The stone battle-axe stands as an iconic emblem of the Scandinavian Battle Axe Culture (BAC), spanning from 3000/2800 to 2300 BC, a period of profound economic and social change. The presence of battle-axes in the single graves, characteristic of the period, has long been regarded as indicative of their symbolic importance and conjectured function. Traditionally viewed as non-functional, purely ceremonial artefacts emblematic of a male elite/warrior class, these axes are often associated with themes of power, violence, and social hierarchy. These are rooted in fixed dichotomies, symbolic: functional; male: female, which severely limit the interpretation of battle axes by avoiding their multiplicity, and by using generalized ideas which separate the battle-axes from the context of their emergence.

This paper challenges prevailing notions of battle-axes as inherently male-gendered objects, interrogating their characterisation as symbols of a male elite/warrior class. It questions whether archaeologists have inadvertently imposed modern gender dichotomies onto ancient societies. It will leverage novel data on the manufacture and use of BAC battle-axes across Fennoscandia, alongside new materialist methodologies, that emphasize the relational and emergent qualities of material objects to rethink what it means to be human (e.g. Alberti et.al. 2013; Fowler 2013; Crellin 2020), and Posthuman feminism (e.g. Braidotti 2013), to critique the humanist ideal of 'Man'. It will challenge the binary interpretations of these artefacts and illuminate their multifaceted nature.

In doing so, it will explore the avenues that lead to the deposition of some of these objects in graves alongside male individuals and investigates whether such associations reflect gendered identities. By examining the broader lifecycles of these artifacts, it aims to discern whether their burial signifies a connection with masculine identity, or if such associations manifest prior to interment. Additionally, it investigates whether the scarcity of battle-axes in burial contexts signifies divergent meanings or societal roles.

4 **MONSTERS, WARRIORS, HEROES... MEN. THE REPRESENTATION OF MASCULINITY IN IBERIAN IMAGERY**

Martínez-Boix, José Luis (Universitat d'Alacant)

Iberian culture, which developed on the Mediterranean coast of the Iberian Peninsula between the 6th and 1st centuries BC, produced a large body of imagery on various supports throughout its evolution. These images are rich in geometric, vegetal, animal and human forms. Within this, the representation of man and masculinity is manifested through diverse works and on different supports. Those on sculpture and, above all, on painted ceramics are particularly noteworthy.

Anatomical differences, distinctive clothing or archaeological and iconographic contexts are good tools to detect the presence of the masculine concept.

Over the last few decades, especially since the rise of feminist approaches, the study of the human image in Iberian culture has multiplied. The focus has been on female representations, more frequent and with public repercussions since cases such as the Dama de Elche or the Cerro de los Santos sculptures.

This paper deals with the internal evolution of male representations within the Iberian. Thus, we will differentiate their stages to analyse the image of masculinity derived from each of these, proposing possible meanings and ideological changes underlying the representation of men in the Iberian period.

5 **BEYOND WARRIORS AND GOOD SHEPHERDS: AN INTERDISCIPLINARY APPROACH TO UNDERSTANDING CHANGES IN MASCULINITY IN THE PROTOHISTORIC CANARY ISLANDS**

Carballo Pérez, Jared (Laboratory for Human Osteoarchaeology, Leiden University) - González Carracedo, Laura (Departamento de Geografía e Historia, Universidad de La Laguna)

This investigation explores the diverse models of masculinity that existed among the indigenous populations of the Western Canary Islands during Protohistory. Utilizing a feminist and constructivist lens, we aim to interpret the variability of everyday practices as evidenced in the skeletal remains of these inhabitants within its historical context. Our focus centers on osteoarchaeological markers, such as physical activity indicators, to understand the performance of daily activities beyond the average masculine roles.

We propose examining outliers and contexts with high standard deviation values as spaces where men could perform activities that deviate from the typical masculine labor pattern. Additionally, our approach includes a historiographical interdisciplinary perspective, enabling us to interpret shifts in gender models following contact with European conquerors, such as a decline in masculine activity. By combining osteological evidence with a feminist and decolonial review of postmedieval written sources, we offer a more enriched and contextualized understanding of their engendered behaviors.

This line of inquiry not only enhances our comprehension of archaeological evidence but also prompts reflection on the imposition of patriarchal and Eurocentric models of masculinity. These models have shaped a contentious collective imagination about the indigenous Canary man, often used to support the construction of modern identities.

1170 **WINDOWS TO THE PAST: ARCHAEOLOGICAL THINKING, INTERDISCIPLINARITY, AND QUALITATIVE ANALYSIS IN THE DIGITAL WORLD**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Manzetti, Maria Cristina (University of Cyprus) - Gonzalez San Martin, Ana (Brown University) - Diaz de Liano, Guillermo (MOLA (Museum of London Archaeology))

Session format: Regular session

Archaeology has traditionally struggled with interdisciplinarity. While the discipline has always been eager to borrow methods and approaches from other fields, it has often failed to integrate them into its core. Furthermore, this attempt to be interdisciplinary has focused strongly on borrowing methodologies from the more scientifically oriented approaches, leaving qualitative methods and subjectivity relegated to very few cases. Indeed, the exploration of affects, senses, and emotions in the past is typical of disciplines such as history, human geography, and literature, even if it would be highly relevant in archaeology as well.

With the unstoppable expansion of the digital world, archaeology faces again the same old dilemma: How can we shift towards a more integrative interdisciplinary framework, rather than instrumentalizing punctual approaches from other disciplines? Shall we just adopt the methods of digital humanities, or will we be finally able to integrate them? How can we integrate the subjective aspect of material culture as affects, senses, and emotions into sciences, and into digital archaeology? Above all: can archaeology be effectively interdisciplinary?

This session is interested in exploring how interdisciplinarity can be integrated into the current digital world that is revolutionizing the discipline. Can we create digital archaeological maps that include geographical and historical data, but also speak about a sense of place? Can we introduce emotional communities into our predictive modeling? Where are the senses in our material analyses? Can we include affective actants in our network analyses?

We welcome any paper that aims to go this step further into interdisciplinarity, bridging the gap between sciences and humanities, and particularly within digital methodologies.

ABSTRACTS

1 **"IT JUST FEELS DIFFERENT": AN ETHNOGRAPHIC EXPLORATION OF FIELDWORKERS' EXPERIENCES WITH DIGITAL RECORDING IN ARCHAEOLOGICAL FIELDWORK**

Aaar, Leila (University of York; Museum of London Archaeology)

Over the years, archaeological recording has witnessed several changes, from free-form notebooks to more systematic form-based recording to the gradual adoption of a range of technological solutions to address archaeological problems. With the arrival of portable computing, the speed of the 'digital turn' has accelerated and as a result, archaeology is in the midst of an undeniable shift toward fully digital, paperless recording systems. While existing studies emphasise their potential for enhancing speed, fidelity, and reflexivity (Berggren et al. 2015; Roosevelt et al. 2015; Taylor et al. 2018, among others), little attention has been directed towards their specific implications for archaeological activities conducted within commercial settings.

As archaeological excavations move towards becoming increasingly efficient over the years, there have been concerns that this trend towards efficiency may compromise our understanding of the site (Morgan et al. 2020). Traditional archaeological methods require archaeologists to spend more time in the field, carefully excavating each layer, drawing and recording their findings. Their digital counterparts, designed for speed, often result in fieldworkers engaging less intimately with the site during the recording process.

This project employs ethnographic approaches to explore the nuanced implications of digital recording technologies on fieldwork practices. It investigates how digital tools reshape tactile, sensory, and collaborative aspects of archaeological recording, including their intersection with craft-based labour practices, and interpretation of archaeological knowledge. Building upon existing research (Aaar, Morgan & Fowler 2023), this paper presents preliminary findings from interviews with field archaeologists, aiming to deepen understanding of the practical uses, challenges, and benefits of digital recording in fieldwork contexts. By focusing on fieldworkers' perspectives, the research contributes to understanding the human dimensions of technological change in archaeology, highlighting the impact of digital technologies on the craft of fieldwork and the interplay between technology, work practices, and social dynamics in commercial archaeological settings.

2 REFLECTION, RITUAL, AND MEMORY: INVESTIGATION OF WALL PAINTINGS IN THE ROMAN MAUSOLEUM OF LE CARCERI VECCHIE, SAN PRISCO, SOUTH ITALY

Pillai, Sujitha (Doctoral researcher, Department of Humanities and Cultural Heritage (DiLBeC), University of Campania Luigi Vanvitelli) - CUBELLOTTI, FABIO (Research Fellow, Department of Humanities and Cultural Heritage (DiLBeC), University of Campania Luigi Vanvitelli)

In Roman times, the rich decoration of the tombs, which included sculptures, wall paintings, mosaics, and stucco reliefs was often intended to attest to the social position of the owners. Additionally, these decorations are pivotal in terms of the symbolism of their representation of the afterlife. The current work presents one of the best preserved and least investigated funerary monuments of ancient Capua, the Mausoleum of the "Carceri Vecchie", with its mural paintings, which form an indispensable archaeological testimony to the knowledge of that ancient metropolis which Cicero referred to as Altera Roma. The importance of the monument has been recognised since the Renaissance, a period in which the building was mentioned and depicted by numerous artists.

The Mausoleum of Carceri Vecchie, is located along the modern route of the ancient via Appia in the commune of San Prisco, in the province of Caserta. With its elaborate architecture in circular typology, the mausoleum consists of three tombs with three panels of wall paintings in situ on each side. The mausoleum is usually dated around the Augustan period and preserves wall paintings executed in fresco style with refined stylistic solutions. The multidisciplinary approach adopted for studying the mausoleum and its paintings involves the collaboration of various specialists in mural paintings, ancient architecture, and archaeometry to study ancient polychromy. This presentation will focus on the results of the scientific investigation, such as broadband imaging, non-destructive analytical techniques, and art-historical analysis of the paintings, their decorative programme, the current challenges, their digital reconstruction, tomb plundering, comparative analysis, and conservation measures.

3 WHY MAPPING SENSATIONS IN ARCHAEOLOGY? THE CASE OF THE GRAND TOUR TRAVELLERS IN THE MEDITERRANEAN ISLANDS.

Manzetti, Maria Cristina (University of Cyprus)

In the 1980s, the movement called "spatial turn", born among the humanities, led archaeologists to intensive use of Geographical Information Systems (GIS) with the intent to produce statistical data from a map, employing quantitative analysis. The spatial turn started up to defend the importance of space over the primacy of time. Indeed, in archaeology as in history, chronological investigations were preferred to the geographical ones. With the years, a further concept developed: the distinction between space and place. Generally, a space is considered a geographical area with coordinates; a place is, in addition to a geographical space, where events and relationships take place, and where the culture develops. Archaeologists mainly keep investigating space rather than places probably because it would require analyses of personal experiences and subjective opinions that would not be considered scientific enough. However, we cannot deny that people's reactions to events happening in determined places are an active part of the process of civilizations' development. The use of digital tools together with deep mapping may help the investigation of cultural characteristics that emerged in different places and are evoked by sensations experienced by the people. This paper aims to demonstrate the importance of considering places to their full extent by conducting qualitative analysis through GIS. The case study is represented by the Grand Tour travellers visiting the Mediterranean area and describing their impressions about the places and their historical landmarks. A geodatabase was built with all the relevant information to create a deep map of the explored areas.

4 UNEARTHING URBAN FUTURES: REVOLUTIONIZING URBAN DEVELOPMENT THROUGH INTERDISCIPLINARY DIGITAL ARCHAEOLOGICAL INTEGRATION IN ALMERE, NETHERLANDS

Vanderhoeven, Timo (EARTH Integrated Archaeology) - Kars, Eva (EARTH Integrated Archaeology)

This presentation discusses the combined application of geo-archaeological, geotechnical, and geohydrological surveys during the urban development of a new district in Almere (The Netherlands). The municipality believes that a synergetic, digitally oriented approach is the only solution to address gaps in archaeological, geological, geotechnical and geohydrological knowledge while reducing the risk and adapting to environmental issues (rising sea levels, soil erosion) during/after construction.

The primary objective of this interdisciplinary project is to conduct a comprehensive geo-archaeological, geotechnical, and geohydrological investigation, with a strong emphasis on delivering a digital dataset that contributes to knowledge of the region's archaeological and geological composition.

The investigation involves advanced mechanical core drilling to extract high-quality subsurface data, enabling profound insights into the archaeological, sedimentological, and geological layers of Almere. This data forms the foundation for a detailed 3D underground model and contributes to the existing national digitised geological model. Subsequent steps include 3D interpolation and subsurface and groundwater modelling. This data-driven approach is fundamental

to the design process outlined in the project's master plan, promising an innovative integration of archaeological features into the urban planning framework. The municipality also envisions the creation of a 3D palaeolandscape model and an archaeological risk assessment model based on the acquired dataset and the existing 3D GeoTop model.

This groundbreaking initiative challenges traditional practices by integrating archaeological considerations in the earliest stages of urban planning and by its strong interdisciplinary approach.

This presentation highlights the unique nature of this interdisciplinary endeavour and its potential to revolutionise the integration of digital archaeological data in urban planning, setting a precedent for future urban data-driven development projects.

1172 HOARD IN SITU. THE ARCHAEOLOGICAL CONTEXT FOR UNDERSTANDING METAL AGE HOARDS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Nordez, Marilou (CNRS (UMR6566 CReAAH-LARA, Nantes)) - Mélin, Muriel (Service archéologique départemental du Morbihan; UMR6566 CReAAH (Rennes)) - Mörtz, Tobias (Universität Hamburg, Fachbereich Kulturwissenschaften) - Nowak, Kamil (Nicolaus Copernicus University (Toruń)) - Tarbay, János Gábor (Hungarian National Museum)

Session format: Regular session

Although the hoards are unanimously considered as emblematic of the Metal Ages, the interpretation of these assemblages is still widely debated. The analysis of hoards in situ provides essential information, which we are deprived of for ancient finds and for assemblages removed from the ground without archaeological excavation. When investigations can be carried out, we can see that these depositions are rarely isolated and are part of a complex of archaeological structures. It is then more appropriate to speak of "sites with hoards". This contextual data concerns the containers of the objects, the type of structure in which they were deposited, and their relations to any other associated structures and immediate surroundings of the hoard. While methodological advances in hoard excavation techniques and documentation (photogrammetry method and computed tomography) are major contributions to the reassessment of these assemblages, large-scale field research at the sites is also necessary for their understanding.

