIQUITIES TRADE IN THE DIGITAL SPACE IN POLAND**

Mroczek, Diana (Adam Mickiewicz University)

The trade in archaeological artefacts is strictly prohibited in Poland, which means that the black market for antiquities has been operating outside of the legal system. This presentation will examine these issues and take into the account historical background and the legislative changes that have occurred within the past year. The growing threat that social media, various e-commerce platforms, and other websites can pose to the preservation of cultural heritage will be discussed in detail, since these websites have the potential to act as middlemen for the illicit trade and exchange of artifacts. The crucial part of the presentation will explore the recent amendment in the Act of Protection of Monuments and Care for Monuments in Poland, dissecting its implications on combating illegal treasure hunting and its relation to antiquities trade and exchange. Additionally, the presentation will demonstrate the incorporation of technological solutions, including the transfer of accountability for discovered artifacts to the citizens during and after the search and the use of open-source data in the research process.

While "traditional" methods of antiquities trafficking often operate discreetly, the emergence and popularity of online platforms has reshaped this landscape, allowing for trade to occur more openly, although often obscured within legitimate auctions and legal nuances. This is especially true, since legal classifications and definitions of cultural heritage items can be unclear and confusing. The anonymity of these platforms further exacerbates the difficulty in tracing the provenance of artifacts, especially in the Schengen Area that allows the free flow of travel. The presentation will clarify the dynamics of the illegal antiquities trade in Poland and propose new coordinated efforts and solutions.

5 **THE IMPORTANCE OF PUBLIC INVOLVEMENT IN THE ADAPTATION AND MODERNISATION OF MOUND SITES IN LITHUANIA 1919-2023**

Viršiliene, Jurgita (Department of Cultural Heritage under the Ministry of Culture)

Today, the number of hillforts in Lithuania exceeds 1000. Currently, about 150 hillforts in Lithuania have been managed and adapted for visitors. In the 1930s, individuals began to raise the importance of their protection, public organisations - to highlight their significance, keeping the public's attention - dissemination of excavation results in the press. As a result of their efforts, the hillforts were de facto protected in 1935-1936.

In 1960 the 20 most important hillforts began to be protected de jure as Landscape Historical Reserves. Since 1970, work on the management of the hillforts has been carried out in accordance with the projects drawn up. Of the 25 projects drawn up in the 1980s and 1990s, 15 have been implemented. The intensification of research and management of the hillforts has enabled them to be brought to the attention of a wider public.

The Department of Cultural Heritage carried out a programme of preservation of Lithuanian hillforts damaged by natural forces in 1991-2010. It also supported research on hillforts. Of the approximately 100 hillforts that have been managed and made accessible to visitors. Since 2006, the Protected Territories Service has contributed to the preservation and adaptation of hillforts, implementing some 20 projects. Active conservation work has maintained public awareness of the importance of hillforts.

The public perception of hillforts was maintained through the publicity and dissemination of the results of hillforts research in the press. The results of the research were used to present the managed hillforts to the public. The emergence of the hillforts as the most important object of the region's prehistory has been achieved by constantly showing and reminding the public of their importance.

6 **SAFEGUARDING JULIOPOLIS: PREPARING SITE MANAGEMENT PLAN IN THE CONTEXT OF INTERINSTITUTIONAL COMMUNICATION AND LEGISLATION IN TÜRKIYE**

Büyükkarakaya, Ali (Hacettepe University, Department of Anthropology; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Sertalp, Evren (Hacettepe University, Faculty of Communication, Department of Radio, TV and Cinema; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Dolmuş, Muhammed (Human Behavioral Ecology and Archaeometry laboratory (IDEA lab))

Juliopolis (Iuliopolis) Ancient City is a settlement located in Ankara (Türkiye), where rescue excavations have been carried out by the Museum of Anatolian Civilizations (the MAC) since 2009, and is known to have been inhabited from the Hellenistic Period to the Ottoman Period. The settlement is located on the border between the provinces of Bithynia and Galatia. It is a strategic ancient center due to its location on both the Roman road and the Pilgrim Way

and its proximity to Ankyra, the capital of Galatia. A significant part of the Ancient City of Juliopolis is located under the dam lake of a hydroelectric dam completed in the 1950s.

Juliopolis Project has been carried out in partnership with Hacettepe University, the Museum of Anatolian Civilizations and Koç University Vehbi Koç Ankara Studies Application and Research Center since 2018. Juliopolis Digital Archeology Archive was created and made available for sharing with open access principles. The project's academic-based activities, such as research, public archeology events aimed at promoting the ancient city, and the creation of a Site Management Plan (SMP), have been supported by various supporters as well as the US Mission. In this respect, the project has gained the support of a public university, a state-affiliated museum, a private university and other public and private institutions in Turkey and is carried out with an innovative and multidisciplinary contemporary approach.

In this study, the process of creating the SMP of the Ancient City of Juliopolis, its relationship with the legislation in Türkiye and the dimensions of inter-institutional communication will be discussed. In addition, the impact and results of the multidisciplinary structure of the Project on SMP and the contributions of public archeology activities to the process will be evaluated.

7 DO NOT COMPARE - CONTRAST! THE DANGERS OF BORROWING MANAGEMENT PRACTICES FROM ELSEWHERE

Carman, John (University of Birmingham)

Although there are common bases to the management of the archaeological heritage across the globe (Carman 2015), the way these are operationalised from territory to territory vary significantly. The issue is never one of 'effectiveness' where the particular practice operates, but rather of suitability: heritage management systems must reflect basic understandings of what matters, how the world should work, and who should wield authority and over what and these vary from country to country, culture to culture. As I have argued elsewhere, borrowing what seems to be successful in another territory without careful consideration of exactly why it is successful there is a recipe for failure.

In particular, those (re)designing heritage management systems need to take into account the following:

- Who is deemed to carry proper authority
- What are the proper limits of law and government
- What constitutes 'heritage' (and what does not)

It does not follow that those who agree on the significance of preserving archaeological material necessarily agree on these issues: it will depend on the context from which they come.

This paper will explain why attempts to borrow from elsewhere are a bad idea!

8 REVERSING OLD PRACTICES. NEW COLLABORATIVE APPROACHES TO THE REVISION OF THE UNESCO WORLD HERITAGE TENTATIVE LIST

La Piscopia, Patrizia (National Monuments Service; Department of Housing, Local Government and Heritage) - Cave, Claire (University College Dublin)

In 2022 Ireland announced its new and revised Tentative List of cultural sites that could aspire to become UNESCO World Heritage properties one day. Compared to the previous list, compiled over a decade earlier, the latest one was shorter, not exclusively focussed on monumentality, and was backed by greater stakeholder involvement. This paper will analyse how, informed by official UNESCO guiding principles, Ireland has shifted its approach to the TL review process to produce a credible and dynamic list built on a participatory platform.

For a long time, the identification of sites and landscapes deserving to be brought on the global stage as World Heritage properties had been a prerogative of central government. This top-down approach was partially dictated by UNESCO procedural requirements that allow only State Parties to the 1972 Convention the opportunity to present sites for nomination to the World Heritage Committee. In time, UNESCO has tried to reverse the top-down approach by encouraging and supporting the involvement of local stakeholders in the identification, conservation and management of World Heritage properties.

In Ireland, the former centralised approach to heritage management, and World Heritage in particular, had seen the previous review of the Tentative List as a self-referential academic and bureaucratic exercise that relegated local stakeholder to the backstage. This had created at times a legacy of negative perceptions which needed to be changed to be able to successfully engage local stakeholders in the review process.

The paper will describe how Ireland has taken concrete steps to reverse old practices by offering guidance to local applicants, building local capacity, and designing support and guidance mechanisms. The new approach, based on communication and collaboration shortened the distance between local stakeholders and central government, and created the foundations for a transparent and flexible evaluation process of all Tentative List applications.

9 PROFESSIONAL ASSOCIATIONS AND TRADE ASSOCIATIONS IN ARCHAEOLOGY

Aitchison, Kenneth (Landward Research Ltd; Federation of Archaeological Managers & Employers; University of Liverpool)

Professional Associations are membership organisations, with individual people as members. And Trade Associations are also membership organisations – with commercial companies as members.

Both professional and trade associations have emerged and played roles in archaeological heritage management across Europe and globally. This paper will compare the roles played by these kinds of organisations, and will look in detail at the archaeologically-specific professional and trade associations that emerged in the first two countries where commercial, development-led archaeology became firmly established – the United Kingdom and the United States.

In the United Kingdom, the trade association is FAME – the Federation of Archaeological Managers and Employers, while the professional association is CIfA – the Chartered Institute for Archaeologists. In the United States, the trade association is ACRA – the American Cultural Resources Association, and the professional association is RPA – the Register of Professional Archaeologists.

The paper will examine the political and economic conditions under which these organisations emerged and how they have influenced the delivery of archaeological heritage management subsequently. The paper will also look at their scope (in terms of membership, finance, organisational infrastructures), and their future potential.

It will conclude by looking at a selection of other professional and trade associations across Europe, and the issues that have either fostered or hindered their development.

10 TENSIONS AND COMPROMISES: THE POWER DYNAMICS OF STATE AND LOCAL AUTHORITIES IN THE NATIONAL ARCHAEOLOGICAL SITE PARK (NASP) MODEL

Lyu, Junting (University of Cambridge)

The intricate interplay between state and local authorities in the management of archaeological heritage has long been a complex issue, given that archaeological sites are often nationally significant and locally managed. This complexity is further compounded during organisational reforms, when power dynamics need to be renegotiated. This paper focuses on the model of the National Archaeological Site Park (NASP) in China. Conceived within the conservation policy framework of the "Large-scale Archaeological Sites" (LAS) by the State Administration of Cultural Heritage, the NASP has been implemented nationwide over the past decade. Despite the NASP's inception with a strong state-authorized nature and nationalistic mission, China's administrative structure and the involvement of multiple stakeholders complicate its implementation. This study looks into the key dynamics underpinning the NASP project. Through fieldwork and interviews with various stakeholders of several NASPs, it becomes evident that the NASP represents an outcome of negotiations and compromises between the central government and local authorities. Moreover, comparative analyses of diverse cases reveal that the NASP model remains challenging to uniformly implement nationwide, particularly against the wider backdrop of China's ongoing social transformation. Furthermore, the NASP model in China serves as a typical example of archaeological site conservation in developing countries. By presenting and discussing different NASP cases, this paper also enriches the broader discussion on archaeological heritage conservation in the context of modernisation.

11 PRESERVING THE 'ORGANIC' LINK AT BEGUNIYA: UNDERSTANDING THE ROLE OF LOCAL POPULATION AT A 'PROTECTED MONUMENT' IN INDIA

Bagchi, Moubani (Department of Humanities and Social Sciences, Indian Institute of Technology Guwahati) - Sharma, Sukanya (Department of Humanities and Social Sciences, Indian Institute of Technology Guwahati)

Within the Indian context, laws and acts prevailing on the archaeological heritage exist in the essence of their protection and conservation. Archaeological heritage in India, comprising of built heritage, archaeological sites, and antiquities, is a common subject within the Union, State, and Concurrent Lists mentioned in its Seventh Schedule by the Constitution of India. As a result, there are Acts formulated for pan-Indian implementation on the archaeological heritage of national importance as well as for the respective states of India. In addition to the government bodies, other stakeholders like private trusts, endowment boards, monasteries, museums, and private individuals also exist in the scenario. The strong legal framework administering the archaeological heritage in India has even allowed some monuments labelled as 'Protected Monument' by the Archaeological Survey of India under the Ministry of Culture to experience harmonious coexistence of governmental and non-governmental parties in protection of the same. This paper, therefore, aims to highlight one such 'Protected Monument' from India – the Beguniya Group of Temples – which has witnessed inclusion of local population by the Archaeological Survey of India in matters relating to the monument, thereby, emphasizing on the need for the existing heritage laws in India to preserve the 'organic' and 'pathological' link between the 'Protected Monument' and its surroundings. This paper also points out the disadvantages of discontinuing this 'organic' link which might lead to making the 'Protected Monument' insecure in various ways.

12 COLLABORATIVE ARCHAEOLOGY, CULTURAL HERITAGE, AND THE MANAGEMENT OF MUSCOGEE (CREEK) NATION LANDS IN THEIR ANCESTRAL HOMELANDS OF GEORGIA, USA

Thompson, Victor (University of Georgia) - Hunt, Turner (Muscogee (Creek) Nation) - Butler, Raelynn (Muscogee (Creek) Nation) - Wendt, LeeAnne (Muscogee (Creek) Nation) - Garland, Carey (University of Georgia) - Luna Goya, Greg (National Park Service)

The Enfulletv-Mocvse (the Muskogee words for “new ways of doing”) Archaeology Field School was implemented through a joint collaboration between the Muscogee (Creek) Nation and the University of Georgia. The field school takes place in the heart of the ancestral homelands of the Muscogee Nation, near Ocmulgee Mounds National Historical Park and on lands recently reacquired by the Muscogee Nation that are part of the broader Ocmulgee Mounds National Historical Park landscape. The main purpose of these archaeological collaborations are three-fold. The first is to provide a model for training undergraduate university students in the context of collaborative archaeology. The second is to elevate collaborative archaeology in the region as a process that emphasizes equal voices in research. Finally, this collaboration provides information critical to the Nation for their management of cultural heritage on their lands, as well furthering the goals of co-management of the National Historical Park and the broader landscape.

13 COMMUNITY ROLE IN CONSERVATION AND MANAGEMENT OF THE CHINCHORRO CULTURE SETTLEMENT, NORTHERN CHILEAN ATACAMA DESERT, UNESCO WORLD HERITAGE SITE

Casanova, Paz (Independent Researcher) - Power, Ximena (Instituto de Investigaciones Arqueológicas y Museo R.P. Gustavo Le Paige (IIAM), Universidad Católica del Norte.) - Díaz, Solange (Independent Researcher; ICOMOS) - Smith, Sebastian (Independent Researcher) - Guzmán, Carolina (Independent Researcher) - Castillo, Camila (Chinchorro Marka Corporation)

The Settlement and Artificial Mummification of the Chinchorro Culture in the Arica and Parinacota Region (Atacama Desert, Northern Chile) was inscribed on the UNESCO World Heritage List in 2021. The property comprises three archaeological components: Faldeos del Morro, Colón 10, and Desembocadura de Camarones, which the Ministry of Culture officially manages. The property is characterized by the coastal desert environment and archaeological shell mounds, which reveal the long-term occupation of hunter-gatherers-fishers (HGFs) in the landscape and their funerary practices, including the oldest artificial mummification of the world (ca. 7400 BP).

Here, we will focus on the Desembocadura de Camarones component, a large shell mound (359.23 ha) in the Camarones district. During the last four decades, a fishing village has coexisted with the archaeological settlement, presenting social and legislative problems that have increased with the UNESCO Declaratory. Despite the political problems, modern HGF inhabitants of Camarones identify themselves with the Chinchorro Culture and voluntarily protect the archaeological sites nowadays.

We present a study case synthesizing an Emergency Project funded by the National Heritage Council of Chile in 2023. The project aimed to stabilize and protect two open archaeological sites in Camarones and included non-invasive archaeological studies and a backfill process carried out by a collaborative approach between conservators, archaeologists, the local community, and the Chilean State. The community was actively involved in the design and decision-making during the operational, archaeological, and conservation activities. The collaborative and decentralized nature of the project enriched the opportunities for mutual learning. On the one hand, the community embedded the technical and scientific criteria that guided the actions undertaken. On the other, the inhabitants shared their knowledge about the territory, the sites, and the maritime way of life, including the internal sociopolitical dynamics. This experience created new bases for developing collaborative management strategies for the property.

14 REIMAGINING ARCHAEOLOGICAL HERITAGE MANAGEMENT IN PERU: THROUGH AN ERA OF THE QHAPAQ ÑAN'S PARTICIPATORY POLICY

Uribe Chinen, Claudia (Pontificia Universidad Católica del Perú (PUCP))

Over the past two decades, community participation schemes have fundamentally reshaped ethical practices in archaeological heritage management on a global scale. However, the adaptation and interpretation of participatory approaches have led to nuanced pathways, as evidenced by recent debates and reported experiences, achievements and challenges. This paper delves into the implementation of a participatory framework for archaeological heritage management within the context of the Qhapaq Ñan Project in Peru. Beginning in the early 2000s, the Peruvian government's efforts to establish a participatory heritage policy coincided with the drive to attain the UNESCO World Heritage status for the Andean precolonial network of roads and sites. This dynamic context spurred debates among public heritage policymakers and specialists, prompting a reevaluation of the traditionally centralized and expert-centric governance models used in managing precolonial remains. In the absence of legal frameworks and widespread technical expertise, the development of participatory practices relied heavily on the skills, advocacy efforts and, multilevel negotiations of individual professional archaeologists working as heritage managers within the public

sector. This paper examines this process within the specific contexts of heritage management projects, which focused on archaeological monuments or segments of roads, under the auspices of the Qhapaq Ñan's policy. The successful integration of participatory practices into highly technical and regulated processes -such as national heritage declarations, zoning and enhancement- underscored the importance of striking a balance between heritage managers' expertise and their relationship with local communities. These participatory approaches were also tested in more flexible arenas, allowing for the involvement of non-expert community members in heritage interpretation, promotion and dissemination efforts. Ultimately, the Qhapaq Ñan's policy served as a catalyst for professional archaeologists to reconsider heritage ethics and spearhead innovative collaborative initiatives. Such initiatives have since emerged as benchmarks for good practices within the Peruvian heritage policy landscape.

15 DOES THE “POLLUTER PAYS PRINCIPLE” FIT ALL SITUATIONS?

Bortolin, Raffaella (Professional Archaeologist) - Pizzinato, Claudia (Professional Archaeologist; Università Ca' Foscari di Venezia)

The ‘polluter pays’ principle was introduced by the OECD in 1972 based on the assumption that polluters should bear the costs of implementing pollution prevention.

This principle becomes fundamental in the EU's environmental policy (art. 191(2) of the Treaty on the Functioning of the EU states) and must be properly applied in four areas of environmental policy: industrial pollution, waste disposal, water management and land use.

In 1992, the Valletta Convention was signed (ratified by Italy in 2015), according to which the funding of archaeological research and conservation must be supported by national, regional and local public authorities, according to their respective competencies. For major public or private works, the entire costs of the necessary archaeological operations must fall on funds from the public and private sectors.

This has been the practice in Italy since the 1990s: the costs for archaeology (assistance, excavation, restoration and enhancement phases) are borne by both public and private bodies.

This paper aims to address the following questions: is it correct to borrow the “polluter pays” principle into “the destroyer pays” also for interventions carried out by private citizens who have to comply with the rules of respect for the environment? Are not conservation operations a matter for society, since cultural property is everyone's property and everyone must take care of it? Why does the private citizen sometimes have to pay substantial sums to honour the protection principle? In order to overcome this inconsistency between the concept of common heritage and private support, it would be appropriate to provide a substantial state contribution with a view to greater economic sustainability and improving citizens perception of the importance of cultural heritage.

The paper will illustrate several cases of excavations supported by private citizens and what negative consequences are derived.

666 THE IMPACT OF DIGITAL METHODS IN BIOARCHAEOLOGY AND PALEOANTHROPOLOGY: INNOVATIVE APPLICATIONS AND TECHNOLOGICAL ADVANCES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, Komotini, Greece) - Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, Komotini, Greece) - Arnaud, Julie (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) - Buzi, Costantino (Catalan Institute of Human Paleocology and Social Evolution (IPHES-CERCA), Tarragona; Department of History and History of Art, Universitat Rovira i Virgili, Tarragona) - Del Bove, Antonietta (Department of History and History of Art, Universitat Rovira i Virgili, Tarragona)

Session format: Regular session

The study of human remains is a fundamental part of archaeology, that is currently undergoing modernization through the improvement and/or development of methods and technologies. The recent innovations in both approaches and protocols increasingly allow for sustainable management of the invaluable sources of information represented by skeletal materials, also aiming at their long-term preservation. Technological advances and multidisciplinary approaches made nowadays possible an easier, safer, and more efficient extraction of data from human remains, with an increased power of analysis. This session wants to address such advancements applied to collections coming from archaeological and paleoanthropological contexts, and it welcomes papers that delve into automatic and standardized methods across the entire spectrum of archaeological and anthropological research. The focus extends to the utilization of tools and methodologies. This session will address the application and/or development of new approaches, rooted in

machine learning, artificial intelligence, databases and other computational tools. Furthermore, implying the application of existing methods to novel contexts or disciplines, or the use of cutting-edge technologies on old samples to obtain new data. It will represent a chance for scholars to present new opportunities and approaches - or novel data from known collections - to colleagues dealing with human remains.

ABSTRACTS

1 NEANDERTHAL OR NOT? THE OCCIPITAL BONE FROM THE MIDDLE PALAEOOLITHIC SITE OF CIOTA CIARA (PIEDMONT, ITALY)

Arnaud, Julie (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara; UMR 7194 HNHP, MNHN-UPVD, Département Homme et Environnement, Musée de l'Homme, (France)) - Frittitta, Riccardo (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara) - Profico, Antonio (Dipartimento di Biologia. Università di Pisa (Italy)) - Grimaud-Hervé, Dominique (UMR 7194 HNHP, MNHN-UPVD, Département Homme et Environnement, Musée de l'Homme, (France)) - Vialet, Amélie (UMR 7194 HNHP, MNHN-UPVD, Département Homme et Environnement, Musée de l'Homme, (France)) - Berruti, Gabriele L.F. (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara) - Daffara, Sara (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara) - Arzarello, Marta (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara)

The Ciota Ciara cave stands as the oldest evidence of human presence in Piedmont. The site, explored since the 1950s, has revealed Mousterian lithic industries and numerous paleontological materials, including three human remains identified as Neanderthal by Villa and Giacobini in 1993 although their precise stratigraphical position remains indeterminate.

From 2009, the University of Ferrara has undertaken a systematic investigation of the site, shedding light on the subsistence behaviors of prehistoric populations in Piedmont. Recent radiometric dating has positioned the site at the onset of the Middle Paleolithic, a pivotal period in Europe, marked by the emergence of Neanderthal. However, the scarcity of fossil hominins and their morphological variability pose challenges in determining if the identified human remains exhibit distinct Neanderthal features indicative of *Homo neanderthalensis*.

Since 2019, the Ciota Ciara cave has yielded eight additional fossil human remains, including seven teeth and an almost complete occipital bone. Several methodological approaches have been applied to examine the internal and external morphology of these fossils. Here we present the preliminary results of an exploratory analysis of the external surface of the occipital bone. Through geometric morphometrics, we investigate the conformation of the occipital bone and in particular the morphology of the occipital bun and suprainiac fossa to replace the Ciota Ciara individual in the European evolutionary context. Preliminary results show that the occipital bone bears a clear Neanderthal signal both in its conformation and morphology. However, in terms of dimension, it lies in the lower variability of the Neanderthal range of variation and in the upper variability for the bone thickness. This data corroborates the analysis performed on the teeth and the internal surface of the bone fragment. This preliminary analysis raises many questions, particularly about Neanderthal evolution, and opens an immense field of investigation for future analysis of this site.

2 THE BONY LABYRINTHS FROM MOITA DO SEBASTIÃO (PORTUGAL), FIRST INSIGHTS INTO THE MESOLITHIC VARIABILITY USING PALEOIMAGING

Coutinho Nogueira, Dany (CIAS - Research Centre for Anthropology and Health, University of Coimbra) - Pujol Arbona, Marina (CIAS - Research Centre for Anthropology and Health, University of Coimbra) - Umbelino, Cláudia (CIAS - Research Centre for Anthropology and Health, University of Coimbra; ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behavior, University of Algarve)

The inner ear structures are often studied in Paleoanthropology as they are a useful phylogenetic indicator. While numerous human fossils from the Middle and Late Pleistocene have been studied, in particular Neanderthals and early anatomically modern Humans, there is a lack of data available for Holocene hunter-gatherer populations.

This study aims, using CT-scan images, to provide the first insights into the Mesolithic variability by analyzing the morphometric data from 9 individuals discovered at Moita do Sebastião (Final Mesolithic, Tagus valley). The burial activity at the site is dated around 8150 and 7500 cal B.P.

The results of the bony labyrinth morphometric study demonstrate a significant intra-site variability, as previously observed in other hunter-gatherer groups. The comparison with the Western European Late Pleistocene *Homo sapiens* (n=5) associated with Upper Paleolithic cultures shows differences between the two groups. The main difference concerns the relative position of the posterior canal in relation to the plane of the lateral canal.

On the other hand, the only Gravettian Portuguese fossil in this sample (Lagar Velho) exhibits a morphology similar to Mesolithic individuals, raising the question of a potential population continuity at the local level.

3 ENHANCING AGE ESTIMATION IN MODERN HUMAN SUBADULT: A GEOMETRIC MORPHOMETRIC APPROACH

Buzi, Costantino (Catalan Institute of Human Paleoeology and Social Evolution (IPHES-CERCA); Universitat Rovira i Virgili) - Chakraborty, Tannistha (Università degli Studi di Ferrara; University of Central Florida) - Arnaud, Julie (Università degli Studi di Ferrara)

This study is an exploratory application of geometric morphometric techniques to combine dental eruption and mandibular deformation in modern human subadults for age estimation. While both dental eruption and mandibular deformation are established indicators of maturity, their correlation with chronological age remains less than optimal. The study therefore applies a new protocol focusing on the mandibular body and the permanent dentition (incisor, canine, premolar and first molar only) of a sex-balanced sample of 48 individuals from age 4 years to 14 years. A combination of Type I and Type II landmarks are placed separately on the mandible body and the cusp of permanent dentition using CT scan images. The digital coordinates are then extracted in the R software interface to create a combined configuration, facilitating three-dimensional visualization and multivariate analysis. The covariation between the developing teeth and mandibular form is then observed through linear regression using PCs scores and centroid sizes. The results show the combined approach has a stronger allometric relation and higher variance of mixed dentition with less overlap of groups in comparison to the proxies analyzed individually. This approach therefore helps to identify the maximum correlation between phases of dental formation and mandibular and provides a more precise range of dental eruption. Significantly, by testing a new protocol in a well-known reference collection (in terms of sex and age-at-death), the study shows an enhanced accuracy in the age determination and lays the foundation for future applications of the protocol to fossil remains.

4 AN EXPLORATION OF NLP AND NER FOR ENHANCED SEARCH IN OSTEOARCHAEOLOGICAL AND PALAEOPATHOLOGICAL TEXTUAL RESOURCES

Lien-Talks, Alphaeus (University of York; Historic England; Archaeology Data Service)

Big Data presents opportunities in bioarchaeology and palaeoanthropology, but excavation reports become trapped in inaccessible archives. This study applies Natural Language Processing (NLP) and Named Entity Recognition (NER) to enhance metadata and map terms, improving accessibility of palaeopathology and osteoarchaeology data. Results from evaluations by bioarchaeology experts, students, and laymen show potential for NLP and NER to unlock previously inaccessible information, despite limitations. A survey using Likert scales verified these technologies allow laymen to better connect with resources.

The results demonstrate NLP and NER's implications for accessing previously inaccessible osteoarchaeological and palaeopathological records, enabling sustainable data extraction. NLP shows promise to efficiently answer research questions using Big Data from multiple sites. These computational tools will be central to bioarchaeology and palaeoanthropology by making records more accessible. They encourage public engagement by connecting these disciplines to the public through enhanced metadata.

This study utilises innovative applications of digital methods, implying existing technologies like NLP and NER to the novel context of palaeopathology and osteoarchaeology data. It highlights technological advances that allow for more efficient and sustainable management of skeletal collections' invaluable information. The focus extends to cutting-edge methodologies for archaeological and anthropological research through machine learning and AI.

5 INTERPOLATING THE PAST: BRIDGING GAPS IN ISOTOPIC SEQUENCES FOR COMPREHENSIVE DIETARY RECONSTRUCTIONS FROM INCREMENTAL DENTINE ANALYSIS

Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, 69100, Komotini, Greece.)

By analyzing stable isotopes of carbon and nitrogen extracted from sequential dentine collagen samples, it is possible to obtain a record of isotopic changes associated with diet across specific age spans. For instance, this method allows for the reconstruction of diet at six-month intervals from birth throughout the first 10 years of life and is commonly used to study ancient weaning duration. However, insufficient collagen in some samples often leads to missing sequential measurements, hindering the precise identification of isotopic changes related to diet. In such cases, addressing how to obtain a representative isotopic sequence becomes essential. Here we show the efficacy of linear interpolation in generating missing isotopic measurements. We utilized a reference dataset, comprised of 68 individuals, each represented by 11-13 subsequent isotopic measurements obtained through incremental sampling. From

this dataset, four, out of 13, random measurements were selected from each individual, and linear interpolation was applied to predict the missing values. To assess the accuracy of this approach, we used the WEAN tool to estimate the weaning age of each individual. We compared the results by calculating the standard error between the original and interpolated values. Our findings reveal an average difference of 0.05 months between the interpolated and true ages, demonstrating the effectiveness of interpolation in generating representative sequences. Additionally, the estimated weaning ages exhibited an average difference of 0.8 months, underscoring the potential to extract crucial biological information, such as weaning duration, from datasets with limited values. This research is part of CityLife, an ERC-Consolidator Grant-funded project investigating long-term human adaptation against the backdrop of urban evolution using ancient molecular, historical, and ecological evidence.

1. Ganiatsou, E., Souleles, A. & Papageorgopoulou, C. WEaning Age FiNder (WEAN): a tool for estimating weaning age from stable isotope ratios of dentinal collagen. *Archaeol. Anthropol. Sci.* 15, 50 (2023).

6 MORPHOMETRIC ANALYSIS AND MACHINE LEARNING FOR INTERPRETATION OF CREMATION FUNERARY PRACTICE

Bouso, Monica (Universitat de Lleida) - Monetti, Lisa (Drew University)

Cremated human remains have historically presented difficulties for the archaeologist when considering the estimation of the biological profile as well as interpretation of funerary practice, yet they represent a large portion of human remains from archaeological contexts. This presentation introduces methodology for interpretation of funerary practice from cremated human remains using morphometric analysis and machine learning technology.

The method is multidisciplinary, drawing from standard bioarchaeological methods, forensic anthropology, as well as ceramic petrographical analyses. By applying automated image analysis for interpreting the morphology of cremated fragments and their fracture patterns, large data sets can be collected rapidly. Random forest machine learning allows for robust analysis of the multivariate data.

When combined with other technological methods of analyzing cremated human remains that have developed over recent decades, such as digitized microexcavation and FTIR analysis, a more complete understanding of the funerary practice can be realized. This presentation will highlight the protocol of the methodology, our experience with its applications, advantages and areas for improvement, as well as the aspects of funerary practice and bioarchaeology it can allow researchers to consider.

7 AGE ESTIMATION OF HUMAN INDIVIDUALS (MICROAGE): SUPERVISED MACHINE LEARNING TOOL FOR BONE HISTOMORPHOMETRY

Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, Greece) - Souleles, Angelos (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, Greece) - Moraitis, Konstantinos (Department of Forensic Medicine and Toxicology, National and Kapodistrian University of Athens, Greece) - Valakos, Efstratios (Department of Biology, National and Kapodistrian University of Athens, Athens, Greece) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace, Greece)

Histological studies have indicated that specific bone microstructures, e.g., secondary osteons and osteon fragments, are strongly correlated with age. On this ground histomorphological and histomorphometric methods have been developed to examine bone micro-alterations emerging from age and their influence on age-at-death estimates. Despite the advantages of these methodological and analytical processes, their application is time consuming and, in some cases, yield imprecise age estimates. In order to accelerate the histological analysis and reduce the estimation error we generated MICROAGE, a tool that performs automated step by step histological analysis and provide high accuracy age estimates.

MICROAGE identifies the secondary osteons and osteon fragments observable in micro-images and calculates the osteon population density (OPD). Moreover, the tool performs a novel histomorphometric method based on OPD, and utilizes the corresponding regression equation for age-at-death estimates, that results standard estimation error of ± 3 years. For the training phase of the tool, machine-learning algorithms were developed using data (number of secondary osteons, number of osteon fragments and OPD) from modern individuals of known age and sex collected from reference collections and forensic cases. The data were retrieved manually, according to the histomorphometric method, prior to the machine-learning performance. The results of the algorithms, were thereafter validated for the accuracy of microstructure identification and calculation of the OPD values. MICROAGE introduces a rapid and automated performance of histological analysis and age-at-death estimations with high accuracy, that enables the retrieval of significant information from ancient and modern individuals.

Funding: This research is part of CityLife, an ERC-Consolidator Grant-funded project investigating long-term human adaptation against the backdrop of urban evolution using ancient molecular, historical, and ecological evidence.

8 MULTIMODAL EXPLORATION OF ANCIENT TEETH DENTIN MICROANATOMY USING TRADITIONAL HISTOLOGY AND HIGH-RESOLUTION IMAGING TECHNIQUES

Trocchi, Martina (Sapienza University of Rome) - Galbusera, Alessia (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome, Rome, Italy; Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music, University of Padua, Italy) - Cognigni, Flavio (Department of Basic and Applied Sciences for Engineering – SBAI, Sapienza University of Rome, Rome, Italy) - Bondioli, Luca (Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music, University of Padua, Italy) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome, Rome, Italy; Department of Evolutionary Anthropology, University of Vienna, Vienna, Austria; Department of Genetics, Harvard Medical School, Boston, United States) - Rossi, Marco (Department of Basic and Applied Sciences for Engineering – SBAI, Sapienza University of Rome, Rome, Italy; Research Center on Nanotechnologies Applied to Engineering – CNIS, Sapienza University of Rome, Rome, Italy) - Nava, Alessia (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome, Rome, Italy) - Capuani, Silvia (National Research Council-Institute for Complex Systems ISC CNR, Department of Physics, Sapienza University of Rome, Italy; Enrico Fermi Study and Research Center – CREF, Via Panisperna 89A, 00184, Rome, Italy)

The analysis of microstructural and micromorphological features of dental tissues in archaeological remains has provided a detailed insight into various biological variables related to the life history of ancient populations, such as developmental mechanisms, stress events and dietary habits. With Virtual Anthropology's advent, high-resolution technologies for the non-invasive acquisition of morphostructural information from odontoskeletal remains has led to a continuous search for new methods and instruments. Recently, the use of high-field Magnetic Resonance Micro-imaging (μ MRI) techniques has allowed the visualization of water-filled porous matrix features at the microscopic level using a negative contrast technique, exploiting the strong resonance signal provided by proton properties in the fluid. This study proposes a multimodal approach using high-resolution imaging techniques, complemented by conventional histology, to visualize the microanatomy of dentin tissue in a sample of isolated permanent human canines from the Neolithic site of Arlit (Niger) and the Bronze Age necropolis of Olmo di Nogara (Verona, Italy). The samples were scanned using μ MRI system operating at high magnetic field (9.4T), X-ray microscopy system (XRM) for microtomographic acquisition, and finally sectioned for histological analysis. The proposed investigation aims to test a new examination protocol for identifying dentin tissue microstructures in samples from archaeological contexts using innovative and established methods, potentially expanding the currently available options for the analysis of human dental remains.

9 DEEP LEARNING ASSISTED SEGMENTATION OF CT-SCANNED ANCIENT BONES

Vanderesse, Nicolas (PACEA, UMR 5199) - Colombo, Antony (Archéosciences Bordeaux, UMR 6034; Ecole Pratique des Hautes Etudes) - Clément, Michaël (LaBRI, UMR 5800) - Bizon, Nolan (ENSEIRB-MATMECA) - Kuo, Sharon (Department of Biomedical Sciences, University of Minnesota Duluth) - Ryan, Timothy (Department of Anthropology, The Pennsylvania State University)

X-ray computed microtomography (μ CT-scanning) has become a customary characterization technique for ancient materials. It allows to produce volumetric images of the inner structure of the specimens under investigation, with contrast levels related to the local density of the material. The processing of μ CT data usually involves a segmentation step aimed at extracting a region of interest from the rest of the 3D image. In the case of ancient human or other animal bones, this operation can be complicated by the presence of exogenous material such as sediment or soil particles.

In these instances, a manual outlining of the bone is often the only workaround. This approach can be tedious and often depends on the expertise of the scientist. The project we present in this communication (IA-SeReOs) aims to leverage the versatility and classifying power of convolutional neural networks (CNN) to automatically discriminate the bone material from any background and thus speed up the processing of μ CT images.

Our CNN model comprises two parallel convolutional layers followed by a U-Net network commonly used in medical segmentation. The first parallel layers aim at computing intermediate representations of the images according to their bone/sediment content. The features are then passed to the U-Net bloc that performs the segmentation task, i.e. separates the bone from the background. After a proper training, the model is able to segment 3D images with reasonable results, yet in a sequential manner, i.e. one slice after the other in the volume. This is currently a limitation of the model, as successive slices are processed independently and, despite their similarity, can produce slightly different segmentations. Further work shall focus on enforcing prior morphological information into the model to enhance its robustness.

CONTRASTING MAGNETIC RESONANCE IMAGING AND COMPUTERIZED TOMOGRAPHY IN PALEONEUROLOGY: A COMPARATIVE ANALYSIS

Frittitta, Riccardo (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara (Italy)) - Profico, Antonio (Dipartimento di Biologia. Università di Pisa (Italy)) - Arnaud, Julie (Sezione di Scienze Preistoriche e Antropologiche - Dipartimento di Studi Umanistici. Università degli Studi di Ferrara (Italy); UMR 7194 - HNHP - Département Homme et Environnement. Muséum national d'Histoire naturelle, Paris (France))

Paleoneurology, a discipline within palaeoanthropology, aims to reconstruct the brains of extinct hominids using fossilized cranial remains.

Magnetic Resonance Imaging (MRI) and Computerized Tomography (CT scan) represent two distinct methodologies utilized in paleoneurology, each offering unique insights into ancient brain size, morphology, and variability. MRI is a non-invasive imaging technique and provides high-resolution images of soft tissues in living organisms, enabling researchers to explore brain anatomy and function in vivo. In contrast, endocast imaging (through CT scan) involves the creation of digital casts of the brain's inner surface from fossilized crania, offering insights into brain morphology and evolution across different species. While MRI facilitates real-time imaging and dynamic analysis of brain structures, endocast imaging provides static representations of brain morphology, primarily constrained by the quality and preservation of fossil specimens. Despite their disparities, both techniques play focal roles in advancing our understanding of brain evolution and adaptation in extinct organisms, underscoring the importance of integrating multiple imaging modalities in paleoneurological research.

This work aims to delineate and present the preliminary results regarding fundamental disparities between MRI and endocast imaging modalities, focusing on their principles, applications, and limitations. In this study, data from MRI and CT scans of thirty-seven living anatomically modern humans (AMHs) were employed using a new methodological approach. By applying principles of virtual anthropology, sixteen anatomical landmark points (Type I) were delineated to primarily analyze correlations between endocast and corresponding brain morphologies, through Principal Component Analysis (PCA), and Partial Least Squares (PLS). This approach offers insights into the relationship between cranial morphology and brain structure, shedding light on patterns of variation. Preliminary results show a correlation between the two datasets concerning brain volume and shape equal to 95,13%.

669 OTTOMAN-ERA/HISTORICAL ARCHAEOLOGY: MATERIALS AND METHODS IN CONTEXT

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Moudopoulos-Athanasίου, Faidon (Catalan Institute of Classical Archaeology) - Vionis, Athanasios K. (University of Cyprus)

Session format: Regular session

The various contexts of the Ottoman Empire span over 600 years and range from the Middle East to North Africa, Eastern and Southern Europe. While the same terminology is used for all regions, the impact of imperial influence among the various provinces is quite distinct, although differences and special characteristics emerge even within the same geographical or modern political units.

Although the field of Ottoman Studies and its focus on textual evidence comprises a well-established discipline, the archaeological investigation of the period is a recent development – grosso modo from the turn of the 20th century. Archaeological surveys, excavation projects and the study of relevant aspects of material culture developed recently as an outcome of systematic regional field projects in the Mediterranean but also from the postcolonial shift that rendered value to the 'local' or 'indigenous' archaeologies of the post-medieval era. Furthermore, the combination of archival research and archaeological methodologies have produced a rich databank that contributes to debates in both disciplines, History and Archaeology.

This Session invites contributions assessing results emerging from the Ottoman-era/ Historical Archaeology of Eastern and Southern Europe and the coastal areas of Turkey and the Levant. We focus on a broader methodological framework, from the intersections of Archaeology, Anthropology and Ethnography to material culture studies and the analyses of organic remains, as well as from approaches to natural and cultural landscapes, rural economy and daily life. Beyond addressing a specific subject, site or micro-region, we strongly encourage contributors to reflect on the broader imperial or disciplinary framework, placing their case-studies within a larger context to promote interdisciplinary and trans-border discussions and wider syntheses.

ABSTRACTS

1 LARISSA DURING THE OTTOMAN PERIOD; EXPLORING THE CITY'S NETWORK TIES THROUGH THE MATERIAL REMAINS

Thamnopoulou, Anastasia (University of Bonn)

Following the Ottoman conquest in the late 14th century and the establishment of the Tirhala sanjak in modern central-north Greece, the city of Larissa experienced a gradual growth in size and importance. This paper aims to investigate Larissa's development into a thriving commercial center, known at the time as Yenişehir-i Fener. The 'new city' soon became a hub for trade and commerce, with boasting workshops and connections that linked its residents to global markets.

Travelers' accounts, administrative records, and other written sources depict Larissa as a vibrant city with a substantial Muslim population strategically positioned at a crossroads, leveraging its geographical position for economic growth. The recently excavated Ottoman marketplace, the bezesten, provides material evidence supporting this narrative. Ceramic and porcelain remains tell the story of a city with access to global trade networks and availability in commercial goods. However, what trade connections were established throughout the almost five centuries of Ottoman rule in the region, how were these performed, and eventually how did they potentially affect the local populations and the social dynamics in this urban center, are some of the questions that need to be explored.

An interdisciplinary methodology that incorporates historical and archaeological perspectives, means in addressing each discipline's limitations, in an attempt to discuss the Ottoman past of Larissa and contribute to a more complete image of the city's development and its position in the world map.

2 UNVEILING BUCHAREST'S OTTOMAN LEGACY: ARCHAEOLOGICAL INSIGHTS INTO BUCHAREST'S HISTORIC INNS

Gavrila, Elena (Bucharest Municipality Museum) - Motei, Raluca-Iuliana (Bucharest Municipality Museum) - Pîrvulescu, Dan (Bucharest Municipality Museum)

The historic inns of Bucharest serve as reminders of the significant Ottoman influence within the Wallachia principality from the late 17th to the 19th centuries. Located in the middle of trade fairs or near them, these inns had an essential role in stimulating commercial and artisanal endeavors by facilitating the steady influx of goods from overseas. Most of the inns from Bucharest had a rectangular shape, with an interior courtyard reminiscent of those found in the Ottoman Empire. Access was made through one or two gates that were locked during the night or in times of danger. The massive walls, with small sized windows on the upper floors together with the secured entrances were necessary to ensure the protection of the merchants and their goods during a period marked by armed conflicts, robberies and natural disasters.

Despite accommodating a variety of activities, numerous of these establishments were short-lived, only a few of them managing to adjust to modern standards and pass the test of time. The gradual disappearance of these inns from the urban landscape of Bucharest, that mainly took place in the late 19th century, represented a significant loss for the city's heritage.

Archaeological investigations conducted in the historical center of Bucharest revealed foundations, cellars, wall structures and artifacts belonging to these long-lost inns. These discoveries complement the information documented in historical records, plans and notes from the era, all together contributing to the rediscovery of an important part of the Bucharest's Ottoman legacy.

3 SETTLEMENT FROM THE OTTOMAN-ERA (XV-XVII CENTURY) NEAR THE VILLAGE OF TARNAYANE, VIDIN REGION

Stalev, Konstantin (NAIM-BAS) - Vasileva, Elena (NAIM-BAS)

The archaeological study carried out near the village of Tarnayane in the Vidin district of Bulgaria provides a comprehensive overview of the history of the site from the Early Bronze Age to the Ottoman-Era. This report, which was initiated as a result of construction work, shows the extensive use of the site over millennia, which is emphasized by the findings of three different necropolises and a variety of residential and community structures. One of the most important findings is the transition from cremation to inhumation in the burial rites, which indicates cultural changes over time.

The Ottoman period forms the core of the study and shows a range of living conditions through dugout and above-ground dwellings as well as evidence of domestic and economic activity through ovens, hearths and a Christian necropolis with a west-east orientation. The report describes the material culture of this period through artefacts such as pottery vessels, including imported majolica, metal domestic objects, coins and animal bones dating from the 15th

to 17th centuries. These finds underline the economic and social dynamics of the settlement and its links to wider regional trade networks. Through the use of interdisciplinary research methods, including geophysical surveys, archaeometric analyses and anthropological studies, the investigation provides a nuanced understanding of the historical significance of the site. This detailed archaeological exploration requires further analysis to fully integrate the Tarnyane settlement into Bulgarian history, which promises to enrich our understanding of the region's past. The ongoing study underlines the potential of interdisciplinary approaches in uncovering the complexity of historical settlements and thus makes an important contribution to the field of archaeology in Bulgaria and beyond.

4 A GLIMPSE OF OTTOMAN SOFIA THROUGH POST-MEDIEVAL GLASS

Nikolova, Veronika (PhD student at the Bulgarian Academy of Sciences)

Sofia – the present-day capital city of Bulgaria – has been an important centre in the Balkan territories of the Ottoman Empire, from the conquering of the town in 1383/1385 until the defeat of the Ottoman troops by the Russian Western Squad in 1878. Because of its strategic position Sofia has served for centuries two important key administrative roles in the Empire, being the seat of the Eyalet of Rumelia – the major unit of the Ottoman lands in Europe – and also the capital of the Sanjak of Sofia.

These circumstances placed Sofia as an important economic and commercial centre in the Empire. During the 15th – 17th c., Sofia was flourishing, as the whole of the Empire. The prosperity of the town is confirmed both by the written sources and by the material remains of the period. The construction of new buildings, as well as imported luxury goods testify to this. Among those imported goods are the glass vessels, brought mainly from Italy, but also from other glass production centres in Europe and from the core Ottoman regions.

This presentation aims to provide an overview of the glass vessels found in Ottoman Sofia. Summarized information regarding the functional and typological diversity of the finds, their dating, and importantly about the origin of the vessels will be presented in an attempt to reflect on wider economy of Sofia in the 15th – 18th c.

Despite being often a neglected archaeological material, glass vessels are found over large areas in the Empire. Therefore, enhancing our systematic knowledge about the vessel glass consumption in important urban centres of the Ottoman Balkans, such as Sofia, can provide better understanding of the trade connections between the Oriental East and the European West and also to shed light on everyday life of the population.

5 SMOKING PIPES AND OTTOMAN LANDSCAPE : THE EXAMPLE OF UPPER MESOPOTAMIA

Guedeau, Nolwenn (Bonn University; Aix-Marseille University)

The present-day Iraqi Kurdistan region had a special position in the Ottoman Empire. They enjoyed administrative autonomy and the region was for a long time the battleground for the border between the empire and the Persian Qadjar dynasty. Thus we are in a hybrid and eclectic region. To understand questions of identity in this context, we will use material culture, and particularly clay smoking pipes. Pipes are a quantitatively very important type of object on every Ottoman sites. Their use coincides with the appearance of tobacco in the early 17th century, its consumption rapidly reaching all strata of the population (men, women, children, rich, poor). Pipes were produced in the large urban centres, such as Damascus, Cairo, or in the imperial workshops of Istanbul. However, each village had its own production for regional consumption. The aim of this paper will be to see how Kurdistan, and its multiple influences, is an interesting case study for understanding Ottoman imperialist economy over local communities.

6 MILETUS WARE: A RECONSIDERED VIEW

Dikkaya, Fahri (TED University)

Miletus Ware stands out as the quintessential archaeological material shaping the material culture of 14th and 15th century Anatolia and the Balkans. It has remained a subject of significance and contention in discussions on Ottoman material culture since Friedrich Sarre's initial description during the 1930s Miletus excavations. Departing from Sarre's characterization, Prof. Aslanapa of the Istanbul Art History School asserted that this pottery tradition should be linked to Iznik, not Miletus, labeling it as "Early Ottoman Pottery. In contrast to this Ottoman-centric categorization, Prof. Peker, also from the same school, offered a more comprehensive perspective within the Anatolian context, defining it as "Anatolian Principalities Period Pottery. These debates have significantly influenced the interpretation, distribution, and production analysis of Miletus Ware to date. Nevertheless, recent excavations yielding Miletus Ware samples are challenging existing notions regarding its distribution and production. This prompts critical questions: Is Miletus Ware truly an Ottoman production? Does it exclusively represent Anatolian Turkish material culture? This paper aims to reassess Miletus Ware in light of these inquiries, scrutinizing the pottery tradition with fresh data gleaned from recent excavations and research.

7 A NETWORK OF CONSUMPTION: THE DISTRIBUTION OF ORIENTAL DECORATIVE CERAMICS IN HUNGARY AND THE BALKANS DURING THE OTTOMAN PERIOD

Komori, Tünde (Central European University)

The presentation discusses oriental decorative ceramics excavated from Ottoman archaeological contexts in present-day Hungary, Romania, Bulgaria, and Serbia, such as Chinese porcelain, Iznik ware, and Persian faience. The main research questions connected to these types of ceramics include their distribution and by extension the trading network in Ottoman Rumeli, and the social value of these objects. The paper argues whether these vessels that are excavated from archaeological contexts can be considered luxury or merely prestigious everyday objects; as well as whether they were part of the commercial items called *res Turcica* in Habsburg sources, or they were personal belongings of the higher ranking officials of the Ottoman Empire. The second argument focuses on the involvement of the Ottoman Empire within the global long-distance trade of the sixteenth and seventeenth centuries based on the identification and mapping of the distribution of the Chinese porcelain sherds excavated in Rumeli. To this day it is unclear exactly how Chinese porcelain arrived in the Ottoman Empire, and the mapping of the porcelain finds in Ottoman Rumeli aims at providing more information towards solving this question.

8 VOICES FROM AFAR: THE POST-MEDIEVAL AND OTTOMAN PERIOD BURIALS AT THE MONASTERY OF AYIA NAPA, CYPRUS

Christofi, Polina (Department of Antiquities, Cyprus; "Saint Epiphanius" Cultural Academy, Institute of Studies Research and Culture)

The Monastery of Ayia Napa is considered to this day one of the most important pilgrim sites at the island of Cyprus and a landmark of the local community, with archaeological evidence dating its architectural development as early as the 13th century AD. Archeological research within the Monastery of Ayia Napa was initiated in 2019, mainly focusing on three different areas of interest. The present paper aims to draw a complete picture of the area/ sounding west of the 14th century church, which relates to strata of the 16th to the late 18th and 19th centuries, and to suggest a working theoretical model for its study.

West of the 14th century church and in front of the entrance to the underground chapel, primary and secondary burials were unearthed from three different strata. I will present the recently published anthropological data in the light of their contextual significance for the history of the Monument, taking into account historical sources, such as traveler accounts. My aim is to address a number of theoretical questions that I will attempt to answer by establishing the identity of the people interred. The main question I will try to tackle is the establishment of a terminus for the local belief systems. Special reference will be made to the modern belief that wants infertile women to conceive with the help of the icon of Virgin Mary of the Ayia Napa Monastery, as well as to Medieval accounts describing the Holiness of the local icon. Finally, adopting the basic principles of our discipline, based on the stratigraphical data, I will propose a chronological sequence for the material culture associated with the burials.