Several examples of recently excavated hoards have renewed our interpretations by suggesting that they were sometimes deposits made as part of community gatherings (Prat, France), bronze workshops (Saint-Avé, France), part of the settlement's internal ritual landscape (Várvölgy-Nagy-Lázhegy, Hungary), sets of households (Zsáka I-II, Hungary) etc. These examples show that it is above all the context, together with the choice and condition of the artefacts, that provides the basic clues for understanding the possible motives for the depositions.

The aim of this session is to bring together case studies of hoards excavated in situ or with the knowledge of the wider context in order to contribute to a more detailed characterisation of the diversity of depositional processes and practices, while contributing to the debate on their function.

ABSTRACTS

1 INCREASING USE OF METAL DETECTORS AND MORE HOARD FINDS - DO THE FIGURES CORRELATE?

Unglaub, Christoph (Archaeologisches Landesamt Schleswig-Holstein)

The use of metal detectors by private individuals for amateur research has been increasing for years. At the same time, more and more hoard finds are becoming known. Based on the practice of public monument preservation in Schleswig-Holstein, the thesis is to be examined as to whether the increased use of metal detectors in areas that were previously only recorded with visual field inspections, if at all, also lead to an increased discovery of hoard finds.

In the north of Germany, the state archaeological office of Schleswig-Holstein has been operating the "Schleswig model" of tense cooperation between the state monument preservation authorities and private detectorists since 2005. The licence to search with a metal detector is linked to a certificate of competence, which must be passed by the applicant. This means that a large number of well-trained and highly motivated people are out and about with metal detectors in the fields of Schleswig-Holstein to find the remains of past eras and make them available to the population as a shared cultural heritage. To mark the 18th anniversary of the cooperation between metal detectorists and state archaeology, the effects on the scientific recording of hoard finds will be examined and compared with other European countries.

2 OFFERING VS. SACRIFICE. A DISTINCTION BETWEEN DIFFERENT KINDS OF METAL DEPOSITION BASED ON SELECTION, TREATMENT AND CONTEXT

Mörtz, Tobias (University of Hamburg)

The Late Bronze Age (c. 1400-800 BC) is characterised by hoards with fragmented metalwork in large parts of Europe. While similar locations were used for deposition across the continent, the very different selection and treatment of the artefacts show regional and temporal variability, which was primarily guided by divergent ideological goals. These can be decoded by analysing the condition of the items, in particular traces of use and deliberate damage, and with detailed knowledge of the respective find contexts, especially the distinction between single and multiple deposition.

Using the Late Bronze Age weapon hoards of north-western Europe as an example, a differentiation between offerings and sacrifices, i.e. acts of consecration and acts of destruction, will be proposed and discussed. Decisive criteria are the choice and arrangement of the artefacts, the extent of deliberate destruction, the possibilities of recovery and the repeated abandonment of bronzes as well as indications of additional ritual practices at the same site.

3 THE NEARLY IN SITU EXCAVATED HOARD FROM JODŁOWNO, NORTHERN POLAND. STUDY OF THE SELECTION PATTERN OF DEPOSITED METALS

Nowak, Kamil (Institute of Archaeology, Nicolaus Copernicus University in Toruń) - Gan, Paweł (Bio- and Archaeometric Laboratory, Institute of Archaeology and Ethnology Polish Academy of Sciences) - Stos-Gale, Zofia (Department of Historical Studies, University of Gothenburg) - Karasiński, Jakub (Faculty of Chemistry, Biological and Chemical Research Centre, University of Warsaw)

The hoard from Jodłowno was discovered in 2021 by a non-archaeologist using a metal detector. However, some artefacts were left in place, which allowed for rescue excavation and partial documentation of the context. Therefore, the arrangement of the bottom of the deposit is known.

Typological and chronological analysis allow us to connect the deposited artefacts with the Early Iron Age, probably Ha D (ca. 650/600-500/450 BC). As a result of amateur exploration and archaeological research, 68 metal objects were recovered. There are such categories of artefacts as ornaments, and their fragments, semi-finished items, casting waste, and bar/ingot fragments. Some metals were connected in groups by an organic cord.

In our ongoing studies, we have undertaken a detailed analysis of all deposit components to try to answer the question of whether a particular depositional pattern is visible. We studied manufacture and use-wear traces to distinguish the state of wear. We also conducted the chemical composition and lead isotope ratio analyses to show the act of deposition on the level of raw-material selection. Finally, we compared the location of deposited artefacts in the hoard with the obtained data.

The hoard we presented was only partially documented in situ, but we believe that the set of analyses we selected allows us to expand our knowledge about the biography of the discovered artefacts and the pattern of their deposition.

Presented paper is financially supported by the National Science Center Poland, Sonata 5 research grant (project no. 2021/40/C/HS3/00097) and Nicolaus Copernicus University in Toruń under the University Centre of Excellence programme (Centre for Applied Archaeology, IA NCU).

4 THE TREASURES FROM TROY - A NEW LOOK AT AN OLD STORY

Pieniazek, Magda (Universität Tübingen, Institut UFG)

So-called Priam's Treasure and other treasures found in Troy in contexts dating to the second half of the 3rd millennium BC belong to the most famous hoards known from prehistory. Nevertheless, their function and the reason for the depositions are still matters of debate. The treasures were found in the 19th century during the excavations of Heinrich Schliemann. Their location can be roughly reconstructed in relation to the architecture of the period Troy II Late and Troy III, but the details of the contextual situation are mostly lost, unfortunately. However, the composition of the objects included in the hoards and comparison with other finds and features known from Troy provide crucial arguments for the discussion and interpretation of motivations behind the deposition.

It is well-known that the treasures contained many valuable objects, among which there were hundreds of gold items. It was observed that they also include ingots, half-products, and broken objects possibly designated for recycling or repair. This speaks quite clearly of the participation of workshops and artisans in the process of deposition. In fact, there are more arguments supporting this interpretation. The repertoire of gemstone objects found at Early Bronze Age Troy (rock crystal, carnelian, and others) indicates that Troy was also a major center of lapidary. This is supported by the presence of not only finished objects but also semi-finished as well as pieces of raw material. Also, in this case, the treasures mirror the local artisanal production.

5 BRONZES LIE ON TUSKS. THE CONTEXT OF HOARD I FROM SOMLÓ HILL, WEST HUNGARY

Tarbay, János Gábor (Hungarian National Museum (Magyar Nemzeti Múzeum)) - Soós, Bence (Hungarian National Museum; Institute of Archaeological Sciences, Eötvös Loránd University) - Péterváry, Tamás (Hungarian National Museum)

In 2023, the National Institute of Archaeology of the Hungarian National Museum launched a new research programme that aims to investigate with multifaceted methods the Somló Hill and its microregion (Veszprém County, Hungary), one of the potential prehistoric power centres with a timespan that overlaps the Urnfield and the Hallstatt periods in Transdanubia. The very first year of the programme provided three hitherto unknown hoards of Younger and Late Urnfield date, as well as a sickle hoard of the Early Iron Age. All the hoards were excavated in situ on-site and, in one instance, within the laboratory of the institute.

The paper presents our first discovery, Hoard I of the Somló Hill, an assemblage with highly complex composition and arrangement. This unique group of finds consists of metal and organic artefacts characteristic of the second half of the Ha B period. The range of objects from the hoard includes a set of Alpine and Carpathian-style bronze weapons, jewellery, and tools. Also, in a manner unique in the West Carpathian Basin, the hoard contained a set of boar and domesticated pig tusks, as well as wolf teeth, deposited intentionally in a single layer underneath the metal artefacts.

The paper focuses on the initial steps of evaluating the hoard; the processing of field documentation, and the evaluation of 3D in situ models of the hoard's context obtained through photogrammetry. By means of this complex hoard, we also intend to demonstrate how in-depth knowledge of the context can help us analyse the way objects are arranged and grouped, and how this information can be integrated into the interpretation of the assemblage, making it more than just a group of finds studied solely through their typo-chronological traits.

6 FEASTS, ENCLOSURES, AND COLLECTIVE OFFERINGS

Baron, Justyna (University of Wrocław)

The presentation addresses several deposits of ceramic vessels, animal bones, and metal objects distributed in various parts of the late Bronze Age and early Iron Age settlements (ca. 900-600 BC) in today's SW Poland. The settlements represent multiple patterns of spatial organization that could have been studied due to large-scale rescue excavations in the 1990s'. Some are fenced with circular post structures and houses facing the central area. Others are open settlements with no clear boundaries and randomly spaced post houses of various sizes. What they have in common is the presence of deposits composed of pottery, animal bones, stones, and metal objects. All the hoards were distributed between the houses and were dug into thick occupational layers. They were also present in the central place and at the borders. Therefore, they likely do not reflect individual offerings, like foundation offerings, but remain collective activities connected with substantial reorganization of the settlements' space.

7 A LATE BRONZE AGE SETTLEMENT AND ITS METALLURGIST WORKSHOP IN SAINT-AVÉ (MORBIHAN, FRANCE)

Blanchet, Stéphane (INRAP)

Authors : Stéphane Blanchet (Inrap, UMR 6566 CReAAH), Muriel Melin (Service départemental d'archéologie du Morbihan, UMR 6566 CReAAH), Cécile Le Carlier de Veslud (Cnrs, UMR 6566 CReAAH), Théophane Nicolas (Inrap, UMR 8215).

In 2022, a preventive excavation led to the study of a Late Bronze Age settlement (between 1000 and 800 BC). It comprises about ten round houses grouped together in a small area (5000 m²). They are accompanied by various ancillary buildings, in particular granaries. The organisation of the site and the associated artefacts indicate that we are in the presence of a grouped settlement mainly concerned with agro-pastoral activities.

Within this occupation, a small metal hoard associated with a construction, a pit rich in burnt clay rejects and the remains of a furnace also testify to a metallurgical activity. The metal hoard is located inside a building whose oval plan differs from that of the other houses. Deposited in a small excavation, the metal assemblage includes a dozen objects including two fragments of plano-convex ingots, fragments of axes and a fragment of a blade. This assemblage is dated of the Late Bronze Age III. Located in front of the construction, a pit shows a filling made up of a succession of more or less carbonaceous levels associated with numerous fragments of burnt clay. Some of these are similar to furnace walls, others to possible metallurgists' moulds. Fragments of a nozzle also come from these levels. It should be noted that the sole of a heating structure is preserved. Finally, the stratigraphy shows multiple phases of reworking which testify to a working area.

These various elements strongly suggest the presence of a bronzier's workshop closely associated with the settlement.

8 BEYOND THE SURFACE: TOWARDS A BETTER UNDERSTANDING OF EARLY IRON AGE HOARD CONTEXTS IN NORTHWESTERN FRANCE

Cabanillas de la Torre, Gadea (DRAC Bretagne - Service régional de l'archéologie - French Ministry of Culture; UMR 6566 CReAAH)

During the Early Iron Age, a massive amount of bronze axes were hoarded in the Armorican peninsula (Northwestern France). Though found regularly since the 19th c., data concerning the circumstance of those deposits remain too scarce to build interpretations. However, during the last 20 years, research around those hoards has led to the excavation of assemblages or remains in context. This allowed to confirm their dating during the Early Iron Age. One of the key sites in this process is the Early Iron Age settlement of La Touche ès Pritiaux in Saint-Glen (Brittany, France). A hoard of over 150 bronze socketed axes was found inside a ceramic container, together with six other storage jars buried within a roundhouse.

Such finds force us to completely rethink the function of Early Iron Age bronze hoards in Northwestern France, but also the way we investigate metallic hoards in the 21st century. They challenge the traditional focus on objects to question how – by which means, on which surfaces – Early Iron Age sites can be detected, excavated and interpreted. Research on hoards' environments being relatively recent and rare enough in this area, it is yet to impossible to decide whether those sites yielding metallic assemblages within settlements are exceptional or only the tip of iceberg. Concerning the Early Iron Age specifically, they have fostered further collective work on growingly precise chronologies, connections between hoards, roundhouses and storage structures, and in general, links between hoarding and social transitions at the beginning and end of the period.

9 A LATE BRONZE AGE HOARD IN A SETTLEMENT CONTEXT IN GERZAT (PUY-DE-DÔME, FRANCE)

Da Cruz, Lucie (Paléotime) - Auxerre-Géron, Florie-Anne (UMR 5608 TRACES)

A project to build detached houses in the French department of Puy-de-Dôme, in the commune of Gerzat, led to the prescription of a preventive archaeological excavation over an area of 1 hectare. This prescription follows the positive results of a diagnosis carried out by the National Institute for Preventive Archaeology (INRAP). A hoard was found during the earthwork of the excavation area, in May 2023. This hoard counts 15 bronze objects or fragments of objects dated from the Late Bronze Age 3 (950-800 BCE). The discovery was made in a context of a settlement including several building plans on supporting posts, extraction pits, wells, silos, and stone fireplaces. One of those latter was probably used for craft activities. The bronze objects were buried in a small pit, close to a house unit. They were probably packed originally in a container made of flexible perishable material. They fall into a variety of categories (tools, weapons, ornaments, semi-finished products) and appear to have been organised according to a specific plan. Some of them are damaged, while others are in the making off process, as well as functional objects belong to the corpus. The main interest of this find lies in its location. It is the first hoard to be documented in the Limagne Plain, in a chrono-cultural context where the deposit on hilltops seems to be the accepted norm at that time.

10 SIZE MATTERS - SO DOES THE CONTEXT. 794 EARLY BRONZE AGE RIB INGOTS FROM OBERDING

Kutscher, Sabrina (LMU Munich)

The hoard from Oberding with 794 rib ingots was discovered in 2014 in Upper Bavaria (South Germany). Thanks to the block excavation, it is one of the few hoards documented in situ and the best contextually analysed Early Bronze Age rib ingot deposition.

In this paper, I want to present the case study of the exceptional Oberding hoard we are currently analysing in an interdisciplinary DFG project under the project lead of Prof Carola Metzner-Nebelsick at LMU Munich. This research project focuses on research questions regarding the copper types used and value systems, as well as on the immediate find context and its embedding in the micro-regional settlement context on the loess terrace of Oberding.

Non-invasive analyses using 3D computed tomography have precisely documented the exact arrangement of the copper ingots in situ. The ingots were tied into handy bundles of ten and placed in eight larger groups in a separate niche at the edge of an already partially filled settlement pit. Other pits in direct proximity and their find material provide an insight into the associated settlement, which also dates to the later phase of the Early Bronze Age.

Extensive scientific analyses (geoarchaeology, archaeobotany, pollen analyses, archaeozoology, metal analyses, radiocarbon dating, experimental archaeology, e.g.) and elaborate restoration have already provided significant results. Based on the metallurgical analyses, for example, we now know that the copper used for the ingots came from different ore deposits, indicating the significance of the hoard for the transition from the Early to the Middle Bronze Age and the changing patterns of commodity transfers and cultural contacts.

11 SELECTIVE DEPOSITION OF METAL OBJECTS ON THE SUBMERGED SETTLEMENT OF LA MOTTE (AGDE, FRANCE, C. 9TH-8TH BC)

Lachenal, Thibault (CNRS)

The site of La Motte, currently submerged in the minor bed of the River Hérault at Agde (France), is known to have yielded a rich deposit of metal and organic ornaments dating from the 8th century BC. Underwater excavations have since clarified the context of this deposit, as it was abandoned on the vegetated banks of a settlement established on the edge of an ancient lagoon. Further work carried out on the opposite bank of the site, in symmetry with this first deposit, led to other comparable discoveries. In an area with fewer domestic remains (ceramics, fauna, etc.), some forty copper-alloy objects were discovered over an area of about one hundred square metres. The finds, which are dated between the 9th and 8th centuries BC, include weapons (daggers, spear), axes and ornaments (bracelets, leg rings, torques, pins), in some cases grouped by type or function. They are also interpreted as intentional deposits laid out on the edge of the lagoon and dismantled by river erosion. Analyses of the elemental composition and lead isotopes of these objects suggest that they were produced locally, as confirmed by the discovery of several metallurgists' casting moulds on the settlement. The site of La Motte therefore documents the practice of voluntary deposition in a wetland environment on the fringes of a settlement, which is consistent with the hypotheses put forward for lake sites in the Alpine Arc.

12 THE KALLERUP HOARD AND THE DEPOSITIONAL PRACTICES IN LATE BRONZE AGE NORTHERN JUTLAND, DENMARK

Møller, Niels (Museum Thy)

Metal hoards have revealed some of the most iconic and informative artefacts from late Bronze Age Southern Scandinavia. By far the vast majority of these hoards have however been encountered as chance finds during the 19th and early 20th century. And our knowledge of the depositional practices and the relation between metal hoards and their contexts are thus severely hampered by a lack of excavation of their immediate surroundings and hazy information of find circumstances at best.

In recent years, a few metal hoards have been encountered and properly excavated as a result of a close collaboration between metal detectorists and the archaeological museums in Denmark. Through both micro excavation of the hoards and excavation of their immediate setting, these newly excavated hoards allow renewed interpretation of depositional practices and new insight into the relation between the hoard and the local context.

This paper will take its point of departure in the excavation results of Kallerup, a site with a long site continuity and a Late Bronze Age metal hoard, to explore the depositional practices of Late Bronze Age metal hoards and their local and regional contexts in the region of Northern Jutland.

13 FRÖSLUNDA REVISITED: A SHIELD HOARD FROM THE LATE BRONZE AGE IN WESTERN SWEDEN

Nitenberg, Annelie (Västergötlands museum) - Uckelmann, Marion (Durham University)

In the Late Bronze Age, people deposited 16 to 18 bronze shields in the shallow waters of a hidden cove of Lake Vänern in Västergötland, Sweden. Almost 3000 years later, in 1985, a farmer from Fröslunda worked his fields in the now dried up cove and ploughed right through the hoard of shields. It is still one of the largest hoards found in Sweden, with an estimated weight of 23-27 kg. The Västergötlands museum was contacted and excavated the shields en bloc the following spring. The shields were further excavated in the Arkeologiska Forskningslaboratoriet in Stockholm, partly puzzled together and then displayed in the museum. The excavation team used different methods and analyses, but their results were never fully published or made available. In 2023 Västergötlands museum initiated a new research project to investigate the shields and to contextualise the hoard in its wider setting. Metal analyses as well as new studies on the shields are currently being undertaken. The findspot has been revisited with magnetometer- and metal detector surveys, revealing new shield fragments, a possible area with burnt material and other structures related to the shields. New excavations at the site to investigate these possible features will be conducted later in 2024, to explore its context. The find circumstances in Fröslunda can be compared to the ones of other shield hoards, almost all of which are found in a wet context. The Fröslunda hoard will also be evaluated within the context of the deposition customs of Late Bronze Age western Sweden. All these strands of research will be integrated to explain the meaning and significance of this extraordinary hoard.

14 METAL HOARDS IN A RITUAL SPACE? THE ATLANTIC MIDDLE BRONZE AGE SITE OF KEROUARN, PRAT (CÔTES-D'ARMOR, FRANCE)

Nordez, Marilou (CNRS)

At Kerouarn, three hoards containing a total of 89 bracelets (around 15 kg of copper alloy), were found buried inside an area half enclosed by two ditch segments. Those ditches, which are preserved to a depth of 1.5m, were associated with an embankment and separated by a 5m-wide opening, creating a possible monumental entrance to the semi-circular enclosure. Several elements point to the importance of this access from the south: two ceramic vessels were deposited side by side at the base of ditch segment 2, and fragments of a large block of worked granite were found in the upper fill, perhaps indicating the presence of a stele beside the entrance.

Geophysical prospections followed by archaeological excavations brought to light that the only features dated to the Middle Bronze Age are those two ditch segments and the three ornament hoards. The lack of domestic or funerary contemporary remains, in combination with the monumentality of this complex, suggests other functions: it is proposed that the site of Kerouarn were destined for gatherings, possibly for ritual, religious and/or socioeconomic purposes. The hoards may either be the cause of these gatherings or a visible consequence among others that left no trace.

15 HOARD OF BRONZE BRACELETS FROM THE MIDDLE AND LATE BRONZE AGE IN PRAGUE-MODŘANY (CENTRAL BOHEMIA)

Petriscakova, Katarina (The City of Prague Museum) - Kacil, Pavel (The City of Prague Museum)

This study presents the hoard of bronze artifacts excavated in 2020 in Prague-Modřany (Central Bohemia). The assemblage contained six cast bracelets placed in a simple circular pit with a pointed bottom. The three pairs of open bracelets, differing in shape, weight, and engraved decoration (triangles, transverse grooves, semi-circles), were subjected to metallographic and use-wear analysis. Based on analogies, the whole find complex can be dated somewhere between the Middle and Late Bronze Ages (Reinecke's Stage Br C/ Br D). Spatially, the hoard was uncovered within an identically dated settlement, represented by several sunken pits. A burial area from the same period was previously also identified in the vicinity of the settlement. All three components mentioned here were thus situated on a terrace above the confluence of the rivers Vltava and Berounka, in the southern part of the Prague basin. Taken all together, the present evidence supports the existence of a possible complex site that includes habitation, burial as well as likely ritual activities. What makes this deposit unique, in this area, is its known context, which offers certain interpretative possibilities. The presentation will be supplemented by a very short video of the in situ excavation of the items.

16 THE EARLY METAL PERIOD HOARD FROM ŽEIMENA RIVER, LITHUANIA - TIN ARTEFACTS IN THE LIGHT OF LONG DISTANCE CULTURAL CONTACTS

Pranckenaite, Elena (Klaipėda University) - Muradian, Lijana (National museum of Lithuania) - Žilinskaitė, Agnė (Vilnius university)

During Bronze and Pre-Roman Iron Age metal artefacts and hoards consisting of metals in the East Baltic Region are rare compared to the other parts of Europe. The reason for this was the absence of non-ferrous metal ore sources in the Eastern Baltic region. In Lithuania, there are about 350 metal objects belonging to the Bronze and Pre-Roman Iron Age, 37 of which are interpreted as hoards. After 2014 when the discovery of the hoard of unknown type of artefacts on Lithuanian territory by an amateur divers in the Žeimena River (Eastern Lithuania), discussions started on interpretation and dating of this find. The hoard was found on the bottom of the Žeimena river, covered by a thin layer of sediment and while the discovery was quite well documented. An analysis of the hoard's surroundings and an examination of the micro-region were carried out in an attempt to obtain contextual data. The hoard consists of 24 metal artefacts found stacked on top of each other. All of them are just one type: cast and hollow, flat-tipped cone-shaped ornaments decorated with six spurs on the top and a whole surface decorated with uneven lines. The edges of the artefacts were pierced by two small holes for attachment to the garment (?). Conducted analysis of elemental composition revealed that the main element of the alloy is tin, radiographic examinations revealed some results on metal casting. Hoard found in the Žeimena river raises discussion on contacts and trade links with particular regions of Europe where rich sources of tin ore are known. This presentation aims to present possible interpretation of this discovery in the context of the known archaeological material and hoarding practices in the Baltic region. It seeks to enhance better understanding of prehistoric crafting technologies and to trace long-distance contacts and influences.

17 THE SANCTUARY OF ZEUS AT OLYMPIA AS AN EXAMPLE OF A METAL 'HOARD' IN SITU

Scarci, Azzurra (Leibniz-Zentrum für Archäologie)

The term hoarding refers to the deliberate depositing of complete and/or broken objects, a practice that was particularly common during the Metal Ages. However, this concept can also be applied to other types of 'hoards', such

as sanctuaries, which were privileged places for storing large quantities of materials that were dedicated there. The sanctuary of Zeus at Olympia is the most significant sanctuary in Greek antiquity from the Late Geometric period onwards. It represents a true example of a 'hoard' in situ, storing thousands of different object classes, including metal objects, particularly bronze. Many of the bronze dedications have been found both whole and in fragments, sometimes matching, and scattered throughout various areas of the sanctuary. This paper presents the results of a spatial and contextual analysis of the practice of hoarding bronze fragments in the sanctuary of Zeus at Olympia. The main aim is to understand their significance based on their distribution in relation to different areas of the sanctuary, such as workshops, altars, and temples.

18 ISOLATED? IRON SEMI-PRODUCTS HOARDS IN CONTEXTS. THE CASE STUDY OF IRON SEMI-PRODUCTS HOARDS IN NORTH OF FRANCE

Berranger, Marion (Institut de Recherches sur les Archéomatériaux-LMC-CNRS-UMR7065) - Gauthier, Estelle (Laboratoire Chrono-environnement-UFC-UMR6249) - Filippini, Anne (EVEHA) - Mentele, Serge (INRAP)

From north-west of France to the west of Germany, several dozen of iron semi-products hoards has been discovered since the XIXth century. The discovery context of most of them was unknown or the excavation windows was too small to permit a real understanding of their context. Recently extensive excavations has permitted, in some cases, to bring datas about their discovery context. In some region, extensive surveys has also permitted to study the localization and archaeological position of concentration of hoards, which reveals common practices.

Analyses conducted on the objects themselves has permit to determined their chronology, scarcely documented by the discovery context. Archaeometrical analyses give other datas which permit to reconstruct some aspects of their condition of exchange.

The aim of this communication, is to propose a review of these hoards, and to analyze the evolution of their interpretation during the XXth to the XXIth c. The contribution of recent discoveries and well established contexts to the understanding of the condition of hoarding will be discussed. Some case studies mostly situated in north-eastern of France will be presented. In a more general point of view the chronological evolution of these practices will be discussed, as well as the circulation of the iron, from the workshop where they were produced to the hoard. These aspects provide clues to better determine the motivation for these depositions.

19 BRONZE AGE HOARDS AROUND SALINS-LES-BAINS (JURA, FRANCE): A CONTEXTUAL STUDY OF IN SITU METAL FINDS

Gauthier, Estelle (University of Franche-Comté; UMR CNRS 6249 Chrono-Environnement) - Piningre, Jean-François (UMR CNRS 6298 ArTeHis)

A systematic survey program conducted over the last twenty years around the hillfort of Camp du Château (Salins-les-Bains, Jura, France) led to the discovery of 85 Bronze Age hoards. The methodology developed, including meticulous excavations, precise topographic surveys, numerous field observations and abundant photographic documentation, provides exceptional conditions for studying in situ metal hoards. This area offers a rich corpus of excavated hoards whose location, composition, layout and stratigraphy are precisely known, as well as their surrounding context like remarkable natural or anthropic elements in their immediate environment. This particularly enables the study of site selection choices and gestures related to deposition practices, aspects still insufficiently known but likely to provide essential information for understanding the phenomenon of Bronze Age metal hoards.

Concentrations of hoards seem to constitute genuine places of deposition, linked to a recurrent practice over the long term. For example, just in front of the hillfort, 21 hoards were aligned along a plateau edge. These scattered finds suggest an accumulation of small successive hoards. Although arrangements are rarely observed, several hoards appear to have been associated with topographical anomalies. Some of them were placed in rock crevices ensuring their protection. In other cases, the pronounced dispersion of objects, although partially related to erosion phenomena, could also suggest an above-ground deposition practice or perhaps a deliberate absence of burying.

Distributed in dominant positions throughout the valley, with specific topographic choices such as on plateau edges, along ridge lines, or atop steep slopes, hoards seem to surround the Camp du Château. Most of them are located immediately below a rocky spur or a large stone block that could have served as an easily recognizable visual marker in the landscape. Hoards could thus be associated with symbolic practices related to the cultural landscape definition and territorial marking.

20 FLAT AXES FROM ESCALLES: AN UNUSUAL CONTEXT!

Leroy-Langelin, Emmanuelle (Département du Pas-de-Calais) - Gandois, Henri (UMR 8215 Trajectoires) - Ghesquière, Emmanuel (Inrap Grand Ouest) - Marcigny, Cyril (Inrap grand ouest) - Riquier, Vincent (Inrap grand est)

A hoard of approximately 60 bronze flat axe-heads (of which 40 are now preserved) of British type (Stuart's Needham class 3 and 4, dated from 2100 and 1900 BC) has been discovered in Escalles (Pas-de-Calais). This hoard, located 2,5 km away from the shore, in front of England (though the latter is not directly visible), is an outstanding example of cross-Channel relations. This hoard is particularly interesting because of the archaeological context in the area. Nearby, other hoards were discovered, gathering finished objects or raw material. The location of these hoards within the Bronze age occupations shows the attractive side of the area and also links with England and all northwest Europe. The creation of a collective research program allows, for some years now, to study these several impressive hoards (amber raw material, bronze axes, and gold objects) spread over an area of 28 municipalities (254 km²). In the same time, we also analyse the territory information to understand better links between hoards, settlements and funerary area. Finally, hoards in context contribute to help us to understand landscape during Bronze Age.

21 OLD HOARDS, NEW STUDIES: CASE STUDIES FROM WIELKOPOLSKA (POLAND)

Maciejewski, Marcin (Institute of Archaeology, Maria Curie-Skłodowska University, Lublin) - Banaszek, Łukasz (Historic Environment Scotland, Edinburgh) - Bednarek, Przemysła (independent researcher) - Krzepakowski, Marcin (Fundacja Relicta, Poznań)

The newly discovered and systematically excavated metal item hoards are fountains of knowledge on various aspects of metal use in prehistoric societies. However, their research potential is much greater as they also reflect the specific cultural frameworks of the communities that deposited them and the stages and scenarios of the deposition process. While the number of those new finds is still modest, they provide incomparably more premises for interpreting the phenomenon of metal object deposition than the older discoveries.