9 MAPPING THE OTTOMAN BALKANS: BUILDING A SPATIAL DATABASE OF ARCHAEOLOGICAL RECORD FROM THE OTTOMAN PERIOD IN BULGARIA

Kirilov, Chavdar (Sofia University) - Staykov, Vladimir (National Archaeological Institute with Museum - Bulgarian Academy of Sciences) - Darakchieva, Maria (Sofia University)

In 1925, the first Ottoman archaeological site in Bulgaria was partially excavated. Located near the village of Kalugersitsa in northeastern Bulgaria, the site was a Christian cemetery. As we approach the centennial next year, Ottoman archaeology in Bulgaria is on the verge of celebration. Despite the passage of time, however, it is still an underdeveloped scientific discipline, as in other modern countries that emerged after the collapse of the Ottoman Empire.

Nevertheless, hundreds of archaeological sites from the Ottoman period have been excavated in Bulgaria over the past century. These excavations have been driven by both scientific curiosity and compulsion, as Ottoman-era structures and layers often occupy the uppermost levels of many multi-layered sites. However, despite these extensive efforts, the results of these investigations have rarely been published, let alone thorough, and a comprehensive study of the Ottoman-era archaeological heritage in Bulgaria has never been undertaken.

To fill this gap, we have embarked on a project funded by the Bulgarian National Science Fund. Our mission is to create a spatial database that will provide a snapshot of archaeological research on the Ottoman period in Bulgaria. The database aims to summarize existing knowledge and to lay the groundwork for future, more in-depth studies. In this report, we present the first 18 months of our project, detailing our methodology, data collection processes, database structure, and initial analysis results. Our goal is to shed light on this period, which has been largely neglected in the field of archaeology. In doing so, we hope to contribute significantly to a deeper understanding of Bulgaria's rich archaeological heritage from the Ottoman period.

THE STATUS OF ANTIQUITIES IN THE OTTOMAN EMPIRE

Lekka, Anna (Greek Ministry of Culture)

European romantics and lovers of antiquity toured the lands of the Ottoman Empire in order to enrich their collections with objects that they considered to be the basis of European civilization. This phenomenon was reinforced in the 18th century after the French Revolution and the heyday of the strategy of establishing national museums, as well as by the Orientalism movement. The activity of European travellers and archaeologists in the territories of the Ottoman Empire resulted in the issuance of firmans that allowed the transfer of objects outside the empire, as long as they were not related to Islam and Ottoman history. There are many examples of Greek antiquities that were exported by European travellers, from the borders of the Ottoman Empire. Until the first half of the 19th century, there is no evidence of any law defining the status of antiquities. In 1835, Muhammad Ali, the Ottoman Khedive of Egypt, issued a decree banning the export of antiquities, established the Cairo Museum and the Egyptian Antiquities Authority, which remained under French control for 94 years. These practices were maintained under the British Protectorate (1914-1922). In the late Ottoman period, antiquities are associated with concepts related to the consolidation of the empire, international relations, power struggles, and the definition of national and cultural identity. Ottoman laws after 1864 stipulate their free movement within the borders of the empire and the prohibition of their export.

By examining the antiquities laws, that were in force during the Ottoman period and some typical examples of the transfer of antiquities within and outside the empire, we will attempt to describe the way in which the protection of cultural heritage was perceived in its various regions.

INTER-IMPERIALITY AND HERITAGE: COLLECTING AND DISPLAYING ARTEFACTS IN MID-19TH CENTURY ROMANIA

Coman, Roxana (inherit - Heritage in transformation | Käte Hamburger Kolleg | Humboldt University of Berlin)

Defined by Lauren Doyle as “a political and historical set of conditions created by the violent histories of plural, interacting empires and by interacting persons moving between and against empires” (Doyle, 2020) inter-imperiality is a concept that provides much needed insight into heritage studies. 19th century (former) Ottoman provinces of Wallachia and Moldavia were navigating between the imperial centre of Constantinople, building a nation state and undergoing an intense process of Westernization.

This proposal aims to focus on the collaboration between private collector, archaeologist, Dimitrie Papazoglu, and Alexandru I. Odobescu, archaeologist and the Commissioner for Romania’s pavilion at the Universal exhibition in 1867, Paris. Papazoglu’s private collection contained a significant amount of Islamic and Ottoman era artefacts, along with Roman, Greek, Egyptian antiquities. In 1867, he offered a number of objects to be exhibited by Alexandru Odobescu in the pavilion Romania prepared for the 1867 Universal Exhibition. This particular dynamic brings forth a recently considered dimension for heritage (Özlü, 2022; Çelik, 1992), that of the colonial, inter-imperial display mode within the framework of international fairs. Questioning the agency of collecting Islamic and Ottoman era artefacts in a nation-building and Westernizing context, and that of exhibiting artefacts in an international fair, this proposal intends to consider material culture as a mediating tool. The display strategies and the types of artefacts selected for the exhibition facilitate a better understanding of how archaeology, and heritage were defined.

TEKKES AND TÜRBES IN EVROS REGION. BETWEEN MATERIALITIES AND LIVED COMMUNITIES

Mylonelis, Ioannis (Aristotle University of Thessaloniki)

The Ottoman monuments of the Balkans today represent a part of the cultural heritage of the Ottoman Empire. In the case of Greece, the monuments are the “remnants” of the former Ottoman past and could be seen as a “palimpsest” whose upper engravings also mark the erasure of this past. The final deliverable of this process is only the preservation and display of the materialities, usually with museological characteristics. The region of Western Thrace is perhaps the only geographical part of the Greek territory, where Ottoman monuments and communities are located, which maintain connections between them to this day. Our research resulted in the systematic recording of old and modern places of worship and the search for the various cultural and religious events that make up the mosaic of the Muslim community of Thrace. A ‘mosaic’ composed of individual communities within the Muslim minority, with commonalities, such as that of Muslim identity, but also differences, such as those of what used to be called ‘mystical Islam’, known in the literature as ‘Sufism’. This article will attempt to highlight the Sufi monuments in the geographical area of Evros and trace the relationships that develop between the monuments and the living communities of the Alevi-Bektashi.

GLOBAL INTERACTIONS IN THE LATE OTTOMAN AND BRITISH MANDATE BOSNIAN COASTAL TOWN OF CAESAREA MARITIMA, PALESTINE

Eger, Asa (University of North Carolina-Greensboro)

The site of Caesarea Maritima was among the largest city-ports from the founding of its Roman era harbor through the Crusader Period and beyond. While numerous archaeological projects have explored its classical remains, few excavations have addressed the city’s fate following the Muslim conquest. None have included investigation into its last period, an Ottoman established Bosnian refugee “camp” village from 1878-1948. Equally, the National Park of Caesarea reveals hardly anything of this settlement. The now diasporic small community of Bosnians, part of Palestine/Israel’s history, is erased. In 2022, the Coastal Caesarea Archaeological Project began conducting excavations in an unexplored portion of the northern area within the Crusader walls. Among its excavation units, the project deliberately selected a Late Ottoman Bosnian house to excavate in full. While the results are still preliminary, the excavations reveal a multi-story well-built stone house unlike typical Palestinian Arab houses, built directly over Crusader structures and incorporating spolia. The material culture comprises globally sourced luxury items from the Ottoman Empire, France, Germany, Japan, China, New York, and beyond. This project aims to resurrect Late Ottoman Bosnian Caesarea through public history combining excavation and oral histories of descendants of its Bosnian residents and founders of the neighboring kibbutz of Sdot Yam. The project joins a small handful of projects that have embraced interdisciplinary modes of archaeology and public history in Israel looking at the Late Ottoman and British Mandate periods. This paper will present one aspect of the 2022-2023 field seasons, its latest phase, tracing global maritime connections in the final phase of the port of Caesarea.

POTS IN TRANSITION: RESILIENCE, CHANGE, AND REVIVAL IN CENTRAL ASIA AND ITS NEIGHBOURHOOD FROM THE PERSPECTIVE OF CERAMICS RESEARCH

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Fusaro, Agnese (University for Foreigners of Siena - International University) - Puschnigg, Gabriele (Institute of Iranian Studies, Austrian Academy of Sciences (Austria)) - Bruno, Jacopo (Sapienza University of Rome (Italy))

Session format: Regular session with presentations + final discussion

Central Asian ceramics, of both pre-Islamic and Islamic date, are a very vast field of study, where many different areas of scholarly expertise, methodological approaches, and academic traditions converge. Indeed, the pottery itself is highly diverse, but at the same time many links and correspondences are traceable through time and space across assemblages of different periods and regions. Therefore, comparative analysis and data sharing between ceramic corpora of different sites are fundamental to a better understanding of such complex and multifaceted dynamics. The lack of common standards and methodology in ceramic processing and data collection, however, often inhibits any comparative approach.

As scholars working in this field, we feel the need to set the state of the art and shape a new agenda in Central Asian ceramic and material culture studies.

Many issues are still to be thoroughly investigated; among them, we have chosen particularly stimulating topics that are deemed to raise lively debates:

- the complex issue of the transition between the pre-Islamic and the Islamic periods as visible in ceramics: cut or continuity;
- the revival of past fashions, techniques, styles, colours, etc. in ceramics;
- communal uniqueness (unique technology, unique use of specific raw materials, unique style, etc.) of ceramic productions, how to interpret them? local response/originality or contacts with distant cultures that are not otherwise evident;
- towards a common agenda and a minimum standard for recording and classification of Central Asian pottery: proposals and case studies.

Speakers are welcome to present data from their archaeological or art history projects, but at the same time are very much encouraged to pay attention to the methodological aspect of their research work, aiming for a final discussion on new standards, shared analytical approach, online platforms, and meeting places for interchanging news, projects, ideas.

1 UNVEILING POT-ENTIAL STORIES OF GREY WARES IN NORTHEASTERN IRAN AND SOUTHEASTERN CENTRAL ASIA FROM THE CHALCOLITHIC TO THE IRON AGE

Abric, Camille (Paris 1 Panthéon-Sorbonne; UMR 7041 ArScAn – VEPMO) - Lhuillier, Johanna (CNRS - UMR 5133 Archéorient)

Since the emergence of Burnished Grey Ware ceramics in the second half of the 4th millennium BCE, until the characteristic production of Archaic Dehistan in the second half of the 2nd millennium BCE, the appearance, disappearance and reappearance of grey wares in Northeastern Iran and Southeastern Central Asia have been interpreted in various ways by archaeologists. Diffusionist and migrationist theories from the 1960s-70s, at times tinged with nationalism based on the chosen trajectory, from Indo-Europeans to Iranians, scholars have often favored the ethno-linguistic thesis in the history of research to explain these phenomena. Today, with the advent of paleogenetics, it is crucial to reexamine a classic debate in ceramic studies, especially for ancient periods where texts are lacking: can we really establish the equation “pots = peoples”? However, a single approach is insufficient to comprehend the developmental trajectories of populations associated with grey wares.

Far from essentialist and evolutionist theses, which sometimes seem to conceal a fantasy of origins, this paper proposes, on the contrary, to consider Northeastern Iranian and Southeastern Central Asian grey wares systematically. Their study should not be limited solely to typology but should also explore their materiality using the ceramic technology method, in order to better highlight the producers as actors and thus contemplate their place within society, both locally and regionally. The adopted approach is not only synchronic but also diachronic, offering a comprehensive perspective on the evolution of this type of ceramics over time.

2 POTTERY ANALYSIS AND THE OXUS CIVILIZATION. REVIEW AND STRATEGIES FROM TOGOLOK DEPE 1 AS A CASE STUDY

Luneau, Elise (Deutsches Archäologisches Institut, Eurasien-Abteilung; CNRS, UMR 8215) - D'Ippolito, Luana (ISMEQ; University of Trieste)

The pottery characterizing the Oxus Civilization (ca. 2300-1400 BCE) in southwestern central Asia is commonly associated with a unique type of ware, defined as fine and wheel-fashioned. This observation is one example among the various issues concerning the study of ceramics at sites related to the Oxus civilisation. We will outline the current biases linked to the choice of the ceramics being studied and to the lack of analysis standards.

To illustrate these obstacles in studying the Bronze Age pottery production, circulation and use, the ceramic assemblage coming from the major Oxus settlement of Togolok Depe 1 in Turkmenistan will be used as a case study. Recent archaeological work within a joint Turkmen-Italian-Swiss Mission at Togolok Depe 1 provides new first-hand data for (re)analyzing the characteristics of the Oxus pottery production in the inner Murghab delta of Turkmenistan and assessing the sociocultural processes of transition throughout the Bronze Age. The paper aims to review and clarify the methodological issues and encourage ways of overcoming them to move towards a greater homogeneity and consensus in the study of ancient pottery in Central Asia.

3 POTTER'S MARKS, THE STORY BEHIND THEM

Ebrahimiabareghi, Setareh (University of Bern; ArchaeoConcept)

This presentation delves into the archaeological landscape of Tepe Sadeh in Sistan, shedding light on potter's marks discovered in this region and other ancient settlements across eastern Iran and Central Asia. Different marks and symbols have been seen on different parts of the pottery. These symbols remained undeciphered and are usually known as the potter's marks. These symbols and marks on pottery have intrigued archaeologists, leading them to examine their meanings and functions within their cultural and social contexts.

This presentation aims to explore the meaning and functions associated with the potter's mark, focusing mainly on Tepe Sadeh in Sistan. It delves into the potential categorizations of these marks, such as trademarks, clan identifiers, or counting marks. Can Potter's marks be compared to early writing systems? Through comparisons and distinctions across various sites, particularly Tepe Sadeh, this presentation seeks to establish connections between them and the possibility that these marks served as a form of communication.

4 THE ACHAEMENID “MIRAGE” IN GANDHĀRA: A STUDY OF THE 5TH-4TH CENTURIES BCE POTTERY FROM BARIKOT (SWAT, PAKISTAN)

Iori, Elisa (Max-Weber-Kolleg, University of Erfurt)

To what extent the Achaemenid domination had an impact on the preexisting socio-economic fabric in Northwestern South Asia is a puzzle. As for the Gandāra satrapy, the apparent absence of references to Achaemenid officers, the lack of Achaemenid administrative centres, and the late or post-Achaemenid date suggested for the diffusion of “tulip bowls” at Charsadda and Taxila have raised several debates about the nature and duration of Achaemenid control at the Eastern edge of the empire.

The distinctive ceramic assemblage of the 5th-4th centuries stratigraphy at Barikot (Swat, N Pakistan), however, draws attention to the fact that, whatever the form of Achaemenid control in the Gandāra satrapy, the Achaemenid rule had some tangible effects on urban society considering how the material culture, and thus social behaviour, changed in the relatively isolated mountain area of Swat.

Building on the main results of the study of 5th-4th centuries ceramics of the city of Barikot, this contribution discusses the socio-economic changes fostered by the annexation of the NW South Asia to the Achaemenid empire.

5 PARADIGMS OF CHANGE AND CONTINUE IN SASANIAN AND EARLY ISLAMIC VESSEL SHAPES AND DECORATIONS

Ziaii-Bigdeli, Layah (PhD Candidate)

This presentation investigates the evolution of tableware during the Sasanian and early Islamic periods highlighting its role in the development of elite social bonds and cultural identities. It posits that the Iranian elite's cultural identity was crucial to the Sasanian political framework, with elite social practices strengthening connections within elite networks. An examination of vessels through foodways and social archaeology lenses demonstrates how the designs and motifs prescribed specific use and practices. This analysis draws from a comprehensive database of Sasanian and early Islamic vessels, collected since 2019, incorporating materials from recent excavations and museum collections.

Despite the decline of the Sasanian Empire as a political entity, its material culture production persisted. The elite's access to luxury items continued, and in the post-empire landscape, various societal segments endeavored to elevate their status within the new socio-political context. Success in amassing cultural and economic capital translated into enhanced social power and fortified social connections. This drive for social advancement and status led to the mass production and standardization of goods, adhering to cosmopolitan artistic trends and signaling the advent of Early Islamic economies. These developments, alongside intensified trade with China, the decline of Sasanian and Sogdian metal workshops, technological advancements, and the adoption of Arabic as the lingua franca, significantly impacted material culture production.

Tableware, in particular, embodies these dynamic shifts, serving as symbols of prestige and practical tools within systems of taxation and monetary exchange. This study focuses on the artistic evolution of early Islamic tableware, exploring narratives of continuity and transformation while emphasizing the enduring significance of cultural heritage. It also sheds light on critical socio-cultural and political shifts that fueled these material culture transformations, offering insights into the complex interplay between culture, identity, and social hierarchy during this transformative era.

6 COARSE WARES FROM THE SURKHAN DARYA VALLEY (SOUTH UZBEKISTAN). CONTINUITY AND CHANGE BETWEEN THE KUSHAN AND THE ISLAMIC PERIOD

Bestetti, Maura (ERAAUB - Universitat de Barcelona) - Martínez Ferreras, Verónica (ERAAUB - Universitat de Barcelona) - Gurt Esparraguera, Josep Maria (ERAAUB - Universitat de Barcelona) - Ariño Gil, Enrique (Department of Prehistory, Ancient History and Archaeology - Universidad de Salamanca)

The paper investigates the morphological, compositional and technological characteristics of the most common types of coarse ware in the Surkhan Darya valley dated between the 2nd and the 11th/12th centuries AD. Two sites have been selected as representatives: ancient Termez for the Kushan, Kushano-Sasanian and Islamic periods, and Khosijat Tepe for the Early Medieval period. The research combines the archaeological contextualisation, the typological categorisation and the archaeometric characterisation (through WD-XRF, XRD and OM) of c. 50 vessels. They mainly consist of cooking wares and storage jars with different shapes and macroscopic characteristics. The aim is to identify the production areas and evaluate the continuity and changes in pottery production (functional categories, shape, raw materials, and techniques), and pottery distribution at a regional, trans-chronological level. The comparison between these vessels and parallels from other nearby sites provides further information on the matter. The results reveal that most of the coarse wares found at Termez and Khosijat Tepe were imported from several production areas in the region. The most significant changes can be detected in the shape of the artefacts. Some productions disappear at the end of the Kushan period, whereas others endure over time with similar compositional and technological features — presumably related to the intended performance characteristics of the vessels— but with formal changes. New types

and productions make their appearance especially in the Early Medieval and Islamic periods, suggesting exchanges with different regional pottery production centres, and the possible introduction of new practices connected with social and cultural transformations.

7 COMPOSITIONAL AND TECHNOLOGICAL FEATURES OF GLAZED AND UNGLAZED WARE FROM ANCIENT TERMEZ IN SOUTH UZBEKISTAN (9TH - 14TH CENTURIES AD)

Martínez Ferreras, Verónica (ERAAUB, IAUB, Department of History and Archaeology, Faculty of Geography and History, University of Barcelona) - Gurt Esparraguera, Josep M. (ERAAUB, IAUB, Department of History and Archaeology, Faculty of Geography and History, University of Barcelona) - Ariño Gil, Enrique (Department of Prehistory, Ancient History and Archaeology, Faculty of Geography and History, Universidad de Salamanca) - Georgieva Mihova, Iva (Faculty of Geography and History, University of Barcelona)

Pottery production was one of the main handicrafts in Termez during the Islamic period, as attested by several pottery workshops located in different areas. Starting from a previous archaeological, morphological and stylistic study, we present the archaeometric characterisation of glazed and unglazed vessels recovered by the Spanish-Uzbek IPAEB team in three pottery workshops (W2, W5 and W11). X-ray fluorescence (WD-XRF), X-ray diffraction (XRD) and thin-section optical microscopy (OM) were carried out on c. 70 ceramic samples and several local clayey sediments used as reference materials. The aim is to identify the types of wares produced in each workshop and to provide new insights into the stylistic and technological evolution of pottery manufacture (i.e., the similarities and differences according to the chronology, the type of ware, the shape or the function).

The results demonstrate that W2 and W11, located outside the defensive walls of the rabad (suburbs), were active during the Samanid period (9th-10th centuries AD). W2 mainly produced medium coarse basins, handled jars, and large flat lids for storage jars; pottery production in W11 was more diversified and entailed fine, Ca-rich unglazed items, sphero-conical vessels and glazed ware (principally underglaze painted and splashed sgraffiato). W5 proves that pottery manufacture moved to the shahristan (previous city centre) from the 12th/13th until the 14th centuries AD. The production involved fine unglazed pilgrim flasks with moulded relief decoration, very fine Ca-rich jugs with comb-impressed dots, sphero-conical vessels and glazed items represented by monochrome (i.e. turquoise and green) and splashed sgraffiato ware. Thus, Termez produced a varied repertoire of high-quality ceramics; they exhibit singular traits but are consistent with the changing fashions over time and the continuous influences arriving from nearby and distant territories.

8 GLAZE AND PIGMENT RECIPES IN ISLAMIC CERAMICS FROM TERMEZ (C. 9TH-14TH CENTURIES AD). TRADITIONAL TECHNOLOGIES OR NEW COLOUR EXPERIMENTS?

Panagopoulou, Adamantia (Demokritos) - Martínez Ferreras, Verónica (ERAAUB, Department of History and Archaeology, Faculty of Geography and History, Universitat de Barcelona) - Gurt Esparraguera, Josep M. (ERAAUB, Department of History and Archaeology, Faculty of Geography and History, Universitat de Barcelona) - Pidaev, Shakir R. (Institute of Fine Arts, Academy of Sciences of Uzbekistan)

In the present case study, the manufacturing technology of functional glazed pottery is investigated with a particular focus on the great variety of colours and glaze recipes used in Termez in South Uzbekistan. The finds, dating from the c. 9th-14th centuries AD, came from excavations conducted in pottery workshops located outside the rabad (suburbs) and the shahristan (previous city centre), and in a domestic dump. An assemblage of 30 ceramic fragments was examined for their advancement of production technology (decoration, surface treatment) through these centuries.

During the early Islamic period, pottery was widely produced in Central Asia, especially at important urban centres such as Termez, Samarkand, Bukhara and Akhsiket. Termez was located on the southern border of the ancient region known as Transoxiana or Mawarannahr. Because of its strategic location at one of the crossing points of the Amu River and one of the intersections of the Silk Road, it had a significant political, economic, and military role in Southern Central Asia. Numerous distinct handicraft productions have been identified in various parts of the city, with pottery production being one of the most significant, at least from the 9th century onwards.

The peculiarities of the colour recipes applied to the glazed pottery were investigated focusing on glaze technology and employed colorants. This was achieved by the use of an analytical workflow that considered the compositional details of pigments, slip coatings, and glazes. The physicochemical analysis was carried out utilizing Optical Microscopy(OM), Scanning Electron Microscopy(SEM-EDS) and Raman Spectroscopy. Through a wide range of glaze recipes (lead glazes with tin in some cases or alkali glazes), colour recipes and different underglaze technologies, this study of glazed ceramics was able to define and express the essential elements of each pottery workshop's perception of colour and determine the advanced technological processes involved in decoration.

9 RECONSTRUCTING GLAZED CERAMIC CONSUMPTION PATTERNS AND TECHNOLOGICAL TRADITIONS FROM SAMANID AND KARAKHANID PERIOD TRANSOXIANA

Klesner, Catherine (University of Cambridge) - Parshuto, Vikentiy (Institute for the Study of the Ancient World, New York University) - Mizaakhmedov, Sirojiddin (Samarkand Archaeological Institute, Cultural Heritage Agency of the Republic of Uzbekistan) - Torgoev, Asan (State Hermitage) - Stark, Sören (Institute for the Study of the Ancient World, New York University)

This paper presents the results of the archaeometric analysis of early Islamic style glazed ceramics, specifically slipware decorated vessels, from Central Asia. Glazed ceramics, introduced to the region in the 9th c. CE, served as important cultural markers and demonstrated the intentional affiliation that the residents in Transoxiana developed with the wider Islamic World. While an increase in research in the past ten years has turned to these intricately decorated vessels, some of the largest historical cities in Central Asia have yet to have any systematic study of their glazed ceramics, including the Samanid capital Bukhara. Here we present the study of Samanid and Karakhanid period glazed ceramics recovered from the cities of Bukhara and Tashkent. Building on prior compositional analysis which identified local production of these wares in Bukhara, Tashkent, and Samarkand, here we report the characterisation (by SEM-EDS) of the technological developments in these glazed slipwares during the Samanid and Karakhanid periods. This research provides key insights into the extent of "Samanid" and "Karakhanid" style slipware ceramics in the eastern Islamic World, and addresses questions about the degree of technological similarity between these major production centers and across these two periods. We also consider how these locally produced glazed wares relate to a number of imported glazed finewares from Mesopotamia, and the pattern of locally produced versus imported goods identified from the city of Bukhara, especially glass objects.

10 GLOBALIZED CERAMICS IN MEDIEVAL CENTRAL ASIA: LESSONS FROM A SMALL TOWN (DANDANAKAN)

Rugiadi, Martina (The Metropolitan Museum of Art) - Wordsworth, Paul (University College London)

The ceramic assemblage excavated between 2019 and 2023 in the medieval town of Dandanakan, in Turkmenistan, was produced locally, as confirmed by comparative analyses with bricks from a kiln just outside of the settlement. However, the style and technologies of Dandanakan's slip-painted, sgraffiato, and monochrome glazed wares, molded wares, and unglazed plain wares (mostly ewers), find parallels in ceramics from a large geography that broadly encompasses Khurasan and Mawarannahr. Clearly, similar wares were produced not only at Dandanakan.

Traditionally, medieval ceramic productions in the regions encompassing Iran and Central-Asia were understood as dominated by few centers in the region's biggest cosmopolises (such as Rayy, Nishapur, and Samarkand), a belief that paired well with collectors' need to easily identify visual styles (so-called Sava or Garrus ware, Kashan stonepaste, etc.) and with the few published assemblages. As more archaeological sites are being excavated and published, including Dandanakan, it has become apparent that a constellation of centers, including small towns, produced ceramics that are similar in style and technology.

In this fragmented and globalized landscape, carrying the legacy of epistemological frameworks still attached to the notion of Central Asia as essentially a network of trade in a vastly empty area, how can we understand today the resilience, change, and revival of styles and technologies across a vast region? How can assemblages from small towns further our understanding of the circulation and broadcast of visual languages? How can the study of small towns challenge our understanding of the production, circulation, and broadcast of visual languages?

11 THE LIFE AND AFTERLIFE OF THE ADÈS COLLECTION OF MEDIEVAL PERSIAN CERAMICS

Ting, Carmen (University of Cambridge)

Using the Adès collection of medieval Persian glazed ceramics that are housed at six museums across the UK as case study, this paper seeks to bridge the gap in narratives and approaches in studying intact museum pieces and their fragmentary archaeological counterparts. We draw on a range of non-invasive analytical techniques that are readily available in most museums to reconstruct the life and afterlife of the Adès collection, which comprises ware types including the lustre, mina'i, celadon and turquoise glazed ware. Our preliminary results show that the technologies used to produce these pieces are consistent with the established practices, but different technical traditions can be identified, suggesting these pieces were made in different workshops. Variation in the composition of the body of these pieces highlights the possibility that these workshops were located in different parts of Iran. This finding, in particular, contributes to the ongoing debate on how the production of medieval Persian glazed ceramics was organised. Together with the curators and conservators of the museums and a pottery artist from Iran, we are working towards incorporating this new information in the display of these pieces to the general public.

679 GENDER AND SEXUALITIES IN MATERIAL CULTURE OF THE ANCIENT WORLD

Session theme: 6. The Mediterranean from Within

Session organisers: Santos, Juliana (Université Paris 1 Panthéon-Sorbonne) - Belo, Taís (Universidade de São Paulo) - Pires, Thiago (Centro Universitário Celso Lisboa) - Kibuuka, Brian (Universidade de Coimbra)

Session format: Regular session

We are glad to invite for this session academic papers related to genders and sexualities in material culture of the Ancient World. We would like to debate about different points of views within postmodern perspectives, such as decolonialism, subaltern perceptions, feminist archaeology, intersectionality, women agencies, masculine dominance, patriarchy, etc.

The first studies on ancient gender and sexuality were carried out focusing on describing and attesting the rationality of the biological body through vestiges of material culture, and what were considered the principles of beauty, temperance, virtue and morality associated with the “normative” rules and its predetermined characteristics. Seen differently in today’s perspective, reflections on gender issues can allow us to observe dominant discourses that hide multiple experiences of gender and sexual representations. Thanks to political movements, such as feminism, it allows us to build critical thinking about how we should reflect on peripheral groups and societies. In this sense, the development of the concept of “gender” is linked to the need to be associated with a better understanding of how it operates in societies, which requires thinking about power in different times and places in a more complex way. Hence, the importance of this discussion may highlight how this kind of study is important to the present, revealing and adding an awareness on diverse sexualities and genders. Our objective is to reflect and produce critical and transdisciplinary remarks about material culture that represent and indicate discourses of power, in a search for a broader and updated analysis of materiality.

We invite you to participate with contributions oriented towards the above issues and other similar ones, such as: Science and theory in the study of human remains; Ancient Societies; Invisible people in the past; Intersectionality; Feminism in Archaeology; Decolonialism in the past; Subaltern groups in the past.

ABSTRACTS

1 RETHINKING ROMAN SEXUALITY: UNDERSTANDING SEXUAL EFFECTS OF THE ROMAN EMPIRE THROUGH ARCHAEOLOGICAL DATA

Vucetic, Sanja (University of Sheffield) - Madden, Kelsey (Institute of Classical Studies London)

The current approach to Roman sexuality has emerged from cultural frameworks geared towards studying the socio-sexual dynamics in Rome using textual evidence. Although recent research has moved beyond the penetration model of Roman sexuality, the current frameworks fail to engage with the context-specific socio-economic practices and empire-wide geopolitical forces that framed people’s lives in the colonised territories. Additionally, it prevents us from making sense of the rich archaeological data now available to us. Our understanding of the effects of Roman imperialism on provincial cultural change cannot further progress without an understanding of how the empire impacted people’s socio-sexual lives.

We argue that to progress the modelling of Roman sexuality, we must approach this social phenomenon as shaped by both the empire and local cultural change. We further propose that the investigations of the sexual effects of the Roman empire necessitate a productive dialogue between archaeology, queer, and new-materialist perspectives with previously overlooked factors, including the predatory characteristics of the empire (Fernández-Götz et al. 2020) and the agency of those who contested dominant socio-sexual power structures (Weismantel 2022; Owens 2023). Using the examples from Rome and the provinces, we explore these ideas and demonstrate that the Roman display of gender-based violence was linked to colonial discourse marked by predatory warfare and that sexuality was embedded in the provincial organised economies of power and colonial order.

2 POWER AND WOMEN’S REPRESENTATIONS ON MATERIAL CULTURE FROM THE EARLY EMPIRE: WHOSE VOICE?

Lopez Gomez, Helena (Universidade de Vigo)

Feminine representation in Roman monumental art started during the High Empire. Until then, Roman tradition established that women should not be seen in public and, at the same time, public portraiture and honorific statues were limited to citizens that had developed an important political or military role, areas where women were excluded, and that justified their null public representativeness. However, the switch that took place during the Early Empire should not be understood as a change in dominant discourses about patriarchy and gender roles, but as a coexistence between traditional views on women and their controlled introduction into public discourse. The aim of this pres-

entation is to put forward how Imperial narratives, shaped through traditional views on masculinity, took ownership of women’s representativeness using it on their own behalf, keeping alive key elements of patriarchal discourse about gender roles. At the same time, we also aim at analysing how taking a hold of the contexts of the new feminine representativeness in material culture meant direct control over women and their power of agency, in a way that allowed a coexistence between the ideal of feminine domesticity and a certain degree of public visibility.

3 CANDACE AND MATER PATRIAE: THE CONSTRUCTION OF FEMALE POLITICAL POWER IN AFRICA AND ROME IN THE EARLY ROMAN EMPIRE

Azevedo, Sarah

In this presentation we will discuss the construction of female power in Antiquity, based on the comparison of two examples of titles and positions of power held by women. The first example is that of Candace, a title attributed to the woman who ruled the Kingdom of Kush (or Cush), in Nubia. The second example is Mater Patriae, a title created in the context of the establishment of the Roman Empire, as a way of defining the political activities of the Roman emperor’s consort. Both examples demonstrate expressions of the exercise of political power by women in the same temporality, but in two distinct but connected spatialities. From a comparative perspective, and based on documents from material and written culture, we will analyse the specificities of this connection between Africa and Rome, focusing on the symbolic construction of female power, its implications in politics and the strategies of women like Amanirenas, Shanakdakheto, Livia and Agrippina in search of sharing power with men.

4 LANAM FECIT: »REAL« WOMEN IN ROMAN EMONA

Zupanek, Bernarda (Museum and galleries of Ljubljana)

In Roman times, the perception of sexual identity differed markedly from today’s understanding. The Roman view of gender was distinctly binary: an individual was considered either female or male. In a strongly patriarchal society, a “good woman” was defined as one who cared for the home, spun and wove, and bore sons. Weaving, as one of the fundamental virtues of women, has roots that trace back at least to ancient Greece, so deep that they extend into the realm of myth, as seen in the story of Arachne.

In some graves in the extensive burial grounds of the colony of Emona (Ljubljana, Slovenia), weaving tools - spindles and spindle whorls - were discovered, defining these graves as female. Some of these objects were made from precious amber, not functional, so they were interpreted as indicating the deceased’s status. Upon a review we found more graves with weaving setup than previously identified, yet the spindle in sometimes incorrectly interpreted and the spindle whorl is overlooked, as it could have been added without the spindle, as a pars pro toto. Most spindles are made of bone and there are some doubts about their functionality due to their often-small size.

It seems that these objects rarely denote status, nor are they solely indicative of sex/gender. We believe they represent the expression of ideal femininity, symbolizing a “good” member of the female gender, a “real” woman. Hence, the deceased is someone for whom their relatives, placing objects in the grave, either believed or wished to believe, to have been following the societal expectations and norms of true womanhood. We propose that these at first sight mundane objects are tools for constructing and reinforcing “ideal” gender identity for Emonan women, thus embedding this ideology in everyday life.

5 LIVIA’S COINS AND HER PUBLIC POSITION FROM A CURRENT FEMINIST POINT OF VIEW

Pagoto Bélo, Tais (University of São Paulo)

Women at the end of the Republic and beginning of the Roman Empire experienced social transformations that allowed them to be more publicly visible, especially through Patronage, and Livia, wife of Augustus, was the greatest example.

Livia’s public activities seem to have been linked to religion, in order to maintain her pudicitia, making the political camouflage itself with the religious, opening up space for the empress’ agency, guaranteeing her a position that such women didn’t have before.

Livia opened the way for other imperial women to enjoy an “apparent freedom” and acquire the right to have their names remembered through statues, plaques and coins, which deceived and disguised a male symbolic dominance, contributing to an imperial propaganda.

However, it will be shown how Livia was related to religion and pudicitia, through a material culture compound of coins, with the personification of goddesses linked to fertility, proving success, abundance and dynastic prosperity, and how these virtues enhanced the empire.

In the presentation, the written sources will also confirm that Roman women of that time were part of a hierarchical power, characterised by boasting male government. They were described in family environments, but with several exceptions, demonstrating a complexity between the public and the private.

In conclusion, the aim of this presentation will be to clarify that the main problem here is the position of women in Roman society, since this issue is not outside the scope of the present study. In this way, the exhibition will aim to invite to a reflection on the reality of the present, with the aim of generating awareness of current female factors in contrast to those of women in Antiquity.

6 SEXUALITY OF NORTH-EASTERN BARBARIAN SOCIETIES IN LATE ROMAN PERIOD

Myzgin, Kyrylo (Faculty of Archaeology, University of Warsaw) - Bursche, Aleksander (Faculty of Archaeology, University of Warsaw)

Several shelves of books have been written on gender and sexuality in ancient Rome. In contrast, almost nothing is known to date about the sexuality of societies living east of the Rhine and north of the Danube during the Empire. This is due to the extreme scarcity of sources: the only stereotyped written account in Tacitus' *Germania* and very few finds with native iconography. We will analyse and interpret two distinctive exceptions: certain types of barbarian imitations of Roman coins and one category of miniature gold foiled pendants found in East-Central Europe. While the first group of finds bears depictions relating to male sexual potency, the objects from the second group contain elements associated with female sexuality. Were these representations inspired by ancient art with which the barbarians were in constant contact (images on coins and precious stones, statues of deities, etc.)? Or are we dealing with the result of strictly barbarian representations of sexuality?

7 WOMEN IN INTELLECTUAL CONTEXTS: SELF-PROMOTION, SELF-PRESENTATION, AND GENDER INTERACTIONS IN THE EASTERN ROMAN EMPIRE

Caruso, Ada (Sapienza University of Rome)

Gender studies have been embroiled in Graeco-Roman archaeology for many years, largely addressed to matters surrounding the role of women in cultural contacts and transfers, with a particular focus on the domestic or religious spaces: women have been presented as daughters, wives and mothers in a stereotypical perspective that points to the polarity male/female and public/private. The relationship between women and intellectual contexts is quite underexplored instead. Archaeological research has highlighted only tentative cases through visual evidence (e.g. attic vases or Pompeian houses paintings) illustrating the interest of women in education. Through examining material evidence (statues and inscriptions), I will present three cases of studies from the Eastern provinces of the Roman Empire, which illustrate female presence in odeia, gymnasia and theatres, thus illustrating women participation in the cultural life on the ancient cities.

Such approach has never been applied to gender studies before. My attempt is to offer a theoretical perspective suitable to understand women's involvement in the society and to reshape research approach on the differences between men and women in their corresponding roles and between women and women in the same civic context. This may help to understand how women presented their own identity to the city and, by extension, how they contributed to the construction of the identity of 'woman'.

The geographical ambitus under consideration, the hellenophone provinces of the Roman Empire during the centuries from 1st to 3rd AD, constitute a very interesting ambitus of study with refer to gender aspects, due to the presence of Greek, Roman, Oriental elements, native and migrants co-existing together. These multicultural societies offer a peculiar perspective to investigate dynamics of social mobility and human interactions.

8 EPIGRAPHIC CLUES FOR WOMEN'S LIVES IN ROMAN PROVINCES

Ivezic, Hana (Archaeological Museum in Zagreb) - Radman-Livaja, Ivan (Archaeological Museum in Zagreb)

Basically any Roman agglomeration has left an epigraphic record, ranging from only a dozen up to thousands of inscriptions. A corpus of inscriptions found in a given city always represents a good starting point for the understanding of that city's life and history. Depending on the number of inscriptions, one may find valuable evidence about the city's inhabitants, their origin, occupations, religious beliefs and interests as well as about the municipal administration, urban life in general and important historical events. The research possibilities, while not endless, are nevertheless very large and may cover many different fields. Gender studies have become an integral part of Roman social history and epigraphy is more often than not, one of the best evidence at our disposal for the study of women in the Roman world. Most of the time Roman epitaphs are formulaic and follow well established standards, providing general information about the life of the deceased. Women are most often described by their filiation, marital status and motherhood. This is hardly unusual for a patriarchal society where most women had no true professional career. Nonetheless, the profession or social status is sometimes explicitly mentioned and it is not a totally uncommon occurrence. For this occasion, we are however interested in inscriptions of a more cryptic character, as far as the status of deceased women (or female dedicants of votive inscriptions) is concerned. We will present as a case study half a dozen inscriptions from Pannonia and Dalmatia, which, while not clearly stating their professional or social role, might be implying a somewhat different position than them just being described as daughters, spouses or mothers.

9 WOMEN IN VASE REGISTERS IN CLASSICAL ATHENS: A INTERCESSIONAL ANALYSIS

Santos, Juliana (Université Paris 1 Panthéon-Sorbonne)

In this communication we will reflect specifically on the lives of three different women based on their names on fragments of terracotta vases found in Athens between the 6th and 5th century BC. If there is a name, there is the possibility of building a memory that can weave a great social web. However, when we deal with women's names, we are dealing with a complex structure of invisibilization, which to date ranges from a smaller volume of documentary records, to identification as a potential research object, through analysis, cataloging and storage of material records. Our objective seeks to reflect on how such names could tell us about the relationship between women and the Athenian polis of the period. We will see if the female names are associated with a family group or *genos* of the period, we will investigate the probable origins (regional and morphological) and if there are real or mythological occurrences that can be attested in other documents. Furthermore, we reflect on the association between names and social class, geographic location and what types of vase fragments can lead us back to them.

10 THE METAMORPHOSES OF TRANSVESTITE MEANINGS: THE TRAJECTORIES OF GENDER REPRESENTATIONS IN THE FINAL SCENE OF EURIPIDES' MEDEA

Kibuuka, Brian (Coimbra University)

Some Greek tragedies from the classical period were produced in text, staged and then represented in images painted on vases. This paper uses textual and pictorial discourse analysis and pragmatics to analyse one of these tragedies, Euripides' *Medea*. The aim of the analysis is to map the shifts in meaning of gender representations in the final scene of the Euripidean tragedy, taking into account aspects of the pre-Euripidean myths, the framing of the myth of *Medea* in Euripides' tragedy, the fragments of other lost tragedies dedicated to *Medea*, and the representations of the final scene of the tragedy on Greek ceramics. The analysis of the images will consider the meanings attributed to them in the paintings and those that can be deduced from the multiple contexts of use of the vases. Finally, it will be shown how the same set of codes describing gender performances is subject to transformation depending on the context of its enunciation and the presence of hierarchies between the characters represented - hierarchies related to their gender.

11 REPRESENTATIONS OF GENDER LIMINALITY IN THE CULTS OF DIONYSOS AND CYBELE

Salerno, Emilia (Università di Palermo)

Mythological narratives of ancient cultures are replete with characters whose gender and sexual identity exist between normative definitions of masculinity and femininity. Indeed, the transgression of the male/female gender binary was only acknowledged in the divine realm or through the intervention of deities.

Dionysos/Bacchus and Cybele/Magna Mater *Idaea* stand out as two of the most 'liminal' deities in the Graeco-Roman pantheon. They are often interconnected not only in mythological narratives but also in rituals and processions. Textual evidence consistently highlights how both these gods, and particularly their followers, defy norms related to gender. However, when examining material sources, representations of gender liminality become tricky to assess.

This paper aims to investigate the iconographic representations of priests and devotees of Dionysos' and Cybele's cults, specifically looking for traits that (may) indicate a similar transgression of gender boundaries as recounted in literary evidence. Special attention will be given to a number of exemplifying representations produced under the Roman Empire, such as the famous portraits of Cybele's *galloi* (Vermaseren, *CCCA* 1, 504; 3, 249, 447 and 466) and some representations of satyrs and maenads (e.g. bronze of dancing satyr from Villa of the Papyri, in Herculaneum; Roman copy of a Greek relief of a dancing maenad).

In this paper, I will demonstrate that, although gender liminality is clearly acknowledged as a trait in literary references concerning Cybele's and Dionysos' attendants, its representation in material evidence is not equally straightforward. While ambiguous gender traits are more readily discernible in portraits of the gods or semi-divine creatures, such as *Attis* and the satyrs, representations of human cultic actors typically conform to physical sexual standards. To identify instances of defiance against gender norms in material culture, one must necessarily examine it through the lens of Roman narrative.

12 WOMEN IN SITULA ART BETWEEN ELITE REPRESENTATION AND EROTIC AGENCY

Schaller, Clara (Ludwig-Maximilians-Universität Munich) - Nebelsick, Louis (UKSW Warsaw)

The intriguing and vibrant narrative imagery of 7th – to 3rd century BCE East Alpine Situla Art (repoussé figured sheet bronze symposial sets and costume accessories from graves and sanctuaries) shows elite women participating in festive and ritual events. An iconographic analysis of the gender-specific roles and a comparison with attendant funerary evidence describes a remarkably clear division of activities assigned to men and women within the context of elite pictorial representation.

Interestingly, women appear relatively rarely in Situla Art and predominantly in Northern Italy. While symposial and ritual scenes generally show male figures dominating social performances and women often acting in seemingly subservient roles, our analysis of Situla Art's recurrent erotic imagery reveals predominant female agency. The lower register of a situla from a turn of the 6th /5th century elite woman's grave on the Alpine piedmont near Pieve d'Alpago, Veneto, is the most spectacular example. It tells a seemingly rustic, lusty narrative featuring intimacy, fornication, punishment, and procreation. Remarkably, and in stark contrast to most contemporary Mediterranean iconographies, women in this frieze are shown dominating drastically rendered erotic action within the framework of a female-charged Pan-Adriatic myth. Beyond the exegesis of this remarkable situla, we explore, typify and interpret Situla Art's surprisingly large number of erotic motifs shown within festive narratives and analyse these images, placing emphasis on the remarkably persistent evidence for female agency and authority in this remarkable early Iron Age erotic iconography. In conclusion, we reflect on the realities conveyed by this iconography of female-controlled intimate performances.

13 WOMEN'S GRAVES AND WOMEN IN GRAVES - REFLECTIONS ON FEMALE SARCOPHAGUS BURIALS IN HELLENISTIC ETRURIA

Nazim, Laura (Ruhr-Universität Bochum (Germany))

The Etruscan stone sarcophagi of the Hellenistic period have been studied so far from various points of view, but above all from stylistic perspectives.

In this way, the focus has inevitably been placed on a group of high-quality individual pieces that stands out from the crowd and represents these monuments and their significance within society and its burial rites. However, precisely these unique objects lead to the question of social, hierarchical but also gender specific differences within the aristocratic class of Etruria from the 4th century BC onwards.

Although our knowledge of the public cults, rites and offices in Etruria is not as extensive as in the Greek area, we do know some official titles and iconographic evidence of the political and religious activities of men in Etruscan society.

As far as the female sphere is concerned, the sources are still sparse and sometimes difficult to identify as part of female religious activity.

Reasons for this are missing literary sources such as the lack of depictions documenting the clear holding of an office by a woman, like for example a magistrate's procession as can be documented on the sarcophagi of men.

Nevertheless, hypotheses about female activities and their status in Hellenistic Etruria can be made based on single sarcophagi in comparison with other genres such as mirrors and tomb paintings.

The contribution will analyse the differences and similarities in the treatment of female and male sarcophagus burials regarding the used iconography, the position in the grave and the socialization with other burials in the funerary context. The key questions are:

What evidence of priestesses and ritual acts by women can be documented? How can female-only burials or a significantly higher proportion of women in graves be explained? Which conclusions can be drawn about the iconographical representations on women's and men's sarcophagi?

14 POWERFUL WOMEN IN THE SHADOW: THE RISE AND FALL OF HELLENISTIC MACEDONIAN QUEENS CULTS

Dipino, Luana (Independent Researcher; Sapienza University Alumna)

Compared to their male counterparts, Hellenistic queens are less documented, especially from a cultic and religious point of view. After their initial subordination within marital unions, queens gradually expanded their authority and even asserted themselves politically in critical circumstances, whether diplomatic, military, or political in nature. Many queens distinguished themselves by their abilities, ambitions, and decisive actions, leading to an increasing popularity and the attribution of divine honors similar to those accorded to kings, although more contained in their manifestations, both civic and dynastic. Yet many of them remain invisible to us today.

It is only from the 21st century onwards that female figures have received increased attention, as exemplified by the works of Carney (2010), Caneva (2012), Savalli-Lestrade (2003).

In line with this recent trend, the present study examines the emblematic case of the cults of the Hellenistic Macedonian queens. By comparing literary, epigraphic, and archaeological evidence, we aim to analyze the rise and fall of the Argead and Antigonid queens, showing how the attention devoted to their cults mirrored the power dynamics and popularity of their husbands. Compared to the more nominal honors accorded to early queens such as Eurydice and Olympias, and the exceptional cultic tributes paid to Philas I (spouse of Demetrius Poliorcetes), the later Antigonid queens cults are much less known, save for a few epigraphic references to female figures associated with the Macedonian ruler.

From the available data, it appears plausible that while Hellenistic rulers universally received honors commensurate with their status, the allocation of cultic tributes to queens, especially to a significant degree, often correlates closely with dynastic influence and the queen's perceived power within the kingdom, along with her individual characteristics and achievements.

15 A VIEW ON GENDER AND SEXUALITY THROUGH THE ANTHROPOMORPHIC FIGURINES OF URKESH

Mahmoud, Yasmine (IIMAS)

Anthropomorphic figurines are a powerful tool of subliminal messages as they help to construct aspects of the ideological identities of ancient people. Figurines have the power to transcend their intended function into a larger frame that allows for the assessment of the ancient's perception regarding gender and sexuality.

In this paper, I would discuss the corpus of anthropomorphic figurines from Urkesh/ Tell Mozan in northeastern Syria, as material culture that helps in shedding more light on gender issues. The collection comprises representation of nude females that have varied degrees of sexualization. The main focus will be on the meaning of such specific representations, dividing them into categories and discussing the underlying gender implications of such intentional representations.

The representation of naked females in Urkesh, and in many other sites in the area, is strongly present in the three-dimensional art. This emphasis on the female sexuality that exceeds that of the male's sexuality is one of the focal points of how we and the ancients view gender, views that we share to some extent even in our day and age.

My goal from this paper is to present previously unpublished materials from Tell Mozan, all the while discussing the gender issue that affects many aspects of our lives, recognizing it as a social construct to be analyzed as a specific category.

695 DESTRUCTION, BURIAL OR JUST FADING AWAY. ROMAN CASE STUDIES ON THE DE-SACRALISATION OF RELIGIOUS SITES AND MATERIAL CULTURE IN ANTIQUITY

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: King, Anthony (University of Winchester, UK) - Haussler, Ralph (University of Winchester, UK) - Spickermann, Wolfgang (University of Graz, Austria) - Marco Simon, Francisco (University of Zaragoza, Spain)

Session format: Regular session

The aim of this session is to explore what happened to religious sites when they (or a particular cult or part of a sanctuary) were de-sacralised, profaned and abandoned. Especially in Late Antiquity, many cult places were abandoned, but did they just fade away? Apart from the architectural remains, a particularly interesting question relates to the fate of the religious material culture, such as cult figurines and statues, altars, votive offerings, sacrificial instruments, and priestly garments. Some sites clearly show the deliberate deposition of such artefacts, such as the large metal deposition of carnices, a bronze horse and many more items at the La Tène sanctuary of Tintignac, or the deposition of Roman-period votive and ritual objects, for example from Bury St Edmunds, notably priestly regalia. Sometimes only a part of a sanctuary might be involved, for example when the cult of a particular god or goddess ceased, like Jupiter Dolichenus in the mid-third century CE: did people still consider his cult statues and altars to be 'sacred'? The aim is to investigate various sites from different periods to explore what happened to a cult and its material culture once the worship ceased. What is the meaning behind the depositions of religious items: burial or merely temporary storage? What rituals were involved in this process? It also raises the question of what alternative treatments we can identify, such as the destruction and recycling of de-sacralised artefacts. This session is less interested in the widely studied transformation of 'pagan' sites into Christian churches, but focuses on the afterlife of a religious place, cult and religious material culture.

ABSTRACTS

1 COMPARATIVE APPROACHES TO THE DE-SACRALISATION OF RELIGIOUS SITES IN THE ROMAN WORLD

Haeussler, Ralph (University of Winchester)

Across the interconnected, entangled Roman World, gods/goddesses and their cults come and go. New cult places were established while other deities fell out of favour, lost their benefactors and worshippers. While the foundations of new temples and sanctuaries is well documented, it is much more difficult to fully comprehend what the closure of a cult place entailed. Were sanctuaries and temples, which had been at the heart of a community for generations and

were filled with sacred and devotional artefacts, not to mention priestly regalia and other movable and non-movable objects, really merely abandoned? Or can we identify particular ritual activities relating to the processes of de-sacralisation and ritual closure? Were the cult objects, votive offerings and sacrificial tools destroyed, recycled, repurposed or carefully buried? The aim of this paper is to investigate a series of case studies from across the Roman empire that allow us to explore different scenarios in different periods, such as the closure deposits from Romano-Celtic sanctuaries, the abandonment of an entire town and its sanctuaries (e.g., Glanum in the 3rd century) or the decline and closure of Philae's Isis sanctuary in late Antiquity. This also leads us to a systematic discussion of different categories of objects, analysing cases of careful deposition, deliberate destruction and conscious de-sacralisation: from stone inscriptions to more precious artefacts. Ethnographic analogies are used to provide food for thought to understand the rituals involved when a religious site and/or religious artefacts were abandoned.