Out of about 1,100 Bronze Age and Early Iron Age hoards documented in Poland, only a dozen deposition places were archaeologically excavated, usually already after the amateurs had taken out the artefacts. Only a few deposits were excavated in a manner consistent with the archaeological standards (typically after the amateur investigators had located them). Can more information be obtained on the deposition contexts of hoards discovered decades ago, often by people with no archaeological know-how? Can new field surveys and excavations reveal more details about these finds?

Multi-stage studies of Late Bronze Age hoards from Wielkopolska showed it was possible. First, we searched for the exact hoard locations using classical methods, including analyses of archives and maps. We also studied data provided by new technologies, such as airborne laser scanning (ALS) or metal detector and geophysical surveys performed in the areas of the potential discoveries. Last but not least, we analysed the excavation results.

The research presented here is part of the project titled "A Biography of Late Bronze and Early Iron Ages Hoards. A Multi-faceted Analysis of Metal Objects Related to Monumental Constructions in Poland" (UMO-2021/41/B/HS3/00038), funded by National Science Centre, Poland.

22 HERTEFELD 7 (BRANDENBURG STATE, GERMANY) A HOLY SITE FOR METAL DEPOSITING AND SPECIAL TREATMENT OF THE DECEASED

Franz, Schopper (Brandenburg State Authorities for Heritage Management, State Museum Archaeology) - Debo-rah, Schulz (Brandenburg State Authorities for Heritage Management, State Museum Archaeology)

At the so far unpublished site of Hertefeld 7 (Havelland district), a volunteer from Brandenburg State Archeology discovered a large, very remote area for depositing bronze objects. The site was then explored geophysically and through archaeological excavation. To protect the area from robbing, the finds so far have not yet been published; In addition to various bronze objects, animal bones and deposits of disarticulated human skeletal remains were found, which deviate from the cremation burial usual in this culture. The discovery area is located on two natural elevations in the lowlands of the Berlin glacial valley. This island location in the middle of moors may have given the place an outstanding position in prehistory. The excavation focused on the larger sand island (approx. 7,5 ha) showed that it was surrounded by a segmented double ditch. The inner ditch had diagonal posts that angled outwards. Scattered across the area - partly concentrated in several hoards - over 500 bronze objects came to light, including numerous weapons (swords, spearheads, arrowheads) but also costume components (brooches, arm rings, neck rings) and implements (sickles, hatchets, punches). Even in comparison to the famous hoards of Lebus and Eberswalde, this site is the richest in metal finds in Brandenburg and a discovery of national importance. 14C dates of bones set the site to Period IVa of the Younger Nordic Bronze Age around 1000 BC. The special feature of the site lies, in addition to its size, in the unusually good documentation of the context of the find. Measurements of individual finds, excavation

plans and blocks uncovered in the laboratory complement each other. This and the results of further analyses allow to define certain deposit zones (costume versus weapons). Undoubtedly, the site is an outstanding feature within the regional ritual landscape.

23 RECONTEXTUALIZING BRONZE AGE AND FIRST IRON AGE HOARDS IN NORMANDY : DIVERSITY OF APPROACHES AND RESULTS

Marcigny, Cyril (INRAP - National Institute for Preventive Archaeological Research) - Gandois, Henri (UMR Tra-jectoires) - Ghesquière, Emmanuel (Inrap)

Since the 1970s, Norman archaeologists have questioned the contexts of the Bronze Age hoards which were regularly unearthed during various works, since the first mention in 1713 by Jean de La Roque. The excavations carried out by Guy Verron at Moidrey (1972) or Marchésieux (1976) in the department of Manche aimed at providing first answers for the Early Iron Age hoards. This work mainly focused on geophysical prospections conducted by Alain Tabbagh such as those which were subsequently carried out on the palstave hoard of La Chapelle-du-Bois-des-Faulx (Eure, in 1978 and 1982) or Norville (Seine- Maritime, 1981). This issue then became a little less pregnant until the excavation of Agneaux (Manche) at the beginning of the 2000s which lifted the veil on the find context of two hoards containing socketed axes of the Armorican type, thanks to a large stripping of almost 5 hectares. Since this discovery, several interdisciplinary research programs, bringing together archaeologists, geophysicists, paleoenvironmentalists and arte-facts specialists, have been carried out in Normandy on varied scales and over a wide period covering the Bronze Age and the beginning of the second Iron Age. These experiments open up new questions.

This paper will be an opportunity to review these results based on surveys and excavations recently carried out at Bény-sur-Mer (Calvados, Middle Bronze Age, hoard of 189 palstaves), at Port-en-Bessin-Huppain (Calvados, sev-eral hoards on a hillfort), in Saint-Samson-de-la-Roque (Eure, several hoards on a hillfort), in the Val-de Saire (mi-croregional diachronic analysis over 90 km², Manche) and near the territorial ramparts of the Hague Dike (Manche) and Yainville (Seine-Maritime).

24 'EVERYTHING IN ITS RIGHT PLACE' - SELECTIVE DEPOSITIONS IN BRONZE AGE SOUTHWEST SWEDEN

Skoglund, Peter (Linnaeus University) - Nimura, Courtney (Ashmolean Museum, University of Oxford) - Horn, Christian (University of Gothenburg)

Hoards have played a significant role in our narratives of the European Bronze Age, but their purpose and meaning have been the source of much debate. These debates have been positively impacted by studies that investigate the ways in which hoards are connected to specific landscape contexts. In this paper, we discuss the outcome of one such in-depth field study of 62 Bronze Age metalwork deposition locations from the Swedish province of Halland. By systematically analysing digital sources such as museum archives, church records, and historical maps, we were able to establish the locations of a number of previously unlocated finds, which were then visited in the field. Through this combined archival work and fieldwork, we distinguished several patterns that allude to a connection between metal-work deposits, object types, and specific places in the landscape. These patterns shed light on the landscape context of hoards in this region, illuminate how deposition patterns changed over time, and consider some factors that may help to explain these changes. The results emphasise the importance of landscape studies for understanding the role of selective deposition in European Bronze Age societies, and more broadly, the social implications of hoards in their context.

25 HOARDS WITH KNOWN FIND CONTEXTS FROM THE NORDIC LATE BRONZE AGE IN SWEDEN

Sörman, Anna (LARA/UMR 6566 CReAAH, Nantes Université) - Ojala, Karin (Department of Archaeology and Ancient History, Uppsala University)

Metalwork hoards from the Late Bronze Age in southern Scandinavia were primarily discovered in the nineteenth and early twentieth centuries during agricultural activities, lake regulations, dredging and construction projects. The discovery rate was higher when manual labour, horse power and small-scale tools were more commonplace, before the advent of larger machinery. The information collected about the find circumstances, location and context of the hoards varies greatly. This paper looks into the hoards from Nordic Late Bronze Age Sweden and their documented find contexts, classifying the depositions with known find circumstances into qualitative categories. Both dry-land hoards and depositions from wet contexts are considered. Information regarding a Hoard in situ can be defined on various scales; the composition and locus of the hoard, activities and characteristics of the surrounding site, and the wider environment or landscape elements where the deposition took place. More information about "old" finds can sometimes be gained via archival information, unrecorded organic finds and renewed interventions on the find site is exemplified through an ongoing project about an iconic wetland hoard; the Hassle deposit with continental metalwork stacked in a large cauldron, found 1936.

1173 GENDER AND ECONOMIES IN TRANSITION IN THE 1ST MILLENNIUM BC MEDITERRANEAN

Session theme: 6. The Mediterranean from Within

Session organisers: Saltini Semerari, Giulia (University of Michigan) - Ferrer, Meritxell (Universitat Pompeu Fabra) - López-Bertran, Mireia (Universitat de Valencia) - Leigh Newland, Tayla (University of Sydney) - Torres Gomariz, Octavio (Universitat d'Alacant)

Session format: Regular session

In the Mediterranean, the end of the Early Iron Age was characterized by profound social and economic changes. Among these, increases in population numbers, social competition and widespread mobility led to the creation of a more interconnected world, new forms of political institutions and new local identities. Yet while it has been widely recognized that these transformations had a deep impact on Mediterranean communities, the ways in which they affected local gender organization remains largely unexamined. This is unfortunate, because gender is one of the main axes around which the production, distribution and consumption of resources is structured, and thus one critical arena in which social and economic changes are negotiated.

In this session, we would like to zoom in on the relationship between the economic and the gendered organization of Early Iron Age Mediterranean communities, and how these shifted as the Mediterranean world became more complex and interconnected. More specifically, we would like to explore:

(1) Changes to production modes (from domestic to specialized) and their impact on labor division and task differentiation.

(2) Changes to access and distribution of resources, both locally produced and acquired through exchange or migration.

(3) Related to this last point, changes to consumption: whether resources these were used differently by different groups across time.

In this way, we hope to illuminate how gender roles and ideologies were implicated in shaping local agency and responses to global changes in the Mediterranean. Authors are encouraged to think wholistically about gender relationships, and about their intersection with other important social axes such as age and status. We welcome a variety of theoretical perspectives and approaches that may speak to this issue, from material cultural studies to osteological and archaeometric analyses.

ABSTRACTS

1 FAR FROM THE 'MED-DING' CROWD? GENDER, NETWORKS, AND THE WOOL TRADE IN EIA HIRPINIA

Morris, Owain (Catalan Institute of Classical Archaeology (ICAC))

The transition from the EIA to the Archaic period brought profound changes with significant implications for ancient communities. In this transformative era, the Mediterranean region witnessed increased interconnectivity, which led to the spread of new ideas, technology, and ways of seeing the world (Hodos, 2020). This was especially the case with Campania on the Tyrrhenian coast of Italy. Standing at the crossroads of diverse cultures—Greeks, Etruscans, Phoenicians, and Italic peoples—Campania bore witness to an intense web of contact from the 8th century BC. However, prevailing scholarship on the region has upheld a Greek-centric narrative, marginalizing the agency of both local men and women. Gender has been a neglected avenue of exploration and the impacts of economic change on gender organisation have seldom entered key regional debates. While interaction has long been recognised along the Italian coast, areas of the hinterland have either been ignored or characterised as primitive and backwards (D'Agostino, 2006).

One such area is the microregion of Hirpinia within modern Campania, but arguably closer to modern Puglia. Focusing on the Oliveto-Cairano culture inhabiting Hirpinia during the EIA, this paper aims to challenge the characterization of Hirpinia as a conservative cultural backwater (Cuozzo, 2007, 2016). Instead, it seeks to reveal Hirpinia's robust network connections from a very early period, with women playing pivotal roles in the exchange of ideas, technology, and interactions across cultures. These women emerged as key figures in inter-regional trade, acting as crucial links between the east and west coasts of Italy. This paper will underscore how economic transformations in Campania during this period also saw women become significant actors in the production, consumption, and trade of wool.

2 ECONOMIC CHANGE, GENDER, AND LABOR IN THE GREEK EARLY IRON AGE

Murray, Sarah (University of Toronto)

The Early Iron Age (ca. 1100–700 BCE) in the Aegean was characterized by considerable economic dynamism. Facing new institutional and political conditions in the post-Bronze Age Mediterranean, communities in the Greek mainland and neighboring islands seem to have adopted diverse strategies for pursuing wealth and well-being in various spheres, from craft production to the agricultural economy. This paper reconstructs some gendered elements of economic systems in this dynamic period, with a focus on its first three centuries, from 1100–800 BCE. It describes the likely economic changes that transpired between the end of the Bronze Age and the Early Iron Age in Greece, then discusses how such changes might have impacted the allocation of economic tasks among gender categories. Finally, it considers the implications these changing allocations may have had for society. While sure answers are elusive, the available evidence indicates that the distribution of work tasks was relatively evenly spread amongst genders and that it was distinctions of class rather than gender that most strongly determined economic roles in this period of the Aegean past.

3 GENDER, CONSUMPTION AND TRANSITIONING ECONOMIES: CASE STUDIES FROM ETRURIA TO CAMPANIA

Cuozzo, Mariassunta (University of Molise)

The paper deals with consumption and modifications to access and distribution of resources acquired through exchange in Iron Age Etruria and Campania.

Under the theoretical point of view, the article focuses on the issue of social and symbolic significance of consumption as an important aspect of social practice and agency.

It is interesting to observe how these dynamics take on gender connotations. In Etruria and Campania both men and women of exceptional social position were buried with imported symbols of status, which suggest their capacity to monopolize the economic and social relations within the groups to which they belonged, and in the community as a whole. Complex dynamics of socio-political negotiation take on different connotations among different groups, a phenomenon which has implications also for the creation of gender identities

The intercultural consumption of objects and practices between Greek, Etruscan and indigenous peoples is borne out by the complexity of the material culture of the isle of Pithekoussai, where indigenous and Levantine people are present in a manner that was not necessarily subordinate to the Greek element. Selective consumption of objects acquired through exchange is evident in the material culture of many Etruscan and Campanian communities in this phase.

4 FORGING CONNECTIONS, WEAVING COMMUNITIES: MODES OF PRODUCTION AND CONSUMPTION IN THE SOUTHERN PORTUGUESE EARLY IRON AGE AND THEIR GENDERED DYNAMICS

Gomes, Francisco (University of Lisbon)

During the Early Iron Age (8th/7th – 6th/5th centuries BCE), the Southern Portuguese territory saw the appearance of differentiated urban and rural spheres. The former are concentrated on some coastal areas, while the latter occupy the territories of the interior. Although evidence for craft activities during this period remains comparatively scarce, the available data suggests very different forms of economic organization in each of those spheres.

In fact, in coastal areas, marked by an intense Phoenician presence, specialized economic activities rapidly arise, including comparatively intense metallurgical production and a rapid rise of pottery workshops producing considerable volumes of wheel-made pottery. In rural areas, on the contrary, economic activities seem to have remained organized on a household basis, and apart from suggested (but far from demonstrated) dynamics of agricultural intensification, craft activities (such as pottery, still dominated by hand-made wares) retain a low intensity rate.

The gendered implications of these two distinct but interconnected economic systems which coexisted at the time in Southern Portugal have not been fully explored. However, the differentiated economic role of women in both areas and systems may explain perceived asymmetries regarding their prominence in strategies of social representation and their visibility in ideologically significant scenarios, such as funerary spaces.

In order to illustrate the possible linkages between the role of women in different modes of production and their differing social roles as expressed through consumption, this presentation will explore the case study of textile production. Recent research has shown that differing modes of textile production arose in Southern Portugal during this period, with a background household production, namely in rural areas, which contrasts with some instances of possible attached production in coastal sites, associated with sanctuaries. This contribution will analyze the significance of the associated shift in the scale and organization of this traditionally female craft.

5 GENDERED NETWORKS IN PRE-ROMAN ITALY: TRACING LOCAL AND REGIONAL INTERACTIONS

Newland, Tayla (The University of Melbourne)

In the context of ancient southern Italy, the study of burial goods has been coloured by entrenched assumptions drawn from the Classical archaeological tradition. From sex and gender to ethnicity and status, the Greek and Italic communities of the region have been subject to an agenda that not only limits our understanding of their identities, but also obscures the connections between them. In the same vein, social interaction amongst these groups has largely been viewed through a Hellenised lens, and while gender archaeology has proliferated in recent years, studies of south Italian social exchange have seldom factored gender into the equation.

The following paper reframes our understanding of gendered connectivity through a novel and systematic network analysis of burial goods. Drawing together affiliation networks and spatial data, it seeks to identify ties between a diverse range of human and material agents, spanning temporally from the Iron Age to the Classical period, and geographically from Campania to Puglia. It also applies new theoretical and methodological frameworks to identify connections at various regional and interpersonal scales. While this research sheds light on gender roles and patterns of resource consumption over time, it ultimately seeks to reconcile the social, gendered and agent-based factors that drove cultural interaction across the ancient world. This paper, then, has the potential to contribute to our understanding of gender and economies in pre-Roman southern Italy, and to situate these findings within the broader Mediterranean milieu.

6 HOW DO MEDITERRANEAN TRADE IMPACT POLITICAL STRUCTURES AND ENGENDER SOCIAL CONSTRUCTIONS IN NORTH ALPINE WORLD DURING THE SECOND IRON AGE?

Feugnet, Aurélie (Service archéologique de l'Aisne; UMR 7041 - ArScAn) - Trémeaud, Caroline (Cellule archéologique des Ardennes; UMR 8215 - Trajectoires)

Societies from the 1st millennium BC are evolving in an interconnected world in which interactions result from repeated contacts, linked to trade or diplomatic practices on any scale and migration phenomenon or transfers of individuals. It seems apparent we need to consider the weight of these various influences to interpret the evolution that archaeological materials highlight.

Based on two doctoral dissertations, this proposition aims to question the links between economic networks between the Mediterranean world and the North Alpine complex and gender analyses in the funeral practices of elites. During the Iron Age, funerary assemblages in elites' burials highlight engendered social evolutions and aristocratic structuration. Our doctoral works indicate on the one hand a link between funerary changes, with fluctuations among feminine and masculine investment in burials, and economic patterns.

On the other hand, deep modifications in political structures from aristocratic systems to a new system with assemblies seem to also succeed due to an increase in economic relationships (trade) with the Mediterranean societies (Roman imports).

In short, this presentation will be focused on the links between intern mutations and Mediterranean contributions, that is to say, funerary evolutions including especially gender transformations and the potential for interpretations in terms of political structures or territorial organisations, given Mediterranean imports and influences during the second Iron Age.

7 DOMESTIC DUTIES, CIVIC VIRTUE: WOMEN'S ROLES IN WESTERN SICILIAN COMMUNITIES (8TH - 5TH CENTURY BC)

Ferrer-Martín, Meritxell (Universitat Pompeu Fabra)

The historiography of Sicily in the early first millennium BC has long been dominated by colonial perspectives, focusing primarily on Phoenician and Greek settlements, and often neglecting the agency of indigenous populations. This colonialist framework has portrayed Sicilian natives as passive recipients of colonial influence, overshadowing their active roles in shaping their communities.

While postcolonial studies have begun to challenge this narrative in Mediterranean archaeology, they have often depicted Sicilian Iron Age peoples as a homogeneous group, neglecting the diversity of their experiences, particularly from a gender perspective. Consequently, indigenous women in Sicily have remained marginalized, their contributions overlooked in scholarly discourse.

This presentation seeks to redress this imbalance by highlighting the significant roles played by Sicilian women in fostering the well-being of their households and communities during this period. It examines how women engaged in ritual practices within their homes and participated in cooperative and communal activities to promote emotional, economic, social, and political stability within their communities. By foregrounding the agency of Sicilian women, this

study aims to provide a more nuanced understanding of ancient Sicilian society and challenge traditional androcentric interpretations.

8 GENDER AND CRAFT PRODUCTION IN OENOTRIA DURING THE EIA-ARCHAIC TRANSITION

Saltini Semerari, Giulia (University of Michigan)

This presentation draws on previous gender archaeology literature to investigate the gendered dimension of craft productions during the Early Iron Age - Archaic transition.

Craft productions were not only vital aspects of the Early Iron Age economy of local communities, but also an essential element of their worldview and ideology, and one of the ways in which gendered differences were embodied in people's lives. Focusing on southern Italy (Basilicata), I will consider Early Iron Age traditions of textile, pottery, wood and metal production and how they might have changed with the arrival of the first Aegean colonizers and the emergence of the early colonial settlements along the coast. The presence of foreign artisans, the possibility of a transfer of skills and the creation of dedicated productive spaces would have unsettled previous gender dynamics and required adjustments both in the practical organization of production and in the ideological construction of gender roles.

9 INTRODUCING GENDER AND ECONOMIES IN THE IRON AGE ANCIENT MEDITERRANEAN. A PROPOSAL FROM THE GENDYTERRANEAN GROUP

López-Bertran, Mireia (Universitat de Valencia) - Saltini Semerari, Giulia (University of Michigan) - Ferrer, Meritxell (Universitat Pompeu Fabra) - Leigh Newland, Tayla (University of Sydney) - Torres Gomariz, Octavio (Universitat d'Alacant)

In this presentation, we shall introduce the Gendytterranean group, which was born at the EAA held in Budapest in 2022 with the goal of integrating gender into the study of 1st millennium BC transitions from Iron Age villages to urban/early state organizations across the Mediterranean. We understand the Mediterranean as a global case study with a high degree of local variability, where gender dynamics have played an essential role in shaping change at the local level. Our approach to this diverse and fragmentary body of evidence is to focus on local shifts within a comparative and long-term methodology. One of the topics that can be approached from this perspective is the gendered and economic organization of Iron Age Mediterranean communities, the second point of this paper. We want to highlight how gender actively influences the production, distribution, and consumption of resources and how this shaped a more complex and interconnected Mediterranean. We will also briefly present how the papers of the session tackle these issues to set the framework for the discussion slots.

1179 THE EXPLOITATION, USES, AND REPRESENTATIONS OF MARINE INVERTEBRATES (MOLLUSCS, CRUSTACEANS, ECHINODERMS) IN THE ROMAN EMPIRE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Mougne, Caroline (Muséum National d'Histoire Naturelle Paris) - Theodoropoulou, Tatiana (UMR7264 - CNRS - Université Côte d'Azur Nice) - Corbino, Chiara (University of Sheffield) - Marzano, Annalisa (University of Bologna)

Session format: Regular session

The aim of this session is to bring together specialists and young researchers working on the role of marine invertebrates (molluscs, crustaceans, echinoderms) in the Roman Empire and provinces. It will offer the opportunity to present studies focusing on various themes, such as:

- dietary practices (exploited environments, harvesting methods, targeted species, preparation of batches, commercialisation and transport, culinary practices, food waste management),
- funerary and ritual practices (offerings, deposits, funerary/ritual meals),
- invertebrates in craftsmanship (dye production, wall decoration, construction material).

The aim is to gain a better appreciation of the relationship that communities that were part of the Roman Empire engaged with the marine world. Various records may help us shed light on these aspects, including invertebrate remains (shell, carapaces, other), iconographic evidence (mosaics, frescoes, vases, objects), ancient texts (Latin, Greek).

A number of more specific research questions may be addressed:

- Are there any differences observed in the ways marine invertebrates were exploited across the Roman empire (West/East, coastal/inland regions, islands/continent) and through time (1st c. BCE to 5th c. CE), as well as with respect to the different identities of various Roman communities?
- What was the impact of the expansion of transport networks in the circulation of marine resources from the coasts inlands?

- What was the influence of romanisation on local dietary traditions linked to marine invertebrates?
- Did the demographic expansion that occurred on the Atlantic and Mediterranean coasts lead to the overexploitation of marine resources?
- Was availability of marine resources a driving factor for the installation of human groups on the coastal zones?
- What role did the marine world play in the symbolic and ritual expressions of ancient communities?
- What were the reasons behind the choice of invertebrates in craftsmanship, dye production, wall decoration, building techniques?

ABSTRACTS

- 1 HARVESTING AND EXPLOITATION OF MEDITERRANEAN MARINE INVERTEBRATES IN ROMAN TIMES**
Carenti, Gabriele (Cepam, CNRS, Université Côte d'Azur, 06300 Nice, France) - Theodoropoulou, Tatiana (Cepam, CNRS, Université Côte d'Azur, 06300 Nice, France)
 Mermaid project proposes an integrated study to understand the relationship between environmental pressure on marine resources and the impact of human communities on marine ecosystems in the ancient Mediterranean Sea. Informations on marine resources and their exploitation in various archaeological sites around the Mediterranean sea are stored in the M-ARCHives database. It is a comprehensive corpus with the aim of addressing environmental and cultural aspects related to the presence and abundance of marine taxa over time in different geographical areas. In this contribution, the discussions will focus on the Roman period in the coastal areas of the Mediterranean. Archaeofaunal data from M-ARCHives mainly concern taxonomic variability and relative abundance of species. The focus will be on the exploitation of marine invertebrates. The data are based on published documents. About 100 archaeological sites were analysed. The archaeozoological data reflect great taxonomic abundance: more than 60,000 identified specimens of 168 different invertebrate species distributed in 73 zoological families were collected. Several topics will be discussed: the spread of the main edible invertebrates; patterns of relative abundance of species over time; differences related to geographic areas; species selection in relation to both dietary practices and exploited ecosystems; industrial production and commercialisation of specific products; and comparisons with pre-Roman communities will also be covered. Through the use of the M-ARCHives dataset, we will be able to perform a synchronic and diachronic analysis useful for detecting differences in the exploitation of marine resources in Roman times along the Mediterranean coasts.
- 2 THE EASTERN VALVE: THE EXPLOITATION OF MARINE INVERTEBRATES IN THE GREEK PROVINCE OF THE ROMAN EMPIRE, AN UNKNOWN RECORD**
Theodoropoulou, Tatiana (CEPAM, CNRS-Université Côte d'Azur)
 Although the Hellenistic as well as Early Byzantine periods are quite well studied for the Aegean area, the Roman domination in this region is much less well documented, especially with respect to the everyday life of Greek populations during this period. Among various material records, shells are a common find in Roman contexts that may provide information on coastal exploitation, but have rarely been studied until now. In this presentation we will present the available evidence of marine exploitation in Roman Greece through recently studied contexts, including residential areas, baths, sanctuaries across the Aegean. We aim to detect possible trends brought to this region by Romans, through comparison with Western Mediterranean contexts, vs. traditional exploitation strategies by local populations, as documented from previous periods. We are particularly interested in the role of local environmental availability vs. cultural choices in the exploitation of marine invertebrates as well as in their uses with the various studied contexts.
- 3 PROVENANCE DETERMINATION OF CONSUMED OYSTERS AT BAELO CLAUDIA, GIBRALTAR**
Mouchi, Vincent (CReAAH - Université de Rennes) - Audebert, Ludivine (ArScAn - Université Paris 1) - Pesnin, Marie (LSCE - Université Paris-Saclay) - Bernal Casasola, Dario (Department of History, Geography and Philosophy - University of Cadix) - Emmanuel, Laurent (ISTeP - Sorbonne Université)
 In Gibraltar, the antique site of Iulia Traducta, located in the current Bay of Algeciras, was a large exploitation site in seashell products, with still visible ostriaria. The contemporaneous site of Baelo Claudia, located by the modern city of Tarifa, a few kilometres West of Algeciras, is characterised by large amounts of oyster shells as food wastes, but no proof of local oyster exploitation has been reported. We attempt to determine if the oysters found at Baelo Claudia originated from the Iulia Traducta ostriaria. To do this, we use shell geochemistry using two methods: stable isotope ratios of oxygen and carbon, widely used in studies focusing on determining shell origins, and the novel approach of elemental fingerprinting. Based on our results, the Baelo Claudia shells share a common origin with most Iulia Traducta

oysters, but we also identify multiple origins among these exploited oysters. Although we are confident that they all originated from the Mediterranean side of Gibraltar, we currently lack references to pinpoint the exact origins. This study highlights the advantages of elemental fingerprinting instead of stable isotope compositions, and raises new questions on the exploitation of oysters at Iulia Traducta, in terms of importation of initial products and/or diversity of fishing localities.