2 UBI ERAT LUCUS: RESACRALISATION AND TRANSFORMATION ON THE JANICULUM

Bianchi Mancini, Sofia (Max-Weber-Kolleg, Universität Erfurt) - Pérez Yarza, Lorena (University of Warsaw)

During the Roman Republic, the Trastevere and the Janiculum were located in the extra-urban area of Rome and housed religious places such as the *Lucus Furrinae*. Although this sacred grove is famous as the site of where Gaius Gracchus died, it seemed to fall into oblivion with the transition to the Empire. Simultaneously, the demographic changes brought eastern communities to Rome, which settled beyond the old *urbs* in peripheral areas such as the Trastevere and transformed the landscape of the Janiculum. It was at this time that the new communities began to establish their cults on the Janiculum. A sanctuary to Isis was built but, more importantly, a temple to Jupiter *Helio-politanus* was possibly erected near the ancient *lucus* on an already sacred site. It is no coincidence that archaeological and epigraphic evidence shows the memory of the sacred grove, with the religious recognition of its deities by the new cultores. The documentation illustrates that the *lucus*, or rather its memory, did not fade away, but it raises a historical problem: was the *lucus* abandoned or desecralised? While under Augustus several *luci* were desecralised, there is no record of such happening to the *Lucus Furrinae*, raising the question of how we can understand the overlap and substitution of cults.

The aim of this paper is therefore to discuss the treatment of a sacred space and the mechanisms used to deal with the religious reformulation of the Janiculum by first contextualising this process of transformation through the changes that various *luci* underwent during the Late Republic. The context will then be compared with the material and epigraphic sources from the second century CE, which will shed light on the conceptualisation of sacred sites and how materiality was used to shape the appropriation and refinement of their religious space.

3 VIOLENT DESACRALISATION: EXAMPLES OF ICONOCLASM IN SOUTHERN IBERIA

Marco, Francisco (University of Zaragoza)

In contrast to the limited attraction of traditional research in the material remains of image destruction, the last two decades have witnessed a more than notable increase in interest in iconoclasm, due in part to the effects of the new contexts of fundamentalism and terrorist violence on historiography itself. Images are destroyed because they are recognised as having agency and performativity. They are (inter)active artefacts endowed with a "technology of enchantment".

On this basis, this paper focuses on two significant cases of ancient iconoclasm in the south of the Iberian Peninsula, both belonging to the funerary world. The first concerns the necropolis of Cerrillo Blanco de Porcuna (Jaén), an excellent example of intentional destruction and burial of the past against a backdrop of social crisis at the end of the 4th century BC, which is manifested in other parallels also contemplated. The second, later example, is the so-called "Tomb of the Elephant" in Carmona (Seville), a cave complex with no less than three ritual rooms and adjoining chambers, which dates from the 1st-2nd century AD, already in the Roman imperial period. The interpretation of this complex, the chronology of its violent desecralisation and the attribution of its iconoclastic agents are also assessed. Both cases are viewed from the perspective of the de-ritualisation of the decommemoration of spaces and materials that had previously been activated through ritual, and are analysed in their respective historical contexts.

4 STILL CULT PLACES? EXPLORING THE MEANING BEHIND MONETARY DEPOSITS IN LATE ROMAN SANCTUARIES IN HISPANIA

Gomez, Jose Carlos (Universidad de Málaga)

The practice of monetary offerings in late antique cult places is a widely attested phenomenon in the provinces of Britannia, Gallia, Germania, Pannonia, and Noricum. This practice has been relatively frequently documented in Mithraic contexts or in Romano-Celtic sanctuaries whose monumental areas had been abandoned or dismantled prior to the date of the last monetary deposits. This means that the abandonment of the building does not necessarily entail the end of cult if such deposits were buried for ritual purposes. The presence of coins in some sanctuaries of Hispania has been precisely one of the arguments put forth to justify the continued use of these cult places until the late 4th or

even the mid-5th century, such as the *Endovellicus* sanctuary in Lusitania, the *Muntanya Frontera* sanctuary in *Tarraconensis*, or the *Mithraeum* of Lugo in *Gallaecia*. The aim of this study is to analyse the conditions under which these presumed late antique monetary deposits have appeared, as well as their characteristics and archaeological contexts, to determine if the practice of *iactatio stipis* could have been successful in some Iberian ritual contexts during Late Antiquity.

5 RUINATION, VENERATION AND SACRED MEMORY: THE ENDING OF TEMPLES IN ROMAN BRITAIN

King, Anthony (University of Winchester, UK)

Excavations in the late 20th and early 21st century have yielded high-quality sequences that enable us to explore change and development of individual sites in some detail. For Romano-Celtic and other temples and shrines in Britain, this can give new insights into the ending of temples as sacred sites. A forensic approach is adopted in this paper, with sequences presented for sites such as Hayling Island (Hampshire), Uley (Gloucestershire), Witham (Essex), Higham Ferrers (Northamptonshire), Bath (Avon) and Maryport (Cumbria). There is clear evidence for continued worship and votive deposition at some of these sites after the collapse or demolition of the buildings. At others there is evidence for deliberate deposition of sacred items, and a planned 'closure' of the site. Two, at least, of the sites show some evidence of a Christian presence in their late Roman levels. This prompts an evaluation of the notion of 'sacred memory' in the context of the Resonance framework of Hartmut Rosa. The paper concludes with consideration of religious change, Christianisation and residual paganism in Roman and post-Roman Britain.

6 ROTTEN BUILDINGS, PROFANE USE AND CHRISTIAN COMPETITION: THE END OF THE TEMPLES IN ROMAN GERMANIA AND GAUL

Spickermann, Wolfgang (University of Graz)

Unlike in Italy, for example, the process of the dissolution of provincial religion in the peripheral areas of the former Roman Empire was initially slower and with clear differences. Although many cult places were abandoned due to the destruction caused by the Germanic invasions in the 5th century, in some cases - as shown - the cult activities in the remaining sanctuaries continued for a long time or they were used for profane and cultic purposes. However, the final takeover of Gaul and Germania by the Germanic tribes will have had a serious influence on the religious beliefs and cult practices of the provincial religions. Unlike in the Ostrogothic kingdom of Italy, for example, we are unable to grasp the ideas associated with this due to the lack of crypto-pagan literature known from Italy. We can only infer from the prohibition literature cited in the examples that pagan rites continued to be practised in various parts of the population long after the Christianisation of the Franks. This did not necessarily require intact cult buildings; the population visited the ruined temples or open cult sites on hills or at springs as holy places. My article attempts to trace this process with selected examples.

7 FROM CELTIC CULT PLACE TO ROMAN TOWN: A CASE STUDY IN LAUSANNE-LOUSONNA (SWITZERLAND)

Guichon, Romain (Archeodunum Investigations Archéologiques SA / University of Lausanne)

Recent excavations at the archaeological site of Lausanne-Vidy "Route de Chavannes 15a" (Switzerland) have revealed a well-preserved monument identified as a protohistoric memorial site. A late Bronze age burial mound built on a Neolithic cemetery shows several redevelopments in the late Iron Age, suggesting the transition from funerary to cultic functions. An external ditch with a wooden palisade 30 meters in diameter contains various material deposits of human bones, animal remains, metal objects and numerous fragments of vessels and amphorae. This could be linked to community practices in a context of ancestral or heroic cult, contemporary with the Gallic War. After the monument was dismantled around 50 BC, a proto-urban settlement occupied the area and the first wooden buildings seem to respect the location of the Celtic memorial, allowing the hypothesis of a foundation rite similar to those known in the Greco-Roman world. From the Augustan period onwards, the space seems to be gradually desecralised and became the backyard of an urban *insula* in use until the late Antiquity. The indigenous cult place thus represents a kind of unconscious memory at the heart of the Roman *vicus*. This site is currently being studied as part of a doctoral thesis about the origins of Lousonna at the University of Lausanne (dir. M. Fuchs).

8 AN OVERLOOKED TREASURE IN THE LATE GALLO-ROMAN TEMPLE OF COBANNUS (BURGUNDY, FRANCE)

Perruche, Rebecca (UMR 6249 Chrono-Environnement) - Nouvel, Pierre (UMR 6298 Artheis)

The sanctuary of Cobannus, near Dijon, in the Burgundy region, is under excavation since 2019. The site is a fairly typical Gallo-Roman sanctuary, with a square temple, surrounded by a stone temenos wall. It was built over the rectangular Iron Age ditch, which was presumably used as a container for votive offerings.

However, the site is best known for the discovery, long kept secret, of an extraordinary treasure trove of Roman statuary and ritual furnishings. Unearthed illegally in 1977, its contents were sold by its discoverer and dispersed among prestigious American collections. In 2007, shortly before his death, full of remorse, he finally confessed everything.

The treasure was buried outside the sacred enclosure in a simple pit covered with tiles. The most valuable artworks were the bronze statue of Cobannus, a local deity who was equivalent to Mars, and a pair of portrait busts of rich young boys from the 1st century AD. It also contained numerous small statues, gold jewellery, metal vessels and at least 6,000 coins, stacked in three separate arcas (offering boxes). The most recent coinage dates from the reign of Julian the Apostate (around 363). This treasure therefore represents the closing deposit of the sanctuary, perhaps hastily created in the middle of the 4th century. However, this burial did not signify the end for the sanctuary. Coins of Valentinian and Theodosius indicate that it was still used as a pagan temple until the end of the 4th century. All the buildings were then violently destroyed by a fire, which led to the final abandonment of the temple.

The aim of this paper is to discuss the question of the end of sanctuaries in the Eastern Gaul, as well as the particular journey of the treasure of Cobannus.

9 FROM TEMPLE TO CHURCH: TESTING SETTLEMENT MODELS IN THE LATE ANTIQUE EGYPT LANDSCAPES OF MEDINET HABU, PHILAE AND ESNA

Guimerà, Ariadna (Autonomous University of Barcelona) - De Soto, Pau (63075)

The story of religion in Roman Egypt was dominated by the triumph of Christianity at expense of pagan religion. Generally studied in binary terms, the decline of the old gods of Egypt had its own dynamic away from the orthodox Church. Indeed, there were material signs showing the decline of the Egyptian paganism before Christians had achieved the religious control of the Empire. And Thebes, the old capital, is an excellent example of that.

Since the middle of the third century the hieroglyphic and Greek texts on the walls of temples showed a very low quality work. For thousand years, pharaohs and Ptolemaic kings had recorded their involvement to the restoration and embellishment of temples as a sign of wealthy cultic activity. This legacy continued under the Roman Empire but at a speedily declining rate. At Deir el Medina there is nothing later than Domitian; at Philae of Caracalla; at Esna of Decius. So, it is difficult to avoid that the imperial support for decoration of Egyptian temples drop after Tiberius, shrank after Hadrian and fade away with Constantine.

This communication will give a panoramic view of the sunset of institutional Egyptian and Greco-Roman religion through the study of the pagan temples in the Thebaid region and how this was related with the outset of Coptic Church. Furthermore, through the historical analysis, the historiographical phenomenon of the abandon, destruction, and Christianization of pagan temples will be reconsidered, and which are the new archeological perspectives for its study.

696 PREVENTIVE ARCHAEOLOGY IN EUROPE: CONTEXT OF EXERCISE, METHODS AND WORKING CONDITIONS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Salas Rossenbach, Kai (Institut national de recherches archéologiques préventives) - Stäuble, Harald (Archaeological Heritage Office of Saxony) - Marx, Amala (Institut national de recherches archéologiques préventives)

Session format: Regular session

Preventive archaeology or development led archaeology is now practiced throughout Europe in a variety of legal, institutional and field contexts. Although it produces most of the archaeological data in part of Europe, there is still a lack of discussion about the methods and working conditions.

Under monetary and time pressure, preventive archaeology has developed and is still developing, methods to study archaeological sites in a short time while maintaining or even improving the scientific quality of the excavation and post-excavation studies. In some countries, the excavation methods used by preventive archaeology are state-of-the-art and the skills of its experienced archaeologists are in demand. However, it is also a field, halfway between business and science, where workers are subject to not only the law of the market, but also to competition and the

vicissitudes of financial crises. Through presentations from different European contexts, this session aims to discuss the context of practice, methods and working conditions of the profession in Europe.

ABSTRACTS

1 A MATTER OF SCALES; THE DUTCH PRACTICE

Muller, Axel (RAAP)

Since the late 90's archaeology in the Netherlands developed into a market driven commercial system. The current evaluation of our Heritage Law gives an interesting opportunity to reflect on the past decades. An overview and evaluation of Dutch preventive archaeology is therefore especially relevant.

Preventive archaeology in the Netherlands has evolved into a rigid system, where a set of research 'modes' are more or less compulsory, before any civil project can be realized. This system is most suitable for the average fieldwork project but smaller or larger projects can be harder to fit in. For small projects the administrative workload is often out of proportion. And for large projects, it is a big challenge to make choices in the analysis of different datasets and to focus on the scientific end goals.

Flexibility can be increased in different ways on different levels as will be illustrated by presenting some case studies. However, these solutions are still very project specific and ad hoc, and a more fundamental change in our daily practice would benefit the scientific output of development-led archaeology.

2 ARCHAEOLOGICAL HERITAGE IN FRANCE: MITIGATION AND WORK PRACTICES IN THE 21ST CENTURY

Peake, Rebecca (INRAP - National Institute for Preventive Archaeological Research; UMR 6298 Artheis) - Marcigny, Cyril (INRAP - National Institute for Preventive Archaeological Research; UMR 6566 CReAAH)

Government legislation implemented during the last 30 years in France have provided a strong framework for archaeological mitigation that allows the management of archaeological risk during the early stages of all developer-led projects while ensuring high standards of practice in the field. These policies form the basis of "preventive" archaeology that has flourished since the 1990s with prominent commercial projects affording large teams of highly trained professionals the opportunity to develop sustainable fieldwork practices for the mitigation of archaeological sites. Evaluation plays a decisive role within this framework and the strategies in place for the detection and assessment of France's prehistoric and historic heritage before development follow stringent guidelines issued by regional archaeology services. Preventive archaeology has come under increasing pressure to provide a high standard of service with limited budgets and has had to develop methods to reduce intervention times while maintaining the scientific quality of its work. From preliminary geophysical survey to on site evaluation to recording systems, we aim to explore the methods in place across France and their practical application in the field. Our focus will be on mechanised trial trenching and excavation applied to large and small scale developments in both urban and rural contexts and how this widely used method contributes to our perception of the archaeological landscape. We will also address the question of managing data from sites whose surface area can exceed 10 hectares, some with complex stratigraphy. The French legislation today demands far-reaching interdisciplinary studies in archaeological mitigation (archaeology, palaeoenvironmental studies, materials sciences, etc.), all information being subsequently archived in a government data system, that guarantees public accessibility.

3 CISAP: AN INRAP TEAM DEVOTED TO THE STUDY OF UNDERGROUND ARCHAEOLOGICAL STRUCTURES" IN COLLABORATION WITH CHRISTOPHE TARDY, INRAP

Dolbois, Jérémy (INRAP - National Institute for Preventive Archaeological Research)

In the field of preventive archaeology, underground archaeological structures (such as wells, quarries, undergrounds, aqueducts, etc.) are recurring remains that were usually incompletely excavated or even untouched and most of the time abandoned for safety reasons.

Since ten years, an increasing number of archaeological state prescriptions have been taking those particular contexts into consideration and required a manual and secure excavation "in accordance with the rules of the art and respect for basic safety rules" for this type of remains.

To respond to those growing demands, The INRAP (French National Institute for Preventive Archaeological Research) made the choice to internalize this skill in 2016. The establishment of a trained team on specific risks of underground environment, the Intervention Unit on Deep Archaeological Structures (CISAP), responds to the will of a scientific treatment of these structures encountered during preventive excavations on the French territory.

Over the last 7 years, this unit has been involved in almost 90 field researches, considering various contexts. The team has acquired a solid experience and the trainings aim to develop specific technical skills within. It allows the team to carry out technical interventions, to propose complex intervention procedures and to consider new field contexts in the future.

This communication is proposed at first to present the materials and methods used to excavate underground remains, whether vertical or horizontal. It will insist on safety aspects and will allow discussions about practices for subterranean researches.

4 EXPERIENCES AND CHALLENGES OF ARCHAEOLOGICAL INVESTIGATIONS OF A GAS PIPELINE ROUTE IN LITHUANIA

Zabiela, Gintautas (Institute of Baltic region history and archaeology, Klaipeda University)

Lithuanian archaeologists do not have much experience in preventive archaeology. The gas pipeline network is the most developed in the last decades. Archaeological surveys of the Gas interconnection Poland–Lithuania path have been carried out in the period 2020–2021 in a 165 km entire length of removable topsoil averaging 8 m wide.

The Institute of Baltic Region History and Archaeology of Klaipėda University excavated 2 sections – 36 km total length. On the basis of these investigations the problems of preventive archaeology are presented.

The pipeline was designed to avoid crossing any known archaeological sites. During the planning works revealed 7 sites of ancient settlements. A further 15 archaeological sites were identified during surface stripping.

The stripping of surface soil and the search for archaeological features are survey, but the excavation of the sites is detailed research. The boundary between these 2 different levels of investigations is unclear.

Buried structures with little archaeological evidence and no finds can only be dated by 14C. Such undated structures are of little significance for archaeology, the dating of each one is expensive and the results are sometimes indicative of a recent period.

In 1999 Lithuania ratified the Valletta Convention, obliging the publication of research results, but developers do not take responsibility for publishing research material. It is not possible to estimate in advance the volume of such publications.

Linear infrastructure objects tend to divide archaeological sites into two parts after research. Their territories remain unclear, as the developer has no interest in carrying out research outside his work area.

National archaeologies have different standards for research and subsequent work on their material. The EU is working on harmonisation in various fields, and it is time to start addressing preventive archaeology at a common European level.

5 ARCHAEOLOGY BETWEEN HERITAGE, SCIENCE AND POLITICAL-ECONOMIC INTERESTS: TWO CASE STUDIES FROM SAXONY, GERMANY

Kretschmer, Saskia (Archaeological Heritage Office Saxony)

In recent decades, methods have become established in Saxony, particularly in open-cast mining archaeology, which have made it possible to work on large areas under standardised scientific criteria. Compared to the excavations of the 1990s, working conditions have been improved by taking archaeology into account earlier in the planning process. The use of modern technology also reduced the time pressure. In open-cast mining archaeology, standards are set both for the excavation and for post-excavation studies by consistently integrating neighbouring disciplines. Various developments have recently led to increasingly complex planning requirements in which archaeology has to assert itself not only against economic and political interests, but also, for example, against nature conservation concerns. Finally, current economic developments and crises are also reflected in the excavation budget.

The second case is a prime example of the impact of economic and political interests on excavation conditions. An extraordinarily rich archaeological site was investigated under enormous time pressure and with a comparatively low budget for the construction of a large leisure park. In order to keep to the time and cost schedule, a partial preservation of the site was agreed with the investor by means of conservation covering. This method is increasingly being used where – unlike in open-cast mining – it is possible to preserve the archaeological substance. In addition to the conservation interest of protecting the archaeological site for future generations, it is primarily economic considerations that lead to its implementation. The future strategy must be to expand the range of methods and develop them further in such a way that the quality of the excavation is not compromised.

6 CENTRAL GERMANY - SAXONY-ANHALT: A REGION IN TRANSITION

Friederich, Susanne (Landesamt für Denkmalpflege und Archäologie Sachsen-Anhalt)

The federal state of Saxony-Anhalt is located in the center of Germany, in the heart of Europe. Vast areas with minimal differences in elevation, often near highways, are currently predominantly used for agriculture but are increasingly being considered as industrial sites. This is due to the well-developed infrastructure, direct access to Germany's largest freight airport in Leipzig Halle, modern port facilities along the waterway network (Elbe and Mittellandkanal), and the significant railway hub in Halle for freight transport, which are major locational advantages rarely found elsewhere in Europe. Therefore, for the past two years, Central Germany (Saxony-Anhalt) has been increasingly coming into focus. Exemplary projects include the rebuilding of Daimler Truck's central warehouse or the mega-factory of chip giant Intel near Magdeburg. Within just one year, 1,000 hectares have been claimed. Additionally, there are still small mining areas in the lignite mining region as well as significant raw material extraction activities (gravel and sand).

The foundation for large-scale archaeological excavations has been primarily tested and positively evaluated in open-pit mines for the past 30 years. However, never before has it been necessary to document 100 hectares within three months within the former settlement area. The existing methods of preventive archaeology were fundamentally reviewed and refined in 2023. Ultimately, prospecting (so-called "hard prospecting with excavation cuts") continues to prevail today; it is the effective method for avoiding costly construction delays. Archaeology must always remain a reliable planning partner, even within tight timeframes.

7 PREVENTIVE CONSERVATION OF ARCHAEOLOGICAL MONUMENTS IN BAVARIA

Berg, Stefanie (Bayerisches Landesamt für Denkmalpflege)

Preventive archaeological monument preservation in the sense of well in advance planned excavations has been carried out in Bavaria for about 20 years. Strangely enough, this still comes as a surprise to many people. Apparently, the image of archaeological "rescuers" in front of an excavator conveys more emotional and long-term significance than our deliberate, sophisticated, well-prepared, but of course for many invisible work.

Bavaria is the largest of the 16 German federal states. Here the initiator of a construction project has to commission and finance a private excavation company to carry out the necessary work proposed by the monument authority and approved by the protection authority.

In 2022, for example, 900 archaeological excavations were professionally documented before construction work was carried out, enabling sections of settlements, burial grounds, fortifications etc. from our rich Bavarian history to be professionally documented, recovered and thus preserved for posterity. However, this also means the loss of monuments in situ and we can only assume that not all monuments have been discovered in time for the specialist investigation.

For us as a specialist authority, this results in many tasks, including, for example, checking the quality of archaeological work and documentation done by private companies in order to ensure permanent and sustainable documentation of the reports and archaeological finds and improving our level of knowledge with regard to the predictability of archaeological monuments. In addition, the focus is also on scientific processing, evaluation and publication.

I would like to present the administrative, legal and scientific requirements of preventive archaeological preservation and the resulting challenges. I would also like to give an insight into the tools we use to help us plan prospecting and excavations. These include desktop analysis with any subsequent in-depth non-invasive activities, GIS-supported geomorphological-historical landscape analysis and the municipal register of monuments.

8 DEVELOPMENT-LED ARCHAEOLOGY IN THE FORMER CZECHOSLOVAKIA. DIFFERENT PATHS OF CZECH AND SLOVAK REPUBLIC

Antal, Robert (Institute of Archaeology of the Czech Academy of Sciences, Brno)

Czech and Slovak republic shared a common history within Austrian-Hungarian Empire, during so called First Czechoslovak Republic and again after World War II in Czechoslovakia. This applies also to development of heritage care and development-led archaeology. Even though, the states divided in 1993, they used the same law from 1987 until year 2004, when new legislation in Slovakia was passed. In its time modern act is still effective in Czech Republic, but the change is now indispensable.

In the beginning, the contribution will briefly summarize the development of heritage care in former Czechoslovakia until 2004, consequently it will compare current state of art in divided countries, aiming to identify strong and weak aspects of archaeological heritage protection during construction works, and their impact on scientific research.

Firstly, the focus will be aimed on formal processes prior excavation with connection to the role of public administration and informatization of scientific knowledge in decision making. Secondly, the paper will describe the organizational structure and business behind research excavations, including obligations, territorial jurisdictions, scope of the excavation and influences on price making. In third part, brief overview on sanctions will be presented.

Last part of the contribution will explain, how presented aspects influence scientific research both in Czech and Slovak Republic, and summarize strong and weak points of both legislations.

9 SOCIAL-EPISTEMOLOGICAL REFLECTION ON ACADEMIC AND PREVENTIVE ARCHAEOLOGY

Novakovic, Predrag (University of Ljubljana)

One of the consequences of the considerable growth of preventive (also development-led or rescue) archaeology is an increased divide between academic and preventive archaeology, which is frequently but erroneously perceived as a distinction between 'thinkers' and 'doers'. While academic archaeology is considered a proper scientific endeavour which contributes new knowledge about past human life and culture, preventive archaeology became increasingly perceived as a technical routinized practice, and its contribution to the development of archaeology was minimized mostly to new discoveries and technical advancements in methods. Already in 2006, Richard Bradley, in his paper about two cultures in archaeological practice, warned against this divide and its long-term harmful consequences for archaeology in general. From the perspective of social epistemology (e.g. research freedom, original scientific vs applied knowledge, organization of work, labour division), we will demonstrate how epistemic asymmetries and dependences reveal different determinants and types of knowledge creation in academic and preventive archaeology. We conclude that the existing epistemic asymmetries do not support hierarchical relations and simple complementarity between the two. Instead, they act simultaneously and dialectically on different levels of the knowledge-obtaining process. Due to different national legislation, organizations, and academic and preventive research management, we will use Slovenia as a case study for a more detailed analysis.

10 CONTRACT ARCHAEOLOGISTS IN GREECE: THEIR PLACE AND ROLE IN THE DOMESTIC PROCESS OF ARCHAEOLOGICAL PRODUCTION

Daravigka, Klea (Phd candidate Aegean University, Lesvos, Greece)

While attempting to explain the role of contract archaeologists in Greece, the research opens up to their wider scientific/working context, that is the entire process of Greek archaeological production. Both the process and the state of contract archaeologists in the country are found to be shaped by a powerful dipole: the old but still robust ideological frame of a "guild", which informs the domestic archaeological production process, and neoliberal imperatives, that shape Greek state cultural management. The impact of the above dipole produces checkpoints, absences and traps for contract archaeologists and at the same time leads to a perpetual reproduction of "Greekness", a product-archetype which remains intact despite the myriad critical approaches and radical reinterpretations deposited throughout the process that could potentially turn into social benefits.

The discussion about the above situation however is totally absent in Greece. Working conditions of contract archaeologists or the role labor relations play in the archaeological process continue to be commonly regarded as irrelevant topics of no scientific value and are thus eradicated from the public agenda. This presentation will attempt to reinstate this controversial subject by opening a dialogue on an international level.

11 LIMITS AND POTENTIALITY OF PREVENTIVE ARCHAEOLOGY IN SICILY

Valbruzzi, Francesca (Museo Interdisciplinare di Messina; Confederazione Italiana Archeologi – Sicilia) - Giannitrapani, Enrico (Arkeos – Servizi integrati per i Beni Culturali s.c.; Confederazione Italiana Archeologi – Sicilia; Dipartimento Culture e Società, Università di Palermo)

In the contribution, the application of the preventive archaeology procedures carried out in the last decades in Sicily, the largest island in the Mediterranean with a vast recognised archaeological heritage, is discussed. After a historical overview of the application of preventive archaeology here, we address the limits afflicting the current research and conservation of the island's archaeology. The first of these limits is given by the regional administration's lack of appropriate cultural heritage management: none of the Soprintendenze, the cultural heritage offices competent for the various territories, have archaeologists in managerial positions. In this way, archaeological risk assessments are examined by personnel with no adequate archaeological background, mainly architects, geologists, and even agronomists. Because of the autonomy of Sicily for cultural heritage management, the recent normative and methodological developments in preventive archaeology occurring in the rest of the country are simply not applied in Sicily. The Sicilian academia's lack of interest in professional archaeology and preventive archaeology further worsens the situation, with insufficient training for the many professional archaeologists daily involved in preventive archaeology. Furthermore, despite the long history of research carried out in Sicily, its cultural, archaeological and paleoenvironmental framework still needs a more accurate definition, often undermined by the absence of information on extension, chronology, and cultural definitions for most of the hundreds of sites reported in the official archaeological maps, often generated without the aid of the most recent computer-based technologies. The definitions of archaeological potential and risk are then more a gamble than a consolidated practice. This situation can be remedied only with greater awareness from archaeologists, regardless of their position within universities and Soprintendenze or because involved in the profes-

sion, of the tools and cognitive processes available today, together with a greater level of multidisciplinary, open data and advanced digitalisation of the archaeological record.

12 ARCHAEOLOGY AND DEVELOPMENT: A POSSIBLE BINOMIAL

Pennisi, Ghiselda (Associazione Nazionale Archeologi (ANA)) - Nicoletti, Rossella (Associazione Nazionale Archeologi (ANA)) - Draïà, Eleonora (Università telematica Internazionale UniNettuno) - Palazzolo, Grazia (independent researcher) - Manenti, Marco (independent researcher) - Arena, Andrea (independent researcher)

Many legends go around archaeology and the archaeological heritage defence. Past choices and set of rules not always applied in a forward-looking way often spread the image of a bailiwick that is a barrier to development.

In this paper we would like to illustrate the methodology adopted by FS Group and the Archaeological Superintendence of Enna for the project of doubling of the Palermo-Catania HS line: an example of coexistence of development and protection and, at the same time, an extraordinary opportunity for scientific research aimed to the knowledge of historical processes of occupation of the territory.

The methodological approach adopted since the preliminary phase of evaluation of the Archaeological Impact has been oriented to identify archaeological traces through systematic surveys, excavation samples in areas with an high density of traces and geognostic surveys up to a final extensive excavation of the settlement that allowed to put into light a high imperial Roman settlement on the River Dittaino valley, in località Cuticchi (Assoro, En), a site with a remarkable informative potential in the general context of studies related to this period in Sicily.

13 PREVENTIVE ARCHEOLOGY OR RESCUE ARCHEOLOGY? CASE STUDY FROM BUCHAREST ROMANIA

Ignat, Theodor Aurelian (Bucharest Municipality Museum) - Majuru, Adrian (Bucharest Municipality Museum)

Systematic and preventive archeology in Romania is governed by almost 25 years old laws, and more important, it is a state monopol. Very few private archeological companies are on the market and they operate by providing consultancy. In reality private companies can not be authorized to do archeological excavation, so they do it under the umbrella of public institutions. This creates the unfortunate situation where those companies get most of the money, and take little to no responsibility for the scientific outcome of the archeological research.

Under the pressure of the contracts, preventive archeology has adapted its excavation methods to cope with the ever-increasing demand for archeological services. Mechanized tools reduce excavation time, but on the other hand are responsible for the loss of details that otherwise might be important.

Non-intrusive investigations that have the power to bring more data and help archeologists to better plan for the excavation, or to better understand the archeological record are very rarely used, as it is not mandatory by law. Even when used, it is considered unreliable by the public services, and can not be used in decision making processes. Attempts have been made to regulate the usage of non-intrusive investigations, but so far, they have been rejected.

The rapid development of the country is putting a great pressure on the preventive archeology, as across Romania are only 1034 registered archeologist, and just above 300 have the necessary credentials to manage an archeological project.

The most expensive commodity is therefore time, and very often little is left for the processing and publication of the results.

14 MORE THAN 30 YEARS OF DEVELOPMENT-LED ARCHAEOLOGY IN ROMANIA: A SWOT ANALYSIS ABOUT OPPORTUNITIES, CHALLENGES, CONSTRAINTS AND BENEFITS

Bors, Corina (National History Museum of Romania (MNIR)) - Damian, Paul (National History Museum of Romania (MNIR))

The European convention for the protection of the archaeological heritage was ratified by Romania in 1997 and set the premises for a new national legislation in regard to this issue. After a void of specific legislation which lasted for an entire decade, in 2000 was adopted the new law concerning archaeology and rather soon the "polluters/developers pay" principle was necessary to be implemented since a series of private industrial projects and public motorways projects were initiated. This was a completely new reality for the archaeology and the archaeologists in Romania. It's very useful that, three decades later to undertake an analysis about how was understood by the different stakeholder the development led archaeology and how is was perceived by the academic environment, the heritage agencies and, last but not least by the institutions involved in this "new kind" of archaeology.

An in-depth analysis will be made, considering the experience of the National History Museum of Romania, which has a major expertise as concerns the rescue/preventive/development-led archaeology in Romania during the last 3 decades. The paper will present a series of key issues such as: the importance of these large-scale rescue excavation

in providing new understanding and knowledge about the archaeological heritage; how to negotiate and communicate with the stakeholders in the benefit of archaeological heritage; the difficult dialogue between the administrative milieu (the heritage agencies) and the professional environment; the opportunities and constraints for developing a professional career in archaeology, yet these are not the only topics to be addressed considering the session's focus. The perspective provided by the paper encompasses certain positive evolutions, but also takes a closer look to the challenges which had to be overcome while undertaking large scale preventive excavation in Romania and recognizing their role in such paradigm shifting.

697 HUMAN-ENVIRONMENT INTERACTIONS IN EUROPEAN CALCAREOUS LANDSCAPES DURING THE PLEISTOCENE AND HOLOCENE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Branch, Nicholas (University of Reading) - Negrino, Fabio (University of Genoa) - Law, Matt (Bath Spa University) - Moore, Pete (University of Reading)

Session format: Regular session

The calcareous landscapes of Europe have long been understood to be an important setting for Palaeolithic and later prehistoric habitation sites and monuments, providing the eventual focus for some of the most iconic settlement and ceremonial complexes. Their landscapes and ecologies undoubtedly provided important qualities for the development of these complexes by virtue of their environmental characteristics resulting a diverse history of human-environment interaction. However, courtesy of their alkaline substrate, reconstructing the history of these landscapes and their interaction with human groups has routinely posed a number of methodological and analytical problems (e.g., geochronology, preservation), including in some geographical areas reliance upon a limited avenue of palaeoenvironmental proxies from geological archives (e.g., Mollusca), whilst in others dependence upon data from archaeological archives (e.g., caves). Due to these challenges, the true diversity of calcareous landscapes, the interrelationships that landscapes had upon the lifeways of populations at the time and the extent to which ecologies impacted settlement and subsistence choices, remain to be fully understood. This session seeks to hear about the latest research that has explored many of the methodological and analytical problems associated with the study of calcareous landscape history, and where research has provided important new insights into human-environment interactions in these settings, especially evidence for transformation, resilience and adaptation. Given that many geological and archaeological archives are located in these iconic calcareous landscapes, the session will also explore how these archives are being protected, conserved and managed in the face of a range of threats at the present day and those predicted for the future.

ABSTRACTS

1 DO CALCAREOUS LANDSCAPES MAKE A DIFFERENCE? ARCHAEOLOGICAL VISIBILITY IN THE LIGURIAN ARC BETWEEN PLEISTOCENE AND HOLOCENE

Negrino, Fabio (University of Genoa)

In calcareous landscapes characterised by caves and shelters, multi-layered deposits are quite ubiquitous, preserving archaeological evidence from the Lower Palaeolithic to the most recent aspects of human history. The particular morphological characteristics of these landscapes, which have favoured the use of caves and shelters for dwelling, resting and carrying out a wide variety of activities, combined with the ease of formation of deposits trapped in depressions created by karst erosion, have certainly favoured archaeological visibility, preserving information that would otherwise have been lost in other contexts.

An area of particular interest for testing the above claims is the Ligurian Arc (north-west Italy), characterised by well-circumscribed karstic limestone outcrops and areas with other lithologies. The conformation of the territory, consisting of the Apennine arc in continuity with the Alpine one, i.e. deep, sunken valleys and a steep coastline with rare coastal plains, is geomorphologically homogeneous, although climatically differentiated.

In the non-calcareous areas, however, siliceous raw materials from which artefacts can be made are abundant, which contributes to a difference in visibility, at least for open-air sites, between the different zones.

An initial analysis of the distribution of sites between the Middle Palaeolithic and the Neolithic in Liguria allows us to highlight some diachronic similarities, with similar distribution patterns, which could suggest how geological outcrops and landscape morphology influenced the way in which archaeological evidence was preserved. The only exception is represented by the evidence related to the Mesolithic, which does not fully correspond to what can be observed for the other phases, suggesting alternative interpretative solutions in which the human behaviour factor, as well as a different occurrence and use of siliceous raw materials, could have played an essential role.

2 HUMAN ENVIRONMENTAL DYNAMICS THROUGH STABLE ISOTOPIC ANALYSIS OF CAVE SEDIMENTS

Lattao, Virginia (Geosciences Centre, University of Coimbra, Portugal; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Centre, Coimbra, Portugal) - Aquilano, Antonello (Department of Architecture, University of Ferrara, Italy) - Collado, Hipolito (Junta de Extremadura, Mérida (Badajoz), Spain; Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal) - Garcès, Sara (Geosciences Centre, University of Coimbra, Portugal) - Gomes, Hugo (Geosciences Centre, University of Coimbra, Portugal) - Henriques, Maria Helena (Geosciences Centre, University of Coimbra, Portugal; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Center, Coimbra, Portugal) - Marrocchino, Elena (Department of Environmental and Prevention Sciences, University of Ferrara, Italy) - Rosina, Pierluigi (Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal)

Stable isotope analysis has been heavily used over the years to achieve reconstruction of environmental changes in continental settings. The objective of this research is to apply this analytical methodology to different cave deposits located in Iberian territory. The deposits studied contain archaeological traces of human occupation, with different chronologies. Part of this work is integrated into the MTAS and FIRST-ART projects, which study early artistic expressions on the Iberian Peninsula. The FIRST-ART project involves monitoring the environmental conditions of formerly occupied contexts. A multiproxy analysis methodology is planned, including stable isotope analysis (particularly $\delta^{13}C$) and sediment composition (using X-ray fluorescence analysis). The data obtained were evaluated in advance to determine whether this methodology can be used as a substitute for paleoenvironmental reconstructions. Results obtained from the study of ten caves located in Portugal, in the Spanish Extremadura, Asturias and Cantabria, will be presented and compared with proxies already established in previous studies carried out in the same caves studied here.

3 NEW INSIGHTS INTO THE PALAEOENVIRONMENTS OF THE CALCAREOUS LANDSCAPES OF SOUTHERN BRITAIN: A CASE STUDY FROM THE COTSWOLDS

Moore, Pete (University of Reading)

The calcareous landscapes of Southern Britain are among the most archaeologically rich in north-west Europe, yet their environmental settings are poorly understood. Courtesy of their well-draining, alkaline soils, they have routinely relied upon a limited array of proxy records, such as land snails, which can only broadly inform the nature of vegetation coverage (i.e. grassland, wooded). Such studies have largely come as secondary elements of anthropocentric monumental settings, rather than considering their broader 'natural' settings, subsequently creating a biased picture of past environments. This approach neglects to consider the true diversity of past landscapes, the interrelationships they had upon the lifeways of populations, and the extent to which this diversity impacted settlement and subsistence choices.

A key landscape which has been consistently overlooked by archaeological and palaeoenvironmental studies alike has been The Cotswolds, despite its significant evidence-base. Proximity to prehistoric centres such as Stonehenge and Avebury have long drawn attention away from the landscape, leading to a lack of consideration for its overall potential. This paper presents ongoing research into the palaeoenvironmental credentials of The Cotswolds, showing the results of extensive ground-truthing and preliminary insights into evidence yielded from two case study locations. The potential of such indications is then contextualised within their broader regional setting and the implications they have on other calcareous landscapes considered.

4 ENVIRONMENTAL CHANGES AND THEIR IMPACT ON HUMAN FREQUENTATION AT THE ARMA DELLO STEFANIN, LIGURIA (ITALY). A GEOARCHAEOLOGICAL PROSPECTIVE

Ghislandi, Sabina (Università di Genova) - Negrino, Fabio (Università di Genova) - Gravel-Miguel, Claudine (New Mexico Consortium) - Riel Salvatore, Julien (University of Montréal) - Rellini, Ivano (Università di Genova)

The proposed paper intends to present the geoarchaeological results on the Arma dello Stefanin deposit, investigated by the University of Montréal and the University of Genova in 2022.

The Arma dello Stefanin is a wide cave, opening at 400 m a.s.l. along the southern calcareous slope of the Rio Penavaria, in the municipality of Aquila d'Arroschia, Imperia (Italy), about 22 km from the current coastline. Scientific studies of the last century documented anthropic frequentation during the Epigravettian till the Neolithic. However, the attribution of the Mesolithic level has not been consistent in the previous publications, leaving uncertainties regarding the Pleistocene-Holocene transition within the cave.

Therefore, new and in-depth studies have been extensively conducted in the last two years, exploring the content of charcoal for radiocarbon dating, microcharcoal, pollen, cryptotephra and soil micromorphology on the stratigraphic sequence. In fact, the application of soil micromorphology to cave contexts has recently given the opportunity to

explore and analyze the depositional levels in relation to human activity, climate and environmental changes and their interactions.

The data presented in the proposed paper focuses on the micromorphological and physical-chemical analyses of the sediments formed during the Pleistocene and Holocene, within the stratigraphic sequence in the Anfossi e Maggi sections. The results show variation of the climatic and environmental conditions, with periods characterised by humidity and intense water dripping, providing information regarding the cave environment in relation to the archaeological evidence.

The aim is to increase the knowledge regarding the anthropic occupation and use of the cave, including the comparison with similar realities from Liguria and contributing to the wider discussion of the human-environment interaction in calcareous landscapes during Prehistory.

5 THE IMPORTANCE OF CALCAREOUS LANDSCAPES TO OUR UNDERSTANDING OF LATE PLEISTOCENE HUMAN-ENVIRONMENT INTERACTIONS IN WESTERN IBERIA

Haws, Jonathan (University of Louisville; ICArEHB, Universidade do Algarve) - Benedetti, Michael (University of North Carolina Wilmington; ICArEHB, Universidade do Algarve) - Carvalho, Milena (ICArEHB, Universidade do Algarve) - Ellis, Grace (Colorado State University; ICArEHB, Universidade do Algarve) - Cascalheira, João (ICArEHB, Universidade do Algarve) - Friedl, Lukas (University of West Bohemia; ICArEHB, Universidade do Algarve) - Bicho, Nuno (ICArEHB, Universidade do Algarve) - Barbieri, Alvisé (ICArEHB, Universidade do Algarve)

The western margin of the Iberian Peninsula is marked by two areas of Mesozoic calcareous substrates surrounded by Paleozoic basement rock draped in places by Cenozoic sediments. In Estremadura and Algarve, karstic landscapes form in Jurassic and Cretaceous limestone massifs interspersed with valleys filled with Miocene and Quaternary sands and gravels. Throughout the Pleistocene, human groups settled these areas in varying degrees of intensity. Although geomorphic bias may impact site preservation and visibility, several key features of the calcareous landscapes provide the bulk of information about Paleolithic land-use strategies and point to a likely preference for these areas. Caves house most of the stratified evidence for human settlement, providing key records of organic preservation, paleoclimatic and paleoenvironmental change, as well as diachronic patterns of human-environment interaction. The calcareous landscape known as the Maciço Calcáreo Estremenho (MCE) contains abundant caves, avens, sinkholes, and poljes or sunken karst valleys. These latter features formed lakes during the Pleistocene providing water to humans and animals. The limestone also contains chert, a highly valued and preferred lithic raw material for tool-making. Recent stable isotope studies from cave speleothems provide additional data on Late Pleistocene climates that can be integrated with Paleolithic archaeological and faunal records from caves, including the site of Lapa do Picareiro.

Here, we discuss the impact of calcareous landscapes on human-environment interactions with special emphasis on Lapa do Picareiro, which has become an important reference site for the Middle and Upper Paleolithic in Portugal. The ongoing excavation has produced an intact stratigraphic sequence of about 11 m with archaeological occupation layers from the Bronze Age to Middle Paleolithic. The sediments contain rich archaeological and faunal records and paleoclimatic data spanning at least 60,000 years, providing a continuous record of long-term human-environment interaction.

6 A CASTELNOVIAN STOP IN THE ALPINE HIGHLANDS AT ARMA DELLA NINA

Riel-Salvatore, Julien (Université de Montréal) - Gravel-Miguel, Claudine (New Mexico Consortium; Université de Montréal) - Negrino, Fabio (Università di Genova)

As part of our new project, which aims to document the Mesolithic occupation of Western Liguria, we are revisiting previously excavated sites as well as surveying untouched caves for new Mesolithic assemblages. From this survey, we recently discovered what looked like potential Mesolithic deposits of Arma della Nina. Arma della Nina is located in the highlands of the Val Pennavaire, where Arma dello Stefanin and Arma di Nasino have yielded recently identified in-situ early Mesolithic assemblages. We conducted a small, targeted excavation of the Arma della Nina in 2023 aimed at documenting its occupation. Unfortunately, the unusually high precipitations of that summer hindered field-work due to the porous quality of the limestone in which the cave opens, which let a lot of rain percolate down onto the excavation. While this stalled our excavation, the amount of water that percolated through the walls helped us understand the site formation history of this intriguing cave; while charcoal was abundant along the walls, our excavation at the mouth of the cave yielded almost no artifacts. Unfortunately, heavy erosion caused by percolating water has likely destroyed most the archaeological deposit. However, radiocarbon dates on charcoal recovered near the walls and a perforated shell help ascertain that the cave was occupied at least briefly during the late Mesolithic, which expands the spatial distribution of Mesolithic hunter-gatherers to regions that were likely challenging. In fact, Arma della Nina contains the first Castelnovian radiocarbon date associated with lithic artefacts from the whole Ligurian Arc and the Maritime Alps. However, our experience at the cave suggest that it might not have been a good shelter during

wet periods, which has brought to our attention the importance of considering the porousness of the caves we study to better contextualize their stratigraphy as well as their potential as occupation sites.

699 TRACING OVICAPRINE LIVES: BIOARCHAEOLOGICAL PERSPECTIVES ON SHEEP AND GOAT HUSBANDRY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Viñas Caron, Laura (Centre for Textile Research, University of Copenhagen, Denmark; Globe Institute, University of Copenhagen, Denmark) - Jæger, Jonas (Centre for Textile Research, University of Copenhagen, Denmark; Globe Institute, University of Copenhagen, Denmark) - Daly, Kevin (Trinity College Dublin, Ireland) - Le Meillour, Louise (Globe Institute, University of Copenhagen, Denmark)

Session format: Regular session

Domestic sheep and goat have played a pivotal role in past societies since their origin, but many aspects of their past lives remain poorly understood. This session aims to bring together current research on the initial stages of sheep and goat domestication and the development of husbandry practices through time, with a particular focus on the use of secondary products and craft materials such as dairy products, wool or skins.

Through this exploration, we seek to identify regional or broad patterns in species proportions, herd composition (age, sex) and morphological variation, providing insights into the socio-economic structures and cultural significance attached to small ruminant herding communities. At the same time, the recent adoption of novel scientific methods has allowed to gain new insights into their individual stories. In this sense, the session welcomes papers focusing on the discrimination of sheep, goats, and other small Bovidae that are most often challenging to distinguish morphologically, and the analysis of the latter in zooarchaeological assemblages. We also encourage studies addressing feeding and management practices, genetic changes, selection and movement of animals through time or space. Finally, the session seeks to highlight technological advancements beyond food production, such as craft practices or the value of wool products within ancient societies.

Thus, the session recognises the importance of adopting a multifaceted approach and we invite papers not only from zooarchaeology but also from the natural sciences, such as ancient and degraded DNA, palaeoproteomics (ZooMS and shotgun proteomics) and isotopic analyses. Papers which integrate evidence from multiple lines of inquiry or types of materials (e.g. wool textiles, leather, parchment) are particularly appreciated, as well as contributions from different time periods and geographical regions that have been understudied.

ABSTRACTS

1 THE ARCHAEOGENOMIC HISTORY OF SHEEP HUSBANDRY IN THE BALTIC SEA REGION

Günther, Torsten (Uppsala University) - Larsson, Martin (Uppsala University) - Morell Miranda, Pedro (Uppsala University) - Kaptan, Damla (METU, Ankara) - Kivikero, Hanna (University of Helsinki) - Kantanen, Juha (Natural Resources Institute Finland) - Somel, Mehmet (METU, Ankara) - Özer, Füsün (Hacettepe University) - Johansson, Anna (Swedish University of Agricultural Sciences, Uppsala) - Storå, Jan (Stockholm University)

Sheep have been the most popular ovicaprid in Scandinavia since the Neolithic but it is unclear how the first sheep in the region relate to later herds and modern breeds. Several large-scale prehistoric migrations into the region have been documented for humans, providing ample opportunity for different livestock breeds to be introduced at the same time. Long and short-distance exchange networks between sheep herders would provide additional possibilities for changes to the sheep gene pool over time. Nevertheless, modern North European short-tailed breeds are often assumed to be among the oldest domestic sheep populations, even thought to represent relicts of the earliest sheep expansions during the Neolithic period reaching Scandinavia a little less than 6000 years ago. This study sequenced the genomes of sheep remains from the Baltic islands of Gotland and Åland, dating from the Neolithic (~4500 cal-BP) to historical times (~1600 CE). Our findings indicate that Nordic sheep largely possessed the genetic characteristics of modern North European short-tailed breeds for at least 4000 years which contrasts the pattern seen in other parts of Europe during the same time frame. The long-term continuity suggests that either human preference or adaptation to local environments has played an important role in the history of sheep in the region. North European short-tailed breeds still play an important role in the region and several small local breeds are subject to conservation efforts while more popular breeds have been crossed with other breeds to increase their production properties. Our results provide important insights into the practices and preferences of sheep herders and breeders from prehistory until today.

2 NO KIDDING! THE USE OF SHEEP HIDES AT THE ROMAN FORT OF VINDOLANDA, UK

Greene, Elizabeth (University of Western Ontario) - Fremondeau, Delphine (University College London) - Stevens, Rhiannon (University College London) - Birley, Barbara (The Vindolanda Trust, UK) - Taylor, Gillian (Teesside University)

The Roman fort at Vindolanda on the northern frontier in Britain has produced the largest assemblage of archaeological leather from anywhere in the Roman empire. The assemblage spans over 200 years of occupation from the 1st to the 3rd centuries CE, offering an excellent opportunity to examine the characteristics of leather manufacturing in the Roman period. This oral presentation presents the preliminary analysis of the animal species exploited for manufacturing tent panels that were used by the Roman army. Past analysis using visual identification techniques emphasized the use of goatskin for Roman tents and research has calculated the number of goats the Roman army would have needed (van Driel-Murray 1990; Groenman-van Waateringe 2009). However, using ZooMS analysis, we provide results for the determination of species used for 102 Roman tent panels from Vindolanda. Preliminary work shows a much higher reliance on sheep hides rather than goatskins, and a small reliance on cow hides. Despite the common refrain that the Roman army used goatskin for their tents, not a single sample reflected this in reality. The analysis used tent panels from all periods of occupation at Vindolanda, starting with eight panels from the same tent found deposited together in a ditch from Period 1 (ca. 85-90 CE). The results showed that three panels were made from cattle hide and five came from sheep hide. Every other tent panel tested from occupation periods 1-7 (85-275 CE) was made of sheep hide. These surprising results have an impact on our understanding of the economy of the Roman army, and will be contextualized within the context of the Roman occupation of Britain, the military setting, and the empire as a whole.