- 4 SEA-URCHIN MIDDENS IN ROMAN ARCHAEOLOGY: NEW EVIDENCE FROM BAELO CLAUDIA**
Bernal-Casasola, Dario (Universidad de Cádiz) - Expósito, José Angel (Universidad de Cádiz) - Lara Medina, Macarena (Universidad de Cádiz) - Díaz, Jose J. (Universidad de Cádiz)
 Marine resources exploitation in Antiquity include sea urchins, even if the evidence from archaeological sites is nearly unknown, at least in the Western Mediterranean. Recent archaeological operations at the fish-salting quarter of the Roman city of Baelo Claudia (Baetica, Hispania), have unearthed deposits of broken sea urchins dating back to the 1st - 2nd centuries AD. Coming from an already abandoned building in the so called Southern Quarter of the Roman city, near the beach, they are said to be remains of garum production in the surrounding later cetariae (fish-salting plants). In this paper we present by the first time these deposits, discussing their composition, and reflecting about the importance of echinoderms in the halieutic cycle in Antiquity. Baelo Claudia has also shown evidence of these marine resources from other archaeological contexts, as well as their representation in mosaic, which will be also part of the discussion, illustrating how sea urchins were much more common in Roman times than expected.
- 5 ECHOES OF THE SEA. MOLLUSKS CONSUMPTION IN THE EGYPTIAN EASTERN DESERT: THE CASE OF DEIR EL-ATRASH FORTRESS**
Morand, Nicolas (Muséum National d'Histoire Naturelle Paris)
 The occupation of the Egyptian Eastern Desert was particularly intense during antiquity, with the extraction of mineral resources (porphyry, gold) and the development of harbors on the Red Sea, facilitating the transportation of goods from the Indo-Pacific world. Roads traversing this region were established, linking the Red Sea coast to the Nile Valley. Along these roads, Roman fortifications (praesidia) were established to protect the populations working in the area and to support caravans crossing the desert. Since 2020, the French Archaeological Mission of the Eastern Desert (MAFDO) has been exploring a fortress in Wadi Deir el-Atrash, located on the road between Qena and Mons Porphyrites. This site has been occupied from the Early Imperial (2nd c. AD) to the Late Roman period (4th - 5th c. AD). Excavations conducted within the fortress and in the surrounding dumpsites have yielded numerous faunal remains, including several hundreds of marine invertebrates. This presentation aims to highlight the increasing part of the invertebrates in the diet of the soldiers occupying the fort through the Roman period. It will provide an opportunity to discuss consumption patterns, as well as potential other uses of shells in daily life, and waste management within the fort. We will be able to compare the specificities of Deir el-Atrash with the other fortlets and quarry sites along this road to the Red Sea in a regional analysis of trade strategies and food supply challenges.
- 6 SHELLFISH EXPLOITATION IN SOUTHERN FRANCE DURING THE ROMAN PERIOD : DEFINITION OF AN " ANTIQUE MODEL " AND RECENT FINDINGS**
Vianney, Forest (INRAP - National Institute for Preventive Archaeological Research; UMR 5608 TRACES Toulouse) - Cyprien, Mureau (CNRS, UMR 5554 ISEM, Montpellier)
 In the 2000s, Anne Bardot-Cambot's academic work on the harvesting of marine shellfish during the Roman period in southern France built up a substantial base of knowledge that serves as a reference for archaeoconchyliological studies in this region. Since then, archaeological sites have provided further insights into various topics. Our communication will focus on recent contributions from archaeoconchyliology in a large part of southern France with the island of Corsica. These include the question of the consumption of *Pecten jacobaeus*, the extraction of porphyrogen from Muricidae and the acquisition of flat oysters *Ostrea edulis*. Moreover, discoveries of marine shells from Late Antiquity and the Middle Ages have made it possible to identify 'markers of Antiquity'. They show that the antique shell trade came to an end around the seventh century. This trade went from being fairly standardised to fluctuating on the basis of several main species already known during the Roman period.

7 IMPACT OF THE ROMANISATION ON THE EXPLOITATION AND USE OF MARINE INVERTEBRATES: THE EXAMPLE OF WEST-CENTRAL GAUL

Mougne, Caroline (UMR 7209 AASPE (Archaeozoology, Archaeobotany, Societies, Practices and Environments), Muséum National d'Histoire Naturelle, Paris, France) - Dupont, Catherine (CNRS UMR 6566 CReAAH (Centre de Recherche en Archéologie, Archéosciences, Histoire), Université de Rennes, Campus Beaulieu, 263 avenue Général Leclerc, bât. 24-25 -CS74205, 35042 Rennes Cedex, France)

Impact of the Romanisation on the exploitation and use of marine invertebrates: the example of west-central Gaul :

We propose to provide an initial overview of the Romanisation's impact on the exploitation and use of marine invertebrates (molluscs, crustaceans and sea urchins) in west-central Gaul, corresponding to Pictons's and Santons's territories. Chronologically, we focus our presentation on the period from the 2nd century BC to the 2nd century AD, thus covering the Romanisation of Gaul over a wider period. As a result, this chronological period will give us an initial glimpse of Gallic practices, followed by the progressive arrival of Mediterranean influences, before concluding with the consolidation of new modes of consumption resulting from the meeting of these two cultures.

Three areas of research will be discussed:

- dietary practices (exploited environments, harvesting methods, targeted species, preparation of batches, commercialisation and transport, culinary practices, food waste management),
- funerary and ritual practices (offerings, deposits, funerary/ritual meals),
- invertebrates in craftsmanship (dye production, wall decoration, construction material).

8 SHRIMPS IN FISH SAUCE? EXCEPTIONAL DISCOVERIES OF SHRIMP REMAINS IN THE ARCHAEOLOGICAL LEVELS OF TWO ROMAN SITES IN WESTERN FRANCE

Borvon, Aurélie (CNRS, UMR 7041)

Shrimp remains (Crustacea decapoda) have been discovered in archaeological excavations in two sites in the West of France: the Roman harbour area of Ratiatum (Rezé, Loire-Atlantique) and the site "Les Coteaux du Calvaire" in the city of Harfleur (Seine-Maritime). Carapace fragments from these small animals can only be detected after careful sieving of the sediment with a 1 mm square mesh. The discovery of these shrimp fragments is exceptional at archaeological sites; their presence in Ratiatum and Harfleur is explained by the favourable preservation conditions offered by a water-logged environment in the first case and a really well-preserved pit in the second one. Shrimp taxa can be identified by the morphology of different parts of their exoskeleton and an identification key for these little animals was recently developed. The morphology of the rostrum (rigid extension of the head) allowed us to identify Palaemon longirostris in Ratiatum, whilst that of the telson (rear end of the body in arthropods) and scaphocerites (antennal scale) makes the sand shrimp Crangon crangon clearly identifiable in Harfleur. On each site, the identified species is quite abundant, with more than a thousand specimens. The ecology of Palaemon longirostris indicates that they were probably caught inside an estuary such as that of the Loire, those of Crangon crangon in estuarine waters near the mouth of the Seine. The fact that pieces of shrimp are systematically associated with small fish used in preparing fish sauces suggests that these shrimps were also used in this type of preparation. The main aim of this communication is to draw the attention to archaeozoologists on this type of neglected remains, and demonstrate that their identification is possible and can provide useful information.

9 SUPPLY AND USE OF MARINE SHELLFISH IN THE CITY OF AUTRICUM (CHARTRES, NORTHWEST FRANCE)

Julie, Rivière (Direction de L'archéologie de Chartres; Museum d'Histoire Naturelle de Paris, UMR 7009) - Caroline, Mougne (Museum d'Histoire Naturelle de Paris, UMR 7009)

Shellfish are often encountered in the sites excavated at Chartres-Autricum, the capital of Carnutes's territory (Northwest Gaul), located to 150 km from the coast.

The arrival of this new resource, whose presence is attested from the 30s AD, onwards, is directly linked to the expansion of the city driven on by the reforms of the emperor Augustus. At the time, the city was undergoing a major demographic boom and large-scale architectural programmes were being implemented.

This synthesis is based on an exhaustive inventory of the presence of shellfish (acquired over more than 15 years of preventive archaeology excavations) and on the archaeomalacological study of four archaeological sites (habitat, sanctuary, burial space). The aim is to document the distribution and use of these marine resources, which are usually overlooked in the economy and belief systems of continental sites during Antiquity.

The results obtained enable us to discuss the systems of transportation and redistribution of these products towards the various consumers, based on a map of finds in the city of Autricum. They also show a certain specialisation of species relating to their use in the different domestic, craft and symbolic contexts.

This initial overview documents more generally the relationship between the sea and a continental urban community, adopting new cultural practices coming from the Mediterranean world from the 1st century AD.

This work is the start of a research project focusing on marine fauna from continental urban contexts in north of Gaul (present-day towns of Chartres, Evreux, Meaux, Paris and Orléans, for the moment). Among other things, the aim is to determine the collection and fishing/preparation areas, then the supply systems via natural communication routes (Seine and Loire rivers) and/or Roman road networks.

10 THE RITUAL USE OF OYSTERS IN ROMAN BRITAIN

Goldstein, Avner (Boston College)

People living in Britain during the Roman period deposited oyster shells for ritual at a number of sites, both spaces associated with more formal religion (temples, shrines, cellars, and cemeteries) and quotidian spaces (pits, floors, wells, and abandoned industrial structures). These oysters were often used across a broad depositional spectrum, accompanied by a number of other materials of religion like priestly regalia, military equipment, plaques, bells, figurines, and portable altars, as well as human skulls, animal heads, antlers, birds, dogs, tools, pots, shoes, lamps, and game pieces. Whilst some of these objects were everyday and more easily sourced, others were precious and difficult to acquire. This becomes especially true at the end of the Roman period when transportation and trade networks disintegrate in the late fourth and fifth centuries. This paper thus investigates the ritual use of the oyster and its place in an economy of religion in Roman Britain. How did those living on coasts and inland acquire their oysters? What ritual practices accompanied their consumption and deposition? How did these practices differ across social groups, geographic location, and time period? What happened to these marine species that were bound up in material, social, and cultural practices after the collapse of Roman systems that had often introduced and sustained them?

1182 COOPERATING OR COMPETING? ? THE ORGANISATION OF SPACE AND POWER USING NETWORKS AND SYSTEMS OF FORTIFICATIONS

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Ibsen, Timo (Zentrum für Baltische und Skandinavische Archäologie (ZBSA); Leibniz-Zentrum für Archäologie (LEIZA)) - Messal, Sebastian (Lower Saxony State Service for Cultural Heritage) - Fontana, Giacomo (University College London (UK))

Session format: Regular session

Fortifications are often viewed and studied as individual monuments, while detecting related pairs or clusters is challenging due to the reliance on clear chronological evidence for their contemporaneity. Without it, interpreting neighbouring monuments as parts of cooperative networks or opposing systems is nearly impossible. Recently, the utilization of LIDAR data and other survey methods has uncovered new elements within known hillfort complexes, shedding new light on the size and function of individual monuments.

Sometimes, previously solitary fortifications are revealed to be part of a network, significantly altering older interpretations and possibly reflecting prehistoric socio-political entities and the processes of organizing space and power to control or protect adjacent territories. Furthermore, there is a plethora of analytical computational tools available for embedding fortifications into spatial or relational networks, focusing on accessibility via routes and road systems, visibility ranges, or cultural territories on both micro- and macro-regional levels. This facilitates the identification of entire fortification systems, such as border defence systems, signalling or warning networks with chains of watchtowers and military camps, or other types of defensive barriers on land and in water. All of these insights provide a deeper understanding of sophisticated organizational structures.

This session diachronically focuses on examples and methods of detecting and interpreting networks and systems of fortifications. We aim to discuss the roles individual monuments played within larger frameworks and the impact of their organization on the control of space and power in entire regions. We welcome papers presenting case studies focusing on landscapes with either opposing systems or cooperating networks of fortifications, and how to identify, define, and interpret such agglomerations. Contributions on analytical tools or methodologies for processing data to identify systems and networks are also appreciated.

1 'THE HEARTBEAT OF HILLFORTS' - ON THE NECESSITY OF CONTEMPORANEITY FOR THE INTERPRETATION OF SYSTEMS OF FORTIFICATIONS

Ibsen, Timo (Leibniz-Zentrum für Archäologie (LEIZA-ZBSA))

Fortifications are often monuments of long existence. Being built originally by one group with a specific purpose, they might change in appearance, function or cultural affiliation over time. Some of them have been used continuously or discontinuously thousands of years with varying degree of intensity.

Very often, spatial neighbourhood is mistaken with simultaneity of the individual fortifications, suggesting a temporarily functional unit. For detecting competing or cooperating systems of fortifications, the prove of contemporaneity on the basis of secure dating is absolutely crucial. Without, all models of settlement development and the role of these monuments in the settlement landscape stay pure speculation.

The lecture emphasises the necessity of proving simultaneity for the interpretation of systems of fortifications, by showing case studies from two micro regions in the Russian Kaliningradskaya district. Here, large numbers of so far mostly unstudied hillforts are concentrated within a limited, but rich in archaeological sites landscape, showing settlement traces from Bronze Age until Medieval times. By applying the method of 'speed-dating', a combination of drilling and C14 dating conducted at the embankments, several hillforts in those agglomerations were dated. The resulting heartbeat of these fortifications shows a surprising number of contemporary sites in almost all time slices. This new chronological information made it possible to identify contemporary hillforts and interpret them on the basis of surrounding archaeological sites and against the background of historical sources. Sometimes patterns become visible and allow for a detailed interpretation of the relation between the strongholds themselves, even hinting at possible functions.

2 LATE BRONZE AGE SETTLEMENT NETWORK IN SERBIAN BANAT, SOUTHERN CARPATHIAN BASIN

Estanqueiro, Marta (University College Dublin; CEAACP- University of Coimbra)

A vast network of more than 100 settlements from the Late Bronze Age was discovered in the Serbian Banat region (southern Carpathian Basin). These sites are spread in the landscape near the major tributaries of the Tisza and Danube Rivers and due to their similarities were designated Tisza Site Group.

The layout and size of these settlements vary, with some featuring a complex system of ditches and encompassing more than 100ha of enclosed space, considered to be mega-forts by some authors.

This presentation will focus on the settlement pattern and spatial analysis results, possible factors that may have influenced site location choice, as well as potential resources exploited and controlled. This seems to indicate the existence of a cooperative network aiming to control the landscape, its resources and fluvial routes.

Additionally, site connectivity will be addressed through intervisibility network analysis and the reconstruction of the former river system, utilizing historical maps prior to the implementation of significant hydraulic regulation works that rerouted and channelled river courses.

Finally, the sudden abandonment of these sites around 1200 BC and a possible connection with a drier climate phase, similar to the Terramare (Italy) will also be discussed.

3 FORTIFIED LANDSCAPES OF HELLENISTIC EPIRUS: FORTIFICATIONS, MOBILITY AND CONTROL OF SPACE

Castignani, Veronica (University of Catania)

Historically divided into tribal groups, Epirus remained a federal state even during the Hellenistic period, under the aegis of the Molossian tribe first and the Epirote League then. The Epirote landscape appears to be strongly militarised. Alongside the urban centres widely known from ancient sources, a dense presence of minor fortified sites has been identified from the numerous wall remains, whose role in the regional context is still uncertain. It has been noticed that most of the Hellenistic examples are hilltop fortifications positioned to control natural routes or access points to significant territorial compartments. An isolated fortification could not ensure an effective defence in a vast territory divided into ethne. Therefore, integrated territorial control systems emerge on a sub-regional scale, established according to internal hierarchical criteria. Through geospatial analyses for determining intervisibility ranges, some networks of fortified sites can be assumed, structured around a main centre - not necessarily urban - and organised in lower-order fortifications along the main routes. The most interesting data for the Hellenistic period seems to be the fading of border militarisation between one ethnos and another. Fortified hilltop sites with plausible strategic roles are located along the main natural route tracks in the Epirote mountainous territory, for which it is not possible to clearly

determine to which political-administrative centre they belong. In light of the data available so far, fortified hilltop sites may have played a role not only in the supervision of borders but especially in the control of communication routes between different communities. This contribution discusses the preliminary results of fieldwork in the Pavlla River Valley (Southern Albania) within the Italian-Albanian "Butrint Project", and the use of a landscape approach to a broader study on Epirote fortifications.