3 DENTAL MICROWEAR IN THE HISTORIC ENGLAND 'SHEEP PROJECT' COLLECTION: A PILOT STUDY

Mainland, Ingrid (University of the Highlands and Islands) - Worley, Fay (Historic England) - Baker, Polydora (Historic England)

Analyses of tooth wear have been widely applied to dietary reconstruction across a range of domestic and non-domestic species, and within single species. Little research, however, has been undertaken on inter-individual variability within a population, despite the fact that foraging behaviour is known to vary between sexes, age groups and with season-of-grazing. Although insight into the nutritional status and hence productivity is arguably one of the primary aims of palaeodietary studies in domestic ungulates, few studies have been able to explicitly address linkages between animal/herd productivity and specific palaeodietary signatures, reflecting a lack of modern known diet comparative datasets with supporting data on animal performance under different nutritional regimes. Here we present the results of a pilot study into the potential for high magnification dental microwear analysis on the effects of short-term dietary shifts, grazing regime and sex on juvenile dentition in unimproved Shetland sheep. The study focuses on a sample of 62 sheep of known age, sex, nutrition, and date of death, raised in the Pentland Hills, Scotland as part of the Historic England sheep project. Analyses of gross tooth wear has indicated significant differences in wear rates between males, females and castrates in this population and that wear is also affected by pasture type (i.e. nutritional status). The pilot data are compared to a pre-existing dataset for seasonal and microwear variability, allowing a more nuanced understanding of the impact on microwear of pasture quality, both seasonally and inter-annually in the grasslands of NW Europe, including the Scottish Borders.

4 ALL'S WOOL THAT ENDS WOOL. TRACING SHEEP AND GOAT LIVES IN NEOLITHIC IBERIAN PENINSULA THROUGH ARCHAEOZOOLOGY AND ADNA

Alcàntara Fors, Roger (Departament de Prehistòria, Universitat Autònoma de Barcelona, Bellaterra, Spain) - Daly, Kevin (School of Agriculture and Food Science, University College Dublin, Dublin, Ireland) - Halpin, Aine (Trinity College Dublin, Dublin, Ireland) - Bradley, Dan (Trinity College Dublin, Dublin, Ireland) - Saña Seguí, Maria (Departament de Prehistòria, Universitat Autònoma de Barcelona, Bellaterra, Spain)

The introduction of sheep and goat during the Early Neolithic had profound and lasting impacts on the economy, culture, and ecology of the Iberian Peninsula, laying the foundation for subsequent agricultural and pastoral practices in the region.

While it is generally accepted that the sheep breeds that arrived at the Iberian Peninsula during the Neolithic have their origins in southwest Asia, we lack information regarding the genetic drift caused by its adoption and the mechanisms through which these small ruminants contributed to the expansion of the Neolithic package.

This communication addresses the adoption and spread, management and exploitation practices of sheep and goat in the Iberian Peninsula through the lens of archaeozoological data and aDNA samples from sites where both animals had relevant roles. Using this combination of proxies will allow us to trace the origins of the sheep and goat populations that entered the Iberian Peninsula during the Early Neolithic, how they spread through the territory, and if varying

management and exploitation practices might have been linked to the different species, their lineages, and herd genetic structure.

The results provide a high-resolution, multi-disciplinary insight into individual sheep and goat lives, providing contrasting perspectives on broader scale dynamics of the adoption of domestic small ruminants in the Iberian Peninsula.

5 ANCIENT GENOMES REVEAL 7000 YEARS OF INTERCONNECTED DEMOGRAPHIC HISTORY BETWEEN SHEEP AND HUMANS IN IBERIA

Morell Miranda, Pedro (Human Evolution Program, Organismal Biology Institute, Uppsala University, Sweden; Population Genomics working group, Veterinary Science Department, Ludwig Maximilian University, Germany) - Galindo Pellicena, M. Ángeles (Centro Mixto UCM-ISCI de Evolución y Comportamiento Humanos, Madrid, Spain) - Iriarte, Eneko (Laboratorio de Evolución Humana, Universidad de Burgos, Burgos, Spain) - Moreno-García, Marta (GI Arqueobiología, Instituto de Historia, CCHS-CSIC, Madrid, Spain) - Tejedor, Cristina (Department of Prehistory and Archaeology, University of Valladolid, Valladolid, Spain) - Rojo-Guerra, Manuel (Department of Prehistory and Archaeology, University of Valladolid, Valladolid, Spain) - Smith, Colin (Laboratorio de Evolución Humana, Universidad de Burgos, Burgos, Spain; Archaeology and History department, La Trobe University, Melbourne, Australia) - Carretero, José-Miguel (Laboratorio de Evolución Humana, Universidad de Burgos, Burgos, Spain) - Valdiosera, Cristina (Laboratorio de Evolución Humana, Universidad de Burgos, Burgos, Spain; Archaeology and History department, La Trobe University, Melbourne, Australia) - Günther, Torsten (Human Evolution Program, Organismal Biology Institute, Uppsala University, Sweden)

Animal domestication by humans was a crucial event in prehistory, with sheep being one of the oldest and most important domesticated species. As humans spread Neolithic practices throughout Eurasia, sheep were brought along, and their remains can be used to trace the presence of human populations and their interactions. However, the impact of later human migrations on sheep populations is less well understood.

To investigate this, we sequenced 17 high-quality ancient sheep genomes (0.0064-8.74x) from two caves in Northern Iberia with a rich record of human and animal remains that, in conjunction, span from the early Neolithic to the late Roman period. We found significant changes in the sheep gene pool that coincided with previously described cultural changes and migrations in humans. Specifically, we observed an increase in eastern ancestry in Iberian sheep during the late Chalcolithic, around the time of the arrival of Steppe ancestry to human populations in the area, which likely coincided with a shift in resource exploitation towards sustainable milk and wool production.

Further shifts in the sheep gene pool were observed during the Bronze Age and Roman periods, the latter one laying the foundation for modern Iberian sheep breeds. These findings demonstrate the complex and interconnected nature of the demographic history of sheep and humans, highlighting the importance of studying both to gain a deeper understanding of our shared past.

6 SHEEP VS GOAT: DIFFERENTIAL EVOLUTIONARY PATHWAYS IN THE NORTHWESTERN MEDITERRANEAN BASIN OVER THE LAST 8000 YEARS REVEALED THROUGH GEOMETRIC MORPHOMETRICS

Jeanjean, Marine (Institut des sciences de l'évolution de Montpellier - ISEM) - Evin, Allowen (Institut des sciences de l'évolution de Montpellier - ISEM)

Sheep (*Ovis aries*) and goats (*Capra hircus*) are important species of the Mediterranean basin since their domestication initiated ~10,500 years ago in western Anatolia. Despite their morphological similarity, distinguishing between these two species remains a challenge, hindering comprehensive studies on their respective evolution. Focusing on the North Western Mediterranean basin over the past 8 millennia, we explored the diachronic evolution of sheep and goats outside their initial domestic center. This study, part of the ERC granted DEMETER project, employs a 2D landmark and sliding-landmark geometric morphometric approach to quantify and analyse the size and shape of third lower molars. A total of 2237 archaeological teeth from over 170 sites located in Catalonia (Spain) and the South of France were analysed in addition to ~900 modern specimens. The study reveals distinctive morphometric evolutionary patterns, with sheep displaying greater size variability and morphological diversity through time than goat. These findings hint at differential selective pressures and historical uses, underscoring the unique evolutionary pathways of these species.

7 UNRAVELING THE GENETIC THREADS OF ANCIENT EURASIAN SHEEP THROUGH SPACE AND TIME

Halpin, Áine (Trinity College Dublin) - Daly, Kevin (University College Dublin; Trinity College Dublin) - Mattiangeli, Valeria (Trinity College Dublin) - Bradley, Daniel (Trinity College Dublin)

Genomic analysis of ancient domestic animal species can reveal important information about prehistoric societies, culture and even human behaviour. One such species is the domestic sheep (*Ovis Aries*). There are three broad episodes of human innovation which have impacted the ancestry of sheep. These are; domestication (~11,000 ya), the use of secondary animal products such as wool and milk, and the development of breeds. Analysis of whole genome data has the potential to reveal the effects that human intervention has had on the genomes of sheep through space and time.

This research focuses on the extension of a spatiotemporal dataset of approximately two hundred ancient Eurasian sheep genomes spanning from the early Neolithic to the Medieval era. Themes this research will aim to explore include the timing of domestication events, the genetic foundations of wool, fine scaled ancestry patterns in Eurasia, and spatiotemporal patterns of consanguinity in Eurasian sheep populations.

Many people have contributed to this dataset and subsequent analyses and will be acknowledged fully.

8 RE-EVALUATING SHEEP AND GOAT DIFFERENTIATION THROUGH MORPHOLOGICAL AND PEPTIDE ANALYSES: A CASE STUDY FROM MEDIEVAL AZERBAIJAN

Larson, Kara (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan) - Haruda, Ashleigh (School of Archaeology, University of Oxford) - Garner, Daniel (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan) - Cooper, Zaria (Department of Anthropology, University of Michigan) - Wordsworth, Paul (Institute of Archaeology, University College London) - Ventresca-Miller, Alicia (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan; Department of Archaeology, Max Planck Institute for Geoanthropology)

The ability to distinguish between the remains of *Ovis aries* (sheep) and *Capra hircus* (goat) continues to be challenging and impacts discussions on herd management and composition. The use of scientific methods, particularly isotopic analyses of bioapatite, have become particularly reliant on the ability to distinguish between these two domesticated species. However, the differentiation of sheep and goat teeth, and to a larger extent mandibles, using visual morphometric criteria has been met with mixed results (Zeder and Pilaar 2010). Yet, visual criteria are still the principal method relied upon in zooarchaeological and isotopic studies. The potential unreliability of visual morphometric criteria directly impacts interpretations of herd management practices, herd composition, and pasture usage, among others. In this study, we conducted a participant survey to test the reliability of visual morphological criteria for differentiating sheep from goat using 58 mandibles from the Medieval period site of Bardha'a, Azerbaijan. Next, we conducted geometric morphometrics on high quality photographs of the teeth (in situ of the mandibles) to identify species based on criteria established by Jeanjean et al. (2022). To test the success of both methods, all 58 mandibles were analyzed using Zooarchaeology by Mass Spectrometry (ZooMS). Based on the results of these three studies, we will present recommendations for the identification of sheep and goat in archaeological contexts, particularly relevant for the use of isotopic analyses on mandibles and teeth.

9 SHEEP AND GOAT MANAGEMENT STRATEGIES IN ANCIENT SOGDIANA THROUGH ISOTOPE AND PROTEOMICS ANALYSES

Armaroli, Elena (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia (Italy)) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt am Main (Germany); Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia (Italy)) - Serrone, Eleonora (Department of History and Cultures, University of Bologna (Italy)) - Cipriani, Anna (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia (Italy); Lamont-Doherty Earth Observatory, Columbia University (USA)) - Vonhof, Hubert (Department of Climate Geochemistry, Max Planck Institute for Chemistry in Mainz (Germany)) - Suyonov, Samaretdin (Samarkand Institute of Archaeology, Uzbek Ministry of Culture and Tourism (Uzbekistan)) - Berdimuradov, Amriddin (Samarkand Institute of Archaeology, Uzbek Ministry of Culture and Tourism (Uzbekistan)) - Mantellini, Simone (Department of History and Cultures, University of Bologna (Italy))

The monumental Sogdian fortress of Kafir Kala (~12 km south of Samarkand, Uzbekistan), was a key site along the ancient Silk Road. Its strategic location allowed to control the southern access to the city, but also the transmission lines for the irrigation system and water supply. Two main phases of human occupation have been recognized in the citadel. The first one is pre-Islamic (late 7th – early 8th century A.D.). During this period the citadel served as an important administrative center. The second phase dates from the Arab conquest of Samarkand (712 A.D.) until the

12th century A.D. In this period the citadel was converted into a residential unit. Ovicaprids predominate among the domestic fauna remains in both occupation phases. The second phase shows a greater focus on meat consumption and the production of secondary products, which is consistent with the change in function of the site. A total of n=20 molars from the Islamic phase were sequentially sampled along the crown length to obtain information on seasonal variation in oxygen ($\delta^{18}\text{O}$), carbon ($\delta^{13}\text{C}$) and strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotope values. A total of n=25 plant samples were measured for the $^{87}\text{Sr}/^{86}\text{Sr}$ baseline. Stable isotope analyses were performed by IRMS; while Sr isotopes were measured by MC-ICPMS. Intra-tooth patterns of $\delta^{18}\text{O}$ and $\delta^{13}\text{C}$ values display significant differences among individuals, allowing the identification of at least three different animal management strategies. According to $^{87}\text{Sr}/^{86}\text{Sr}$ isotope analysis, only a few individuals display high seasonal mobility. However, many individuals show $^{87}\text{Sr}/^{86}\text{Sr}$ values non-compatible with the local baseline, meaning that they were likely raised far from Kafir Kala. ZooMS analyses are underway to understand if the isotope results can be related to the species. This multi-proxy work promises to be of great importance in light of the scarcity of data for this key but understudied area.

10 MIXED HERDS, MIXED FEED: A MULTIMETHOD APPROACH TO CAPRINES AND DIETS AT TEPE YAHYA, SE IRAN

Seabrook, Melina (Harvard University)

The production of meat, milk, hair, and manure were undoubtedly crucial factors driving caprine management. However, a purely economic approach to studying sheep and goats limits our understanding of a more complex system of human-animal relationships. Using traditional zooarchaeological and new archaeological science methods, I demonstrate the continued value of returning to older assemblages for increased data resolution into the lives of the animals for studying ancient caprine husbandry. My work focuses on fauna from an archaeological site of in Southeast Iran called Tepe Yahya. This fauna was last studied in 1986, before the introduction of newer archaeological science methods. Tepe Yahya is unique for its repeated occupations over 6,000 years. The site grew from a small village to a prospering urban center between 5500 BCE and 2000 BCE. This project takes a diachronic look at how provisioning for sheep and goats changed over time and how the process of urbanization affected these changes. A large assemblage of 405 sheep and goat mandibles was assessed for species and age, then sampled for paleoproteomic and isotopic analyses. Sheep and goats are often morphologically indistinguishable, however, using Zooarchaeology Mass Spectrometry (ZooMS), we can discern between these two species through differences in collagen. ZooMS allows for the inclusion of mandibles that would otherwise be excluded from the study. Carbon and nitrogen isotopic values are used to investigate the diets of these caprines, the types of plants they consume, and give insight into potential environmental conditions. The combined age profiles, species identifications, and carbon and nitrogen isotope ratios provide a level of insight into the caprines and their diet previously unattainable, that allows us to investigate how the animals were managed and cared for, going beyond a strictly economic view of caprine herds.

11 ANIMAL MOBILITY AND THE EMERGENCE OF ANIMAL HUSBANDRY IN THE SOUTHERN LEVANT: MULTI-STABLE ISOTOPIC ANALYSES OF PRE-POTTERY NEOLITHIC CAPRINES

Makarewicz, Cheryl (University of Kiel; University of Haifa)

Stable isotope data gleaned from the bone collagen and enamel bioapatite of herbivores has revealed how the role of seasonal provisioning of animals with fodder contributed to the initial management and eventual domestication of sheep and goats during the early Holocene. Surprisingly, how mobility configured nascent experimentation with animal husbandry remains largely unknown. Here, carbon, oxygen, and strontium stable isotope analyses of incrementally sampled caprine teeth recovered from key Pre-Pottery Neolithic sites located in the southern Levant, where people first experimented with animal husbandry and later herded fully-fledged domesticates, document the ways in which animal movement was enhanced or constrained by human caretakers. These isotopic data, coupled with faunal biometrical and ageing data that further inform on herd demography dynamics, further reveal the diversity of husbandry practices that directed domestication and also confront analytical challenges in the use of oxygen and strontium isotopes to trace movement in the southern Levant.

12 BUILDING -OVICAPRINE- BRIDGES: COMBINED PALAEOGENOMIC AND PALAEOPROTEOMIC ANALYSIS FOR THE STUDY OF CAPRINAE EARLY DOMESTICATION

Le Meillour, Louise (Section for Molecular Ecology and Evolution - Globe Institute - University of Copenhagen - Denmark) - L'Hôte, Louis (Smurfit Institute of Genetics - Trinity College Dublin - Ireland) - Bangsgaard, Pernille (Section for GeoGenetics - Globe Institute - University of Copenhagen - Denmark) - Yeomans, Lisa (Centre for the Study of Early Agricultural Societies - Department of Cross-Cultural and Regional Studies - University of Copenhagen - Denmark) - Zeder, Melinda (Department of Anthropology - National Museum of Natural History - Smithsonian Institution - Washington - USA) - Richter, Tobias (Centre for the Study of Early Agricultural Societies - Department of Cross-Cultural and Regional Studies - University of Copenhagen - Denmark) - Darabi, Hojjat (Razi University - Kermanshah - Iran) - Welker, Frido (Section for Molecular Ecology and Evolution - Globe Institute - University of Copenhagen - Denmark) - Daly, Kevin (School of Agriculture and Food Science - University College Dublin - Ireland)

The advent of domestic species marks a turning point in our (pre)history. With the cultivation and herding of domesticated plants and animals, humans became less reliant on what they could gather and hunt, shifting societies and their economies to controlled food production. Starting around 10,000 years ago, the domestication of sheep (*Ovis aries*) and goats (*Capra hircus*) is now understood as a geographically complex and gradual process. The management and control over reproduction of populations of the wild representatives *Ovis orientalis* and *Capra aegagrus* consequently led, after many generations of breeding in the anthropogenic environment, to the domestic forms of caprines currently herded. It is thus crucial for understanding these very first steps of animal domestication to specifically characterise archaeological faunal assemblages dating to this transition towards more intensive livestock management. The present paper aims at inferring the nature of caprine domestication in the Zagros Mountains using biomolecular methods. Genetic analysis showed limited success, but we nevertheless report the first ancient *Capra* specimens from Shanidar Cave and Tepe Guran, widening our temporal understanding of the local wild and managed goat populations. Some of the sampled specimens failed aDNA recovery and were thus sub-sampled for ancient protein extraction and characterisation through Zooarchaeology by Mass Spectrometry (ZooMS). We therefore report the first use of a dual biomolecular approach on faunal assemblages from southwest Asia, by combining ancient DNA and ancient protein analyses, shedding new light on the initial steps of Caprinae domestication.

13 SHEEP OR GOATS? CAPRINE MANAGEMENT IN THE CENTRAL SAHARA IN THE MIDDLE-LATE HOLOCENE (8300-3400 CAL BP)

Di Matteo, Martina (Department of Ancient World Studies, Sapienza University of Rome, Rome, Italy) - McGrath, Krista (Department of Prehistory and Institute of Environmental Science and Technology (ICTA-UAB), Universitat Autònoma de Barcelona, Bellaterra, Spain) - Soncin, Silvia (MARE, Department of Environmental Biology, Sapienza University of Rome, Rome, Italy) - di Lernia, Savino (Department of Ancient World Studies, Sapienza University of Rome, Rome, Italy; GAES, University of Witwatersrand, Johannesburg, South Africa)

The introduction of domesticated animals from the Near East to Africa is now well established, although it remains unclear how this took place in the case of sheep and goat.

Recent studies have shown how this process is complex and articulated (di Lernia, 2021; Le Meillour, 2021; Prendergast et al., 2019) and that sheep and goat require individual histories that are often lacking due to the difficulty of discriminating bones between the two species. This is further complicated in African contexts due to the presence of wild bovids of the same size of sheep and goat.

Most importantly, the introduction of domestic animals did not always result in a complete interruption of hunting activities and therefore distinguishing between domestic and wild species is crucial for the archaeological documentation of the passage towards a productive economy. Decades of research suggest that the Central Sahara has among the oldest evidence of domestic animals in Africa and therefore is a key spot to investigate such dynamics.

Here we present a high-resolution analysis of the faunal record from some archaeological contexts in SW Libya with ZooMS (Zooarchaeology by Mass Spectrometry). Representing the very first application of this method in the Sahara, this study has enabled the refinement of sheep and goat taxonomic determinations, highlighting the simultaneous presence of both species in archaeological levels dating to around 8300-8000 cal BP. These fragments constitute among the oldest goat and sheep remains of the African continent.

Thanks to our results, it is now possible to observe changes in the management of sheep and goats to cope with an increasingly unpredictable and variable environment and climate from the mid-Holocene onwards, even on a seasonal basis. Specialized goat breeding would appear to be the resilience strategy implemented by Saharan pastoralists to cope with the desertification process.

14 UNRAVELING PASTORALIST HUSBANDRY: INSIGHTS FROM DENTAL ANALYSES AT THE KASTEELBERG SITE, SOUTH AFRICA

Hutten, Louisa (University of Cape Town) - Stynder, Deano (University of Cape Town)

The Kasteelberg site, situated along South Africa's west coast, provides a unique opportunity to explore a pastoralist history extending over two millennia. With a significant accumulation of sheep dental remains, this archaeological site offers valuable insights into early herding practices within the region. Our study investigates whether the Kasteelberg people employed grazing strategies reminiscent of those observed in Khoekhoe pastoralist societies during the colonial era, aimed at optimizing grass availability for their livestock. Utilizing dental micro- and mesowear analyses, our study endeavors to elucidate the dietary patterns of Kasteelberg's sheep, shedding light on their grazing behaviours and the husbandry practices of their owners. The local region experiences seasonal fluctuations in grazing conditions, characterized by abundant grass during winter and scarcity in summer. Conditions were likely similar during the pre-historic period, with seasonal aridity prompting pastoralist mobility to more perennial inland pastures. Through the characterization of dental wear patterns on the molars of sheep and comparably sized wild bovids, our study aims to unravel the intricate dynamics of human-animal interactions and resource exploitation amidst varying grazing conditions during the prehistoric era. Given the paucity of studies in southern Africa, we draw upon insights from European research to augment our understanding of local farming and herding practices.

15 PASTORALISM AND PALAEOPROTEOMICS: INSIGHTS FROM DIEPKLOOF ROCK SHELTER, WESTERN CAPE, SOUTH AFRICA

Nyambiya, Humphrey (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB), Universidade do Algarve) - Hansen, Jakob (Globe Institute, University of Copenhagen) - Hutten, Louisa (Department of Archaeology, University of Cape Town) - Parkington, John (Department of Archaeology, University of Cape Town) - Welker, Frido (Globe Institute, University of Copenhagen) - Rhodes, Sara (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB), Universidade do Algarve) - Val, Aureore (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB), Universidade do Algarve; CNRS, UMR 7269 LAMPEA, Aix-Marseille Université, Aix-en-Provence, France; School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand, Johannesburg) - Meillour, Louise le (Globe Institute, University of Copenhagen)

Animal domestication changed human subsistence strategies by ensuring availability of animal resources. Domesticated caprines were introduced to Africa from the Near East, and are documented in north Africa from 9000 BP. Caprines moved slowly southwards and appear in southern Africa only at 2000 BP. While the scientific community agrees that the appearance of livestock in southern Africa was from further north, how this happened and the nature and impact of herding practices on existing subsistence strategies remains debated. Recently, criticisms have been levelled against sheep identifications based on modern reference collections as there exist morphological overlaps between sheep, goat and other wild bovids. Here, we report dual species identifications from both zooarchaeological and palaeoproteomic approaches. We used Zooarchaeology by Mass Spectrometry (ZooMS) on 90 long bone specimens from Diepkloof Rock Shelter, Western Cape, South Africa. This site has a long chronology dated from 100 kya of the Middle Stone Age (MSA) layers to the late phases of Later Stone Age (LSA) dated to 1500 BP; thus covering the period when domesticated sheep and goat are attested in the region. Our results identified both wild and domestic taxa, demonstrates the exploitation of juvenile individuals, thereby supporting previous morphological identifications and past broad interpretations from various zooarchaeological studies. This paper will further discuss the importance of combining traditional zooarchaeology and palaeoproteomics, the combination of which promises to unravel intricate details of animal resource exploitation and human-animal interactions during this critical phase.

16 COMPLEX INTERCONNECTIONS BETWEEN CLOTH PRODUCTION AND THE ANIMAL WORLD: NEW PROTEOMIC INSIGHTS FROM ANCIENT SUDAN AND NUBIA

Viñas Caron, Laura (University of Copenhagen)

The animal world has tremendously influenced the economy of ancient Sudanese societies along the Middle Nile Valley. Most studies have focused on the dietary and symbolic role of animals so far and, thus, their importance in cloth production remains largely unassessed. Sheep and goat pastoralism spread along the Nile around the 5th millennium BCE, but the first attestations of wool textiles only date back to the 1st millennium BCE. Camel or dromedary was also probably used for wool production in ancient Sudan after its arrival during the 1st millennium BCE. However, the identification of wool fibres with morphometric methods is challenged by degradation, impeding the discrimination of sheep, goat or camel wool in most cases. Another long-lasting debate has revolved around the usage of domesticated versus wild animals (e.g. gazelle, giraffe or leopard) for skin garment production. Their correct identification is essential to understand which species were selected to answer the demands of garment production and assess how they were

managed within the whole economic system. Additionally, it can inform us about the interactions between sedentary and nomadic communities, landscape use and trade networks.

To elucidate these questions, the ERC project “Fashioning Sudan. Archaeology of Dress along the Middle Nile” is investigating cloth garments made of textiles and animal skins preserved in Sudan and Nubia and ranging from the Bronze Age to the Late Medieval Period (c. 2500 BCE to 1500 CE). Furthermore, we incorporate new developments in ZooMS and palaeoproteomics to identify the animal species used across time and space. In this paper, we will present the overall project and place our preliminary proteomic results within the broader context to shed new light on pastoral practices in ancient Sudan.

17 ANCIENT NUBIAN FURSKINS – TRACING OVICAPRINE BREED DIFFERENCES BY INVESTIGATING HAIR MORPHOLOGY

Skinner, Lucy-Anne (University of Copenhagen)

Biomolecular and morphometric techniques have been employed to identify the animal provenance of Nubian leather and furskin garments dating between the Early Nubian Period (3800BC) to the end of the Middle Nubian Period (1550 BC).

Animal provenance (species, breed, age) of Nubian leather has proved difficult to identify by comparing a skin’s Grain Follicle Pattern (GFP) with modern reference skin sets, because the diagnostic part (the skin’s grain surface) is typically scraped away during leather processing. However, Nubian furskin garments have residual animal hair. Since animal hair often has large inter / intra-species variations in morphology, it offers a viable alternative for morphometric ID. This paper builds upon results from the bio-molecular analysis of furskins, used to identify sheep and goatskin; carrying out systematic morphometric investigation of hair, whereby multiple diagnostic features have been recorded. These include hair length, hair bulb, tip and shaft shape, thickness, proportions of primary and secondary hairs, hair-density on the skin surface, and diagnostic patterns and features of the hair scale-cuticle.

Insights provided by morphometric investigation of hair from Nubian furskins include – an impression of fleece/hair types of domestic animal breeds living during different periods, suggestions of the season of animal slaughter, and differences in coat type depending on animal age.

Challenges with the methodologies employed include – fragility and degradation of ancient hair-shafts, high-magnification required and difficulties resolving images of hair scale-patterns (using regular microscopes), and issues interpreting the features of hair from ancient animal breeds when access to comparative reference hair samples was limited to modern breeds.

Nevertheless, (especially when supported / complimented by bio-molecular species ID), morphometric investigation using residual hair can provide insightful impressions of ancient breed appearance and animal management practices.

704 BIOARCHAEOLOGY OF ANCIENT PATHOGENS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Pochon, Zoé (Department of Archaeology and Classical Studies, Stockholm University; Centre for Palaeogenetics) - L’Hôte, Louis (Smurfit Institute of Genetics, Trinity College Dublin) - Barbieri, Rémi (Institute of Genomics, University of Tartu) - Wilkin, Shevan (Institute of Evolutionary Medicine, University of Zurich) - Majander, Kerttu (Integrative Prehistory and Archeological Science (IPAS), University of Basel)

Session format: Regular session

Epidemics and disease have played a pivotal role in shaping human history, leaving their indelible marks on societies and civilizations throughout time. Join us in an exploration of the profound impact of ancient pathogens on human history. We invite contributions that delve into the study of various pathogenic agents, including bacteria, viruses and eukaryotic parasites and their impact, all with relevance to archaeological research.

Our aim is to uncover how these ancient pathogens influenced human populations, their domesticated animals and crops. These influences encompassed direct contaminations, through devastating plagues, zoonotic outbreaks or endemic pathogens, but also indirect consequences, such as crop disease induced famines and livestock epidemics leading to restricted access to animal products.

This session offers a platform for scholars with diverse archaeological methodologies, including, but not exclusive to, bioarchaeological methods, palaeopathological analysis, metagenomic screenings, the study of immunological protein biomarkers, and historical account analysis. We invite your participation in the exploration of the past to better understand the profound impact of infectious diseases on past human history.

ABSTRACTS

1 BIOMOLECULAR INSIGHTS INTO THE SECOND PLAGUE PANDEMIC FROM THE LAZZARETTO VECCHIO OF VENICE

Gaul, Emily (Institute for Archaeological Sciences, Department of Geosciences, Eberhard Karls University of Tübingen, Germany) - Krettek, Kim-Louise (Archaeo- and Palaeogenetics Group, Senckenberg Centre for Human Evolution and Palaeoenvironment, Tübingen, Germany) - Reiter, Ella (Institute for Archaeological Sciences, Department of Geosciences, Eberhard Karls University of Tübingen, Germany) - Vazzana, Antonino (Dipartimento di Beni Culturali, Università di Bologna, Ravenna, Italy) - Figus, Carla (Dipartimento di Beni Culturali, Università di Bologna, Ravenna, Italy) - Benazzi, Stefano (Dipartimento di Beni Culturali, Università di Bologna, Ravenna, Italy) - Posth, Cosimo (Institute for Archaeological Sciences, Department of Geosciences, Eberhard Karls University of Tübingen, Germany; Archaeo- and Palaeogenetics Group, Senckenberg Centre for Human Evolution and Palaeoenvironment, Tübingen, Germany) - Spyrou, Maria (Institute for Archaeological Sciences, Department of Geosciences, Eberhard Karls University of Tübingen, Germany)

The Second Plague Pandemic, considered to be among the largest infectious disease pandemics of human history, is generally recognised to have lasted from the 14th to early 19th centuries, affecting regions across Eurasia and likely beyond. Over the last decade, biomolecular, archaeological, and historical data have yielded insights into global patterns of the disease’s distribution and the bacterium’s genetic diversity during the Second Pandemic. Yet, whilst more than 100 ancient *Y. pestis* genomes are currently available from this period, the precise mechanism and chronology of the disease’s dissemination remain subjects of debate, including the geographical origin(s) of successive plague waves during the period following the Black Death (1346-1353). To this end, important new perspectives might be derived from high-resolution analysis of mass burial sites proximal to centres of trade, which likely played a key role in the disease’s dispersal. In this study, we present the results of ancient DNA analysis conducted on individuals recovered from the Lazzaretto Vecchio, Venice’s first permanent plague hospital. Constructed in 1423 on the island of Santa Maria di Nazareth, it served as a quarantine facility for people infected with plague right until the city’s last major outbreak in 1630-31. Through a metagenomic screening of non-targeted sequencing data, we investigate broad viral and bacterial presence as informative for overall population health. In addition, we find a high degree of *Y. pestis* DNA preservation at the site, with traces of the pathogen detected in a large number of the individuals studied. As a major intersection of people and goods from across the Eurasian continent, the Lazzaretto Vecchio presents an important case study for our understanding of intra-pandemic dynamics. More broadly, our findings attest to the potential of denser sampling strategies, applied to single burial sites, as a tool for exploring localised temporal patterns of pathogen presence.

2 BLACK DEATH IN SÁPMI? THE IMPACT OF THE SECOND YERSINIA PESTIS PLAGUE PANDEMIC ON THE SAAMI POPULATION IN NORTHERN FENNOSCANDIA

Spangén, Marte (Museum of Cultural History, University of Oslo) - Jørgensen, Erlend (Norwegian Institute of Cultural Heritage Research)

The AD 1346–1353 Black Death pandemic constitutes one of the most distinct and best studied historical events in Europe, forming a unified and synchronous historical and epidemiological boundary horizon. However, studies of the impact of this plague and subsequent outbreaks in northern Fennoscandia are lacking, particularly concerning the Saami population. Existing studies focus on urban centers and agricultural communities, while there are few studies of the effect on indigenous and foraging populations, mainly due to the lack of relevant historical sources to draw on. This paper contributes to closing this knowledge gap through temporal frequency distribution analyses of 156 radiocarbon-dated burials and 543 typologically or historically dated burials in Saami areas (Northern Fennoscandia). The results strongly suggest that Saami groups were directly affected by the Black Death. They also reveal other interesting trends in burial customs. Combined with historical and archaeological evidence, we conclude that the plague had substantial impact on religion and social organisation among the Saami.

3 REFINING THE CHRONOLOGY OF THE SECOND PLAGUE PANDEMIC THROUGH PHYLOGENETICALLY INFORMED RADIOCARBON MODELLING

Keller, Marcel (Estonian Biocentre, Institute of Genomics, University of Tartu, Tartu, Estonia; Integrative Prehistory and Archaeological Sciences, Department of Environmental Sciences University of Basel, Switzerland; Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern, Bern, Switzerland) - Guellil, Meriam (Estonian Biocentre, Institute of Genomics, University of Tartu, Tartu, Estonia; Department of Evolutionary Anthropology, University of Vienna, Vienna, Austria) - Slavin, Philip (Division of History, Heritage and Politics, University of Stirling, Stirling, UK) - Valk, Heiki (Institute of History and Archaeology, University of Tartu, Tartu, Estonia) - Robb, John (Department of Archaeology, University of Cambridge, Cambridge, UK) - Reitmaier, Thomas (Archaeological Service of the Canton of Grisons, Chur, Switzerland) - Baetsen, Willem (RAAP Archeologisch Adviesbureau b.v., Leiden, The Netherlands; School of Archaeology and Ancient History, University of Leicester, Leicester, UK) - Szidat, Sönke (Department of Chemistry, Biochemistry and Pharmaceutical Sciences, University of Bern, Bern, Switzerland; Oeschger Centre for Climate Change Research, University of Bern, Bern, Switzerland) - Tambets, Kristina (Estonian Biocentre, Institute of Genomics, University of Tartu, Tartu, Estonia) - Scheib, Christiana (Estonian Biocentre, Institute of Genomics, University of Tartu, Tartu, Estonia; St John's College, University of Cambridge, Cambridge, UK)

The second plague pandemic in Europe between the 14th and 18th centuries is one of the most studied pandemics in human history not only through historical research, but also through ancient pathogen genomics, counting now over 90 reconstructed genomes from dozens of places in Western and Central Eurasia. Yet, combining datasets of both disciplines has been challenging, since for most ancient *Yersinia pestis* genomes only broad radiocarbon dating intervals are available, often making it impossible to associate them with historically documented outbreaks.

For our study, we reconstructed new *Y. pestis* genomes from eight archaeological sites in England, Estonia, the Netherlands, Switzerland, and western Russia dating from the Black Death in 1349 up until the Great Northern War in 1710. This new genomic evidence showcases the presence of plague in the Eastern Baltic region over more than three centuries and elucidates the geographic spread of individual *Y. pestis* sublineages through Europe. Furthermore, we present a novel dating methodology by feeding relative chronological information from phylogenetic trees into radiocarbon models, which in some instances narrows down dating intervals for ancient plague genomes to only a few decades. Combined with an in-depth historical contextualization, this allows us to discuss the probable association of those genomes with documented epidemics, improving our understanding of the dynamics of the second plague pandemic. We expect that sequencing of additional ancient *Y. pestis* genomes along with radiocarbon dating will further improve the temporal resolution of our models, and suggest that the application of our methodology to other clonally evolving pathogens as well.

4 COEVOLUTION OF PATHOGENIC YERSINIA IN DOMESTICATED SPECIES

Hearne, Katherine (University of Oxford)

Yersinia pestis is a significant human-associated pathogen, and is relatively well researched in ancient pathogen genomics (Spyrou et al. 2019). Understanding of *Y. pestis* evolution during the Neolithic is being continuously refined as more ancient *Y. pestis* genomes are sequenced, allowing insight into the development of virulence factors since pathogen emergence c. 5000 years ago (Andrades Valtueña et al. 2022).

The shifting human-animal interactions and changing human and animal demographics associated with the Neolithic would have substantially affected pathogen evolutionary dynamics. To understand the early evolution of *Y. pestis*, from its clonal ancestor *Yersinia pseudotuberculosis* (McNally et al. 2016), it is essential to contextualise it within the wider ecological and pathogenic landscape of the genus *Yersinia*.

Dogs and pigs have a degree of resistance against *Y. pestis* infection, sometimes linked to their domesticated status (Barbieri et al. 2020), though this resistance is likely exhibited at the genus level. Here I consider the hypothesis that canids and suids are resistant to pathogenic *Yersinia* due to an extended period of coevolution, which pre-dates domestication. Changing interactions with domesticated species during the Neolithic likely increased human exposure to *Yersinia* species, and human susceptibility to pathogenic *Yersinia* may be due to an absence of coevolution.

Based on metagenomic screening of ancient and modern human and animal genomes I explore temporal and geographic patterns of *Yersinia* infection, including potential effects of demographic change upon disease burden. By shifting focus from an anthropocentric understanding of pathogen evolutionary dynamics to one encompassing animal ecologies I consider the hypothesis that *Yersinia* species are a major burden for humans because several important domesticates are resistant at the genus level. In this view, we increase our exposure to pathogenic *Yersinia* species by cohabiting with these animals, but are outsiders in their wider bacterial ecology.

5 RETZIUS COLLECTION: ABORIGINAL CRANIA FROM PUERTO RICO IN STOCKHOLM

Llorens-Liboy, Myriam (Independent researcher) - Nuñez-Garcés, Milton (Professor emeritus Oulu University)

This paper deals with the fate of a group of nine Taino crania of different age and sex. They were originally found in a burial cave on Puerto Rico and then taken to Sweden by the pharmacist Justus Adalric Hjalmarsson (1823-1876), who donated them to Professor Gustaf Retzius's collection in 1857. Later, the crania were incorporated in the collection of the Osteoarchaeology Laboratory of Stockholm University. Eight of the crania present, in major or minor grade, lesions similar to those left by treponematosi, and three of them show possible signs of intentional deformation. In 1971, the anthropologist Nils-Gustav Gejval and the pathologist Folke Henschel published a brief description of eight the crania. For three decades, the "Boricuas" crania were forgotten until they were rediscovered by Jan Storå and Milton Núñez in 2006. Their existence remained unknown to Puerto Rican archaeologists until Myriam Llorens-Liboy became a member of the research team in 2008. She was the first Puerto Rican to gain access to the crania and describe the results of the analyses made so far as well as future research plans and new possible osteological evidence.

6 NON-INVASIVE ANALYSES OF INCA MUMMIES REVEAL UNDOCUMENTED GENETIC AND PATHOGENIC VARIATION

Gelabert, Pere (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Hämmerle, Michelle (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Guellil, Meriam (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Socha, Dagmara (Center for Andean studies, University of Warsaw) - Sawyer, Susanna (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Cheronet, Olivia (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Bernaski, Mario (Museo de Arqueología de Alta Montaña (MAAM)) - Recagno, Gabriela (Museo de Arqueología de Alta Montaña (MAAM)) - Kuhlwiilm, Martin (University of Vienna; Human Evolution and Archaeological Sciences (HEAS)) - Pinhasi, Ron (University of Vienna; Human Evolution and Archaeological Sciences (HEAS))

The three Mummies of the Llullaillaco (Argentina) were discovered in 1999 on the top of the Llullaillaco volcano, making the volcano the world's highest ceremonial site. They were buried about 1.7m deep inside pit tombs. The bodies are the best-preserved mummies discovered to date in the Andes. Their perfect conservation owed to freezing temperatures, mild humidity, and an anaerobic environment. The Inca sacrificed them as part of a ritual called "Capacocha". Besides religious significance, the sacrifices helped exert social control and gained socioeconomic benefits over conquered provinces.

The mummies were sampled non-invasively at the Museum of Arqueología de Alta Montaña (MAAM) in Salta and the sequencing libraries were prepared in a dedicated ancient DNA facility at the University of Vienna. The sequencing data was analyzed following well-established bioinformatics tools adapted specifically to ancient DNA. We obtained a 3.2x, 14.3x, and 25.3x human genome from the three individuals, respectively. Their genomes reveal that they are genetically most similar to indigenous people from what is nowadays Peru, and provide genetic insights into their health conditions. These are unique genomes as they are from a time before the colonization of the Americas. Additionally, we identified pathogenic reads from both Human gammaherpesvirus 4 (HHV4) and Bartonella quintana, whereby the latter has not been sequenced from ancient individuals before.

7 TRACKING ANCIENT ZOOZOSIS AND LIVESTOCK PATHOGENS ACROSS THE DOMESTICATION PROCESS

L'Hote, Louis (Trinity College Dublin) - Makarewicz, Cheryl (Institute of Pre- and Protohistoric Archaeology-Christian Albrechts University, Kiel - Germany) - Gourichon, Lionel (CNRS, CEPAM (UMR 7264) - Université Nice Côte d'Azur - France) - Daly, Kevin (School of Agriculture and Food Science - University College Dublin - Ireland)

The Neolithic period in Southwest Asia was characterized by the domestication of livestock animals, which had a profound effect on human health, as it provided a stable source of animal protein and secondary products. This increased interaction between animals and humans is thought to have resulted in a heightened risk of zoonotic disease transmission, both within herds and between animals and humans. Here we present the recovery of zoonotic and animal pathogens from multiple species and temporal contexts, shedding light on the evolutionary trajectories and spread of these pathogens during the domestication process. Among these we report the retrieval of an ancient genome of *Brucella melitensis* from a Neolithic sheep in Mentese, Turkey (6024-5842 cal BCE), the agent of brucellosis, a prevalent zoonotic bacterial infection causing chronic infections and spontaneous abortion in livestock, a cause of substantial harm to both herd those communities reliant on livestock, such as pastoralist societies. Furthermore we explore the evolutionary and temporal dynamics within the *brucella* genus.

8 REDEFINING THE TREPONEMAL HISTORY THROUGH PRE-COLUMBIAN GENOMES FROM BRAZIL

Majander, Kerttu (Integrative Prehistory and Archeological Science (IPAS), University of Basel, Basel, Switzerland) - Pla-Díaz, Marta (Integrative Prehistory and Archeological Science (IPAS), University of Basel, Basel, Switzerland) - du Plessis, Louis (Department of Biosystems Science and Engineering, ETH Zürich, Basel, Switzerland; Swiss Institute of Bioinformatics, Lausanne, Switzerland) - Arora, Natasha (Zurich Institute of Forensic Medicine, University of Zurich, Zurich, Switzerland) - Filippini, Jose (Institute of Biosciences, University of São Paulo, São Paulo, Brazil) - Pezo Lanfranco, Luis (Institute of Biosciences, University of São Paulo, São Paulo, Brazil; 10. Institute of Environmental Science and Technology (ICTA), Universitat Autònoma de Barcelona, Bellaterra, Spain) - Eggers, Sabine (Department of Anthropology, Natural History Museum Vienna, Vienna, Austria) - González-Candelas, Fernando (Unidad Mixta Infección y Salud Pública FISABIO/Universidad de Valencia-I2SysBio, Valencia, Spain; CIBER in Epidemiology and Public Health, Instituto de Salud Carlos III, Madrid, Spain) - Schuenemann, Verena (Integrative Prehistory and Archeological Science (IPAS), University of Basel, Basel, Switzerland).

Treponemal spirochetes constitute a group of both historically grievous and globally re-emergent pathogens with serious human health implications. In the absence of ancient DNA (aDNA) evidence until recently, their origins and evolutionary trajectories have remained widely debated. For instance, the severe syphilis epidemic in Europe, starting in the late 1400's, has in turns been ascribed either to Columbus' first expedition to America, or to an alternative, Old World or ancient global origin. In a novel study, we present indisputable genomic evidence of a pre-Columbian treponematoses from South America, dating back nearly 2000 years: four *Treponema pallidum* genomes, reconstructed from pathogen aDNA in prehistoric human remains from a sambaqui (shellmound) burial, Jabuticabeira II, south coast of Brazil, where at least three cases (in 56 evaluated individuals) of treponematoses were previously diagnosed with morphological methods. Unexpectedly, the recovered pathogen genomes appear extremely similar to the modern strains that cause bejel, an endemic type of treponematoses which today is mainly found in the hot and arid regions of the world, instead of humid, coastal environments. This spatial discrepancy despite the genomic likeness between the ancient and modern strains demonstrates the high adaptive abilities of *T. pallidum* subspecies under various conditions, and extends the plausible range of their dispersals in the past. One of the genomes exhibited a particularly high coverage (33.6X), allowing an in-depth analysis of the recombination events across the *T. pallidum* family and an improved molecular clock dating estimation with previously published diversity of ancient *T. pallidum* genomes and currently circulating treponemal strains. Together, these analyses suggest a pre-Columbian divergence time for all *T. pallidum* subspecies present today, and showcase the remarkable potential of archaeogenetics in solving essential questions of treponemal evolution and in illuminating their elusive origins.

9 GENETIC ASPECTS OF ANCIENT PATHOGENS IN SOUTH KOREA

Hong, Jong Ha (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea) - Shin, Dong Hoon (Department of Anatomy and Cell Biology, Seoul National University College of Medicine, Seoul, Republic of Korea)

To reveal epidemic patterns of infectious diseases among ancient populations, bioarchaeology employs various scientific techniques on archaeological samples. Over the past several decades, ancient DNA (aDNA) study has received considerable attention in the field of bioarchaeology. However, until recently, the number of aDNA research cases has been insufficient to acquire detailed information on genetics of ancient pathogens in Korea. Latterly in South Korea, various evidences of ancient pathogens have been discovered in mummies dated from the 15th to the 18th century through microscopic examination. Fortunately, aDNA analysis has been successfully conducted on a total of six ancient pathogenic agents. In this presentation, we will briefly introduce the paleopathological research being conducted in South Korea and present the results of examinations for five ancient parasite species and one bacterial species. The utility of aDNA analysis in the field of bioarchaeology will be explored thus. Genetic differences between modern and ancient pathogens, and differences among geographically disparate pathogens will also be presented in this study. This study is supported by the National Research Foundation of Korea (NRF) grant (NRF-2023R1A2C1006785).

10 INSIGHTS INTO THE ORIGIN OF LEPROSY BY ANALYZING ANCIENT MYCOBACTERIUM LEPRAE GENOMES FROM ANATOLIA

SEVKAR, Arda (Human-G Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey) - ALTINIŞIK, Nefize (Human-G Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey) - UYSAL, Gülfem (Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey) - GÖTHERSTRÖM, Anders (Department of Archaeology and Classical Studies, Stockholm University, Stockholm, Sweden; Centre for Palaeogenetics, 106 91 Stockholm, Sweden) - SOMEL, Mehmet (Department of Biological Sciences, Middle East Technical University, 06800 Ankara, Turkey) - ERDAL, Yılmaz (Human-G Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey; Husbio-L Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey) - ÖZER, Füsün (Human-G Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey)

Leprosy, caused by *Mycobacterium leprae*, stands as one of the most feared infectious diseases in human history and has elicited widespread apprehension and social stigmatization. Phylogenetic analyses of ancient and contemporary *M. leprae* strains have revealed that Europe, compared to other regions, harbored the most ancestral strains and displayed higher genetic diversity throughout time. These findings have led to two hypotheses regarding the origin of leprosy. The first hypothesis suggests that leprosy may originate from Europe or even the Near East. Conversely, the alternative hypothesis posits that Europe's higher genetic diversity stems from mutual interactions with neighboring regions. Even with relatively extensive genetic data comprising over 200 ancient and contemporary strains, the exact origins and evolutionary trajectory of *M. leprae* remain unresolved due to the spatial sparsity of ancient genomic data. Therefore, *M. leprae* whole-genome data from regions that have not been previously studied such as the Near East and Central Asia are needed to address these questions.

Here, we genetically screened 9 individuals from ancient Anatolia, spanning the Byzantine to the Late Ottoman Period, displaying palaeopathological signatures compatible with leprosy. Among four samples diagnosed as lepromatous leprosy, three of them yielded ancient *M. leprae* DNA. Phylogenetic analysis placed two Byzantine period samples in the 3K-0 Branch, representing the most ancestral strains. Furthermore, these two ancient strains are positioned in the outermost nodes of the 3K-0 Branch, supporting the first hypothesis. Another ancient strain from the Late Ottoman Period formed a clade in the 2F Branch, closely clustering with modern Ethiopian and historical Russian strains, possibly indicating Late Modern Period interactions between Eastern Africa, Near East, and Eastern Europe. Thus far, this study provides the first ancient whole genome data for the 2F and 3K-0 strains beyond Europe, enabling us to revisit the hypotheses proposed for the origin of leprosy.

11 INFECTIOUS DISEASES IN THE MEDIEVAL NECROPOLIS OF LAS GOBAS, IBERIA

Pochon, Zoé (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University) - Rodríguez-Varela, Ricardo (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University) - Yaka, Reyhan (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University) - Sanchez-Pinto, Iban (Departamento de Geografía, Prehistoria y Arqueología, University of the Basque Country, UPV/EHU; GPAC, C. I. Micaela Portilla, University of the Basque Country, UPV/EHU) - Luis Solau, José (Departamento de Geografía, Prehistoria y Arqueología, University of the Basque Country, UPV/EHU; GPAC, C. I. Micaela Portilla, University of the Basque Country, UPV/EHU) - Lagerholm, Vendela (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University) - Krzewinska, Maja (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University) - Herrasti, Lourdes (Departamento de Antropología, Sociedad de Ciencias Aranzadi) - Azkarate, Agustín (Departamento de Geografía, Prehistoria y Arqueología, University of the Basque Country, UPV/EHU; GPAC, C. I. Micaela Portilla, University of the Basque Country, UPV/EHU) - Götherström, Anders (Centre for Palaeogenetics; Department of Archaeology and Classical Studies, Stockholm University)

The Las Gobas necropolis, spanning five centuries from the 7th to the 11th, represents a unique archaeological site offering insights into medieval populations in Northern Spain. Situated within an extensive complex of medieval cave settlements, Las Gobas provides a glimpse into the societal dynamics and interactions within this rural Christian community during the transformative era of the early Middle Ages. Through a comprehensive analysis, our study combines archaeogenetic methods with metagenomics to unravel the health, demography, and societal intricacies of this ancient population.

Here, we focus on the analysis of infectious diseases found at the site through ancient metagenomic screening. Employing the ancient metagenomic workflow, aMeta, developed in collaboration with the National Bioinformatics Infrastructure Sweden (NBIS), we identified significant ancient pathogens. From the screening of 33 individuals buried at Las Gobas, we detected ancient infectious diseases such as *Yersinia enterocolitica*, *Erysipelothrix rhusiopathiae*, and *Leptospira interrogans* using aMeta. These findings hold particular significance as they shed light on previously understudied diseases in ancient populations, highlighting potential implications such as contaminated water sources,

animal handling practices, and other factors contributing to the health challenges faced by medieval communities. Further investigation using KrakenUniq, Bowtie2, and MapDamage of the organisms under the default thresholds of aMeta indicates the potential presence of *Borrelia recurrentis* and the Variola virus, agent of smallpox. The detection of these pathogens, if confirmed, would offer unprecedented insights into the health challenges faced by medieval populations of Iberia and could indicate new opportunities for understanding disease transmission and societal impacts during this transformative period.