4 THE OPPIDA OF THE ALTO MINHO (PORTUGAL) AND THEIR TERRITORY BETWEEN 2ND CENTURY BC-1ST CENTURY AD: IDENTIFYING SPATIAL NETWORKS

Maciel, Silvia (University of Santiago de Compostela, Spain; Lab2PT University of Minho) - Rotea, Rebeca (Lab2PT, Unity of Archaeology, University of Minho) - Fernández-Götz, Manuel (University of Edinburgh)

The dynamics of fortified settlements in the Alto Minho region (Northwest Portugal) present a great complexity as a result of both endogenous processes and exogenous contacts, as well as the landscape diversity of the region, which provided a rich set of resources to its inhabitants. During the 1st millennium BC we find a mosaic of settlement types, with the large oppida beginning in the 2nd century BC and acting as central places that concentrated religious, political, and economic functions. Although the oppida of this region are well characterised, having been the subject of research for decades, many questions still arise regarding the way in which these settlements consolidated a hierarchical landscape and how this materialised in the establishment of networks of control and coordination between the various indigenous communities. In this paper, we present a methodological approach for multi-scalar analysis, carrying out territorial analysis from the micro to macro scale, using non-invasive techniques (LiDAR, satellite image, geospatial analyses). This strategy allows us to locate new elements, understand the network of settlements with different characteristics and functions, and also explore the relationship between them and the surrounding territory. These new data are combined with archaeological data previously obtained by excavations at these sites.

5 MIDDLE IRON AGE FORTIFICATIONS ON THE NORTHERN EDGE OF THE GERMAN LOW MOUNTAIN ZONE

Messal, Sebastian (Lower Saxony State Service for Cultural Heritage)

A dense network of Iron Age fortifications characterizes the northern German low mountain zone (southern Lower Saxony as well as parts of Hessen and North Rhine-Westphalia). The fortifications are generally regarded as evidence of military conflicts in the centuries before the birth of Christ. Because of the lack of building features in the inner area that indicate permanent habitation, these fortifications are usually referred to as refuges. However, most of the fortifications have been destroyed at the end of the third cent. BC.

In general, the state of research on the castles is very poor. Excavations have only sporadically been conducted so far, and the state of knowledge is mostly based on extensive metal detector prospections. The artefacts from the fortifications are all very varied and partly of high quality. It includes costume accessories, tools and weapons, some of which were deposited outside the castles along the slopes. In fact, the mapping of artefacts also seems to indicate movements of groups of people along the slopes, which researchers interpret as escapes event of the inhabitants of the fortifications. However, questions about the social function of the fortifications and their setting within the archaeological landscape remain largely unanswered.

The lecture would like to summarize the current state of research and look at the Iron Age castles in southern Lower Saxony from the perspective of current research. One of the questions to be addressed is whether the castles, which were built in the beginning of the 3rd century BC and already destroyed shortly after a few decades, can actually be described as refuge castles or whether other possible interpretations can also be considered.

6 LATE IRON AGE ENCLOSURES IN WESTERN GERMANY

Claßen, Erich (LVR-Amt für Bodendenkmalpflege im Rheinland) - Herzog, Irmela (LVR-Amt für Bodendenkmalpflege im Rheinland) - Frank, Klaus (LVR-Amt für Bodendenkmalpflege im Rheinland) - Berthold, Jens (Bornholms Museum) - Weiler-Rahnfeld, Ivonne (LVR-Amt für Bodendenkmalpflege im Rheinland)

In a low mountain range east of the river Rhine in North Rhine-Westphalia there are 44 monuments with above-ground preserved ramparts and ditches. Some of these were investigated in the past by excavations, but most were only topographically surveyed. As a result, only occasional finds were discovered. Written sources lack as well. For these reasons, reliable information on the dating and construction of the ramparts, as well as structures in the interior, are scarce.

Since 2016, we have been working on these issues by analysing LIDAR data, systematic prospections and small-scale excavations. In general, it should be noted that the sites that have been investigated so far date to a wide range of periods, from the Late Bronze Age to the Napoleonic campaigns.

With regard to the topic of the session, we will focus on the Late Iron Age sites, as they are considered to be contemporaneous within a period of about 50-100 years. Several location factors of these sites will be analysed. These include the proximity to different ores in the region, the exploitation of which has been documented since the Middle Ages but can also be traced back to the Roman Imperial period and the Iron Age. Another factor being studied is the accessibility of small waterways. The results will allow assessing the variability of these factors and may provide some guidance for dating the rampart and ditch sites that still lack a verified date. Moreover, the relationship of the Late Iron Age fortifications with settlements of the same period is investigated. Despite all reservations – e.g. regarding small-scale excavations, 14C data accuracy or lack of knowledge of contemporary sites without enclosures – the spatial distribution of these sites indicates a system of fortifications that played an important role in the settlement structure of the region.

7 ROMAN FORTS IN THE LINE OF FIRE. ANALYSING BUILDING PROGRAMMES IN THE LOWER RHINE DELTA

Chorus, Julia (Chorus Archeologie; Radboud University)

The occupation of the Lower Rhine area (the Netherlands) by the Roman army lasted more than three centuries. During that period several series of auxiliary forts were built on the left bank of the river Rhine. Starting as a fortified transport route, the Rhine became the northern frontier of the Roman empire in this area.

The series of timber forts, built in the 1st and early 2nd centuries AD, have long been interpreted as part of one and the same building programme, as one system within the same political situation. A similar picture applied to the stone successors, the forts that were (partly) built in stone during the last decades of the 2nd century AD on top of the remains of their timber predecessors.

Due to dendrochronology, new detailed research of the old excavations of these forts and comparison, the differences appear to be greater than always assumed. By comparing the entire series of forts instead of solely focusing on individual sites, much more becomes clear about their significance. Both foundation dates and building characteristics point to new interpretations of these networks of forts in the Lower Rhine area.

8 WAR ON HIGH: THE EARLY MEDIEVAL KASTRA OF KALYMNOS, GREECE

Kardulias, Drosos (University of Michigan Museum of Anthropological Archaeology) - Greiner, Elliot (University of Michigan) - Nama, Shriya (University of Michigan) - Battista, Vincent (University of Michigan)

The Aegean island of Kalymnos was unsurprisingly transformed by conflict between Roman and Caliphate forces through the early Middle Ages; atypically among its neighbors, the end of antiquity seems to have produced a more durable and connected Kalymnian community, compared to that which came before.

This paper presents new GIS analyses of the island's Roman remains, both previously-undocumented sites and external features of previously known locations. Substantial attention is paid to distinctive emerging tactical trends in fortification architecture, as well as the issue of transport through such a rugged coastal environment. Of special note is the network of previously unrecorded high ground lookout posts which facilitated contacts both among the communities of the island, and from Kalymnos to the broader empire. Connections between the island and its connected islets highlight oft-unrecognized aspects of maritime Aegean economies.

The Medieval Roman Archaeological Survey of Kalymnos project is also a case study in 'agile archaeology', utilizing many vectors of analysis to build a picture of the past without excavation or remote sensing. Through the use of lay informants, consultation with museum personnel, and participation of Greek university students, the project aims to maximize involvement of the local community, while minimizing its impact on the archaeological record.

9 A FORTIFIED ISLAND? SYSTEMS OF DEFENCE AND SURVEILLANCE ON BORNHOLM IN THE 1ST MILLENNIUM CE

Albris, Sofie Laurine (National Museum of Denmark)

How would a relatively small island community organise its defence in the Scandinavian iron Age? The island of Bornholm in the Baltic Sea has at least six hill forts dated to various periods throughout the 1st millennium CE, some located very close to each other, and all drawn away from the coast. A new research project, FORTIS, is investigating the possible relations of these forts to their local landscape and settlement, evaluating historical maps and LIDAR data. Through previous archived investigation reports and small-scale excavations, the project will also address the relations between the forts both in terms of functionalities and chronology. A main question is whether the individual forts replaced each other, competed or belonged to different communities in the island society?

In military descriptions from the Napoleonic Wars, a warning system of beacons covering the entire island is mapped. This paper directs particular attention towards these signalling networks asking if they can be used as a basis for re-constructing older warning systems? Combined with indications of beacons in onomastic material, the project will

investigate whether fortified sites on Bornholm were related to or even connected by such signalling networks and if tracing the networks may provide clues to their interrelations.

10 THE HILLFORT BROBORG PROTECTED THE UPPSALA REGION AND WAS THEN LEFT IN ISOLATION

Sjöblom, Rolf (Luleå University of Technology) - Hjärthner-Holdar, Eva (Luleå University of Technology) - Ogenhall, Erik (Biskopskulla Villsberga 3, 74963 Örsundsbro, Sweden) - Pearce, Carolyn (Pacific Northwest National Laboratory) - Marcial, José (Pacific Northwest National Laboratory) - Neeway, James (Pacific Northwest National Laboratory) - McCloy, John (Washington State University) - Vicenzi, Ed (Smithsonian Institution, Museum Conservation Institute) - Kruger, Albert (US Department of Energy, Office of River Protection)

The hillfort Broborg is located 21 km Southeast of Uppsala in Sweden, and along the Långhundra Waterway, which connected Uppsala with the Baltic Sea. Most of the remaining inner wall was vitrified. This glassy material is presently being investigated for the purpose of serving as an analogue to radioactive waste glass, i. e. to enable comparison with a similar material that has been exposed to the near surface environment for around 1500 years. It has been assessed that the vitrification took place for the purpose of constructing the fort.

This raises the questions of the viability of the waterway during the operational phase, i. e. the incentive to vitrify, as well as that of how the glass might have become altered afterwards. The present work comprises information searches covering various disciplines and includes work by Arbetsgrupp Långhundraleden.

The countryside around Uppsala and Broborg has undergone substantial changes since the fort was constructed and used: a land rise of presently ≈ 1 mm/y, and substantial drainage operations, mainly during the 19th century. Extensive studies of contemporary boat constructions as well as portaging indicate that the waterway was fully operational 1500 years ago and several centuries thereafter.

It has been suggested by Damell (1993), that the protection of Uppsala might well have been coordinated between Broborg, Sunnersta Hillfort and Predikstolen, thus covering all of the potential waterways.

Somewhat later, hillforts fell out of use, Sweden became united, mortar was introduced, and gradually, the Långhundra Waterway became partially drained due to the land rise. Broborg became abandoned and left in isolation. Contrary to the Sunnersta Hillfort where large parts have been turned into a ski-slope, Broborg was left in peace. A plausible contributing factor being that, according to Swedish folklore, such forested heights were inhabited by evil or unreliable creatures such as trolls.

11 THE PIAST DYNASTY'S KEY TO EASTERN POMERANIA? UNIQUE CLUSTER OF THREE STRONGHOLDS IN CIEPŁE (NORTHERN POLAND)

Wadył, Sławomir (Faculty of Archaeology, University of Warsaw) - Szczepanik, Paweł (Institute of Archaeology, Nicolaus Copernicus University in Toruń)

The settlement complex in Ciepłe is a unique cluster of archaeological sites. Until recently Ciepłe was best known for the chance discovery in 1900 of a remarkable cemetery. However, necropolis is only one part of an extensive complex comprising three strongholds, several settlements and two burial grounds.

There is no doubt that gaining control of Pomerania was vitally important for the expanding realm of the Piasts. Most historians are convinced that this region had already become part of the Piast state during the reign of Mieszko I. Current findings indicate that the complex at Ciepłe came into being on the initiative of the Piast princes, Mieszko I or Bolesław I the Brave (late 10th c.). It was probably raised on a site where there had been no previous settlement. One of the factors contributing to the significance of this complex was its favourable location, enabling easy communication with other areas, as well as access to (and control of) the River Vistula and the overland route connecting Greater Poland and Kuyavia with Pomerania.

Despite numerous indications that this was an extremely significant site, Ciepłe has never received the attention it deserves. Strongholds in Ciepłe were excavated on a small-scale during the 1970s, but results of this work have never been published. Analyses of old data and materials prove that strongholds were contemporary. What was the idea behind that? What was the structure of that unique fortification system? These are just a few of questions that are asked as a part of a new multidisciplinary project. It was launched in 2023, and new excavations were carried out.

Objective of our paper will be to show the uniqueness of the cluster of three strongholds in Ciepłe and discuss its significance. We will present results of recent excavations, and results of some spatial analysis.

1184 **ARCHAEOLOGY AGAINST RURAL ABANDONMENT: RETHINKING MEDIEVAL AND POST-MEDIEVAL RURAL SETTLEMENT IN THE LIGHT OF THE CHALLENGES OF THE 21ST CENTURY.**

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Menendez Blanco, Andres (University of Oviedo) - Gago Chorén, Laura (University of Genoa) - Millán Pascual, Rafael (Institute of Heritage Sciences (CSIC))

Session format: Regular session

The depopulation of rural areas is a reality throughout Europe. Although at different rates in each country, the first symptoms were observed in the 18th century and intensified in the second half of the 20th century. In some countries, it is nowadays a central theme in political agendas and a regular topic of debate in the media. In parallel, rural archaeology has experienced intense development in recent decades, generating complex readings on the diachronic transformations of these areas. One issue of this archaeological approach to rural areas is the dynamism of rural settlement over time, in which foundations, profound transformations and abandonment of settlements follow one another.

This session is dedicated to analysing changes or continuities in rural settlement networks in the medieval and post-medieval periods. The theme is open to different approaches, with the central objective of delving into the processes that trigger changes in different regions and periods. Multidisciplinary approaches that build horizontal dialogues between archaeology and other humanistic or environmental disciplines will be particularly welcome.

On the other hand, we propose this session to debate on the role of archaeology in the face of the current depopulation processes. The abandonment of rural areas cannot be separated from other major problems, such as the sustainable management of resources, the loss of biodiversity or the increasing incidence of natural disasters such as fires and floods. Faced with this challenge, can archaeology be a useful tool against depopulation? And if so, how?

ABSTRACTS

1 **REPOPULATING THE BRAES: UNDERSTANDING THE VALUE OF A REPOPULATING APPROACH TO THE ARCHAEOLOGY OF UPLAND SETTLEMENT IN THE SCOTTISH HIGHLANDS**

Stewart, Edward (University of Glasgow)

The Highlands and Islands of Scotland are a region which over the past three centuries has experienced dramatic depopulation with government repression, forced eviction and emigration in the 18th, 19th and 20th centuries resulting in the creation of 'emptied lands'.

In the present, economic and political marginalisation continue to result in depopulation in this region, and as new futures are imagined for the region in the wake of the climate crisis archaeological narratives are increasingly deployed to support competing visions for the future of the Highland landscape. Calls for 'rewilding' inspired by an imagined past wildness are increasingly challenged by local activists with visions of a 'repopulated' landscape, inspired by the busyness of these landscapes in the early modern period, and the past economic and political power of the region.