708 DIGITAL DISSEMINATION: USING NEW TOOLS TO COMMUNICATE WITH STAKEHOLDERS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Rinehart Macrae, Grace (University College Dublin; The Humanities Guild) - Loy, Aida (Independent Researcher) - Petrocelli, Alexandria (The Humanities Guild) - Martínez Espinosa, Isaac (Urraca Historiadores; Colegio Menesiano; Instituto de Estudios Riojanos) - Mora Rodríguez, Fernando (Asociación del Hórreo Asturiano; Red Horrea (Red Internacional De graneros elevados tradicionales))

Session format: Session with keynote presentation and discussion

As archaeologists and heritage specialists, we know that civil engagement is vital for a project to live, survive, and thrive. Without the inclusion of local communities, a project cannot happen. Local communities are indispensable for any archaeological or heritage project to happen and have continuity. As professionals, we know that people care mainly for what they know and hold close in their daily life. Similarly, in this digital age, adapting to new forms of media will prove imperative for the continuation of public engagement with archaeological sites and the field as a whole.

Short-form content has become our main source of social media with the highest return on investment (ROI) of any online marketing, comprising over 80% of internet traffic. The increase in the use of social media and online tools makes these projects diverse and civil engagement spreads in the online world as well as the offline.

With this session we want to create a space for communication, where we can discuss both sides of the same coin. On one hand we will look at the benefits and hurdles of establishing an online presence with archaeology outreach as a whole. Discussing real world examples of opportunities, impactful outreach, and new forms of research dissemination, as well as the need for online safeguards against doxing and cyber-threats. On the other hand we will discuss projects focused on the inclusion and participation of different stakeholder groups (with no importance of group size, age, gender or any of the participant's characteristics) where the civil engagement is the main key. Here we can discuss the after effects of the use of digital tools on archaeological dissemination in civil engagement and society.

ABSTRACTS

1 OUTREACH IN THE DIGITAL AGE

Petrocelli, Alexandria (The Humanities Guild) - Rinehart Macrae, Grace (The Humanities Guild; University College Dublin)

According to Google data in 2022, around 40% of Gen Z (18-24 year olds) in the United States are using TikTok and Instagram as their search engine as opposed to traditional sites. They are increasingly gathering their news, opinions, and understanding of history from social media as opposed to other, more traditional forms. As archaeologists, in order to reach this demographic, a presence through visual storytelling is imperative. With the rise of pseudo-historians and "amateur-archaeologists" whose platforms have garnered millions of followers, and algorithms pushing popular takes, this is the new battleground for presenting history and heritage with nuance that matters.

The Humanities Guild is an organization of over 130 members, that seeks to equip the underrepresented in the humanities fields. Over 75% of our members rely on TikTok for their primary outreach in history and archaeology. Our team focuses on community and advocacy, equipping our members to continue creating effective visual storytelling in both public and academic spheres.

With this experience in mind, this paper we will be discussing how short-form media can be used to communicate with stakeholders. This paper will seek to walk through the steps of creating engaging content that is not just sustainable but translates into communication and curiosity for heritage sites and their preservation.

We will also take a look at defensive engagement - proactive steps and tools to combat the ever-growing threats of doxing, death threats, and defamation.

2 ARCHAEOLOGY MEETS POPULAR CULTURE: PRESENTING THE PAST ON SOCIAL MEDIA

Duricic, Ana (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)

With the expansion of digital technologies, archaeologists do not have to depend on media representatives to be present in the public space. We are currently living in Web 2.0 era, characterised by user-generated content on media platforms, where users participate in production and dissemination of online content. This new media era with not just television, radio and newspapers, but also with social media networks, blogs and podcasts, creates new opportunities and problems for archeologists. The emergence of social media platforms has created new jobs – content creators – individuals who produce and share content on their social media profiles. With no restrictions or criteria a creator has to fulfil in order to produce content for social media, the amount of misinformation on the Internet is increasing. This also translates to archaeology. With that in mid, archaeologists should join social media and contribute to the narrative in the public space by presenting their research and providing credible information. Luckily, nowadays more archaeologists are recognising the potential this mode of communication can have on the visibility of the discipline in the public space. There is no one right way to present archaeology and each archaeologist or a team can choose a format, platform and style of content that resonates the most with their target group. The aim of this presentation is to show one way of presenting archaeology on social media. Djuroplov, available in two languages (English and Serbian) on different social media platforms – YouTube, TikTok and Instagram, combines archaeology and entertainment. The idea behind Djuroplov is to offer a new form of modern video content for social media focused on bridging the gap between the past and the present, using trending topics, popular video formats and humorous high-quality edits. Differences in approaches to different platforms will be presented as well.

3 A PROJECT OF DISSEMINATION AND HERITAGE EDUCATION IN THE RURAL ENVIRONMENT

Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

Our proposal is to expose a heritage project that we have been developing for almost 30 years. It is based on a global conception of heritage from the knowledge, recovery, dissemination and social uses. This heritage project is linked to the less populated rural area of a small region and its inhabitants, although the problems, realities and processes of research and dissemination of archeology, heritage and history can be extrapolated to other territories. In these years, we have approached the study and research from a historical-archaeological and patrimonial point of view on heritage assets located mostly in rural areas, little known and often abandoned. These studies are part of larger projects such as restoration, enhancement and integration into cultural, tourist, educational and social identity resources. Sharing research with society is one of our priority objectives, especially because of the neglect or lack of knowledge about these heritage assets. In this way, through various activities such as guided tours -also on site-, talks, exhibitions, etc., we link the nearby and not so nearby society with the heritage property, with its history and the need for conservation and enjoyment for this and future generations.

This research-dissemination process is based on a double methodology, traditional and digital, such as the use of GIS systems, apps, online photographic repertoires or social networks.

4 URRACA HISTORIADORES, DIFFERENT WAY OF EXPLAINING LOCAL HERITAGE

Espinosa, Isaac (Urraca Historiadores)

My proposal consists of the analysis and presentation of the model for the dissemination of archaeology, history, heritage and culture developed by Urraca Historiadores in La Rioja, Spain. It is a system that is developed from different points of view, digital and traditional, and is based on the use and development of local and regional heritage, relating it to users of all ages and educational levels. This research and development group is composed of Isaac Martínez and Belén Martínez who develop their work in local communities and educational centres using digital tools, new forms of dissemination in the humanities with traditional activities such as the elaboration of proposals with recycled materials, dissemination through conferences, research days or practical workshops. They also write monographic publications that combine (and are equally important) history and fun activities. The main concept is to reach out to local communities using heritage recognisable to the people living in those places, achieving several objectives. The first is to enhance the value of local heritage, the second is to make it known to local and foreign people, the third is to prevent its degradation, the fourth is to solve problems that may arise from its conservation, and finally to prevent abuse of heritage.

5 ALMA DE BOSQUE: A PROJECT PROMOTED BY HORREA ABOUT THE APPLICATION OF ROUTES OF THE CULTURE OF TRADITIONAL RAISED GRANARIES

Rodríguez, Fernando (Asociación del Hórreo Asturiano; Red Horrea)

The Ethnological Routes are part of ALMA DE BOSQUE, innovative project promoted by HORREA that, from the consideration of the culture of the elevated granaries as living heritage bearers of the ancestral wisdom of the people,

tries to update its potential to root us and thus to be able to face today's problems in a way different, continuing our story in the now. It is about the creation and application of routes based on the culture of traditional raised granaries.

These routes range from the study of the structures to the great intangible heritage that surrounds them, starting from the craft of the carpenter craftsman, the uses for sociability, traditional uses, oral memory and the stories of their owners whose families have often preserved them during centuries.

These routes are accessible through QR codes that allow access to videos that contain oral memory and information associated with the element in which the QR code is located.

This is a project that has already been successfully implemented in some town in Asturias and we want to present it to you along with the magnificent results obtained.

6 SHARING IS CARING. SOCIAL MEDIA AND PODCASTS AS HERITAGE DISSEMINATION TOOL ("PIEDRAS VIVAS Y OTRAS MOVIDAS" PROJECT)

Loy, Aida (Piedras Vivas y Otras Movidas; independent Researcher)

Dissemination is as an important part of the archaeological process as researching. At the same time, we all know that more involved and informed communities tend to care and participate more with the heritage around them.

Natural sciences have understood the importance of dissemination of the scientific process, methods and results, and the role of scientific disseminator has been an important and influential one since the end of last century.

Following this trend when the social media arrived to mainstream audience, natural science disseminators took to them and started creating dissemination sciences channels and accounts. Even with a few years delay, social sciences, archaeology and cultural heritage professionals are taking to the social media as disseminators to share their work and involved the communities.

It is in this space that we have created the podcast "Piedras Vivas y Otras Movidas" (Living stones and other stuff) as we think that this is lacking in the Spanish speaking community. In this podcast, two archaeologists (Aida Loy and Isaac Martínez Espinosa) who work with heritage dissemination in different ways, choose a topic to talk in every episode. To make each topic more approachable to the listeners we use our own personal experiences with the related heritage, likewise, we finish each episode talking about our favourite heritage within the theme. As well we invite other professionals to talk about their specialities and their personal experience working in a heritage related field. We understand that many times heritage professions are surrounded by a mysterious and romanticised vision of their activities, so we want to give a space to those professionals to tell us about their work, why they do it and how it is important.

7 'SAD GIRL' ARCHAEOLOGY: RECLAMATION OF EMOTIONAL EXPRESSION IN DIGITAL ACADEMIC SPACES

Black, Stephanie (Durham University) - Bowyer, Charlotte (Independent Scholar) - Parker, Han (University of Nottingham)

TikTok has grown to become one of the most popular social media apps, expected to reach over a billion monthly users in 2024. Its growth has attracted a diverse community of archaeologists and historians, who engage viewers with educational (and often humorous) short-form content. Within this space, a specific style of video - that of the 'Sad Girl' - has gained popularity. These videos focus on the creator: showing them crying, sad, or emotional about archaeology and history. Through poignant storytelling, these creators, primarily young women in their 20's, weave together threads of melancholy, nostalgia, longing and empathy, inviting viewers into intimate narratives that transcend academic boundaries.

As a platform, TikTok encourages authenticity and vulnerability, however manufactured that may be. The 'Sad Girl' fits within this space by intertwining personal narratives with archaeological themes, offering a specific lens through which to explore the complexities of human existence and the legacies of the past. Furthermore, these creators challenge traditional notions of objectivity and detachment in archaeological discourse by foregrounding subjective experiences and emotions. Rather than viewing archaeological sites and artefacts as mere relics of the past, viewers are invited to empathise with the individuals and communities whose stories are embedded within these material traces.

At its core, 'Sad Girl' archaeology represents a deeply personal and introspective approach to the field, creating a space where the emotional landscapes of individuals are free to be explored outside of the rigid constraints of traditional academic circles.

8 SOCIAL MEDIA AS A RESEARCH METHOD IN HERITAGE STUDIES: A CASE STUDY OF UNDERSTANDING MUSEUM FOLLOWERS' EXPERIENCES ON SOCIAL MEDIA

Bakogianni, Sophia (Byzantine and Christian Museum; Open University of Cyprus; Panteion University of Social and Political Sciences)

Social media has evolved to a ubiquitous and powerful form of two-way communication, that is both to keep informed and to share opinions, thoughts and feelings. Social media has also become a source of data for researchers from different disciplines to understand social media users' perceptions, attitudes, and feelings for various issues. Thus, tools and techniques have been developed to support social network analysis, based on mining text content from social media data, and/or identifying links that form the networks evolved on social media. However, given the recent limitations that social media platforms have imposed to researchers restricting access to platforms' data for research (e.g., Facebook and Instagram APIs shut down for researchers and X/Twitter's demands for payment to use the platform's data), there is the need for new methods to emerge in studying social media platforms.

In this context, this paper suggests that in-depth mixed-methods research of social media data has many potentials and benefits and offers an alternative to researchers overcoming platforms' restrictions and limitations. Through a specific case study examining how social media users interact with museums on Facebook, Instagram, X/Twitter, I contribute with an in-depth, user-centered method that goes beyond the metrics and analytics offered by the platforms to assess museum followers' experiences on platforms. The strength of the methodology used to implement the current empirical study and collect the data is that it goes away from the platforms' standpoints and centers its attention to users, aiming to extract their thoughts and feelings, preferences and motivations using exclusively traditional online methods (surveys, interviews, observations) in digitally saturated environments as social media is. Finally, this is a paper that advocates for methodological innovation and creativity in studying social media data, and especially in relation to museum and heritage studies.

709 TIES THAT BIND: COMMUNITY, ECOLOGY AND CHALLENGES OF SCALE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Schmaus, Tekla (Washington State University) - Franklin, Kate (Birkbeck, University of London)

Session format: Regular session

This session invites participants to interrogate two concepts used by archaeologists to create boundaries around our questions and our assemblages. If community has long served as a heuristic term for the ties of culture, kinship, and mutual regard that contain human societies, then ecology has likewise served to delimit the linkages between human societies and the natural world in which they exist. But what happens if we untangle and re-tie these bindings and boundaries, questioning how ecology leaks into community and vice versa? How can multi-scalar and interdisciplinary archaeology knot knots across our categories of nature and culture? How might we consider seasonal interactions that forged shared identity with human and natural neighbors? Who—and what—would have been part of the larger imagined community and how are human, creaturely, and vegetal kinships manifest in material culture, landscape and/or ecofacts? We ask the participants to consider not only the material rhythms of everyday life, or the timescales of ecological change, but also the methods we use to recreate these patterns. How can newer scientific techniques (isotopes, aDNA, proteomics, etc) productively un-bound and re-tangle human and more-than-human scales in the archaeological past?

ABSTRACTS

1 FEEDING SHEEP, CREATING COMMUNITY: LINKING PEOPLE, ANIMALS, AND THEIR ENVIRONMENT

Schmaus, Tekla (Washington State University; University of Pittsburgh) - Eklund, Emily (University of Pittsburgh) - Greaves, Aspen (University of Pittsburgh) - Ebert, Claire (University of Pittsburgh)

A number of isotopic studies from Central Asia have provided glimpses into the lives of ancient people, teaching us about the weaning of human infants or the use of millet to fodder animals. But what do these glimpses tell us about the creation and maintenance of community, either within a local group, or across the region? This paper presents a novel stable isotope dataset from southeast Kazakhstan that can help us think through these questions. It also asks us to reconsider the earlier Central Asian datasets through the lens of communities and their ecologies. What insights on community can be derived from isotopic data on the diets of non-human animals? In the context of Iron Age Kazakhstan, can variation in caprine diet be used a proxy for human access to resources? Or does it better reflect cultural choices about animal husbandry, or even connections between different communities? Whatever the meaning of the variation, it indicates a need for reflection on the linkages between humans, their animals, and their ecosystems.

2 LANDSCAPES THAT BIND: MOBILITY AND MONUMENTALITY IN THE INDIGENOUS AMERICAS

MacLellan, Jessica (Wake Forest University) - Lanoë, François (University of Arizona)

The field of landscape archaeology often seems polarized between environmental and social approaches. However, cultural landscapes offer the potential to weave together archaeological concepts of ecology and community. Particularly in the Americas, the Western dichotomy of culture versus nature is often not meaningful to Indigenous people. Communities come together at various scales and integrate non-human entities (e.g., animals, plants, stones, bodies of water, mountains, caves, human-made objects, architecture) in activities that result in socio-ecological landscapes. In this paper, we combine environmental and social approaches to discuss the creation and use of monuments by both sedentary and mobile peoples in Mesoamerica and the North American Great Plains. We draw examples from various scales of interaction, construction processes, and levels of residential mobility. The resulting “built” environments were not separate from the “natural” environments, but rather parts of living and lived-in landscapes. We see a recursive relationship between people and their environments, in which enduring places shaped and were shaped by social communities.

3 CULTURAL RESPONSES AND COPING WITH THE NEGATIVE INFLUENCE OF PARASITES IN THE ROMAN EMPIRE: A SPATIAL APPROACH

Kheml, Sebastian (Masaryk University)

The ancient period experienced substantial migration and urbanization, directly impacting the general human condition and elevating the risk of pathogen and parasite transmission. Extensive archaeoparasitological research has indeed revealed the widespread prevalence of intestinal parasites in the Roman Empire throughout its existence. In response to these challenges, Greco-Roman society developed various sophisticated tools and practices, including sanitation, hygiene, waste disposal, and a specialised branch of ancient medicine. A related tool that has played a role in dealing with parasites was the worship of healing deities, particularly the cult of the god Asclepius, as evidenced by votive stelae uncovered at Epidaurus. However, the extent of cultic practices focused on mitigating dangers associated with parasites in the Greco-Roman world has not yet been thoroughly explored in the scholarship. This paper aims to investigate the potential influence and relationship between parasite burden and the prominence of religious healing centres. The quantitative analysis of archaeoparasitological data enables the identification of areas of parasitological importance, considering both species diversity and the severity of infection, which is expressed by the amount of eggs in the examined samples. These data, coupled with the epigraphic records of ancient healing deities, can serve as proxies in a comprehensive spatial analysis, shedding light on the interplay between natural and cultural factors that shaped the daily life of ancient society. While interest in archaeoparasitological findings is gradually increasing, their integration into mathematical GIS models is still in early stages.

4 FINAL FORM: REFRAMING ZOOARCHAEOLOGICAL REMAINS AS A CO-CREATED ARTEFACT THAT UNVEILS NEW DATA FROM THE MICRO TO MACRO SCALE

Haruda, Ashleigh (University of Oxford)

Animal bones are unique archaeological artefacts, shaped not just by the human hand, but also by inherited frameworks of ancestry, the palaeoenvironment of the shared human-animal community, and physiological processes of the individual animal. The existence of a domestic animal is evidence of this unique interplay between organism and human innovation, and investigating bones from this perspective reframes these objects as acts of co-creation between ancient humans and animals.

Zooarchaeological remains are analysed as a critical source of data on human economy and diet, yet there are additional datasets that have recently been revealed with the advent of a wealth of new biomolecular and digital approaches. These new methods, alongside expanded multivariate statistical power, have vastly increased resolutionary power, uncovering human and animal lives.

This paper proposes a new way to consider the final form of archaeological animal bones and will present examples from Eurasia that range from the micro to continental in scale, such as how bone shape and ancient DNA detail population variability, connectivity, and mobility at site level. Furthermore, at regional scales, the integration of zooarchaeological data with palaeoecological data using multivariate statistics will show how it is possible to detect unseen trends in ecological niche exploitation, while big data approaches at a continental and millennial scale to reveal the impact of social and cultural changes on day-to-day life in what we perceive as a *longue durée*.

Thus, these unique artefacts contain a wealth of biocultural information that can be interrogated and linked to the interplay between human decision making and the feedback from the animals themselves as they reach their final form before they are consumed and deposited in the archaeological record.

5 SOCIO-ECOLOGIES OF THE DEAD? RETHINKING THE SAXE-GOLDSTEIN HYPOTHESIS USING SCYTHIAN EPOCH MORTUARY LANDSCAPES

Johnson, James (University of Wyoming)

In 1970, Arthur Saxe suggested that corporate groups who maintain their rights to restricted resources will maintain formal disposal areas of the dead. A decade later, Lynn Goldstein followed up on the Saxe Hypothesis, adding that permanent, specialized, bounded areas for the disposal of the dead will be maintained by a corporate group, and that the more structured and formal the disposal area, the fewer alternative explanations for social organization. By the last part she meant that the more institutionalized the mortuary practices become in a culture, the more difficult it is to distinguish social organization based on mortuary evidence. But embedded in the Saxe-Goldstein hypothesis is another central actor, those of the restricted resources. In this paper, I interrogate how Scythian epoch burial mounds became not only useful and highly visible socio-political resources, but also ones firmly rooted in the historical and ecological imagination of Iron Age mobile pastoralists of Dnieper region of central Ukraine, ca. 700 – 200 BCE.

6 UNEARTHING FAMILY TIES: AN ANCIENT GENOMIC ODYSSEY THROUGH WESTERN EURASIA

Altinisik, N. Ezgi (Human-G Laboratory, Department of Anthropology, Hacettepe University, 06800 Beytepe, Ankara, Turkey) - Vural, Kivılcım Başak (Department of Biological Sciences, Middle East Technical University, Ankara, Turkey)

The last 3000 years have witnessed many changes in social interaction between people of Western Eurasia. The emergence, expansion, and fall of several empires and cultures (e.g., Achaemenids, Hellenes and Roman Empire) have left traces on the social system and human activity in the region. Recent advancements in analytical methods allow us to identify these traces directly from the data in an interdisciplinary approach.

In this study, we compiled an extensive ancient genomic dataset comprising more than 1500 individuals inhabiting Western Eurasia over the past three millennia. Our analysis encompassed examination of both close-kin relationships and long-range relatedness among these individuals, achieved through the utilisation of shared identity-by-descent segments and pairwise mismatch rates. Additionally, we assessed runs of homozygosity within this cohort to elucidate shifts in inbreeding patterns from a spatio-temporal perspective. These analytical endeavours facilitated a nuanced comprehension of the variances in social structure evident across rural and urban locales within the studied region.

Here, we observed that in some sites, close-kin relationships up to the third degree were common, whereas they diminished in other sites. Strikingly, we also detected close-kin pairs coming from different sites, which allowed us to discover the historical family ties. Furthermore, the inbreeding analysis enabled the identification of small homozygous segments indicating a small population size, as well as longer segments suggesting recent inbreeding within an individual's ancestral lineage.

7 UNTANGLING PAST ARBOREAL RELATIONSHIPS AMONG ANCESTRAL KALISPEL LANDSCAPES

Carney, Molly (Oregon State University)

During the winters of 1850-1851, missionary Pierre Jean De Smet stayed in a Kalispel winter village in what is now northern Idaho, USA. Within his letters, De Smet writes of a nearby fuel wood lot which had been recently burned to clear understory, fell smaller trees, and maintain access for winter fuel. Contemporary conversations with Kalispel Tribal members and employees suggest that this practice was common, that the modern mesic forest composition is a product of contemporary US settler-colonial management practices and is not reflective of the systems of woodland care and stewardship that maintained regional plant communities for millennia. Here, we critically examine these colonial legacies and draw on these conversations and Kannigieser and Todd's (2020) concept of kin studies to center Northwest Indigenous conceptualizations of plants as kinspeople, ecological communities, and stewardship practices. Our work re-analyzes existing anthracological collections from 45PO149, a multi-component archaeological site located close to De Smet's winter lodgings. We merge existing archaeological models of fuel selection and historical records with place-based Indigenous onto-epistemologies in an attempt to reconstruct the past woodland composition and assess evidence for the use of cultural fire, but also to consider how past people-plant communities were co-constituted. We compare our work with other archaeobotanical reports from ancestral Kalispel lands and contemporary forest compositions to consider these reciprocal relationships which structured these woodland spaces. We hope that both our findings and framework will be used in establishing new ecocultural landscape practices and plans for today's inhabitants.

8 WHAT CREATURES CREATE CREATION? NETWORKED LANDSCAPE AND LABOR IN MEDIEVAL VAYOTS DZOR, ARMENIA

Franklin, Kathryn (Birkbeck, University of London) - Babajanyan, Astghik (Institute of Archaeology and Ethnography NAS RA)

This paper summarizes recent research by the Vayots Dzor Silk Road Survey, a collaborative project rooted in the medieval landscape archaeology of Vayots Dzor region of the Republic of Armenia. The VDSRS has compiled a complex record of the sites, monuments, and artifactual assemblages of this region, specifically focused on a period in the high Middle Ages (AD 13th-15th c), when the region was administered by the Armenian Orbelyan clan, favored vassals of the Mongol Ilkhanate. This paper will focus on the ongoing work of the VDSRS to knit together the networks of sites—monastic centers, fortresses, villages, bridges, field systems and standing monuments—with the medieval account of this social landscape contained in the rich epigraphic record. We work with the rich corpus of architectural inscriptions, which make up a distributed narrative about place in place, and which record relationships of patronage that tie together not just human beings, but also green landscapes, animal and plant lives, waters and soil. Ultimately this paper will explore what we can learn about medieval ecological thinking from the ways that human politics are enmeshed in natural-cultural systems, and dependent in their creation on the labors of non-human creatures.

710 AROUND THE BLACK SEA: RESILIENCE AND MOBILITY IN PREHISTORY

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Andriiovych, Marta (University of Oxford, School of Archaeology) - Bogaard, Amy (University of Oxford, School of Archaeology) - Manko, Valery (Institute of Archaeology of Ukrainian National Academy of Sciences)

Session format: Regular session

The Black Sea is a fascinating geographical and historical region. The region has a diverse and complex landscape in which prehistorical societies have lived since Palaeolithic times.

The Black Sea was shaped by rapid climate change caused by the 8.2k cooling event. This dry and cold period affected not only the prevailing climate but also the nature of the Black Sea as a large water body, from a lake to a sea. At the same time, the coastline changed rapidly, with water levels rising from 30 to 80 m a.s.l. and flooded numerous prehistoric monuments. The Black Sea was also situated on the periphery of a major migration route through which the Neolithic spread to Europe. What do we know about how Neolithic innovations spread from Anatolia and western Asia around the Black Sea? What role in the Neolithization of the region did the complex landscape of the Black Sea play in this process? The chains of the Pontic Mountains, the Caucasian Mountains and the Crimean Mountains cover a larger area around the western and northern areas of the Black Sea, contrasting with a massive grassland steppe landscape, with huge potential for the spread of early farming and herding.

We are looking forward to discussion of prehistoric evidence around the Black Sea region, the role of the landscape and seascape in prehistoric population movement and settlement, resilience to climate changes and patterns of migration, and the spread of innovations in the region from the Palaeolithic to the Chalcolithic periods. We will discuss the development of early societies in the area and to explore out how the Black Sea influenced the development of prehistoric communities.

We welcome contributions to our session from archaeologists (including those working on botanical or faunal aspects), geographers, geologists, and climatologists interested in the Black Sea region.

ABSTRACTS

1 INTRODUCTION TO THE PREHISTORY OF THE BLACK SEA - THE PREHISTORIC REGION OR NOT? (WITH A SPECIAL FOCUS ON NEOLITHIZATION)

Andriiovych, Marta (School of Archaeology, University of Oxford)

When we talk about the Black Sea region the first idea which came to us is the Ancient Greek colonization and the Early Medieval History connected to Byzantium Impair and Kyivan Rus, Trading ways, Ottomans and so on. The researchers have no doubts about the logic and reasons for the separation and establishment of the region in these periods. However, the prehistory period in the same geographical area is not a common term in archaeological sciences. Also, the trickiness of the potential of the region is that it involves not only the Black Sea shores itself, but rather the Seashores which are extended along the river that flows into the sea, and expanded by river valleys, the territories of mountains and valleys beyond them, and broad plains to the West and North of the sea.

The landscape and climate diversity certainly greatly impacted the spreading of the tribes around the sea from the Late Palaeolithic to the Chalcolithic period. Nevertheless, the region was on the way to spreading Neolithization to

Europe. And here is the question Was the region indeed a part of the Neolithization process? Or Black Sea region was a rather uncommon and not-so-obvious phenomenon in terms of question Neolithization Central Europe directions?

In this talk, we will try to clarify which characteristics will introduce the Prehistory of the Black Sea as a unique region or the territory recognized by several separated sub-regions and zones in Prehistory.

2 EARLY UPPER PALEOLITHIC GENOMES OF CRIMEA SHOW MIGRATION AND ADMIXTURE DYNAMICS OF THE FIRST MODERN EUROPEAN ANCESTRIES

Geigl, Eva-Maria (Université Paris-Cité, CNRS, Institut Jacques Monod) - Grange, Thierry (Université Paris-Cité, CNRS, Institut Jacques Monod)

Populations migrated from the Middle East through the Caucasus since the beginning of the Pleistocene. Our analysis of the genomes of 37-36,000 year-old skeletal remains from Buran Kaya III in Crimea revealed that these individuals were among the earliest to migrate into Europe after a major climatic crisis, the Heinrich Event 4 and the Campanian Ignimbrite volcanic super-eruption around 40,000 years ago. Their genomes also contained traces of the genomes of the earliest sapiens populations living in Europe and associated with the Initial Upper Paleolithic. This demonstrated that the newer migrants did not simply replace the earlier inhabitants of Europe, but some intermixing between the groups did occur. The genomes of the individuals from Buran Kaya III further revealed strong genetic relationships with pre- and post-Glacial populations from the Caucasus in agreement with archaeological evidence pointing to extended social contacts from the Zagros to the Carpathian mountains. These results indicate that the arc north of the Black Sea saw back- and forth migrations for thousands of years. Moreover, they were genetically closely related to the more than 5,000 years younger individuals in central and south-western Europe associated with the Gravettian culture. The individuals from Buran Kaya III were thus among the predecessors of the Gravettian artists that thrived between 31,000-23,000 years ago suggesting the Black Sea region played a key role in the early peopling of Europe. Bennett et al, 2023, Nature Ecology & Evolution, 7, 2160-2172.

3 TYPES OF MIGRATORY ACTIVITY IN PRE-NEOLITHIC TIMES

Valery, Manko (Institute of Archaeology of NAS of Ukraine)

1. The development of the Neolithic in the Black Sea region begins in the 7th millennium B.C. At this time we do not find any traces of migrations associated with the movement of populations.
2. All major migrations took place in the XIII-VIII millennium B.C. These migrations created the conditions for the formation of interregional networks within which the innovations of the Near and Middle East were spread.
3. Three types of migration are known. All of them were driven by both natural and anthropogenic factors.
4. Migrations along open spaces and river banks were the most comfortable. Migrations along the shores of the Black Sea were complicated by the mountainous terrain, the presence of many small rivers flowing into the sea, and the presence of swampy shores. Sea migrations were an alternative to the difficult journey along the coast. Migration through mountain passes is linked to the search for safe routes.
6. The presence of hostile populations along the coasts and in the open spaces dictated the need to use inaccessible routes in sparsely populated regions.
7. The movement of populations from one region to another often involved the practice of several types of migratory activity. The movement of the M'lefaatian population from the Middle East to the south of Eastern Europe involved both the use of open spaces and the use of inaccessible mountain passes. The migration of Karain B culture bearers was associated with the use of coastal shipping, and movements across plains and mountain systems are also recorded.
8. The experience of practising different types of migrations determined the peculiarities of the economic strategy of the aliens at the final point of migration. We observe a tendency to maximise the use of several landscape niches.

4 MESO-NEOLITHIC TRANSITION OF THE NORTHERN PONTIC REGION: OLD HYPOTHESES VS NEW DATA INTERPRETATIONS

Demchenko, Olha (University of Salamanca (Universidad de Salamanca))

The active archaeological fieldwork in the Northern Pontic Region (NPR) conducted from the 1930s enabled the accumulation of a vast amount of archaeological, paleozoological, and anthropological material belonging to the Mesolithic-Neolithic period. The mainstream hypothesis, dominant in current Ukrainian scholarly, was proposed in the 1950s. It concentrates on ceramics and posits an early Neolithization of NPR in second half of the 7 millennium BCE. Due to various circumstances, the interpretation of this material has generally aimed at demonstrating the emergence of animal husbandry and farming earlier than in neighboring countries. As a result, current Ukrainian scholarship tends to discuss the existence of several Neolithic cultures in the NPR from the middle of the 7th millennium BCE

(Bug-Dnistro, Surskyi, Azov-Dnipro, etc.). The concept of early Neolithization as a kind of “primacy” in economic development, as well as its popularization in scientific literature, has led to a distortion of the real picture.

We are revisiting old hypotheses using materials from previous excavations, incorporating modern research methods. As a result, we are demonstrating that despite the territorial proximity to early agrarian societies (such as the LBK), the steppe regions of the NPR maintained a Mesolithic way of life until the advent of the first metals. Therefore, the terms “early Neolithization” and even “Neolithic” cannot be applied to this region. Some old radiocarbon dates have been refuted by new ones obtained in 2022 and 2024. There are no reliable paleobotanical studies that could test the agrarian lifestyle. The methods of archaeozoological and paleobotanical analyses in the 1950s-1980s are unsuitable for current standards to identify vegetal and animal domestication. A recent review of previously studied osteological faunal remains (including DNA analysis) has shown the absence of domesticates. Genetic analyses demonstrate a lack of changes in population composition from the Mesolithic period until the Copper Age.

5 CAUGHT BETWEEN EVENTS (8.2KA AND 5.9KA): HUMAN RESILIENCE AND MOBILITY IN THE EASTERN BLACK SEA AREA BETWEEN 7000-4000 CAL. BCE

Lazar, Catalin Alexandru (ArchaeoSciences Platform, ICUB, University of Bucharest, Romania) - Vespremeanu-Stroe, Alfred (Faculty of Geography / ICUB, University of Bucharest, Romania) - García-Vázquez, Ana (ArchaeoSciences Platform, ICUB, University of Bucharest, Romania) - Popescu, Gabriel (ArchaeoSciences Platform, ICUB, University of Bucharest, Romania) - Tafani, Aurélien (ArchaeoSciences Platform, ICUB, University of Bucharest, Romania; University of South Florida, USA) - Covătaru, Cristina (ArchaeoSciences Platform, ICUB, University of Bucharest, Romania)

The period spanning 7000-4000 cal. BCE witnessed the coexistence of indigenous populations of hunter-gatherers alongside the arrival of Anatolian Neolithic farmers, who migrated in at least two distinct waves. Towards the end of this timespan, the gradual penetration (in several stages) of human groups from the North Pontic Steppes, coupled with the collapse of the Neolithic socio-economic model. The 3000 years at stake here are marked by two major Bond Events (8.2ka and 5.9ka), which profoundly impacted the dynamics, mobility, resilience, and adaptation strategies of human communities in this region.

The current paper will delve into the intricate interplay between the environmental, anthropogenic, climatic, and cultural factors that moulded the resilience and mobility of human populations located in the Lower Danube Basin and the Eastern Black Sea Coast. The analysis will encompass the archaeological signals from the target area, in conjunction with the 8.2ka and 5.9ka Bond events, alongside genetic, radiometric, isotopic, geoarchaeological, and palaeoecological data, related to the three documented population blocks (hunter-gatherers, Neolithic farmers, and populations from the North Pontic Steppes). Our approach is unconventional as it attempts to sidestep the traditional cultural-historical narratives written about this geographic area over the past century, instead opting to integrate diverse data sources to map the distribution of human groups in correlation with the specified Bond events.

This work was supported by a grant from the Ministry of Research, Innovation, and Digitization, contract number 41PFE/30.12.2021, within PNCDI III.

6 PREHISTORIC MIGRATIONS IN THE NORTH PONTIC REGION IN THE LIGHT OF INTERDISCIPLINARY STUDIES

Potekhina, Inna (Institute of Archaeology NAS Ukraine)

Numerous prehistoric burial sites in the territory of Ukraine, in particular in the steppes of the Northern Black Sea region - the so-called North Pontic Region - contain evidence of demographic and migration processes, connected, in particular, with the transition of ancient societies from hunting-gathering to agriculture and cattle breeding. Anthropological collections from Mesolithic and Neolithic necropolises in the Middle and Low Dnipro River Basin as well as from the burial grounds of a number of Eneolithic and Early Bronze Age cultures are an inexhaustible source of research into these processes. Recently, anthropological and archaeogenetic data have become an important factor in the discussion about the Indo-European homeland.

The proposed report highlights the dynamics of the anthropological composition of the population of the Northern Black Sea region from the Mesolithic to the beginning of the Bronze Age. Possible directions of migrations to and from the territory of Ukraine at this time are considered in view of new anthropological, archaeological and archaeogenetic data.

7 EASTERNMOST PAINTED POTTERY AT THE CUCUTENI A-TRYPILLIA B1 STAGE: POPULATION DYNAMICS AND INNOVATIONS IN THE SOUTHERN BUH AREA

Lobanova, Mariia (Odesa Archaeological Museum of the National Academy of Science of Ukraine)

The Cucuteni-Trypillia settlements in the Southern Buh area were the south-eastern periphery of this cultural complex during the 2nd half of the 5th millennium BCE. Their location allowed the population to face a number of modern innovations. The material complex includes findings that suggest contacts in the area with the population of the Gumelnița-Kodžadermen-Karanovo VI complex and the Seredniy Stoh culture.

The crisis of changing the Precucuteni tradition to Cucuteni is characteristic of this period. It is recognized by the appearance of painted pottery, the increase in population, and the complexity of social structures. In this regard, a larger number of settlements appeared, which are divided into local groups in research.

The new AMS dates for the settlements of the group (Sabatynivka 1, Berezivska HES, Kamiane-Zavallia 1, Shamrai) show that they existed during the 44-42 centuries BCE. The major innovation of the transition to the Cucuteni tradition is painted pottery. There are painted pottery examples among the ceramic complexes of the region's sites. It makes up a small percentage - 3-5% of the total number of ceramic finds among the Sabatynivka group settlements. They are also presented in several samples in the Borysivka group complexes. The painted ware is imported from the Cucuteni culture, the southwestern neighbors of the Southern Buh area population. The vessels do not come from a specific area or settlement. The analogies are recorded on many Cucuteni A3 sites in the Dniester and Prut area. Thus, the sites in the Southern Buh area are the easternmost area of distribution of painted ceramics among the currently known Cucuteni A-Trypilla VI settlements.

717 INTERWOVEN. TEXTILE EXCHANGES ACROSS THE MEDITERRANEAN FROM PREHISTORY TO US

Session theme: 6. The Mediterranean from Within

Session organisers: Ferrante, Nina (Sapienza University of Rome) - Morgado-Roncal, Leyre (University of Granada) - Muti, Giulia (Independent Researcher) - Rosell Garrido, Patricia (Independent Researcher; University of Alicante)

Session format: Regular session

The Mediterranean has long been a place of exchange and interaction, where traditions have been upheld while remaining open to new influences. The goal of this session is to re-investigate the interaction and exchange of ideas, technologies, objects, and people across the Mediterranean through textiles.

Over the past 30 years, significant strides have been made in the textile research. Thanks to its recent dynamism, the potential of textile culture has been highlighted to understand past and present societies. In past economies textiles and textile production, in fact, played a pivotal role. They were a valuable trading good, as well as the raw materials, tools, technologies, craftspeople, which circulated and spread across vast areas. This session invites scholars to explore the dynamics of the circulation, exchange, adoption and resilience of textile cultures. This encompasses technological, productive, and socio-economic aspects associated with ancient and traditional textiles in the Mediterranean.

Due to the elusiveness of archaeological textiles in the area, the studies have been mostly focused on the circulation of ideas and materials connected to other productions (e.g., metals, pottery, glass). When they got preserved, the focus was on technology and product exchange, but dealing with single aspects of material culture within specific chronologies and regions. In this session, we aim to gather, diachronically, different perspectives of Mediterranean communities to weave the fabric of the entire region.

Our main objective is to investigate the theme of textile exchanges in the broadest sense possible. In doing so, we will attempt to compare and synthesise different realities in the Mediterranean to create a comprehensive narrative. Participants are encouraged to submit proposals that delve into the agents and mechanisms of textile exchange identified above.

ABSTRACTS

1 TEXTILES AND GENDER IN THE LATE NEOLITHIC/EARLY CHALCOLITHIC OF SOUTHWEST IBERIA

Soares, Joaquina (UNIARQ – Centre for Archaeology. School of Arts and Humanities University of Lisbon)

The present contribution focuses on Late Neolithic/Early Chalcolithic “Engraved Stone Plaques” from the Southwest of the Iberian Peninsula (3250 to 2600 cal BC, 2σ). This typological set of ideotechnic artefacts, interpreted as representations of a female deity linked to textiles (spinning and weaving), will be analysed in a diachronic approach and dialectically articulated with the economic structure of the revolution of the secondary animal products exploitation.

The application of a new source of energy to agriculture, namely animal traction (*Bos taurus*) exploited by plough and cart, triggered an increase in production volume and unprecedented productivity yields that provided conditions for the development of crafts, as a new independent sector of social activity (intra-social division of labour).

Contextualizing idols and symbols from a socioeconomic perspective allows the construction of a comprehensive model of interpretation where gender will be discussed.

Neo-Chalcolithic textiles from the southwest of the Iberian Peninsula may have played an important role in the network of interactions and exchanges within the Iberian Peninsula and with the Western Mediterranean basin, namely North Africa and Sicily suppliers of ivory and amber in the period under analysis. However, this is a hypothesis that requires further investigation.

2 SPINNING IN THE CHALCOLITHIC OF THE SOUTHERN LEVANT: THE RESULTS FROM THE EXCAVATIONS AT YAVNE EAST

Cecconi, Gaia (Israel Antiquity Authority) - Betzer, Pablo (Israel Antiquity Authority) - Varga, Daniel (Israel Antiquity Authority) - Milevski, Ianir (Israel Antiquity Authority; National Council of Scientific and Technical Research, Argentina)

Spindle whorls are extremely valuable for understanding the evolution of textile industry (Costin 1990, 3) or other cultural significance (Barber 1991, 299). The study of these tools is critical in late prehistoric contexts, as the loom was not introduced until the 4th millennium BC (Barber 1991, 83; Levy 2006, 58; Newell 2012), and spindles are not frequently attested due to the perishable material (mostly wood) from which they were commonly made (Langgut et al. 2016).

During the most recent excavations conducted by the Israel Antiquities Authority at Yavne East, a Chalcolithic settlement associated with the Ghassulian culture (Gilead 2011) was discovered in the Southern Mediterranean Coastal Plain. The finds included a particular collection of spindle whorls, composed mainly by clay biconical specimens that we will present in this communication. The spinning whorls reveal interesting new data about the textile industry of the site, ruled mostly by the supported-spinning technique, during the second half of the 5th millennium BC. Moreover, the findings from Yavne East will be compared with other Chalcolithic Ghassulian sites, as Grar, Gilat, Bir Safadi, where mostly the drop-spinning technique was developed. These new archaeological evidences will be discussed as an indication that the textile industry of the Southern Levant was much more variegated than what it was previously considered. Therefore, the second half of the 5th millennium BC was a phase of technological development parallel to other regions of the Near East and Egypt.

3 UNRAVELLING A SPLENDID WEB. AEGEAN-STYLED DISCOID LOOM WEIGHTS IN THE EASTERN MEDITERRANEAN AND THEIR ROLE IN THE LBA MARITIME EXCHANGES

Muti, Giulia (Independent Researcher)

Textile artefacts offer invaluable insights into ancient societies, reflecting practical needs and socio-economic dynamics. This paper proposes an investigation into the spread of discoid loom weights beyond the Aegean in the Eastern Mediterranean during the Late Bronze Age (LBA, c. 1700/1600–1200/1100 BCE). Drawing from recent advancements in the study of textile production, this study aims to shed light on the transmission networks associated with these textile tools. The presence of Aegean-inspired discoid loom weights in Cyprus and key sites in the Levant, such as Ugarit, suggests intricate networks of exchange and interaction in the region during the LBA, providing new avenues for their understanding.

Using primary data and published literature, the research will map the distribution of discoid loom weights, describe their material and functional characteristics and analyse their archaeological contexts. By investigating the relationships between discoid weights and other materials, such as ceramic and metal objects, the dynamics of Aegean-Cypriot-Levantine networks will be elucidated. Furthermore, the implications of discoid loom weights in both female mobility and mercantile activities will be explored. This paper has two primary objectives. Firstly, it seeks to contextualise the long-term transmission of weaving practices and technologies across the Mediterranean. Secondly, it aims to offer new perspectives on the interconnectedness of ancient Mediterranean societies by comparing the possible channels, routes and extension of the transmission of textile practice with trade networks.

4 INTERWEAVING TRADITION AND INNOVATION: THE TEXTILE CULTURE OF THE LATE BRONZE AGE TO EARLY IRON AGE AEGEAN

Bowers, Madeline (Macquarie University)

By the end of Late Helladic IIIB2 (c. 1190 BCE) the last of the Mycenaean palaces was destroyed in a violent conflagration, representing the end of the palatial system and their vast capacity to produce and consume cloth. Despite the destruction of the palatial textile industries and the elite consumer market that it supplied, the need for cloth did

not disappear and garments, bedding, wrappings, sailcloth, etc. remained fundamental necessities for everyday life. As the Late Bronze Age transitioned into the Early Iron Age and the shared palatial koine broke down, the established traditions of material culture were selectively adapted, rejected, and transformed to suit the changing socio-political and economic environment, most notably in metallurgy and pottery. Changes within the textile culture too reflects the innovations of the period as new ideas, technology, and techniques were circulated throughout the Aegean and Mediterranean to a receptive audience.

This paper has assembled data on textile tools and surviving textiles from a sample of mainland Greek and Cretan sites to define the key features of the Aegean textile culture during Late Helladic IIIC to the end of the Protogeometric (c. 1190–900 BCE). Through the lens of the textile culture, this paper will explore innovation, tradition, and resilience in the Aegean during this period of significant cultural and economic change.

5 TEXTILES CRAFTS IN THE PHOENICIAN CITY OF GADIR (CÁDIZ): TECHNOLOGICAL AND SOCIOCULTURAL CHANGES IN ITS HINTERLAND

López Rosendo, Ester (CEFYF; Equipo de investigación Teatro Cómico de Cádiz) - Navarro García, M^a Ángeles (Equipo de investigación Teatro Cómico de Cádiz) - Gener Basallote, José M^a (Ayuntamiento de Cádiz) - Torres Ortiz, Mariano (Universidad Complutense de Madrid) - Pajuelo Sáez, Juan Miguel (Equipo de investigación Teatro Cómico de Cádiz)

One of the most famous crafts of the Phoenician city of Tyre was the production of purple-dyed textiles, a luxury product that gave her fame throughout the Mediterranean. In this context, some scholars have suggested that one of the aims that led to the settlement of Phoenician colonist in the Western Mediterranean was not only the search for metals, but also to take control of the sea routes to the Atlantic coast of Northern Africa, rich in murex to make purple.

In Iberia, clothes were basically made since the Neolithic with fibers of animal origin – such as wool – and leather, in addition to plant fibers such as esparto grass. From the Bronze Age onwards, there is evidence of non-locally cultivated flax seeds in some sites in Portugal and Southeastern Iberia, as attested in some Argaric tombs. Besides, in Southwestern Iberia we barely preserve remains of fabrics from Late Bronze Age local contexts, but we do have a whole tool set that inform us about craftsmanship to make textiles.

Phoenician colonization in Iberia possibly brought in new vegetable crops intended to produce fabrics, as well as new spinning and weaving technologies, new looms and, possibly, sophisticated dyeing and embroidering systems with gold threads.

The aim of this lecture is to analyse all these changes in Gadir and the local populations of its hinterland, which resulted in that the later ones were integrated into a trading network that implied the demand for luxury fabrics as prestige items, new techniques of making fabrics and new ways of dressing.

6 THE FUNCTIONAL INTERPRETATION OF SOME ARCHAEOLOGICAL SPACES THROUGH THE DISCOVERY OF UTENSILS DEDICATED TO SPINNING-SEWING IN THE SOUTHWEST OF SPAIN

Bueno Serrano, Paloma (Aut)

The discovery of movable archaeological objects dedicated to spinning and sewing in the southwest of the Iberian Peninsula allows the dates of textile production to be traced back to an advanced period of the Neolithic and especially to the Chalcolithic. The discovery of these tools in coastal and inland settlements allows us to know other aspects of the populations of recent prehistory in the Bay and mountains of the Bay of Cádiz. The archaeological excavations carried out in 2021 on the Cerro del Castillo de Chiclana (Cádiz). The joint study of all these findings allows us to establish a development and evolution in techniques that is also evident in other territories of the Iberian Peninsula. Specifically, and focusing on the archaeological site on which we focused our investigations, the findings have allowed us to understand the practice of spinning, weaving and sewing activities in the 4th-3rd centuries BC. The chronostratigraphic and spatial study of these allows us to contextualize it in a place within a building with special functionality and characteristics, possibly a sanctuary. These objects are, among others, needles, weights, tweezers and spindles. After analyzing the objects at hand typologically and functionally, we will dedicate a part to the role of women and their work in ancient society.

7 DRESSING THE PHOENICIAN AND PUNIC WORLD: EXCHANGES OF IDEAS AND INTERCONNECTIONS ACROSS THE MEDITERRANEAN

Ferrante, Nina (Sapienza University of Rome)

Investigating clothing in the Phoenician and Punic world proves to be a complex endeavour due to the scarcity of archaeological, iconographic, literary, and epigraphic evidence available to us. Likewise, elsewhere the Mediterranean region, the climate does not favour the preservation of perishable materials, discouraging archaeological investigations

on the topic. This includes not only Phoenician and Punic textiles but also many tools used in their production. In contrast, literary sources inform us of particularly valuable Phoenician and Carthaginian textiles, admired for their colours, embroideries and decorations. Likely, these textiles played an important role not only in conveying messages and ideas within the Phoenician and Punic world but also in becoming true emblems of the social status of their owners.

In this paper, through the analysis of archaeological remains studied for my PhD at the Sapienza University of Rome and the subsequent studies of iconographic sources, an attempt will be made to reconstruct Phoenician and Carthaginian clothing, style and fashion. All sources will be examined to uncover potential interconnections and influences with other ancient Mediterranean peoples. These interconnections took place through movements of people and trade in goods, creating a complex web that will be briefly illustrated in this paper.

8 TEXTILES FOR RITUALS IN ETRURIA: INTERACTIONS AND EXCHANGES

Gouy, Audrey (University of Lille)

As said by Livy, the Etruscans were “more than any other dedicated to religion, the more as they excelled in practicing it” (5.1.6). Indeed, rites were an essential part of Etruscan life. They had powers of transformation, and in particular the power to move an individual from one symbolic and social status to another. In this context, textiles were given a crucial place. Used as dress, furniture and building, they had a key role. More particularly, they accompanied ritual performances, such as dance, and banquet. And as such, they constituted an important form of non-verbal communication known to be effective.

This paper aims to investigate the use of textiles in Etruscan ritual practices from two perspectives. First, it will explore the selection of textiles made by Etruscans for rituals. This implies to reflect on the origins of Etruscan ritual textiles. Indeed, which textiles were specifically Etruscan? which ones were similar to Greek ones, or more widely Mediterranean ones? what could have been the ritual power and impact of foreign textiles in Etruscan ritual practices? what does this tell about Etruscan practices? This also implies to think in terms of circulation and dynamics of exchanges. Second, this paper will investigate the textiles that were specifically exchanged during rituals by the different participants, such as the garlands, wreaths, and covers. What were the possible meanings of such exchanges in rituals, and their impact?

9 CHANGES IN PERCEPTION IN BRITISH TEXTILES INDUSTRIES DURING PRE-AND ROMAN GLOBALISATION

Poulter, Helen (University of Winchester)

Textiles are a prominent part of humanity’s story, transcending language barriers. With the mobilisation of Roman globalisation, new and emerging trade and communication routes provided an imagistic presence. Textiles’ unique tactile and malleable nature provides an art of engineering structure and flexibility. These strands of structural engineering offer the key to the original purpose of a woven textile piece, as they provide weight, movement, and strength, whether it is cloth or braiding. Any associated objects, features and structures can indicate traditions and social trends amalgamating cultural styles and new ergonomic blends. Even textile equipment can reflect the stress and strains of an economy, whilst textile workers maintain textile traditions, with the added written and isotope information on materials connecting to other provinces.

Scholarship on textile trade connections has previously focused on costume, tool styles, shapes, decoration and, to a small extent, the material of the tools, including woven cloth types, different fibres, and yarn types (spun and spliced). Not all this research is aimed at Roman globalisation; for example, Dr Susan Harris’s (2018) work on spliced plant yarn from Must Farm has given a different insight into Britain’s prehistoric textile production methods. Dr Margarit Gleba (2018) has focused on the Iron Age Italian textile workers’ migration, highlighting traditional methods versus changing ideologies, including conflict with changing influence and fashionable trends during the rise of Roman culture.

Through experimental archaeology and other lines of inquiry, this paper will explore the viability of using a warp-weighted loom within the context of Iron Age and Roman buildings in Southern Britain. The effect of the working environment on equipment, fibres, and the individual worker has produced results that challenge previous assumptions and interpretations of production seasons in southern Britain, therefore providing a season for the sale of different types of fabrics and specialism.

10 THE SECONDHAND USE OF TEXTILES IN ROMAN EVERYDAY LIFE AND ECONOMY

Lovén, Lena (University of Gothenburg)

In ancient Roman society, everyone used textiles in daily life. Huge amounts of textiles were produced and for many different purposes, clothes, household products, sails, awnings, textiles for the Roman army, and more. Producing new textiles, especially of wool, was a vital part of Roman economy, trade, and consumption but textiles already in use were also regularly reused for various purposes. Literary and documentary sources testify to the reuse of textiles

and in many urban contexts, there is epigraphic documentation of the occupational groups of *centonarii*. They were specialized in dealing with discarded textiles and the recurrent appearance of *centonarii* in epigraphy reflects the scale and importance of this line of business. However important the reuse and secondhand market of textiles may have been in ancient Roman society, this is a sector of ancient textile economy which is still rather unexplored. This paper seeks to discuss some aspects of secondhand textiles in Roman society hitherto largely uninvestigated, which aims to a better understanding of the complexity of Roman textiles and textile economy.

11 GOLD THREADS IN A GROUP OF 14TH CENTURY LAMPAS OF ITALIAN AND PERSIAN MANUFACTURE: PRODUCTION, TRADE OR TRANSFER OF TECHNOLOGY?

Scibè, Cristina (University of Seville; Opificio delle Pietre Dure of Florence) - Solazzo, Caroline (Independent researcher) - Lam, Thomas (Museum Conservation Institute, Smithsonian Institution) - González López, María José (University of Seville)

By the end of the 13th and the beginning of the 14th century, the extensive commercial network across Euro-Asian territories, through the well-established trade routes across the Mediterranean, gave rise to an unprecedented trade and exchange of silk and gold fabrics and their raw materials from East to West and vice-versa. The appropriation and re-interpretation of designs, and the transfer of technology of weaving techniques and perhaps gold threads that followed, was also a result of the forced relocation of artisans from one area to another.

This phenomenon was especially evident in Italy during the 13th and 14th century. Although by the 12th century the silk industry was well established in the city of Lucca, the spread of Eastern textiles promoted a local production, characterized by a unique decorative style resulting in dynamic compositions of animals, fantastic creatures, vegetal motifs and pseudo-cufic inscriptions, developed by the unification of different cultures and tastes.

At this regard, a group of 14th century lampas fragments, assigned to Persian, specifically Iranian, and/or Italian workshops, having similar decorative repertoire is here presented as an example of the long history of controversial attributions. Similar textiles collected in worldwide collections, indeed, show uncertain or contradictory attributions.

The multidisciplinary and multi-analytical study of gold threads in this group of textiles, belonging to Persian and/or Italian manufacture, as well as in few contemporary Italian lampas, as regarded to be from Lucca or Venice, will be presented to reveal analogies and differences in materials and manufacturing techniques. The identified gold threads patterns of technologies provide a novel key to re-discuss the origin of these textiles, and raise the question whether a unique workshop was active with the corresponding trade of gold threads from one area to another, or if similar technology was adopted contemporaneously in workshops in Italy and Persia.

723 EGYPTIAN BLUE - FROM LITERATURE TO THE ARTIFACT TO THE LAB

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Baragona, Anthony (University of Applied Arts Vienna) - Rodler-Rørbo, Alexandra (Austrian Archaeological Institute) - Becker, Hilary (Binghamton University) - Verri, Giovanni (Art Institute of Chicago) - Kostomitsopoulou Marketou, Ariadne (Norwegian School of Theology, Religion, and Society)

Session format: Regular session

As the first artificial pigment, Egyptian blue has a millennia-long history of production, processing, working, and use. Throughout its impressive life history, this material has been used for making small objects, such as mosaic tesserae, for painting walls, for sculptures or architectural elements, and as a cosmetic.

Experimental archaeology, archaeometry, and research into ancient texts make it possible to understand more about how this first synthetic pigment was made, distributed, and used. The small chemical and physical variations revealed by these first two techniques, combined with a deep knowledge of the written record, is the key to constructing historical narratives about Egyptian blue.

Technological choices in ancient production practices and the provenance of resources are interesting meeting points for discussing cultural change and trade interactions in human history. An interdisciplinary dialogue between archaeologists and natural scientists is desirable to address challenges related to the analysis of archaeological materials. We invite contributions that inspire this dialogue and discuss their work on the development of analytical instruments and techniques, experimental approaches, analysis of production technology and material provenance.

1 FURTHER FLESHING OUT THE STAGES OF PRODUCTION OF EGYPTIAN BLUE IN THE ROMAN ERA

Becker, Hilary (Binghamton University, SUNY) - Smith, Gregory (Indianapolis Museum of Art at Newfields)

Egyptian blue scholarship has been necessarily dependent on the production steps outlined by Vitruvius in his *de Architectura*. Vitruvius's account mentioned the crucibles in which Egyptian blue balls were fired and while their shape and ideal firing time of these crucibles has been explored by Laetitia Cavassa and others, it is worthwhile to probe the blue incrustations that appear on the walls of some of these sherds from production in Egypt and Italy. This phenomenon, explained by Tite and Hatton, will be explicated with more detail.

Vitruvius' account vividly explains that once the ingredients were combined, the paste should be rolled into balls in the hands. Experimental archaeology importantly makes it possible to understand that process. One production variable that helped to make these balls more efficiently was which type of copper was used in the first place. This paper also explores the morphology of Egyptian blue in the Roman era. Egyptian blue was made in blocks or ingots from the Bronze Age to Archaic period, and yet Vitruvius instructed his readers to roll this pigment paste into balls. Raw Egyptian blue was fired in these very balls at least by the Hellenistic and Roman eras (Weatherhead and Buckley 1989; Kovalev et al. 2023). This paper looks at the morphology of Egyptian blue over time thinking about how this pigment was made and uses archaeometry and experimental archaeology to consider what the advantages and disadvantages of each shape in terms of production and economy would have been. And while the crucibles used to fire Egyptian blue and the shape this pigment was formed into were both explicitly mentioned by Vitruvius, it is worthwhile to explore in more detail both what Vitruvius said and what was not stated but which any Roman Egyptian blue producer might have known.

2 A NEW, BLUE EXPERIMENT - PART ONE: USING LABORATORY-CREATED EGYPTIAN BLUE PELLETS IN THE INTERPRETATION OF ARCHAEOLOGICAL MATERIAL FROM NORICUM

Baragona, Anthony (University of Applied Arts Vienna) - Rodler-Rørbo, Alexandra (Austrian Archaeological Institute) - Tehrani, Rebecca (Dresden University of Fine Arts)

Everyone knows how to make Egyptian Blue in the laboratory - grind some quartz sand, limestone, copper, and flux together, and "cook" it for a long time at around 900 °C. But the Romans, skilled as they were, did not make their pigments in a laboratory setting, and this is reflected in the great diversity of final pigment products that can be observed in the archaeological record.

This submission details the results of a series of laboratory experiments in which the parameters for producing Egyptian Blue were purposely adjusted to reflect a wide variety of hypothetical conditions, such as various non-standard recipes, differing firing times and temperatures, as well as the process by which the ingredients were mixed and milled together. The experiment produced a wide range of Egyptian Blue pigment pellets of variable quality. These pellets were then analyzed with light and digital microscopy as well as SEM-EDX and compared to a series of pellets excavated in Austria - Roman Noricum. By these means, new insight was gained into the production of Egyptian Blue in antiquity and the archaeological record of the Roman province of Noricum.

3 APPLYING LABORATORY-CREATED EGYPTIAN BLUE PIGMENT AS A PAINT TO REPLICATE WALL PAINTING FRAGMENTS FROM NORICUM

Tehrani, Rebecca (Dresden University of Fine Arts) - Baragona, Anthony (Freelance Conservation Scientist working with the University of Applied Arts Vienna, Austria) - Santner, Markus (Dresden University of Fine Arts)

You have just come back from the forum, and that wretched scoundrel Flaminius sold you a substandard batch of Egyptian Blue pigment! You don't dare to tell your boss, Flavius, of your error and besides - the intonaco will be ready in an hour! But worry not, you and your skilled artisans can make that wall as blue as if you had spent every last denarius.

This submission details an experiment in which Egyptian Blue pigment of differing qualities were used to produce replica Roman wall paintings. Variations in application, binder and paint stratigraphy were tested in an effort to match the historical record. Polished cross sections of the resulting painting replicas were then analyzed with light microscopy and SEM-EDX and compared to a series of wall painting fragments excavated in Austria, Roman Noricum. By these means, new insight was gained into wall painting practices in antiquity which allows for a better understanding when it comes to their conservation and its Egyptian Blue paint layers.

4 THE COMPLEMENTARY USE OF VISIBLE-INDUCED LUMINESCENCE IMAGING AND MACRO-X-RAY FLUORESCENCE FOR IDENTIFYING AND MAPPING EGYPTIAN BLUE ON ROMAN WALL PAINTING

Sessa, Clarimma (Technical University of Munich, Munich, Germany) - Tehrani, Rebecca (Dresden University of Fine Arts, Dresden, Germany) - Herm, Christoph (Dresden University of Fine Arts, Dresden, Germany) - Santner, Markus (Dresden University of Fine Arts, Dresden, Germany)

In this study, the combination of visible induced luminescence and macro-x-ray fluorescence was demonstrated to be a very effective methodology for the characterisation and mapping the Egyptian blue applied alone or in admixture. Both methods were applied to investigate excavated Roman wall paintings and stucco fragments assigned to the only known stage theatre (2nd century AD) in the Roman province of Noricum, in the Municipium Claudium Virunum. The fragments show various ornamental elements and figures of high artistic and technical quality, comparable to those in Pompeii. More than 500 fragments were catalogued and investigated non-invasively as part of the conservation and research project carried out by Dresden University of Fine Arts in collaboration with the Landesmuseum für Kärnten.

The visible-induced luminescence has been used as a fast-screening method for identifying the Egyptian blue. Only a representative selection of those fragments that showed luminescence was then investigated by means of macro-x-ray fluorescence. The two methods were compared in terms of sensitivity. The use of complementary imaging methods clearly shows the lavish use of Egyptian blue in the decoration of the theatre and the artists' skilful application. The study allowed a further understanding of the use of Egyptian blue, which was applied as a single paint layer or in admixture with other colourants to create cooler tones or used as a glaze to create subtle shading. In addition, the information obtained by means of macro-x-ray fluorescence complemented with laboratory analysis on micro-samples permitted the characterisation of additional pigments, thus unveiling the palette used.

5 REAL-TIME IDENTIFICATION AND VISUALIZATION OF EGYPTIAN BLUE USING MODIFIED NIGHT VISION GOGGLES

Nicola, Marco (Adamantio) - Sgamellotti, Antonio (5 Accademia Nazionale dei Lincei, Via della Lungara 10, 00165 Rome, Italy; Department of Chemistry, Biology and Biotechnology, Università degli Studi di Perugia, Via Elce di Sotto 8, 06123 Perugia, Italy) - Anselmi, Chiara (Istituto di Ricerca sugli Ecosistemi Terrestri, CNR-IRET, Via G. Marconi 2, 05010 Porano, TR, Italy)

The possibility to use light in the visible spectrum to induce near-infrared luminescence in some materials, particularly Egyptian blue and related pigments, offers a significant advantage in terms of their detection. Since 2008 this property has been exploited to reveal their presence even in minute quantities on ancient and decayed surfaces, using a technical-photography method. This paper presents a new type of imaging device that allows for a real-time, easy, and inexpensive identification and mapping of Egyptian blue and other luminescent materials. The new tool's potential is demonstrated by showing its effectiveness within some prestigious sites: a) Egyptian findings at Museo Egizio, Turin, b) underground Roman frescoes at Domus Aurea, Rome and c) Renaissance frescoes by Raphael, Triumph of Galatea and Loggia of Cupid and Psyche, at Villa Farnesina, Rome. The device is based on night vision technology and allow for an unprecedentedly fast, versatile and user-friendly approach that is employable by professionals including archaeologists, conservators and conservation scientists, as well as by un-mastered individuals such as students and casual visitors at museums and sites. The overall aim is not to replace existing photographic techniques but to develop a tool that allows rapid and preliminary recognition, useful for organizing and improving the work to be carried out with conventional methods. The ability to immediately track Egyptian blue and related materials, through real-time vision, photos and videos, provide also a new kind of immersive experience and can foster the modern use of these materials in innovative applications and future technologies.

6 TRACING THE TRAJECTORIES OF EGYPTIAN BLUE PRODUCTION TECHNOLOGY: XRD, SXRF AND SXANES ANALYSIS OF HELLENISTIC AND ROMAN SAMPLES

Kostomitsopoulou Marketou, Ariadne (MF Norwegian School of Theology, Religion and Society, Oslo, Norway) - Pinakidou, Fani (Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece) - Ravan, Eva Luna (Istituto di Scienze del Patrimonio Culturale, CNR, Catania, Italy; Sapienza University of Rome, Rome, Italy) - Romano, Francesco Paolo (Istituto di Scienze del Patrimonio Culturale, CNR, Catania, Italy) - Brecoulaki, Hariclia (Institute of Historical Research, National Hellenic Research Foundation, Athens, Greece) - Rodler-Rørbo, Alexandra (Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna, Austria) - Karydas, Andreas (Institute of Nuclear and Particle Physics, NCSR "Demokritos", Athens, Greece)

Egyptian blue (EB) is the artificial blue pigment that dominated ancient Mediterranean art. It is produced through a complex pyrotechnological process, during which a copper compound is heated with silica- and calcium-rich sand and

an alkali flux, in temperatures ranging from 850 to 1050 °C. The outcome of this process is a multicomponent material, which includes a newly synthesized copper calcium tetrasilicate (CaCuSi₄O₁₀) crystalline phase, responsible for the pigment's impressive blue colour.

Despite the wide diffusion and use of Egyptian blue (EB) across the Graeco-Roman world, there is little information regarding the pigment's manufacturing loci and trade. Variations in the choice of starting materials used and/or the operational sequence followed for the production of EB could result in products of varying chemical and mineralogical compositions.

The present contribution discusses the XRF and XANES (Cu-K edge) analysis of EB samples carried out at the Elettra Synchrotron (Trieste, Italy). In addition, we have performed at the lab XRD analysis of the same samples. The analysed samples derive from a range of well-documented archaeological sites, including wall paintings from Macedonian tombs and pellets from Kos (Greece), Noricum (Austria), and Ostia (Italy). The analysis sheds light on the choice of starting materials and the specifics of the production process, such as firing conditions, through the characterisation of the chemical state (XRD, and XANES) and environment of Cu-species (XANES). The obtained results contribute to EB provenance research and illustrate technological adaptations and developments.

7 RAW MATERIAL POTENTIAL SOURCES FOR EGYPTIAN BLUE MANUFACTURING DURING THE LATE ANTIQUITY IN THE CRYPT OF ST. STEPHAN'S CHURCH

D'Erme, Chiara (University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Switzerland.) - Cavallo, Giovanni (University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Switzerland.) - Villa, Luca (Foundation pro Monastery of St. John, Müstair, Switzerland) - Cassitti, Patrick (Foundation pro Monastery of St. John, Müstair, Switzerland; Albert-Ludwigs-Universität Freiburg, Abteilung für Frühgeschichte und Archäologie des Mittelalters - Otto-Friedrich-Universität Bamberg.)

The crypt of St. Stephan's church in Chur, Canton of Grisons, served as the resting place for the arch martyr's relics and the bishops of Chur. Likely built in the 5th century, it underwent two decorative phases (Phases 1 and 2). A church adorned with mosaics and frescoes, probably from the early 6th century, was later erected above the funerary chamber (Phase 3).

Under the SNSF-funded project "Forgotten Colors", researchers investigated mural paintings within the crypt and fragments of painted plaster from archaeological excavations. The former spans the ornamental phases of the crypt, while the latter can be linked to both the crypt and the upper church.

Technical photography revealed the typical Visible Induced Luminescence (VIL) of Egyptian blue (EB) in both wall paintings and fragments. Hand-held X-ray spectrometry (HH-XRF) highlighted EB's main constituents and an additional Zn content. Micro-stratigraphic research, using the combination of optical and electron microscopy, confirmed the presence of EB (Ca, Cu, Si with constant CaO/CuO ratio) for all the archaeological phases. In the phases of the crypt (1 and 2), the presence of Zn is generally associated with other chemical elements (Ti, Fe, Ni) in grains dispersed in the paint layer, and sometimes found in EB grains in variable percentages (0.3-1.5%). It is noteworthy that Sn is also detected as metal residue within EB grains and in the paint layer.

In both cases, their presence can be connected to the impurities in the metal used as the copper source for pigment production.

The analysed EB sample from the upper church does not show the presence of Sn and Zn.

The analytical results suggest a difference in the raw materials employed for EB manufacture used in the crypt (5th-6th century) and in the paintings probably referable to the upper church (early medieval).

8 FROM PELLETS AND PAINTINGS. EGYPTIAN BLUE FINDINGS FROM AGUNTUM (EAST TYROL)

Zerobin, Bianca (University of Innsbruck, Institute of Archaeology) - Auer, Martin (University of Innsbruck, Institute of Archaeology) - Goldenberg, Gert (University of Innsbruck, Institute of Archaeology) - Tropper, Peter (University of Innsbruck, Institute of Mineralogy and Petrography)

Excavations in the Roman town of Aguntum (today's Dölsach, East Tyrol, Austria) brought to light several hundred blue pellets, which were stored in two ceramic vessels. The room where the pellets were found, was used as a storage room. In addition to the pellets grain, marble plates, pottery, metal tools and other objects were excavated in this room. During the 3rd century AD a big destructive fire in the town center destroyed the storage room. As the room was not uncovered after the fire, the 3rd century inventory remained intact.

Regarding the blue pellets, initial qualitative analyses with XRD were able to confirm the mineral phase cuprorivaite (CaCuSi₄O₁₀) as the characteristic and colouring main component of Egyptian blue in the finds from Aguntum.

Such a quantity of this material is very rare, if not unique, north of the Mediterranean. In addition to the pigment pellets, several fragments of wall paintings with blue components were also found in Aguntum. Some of these fragments show relatively coarse-grained blue pigments under the microscope, which were applied to a brown painted surface.

It is assumed that the pellets of Egyptian blue were used as raw material for the blue wall paintings. This synthetic pigment was a standard colour for the Romans and was widespread throughout Noricum.

The approximately 800 pigment pellets from Aguntum represent one of the richest finds of Egyptian blue north of the Mediterranean to this day. It remains an open question, whether these pellets were imported or produced in the region. However, only very few pellets have been analysed so far and the questions of provenance still need to be researched in more detail.

9 AN UNCOMMON INSTANCE OF EGYPTIAN BLUE LIME-PAINTED INTONACHINO FROM "THE ROMAN VILLA OF TORRE DI PORDENONE" (NORTH-EASTERN ITALY)

Sbrolli, Clelia (Università di Padova) - Dilaria, Simone (Università di Padova) - De Zotti, Anna (Università di Padova) - Salvadori, Monica (Università di Padova)

The increasingly tight integration of analytical techniques within the realm of Greek and Roman wall-paintings' research are highlighting how Egyptian Blue was a fairly common pigment, frequently documented for the making of blue/greenish hues in ancient fresco and secco pictorial decorations.

This contribution aims to report a peculiar employment of this artificial pigment, documented along with the investigations of some wall-painting fragments recovered from the "Roman villa of Torre di Pordenone" (Friuli Venezia Giulia, North-Eastern Italy). This site, located along the Noncello River, yielded numerous well-crafted wall-paintings from secondary debris, featuring marine-themed motifs. These fragments, showcasing decorative and figurative patterns of the full III style, contribute to the villa's exceptional wall decoration system. A noteworthy distinctive feature is the use of uncommon raw materials, in both the layers constituting the preparation mortars and the painted decorations. These were characterized through transmitted-light polarized optical microscopy, for a petro-mineralogical description of mortar layers constituting the tectorium, and reflected-light optical microscopy, for a microstratigraphic analysis of painted decorations. Moreover, the most intriguing aspect is the identification of a blue painted intonachino layer, conferred by the mixing of cuprorivaite as a pigmentation phase within the lime binder of the uppermost intonachino layer, as confirmed by in detail SEM-EDS and micro-Raman analyses. This utilization of the Egyptian blue marks an uncommon instances of Roman "blue lime-painted mortar" thus re-opening the discussion concerning the availability of this artificial pigment in ancient markets.

10 E(TRUSCAN)-BLUE. A SURVEY ON THE EGYPTIAN BLUE IN THE PAINTED TOMBS OF TARQUINIA

Adinolfi, Gloria (Pegaso Srl) - Bellelli, Vincenzo (PACT) - Tomassetti, Maria Cristina (PACT) - Carmagnola, Rodolfo (Pegaso Srl)

This infra-disciplinary research is carried out within a comprehensive programme of investigations on Etruscan painting techniques promoted by PACT, in which the MAP project is also involved. The research is focused on Egyptian blue mapping in the painted tombs of Tarquinia, between the 6th and 5th centuries BC. The ongoing investigation features different phases using different methodologies, starting with areal-based investigations aimed at the spatial characterisation of Egyptian blue through non-invasive imaging techniques (VIL), followed by punctuative archaeometric analyses to determine the composition of the pigments, its laying pattern and prevalent associations with other pigments. The comparison between different pigments used to chromatically render the colour blue, as we perceive it today, leads to the evidence of the almost exclusive use of Egyptian blue in Tarquinian painting. Initial results are presented that highlight the different methods of EB use, which go beyond the expression of the chromatic value of blue, sometimes with unexpected results.

11 STUCCO RELIEFS WITH AN EGYPTIAN BLUE BACKGROUND AT THE ART INSTITUTE OF CHICAGO

Verri, Giovanni (Art Institute of Chicago) - Raff, Katharine (Art Institute of Chicago)

Originating in ancient Greece, wall and ceiling reliefs became commonplace in the Roman period across the empire. Historically, the term stucco has been used to refer to both lime- and gypsum-based moldable plasters, which harden to a stable material upon setting. Due to their plasticity, they can be formed into a variety of shapes as well as painted. Because of their durability, stucco reliefs and moldings have been extensively used to decorate both private and public buildings, including bathhouses, where decorative frames and figurative scenes are commonly found in varying degrees of complexity. The Art Institute of Chicago holds in its collection two 1st century CE stucco reliefs (1922.4428-9), showing animals, women and mythical creatures against a vivid-blue background, executed with Egyptian blue. Albeit monochrome at first sight, the stucco reliefs show evidence of elements of polychromy. This presentation will discuss the scientific investigations of the two reliefs at the Art Institute of Chicago, including broad-band imaging,

macro X-ray fluorescence, hyperspectral imaging, Fourier-transform infrared spectroscopy, with a focus on how Egyptian blue was applied to the background.

12 SPECTRAL VARIATIONS OF EGYPTIAN BLUE IN EARLY ROMAN JUDEA

Asscher, Yotam (Department of Conservation of Material Culture, School of Archaeology and Maritime Cultures University of Haifa, Israel; Department of Artifacts Treatment and Laboratories, Israel Antiquities Authority, Jerusalem, Israel) - **Sharabi, Naama** (Department of Archaeology, The Hebrew University of Jerusalem, Israel)

As Egyptian blue is an artificial pigment, the final product varies in structure depending on temperature and the mixture of lime with silica and copper. The structure and chemical variations of Egyptian blue can be characterized in the lab using spectroscopy, which recently has become portable with instruments such as X-ray fluorescence (pXRF) and fiber optic reflectance (FORS) spectrometers. These techniques are also non-invasive as they characterize the surface of the material, and therefore can be brought to the archaeological site or the museum environment. The structural and chemical characteristics of Egyptian blue are directly linked with workshop production techniques and their accessibility to the raw materials.

In this study we characterize Egyptian blue in Herodium, a palace complex built by King Herod (37-4 BCE), c. 12 km south of Jerusalem, in the kingdom of Judea. We discuss the spectral variations of Egyptian blue of a pigment ball, blue and purple colors mixed in pottery vessels used as raw materials, and wall painting fragments retrieved from the palace.

Analyses of the color schemes of the wall decorations shows a preference for luxury colors. The dark-blue may be connected to the techelet that had specific importance in Jewish religion. This color was manufactured of the purpura snail and was used in the veil of the Jerusalem Temple and in the garbs of the High Priest. Flavius Josephus associated it with the sky and the Rabbinic sources to the throne of glory of the Almighty.

Herod succeeded the Hasmonean dynasty that served both as kings in Judaea and High Priests in the Jerusalem Temple. Herod strove to legitimize his rule by marrying a Hasmonean princess, and engage in reconstruction of the Temple. The Egyptian blue, that resembled the techelet, was used to decorate his palaces as a symbol of his piety.

13 EPHESIAN EGYPTIAN BLUE: MATERIAL PROVENANCE AND PROCESSING IN THE LATE HELLENISTIC PERIOD

Rodler-Rørbo, Alexandra (Austrian Academy of Sciences) - **Kostomistoupoulo Marketou, Ariadne** (MF Norwegian School of Theology and Religion) - **Baragona, Anthony** (Freelance, Associated with the University of Applied Arts) - **Jansen, Moritz** (Deutsches Bergbau-Museum Bochum) - **Klein, Sabine** (Deutsches Bergbau-Museum Bochum) - **Artioli, Gilberto** (University of Padua)

The Hellenistic and Roman period were particularly colorful – people processed various materials to use them as colorants and it is likely that material provenance mattered. Yet, little is known about where these materials came from and where they were processed. Some colorants such as Egyptian blue (a synthetic calcium-, silica- and copper-based pigment) were produced from easily available resources and were likely an output of far-reaching trade networks. Mineralogical-petrographic and geochemical analysis can help tracing production processes and raw material provenance to reveal the connectivity of ancient societies through pigment trade. Even though Egyptian blue is considered among the most widely used ancient colorants since the Egyptian Bronze Age until late Antiquity, provenance studies have so far been limited to a few case studies from museum collections. This work investigates the provenance of the copper compound of Egyptian blue pigments used for wall paintings at Ephesus at the west coast of Anatolia during the late Hellenistic period. Egyptian blue production technology is compared to the Egyptian blue production of the late Hellenistic pigment workshop of Kos, Greece, and raw material provenance is compared to available copper resources. This enables a better understanding of interaction across trade networks and contributes to generating a pigment-specific reference database for provenance studies.

14 EXPLORING EGYPTIAN BLUE: INTEGRATING MULTISPECTRAL AND REFLECTANCE TRANSFORMATION IMAGING FOR IN-DEPTH DOCUMENTATION AND STUDY

Shaheen, Islam (Sapienza University of Rome; Grand Egyptian Museum) - **Hamza, Nagmeldeen** (Grand Egyptian Museum)

This research aims to transform the documentation and understanding of cultural artifacts adorned with Egyptian blue pigment, employing cutting-edge technologies to revolutionize preservation and study methods. The primary focus lies in the integration of advanced digital techniques for the comprehensive examination of polychrome artifacts, with particular emphasis on the distinctive properties of Egyptian blue.

Through a systematic exploration of Multispectral Imaging (MSI) and Reflectance Transformation Imaging (RTI), this study delves into the intricate layers of Egyptian blue pigment and its application on various artifacts. MSI serves as a non-destructive initial method, enabling swift and cost-effective surveys to identify painted layers and historical pig-

ments, including those hidden beneath the surface. RTI, on the other hand, captures detailed images that reveal the nuances of Egyptian blue pigment, providing insights into its geometry, morphology, and surface texture.

Central to this research are artifacts from the Grand Egyptian Museum collection, including Cartonnage mummy trappings and a wooden coffin lid from the 21st Dynasty and different fragments of Egyptian blue from the collection of Tutankhamun. These artifacts serve as focal points for examining the polychrome surfaces adorned with Egyptian blue, unraveling their layered compositions and aiding in dating and iconographic deciphering.

Through a synergistic approach combining MSI and RTI, this research yields fresh insights into the material characteristics of Egyptian blue pigment, pushing the boundaries of technological applications in the study and documentation of polychrome artifacts.

15 TRACING EGYPTIAN BLUE: A DIACHRONIC STUDY OF USE, PRODUCTION, AND APPLICATION IN THE BRONZE AGE MEDITERRANEAN

Hunter, Allisen (Florida State University)

The pigment Egyptian blue is widespread throughout the Bronze Age Mediterranean and possesses a variety of manufacturing and application processes. While the identifications of these processes and the presence of Egyptian blue at a site can provide more data as to a site's connections, an examination of these factors across a variety of sites and through time and space can demonstrate broader patterns of use. These patterns may further demonstrate the role of artisans, the borrowing and negotiation of practices, and the complexities of techniques present at individual sites.

This paper demonstrates the advantage of utilizing previously published data sets of analytical and technical studies in order to produce a diachronic study of Egyptian blue's use, manufacture, and application to better understand the patterns present in the Bronze Age Mediterranean fresco. The presence of Egyptian blue at a site demonstrates the spread of technology and its exclusion may indicate separate practices. The presence of tin or arsenic in a pigment's composition alongside the chosen application practice suggests the origin of the pigment's production technique and-, therefore, the greater social implications and connections of a site. A diachronic study of Egyptian blue and its components in the Bronze Age Mediterranean allows for greater complexities of use, production, and application and their social relevance to be revealed.

727 THE ROMAN ECONOMIC MOSAIC: EXPLORING THE COMPLEXITY OF ECONOMIC DYNAMICS DURING THE ROMAN EMPIRE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: **Zerzeropulos, Katharina** (ROOTS Cluster of Excellence; Christian-Albrechts-Universität zu Kiel) - **Coto Sarmiento, María** (Centre for Urban Network Evolutions (UrbNet); Aarhus University)

Session format: Regular session

Economic mechanisms of the Roman Empire varied across regions, influenced by geography, time, and geopolitics. Frontier zones, characterized by a strong military presence and mingling of populations, exhibit distinct demand and supply dynamics in contrast to the Mediterranean seaboard, where Roman authority was firmly established and military influence minimal.

Italy, at the empire's heart, enjoyed privileges, benefiting from Rome's substantial consumption. In contrast, provinces on the periphery, influenced to a lesser extent by Rome, might have faced fewer advantages or exploitation, particularly if agriculturally rich.

This session explores the Roman Empire's influence on diverse economic dynamics, examining how policies and trade practices led to both convergence and divergence in the economic system. We welcome contributions that offer ideas related to the following topics,

1. Identifying varying economic patterns from small-scale to large-scale markets
2. Debating how different geopolitical contexts affected markets in frontier vs. non-frontier regions and their impact on market differences (private vs. state markets)
3. Exploring complex supply dynamics, including the dominance of specific goods in fringe areas, unrelated to transportation costs.
4. Old and novel approaches for studying economic dynamics (modeling, network analysis, GIS)

This session aspires to identify and scrutinize varying mechanics of trade that characterized the Roman Imperial period across the expanse of the Empire. Through an examination of specific case studies rooted in regional contexts or material evidence, it is anticipated that distinct dynamics will emerge, delineating variances in regions, eras, product markets, and sub-systems within the Roman Empire, thereby facilitating a nuanced understanding of the economic mechanisms governing the Roman world.

We invite contributors who can provide insights into local, regional, inter-regional, and intra-regional economic patterns, with the aim of synthesizing these findings into a comprehensive economic framework for the Roman Empire and generating novel methods for identifying these outside of isolation.

ABSTRACTS

1 AN INTEGRATED MODEL FOR THE ECONOMY OF THE EARLY ROMAN EMPIRE

Zerzeropulos, Katharina (Institut fuer Ur- und Fruehgeschichte Kiel; ROOTS Cluster of Excellence)

Several studies have been done on the Roman economy in the past decades and even centuries by focusing on historical sources and only to a small degree on the actual large archaeological record. This mostly preferred qualitative over quantitative studies as historical sources for the time under investigation are sparse and treat only particular settings, mostly those of the richer strata of society. To get a better picture of the entire society from 50 BCE to 150 CE, we should use the potential that archaeology offers through its large amount of data available in the form of artifacts recovered in sites around the empire. The main merit of archaeological data comes from a) its quantity, b) its potential to give insight into all strata of society, c) its relatively unbiased nature (compared to historical sources), and d) its existence throughout geographical space. The traceability of certain archaeological materials, in this case, fine wares and amphorae, also allows us to reconstruct trade flows and economic measures for comparison.

The second part of the investigation is the modeling of fictive distribution patterns that are based on varying economic mechanisms that may have been in place. Several distribution patterns will be created by using parameters that can influence these patterns. The scenarios that will be tested are:

- Basic models: Random, Transaction costs
- Network models: State-networks, Private networks
- Economic/political models: Protectionism, Imperialism, Combination Protectionism/Imperialism
- Historical/inferential model
- Price-based model

The article will focus on the conceptualization of the models and the theory behind them. The material distribution patterns of the archaeological record have already been presented in a previous EAA session in 2023.

2 THE ECONOMIC DYNAMICS AND CONNECTIVITY OF LATE ROMAN THRACE

Watson, Claire (University of Chicago)

For much of the 21st century, scholars (e.g., Leidwanger 2020; Pitts and Versluys 2014) have continually reaffirmed the dense, diverse, and sustained network of connections across the Roman Empire, adding developed perspectives utilizing an ever-growing corpus of evidence to earlier arguments around the relative connectedness of provinces and settlements. This concern with connectivity emerges perhaps most prominently in studies of trade and the Roman economy, along with interrelated concerns such as ancient globalization. However, many evaluations of connectivity remain somewhat nebulous. What specifically can we say about connectivity, both in theory and in practice, using Roman evidence for the movement of goods across the empire? How can we best evaluate and compare discrete regions' connectedness, and what does that reveal about the economic life of specific provinces and the factors influencing those dynamics?

By utilizing the disparate archaeological record of amphorae from sites across the diocese of Thrace—situated in modern Bulgaria and Romania—this project aims to elucidate the relative weights or densities of connections in which Thrace was involved via trade. As a diocese containing several frontier provinces, how does Thrace relate to the wider Roman world, in both a social and economic sense? And, furthermore, how does Thracian connectivity—to the extent that it can be quantified and evaluated—compare to that of the relatively more secure, well-connected interior? And how do different types of sites—rural settlements and urban centers; riverine, coastal, and inland—compare to each other within a given province? The answers to these questions promise to advance our understanding of the economic functioning of, and the lived experience within, Roman eastern Danubian frontier provinces.

3 RETHINKING ROMAN MINING DOMAIN BORDERS: INNOVATIVE INSIGHTS (CASE STUDY ON THE NORTH PART OF METALLA DARDANICA IN UPPER MOESIA)

Maric, Marija (University of Novi Sad, Department of History, Faculty of Philosophy)

The organization of Roman mining was a meticulously controlled process encompassing various activities by imperial authorities, including the delineation of mining domain borders, the organization of administrative systems, infrastructure development, and more. The *Lex Metalli Vipascensis* and *Lex Metallis dicta* from Vipasca provide direct insights into this process. The described territorial organization concept was extended to additional mining provinces

considering peculiarities. Scholars such as Alföldy (Noricum) and Dušanić (Danubian provinces) defined the borders of mining districts based on an analysis of the position and function of customs stations (*Ad Fines*) and written sources. They further explored social, political, economic, and other relationships within and beyond provinces in the Central Balkans. Due to a lack of relevant research following the issue, archaeological sources rarely informed their hypotheses.

Recent excavations in the northern part of metalla Dardanica and surrounding areas reveal a considerably stronger presence of Roman mining activities than previously thought. Furthermore, spatial assessments by GIS have revealed new information about resource area organization, particularly in late antiquity, when the economic system, including metal extraction, processing and distribution, transformed. During this period, emerging architectural forms like villae rusticae and fortifications became significant landmarks in the mining landscape, confirming changes in provincial organization.

This talk reconsiders assumptions about mining domain borders, focusing on the northern part of metalla Dardanica and reevaluating older arguments in light of recent archaeological findings. It prompts a reevaluation of the principles of border establishment by imperial authorities in the Central Balkans. Additionally, adjusting domain borders raises questions about their significance in organizing economic activities, particularly their symbolic and functional relevance as boundaries between mining domains and urban agri or metalla within territoria metallorum. Finally, consideration will be given to how this spatial change affects the interpretation of the economy at the district, provincial, and imperial levels.

4 THE IMPACT OF ROMAN IMPERIAL ECONOMY ON LOCAL HISPANIC ECONOMIES: A COMPARATIVE APPROACH

Sastre, Inés (CSIC) - Orejas Saco del Valle, Almudena (CSIC) - Currás Refojos, Brais (CSIC)

Rome's strategic interests in certain areas of provincial land generated early and drastic interventions. This is clearly seen in areas that produced precious metals, such as gold in western Hispania and silver in the southeast. The acquisition of these resources implied the development by the Roman state of instruments for their control and exploitation, as well as for the mobilization of the necessary workforce. Research has often focused on these singular assets, but the material evidence indicates that Rome's intervention had a greater scope with a profound impact on local communities, their social relations, and their economies. In this contribution we address the processes of change under the Roman dominion from an economic point of view in some regions of the Iberian Peninsula marked by the impact of mining following a comparative approach: Northwestern (Gallaecia and Asturia), north-central Lusitania and Carthago Nova. Our aim is to propose a reflection on the degree of real implementation of market economies and the extent of the participation of local communities in them during the Iron Age and Roman expansion in Hispania. We will take into account many different scales of analysis, from local to imperial, around the following historical realities:

- The role of the Roman administration through the presence of the army and fiscal control of productive activities. This directly affects technological development and also the forms of ownership, with clear differences in the diverse periods and areas considered.
- The relationship between public interests and private participation.
- The foundations of the wealth of the elites: control of land and agricultural production versus investment in extractive or commercial activities.
- The weight both of the forms of peasant organization and the prestige mentalities of the elites, and their relationship with the forms of organization of production.

5 BETWEEN THE ATLANTIC AND THE MEDITERRANEAN: THE ARCHAEOLOGICAL SITE OF TORRINHA

Azevedo, António (Coimbra University)

In the ancient and small town of Salir in inland rural Algarve (region from south of Portugal), there is an open field with a lot of pottery pieces in the surface that is recognized as the archaeological site of Torrinha. The site was intervened by Dra. Helena Catarino, with the procedure of archaeological prospection in that area during her campaign in the nearby Islamic fortress of Salir.

Unfortunately, Torrinha was never excavated and there isn't any kind of archaeological data about structures or any kind of geological unit recorded. In a couple of years, the 514 pieces were collected from the surface, kept under the laboratory of the local museum of Loulé, to be studied by students in the institute of archaeology of Coimbra University.

Only by the analysis of those materials, the results shows the chronological occupation of this site that probably started in the first century AD until, at maximum, sixth century as a roman villa. It is important to emphasize the presence of terra sigillata, as the example of Arretine ware, South Gaulish Samian ware, Spanish Samian ware, African Red Slip

ware and Phocaean Red Slip, many categories of amphorae, and other kind of domestic artifacts. The results provide important information about the social-economic reality of the first six centuries of our Era in rural Algarve, which is not so scientifically well known as other archaeological roman sites in it's famous coast.

6 SUPPLY DYNAMICS IN THE CHANGING LATE ANTIQUE ECONOMY: STORAGE TOPOGRAPHY AND NETWORK OF THE ROME-SYSTEM

Pizzi, Marina (University of Regensburg)

Late Antiquity marked a significant turning point in the reorganization of the annona system. Considered that substantial changes affected the Italian peninsula, which acquired a new role in producing goods for Rome or mediating their movement toward the old capital of the Empire, the supply system of the latter must have evolved as well.

Reconstructing supply dynamics is challenging due to the multitude of aspects involved, not all of which are concretely documented. However, storage, as a crucial - perhaps the most crucial - material evidence of supply, can considerably help shed light on its functioning. Unfortunately, this aspect has so far been largely overlooked, especially as far as Late Antiquity is concerned.

For this reason, this paper primarily aims to delve deeper into the case of Rome, offering a picture of storage in the city between the 4th and 7th c. AD, secondly trying to contextualize its situation in terms of evolution of the metropolis-hinterland system. On one hand, storage facilities will be considered from a typological perspective, examining how different categories may have been connected with specific functional roles within the city's supply system. On the other hand, they will be analyzed from a topographical and distributional perspective using GIS and network analysis. The combination of traditional and newer approaches will hopefully lead to some new insights on this theme.

7 ANALYZING POST-GETAE OLBIA'S ECONOMIC RELATIONS THROUGH BONE AND IVORY ARTIFACTS

Semenova, Alisa (Institute of Archaeology National Academy of Science of Ukraine.)

After surviving the devastation by the Getae in the mid-1st century BCE, the Hellenistic colony of Olbia Pontica saw a revival in the early 1st century CE. Since then, its history has been closely related with the Roman Empire. This connection is evidenced by numerous Roman artifacts and epigraphy sources, which have been discovered within the polis limits.

I aim to explore the connections between Olbia and Rome, focusing specifically on bone artifacts, such as examples of standardized Roman craftsmanship. I will draw parallels with data from other Roman sites. Some of these artifacts could possibly be crafted by local workshops based on Roman models. Thus, in addition to the import of goods to the frontier regions, the spread of crafting techniques and standards is also conceivable. Discoveries of bone artifacts and other Roman items indicate the intense economic ties between Olbia and the Roman Empire. Initially, these connections existed as areas of Rome's interest, later extending to become part of the province of Moesia Inferior.

Moreover, some unique items made of ivory that are not common in the Greco-Roman world were found in Olbia. These artifacts come from Central Asia, for example, the unique ornamental comb and the decorated overlays. The discussion about how these artifacts ended up here is ongoing since it might be connected to the influence of the Sarmatians. They played another crucial role in shaping the political and, as a result, the economic life of Olbia. The significant influence of the Sarmatians in the latter half of the 1st century CE is evident from the fact that coins of two Sarmatian kings, Pharzoios and Inisemeus, were minted here, and other archaeological evidences.

8 A THOROUGH INVESTIGATION OF A ROMAN INKWELL FROM THE ROMAN TOWN OF CONIMBRIGA, PORTUGAL

Oliveira, César (HERCULES Laboratory & IN2PAST, University of Évora, Portugal) - Bottaini, Carlo (HERCULES Laboratory & IN2PAST, University of Évora, Portugal; Queen's University Belfast, School of Natural and Built Environment, Belfast, UK) - Candeias, António (HERCULES Laboratory & IN2PAST, University of Évora, Portugal) - Pereira, António (HERCULES Laboratory & IN2PAST, University of Évora, Portugal) - Miguel, Catarina (HERCULES Laboratory & IN2PAST, University of Évora, Portugal) - Cardoso, Ana Margarida (HERCULES Laboratory & IN2PAST, University of Évora, Portugal) - Perpétuo, João (ARQUEOHOJE, Viseu, Portugal) - Correia, Virgílio (Conimbriga National Museum, Condeixa-a-Velha, Portugal) - Dias, Vítor (Conimbriga National Museum, Condeixa-a-Velha, Portugal)

The ancient Roman city of Conimbriga stood out as the main city of the Conventus Scallabitanus, a Roman province within Lusitania. It is one of the largest Roman settlements in Portugal, having been the subject of systematic excavations since 1930. Some of the main findings include Roman dwellings with intricate mosaic floors, a forum, a basilica, thermal baths, and defensive walls.

During recent excavations at locations designated for drainage well installation to reinforce the Roman wall, archaeologists discovered a small metallic inkwell of the "Biebrich Type," which is characteristic of the first half of the 1st century AD, still retaining remnants of its contents. The rarity and importance of the find justified the intervention of the HERCULES Laboratory in the study of these materials, using a multi-analytical approach combining chromatographic techniques, NMR, FTIR, XRF, and SEM-EDS for the characterization of the metallic inkwell and the ink preserved within it.

NMR analysis revealed a notable concentration of aromatic compounds within the ink, while chromatography identified it as predominantly black ink consisting of amorphous carbon, a byproduct of the combustion of organic matter, mixed with beeswax, as a binder. Additionally, FTIR analysis detected the presence of calcite and phosphate groups. SEM-EDS analysis unveiled elevated levels of phosphorus and calcium, indicative of the presence of bone black, as well as iron, suggesting the existence of ferrogallic compounds. XRF analysis confirmed that the inkwell was crafted from a ternary alloy comprising copper, tin, and lead.

In conclusion, the ink would be a mixture of amorphous carbon with gall nuts, which act as a source of tannins, iron sulphate, a binder, and water.

9 MARKET COMPETITION IN WAR TIMES? THE IMPACT OF OLIVE-OIL PRODUCTION ON THE ROMAN ECONOMY

Coto-Sarmiento, Maria (Centre for Urban Network Evolutions (UrbNet), Aarhus University) - Brughmans, Tom (Centre for Urban Network Evolutions (UrbNet), Aarhus University)

The production of olive oil became essential during the Roman military campaigns in the border region of Germania (Germany). Hundreds of olive oil amphorae were supplied to the army, creating a large-scale infrastructure specialized in the production of olive oil from different areas of the Roman Empire. However, high uncertainty regarding the organization of the supply to the military stationed along the frontier border remains unresolved.

We present an approach by combining computational models and archaeological data to explore the economic mechanisms during the Roman Empire. We use archaeological data as a data proxy to understand the dynamics of the inter-market competition and shed light on the reasons behind the dominance of olive oil from the Iberian Peninsula over other regions, and why this production increased and suddenly dropped. We implement a theoretical framework to analyze the impact of economic competition in the olive oil market on production and consumption within a frontier region in Germania.

In the model, the producers will be represented by three different main regions of olive oil production, while the consumers are military and civilian sites in Germania. To do so, we design four hypothetical scenarios, each representing a market structure based on the hypotheses of free market principles and interventionism in olive oil production. The model will provide a comprehensive understanding of how transport costs, productivity, and pricing mechanisms impact strategy decision-making, competitiveness and adaptability within the Roman market.

Our preliminary results suggest: a) initial production influences but it requires a higher percentage, b) strategies can be effective without requiring substantial investments and c) effective interventionism does not require a high percentage of government involvement.

Computational models can improve our understanding of different economic dynamics in the Roman Empire, offering a new perspective on how significant changes in economic patterns unfolded over time.

10 SOLDIERS' MARKET. RETAIL TRADE IN MILITARY CAMPS ON THE PANNONIAN LIMES

Dumitrache, Iulia (Accademia di Romania, Roma; Alexandru Ioan Cuza University of Iasi)

The presentation's primary objective is to identify and characterize potential patterns and networks of self-supply mechanisms among military personnel, including ordinary soldiers and officers, stationed on the Pannonian borders. Our study will focus on three main coordinates: the products supplied, the distribution routes, and the commercial agents involved, who may be individuals or members of profile associations.

The study aims to examine archaeological findings related to military settlements, specifically focusing on food items such as oil, fish, and wine, textiles, and luxury ceramics. Literary sources and epigraphic evidence, such as tituli picti or inscriptions on instrumenta domestica, will also be used to trace the origin and itinerary of the goods. The research seeks to answer the following questions: Is it possible to distinguish between military-provided products and personal purchases? What influences the consumption preferences of military personnel who sometimes spend their own money on personal items? Is there a correlation between the origin of the military personnel and their preferred products, or is it a result of the globalization of tastes and preferences? Can we identify the role of the military in promoting certain types of goods in the civilian provincial milieu?

11 WEAVING RESILIENCE: ECONOMIC DYNAMICS OF RURAL COMMUNITIES IN THE ROMAN WEST**Moreno-Navarro, Fernando (Università degli Studi Roma Tre)**

This work explores the adaptive strategies and resilience of rural communities in the Roman Mediterranean, focusing on how domestic economic practices reflected and promoted adaptation to economic, social, and environmental changes. By integrating theories of resilience and adaptive cycles, it aims to better understand the dynamics of rural life in ancient societies and their role in broad socio-cultural transformations.

Centring on the Theory of Resilience and the concept of the adaptive cycle, this work examines how domestic economies were integrated into cycles of exploitation, conservation, collapse, and reorganization, assessing their influence on the communities' resilience capacity. Through network analysis and theories of complex systems, economic connections are mapped, and their impact on community adaptability is interpreted.

Adopting a comparative approach, we analyse domestic economies in different regions of the Roman west to illustrate how rural communities faced and adapted to changing conditions. This relational analysis of archaeological data underscores the importance of local responses to climate change and regional policies as essential adaptive functions.

This approach broadens our understanding of the Roman economy and the adaptability of its rural communities, providing insights into socio-cultural transformations within the Roman Empire. We highlight the relevance of everyday economic practices in the formation of resilient and adaptive communities, contributing to our knowledge about the ancient rural economy and its capacity for adaptation and resilience in the face of adversity.

12 CENTRALITY, PUBLIC SPACES, AND THE ROMAN PROVINCIAL ECONOMY: A NETWORK-BASED INVESTIGATION OF THE NORTH WESTERN PROVINCES**Vadineanu, Paul (Universität zu Köln) - Paliou, Eleftheria (Universität zu Köln)**

The Forum, a public space often thought about in terms of its monumentality and prestige and rightfully considered a staple of Roman urbanism, has been undoubtedly connected to economic activity or at least viewed as benefiting from such activity directly or indirectly. Indicative in this respect is the case of the Roman Forum, concerning which Cicero noted in 66 BC: "This system of credit and finance which operates at Rome, in the Forum, is bound up in, and depends on capital invested in Asia; the loss of the one inevitably undermines the other and causes its collapse". However, while the fora of Rome and of *coloniae* and *municipia* across the Empire have long been a subject of historical and archaeological investigation, those of secondary agglomerations, along with various other open public spaces have not seen the same interest.

In this study, we will attempt to investigate the roles these smaller towns played within the settlement network of the Roman provinces and what their economic function in the provincial urban milieu may be. Through the use of network analysis, we will examine the regional and supra-regional patterns of interaction linking the individual settlements of Germania Inferior, Superior, and Raetia in an attempt to explain the possible connection between the observed position within the network and the presence or absence of open public spaces such as fora. The connective tissue of the provincial road systems will be included in the network model as a proxy for economic exchange while each town will be considered a node that participates in this exchange. Different measures of centrality will be addressed as they pertain to the particular positions the nodes may occupy.

13 MARMORISATION OUTSIDE ROME: ON THE INTERACTIONS OF LATE REPUBLICAN MARBLE IMPORTS ON ARCHITECTURE, ECONOMY AND PERCEPTION**Beck, Dennis (University of Bonn)**

In the course of the most expansive phases of the Roman Republic in the 2nd-1st century BC, an abundance of diverse marbles and new materials became available and part of a living environment that was in a state of continuous change due to ever-changing hierarchies of materials and values, influences and fashions. In this paper, the influence of new building materials on the existing „Roman and Italic architecture“ and the associated modifications will be discussed with some examples and key studies. While research on late Republican marble imports was strongly guided by written sources, especially Pliny the Elder, and focused primarily on Rome, a broad spectrum of archaeological contexts show a different picture. This article is therefore dedicated to the oldest archaeological contexts, predominantly mosaics and depictions in wall paintings, which should also provide an overall picture of marble imports outside the Urbs. Some examples will be used to discuss the associated changes within architecture and decoration, and how the relationship between marble use and for instance monumentalization can be evaluated. Some discuss the interactions between imitated marbles and physically used marbles? Which networks and actors are responsible for the marble trade during this period and which marbles were commonly traded and used?

This session aims to provide an overview of current research on imported marbles and site-specific case studies. It seeks to shift the focus away from Rome in order to broaden our understanding of the earliest uses of marble during the Roman period.

14 FOUR SMALL-QUARRY STONES FROM EGYPT'S EASTERN DESERT AND THEIR DEPLOYMENT IN THE VESUVIAN CITIES**Barker, Simon (Ghent University)**

Decades of archaeology in Egypt's Eastern Desert and accrued documentary evidence, set alongside an ongoing census of lithic decor in Campania, allow a more nuanced understanding of the interplay of Roman investment in the Desert. This paper focuses on four types of stones (granito della colonna, gabbro eufotide, Wādi Umm Esh serpentinite, and ophites) from Egypt's Eastern Desert that come from quarries which were physically quite small, at least in comparison to the better known and more fully explored operations at Porphyrites, Mons Claudianus, and their satellites. Because they have attracted less attention from archaeologists and papyrologists, their chronological profiles are less clear and their ancient names, with the exception of ophites, remain unknown. However, these stones enjoyed a surprisingly wide distribution in Italy, albeit not in large quantities.

In this paper we aim to set the Egyptian evidence directly against that for its distribution and use in Campania, with the hope of learning more both in terms of chronology and contexts of use. Production of four lesser-known Egyptian stones seems in all cases to have begun under Augustus (prior to AD 14), and diffusion in Italy was well established before the eruption of Vesuvius in AD 79. Elsewhere we have studied the case of ophites; here we look at all four. Interestingly, the distribution of the four stones considered here stands in stark contrast to those from the large quarries of Porphyrites and Mons Claudianus.

15 THE MARBLE URN FROM THE GERMANIC CEMETERY IN OČKOV**Kalapáčová, Anna (The Institute of Archaeology of the Slovak Academy of Sciences)**

Očkov cremation cemetery is the biggest Germanic burial site in southwestern Slovakia and it's dated to the B2/C1 – C3 stages of the Roman Period. In grave 222, the bones and other finds were discovered in the marble urn. It is so far the only known find of a marble urn from the territory of Barbaricum. The grave is exceptional and probably an elite individual was buried in it. Based on the grave attachments the grave has been dated to the first half of the 3rd century. The urn was probably made several centuries before being placed in the grave. Because the urn from Očkov has no analogies even in the Roman world, we tried to determine the provenance based on natural science analyses.

Material composition and provenance were examined by ratios of stable isotopes of carbon and oxygen by mass spectroscopy (MS), powder X-ray diffraction (XRD), polarized light microscopy, scanning electron microscope coupled by wavelength-dispersive X-ray spectroscopy (SEM/WDS).

The marble urn from grave 222 was made of pure white calcite marble with distinctive crystals without dolomite content and made on a lathe. Based on the results of the analyses we could be inclined to assume that the marble from which the Očkov urn is made probably has an origin in the quarries of Carrara (Apuan Alps, Italy).

Compared to known Roman provincial marble urns, it is characterized by a higher degree of processing. Probably it was made directly in Italy, where the tradition of stoneworking was prevalent. The main question is how the urn came from the Roman environment to the Barbaricum and whether the Quadi used the urn before it was placed in the grave or they came into contact with burials with stone urns on the territory of the Roman Empire.

729 RECENT ADVANCES IN DOCUMENTING THE ARCHAEOLOGY OF CAVES AND THEIR ENVIRONMENTS**Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps****Session organisers: Machause López, Sonia (Universitat de València) - Trimmis, Konstantinos (King's College London) - Skeates, Robin (Durham University) - Diez Castillo, Agustín (Universitat de València)****Session format: Regular session**

New ways of thinking about caves and about humans and their multi-dimensional relationships call for new ways to record the archaeology of caves and their environments. Over the last decade, rapid progress has been made by archaeologists in rethinking the cultural life of caves, acknowledging: the diversity of cave forms and of their human uses; their landscape contexts; the connectivity of their occupants, practices and materials; the complexity of taphonomic processes; and the embodied, sensory and psychological human experiences of cave environments and performances. In the process, traditional conceptions of caves as inanimate underground spaces in bedrock have begun to be replaced by ideas about the dynamic affordances and vibrancy of caves and of the arguably symbiotic relations and affects of caves, people and other forces.

With these dynamics in mind, this session aims to showcase recent technological advances in recording and interpreting these complex relationships, over various spatial scales—ranging from the landscapes that caves form an integral part of through to cave environments and sediments—and over time.

We consequently welcome papers that centre on but are not limited to:

- progress made in documenting the archaeology of caves and their internal and wider environments.
- new technologies and techniques for recording human behaviour and activity in caves, such as: 3D scanning, photogrammetry, LiDAR, and virtual reality applications.
- field-based and digital methods that document and model the place of caves within wider natural and cultural landscapes.
- experimental methods that seek to make sense of how people performed in and experienced cave environments
- interdisciplinary approaches to human-cave interactions and conceptions, including those that incorporate local knowledge, oral traditions and ethnographic studies.

ABSTRACTS

1 CONVERSATIONS WITH CAVES: ELUCIDATING THE ROLE OF THE VISUAL BRAIN IN THE EMERGENCE AND EARLY DEVELOPMENT OF PALAEO-LITHIC 'CAVE ART'

Wisher, Izzy (Aarhus University) - Pettitt, Paul (Durham University)

Palaeolithic archaeologists have long recognised anecdotally that Upper Palaeolithic figurative imagery (40,000-15,000 cal BP) formed part of a continuum of sensorial experiences in the dark zones of European caves. The effects of light sources, shadow and visibility, movement and perspective of viewers, and synecdoche and pareidolia evoked by the topography of walls and ceilings in the dark zone, have all been documented to play roles in the nature and placement of 'cave art'. In recent years, we have developed visual palaeopsychology, an interdisciplinary field dedicated to testing hypotheses related to sensorial dimensions of Palaeolithic art through collaborations between archaeology and visual psychology. Our research integrates archaeological materials, such as photogrammetric models of cave walls, as high-resolution stimuli within psychological experiments. Through utilising approaches such as eye-tracking and virtual reality (VR) experiments, we have provided nuanced insights into how psychological phenomena informed the making and experience of Upper Palaeolithic cave art, and how certain perceptual phenomena may be responsible for the emergence of figurative representation. In this talk, we document our pioneering research in visual palaeopsychology, using several examples from cave art sites in northern Spain. We demonstrate caves acted as suggestive environments for Upper Palaeolithic peoples, actively shaping their engagement with artistic behaviours.

2 TOUCHING THE DARK: EXPLORING PALAEO-LITHIC EMBODIED CAVE MARKINGS IN CROSS-CULTURAL CONTEXT

Oosterwijk, Barbara (University of Exeter)

In rock art research, the predominant focus has been on the visual character of artistic expressions, while sensory experiences such as smell, taste, and, more notably, touch have been overlooked. During the European Middle and Upper Palaeolithic, a period characterized by the coexistence of different human actors, an intriguing category of cave markings emerges: embodied markings. The creation of these cave markings required a bodily attitude, involving not only the deliberate formation of an outline representing specific body parts but also physical contact with the cave surface. The tactile interaction and marking of distinct formations and surfaces seem to have constituted a pivotal element in the early exploration of underground spaces. The personal and exploratory character of embodied markings, along with the restricted accessibility of certain locales, connects their occurrence with thrill-seeking and risk-taking behaviour, associating their emergence with young individuals.

Hand stencils, painted finger dots and finger lines have a ubiquitous distribution, appearing on every continent except Antarctica. In this presentation the appearance of embodied markings will be contextualised through a comparative analysis of examples drawn from Palaeolithic caves, including Ardales and El Castillo in Spain, and Pech Merle in France. Furthermore, the analysis will extend to ethnographic and prehistoric parallels in Australasia, the Americas, and Africa, where the occurrence of handprints and stencils, often accompanied by intricate decorations, will be explored. Thus, in contrast to accentuating the differences in the interactions between human actors and their environments, this research endeavours to examine commonalities in both people and their practices.

3 "DEEP IN CAVES": SENSORIAL ANALYSIS OF IBERIAN RITUAL CAVES (5TH-3RD CENTURIES BC)

Skeates, Robin (Durham University) - Machause López, Sonia (Department of Prehistory, Archaeology and Ancient History, University of Valencia, Valencia, Spain) - Trimmis, Konstantinos (Centre for Hellenic Studies, Department of Classics, King's College, London, UK) - Diez Castillo, Agustín (Department of Prehistory, Archaeology and Ancient History, University of Valencia, Valencia, Spain) - Nequeruela Villanueva, Daniel (Department of Prehistory, Archaeology and Ancient History, University of Valencia, Valencia, Spain)

This paper presents the first results of the project "Deep in Caves: Iberian Ritual in Context" (CIGE/2022/94). This project is studying Iberian Iron Age caves (5th-3rd centuries BC), with an emphasis on defining various stages of the ritual processes performed in and around them and their sensory dimensions. These natural spaces evidently were arenas for diverse rites of passage, as documented archaeologically by the remains of offerings such as indigenous and imported ceramics, metal ornaments and faunal remains. Geographically, our research is focussing on caves situated within the Iberian territories of Kelin and Edeta (Valencia, Spain).

Applying and adapting recent methods developed by members of our team in other Mediterranean contexts, we have recorded some environmental/sensory variables (such as temperature, humidity and light). We are considering the extent to which these aspects of cave environments/sensoria might have impacts on the movements of ritual participants and their choice of specific areas of a cave within which to perform certain ritual actions.

The initial results of this work are already offering new insights into Iberian ritual practices in the Valencian area and helping to develop new approaches to recording cave environments/sensoria that can be extended to other regions and periods of study.

4 "STALAC-RITE": GEOCHEMICAL ANALYSIS OF STALACTITES IN RITUAL CONTEXTS

Machause López, Sonia (Departament de Prehistòria, Arqueologia i Història Antiga (Universitat de València)) - Gallego, Gianni (Departament de Prehistòria, Arqueologia i Història Antiga (Universitat de València)) - Albelda Borrás, Vanessa (Independent researcher) - Trimmis, Konstantinos (Centre for Hellenic Studies (King's College of London)) - Skeates, Robin (Department of Archaeology (Durham University)) - Diez Castillo, Agustín (Departament de Prehistòria, Arqueologia i Història Antiga (Universitat de València))

The recent identification of stalagmite and stalactite fragments in Iberian Iron Age open-air sites raises important questions about the use of these particular mineral formations inside and outside the ritual space of contemporary caves. Since the macroscopic definition of stalactite and stalagmite characteristics (colour, presence of carbon, etc.) is too imprecise to distinguish different sources and to determine the provenance of samples, scientists have tried over the last decades to develop methods to improve the characterisation of these speleothems from a chemical, mineralogical and petrographic point of view.

In this study, we characterise samples collected during the excavation of an open-air site: El Castellar (Casinos), as well as other natural speleothems sampled from the cave walls and from the fragments found on the ground of two Iberian Iron Age ritual caves: Sapo and Merinel. All three sites are located in the inland area of the Valencian Community (Spain), in the ancient territory of Edeta (Tossal de Sant Miquel, Llíria). Samples from the caves were separated into inner and outer fragments and individually analysed to check layers variability. Subsequently, a non-destructive methodological approach was developed to distinguish between different sources in a restricted geographical area (a radius of 15 km). Measurements of the stalactite and stalagmite samples' chemical profile were carried out employing two different analytical techniques: portable X-Ray Fluorescence and Laser Ablation Inductively Coupled Plasma Mass Spectrometry. Results indicate that relative concentrations of major elements, trace elements and rare earth elements identified in samples from caves and from the open site were affected by different depositional and post-depositional conditions. Finally, the obtained data were processed by multivariate statistics to investigate the potential provenance sources of stalactites from El Castellar.

5 GEOMATIC PERSPECTIVES ON UPPER PALAEO-LITHIC HAND STENCILS: INSIGHTS FROM EL CASTILLO CAVE

Spaey, Olga (IKER (CNRS - UMR 5478); UBM; UC) - Arriolabengoa, Martin (UPV/EHU) - Intxaurre, Iñaki (UPV/EHU) - Salazar, Sergio (IIIPC; UC) - Irurtzun, Aritz (IKER (CNRS - UMR 5478)) - Garate, Diego (IIIPC; UC)

This work presents a fresh perspective on space analysis within Upper Palaeolithic decorated caves. We argue that previous research approaching this notion encounters several gaps, surfacing on multiple levels: (i) subjectivity, (ii) vagueness, (iii) restrictions on its conceptualization, (iv) and its planar illustration (two-dimensional description and representation), among others. To address the aforementioned issues, we propose a new methodological approach relying on digital quantitative tools for spatial analysis (Geographic Information Systems) and three-dimensional vis-

ualization, allowing new forms of study with quantitative data, to enable researchers comprehend the complexities of spatial distribution in a more objective and systematic manner. Note that, while GIS is today widely embraced in archaeological studies in general, particularly in the field of landscape archaeology, its application to three-dimensional objects is far from obvious, as these tools were designed for a two-dimensional universe (plan view). Our proposal attempts to go beyond these limits. We applied it to the case of El Castillo cave (Cantabria, Spain), specifically on the distribution of its hand stencil motifs. To proceed to the 3D restitution of its Palaeolithic state, we carried out a geomorphological study of the entire cavity, to assess the processes at play and their distinct phases of development during the (Pre)historic times. This work, completed with archival record analysis (to identify more recent changes), enabled us to proceed to the modification of the tridimensional object of the cave and directly address, via the GIS, questions such as visibility (via different body postures), capacity (volume), accessibility (Least Cost Path, access difficulties) or spatial organization (distribution of the motifs within the space and arrangement of the figures in relation to each other). The results of these analyses, assessed through statistical methods, enable us to enhance our understanding of the Palaeolithic social groups that invested the cave during ancient times.

6 **ARCHAEOLOGICAL AND SPELEOLOGICAL DYNAMICS OF A DEVELOPED KARST SYSTEM AND SUBTERRANEAN RITUALS IN THE EARLY 5TH MILLENNIUM BCE SOUTHERN LEVANT**

Ullman, Micka (Department of Cross-Cultural and Regional Studies, University of Copenhagen, Denmark) - Davidovich, Uri (Institute of Archaeology, The Hebrew University, Jerusalem, Israel)

Har Sifsof Cave, located in the Mountainous Galilee, northern Israel, is a developed karst system measuring 518 m in total length and 49 m in vertical extent. The cave contains rich archaeological assemblages dated to the 5th millennium BCE, including pottery, flint tools, stone tools, architecture, and human remains. Archeological and speleological analysis coupled with a three-dimensional SLAM-based LiDAR modeling of the cave and adjacent surface topography were incorporated to address issues of site formation process and spatial arrangement of human activity in the cave. The study shows that by the fifth millennium BCE the underground system assumed its present configuration, indicating that ancient human activity in the cave involved overcoming multiple environmental obstacles and hazards. In tandem, changes in the configuration of voids and shafts in the upper part of the underground system led to the secondary deposition of external flint-bearing sediments alongside the primary deposited remains in the cave. These insights, combined with a meticulous typo-technological study of archaeological assemblages, their spatial distribution in the cave, and the broad cultural context, suggest that ancient human activity in the cave revolved around fertility cults associated with the agricultural cycle of cereal grains and the death and regeneration of humans and crops, nourished by the vitality of the concealed, humid, and dark underground.

7 **MAPPING IN THE DARK. AN EVALUATION OF DIFFERENT SURVEY METHODS IN ARCHAEOLOGICAL CAVES FROM LASTOVO ISLAND, CROATIA**

Trimmis, Konstantinos (Universidad de Valencia) - Drnić, Ivan (Archaeological Museum in Zagreb) - Brkić Drnić, Kristina (University of Zadar) - Đukić, Ana (Archaeological Museum in Zagreb)

Surveying caves, and especially caves with archaeology, is a challenging attempt, due to the cave environment and the absence of satellite or broadband reception underground. This paper evaluates all different methods that have been employed for surveying and recording the caves at the Island of Lastovo in Eastern Adriatic, and especially for the recording in Rača cave. Rača is the most important archaeological site on the island due to the wealth of archaeological finds from different periods. The archaeological layers indicate various human activities, carried out over the course of 7000 years. For the recording in Rača during the present archaeological research in the cave since 2021 and in other four caves on the island with evidence of human interaction, Heeb's paperless mapping, Total Station, handheld and airborne Structure from Motion Photogrammetry, and mobile phone based LiDAR have been employed. Further of a presentation of the outputs of applying these methods in Rača and in other caves, all applications are evaluated against SfM photogrammetry that have been the backbone recording methodology for the same elements of the project until the 2022 season. The recording opportunities that each application offers for surveying and recording archaeology underground are presented, alongside the project's workflows.

8 **THE UNDERLANDSCAPE PROJECT: AN INTERDISCIPLINARY AND SHARED STUDY OF THE UNDERGROUND ENVIRONMENTS**

Baldassarri, Monica (Università degli Studi di Milano; CNR ICCOM di Pisa; Sistema Museale di Montopoli in Val d'Arno) - Alberti, Antonio (Università di Pisa) - Bertacchi, Andrea (Università di Pisa) - Chiti, Letizia (Università di Pisa) - Deri, Maria Grazia (Università di Pisa) - Fiorentino, Girolamo (Università del Salento) - Serradimigni, Marco (Università di Pisa) - Salvatori, Enrica (Università di Pisa) - Senesi, Giorgio (CNR IISTP di Bari) - Palleschi, Vincenzo (CNR ICCOM di Pisa)

Over the last two years, the University of Pisa and the CNR conducted a multidisciplinary and diachronic study on the mountain landscapes of Lunigiana, Garfagnana and Mediavalle del Serchio (north-west Tuscany) as part of the PRIN 'UnderLandscape' project, aimed to the definition of an analysis protocol applicable in particular on hypogean structures and based on non-invasive scientific techniques, operating mainly in situ.

Lunigiana, Garfagnana and Mediavalle present several examples of caves and rock shelters in different contexts and types of settlement, which can be studied by acquiring a deeper knowledge of these structures and the past and present environment where they are located. The experimented methodology integrates the technical-scientific and historical-archaeological approaches through the application of non-destructive diagnostic methods and digital and multimedia technologies for archaeological, geo-historical and palaeobotanical research, including 3D modelling and aerial photography from drones. Part of the project involves also the collection of oral sources and the sharing of the research progresses with the local population. The last phase of the project is the redevelopment of the investigated sites through the creation of shared geo-tourist itineraries, in order to promote the cultural and identity values they contain, thanks to the involvement of the local community.

In this communication we intend to present the research strategy adopted in the UNDERLANDSCAPE project, together with an initial analysis of the data collected, introducing as case studies several caves and a hypogean church located in Lunigiana and Mediavalle as well as their past and present environment.

9 **DIGITAL SURVEY FOR DOCUMENTATION AND VIRTUALIZATION OF ROCK PASTORAL SITES IN ASPROMONTE NATIONAL PARK (ITALY)**

Pizzonia, Lorella (Mediterranean University of Reggio Calabria) - Stilo, Francesco (Mediterranean University of Reggio Calabria)

The documentation of underground and rock heritage has undergone great development in recent years, thanks to the growth and diffusion of digital survey technologies. In terms of documentation, these developments initially led to the production of accurate graphic documents, useful for the morphological and spatial analysis of cave contexts. Subsequently, the spread of technologies such as virtual reality (VR) and augmented reality (AR) have allowed the sharing of the 3D digital documentation collected to an audience of users not limited to professionals and researchers. In the field of digital survey, the documentation of rocky and underground environments in particular, has always presented peculiar problems, in particular relating to the insertion of these contexts within the surrounding landscape. These problems were subsequently overcome thanks to the spread of UAVs for aerial photogrammetry. This contribution intends to explore the concrete application of these technologies applied to the study of rock pastoral sites in the Aspromonte National Park in Calabria (Italy). These non-invasive archaeological interventions are inserted in contexts previously not investigated from a scientific perspective, as part of an interdisciplinary research that involves the disciplines of representation and archaeology.

10 **THE WRITINGS ON THE WALL! THE MODERN GRAFFITI OF RAČA CAVE IN LASTOVO ISLAND CROATIA**

Theodoroudi, Eleftheria (Basketball Museum YMCA Thessaloniki)

Rača cave is located in the southeast part of the Lastovo Island in the Eastern Adriatic. First descriptions of the cave date back to the 19th century, with minor archaeological research and excavation undertaken during the WW II and later in the 1950s. Materials from this excavation were published in the 1970s. The cave presents elements of diachronic occupation from the Late Neolithic to the modern times. An interesting feature of the cave and focus of this paper is that it is full of contemporary graffiti all over the walls of all of its five chambers.

The graffiti covering the cave walls are mostly inscriptions of names and dates with few figurative pictures. Most of them are dated in the 20th century, although there are a few dated in the 19th. During the Lastovo Archipelago Cave Archaeology Survey, a systematic recording of the graffiti took place. For the recording of the graffiti, apart from the macroscopic observation and visual identification, we used Reflectance Transformation Imaging (RTI) and Structure from Motion Photogrammetry. These methods have been used in a variety of archaeological contexts but in our case they have been proven effective and they revealed the earliest graffiti in the cave that is an inscription of 1673.

Using archaeological tools we recorded the ephemeral and ordinary human presence in the cave. The shift to the small scale, however, managed to illuminate the narratives that make up the island's contemporary historical trajectories.

731 CHANGES IN LIFE, CHANGES IN DEATH: AN INTEGRATIVE APPROACH TO THE NEOLITHIC TRANSFORMATIONS IN SOUTHWEST ASIA

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Fernandez, Eva (Department of Archaeology, Durham University.) - Pearson, Jessica (Department of Archaeology, Classics and Egyptology, University of Liverpool.) - Chamel, Berenice (Institut Français du Proche-Orient (IFPO), Beyrouth; French Ministry of Foreign Affairs/CNRS) - Plug, Jo-Hannah (Department of Archaeology, Classics and Egyptology, University of Liverpool.) - Blevins, Kelly (Department of Archaeology, Durham University.)

Session format: Regular session

The Neolithic was a period marked by profound transformations in subsistence, lifestyle, and social organisation. In Southwest Asia populations grew and aggregated in permanent settlements, farming and animal domestication became the main ways of subsistence, and the environment was slowly modified to meet the needs of the new economic system. These changes had an impact on the health status and disease outcomes of these very first farmers, permeated into their cultural and ritual spheres and crystallised into their varied funerary traditions.

Advances in archaeological science during the past decades have enabled the recovery of a rich body of first-hand data on aspects like subsistence practices, chronologies, funerary traditions, mobility, pathologies, genetic relatedness, biological and social kinship of some of these farming groups. The information is, however, greatly fragmented due to the limitations imposed by the harsh climate conditions -incompatible with good biomolecular preservation- and the political instability in the region, and still highly compartmentalised with limited engagement across disciplines.

This session aims to bring together different research areas within archaeology that can contribute to the understanding of the changes in lifeways, social organisation, and funerary traditions, to push the discussion towards a more integrative overview of the life and death in Neolithic societies (ca. 10,000-5,000BCE) of Southwest Asia.

We welcome contributions from researchers working in human, animal and environmental bioarchaeology in disciplines such as ancient DNA, isotope analysis, proteomics, dating, osteoarchaeology, zooarchaeology, geoarchaeology or archaeobotany, as well as more theoretical approaches to settlement patterns, economic systems, and burial customs. We particularly welcome studies that provide a multi-disciplinary approach to the life and death of the world's first farmers.

ABSTRACTS

1 AN INTEGRATIVE APPROACH TO UNDERSTANDING INFANT DEATH IN THE LATE EPIPALAEOLITHIC OF THE LEVANT

Richter, Tobias (University of Copenhagen)

Prior to the advent of modern sanitation and hygiene standards, infant and mortality rates were generally high in most pre-industrial societies. The Neolithic Demographic Transition, which set in with the development of plant cultivation and animal herding during the Epipalaeolithic-Neolithic Transition in southwest Asia, has been argued to have resulted in a concurrent increase in both fertility and infant and child mortality rates. The undoubtedly frequent death of newborn babies and young children was certainly a traumatic and challenging experience for parents, families and the wider social group. How did Late Epipalaeolithic and Early Neolithic societies experience and cope with the deaths of newborns and young children?

This paper will explore how Late Epipalaeolithic and Early Neolithic societies experienced and coped with the deaths of newborns and young children based on the excavations at the Late Epipalaeolithic Natufian site Shubayqa 1. Here, excavations revealed a high concentration of neonatal, infant and child remains buried beneath stone pavements. Previous work has revealed aspects of their life-histories and the funerary practices associated with their interment. Integrating these perspectives, this paper will discuss possible interpretations for the high frequency of neonatal, infant and child remains at the site, and consider the wider implications of this evidence for understanding human lifeways during the Epipalaeolithic-Neolithic transition.

2 CONTINUITY AND CHANGE IN MORTUARY PRACTICES IN SOUTHWEST ASIA FROM THE NEOLITHIC TO THE EMERGENCE OF COMPLEX SOCIETIES

Philip, Graham (Durham University)

The human remains of the Neolithic in Southwest Asia have been studied in considerable detail in recent decades. Characteristic practices include skull removal, the curation of body parts, burial under house-floors (and offsite cemeteries in some cases), and where provided grave goods were modest. By the 3rd millennium BCE (Early Bronze Age), evidence for the existence of complex societies is clear across a wide swathe of Southwest Asia, which raises the question of where the treatment of the dead fits into these developments.

In some parts of Southwest Asia, practices that resemble those documented in the Neolithic appear to continue into the Early Bronze Age and there is archaeological evidence to argue for threads of continuity that extend back to earlier traditions. However in other regions, there is extensive evidence for 3rd millennium mortuary behaviours that, in many respects, look quite different from earlier practices. The significance of this is emphasised by the paucity of evidence from some parts of Southwest Asia for mortuary activity dating to the 4th millennium BCE. This leads to the possibility that the practices that we observe in 3rd millennium BC contexts, in some areas at least, might represent, not a modification of past practices to meet the needs of new forms of social organisation, but rather a re-invention of burial, perhaps even a complete re-evaluation of the relationship between the dead and (parts of) the community of the living. The current paper is intended to open these questions for wider consideration.

3 EXPLORING MORTUARY PRACTICES DURING NEOLITHIC PERIOD IN TEPECİK-ÇİFTLİK HÖYÜK

Emmez, Yaren (Yeditepe University, Department of Anthropology, 34755 Atasehir, Istanbul, Türkiye; Hacettepe University, Department of Anthropology, 06800 Beytepe, Ankara, Türkiye; Human Behavioral Ecology and Archaeometry Laboratory (IDEA Lab), Hacettepe University, 06800 Beytepe, Ankara, Türkiye) - Büyükkarakaya, Ali Metin (Hacettepe University, Department of Anthropology, 06800 Beytepe, Ankara, Türkiye; Human Behavioral Ecology and Archaeometry Laboratory (IDEA Lab), Hacettepe University, 06800 Beytepe, Ankara, Türkiye)

The Neolithic period is marked by a distinctive reshaping of humanity's relationship with nature. The transition of communities to permanent settlements and the shift in primary subsistence strategies through plant and animal domestication inevitably led to social changes within these communities. Rituals within these communities serve as crucial markers for understanding and tracking these social transformations. Archaeologically, evidence of rituals can be traced within the mortuary contexts.

Various mortuary practices and material remains of rituals in the Neolithic period of Southwest Asia illuminate the diversification in human thoughts and behaviours towards death, consequently aiding in understanding the changes in social structures during this transformative era. This study examines the mortuary practices observed in Neolithic settlements of Southwest Asia, focusing on the Tepecik-Çiftlik Höyük located in Central Anatolia, considering geographical and chronological similarities and differences. Data provided from Tepecik-Çiftlik Höyük has been analyzed to explore and interpret mortuary practices and rituals, comparing the similarities and differences observed in various settlements across Southwest Asia during the Pre-Pottery Neolithic (PPN) and Pottery Neolithic (PN) periods. Additionally, the study explores whether Tepecik-Çiftlik Höyük's potential involvement in an obsidian exchange network could have facilitated cultural exchange, thus examining its interaction with other Southwest Asian settlements.

By scrutinizing the changing practices between the PPN and PN periods, this research aims to elucidate how these shifts reflected regional interactions and processes of cultural change. Understanding how evolving practices between PPN and PN periods impacted inter-regional interactions and cultural transformations provides a comprehensive perspective on Neolithic era life and mortuary practices.

4 DEALING WITH THE DEAD AT TELL EL-KERKH, NORTHWEST SYRIA

Jammo, Sari (Nagoya University) - Tsuneki, Akira (University of Tsukuba)

The social transformations during the development of the Neolithic societies in the Near East have long been investigated from the perspectives of economics, subsistence, tools-production development, and changes in funeral practices in the Pre-Pottery Neolithic A and B periods. However, the cultural changes at the transition from the Late PPNB (Late PPNB) to the Pottery Neolithic (PN) have not received sufficient attention, and only limited data have been released. Nevertheless, the small but rich body of data derived from excavated sites in different regions has revealed some of the secrets of the Neolithic societies in this transitional social period, illustrating major changes in settlement organization, cultural materials, subsistence strategy, society segmentation, funeral practices, and means of expressing identity. Excavations at the Neolithic settlement of Tell el-Kerkh, located in the south of the Rouj Basin, revealed a series of intermittent occupations spanning approximately 3,000 years from Early PPNB to Late PN periods. Remains of 294 individuals unearthed dated to the Late PPNB and Late PN periods. The Late PPNB settlement revealed a handful of burials, while in the PN settlement the majority of burials were located in an open-air communal cemetery, including several burials, mainly of infants and small children, discovered in a designated space outside the

cemetery. Researchers discuss this transition from the perspective of environmental, economic, demographic, and social factors. This paper discusses the social transition toward the Late PN period from the perspective of changes of funerary practices, household burials and the shift of burial location at Tell el-Kerkh. We argue that transformations in PN societies and the diversity of burial customs can be attributed to changes in social structure and the increasing of household autonomy. Furthermore, we suggest that these societies had developed distinct local or regional-based culture, which distinguishes sites and regions.

5 A MOMENT FOR THE MISFITS: HOW DO BODY DATA SPEAK TO SOCIAL STRUCTURE IN FEMINIST, MORE-THAN-HUMANIST FRAMES?

Kay, Kevin (University of Leicester)

Archaeology tends to reconstruct social structure as a complex, singular system in which individuals have particular positions. New methods are quickly fitted into this framework—adding new information about (say) diet or DNA atop older ways of classing bodies based on sex or mortuary treatment. The expectation is that, as new data become available, a more holistic understanding of social structure, and individuals within that structure, will become possible.

But what if no one has a, singular, social position? Feminist, intersectional and posthumanist theorists have argued this for decades. Our bodies are multiple; in different moments and different interactions, their capacities, identities, and significant features shift and rearticulate. These conversations rethink social structure—from an enveloping system to an emergent quality of moments, which never encapsulates any one of us in our entirety. Indeed it is the tension between our dis-unified positions that tends to prompt our most concerted thought about—and struggle against—social patterns. Archaeologists in SW Asia have engaged with such theory, but theory-driven research in the region has not always been quick to accommodate new methods. There is a risk of our best theory remaining in the philosophical clouds, leaving the work of bringing in new tech to old epistemologies.

I don't think feminist theory, intersectionality or posthumanism belong in the clouds, and want to explore how new and old burial data can do work in an epistemology of multiples. By showing how arrays of data around Neolithic bodies illuminate diverse, momentary and fracturing social positions, I aim to reappraise the role emerging methods play in unravelling Neolithic worlds.

6 CONTRIBUTION OF FUNERARY DATA TO EXPLORE TELL HALULA'S ROLE IN EXCHANGE NETWORKS OF THE 8TH MILLENNIUM CAL BC

Gomez Bach, Anna (Universitat Autònoma de Barcelona) - Molist, Miquel (Universitat Autònoma de Barcelona) - Orri, Olivia (Universitat Autònoma de Barcelona)

The study and excavation project of Tell Halula site, settled in the Middle Euphrates Valley (Syria), is providing a significant set of innovations for understanding the early agricultural-pastoral populations in a diachronic view from the Pre-Pottery to the Pottery Neolithic. The collection of funerary evidence from the second half of the 8th millennium cal BC (Middle and Late PPNB) is particularly noteworthy. Paleoanthropological studies and already conducted social approaches have allowed the highlighting of the main characteristics and an approximation, among other topics, to the population, traditions, and funerary gestures recovered in the domestic units that form the essence of a structured village.

This communication aims to, based on the evidence of material goods associated with the burials (grave goods, accompanying objects, etc.), review and expand the role of the population of Tell Halula in the circulation and exchange networks of the 8th millennium in the northern region of the Near East.

7 METRIC AND NON-METRIC DENTAL TRAITS FROM THE NEAR EAST POPULATIONS ON THE TRANSITION FROM HUNTER GATHERS TO FARMERS

Dyowe Roig, Albert Epite (Departament de Prehistòria, Universitat Autònoma de Barcelona) - Martínez Martínez, Laura M. (Departament de Biologia Evolutiva, Ecologia i Ciències Ambientals, Secció de Zoologia i Antropologia Biològica, Universitat de Barcelona, Barcelona, Spain; Institut d'Arqueologia de la Universitat de Barcelona, Barcelona, Spain) - Molist Montaña, Miquel (Departament de Prehistòria, Universitat Autònoma de Barcelona) - Pérez-Pérez, Alejandro (Departament de Biologia Evolutiva, Ecologia i Ciències Ambientals, Secció de Zoologia i Antropologia Biològica, Universitat de Barcelona, Barcelona, Spain; Institut d'Arqueologia de la Universitat de Barcelona, Barcelona, Spain) - Estebananz, Ferran (Institut d'Arqueologia de la Universitat de Barcelona, Barcelona, Spain) - Coqueugniot, Eric (- UMR Archéorient, Maison de l'Orient et de la Méditerranée. Lyon, France)

Neolithization was a major event in human history, marking the transition from hunting and gathering to agriculture and pastoralism as a means of survival. This change occurred around 12000 cal BP during the Holocene, a period of global warming. The Neolithic period in the Near East brought several changes in social practices, including subsistence strategies and settlement patterns. To track dietary and ecological adaptations in Hominini, tooth size and

enamel thickness are important markers of food availability. There is evidence that tooth size has decreased throughout Homo sapiens' evolution. For example, the dentition of hunter-gatherers was larger than that of agricultural groups. Some researchers suggest that the decrease in dental size between the Palaeolithic and Neolithic periods was due to a process of gracilization, which was necessary to support masticatory pressure despite the loss in muscle mass.

This study analysed metric and non-metric dental traits of adult human premolars and molars from 28 different sites and periods of the Early Neolithic in the Near East and Anatolian Peninsula. Buccolingual and mesiodistal diameters of the tooth crown and ASUDAS non-metric dental traits were analysed. The results show significant differences ($p < 0.05$) in dental area between different prehistoric periods. In addition, the buccolingual measurements show a higher rate of difference than the mesiodistal measurements.

Regarding the analysis of non-metric traits, the results show that there is a higher frequency of these traits between sites from the same period. For example, Tell Halula showed higher frequencies than the samples from other sites of the same period. Additionally, different frequencies were observed between periods.

We are grateful to all the curators and technical personnel of the different institutions where the specimens were molded. Grants PID2020-112963GB-I00, funded by MCIN/AEI/10.13039/501100011033 and by "ERDF A way of making Europe", by the "European Union".

8 INVESTIGATING PATTERNS OF MOBILITY DURING THE PRE-POTTERY TO POTTERY NEOLITHIC OF SOUTHWEST ASIA USING STRONTIUM AND OXYGEN ISOTOPES

Plug, Jo-Hannah (University of Liverpool) - Blevins, Kelly (Durham University) - Abbès, Frédéric (Universite Lyon 2) - Akkermans, Peter (Leiden University) - Bach Gómez, Anna Maria (Universitat Autònoma de Barcelona) - Chambrade, Marie-Laure (The University of Chicago) - Coqueugniot, Eric (Universite Lyon 2) - Pearson, Jessica (University of Liverpool) - Fernández-Domínguez, Eva (Durham University)

In addition to fundamental changes in modes of economic subsistence, the Neolithic transition in Southwest Asia (starting ca. 12,000 years ago) was associated with increased sedentism and unprecedented population aggregation. This paper investigates, for the first time, the role of inter-regional mobility in Northern Syria throughout this pivotal process from a diachronic perspective, by combining archaeological (burial location, mortuary treatment) and isotope (strontium and oxygen) evidence from five sites (Cheikh Hassan, Dja'de El Mughara, Tell Mureybet, Tell Halula, and Tell Sabi Abyad) spanning the Pre-Pottery Neolithic A to the Pottery Neolithic period (9th to 6th millennium BCE). Our preliminary results show that whereas the PPNA is marked by significant variability (suggesting that the population frequented various isotopically distinct areas), the populations of the PPNB show an increased homogeneity in Sr and O values (suggesting limited intraregional mobility). In contrast, the final stages of the Neolithic are marked by a more mixed pattern of mobility, with substantial numbers of non-locals making part of the population buried locally. Importantly, combining our isotope data with the mortuary evidence, it is clear that throughout the Neolithic in this region newcomers were afforded similar treatments in death and buried in the same locations as those born locally.

9 LIVESTOCK AND SOCIAL CHANGE IN THE PPNB OF SOUTHERN JORDAN

Price, Max (Durham University) - Makarewicz, Cheryl (University of Kiel)

Human-animal relations in the Neolithic are usually understood in terms of their dietary significance. The shift from hunting to herding did have radical implications for human diets. Yet ethnographic information reveals that domestic animals are also significant sources of wealth. The Pre-Pottery Neolithic B societies (c.8500-7000 BC) east of the Jordan Valley experienced significant changes in social structure. Broadly speaking, the mode of production, or the ways in which surplus production was organized and mobilized, shifted from one grounded in the community to one centered on extended households. This pattern of household atomization, widely observed by archaeologists, has only been tangentially related to livestock production. We suggest that the adoption and expansion of livestock keeping was, in fact, a major driving factor in the shift in mode of production in the PPNB. Taking a broadly Marxist perspective, we posit a model in which wealth in livestock was mobilized for the reproduction of "wealth-in-people," or the accumulation of rights stemming from relationships between people. Wealth-in-people was the key asset for PPNB households; wealth in livestock served as a major component of its reproduction. This might explain why the gradual dominance of livestock production in the region coincided with major social changes.

10 FOLLOWING THE HOOF-PRINTS: PARALLELS AND PECULIARITIES OF SMALL RUMINANT DOMESTICATION IN SOUTHWEST ASIA

Daly, Kevin (University College Dublin)

Sheep and goat, the so-called "ovicaprines", are thought to have entered under management by humans in Southwest Asia during the ninth and eighth millennium BCE, an intensification of a process which led to phenotypic and genetic distinction from their wild progenitor species. However, the difficulty in distinguishing sheep and goat archaeological

remains have limited our ability to determine if these domestication trajectories were entangled at a herd level or if sheep and goat management was practised by distinct communities.

This presentation will synthesize our current understanding of the genetic makeup of early managed sheep and goat herds, to directly address the question of entangled domestication histories in the earlier phases of small ruminant management. We will draw together archaeozoological, carbon isotope, animal palaeogenomic, and animal pathogen palaeogenomic data to identify the current knowns and unknowns of small ruminant domestication in Southwest Asia.

The large number of other contributors to this work will be acknowledged in the presentation itself.

11 ANCIENT HUMAN DNA PRESERVATION AND GENETIC AFFINITY OF PRE-POTTERY AND POTTERY NEOLITHIC SITES OF NORTHERN SYRIA

Blevins, Kelly (Department of Archaeology, Durham University, UK; Center for Bioarchaeological Research, Arizona State University, USA) - Plug, Jo-Hannah (Department of Archaeology, Classics and Egyptology, University of Liverpool, UK) - Akkermans, Peter (Faculteit Archeologie, Universiteit Leiden, The Netherlands) - Chamel, Bérénice (Laboratoire Archéorient- Jean Pouilloux, UMR 5133. Maison de l'Orient et de la Méditerranée, Université Lyon, France; Institut Français du Proche-Orient, CNRS, Lebanon) - Coqueugniot, Éric (Laboratoire Archéorient- Jean Pouilloux, UMR 5133. Maison de l'Orient et de la Méditerranée, Université Lyon, France) - Molist, Miguel (Departament de Prehistoria, Universitat Autònoma de Barcelona, Spain) - Orange, Marie (Laboratoire Archéorient- Jean Pouilloux, UMR 5133. Maison de l'Orient et de la Méditerranée, Université Lyon, France; Department of Archaeology, Classics and History, University of New England, Australia) - Pearson, Jessica (Department of Archaeology, Classics and Egyptology, University of Liverpool, UK) - Fernández Domínguez, Eva (Department of Archaeology, Durham University, UK)

The Neolithic transition in Southwest Asia led to significant changes in population density and modes of subsistence. Around 12,000 years ago, people began living within semi-permanent structures and became at least partially reliant on agriculture. To understand population movement and contact during the transition to farming in the yet unsampled Middle Euphrates region of Northern Syria, we extracted human DNA from 175 petrous portions and dental pulp chambers from 5 sites spanning the Pre-Pottery Neolithic A (PPNA) to the Pottery Neolithic period (9th to 6th millennium BCE): Cheikh Hassan, Dja'de El Mughara, Tell Mureybet, Tell Halula and Tell Sabi Abyad. Modifications to DNA extraction pre-treatments methods allowed us to increase the amount of endogenous DNA in some of the samples, but preservation was still challenging, and less than 10% of the sampled individuals retained enough DNA after in-solution hybridization capture of 1,350K single nucleotide polymorphisms (SNPs). Ten individuals from Tell Sabi Abyad, Tell Mureybet, Dja'de el Mughara and Tell Halula yielded >6,000 SNPs, and were taken forward for downstream computational analyses. Our preliminary results show that these individuals cluster closely with other Pre-Pottery Neolithic farmers from Northern Mesopotamia and show affinities to Pre-Pottery groups from the Southern Levant, Anatolia and the Zagros, adding to the tapestry of genetic contributions to the first farmers of Southwest Asia.

12 GENOMIC INSIGHTS INTO THE EMERGENCE OF NEOLITHIC VILLAGES IN WESTERN ANATOLIA

Koptekin, Dilek (University of Lausanne, Lausanne, Switzerland; Middle East Technical University, Ankara, Turkey) - Umurtak, Gülsün (Istanbul University, Istanbul, Turkey) - Duru, Refik (Istanbul University, Istanbul, Turkey) - Fidan, Erkan (Bilecik Şeyh Edebali University, Bilecik, Turkey) - Çevik, Özlem (Trakya University, Edirne, Turkey) - Erdoğan, Burçin (Akdeniz University, Antalya, Turkey) - Korkut, Taner (Akdeniz University, Antalya, Turkey) - Malaspinas, Anna-Sapfo (University of Lausanne, Lausanne, Switzerland) - Götherström, Anders (Stockholm University, Stockholm, Sweden) - Ancient DNA Teams, METU/Hacettepe (METU/Hacettepe Ankara, Turkey)

The emergence of Neolithic villages in Western Anatolia, particularly between 7000-6000 BCE, has caused debates regarding the driving forces behind this transition. While earlier hypotheses leaned towards demic diffusion from the Fertile Crescent, recent studies have indicated the complexity of population dynamics during this period. Here, we aimed to interpret the origins and movements of Neolithic populations in Western Anatolia by integrating material culture analyses with paleogenomic data.

The analysis of ancient human genomes dating back to the pre-7000 BCE period reveals a local population in Western Anatolia genetically linked to Epipaleolithic Central Anatolia. This suggests population continuity in the region, possibly indicating cultural interactions or the gradual adoption of farming practices by local hunter-gatherer groups. However, during the Pottery Neolithic phase, spanning 7000-6000 BCE, genetic affinity between Western and Central Anatolian populations hints at significant population movement and cultural exchanges among regions.

Interestingly, while migration from neighboring areas seems to have played a role in shaping the genetic landscape of Western Anatolia, our analysis also indicates evidence of local admixture with local groups, particularly in Northwest Anatolia. This finding aligns with cultural evidence, highlighting the presence of foraging and fishing activities in early

Neolithic villages in the region. Furthermore, intra-site and inter-site variability particularly notable in the NW Anatolia, underscores the complexity of population interactions and local dynamics during the Neolithic transition.

In summary, our analysis suggests a multifaceted process of Neolithization in Western Anatolia, characterized by a combination of demographic movements and cultural interactions from Central Anatolia, and admixture with local populations. These findings contribute to a deeper understanding of the complex socio-cultural and genetic dynamics that shaped the emergence of Neolithic societies in Western Anatolia.

13 ANCIENT GENOMES OF ÇATALHÖYÜK: LACK OF FEMALE EXOGAMY AND PREVALENCE OF MATERNAL RELATEDNESS AMONG INTRAMURAL BURIALS

Somel, Mehmet (Middle East Technical University) - Yüncü, Eren (Middle East Technical University) - Küçükakdağ Doğu, Ayça (Middle East Technical University) - Kaptan, Damla (Middle East Technical University) - Kılıç, Muhammed (Middle East Technical University) - Hodder, Ian (Stanford University) - Knüsel, Christopher (University of Bordeaux) - 2014-2017, Çatalhöyük Human Remains Team (University of Bordeaux) - 2014-2017, Çatalhöyük Excavation Team (Stanford University) - Ancient DNA Team, METU/Hacettepe (Middle East Technical University)

Patterns of genetic kinship among burials from prehistoric sites can reveal gender-related aspects of mobility patterns and social organization. We present an archaeogenomic dataset including 132 individuals spanning the 7th millennium BCE from Neolithic Çatalhöyük in Central Anatolia. The genomic sample as a whole shows no indication of female exogamy, a result consistent with those obtained from other Neolithic sites in Anatolia (c.8000-6000 BCE) and contrasting with patrilineal-like genetic kinship patterns observed in various European Neolithic sites (c.5000-3000 BCE). Next, we focus on the identification of genetic kinship among co-burials within Çatalhöyük houses. Analysis of genetic kinship among co-buried individuals within 23 Çatalhöyük buildings, mostly subadults, reveals a diachronic decline in the frequency of close biological relatives among co-burials, indicating changing burial practices and possibly house-use through the occupation of the site. In addition, we find that Çatalhöyük individuals co-buried within the same buildings were more closely related maternally than paternally. This pattern is detected using both pedigree reconstructions and analysis of uniparental markers and can be observed through the occupation of Çatalhöyük. Our results suggest that house-based social organization in Çatalhöyük may be biased towards maternal kinship networks and that this pattern of social dynamics was maintained in the context of changing social traditions.

14 UNRAVELING THE FUNERARY RITES: INSIGHTS FROM BURIAL PRACTICES AT ÇATALHÖYÜK CHARNEL HOUSE

Harabasz, Katarzyna (Uniwersytet Szczeciński)

This paper examines the burial practices observed within a charnel house at Çatalhöyük, shedding light on the complex rituals and funerary customs of its inhabitants. The analysis encompasses the interment of twenty individuals across different phases of the charnel house's existence, with distinct patterns regarding the placement and treatment of remains. The study identifies a diversity of burial practices, including the interment of fetus skeletons. The meticulous recording of skeletal remains and associated artifacts provides insights into the social and cultural significance of these burials. The presence of intricate burial pits and associated artifacts underscores the significance of these rituals within the community.

Moreover, the transition from in-house burials to specialized burial chambers reflects shifts in funerary practices over time, suggesting evolving beliefs and social structures within the Çatalhöyük settlement. That contributes to our understanding of prehistoric burial customs, emphasizing the importance of interdisciplinary approaches in revealing the complexities of ancient societies and their rituals.

15 KINSHIP AT ÇATALHÖYÜK: PART 2, THE BIOLOGICAL DATA

Ensor, Bradley (Eastern Michigan University) - Souvatzi, Stella (University of Thessaly)

Kinship, though rarely biologically based, is an organizing principle of human groupings, intergroup relations, and identities forged through practice. The kinship practices at Neolithic Çatalhöyük have been the subject of speculation using dubious associations between material culture and social organization or misunderstanding the relationship between biodistance and kin group compositions and postmortem burial location. Our 2022 EAA presentation on Çatalhöyük applied a well-tested archaeological approach to infer residence and descent in the North Area excavations. That analysis identified specific cognatic residence strategies - bilocal corporate groups, neolocality, and stem families - and that descent was probably bilateral. Here we focus on the phenotypic and aDNA sources. Previous bioarchaeological literature on Çatalhöyük typically lack a framework for identifying kinship practices. Other problems are the inclusion of infant and child traits, when residence and descent require analysis of adults who lived long enough to have married, the assumption that spouses are buried together, the lumping of burials across long time spans, a questionable assumption of biological homogeneity within kin groups, and a failure to seek the specific residence and descent strategies negotiated. We reevaluate the published phenotypic and aDNA data using revised models

on intra- and intercemetary biodistance based on cross-cultural ethnographic patterns for group composition and postmortem location by combination of residence and descent (Ensor 2021; Ensor et al. 2017). Though prior studies on Çatalhöyük observed a lack of close biological relationships among individuals interred within houses, the revised models enable the identification of the strategy behind that pattern. The results conform with our 2022 archaeological results: kinship at Çatalhöyük was cognatic, which, as opposed to descent groups with exclusive memberships, enables flexibility in negotiating relations and identities within and among groups.

732 WETLAND ARCHAEOLOGY: ADVANCES IN PRACTICE AND POLICY IN THE 21ST CENTURY

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Stratigos, Michael (University of Aberdeen) - McLeester, Madeleine (Dartmouth College) - Schepers, Mans (University of Groningen)

Session format: Regular session

Wetland Archaeology can give exceptional insight into past lives. With unparalleled preservation conditions, archaeological finds from wetland environments have gained far-reaching wider cultural importance. The last 30 years of wetland archaeological research has been dominated by investigation aimed at capitalising on those conditions to illuminate the past, especially histories of changing environmental conditions, alongside work aimed at understanding how wetland conditions have and are changing with a view to ensure in situ preservation of these sensitive and important archaeological deposits. However, there are new horizons for wetland archaeology as broader efforts to combat climate change and catastrophic declines in biodiversity are implicating, utilising, and championing wetland environments; often in a very direct sense, reversing the decades and centuries of drainage, reclamation and marginalisation which was responsible for both the creation and destruction of the archaeological record. Wetlands of various kinds are often regarded as the 'low-hanging-fruit' for restoration in mitigating climate change to, for example, reduce the impacts of floods or sequester carbon. These restoration, rewilding, and carbon capture initiatives are a 'brave new world' for wetland archaeology with new threats emerging for the ways in which wetland archaeology is protected and managed in most jurisdictions. This session aims to take stock of new turns in wetland archaeology theory, practices and policy set within the context of global, national, regional, and local efforts to mitigate climate change and reverse declines in biodiversity. We seek papers from all wetland archaeological contexts, from the conceptual to practical, that deal with these new realities, moving beyond simplistic, single-direction narratives. Papers communicating new wetland archaeology management policy or practice with respect to ecological restoration and carbon sequestration policies are particularly welcome.

ABSTRACTS

1 THE DEATH OF PRESERVATION IN SITU FOR WETLAND ARCHAEOLOGY?

Gearey, Benjamin (Dept Archaeology UCC)

In this paper, I reflect on the continuing and catastrophic degradation and loss of archaeological sites and deposits in wetlands, and especially peatlands, across northwest Europe and consider what, if any reasons, we have for future optimism. Recognition of this parlous situation is nothing new, but recent years have brought new insights into the rate and nature of loss of both specific sites and the problems of maintaining the integrity of others. The 'climate emergency' may well exacerbate this situation, but human impact has long been, and will probably continue to be the key issue. I consider the potential benefits for tangible heritage, that wetland rehabilitation programmes might bring, considering the various practical challenges to ensuring ecological restoration programmes take sufficient account of the particular character and vulnerability of archaeological remains. I pose the question of whether the time may well be very near that we must accept that certain sites may not be preservable, and require either excavation or sacrifice.

2 NATURE RESTORATION: A GIFT TO NATURE - A THREAT TO THE ARCHAEOLOGICAL HERITAGE AN EXAMPLE FROM LOLLAND, DENMARK

Måge, Bjørnar (Museum Lolland-Falster) - Groß, Daniel (Museum Lolland Falster) - Koivisto, Satu (Museum Lolland Falster) - Mortensen, Morten (National Museum of Denmark)

In recent years, there has been an increased focus on re-establishing wetlands, bogs and waterholes to reduce CO₂ emissions on the Danish islands Lolland and Falster, as in the rest of Europe. In this contribution, we will present archaeological results made in connection with a major nature restoration project at Røgbølle Sø on Lolland. During the deconstruction of drainages around the lake, well preserved Late Pleistocene and Early Holocene layers were uncov-

ered, that witness a varying history in the water milieus during these periods. The preliminary analysis shows massive fluctuations in water levels as well as human presence in the area.

Furthermore, we will discuss the major challenges we as archaeologists and cultural heritage advocates are going to face in the coming years by pointing out to authorities and decision-makers that achieving a better balance in nature, often has a very destructive effect on the rich cultural heritage found in wetlands. We must create a focus on and, above all, provide means to investigate wetlands before they are made wet again – and we thereby silencing their cultural-historical statements forever.

3 ALKEN ENGE - TO PRESERVE THE REMAINS OF A 2000 YEAR OLD ARMY

Hertz, Ejvind (Museum Skanderborg) - Simmelsgaard Platz, Marie Louise (Danish Nature Agency; Danish Nature Agency) - Brok-Brandi, Hans (Skanderborg Municipality)

Over the past 20 years, the research of bones from several hundred warriors sacrificed in a lake in central Jutland, Denmark, has opened up new perspectives for the exploration of the Iron Age man, from an anthropological point of view and societal civilian as well as military. As something very special, the DNA have turned out to be extremely well preserved, and it is now a clear goal to preserve the remaining remains in situ under anaerobic and waterlogged conditions. The best preservation conditions for human DNA are found precisely where the human remains are sacrificed. The wetland is therefore considered as a genome bank for further exploration of the Northern European Iron Age population. Therefore, for a number of years, efforts have been made to secure the finds by raising the water level in Alken Enge but without much success. The best-preserved parts of the sacrifice are located in the backyards of a number of houses. Museum Skanderborg's wish to construct a sheet pile combined with a dike between the houses and the sacrifice poses a dilemma for the house owners. It will protect the houses against flooding during the extreme rainfall events, which has already happened three times to some of the houses. But are the house owners ready to give up their backyards in exchange for flood protection and the preservation of the archaeological remains in the museum's interest?

Fortunately, The Danish Nature Agency has stepped in with a wetland project mainly to capture carbon that could lead to a solution. It is a project that covers Alken Enge and the entire Illerup river valley, and therefore as a side benefit, the project will also improve the in situ preservation conditions of the known weapon sacrifice site in the river valley.

4 A COMPARATIVE APPROACH TO WETLAND ARCHAEOLOGY: CASE STUDIES FROM NORTHWESTERN OHIO AND SOUTHERN CARPATHIAN BASIN

Bossio, Laura (University of Michigan Museum of Anthropological Archaeology) - Tomazič, Iride (University of Michigan Museum of Anthropological Archaeology)

Wetland archaeology serves as a valuable lens to explore different adaptations to critical wetland ecologies. This study compares two wetland archaeological sites – the first in Northwestern Ohio, United States, and the second in Banat, Southern Carpathian Basin. While geographically distant, analysis of these two sites allows for the comparison of lifeways at the edge of wetlands and the study of human-wetland interactions through millennia.

The first case study explores the Buttonwood site of Northwestern Ohio, situated at the First Rapids of the Maumee River and bordering the now-extinct and expansive (ca. 4,000 km²) "Great Black Swamp. This site contains occupations from the Archaic period (ca. 8,000-6,000 BC) to the Late Prehistoric (ca. AD 1500), along with a more recent historic component. Notably, this site contains one of the earliest ditch-enclosed village sites of the region. The village site, along with preceding and post-dating occupations, will be analyzed to discuss the intensification of wetland locales.

The second case study delves into the lifeways of societies that lived at the site of Crna Bara, Serbia. The site was identified as a Copper Age (4500-3800 BC) site in the 1940's; however, recent work discovered a multi-period locale extending from the Neolithic (showing Starčevo occupation) to the 20th century. The long occupation of Crna Bara allows for a multiperiod analysis of changing interactions and exploitation of the nearby wetlands.

By synthesizing the archaeological data from these regions, this comparative approach facilitates discourse on human-wetland interactions from the social and environmental perspectives while also presenting the outcomes of 19th century drainage in both locales. The comparative approach emphasizes the importance of wetlands as diverse and critical ecosystems that maintain the natural balance for humans, animals, and nature alike.

5 DETECTING WILD RICE IN ANCIENT LAKE SEDIMENTS, ARCHAEOLOGICAL SITES AND FOOD RESIDUES ACROSS THE UPPER GREAT LAKES OF NORTH AMERICA

Kooiman, Susan (Southern Illinois University Edwardsville) - Boyd, Matthew (Lakehead University) - Dunham, Sean (United States Forest Service)

Wild rice (*manoomin*, *Zizania* spp.) is closely linked to past and present Indigenous cultures in the North American Great Lakes region and an important contributor to northern wetland ecological diversity throughout the Holocene. However, wild rice is difficult to detect in sediments and archaeological sites using traditional methods such as pollen analysis, plant macrofossil analysis, and excavation/survey. Modern plant distribution data, while useful for understanding possible past wild rice stands, can also be problematic due to recent environmental changes and deliberate seed dispersal. Here, we present recent developments in the detection of *Zizania* focusing on silicophytolith analysis layered with archaeological and modern ecological data. Application of this method to the analysis of lacustrine sediments, archaeological food residues, and soil samples, highlights both the potential as well as the limitations of this method for understanding the long-term history of wild rice at the stand level and the incorporation of *manoomin* into Indigenous foodways. In addition to enhancing archaeological interpretations of past human-environmental interactions in this region, information gleaned from wild rice phytolith studies have the potential to contribute to Indigenous food reclamation and food sovereignty efforts, wetland restoration projects, and other contemporary issues.

6 THE CRITICAL ROLE OF WETLANDS IN ANCESTRAL NATIVE AMERICAN AGRICULTURE IN THE NORTHERN GREAT LAKES, USA

McLeester, Madeleine (Dartmouth College) - Casana, Jesse (Dartmouth College) - Alperstein, Jonathan (Dartmouth College) - Tang, Yiyi (Dartmouth College)

The dense forests of the northern Great Lakes region of the USA and Canada seem an unlikely place for expansive ancestral Native American agricultural fields, especially ones dedicated to sun-loving crops, like maize. The short growing season in these northern climes, thick forest cover, alternative staples like wild rice, and past settlement history composed of small-scale societies all would suggest limited agricultural production. Despite these circumstances, our recent lidar survey documented expansive raised fields at the ancestral Menominee Sixty Islands site in Michigan's Upper Peninsula, challenging long-standing conceptions of agricultural intensification. Seemingly critical to a successful harvest, wetland soils were incorporated during the construction of the garden beds, likely to enhance soil fertility. Sixty Islands, dating to approximately AD 1400, is the largest, intact ancestral Native American agricultural field in the eastern United States, yet ongoing resource extraction from open mining infrastructure to sustainable forestry to private landownership threatens it. Here, we describe our ongoing efforts to document and investigate the expansive raised fields and the role of wetland resources in agriculture at this threatened site in Michigan's Upper Peninsula using lidar, excavation, and phytolith analysis. Results illustrate the previously unacknowledged, tremendous scale of landscape construction by ancestral Menominee communities.

7 UNDERREPRESENTED-LANDSCAPES: METHODS AND ANALYSIS OF HUMAN PAST AFFECTION OF WETLANDS. THE SALTWORKS PRODUCTION DURING THE ROMAN TIME IN CADIZ (SPAIN)

Aragón, Enrique (Universidad de Almería) - Rondán Sevilla, Isabel (Universidad de Cádiz) - Lagóstena Barrios, Lázaro (Universidad de Cádiz)

The wetlands and marshland landscape has changed drastically over the last millennia. Relative Sea Level (RSL) change and coastal dynamics -by natural or anthropic actions- since the Pleistocene modified the morphology, impacting societies and affecting their design for decisions on organisation, habitat establishment, and use of their resources. This paper will focus on relevant evidence about saltworks production during Roman times in southern Spain. Most significant study cases for coastal wetlands have been selected from the province of Cadiz (Spain), allowing insights into the development of occupation of the territory, use and evolution as well as enhancing the role of this type of economic activities integrated into ancient wetlands. Whether focused on a specific research question, this contribution addresses a broader concern in the field of expertise, exposing the relevant use and occupation of wetlands during History within a society-environment relationship as a theoretical framework (WETMAP Project). More specifically, this paper is an opportunity to present a methodology based on non-invasive techniques (LiDAR, UAV, GPR, Magnetometry and micro-topography) to cover extensive areas occupied by wetlands that are still underrepresented and overwhelming to cover by research. Finally, this study is used as a framework to claim the need to consider wetlands as one of the most fragile cultural landscapes, with a rich historical and archaeological heritage that awaits yet for a formal establishment of actions and policies to be treated and studied not fragmentarily but as a single entity.

8 CUTTING THROUGH: ARCHAEOLOGY'S ROLE IN MAJOR INFRASTRUCTURE FOR GREEN ENERGY

Christie, Claire (Headland Archaeology (UK) Ltd)

Major infrastructure projects are essential to meeting national and international targets for reducing carbon emissions. Headland Archaeology (UK) Ltd has experience in the UK handling these major infrastructure projects which aim to reduce carbon emissions and traverse or are located wholly within wetland environments – past and present. The scale of these projects offers unique insights into human/environment interactions in wetlands crossing the full profile from coastal to marsh and fen. This paper will present results from some of these investigations which demonstrate a range of interactions from the development of prehistoric trackways, coastal industries and the placement of settlement to programs of reclamation. A key focus will be how people have coped with both rapid and long-term environmental change in wetland habitats. Furthermore, this paper will highlight how commercial archaeology can bring benefits to addressing the climate crisis by communicating these long-term human perspectives to both developers and the wider public.

9 FULL POLICY, EMPTY POCKETS: FINANCING CULTURAL HERITAGE IN PEATLAND RESTORATION

Everett, Rosie (Scotland's Rural College (SRUC Edinburgh); University College Cork)

The achievement of 20+ years of lobbying from academic, commercial and curatorial bodies for protection of peatland cultural heritage (here defined as tangible archaeology and palaeoecology) in policy directly associated with programmes of peatland restoration cannot be underestimated. The one-line peatland cultural heritage has been allowed in national and international policy (e.g., England Peat Action Plan; United Nations Environment Programme Global Peatland Assessment), often ascribing the protection of peatland cultural heritage to “ensure that restoration projects deliver cultural heritage, education and enjoyment, alongside other public goods” (EPPAP, 2021) is the gold dust we (the ascribed lobbyists) sought to kickstart mitigation strategies and best practice in the inclusion of cultural heritage in peatland restoration programmes. In 2023, UK archaeology was given even more hope with the inclusion of peatland cultural heritage in the Peatland code 2.0, further solidifying the value and requirement for its inclusion in peatland restoration programme strategies.

In theory, the duality of policy representation and inclusion in the Peatland Code, provides a platform for financial mechanisms through government initiatives (e.g. the Nature for Climate Grant Scheme) to support restoration groups to finance an archaeologist as part of the restoration team. We know that this is happening on a small scale, but as with most cultural ecosystem services, this a voluntary contribution. We also know from recent training with UNEP Global Peatlands, there is both limited knowledge and limited funding on archaeological mitigation in peatland restoration on a global scale.

This paper explores the paradox of full policy, empty pockets in peatland restoration, and the gaps in funding mechanisms for cultural heritage protection. As a potential solution, this paper also explores the emerging market of private enterprise and why blended finance options and the carbon credit market may be the key to protecting peatland cultural heritage.

10 THE 'RESTORER-PAYS' PRINCIPLE? WETLAND ARCHAEOLOGY AS TABOO TRADE-OFF IN NATURE-BASED SOLUTIONS

Stratigos, Michael (University of Aberdeen) - Everett, Rosie (Scotland's Rural College) - Gearey, Benjamin (University College Cork) - McLeester, Madeleine (Dartmouth College) - Schepers, Mans (University of Groningen)

This paper articulates a new challenge for wetland archaeology in the 21st century as efforts to combat climate change and halt catastrophic declines in biodiversity ramp up. Globally, wetland environments are the 'low-hanging fruit' for nature-based solutions that target carbon sequestration and halting biodiversity loss. These programmes of nature-based solutions are being pursued by environmental charities, local/national nature conservation authorities and increasingly by businesses/investors participating in growing markets for carbon sequestration and biodiversity net gains. While undoubtedly necessary, such developments can and often do have negative impacts to cultural heritage, including the archaeological record. In most of the world, archaeological mitigation for development operates under a 'polluter pays' principle that ensures archaeological heritage is, at the very least, recorded before it is destroyed. With transition to 'greener' economies, we now face a new situation -- the 'restorer-pays' principle. This paper lays out the case that archaeological heritage is often a 'taboo trade-off' in nature-based solutions in wetland environments for a variety of context specific reasons. We argue that the Ecosystem Services Framework is one potential way that wetland archaeology can successfully navigate this new landscape and demonstrate the value of the archaeological record both intrinsically, but also to the benefit of most nature-based solutions. The paper will illustrate this with a range of case studies. As wetland archaeologists, we must highlight this taboo trade-off with urgency and bring an

archaeological perspective to nature-based solutions in the 'green' economy that can effectively understand human/environment relationships change through time.

733 INTERDISCIPLINARY APPROACHES TO THE ARCHAEOLOGY OF ROMAN TEXTILES - A STORY TOLD THROUGH THREADS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: coletti, francesca (Department of Classics, Sapienza University of Rome) - Carroll, Maureen (Department of Archaeology, University of York) - Droß-Krüpe, Kerstin (Department of Alte Geschichte, Ruhr-Universität Bochum)

Session format: Regular session

The recent academic interest in textile research demonstrates how much ancient fabrics can shed light on social and economic factors of past societies. They are one of the early tangible expressions of technology, culture, and identity. During the Roman Empire, textile production and trade reached levels of globalisation not seen in Europe before, including Africa, Asia, and China via the Silk Roads. Despite the existence of historical sources, in-depth archaeological investigations of Roman textile production, trade, and distribution are still needed. While there has been considerable debate about textile production and trade in the Roman world, this has mainly taken place on a regional level. A systematic collection of data across the various regions of the Roman Empire is lacking, precluding their meaningful historical-archaeological evaluation. For this reason, a sound interpretive perspective of local textile features and peculiarities has yet to be gained that enables us to reconstruct a broader picture of Roman textile cultures.

This session aims to investigate the technology and economy of textile production in the Roman Empire by integrating data from a broad range of evidence such as fabrics, textile tools, literary sources, and archaeological contexts. The aim is to combine local and empire-wide scales of investigation to generate new knowledge regarding natural resources, technical operations, tools, workplaces, and social practices connected with Roman textile cultures. Textile consumption also will be explored in the session. Textiles have always played a prominent role, in everyday life as well as in death, being highly informative about self-perception, group identities, and ritual. The session seeks to provide new knowledge and data related to a potential standardisation in Roman textile economics by bringing together scholars from different disciplines and fostering interdisciplinary discussion which will result in a deeper understanding of textile craft development, production, and consumption.

ABSTRACTS

1 LIVING LAVISHLY: LUXURY TEXTILES FROM DURA-EUROPOS AND PALMYRA

Fowlkes Childs, Blair (New York University)

Almost a century after Rudolf Pfister published his seminal work *Textiles de Palmyre* (3 vols.) between 1934-1940, almost eighty years after he and Louisa Bellinger produced the final report on textiles from the Yale University-French Academy Excavations at Dura-Europos in 1945, and nearly a quarter century after Andreas Schmidt-Colinet, Annemarie Stauffer and Khaled al-As'ad published *Die Textilien aus Palmyra* in 2000, interest in the textiles discovered at Palmyra and Dura-Europos is burgeoning. New interdisciplinary research utilizing current technology is contributing to our knowledge of the production and trade of textiles in ancient Syria on the western edge of the Silk Roads/Routes. This paper focuses on several textiles from both Dura-Europos and Palmyra that contribute to our understanding of the representations of luxury textiles on Palmyrene sculptures dated to the second century and first half of the third. Additionally, a discussion of the use of digital color reconstructions, photomicrographs, other images and diagrams in the 2023 exhibition "Stories of Syria's Textiles: Art and Heritage across Two Millennia" at the Katonah Museum of Art provides an important example of a collaborative project that combined the research of archaeologists and conservators for the benefit of a wide public as well as a scholarly audience.

2 BEYOND THE RAINBOW: TECHNICAL AND SCIENTIFIC FINDINGS OF FOUR TEXTILE FRAGMENTS WITH SHADED BANDS FROM DURA-EUROPOS

Poskrobko, Janina (The Metropolitan Museum of Art) - Ferrari, Martina (The Metropolitan Museum of Art) - Lackner, Rachel (The Metropolitan Museum of Art) - Shibayama, Nobuko (The Metropolitan Museum of Art)

Four outstanding 3rd-century textile fragments excavated in Dura-Europos, Syria, and belonging to the Yale University Art Gallery collection (Table 1), became the center of a multidisciplinary study by The Metropolitan Museum of Art's Departments of Textile Conservation and Scientific Research.

Two of the fragments—one which features weft-faced plain weave shaded bands alternated with tapestry weave bands of a geometric pattern (1933.488), and the other, which is the earliest known example of weft-faced compound plain

weave called taqueté (1933.486) — were displayed in the Met's 2019 exhibition *The World Between Empires*, while the other two—both weft-faced plain weave shaded bands alternated with tapestry weave bands of a geometric pattern (1933.490a-b and 1933.489a-c)—underwent in-depth analysis for comparative studies. Remarkably, three of these textiles exhibit a wide range of colors (including bright pastels and rainbow hues) in their shaded bands, adding a striking feature to overall aesthetics.

This paper presents the collaborative efforts of Textile Conservators and Conservation Scientists in building upon the groundbreaking report published 75 years ago by L. Bellinger and R. Pfister on the Dura textiles through photomicrography, weave structure analysis, computer-aided design diagramming, fiber identification, multiband imaging, and dye analysis. The result of this comprehensive investigation leads to historical and technical insights regarding textile provenance, material sourcing, and yarn preparation (carding, spinning, etc.), which are also essential for establishing connections to textiles from diverse cultural realms and periods.

The study aims to deepen our understanding and interpretation of these fragments excavated along the Silk Road and specifically at multicultural Dura-Europos, located at the intersection of empires and characterized by a diverse tapestry of communities, ethnicities, and religious identities.

3 THE ORIGIN, PRODUCTION, (RE-)USE AND TRADE OF DELICATE FABRICS AT THE TRANSITION FROM LATE ANTIQUITY TO THE EARLY ISLAMIC PERIOD

Hildebrandt, Berit (Georg-August-University Goettingen)

Since Ferdinand von Richthofen coined the term "Silk Road", silk has been a focus in the exchange of textiles between East and West. However, ancient texts use different terms for silk and compare or even confuse its origins well into Late Antiquity: While the term *bombycina* seems to be always related to insects, *serica* from the East were often likened to or explained as plant fibres. However, the question has not yet been asked how these mix-ups may have come about.

This contribution aims at taking a comprehensive approach regarding the origin, production, (re-)use, and trade of delicate fabrics made of plant and animal fibres that were traded along the Silk Roads at the end of Late Antiquity and during the Early Islamic period. It will do so by comparing ancient Greek, Latin and Arabic texts with new archaeological textile finds of the middens of the Early Islamic settlement of Nahal Omer/Israel in order to gain new insights into the *chaîne opératoire* of high-end textile production and trade along the Silk Roads, and in particular the availability and spread of raw materials and their connected technologies. It will also discuss the implications of these results for our data collection as researchers and future collaborations in the field of textile archaeology, especially with regard to the sciences.

The research about the textiles at Nahal Omer is part of the collaboration project "Revealing the Israeli Silk Road" between Lower Saxony and Israel with Prof. Guy Bar-Oz and Dr. Orit Shamir, as well as Nofar Shamir and Dr. Roy Galili, and financed by the Ministry of Science and Culture of Lower Saxony/Germany: <https://www.israel-silk-road.com>.

4 UNRAVELLING THE GOLDEN THREADS: SCIENTIFIC INVESTIGATIONS OF ROMAN GOLDEN TEXTILES FROM THE VESUVIAN AREA

Rossignoli, Guia (Opificio delle Pietre Dure) - Cagnini, Andrea (Opificio delle Pietre Dure) - Galeotti, Monica (Opificio delle Pietre Dure) - Gennaioli, Riccardo (Opificio delle Pietre Dure) - Miele, Floriana (National Archaeological Museum of Naples) - Patera, Anna (Opificio delle Pietre Dure) - Petrocchi, Dominique (Opificio delle Pietre Dure) - Porcinai, Simone (Opificio delle Pietre Dure) - Scibè, Cristina (Opificio delle Pietre Dure) - Rotondi, Giovanni (Opificio delle Pietre Dure)

The presentation focuses on the interdisciplinary research performed at the Opificio delle Pietre Dure in Florence, under the guidance of the National Archaeological Museum of Naples, concerning the extensive collection of golden Roman textiles at the at the aforementioned museum. These artifacts, coming from different excavation sites conducted from the second half of the 17th century BC in the Vesuvian area, are the world's largest assemblage of its kind, encompassing various items such as golden ribbons, netting, and a rare silk thread spool.

This paper will focus on some of the results of the scientific investigations conducted at the Florentine Institute, which have uncovered crucial aspects of the materials and execution techniques used in the production of these precious artefacts. Through a combination of advanced analytical techniques including both optical and scanning electron microscopy with microprobe and spectroscopical and chemical analysis on microsamples, directly or embedded on cross sections, researchers have meticulously examined the morphology, materials and weaving patterns, shedding light on the sophisticated craftsmanship of ancient golden Roman textile production.

Furthermore, the conservation project encompasses not only the restoration of these invaluable and unique artifacts but also the design and implementation of suitable conservation strategies and storage solutions for both display and archival purposes. By integrating scientific inquiry with conservation practices, this endeavour not only advances our

understanding of Roman textile technology but also ensures the long-term preservation and accessibility of this unparalleled cultural heritage.

Overall, this presentation underlines the importance of an interdisciplinary approach in unravelling one side of the perspective of Roman history related to the golden threads of the textile remains from the Vesuvian excavations.

5 ROMAN TEXTILE TECHNOLOGY AND CONSUMPTION: THE TEXTILE COLLECTIONS FROM THE VESUVIAN AREA

Coletti, Francesca (Sapienza University, Department of Classics)

The large corpus of textile remains and imprints from Pompeii and the Vesuvian area offers the chance to significantly improve our understanding of Roman textile technology and consumption in the I century AD, drawing conclusions from this important site located at the centre of the Empire.

The specific environmental conditions caused by the volcanic eruption in AD 79 sealed the city of Pompeii and the surrounding areas, preserving a multitude of archaeological evidence. Among that, a wide range of textile finds have been preserved: garments, soft furnishings, soles, nets, cordages, as well as gold threads and purple/gold fabrics.

This presentation aims to show the major results of the analysis carried out on the textile fragments and fabric imprints preserved on the human plaster casts. Microscopic and archaeometric analyses allowed us to obtain essential information concerning the chaîne opératoire: spinning, weaving, and finishing techniques, as well as the qualities and the standardization of the textile materials, allowing in some instances the reconstruction of garments and their reuse.

6 NEW DEVELOPMENTS IN CHARACTERIZATION OF ARCHEOLOGICAL TEXTILES: A COMPLETE STUDY OF DYES AND PROTEINS ANALYSIS IN A UNIQUE WORKFLOW

Serafini, Ilaria (Sapienza University of Rome - Department of Chemistry; Smithsonian Institution - Museum Conservation Institute) - Ciccola, Alessandro (Sapienza University of Rome - Department of Environmental biology) - Bosi, Adele (CNR -ISC) - Coletti, Francesca (Sapienza University of Rome - Department of Classics) - Galli, Marco (Sapienza University of Rome - Department of Classics) - Gleba, Margarita (Padua University - Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music) - Favero, Gabriele (Sapienza University of Rome - Department of Environmental biology) - Kavich, Gwénaëlle (Smithsonian Institution - Museum Conservation Institute) - Cleland, Timothy (Smithsonian Institution - Museum Conservation Institute)

Archaeological textiles represent precious remains from ancient culture, due to their historical and cultural importance. However, their complicated state of preservation requires highly sensitive analytical tools to perform a comprehensive study. The PARCA project focuses on both components of ancient wool textiles, dyes – anthraquinone ones- and keratins (IFs) and keratins associated proteins (KAPs). It aims to develop an innovative protocol that would combine dye and protein analysis in a single extraction, minimizing the sampling while maximizing the amount of information obtained.

Starting with madder-dyed wool mockups, proteins and dyes from madder dyed wool were extracted simultaneously using the novel TCEP/CAA method or a modified urea method. After extraction, dyes were isolated with various clean-up methods, such as μ -SPE, stage tips, or paramagnetic beads evaluating their application in different steps of the protocol to minimize any possible alteration in the protein composition. Proteins were digested with trypsin either in-solution or on the beads and desalted with C18 SPE/C18 stage tips. Peptides were separated with ThermoScientific Acclaim PepMap 100 trap and analytical columns at 300 nL/min; dyes with a Waters BEH Shield RP18 with an Ultimate 3000 at 200 μ L/min and detected on an Orbitrap Elite. The methodology was tested on laboratory charred samples, investigating the survival of proteins and dyes at different temperatures (200 to 300°C).

The contribution presents the preliminary results of the new methodology applied on wool samples from the I century AD, which are part of the textile collections of the Archeological Park of Pompeii and the Museum of Museum of the Roman Ship in Nemi (Italy).

Acknowledgments-This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 101029204. This project was also supported by the Smithsonian Museum Conservation Institute Federal and Trust funds (GMK, TPC).

7 INTRODUCING THE ROMAN TEXTILE DATABASE

Dimova, Bela (University of Padua)

There has been considerable research and debate about textile production and trade in the Roman world, but this debate has mainly taken place on a regional level, with empire-wide questions rarely addressed. A systematic collection of data across the various regions of the Roman Empire is still missing precluding their meaningful historical evaluation. Another important challenge in Roman textile studies is the fact that there is a wealth of collected primary data that are unpublished or difficult to access and use. In order to make a qualitative and quantitative leap in our

knowledge there is a need to unite and integrate the heterogeneous archaeological documentation of ancient textiles. There is also an urgent need to preserve and make universally accessible the archival data accumulated by scholars in different countries. The Roman Textile Database – which this paper introduces – addresses these needs. The Roman Textile Database is an open access platform, created within the project ADigTex, involving Universities of Sapienza and Padua.

The Roman Textile Database comprises a digital corpus of textile fragments, tools and all the attached archaeometric and contextual documentation. It digitizes and unites the extensive scientific archives of Roman textiles, and will serve as a tool for both research and preservation of data (in some cases of no longer extant textiles). In doing so, the Roman Textile Database will lay the foundation for future multi-scalar analysis of Roman textile production and enable researchers to perform more complex spatial and statistical analyses of large sets of textiles to identify empire-wide chronological, geographical, fashion and social trends.

8 TEXTILES FROM THE ROMAN PERIOD IN THE GERMANIC PROVINCES

Linscheid, Petra (University of Bonn)

In the framework of two projects „Textile finds in the LVR-LandesMuseum Bonn“ and „The Textile Archive of Hans Jürgen Hundt“ (<https://www.iak.uni-bonn.de/christliche-archaeologie/de/forschung/textilforschung/kontextil>) about 150 textile finds from Roman Germania Superior and Germania Inferior had been recorded, most of them are unpublished so far. Many of the textile finds came to light in 3rd century graves near Villae Rusticae, others were found in the context of hoard finds or settlements. The textiles are partly old findings, partly they are from recent excavation, the majority of them comes from the Rhineland. The techniques are tabby, twill, tapestry and sprang. Bast fibres and wool are the most frequent materials, rarely gold thread and silk are encountered. The textiles provide insight into various textile functions: into clothing comprising tunics, hair nets and girdles, utilitarian textiles like purses and ropes and the role of textiles in burials as shrouds and wrappings of grave goods, urns and ashes.

9 TEXTILES AND FUNERARY RITUAL IN ROMAN YORKSHIRE

Carroll, Maureen (University of York)

The paper presents an in-progress research project at the University of York that focuses on the notable mortuary practice in the city of Roman York and its environs of pouring liquid gypsum over the wrapped corpses of adults and children in stone or lead sarcophagi before deposition in the ground in the 3rd and 4th centuries A.D. As the gypsum hardened and the human tissues decomposed, a negative impression formed in the casings that preserves the contour, shape, and position of the bodies as well as the remarkably detailed imprint of textiles used to clothe and shroud the dead. A particular strength of the research is the generation of new knowledge about the nature and function of burial textiles and how they reflect the social status and identity of the people in them. In addition to examining remains of embedded textiles and threads in the gypsum, we are transforming the negatives in the casings into positive images through 3D digital technology, capturing unparalleled detail and allowing a nearly complete visual reconstruction of the burials before the sarcophagi were sealed in antiquity. An additional project aim is to use mass spectrometry and Raman spectrometry to reveal resins, dyes, and chemicals originally used on the textiles. The wrapped bodies in Yorkshire will be related to contemporary elite Roman mortuary customs attested on continental sites of wrapping, adorning, and partially preserving bodies in textiles as part of lavish funerary displays.

10 AN ASSEMBLAGE OF ARCHAEOLOGICAL TEXTILES FROM SOKNOPAIU NESOS (FAYYUM, EGYPT)

Cozza, Francesca (University of Salento, Lecce, Italy)

The arid climatic conditions of the Egyptian desert have guaranteed the good preservation of organic artifacts, such as archaeological textiles. During the excavation campaigns at Dime es-Seba/Soknopaiou Nesos (Fayyum, Egypt, 3rd century BC - 8th century AD), between 2019 and 2022, a substantial number of well-preserved textile fragments were unearthed within the ST6 building. Although its interpretation is not yet certain, it seems likely that the building, located within the temenos and built between the 1st and 2nd centuries AD, was connected to cultic practices, and may have functioned as a deipneterion. The purpose of this paper is to present the assemblage of the discovered textiles, identifying the main typologies, and proposing a preliminary interpretation of their function within the building. In addition to the good preservation of the textiles, the exceptional nature of this case study lies in the strong connection of the materials to the context of their discovery. In fact, despite the disruption of the stratigraphy due to repeated clandestine excavations, the consistency of findings in the stratigraphic units suggests that, with a high degree of probability, they have been found in the same place where they were originally used. Therefore, the analysis of these archaeological textiles within their context can contribute not only to shed new light on textile technology and production, but, in combination with an interdisciplinary study of documentary and iconographic sources, it can also lead to a further insight of their function within a cultic building in Roman Egypt.

11 AN ANALYSIS OF THE ROMAN TEXTILES FROM QASR IBRIM

Hitchens, Sarah (Independent Researcher)

Qasr Ibrim is a multi-phase site situated in Lower Nubia on a strip of land above the Nile floodplain. This meant that the site was not subject to the effects of Nile flooding nor did the area receive much rainfall resulting in the excellent preservation of organic material including thousands of textile fragments. For most of its history, Ibrim was, at various times, a commercial, political, and religious centre. It was controlled by different northern and southern polities at various points throughout its long history. Control of the city and its surrounding area was often disputed throughout antiquity. Due to the site's geographical and political situation, Qasr Ibrim has been described as a frontier post.

This was particularly evident in the first century BC when the expansionist policies of Kushite rulers in Lower Nubia brought them into contact with Roman Egypt resulting in conflict which came to a head at Qasr Ibrim when Roman forces led by Egypt's second Prefect C. Petronius captured the city. After which, a Roman garrison was stationed at Qasr Ibrim in circa 25/24BC. However, the length of the Roman occupation at the site is debated.

Large deposits of Roman material, including textiles, were discovered at the site. The analysis of these textiles will form the basis of this talk. The textiles ranged from fine to coarse and included examples of clothing as well as clearly utilitarian textiles. They were made using different fibres and weaves. The textiles not only represent the cloth and clothing left behind by a Roman legion in a foreign land, but also give an insight into Roman textile traditions at the edge of the Roman empire.

12 THREADS OF WAR. TEXTILES AND SCALE ATTACHMENT IN ROMAN SCALE ARMOUR

Wijnhoven, Martijn (Institute of Archaeology of the Czech Academy of Sciences, Brno)

The Roman army might not immediately spring to mind within the field of textile studies. However, textile played a crucial role in the army, serving not only in clothing but also as a significant component of their equipment. An illustrative example is scale armour, characterised by metal scales attached to a textile base. While instances of scale armour with preserved textile bases are rare, they do exist. Some cases involve fragments preserved under favourable conditions, as seen in multiple examples from Dura-Europos in Syria. In other instances, characteristics of the original textile endure in the corrosion products of the metal scales, as observed in findings from Carnuntum in Austria. This paper aims to examine the collective evidence for Roman scale armour featuring textile remnants. This examination extends beyond the textile used as a base garment to include the diverse methods employed to affix scales onto this foundation. Through this analysis, it becomes apparent that there was no singular method but rather a diverse spectrum, potentially reflecting the cultural diversity of the individuals serving in the Roman army.

13 TEXTILE USAGE IN THE ROMAN IMPERIAL DEFENSIVE EQUIPMENT

Spagiari, Fabio (Università degli Studi di Padova) - Malaman, Elisabetta (Università degli Studi di Padova)

The study of the Roman military equipment has always aroused scholars' interest; however, the usage of textile elements in the production of the Roman soldier's defensive weapons is greatly underestimated, due to the rare preservation of these components, as well as their lesser conspicuousness when compared with the metal parts. The protection of the head was complemented by a lining inside the helmet, consisting of a sort of hat made of wool, linen or felt. Well-preserved examples come from Didymoi (Cardon, Granger-Taylor, Nowik 2011), Mons Claudianus and Dura Europos (James 2004). These could be attached to the helmet bowl and to the cheek-pieces by resin glues, as found in two helmets from Newstead (Curle 1911) and on the face mask from Hellange (Müller 1912). Similarly, fabrics could be used as linings for greaves and armguards as reported in Dura Europos (James 1990) and Carnuntum (Von Groller 1901), respectively. The presence of the fabric is not only related to making the elements of the soldier's panoply comfortable to wear but it is also an integral part of their production technology: fragments of scale armours from Dura Europos, Carpow and Carnuntum attest the use of a linen backing for sewing the scales of the armour (Wild 2011). A layer of fabric was also placed within the construction system of the shields, with the purpose of connecting the wooden part and the outer skin, as demonstrated by the findings at Masada (Stiebel, Magness 2007), continuing an older tradition mentioned by Polybius (6, 23, 3). This contribution aims to highlight the importance of textiles in the different elements of the Roman soldier's defensive weaponry during the Imperial age through an analysis of the textile remains observing the fibres used, the techniques employed and the possible presence of regional differences or large-scale standardisation.

14 TOWARDS THE ARCHAEOLOGY OF ROMAN TEXTILES IN SERBIA - PRODUCTION OF TEXTILE IN VIMINACIUM

Marjanovic, Milica (Institute of Archaeology Belgrade) - Dankovic, Ilija (Institute of Archaeology Belgrade)

Textile use and production have been insufficiently researched areas in Roman archaeology for a very long time. Although significant advances in exploring this topic have been made in recent years, the knowledge gap in certain

geographical areas still exists. Textile production is mostly an unexplored and rather unpopular topic in Serbian archaeology, including the Roman period. There is not a single detailed study on the Roman textile industry, while textile specimens and tools for its production are published sporadically. Almost complete lack of information about Roman textile production leads to numerous mistakes in archaeological reasoning, such as misinterpretation of certain textile-related tools.

This paper aims to shed light on the textile production in Roman provinces in the territory of Serbia, starting with the overview of finds from Viminacium, the industrial and economic center of the province of Moesia Superior. During several decades of excavations, this site yielded plenty of artifacts used in all stages of yarn and textile production. Several textile specimens were also discovered, most of them originating from graves and usually mineralized. Three structures from the Viminacium suburban area were interpreted as locations of possible textile production-related activities, based on architectural features, artefacts, and the presence of pigment pieces. Gathering and systematizing of all available data from Viminacium are necessary first steps towards a better understanding of textile production and use in Roman provinces in Serbia. Only after that, it will be possible to continue with more detailed analyses, such as physicochemical ones, for determining the basic characteristics of the material (type and origin, spin, weaving method, traces of pigments, wear marks on the tools) or distribution patterns of artefacts, which will show the possible workshop locations within the city.

15 TEXTILE WORKSHOPS IN POMPEII: PAST RESEARCH AND FUTURE PERSPECTIVES

Casa, Giacomo (Sapienza Università di Roma)

Thanks to the exceptional preservation of textiles, utensilia, and workshop, the ancient city of Pompeii represents a privileged context for studying Roman textile production. Indeed, the large number and variety of workshops related to the different stages of textile production and treatment (*officinae lanariae*, *officinae tinctoriae*, *fullonicae*) offers the chance to reconstruct in detail the entire textile chain - *operoire* and, at the same time, provides valuable insight into the specific activities, installations and actors involved in the production. This enormous informative potential aroused great interest in scholars, who have investigated textile workshops with different approaches, not only from a productive-technological point of view, but also from a socio-economic perspective. This contribution aims to give an overview of the state of the art, highlighting the need for further investigations on production stages and contexts, which are still largely unknown and critical in tracing the broader dynamics of Pompeian textile production. In particular, the paper offers new insights for the study of Pompeian textile working places, considering two main aspects: 1. a workshop-based approach, considering their multi-functionality, in which different activities and stages of production could have taken place; and (2) a broader approach that will discuss the Pompeian "topography of textile production" by examining the distribution maps of textile utensilia in order to identify production districts. This research will re-discuss and contribute to the topic of Pompeian textile production through remarkable key studies.

735 POST-MEDIEVAL CEMETERIES ON THE FOCUS - ANTHROPOLOGICAL AND ARCHAEOLOGICAL STUDIES ABOUT THE PAST 500 YEARS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Líbor, Csilla (Hungarian National Museum) - Lepionka, Hubert (Podlaskie Museum in Białystok) - Dec, Olga (Adam Mickiewicz University) - Balogh Bodor, Tekla (Hungarian National Museum)

Session format: Regular session

Due to the successful session on the 29th EAA, we are once again hosting a session focusing on post-medieval cemeteries. Researching post-medieval/modern cemeteries offers us a variety of possibilities and information for us about our past. Bioarchaeological research of these human remains and their archaeological contexts enriches our knowledge in several ways: we can learn about the social structure, burial customs, migrations, population changes, diseases, health conditions, crises, and violent events. Opposite to earlier periods, bioarchaeological data can often be testified by a written source about the individual or a community, or even by documented major historical events. For example, in the case of studying epidemic periods, the cemeteries of the last 500 years can provide the best opportunity to examine different impacts on human populations in the past. Furthermore, it raises important ethical questions, since, on the one hand, the relatives of those buried may still be alive, thus opening up the possibilities to connect those buried with the living local community. In this way, through the exhibition and storytelling of the remains and material culture, the local community can become closer to their own history and heritage and foster a sense of pride and connection to the past. On the other hand, actual trends in museum studies emerge, which concern the question of how human remains from a period so close to our present can best be treated and exhibited.

This session represents a developing but essential field of archaeology. This session aims to bring together researchers who share a similar interest in cemeteries of the post-medieval/modern period.

Expected papers may include:

- Presentation of excavations and findings.
- Bioarchaeological analysis of the cemeteries
- Paleopathological analysis of the individuals
- Ethical questions
- Storytelling through post-medieval material culture and human remains in exhibitions.

ABSTRACTS

1 UNVEILING THE SECRETS OF THE LATE MEDIEVAL CHURCH OF MANEA BRUTARU IN BUCHAREST (ROMANIA)

Sonu, Diana (Bucharest Municipality Museum) - Manea, Ioana (Bucharest Municipality Museum)

Between 2020 and 2023, an archaeological rescue excavation was carried out at the church of St. Nicholas Manea Brutaru in Bucharest. Our objective is to present the main discoveries, namely 210 graves and 39 more reburials, long forgotten. In an effort to gain deeper insights into the daily lives of the deceased, we have used both quantitative and qualitative methods to analyze the graves. The history of the church begins in the latter half of the 18th century, more specifically in the year 1777, when three merchants from the Popa Radu neighborhood provided funding for the construction of a wooden church. As a result, a cemetery was established in close proximity. After the church was destroyed by fire a decade later, another one made of brick was erected. As a consequence of limited space, the new church was built on top of the cemetery linked to the old one. Therefore, approximately half of the uncovered graves were found beneath the second church. Until a new law mandated the relocation of all cemeteries on the city outskirts to lessen the epidemiological risk, parishioners continued burying their dead around the newly constructed church for another hundred years. Initial examination of the graves and burial inventory indicates that the community did not consist of wealthy individuals but rather a varied group facing the challenges of the time, such as infant mortality and venereal disease.

2 UNVEILING FAMILIAL DYNAMICS IN THE MIDDLE AGES: A CASE STUDY OF THE VANISHED VILLAGE OF GAĆ, POLAND

Gembicki, Maciej (University of Adam Mickiewicz, Faculty of Archaeology) - Snow, Meradeth (University of Montana, Department of Anthropology) - Airola, Danielle (University of Montana, Department of Anthropology) - Czaplinska, Tina (University of Montana, Department of Anthropology) - Krzpekowski, Marcin (Regional museum of Wagrowiec)

Our study aims to explore the potential of spatial, genetic, and archaeological analyses in investigating familial dynamics using a high medieval-modern cemetery in Gać as a case study.

Throughout three seasons, an international team affiliated with the Regional Museum in Wagrowiec and Mortuary Field School, operated by the Slavia Foundation, has conducted regular examinations of the cemetery located in the abandoned village of Gać. So far, our investigations have uncovered 206 burials spanning from the 14th to the 16th century. Throughout our research in Gać, numerous phenomena have emerged that hold promise for addressing our research objectives.

Initial findings from spatial analyses suggest a non-random distribution of graves. Clustering of subadult burials has been observed, along with a notable proximity between the burials of women and subadults. This spatial arrangement may signify the existence of family units, likely centered around the interment of a mother alongside her prematurely deceased offspring.

A particularly intriguing observation is the practice of placing additional skulls within the coffins of the deceased. We hypothesize that this custom may have served as a gesture of reverence towards a deceased relative whose original grave was inadvertently disturbed during burial proceedings.

3 EXTERIOR SPLENDOR - EARLY MODERN BURIALS (C. 1600-1738) IN THE CLOISTER AT RIBE CATHEDRAL

Knudsen, Maria (Museum Vest (Denmark))

Between 2008 and 2012, hundreds of burials dating from AD c. 860-1800 were excavated south of the cathedral in the town of Ribe in Denmark. 168 of the graves had been buried in the cathedral's cloister (ambitus) in the period c. 1600-1738, when Ribe transformed from a major trade- and ecclesiastical center into a small provincial town. The digitised and phased material shows diverse aspects of burial practice and living conditions for people of higher status in an early modern, Danish town.

This paper will present the physical aspects of the burial practices used, including coffins and their decoration, the location of the graves in the cloister and the few preserved examples of personal adornment. It will be discussed what this can tell us about the social status of the buried, and in some cases bring us very close to individuals.

Osteological studies of the skeletons have also increased our understanding of the living conditions of a specific social group in a Danish town in the early modern period. Thus, the distribution of age and gender gives an insight into both child mortality and gender-related vulnerability, while the skeletons in general show a variety of diseases. Finally, the material includes a few examples of abortion, stillbirth and death in childbirth.

The few objects found in graves, as well as a single burial with the head in the east, may be examples of superstitious acts that were supposed to help the deceased on their journey into the afterlife. And perhaps especially those who had met death in a tragic way. Similarly, the extensive decoration of the coffins may be a last attempt to shine a light on a life that had still been hard despite relatively high status.

4 ST. ROMBOUT'S CEMETERY IN MECHELEN, BELGIUM (10TH-18TH CENTURY AD): AN ARCHAEOGENETIC PERSPECTIVE

Pierini, Federica (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Giffin, Karen (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Coppola-Bove, Lorenza (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada, Granada, Spain) - Kirkpatrick, Casey (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Department of Anthropology, University of Western Ontario, London, Ontario, Canada) - Van de Vijver, Katrien (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Bos, Kirsten (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

St. Rombout's Cathedral cemetery, located in the historic city of Mechelen (Belgium), is currently recognised as the largest excavated churchyard assemblage in the region of Flanders. With its use spanning the 10th through 18th centuries, the cemetery offers a unique opportunity to evaluate genetic continuity amongst the inhabitants of Mechelen over a large temporal interval. In this work, we apply an archaeogenetic approach to investigate population-level genetic changes in the community represented in the cemetery. Genomic human DNA was generated for 203 individuals, representing the cemetery's full period of use. A notable shift in population composition was apparent in the post-medieval period, which aligns with historical documentation for the presence of the Spanish military in the city. Overall, our genetic analysis, which encompasses a large temporal transect, offers invaluable insights into periods of transition from the pre- to post-medieval centuries, which are characterised by complex economic and political transformations in this city of historical prominence.

5 CHILDREN OF SZÉCSÉNY - BIOARCHAEOLOGICAL APPROACH OF THE NONADULT REMAINS OF A POST-MEDIEVAL CEMETERY FROM HUNGARY

Líbor, Csilla (Hungarian National Museum) - Balogh Bodor, Tekla (Hungarian National Museum) - Szénásy-Laczkó, Virág (Hungarian National Museum) - Zay, Orsolya (István Dobó Castle Museum)

In 2019, we had the opportunity to excavate a cemetery from the 17-18th centuries in Szécsény (Hungary). We could not excavate the whole site, and our work took place in the cemetery's middle and northeast segments. The graves were relatively rich in finds and this essentially reflects post-medieval trends. Among the almost 300 graves, more than 50% were nonadults. This phenomenon is common in the medieval, and post-medieval eras, but in the case of Szécsény, we have more than 30 "párta", different kinds of hair pins, and bon pins also. These objects have important meanings, therefore help us understand and study the transition between children and grown-up women. In these centuries, hair was a significant carrier of information. The hairstyles of children, unmarried and married women were significantly different.

Even the bones exhibit relatively bad preservations, a very high percentage of the examined children showed pathological changes. In particular, there were many lesions associated with infectious diseases. We were able to excavate a relatively small part of the cemetery, and 300 graves cannot be considered - many. However, thanks to the non-adult's graves, we can get a clear picture of the health status in this settlement at the time.

6 THE EXCAVATIONS OF CHILDREN'S BURIAL GROUNDS (CILLÍNÍ) IN IRELAND

Mundt, Courtney (Queen's University Belfast)

Children's Burial Grounds (Cillíní) are an archaeological site type found across the island of Ireland. These burial grounds were created as a response to the Roman Catholic Church's Counter-Reformation when the Council of Trent (1545-1563) reformed and reaffirmed canon laws. Canon Law 1239 forbade the burial of the unbaptised in

consecrated ground as they were seen to still be 'tainted' with Original Sin, while Canon Law 1240 stated that certain adults – such as suicides, murderers, strangers, and shipwreck victims – were not eligible for burial in consecrated ground as well. As no instruction was given on where to bury these individuals, cillíní were established in order to safely bury these 'unfortunates' whose souls were bound for Limbo. Some cillíní were still in use before and after the Second Ecumenical Council of the Vatican (1962-1965) removed laws like Canon Law 1239. Many cillíní have now been memorialised and the human remains of those excavated from them reburied in consecrated ground by the local communities, who still view them as part of their heritage and community.

Even with 1693 recorded across Ireland, only 52 cillíní have been excavated since 1955. Primarily, these sites are found during the excavations of older archaeological monuments (i.e. disused ecclesiastical sites and graveyards, ringforts/raths, fortifications, megalithic monuments) or before urban development. While earlier excavators believed that these sites were pre-Christian pagan cemeteries that may have been reused during the early Christian period, archaeological evidence found during these excavations has confirmed that these sites are Post-Medieval or Early Modern in origin and usage.

This paper aims to discuss these excavations and their results found during the analysis of excavation reports, historical documentation, archives, databases, folklore, oral history and publications, research undertaken as part of the author's doctoral dissertation.

7 LIFE AND DEATH IN THE POST-MEDIEVAL WORLD

Balogh Bodor, Tekla (Magyar Nemzeti Múzeum)

Storytelling through post-medieval material culture and human remains in museum exhibitions can offer a vivid window into the past, illustrating the everyday lives, social structures, beliefs, and practices of people from that era. Although the post-medieval period is very close to our time and therefore its appearance in the walls of museums in the classical sense was previously difficult to imagine, today more and more examples are known from all over the world. But how can the objects and human remains of the recent past be correctly presented museologically and ethically? Precisely because it is such a recent past, people have a different attitude towards human remains, but also towards material culture. However, there are two different ways to view the objects and remains: scientific and emotional. What can the recent past tell us and why is it important to exhibit its objects and stories? In my presentation, I will bring examples of good practices and case studies that can hopefully shed light on the many interesting lessons of the post-medieval period.

8 DOLMANS AND THEIR OWNERS – DOLMAN REMAINS FROM THE GRAVES IN THE CHURCH OF ST. MARTIN AT PROZORJE, CROATIA

Stingl, Sebastijan (Institute of Archaeology) - Kokotović, Tea (Institute of Archaeology) - Belaj, Juraj (Institute of Archaeology)

Near Zagreb, at the site called Prozorje, there are ruinous remains of the Church of St. Martin. Archaeological campaigns conducted over a period of several years during the first two decades of the 21st century excavated the nave, sanctuary, lateral chapels and sacristies, as well as a narrow space around some of the church walls. Almost 300 graves have been excavated and documented, most of which can be dated to the 17th and 18th centuries. Some of these graves are particularly intriguing since they contain vertical rows of buttons situated in the chest area of the deceased. The comparison of the appearance of the buttons, the position in which they were discovered on the skeleton, and the spacing between the rows with contemporary paintings confirmed that they were part of a male garment called dolman. This paper will place these dolman finds into a wider geographical and social context and, using the comparison of these new findings with the bioarchaeological analysis and available historiographic data, try to determine who the persons buried in them were.

9 CHRISTIAN CHANGES WITH PERSISTING PAGANISM? COMPARATIVE STUDY OF MOGIŁKI CEMETERIES RITES IN THE POST-MEDIEVAL TERRITORY OF TODAY PODLASIE, NORTH-EASTERN POLAND

Lepionka, Hubert (Podlasie Museum in Białystok)

Mogiłki is post-medieval cemeteries with are typical to the village landscape of today's Podlasie region in North-Eastern Poland. They are characterised by standing erratic tombstones, with small peddles on top of the grave, mostly located on the top of the hill in the eye range of the village to which it belonged. They are dated from the late 15 st to late 18th century.

The discussion about the origins of cemeteries called Mogiłki was disputed long ago in archaeological literature. In one publication they were associated with the full Christian phase of the colonisation of Podlasie, in others as remain the