Through the case study of Glencoe this paper will explore the value of a repopulating approach to the archaeology of these 'emptied lands', highlighting their busyness and connectedness, challenging the dominant narrative of these landscapes as being marginal, wild and empty. Based on archaeological survey, excavations, environmental and creative engagements, and engagement with local stakeholder bodies and communities, this paper will set out a positive vision for the role of archaeology within such marginalised rural upland landscapes in the Scottish context.

2 **BEGINNING, CHANGE AND ABANDONMENT. LOOKING FOR THE TEMPORALITY OF SHEPHERD'S SETTLEMENTS IN MOUNTAIN REGIONS**

Garcia Casas, David (Instituto de Ciencias del Patrimonio (Incipit) - CSIC) - Ballesteros Arias, Paula (Xunta de Galicia)

Seasonal pastoralism was one of the main important socioeconomical activities in different mountain regions of southern Europe until their abandonment during 20th century. During centuries, agropastoral practices shaped the landscape of rural areas in which took place. These remains have been studied by several archaeological researches which showed the human occupation of mountain grazing areas since the fourth to third millenniums BC.

This paper explores the temporality of the pastoral practices which exists during 20th and 19th centuries and were recorded by ethnographers. These concrete ways of livestock are considered "traditional" by the common opinion which drive towards the black and white photography's taken one hundred years ago. Our goal is wonder about the

timeless image assumed in the narratives about ancient pastoralism showing the dynamism of agropastoral communities during long term chronologies. To discuss about the historical changes in livestock practices I will show two study cases. The first one in the Aigüestortes National Park (Central Pyrenees, Spain) and the second one in Sierra do Suido (Galicia, Spain), where new data shows the temporality of traditional agropastoral economy in this mid-altitude mountain range.

Finally, this paper aims to talk about how the archaeological legacy and ethnographical knowledge are turning nowadays in cultural heritage to be protected by public policies. We would like to discuss about if it could contribute to define new socioenvironmental substantiable practices in the regions which are nowadays suffering depopulation and his role to define the future of rural mountain areas.

3 **FROM LANDSCAPE ARCHAEOLOGY TOWARDS A SUSTAINABLE FUTURE FOR RURAL AREAS: ANALYZING THE CASE OF VELVA (LIGURIA, ITALY)**

Chorén, Laura (Università di Genova) - Blanco, Andrés (University of Oviedo)

The inland of Liguria (Italy) currently displays a rural landscape marked by depopulation and accelerated abandonment of agrosilvopastoral activities. The village of Velva represents a paradigmatic example of this process, which began in the mid-20th century. For this reason, the local community has created a Museum of Peasant Culture (MUVEL) that promotes research, dissemination, and reflection on these issues. In this context, in 2023, we have started a research project within the CLOE Project and the Laboratory of Environmental Archaeology and History at the Università di Genova, which aims to contribute to the construction of new policies for the sustainable development and conservation of rural areas.

The first objective is to reconstruct and understand the processes that have led to its current state and configuration, analyzing changes in the management practices of environmental resources in the post-medieval period. Through a methodological program specific to Landscape Archaeology, we are conducting multidisciplinary research that combines analysis of archaeological, environmental, written, and oral sources.

The second objective is to generate new knowledge and tools that can reinforce community initiatives, through close and continuous dialogue with its inhabitants. This communication will present the methodology and results obtained so far and will reflect on their effectiveness in generating useful tools to address the major challenges facing of rural areas today.

4 **ARCHAEOLOGICAL RESEARCHES FROM THE LIGURIAN APENNINES: MULTIDISCIPLINARY APPROACHES TO UNDERSTAND ABANDONMENT PROCESSES OF RURAL AREAS**

Piu, Caterina (Laboratory of Environmental Archaeology and History - University of Genova)

The Laboratory of Environmental Archaeology and History (LASA), a University of Genoa Interdepartmental Centre founded in 1995, carries out researches in the Ligurian Apennines on environmental resources management, depopulation and abandonment dynamics through a regressive and microhistorical approach.

Borrowing from LASA's methodologies, the paper investigates the historical environmental resource management systems – and their transformation, continuity, and discontinuity over centuries – through an archaeological approach. The aim is to provide an overview of five case studies: Viganego (Bisagno Valley), Castagnello (Sturla Valley), Bosco Fontana (Aveto Valley), Fontanigorda and Rovigno (Tebbia Valley). These municipalities are part of the inner area of Antola-Tigullio, which preserves relevant historical, archaeological and environmental evidences of frequentation dating back to pre-protohistorical times.

But which are the limitations of this methodology? And how can we deal with them? The paper discusses these issues in relation to the five case studies: it presents the results of a multidisciplinary approach that combines archaeology with the study of oral tradition, geoarchaeological and ecological data, and archival documentation. The aim is to demonstrate that the abundance of perspectives allows more precise and comprehensive data about depopulation and abandonment dynamics – and, consequently, to develop more effective strategies for environmental resources management, preservation and safeguard of upland landscapes and memories.

The data are the outcome of a PhD project funded by the Department for Cohesion Policies of the Italian Ministry, which works in collaboration with the National Strategy for Inland Areas to fight marginalization and demographic decline of rural areas.

5 **ABANDONMENT OF A RURAL LANDSCAPE. THE CASE OF SIERRA NEVADA (GRANADA, SPAIN)**

Paciotti, Ylenia (University of Genoa) - Stagno, Anna (University of Genoa)

The focus of this research is the study of an area of Alpujarra, in Sierra Nevada in the Southern Spain, specifically in the municipalities of Bubión, Capileira and Pampaneira. This area is characterized by the presence of resource-sharing practices, particularly related to water management. This practice has been highly significant and has persisted for

centuries, making the area interesting for studying resource management practices and understanding the dynamics of abandonment and continuity.

This study focuses on the water system and the utilization of these areas by communities, making use of terraces for both cultivation and pastures.

We will follow a regressive approach, identifying the changes of the rural landscape and observing its continuities and ruptures, especially from the second half of twentieth century to the present.

This research involves cartographic sources, historical aerial photographs, cadastral sources and archaeological data which will allow us to understand the causes and motivations that led to the abandonment of rural areas.

Finally, this study aims to identify and document knowledge and practices that have been disappearing in recent years due to the abandonment of these areas, and how these actions have influenced the appearance of the territory we see today.

The study is related to the research project ANTIGONE (ERC Stg 2019), which aims to verify whether the disappearance of shared practices has played a key role in the abandonment processes of mountain areas in Southern Europe between the 19th and 20th centuries.

The objective of ANTIGONE is to investigate the relationships between material changes in environmental resource management practices and the social organization of local communities, particularly in relation to resource sharing, which has played a significant role in the life of rural communities.

6 RECENT TRANSFORMATIONS OF THE AGRARIAN LANDSCAPE OF ASTURIAS (SPAIN). PERSPECTIVES FOR ITS FUTURE FROM THE STUDY OF CULTURAL HERITAGE

Sánchez Broch, Paloma (Universidad de Oviedo) - Rodríguez Pérez, Santiago (Universidad de Oviedo)

From the mid-19th century to the present day, the Asturian countryside has undergone a deep transformation, accelerated in the last decades of the 20th century. The traditional agricultural model, oriented towards polyculture and domestic livestock farming, was converted into industrialised agriculture, specialising in the dairy and meat industry. This conversion had a strong impact on the landscape, with the transformation of cultivated areas into pastures or monoculture fodder crops; the conversion of the forest into intensive timber exploitation; the disappearance of the peasantry as a social group, and depopulation. The current geopolitical context has demonstrated the weaknesses of this model. The oil crises and the war in Ukraine have highlighted the heavy dependence on fossil fuels for heavy machinery and fertiliser production. Also, the dependence on countries producing cereals used in animal feed for the meat industry. On the other hand, the intensive use of agricultural land has led to heavy soil erosion. Furthermore, in recent years the problem of depopulation has become more acute, together with a series of other issues such as urban speculation, the installation of large-scale energy plants, etc.

Against this backdrop, archaeology and the study of rural heritage can offer analyses and tools to inspire an alternative future for the rural environment: in-depth knowledge of the territory and its historical uses, the role of rural communities as managers of the landscape and ecosystems, cultural heritage and the tangible and intangible record can be key factors for future sustainability. Archaeology also studies the processes of change and the realities of the old and new inhabitants, and through heritage education projects, it can offer its inhabitants the possibility of getting to know their territory better and redefining their relationship with the landscape.

7 FROM THE PAST TO THE FUTURE. ARCHAEOLOGY OF RURALITY IN EXTREMO (ARCOS DE VALDEVEZ, PORTUGAL)

Blanco-Rotea, Rebeca (University of Minho, Landscapes, Heritage and Territory Laboratory (Lab2PT); Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory (IN2PAST)) - Magalhães, Fernanda (University of Minho, Landscapes, Heritage and Territory Laboratory (Lab2PT); University of Minho, Unit of Archaeology; Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory (IN2PAST)) - Oliveira, César (HERCULES Laboratory, University of Evora; Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory (IN2PAST)) - Conceição, Margarida (Art History Institute, Nova University of Lisboa) - Coradeschi, Ginevra (HERCULES Laboratory, University of Evora)

Extremo (Arcos de Valdevez, Portugal) is a small village located in a rural mid-mountain area. Its landscape reproduces the historical processes that took place over time according to political, social, cultural or economic interests of the communities that settled there. The village is dominated by two fortifications erected during the Restoration War (1640-1668). In 2018 we began the archaeological study of its fortified landscape, and identified a defensive complex resulting from the construction process during this war. The fortifications had a major impact on the preceding landscapes. They were also transformed in later times after their ineffectiveness and abandonment. Today, they are important fossil directors for understanding the diachrony of this landscape.

Extremo has a strongly ageing community, which has abandoned most of its traditional agricultural activities, with significant international emigration or emigration to nearby urban areas. The consequences: abandonment of rural areas, disorganisation of the territory and of the activities associated with it, loss of identity and of memory with regard to heritage.

All this makes this village a privileged place to carry out research centred on the Science, Technology and Society paradigm, guided by the following research hypothesis: the landscape of Extremo in the historical period responds to two superimposed constructive processes in the Modern Age that respond to very different macro-structural logics: war and agrarian transformation. Today it responds to processes that are common in many European rural areas. From an interdisciplinary research that crosses archaeology, geoarchaeology, chemistry, geospatial technologies and conceptual modelling of heritage, developed in collaboration between several centres in Portugal and Spain, and in collaboration with the local community that participates in the processes of knowledge generation, we intend to contribute to reversing these problems.

8 THE OTHER TRANSITION: THE LONG LASTING END OF THE MIDDLE AGES IN CALABRIA

Citter, Carlo (University of Siena)

This paper aims to give hints about one of the most neglected topics within the scientific debate in the last forty years not only in Italy. The major focus on the transition to the early middle ages left this large period between the Black Death and the emergence of capitalism virtually without reflections and debate. A new series of projects in Calabria end specifically in the provinces of Vibo Valentia, Reggio Calabria and Catanzaro will address this main topic as the key question. The emergence of open villages, the sparse settlement still visible in most areas, the terraced cultivation systems seem to ferry the middle ages to the contemporary period. This paper aims to introduce the scientific community these researches as part of a single main project. They are at different level of development but they start as strong agreement among the National Heritage Service, the University of Siena and local institutions.

9 BETWEEN STABILITY AND SEASONALITY. MEDIEVAL AND POST-MEDIEVAL VARIATIONS IN THE SETTLEMENT NETWORKS OF THE ASTURIAN MOUNTAINS (NORTHERN IBERIAN PENINSULA)

Menendez Blanco, Andres (University of Oviedo) - Gago Chorén, Laura (Università di Genova)

Settlement networks in the Asturian mountains (northern Iberian Peninsula) shows significant variations over the last thousand years. Among them, moments of regression or expansion of the number of settlements can be detected. Major changes in the internal structures of some settlements are also visible. These dynamics respond to complex and different causes in each historical period. In this paper we will analyse a series of sites that vary between seasonal pastoral settlements and stable villages. From the approaches of Landscape Archaeology and Environmental Archaeology, changes in environmental resource management practices will be related to changes in settlement networks and internal transformations of settlements. The first objective is to understand the broad-scale expansive or regressive dynamics in earlier periods, paying attention to aspects such as the resilience of local communities or their vulnerability to different external factors of change. The second objective is to reflect on the current depopulation process in this region by integrating it into a long-term perspective.

1188 PAST, PRESENT, AND FUTURE OF ARCHAEOETHANATOLOGY: A CRITICAL DISCUSSION ON THE STATE OF THE DISCIPLINE.

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Tamorri, Veronica (Leiden University) - Noterman, Astrid (Department of Archaeology and Classical Studies, Stockholm University) - Fiorin, Elena (Sapienza University of Rome) - Törv, Mari (University of Tartu)

Session format: Regular session

The way we excavate and document burial sites profoundly influences our understanding of past practices, customs, beliefs, and identities. Since the late 1970s, archaeoethanatology has provided a toolkit to conduct rigorous excavations of human remains, further enhancing our ability to more comprehensively study how people in the past handled and interacted with the deceased, regardless of their discovery context. As a result, archaeoethanatology is now widely recognised within archaeology as a discipline in its own right.

Attaining a method that crosses disciplinary and geo-temporal boundaries is a great achievement; however, in the process, its core essence can be lost or altered. Given the growing ambiguity surrounding archaeoethanatology as a discipline, it is now time to pause and return to the fundamentals of the method.

This session aims to reflect on what has been accomplished over the past decades through archaeoethanatology, and how this method is key to bridge the gap between theoretical and scientific approaches to the study of death and

burials. The goal is to foster discussion on the potentials of its current applications, and how to further advance the discipline while preserving its original scope and principles. We invite submissions that address the fundamental question of defining archaeoethanatology, while exploring the ways that various fields within/outside archaeology, such as GIS, forensics and experimental research, feed into this discipline and create new ways of reflecting on ancient burial practice.

We also encourage papers looking at the less studied effects of different climates on the taphonomic history of burials, and research integrating archaeoethanatology within a broader theoretical/methodological framework. Case studies from diverse geographical and temporal contexts, active fieldwork as well as those (re)examining post-excavation documentation are welcome.

ABSTRACTS

1 DIGGING UP BONES, IN A HURRY: ARCHAEOETHANATOLOGY AND RESCUE ARCHAEOLOGY

Oudry, Sophie (INRAP - National Institute for Preventive Archaeological Research; UMR 7268 ADES; ULR 7367 UTML & A Institut Médico-légal de Lille) - **Mangier, Camille** (INRAP - National Institute for Preventive Archaeological Research; UMR 5608 TRACES)

In France, archaeoethanatology – and its predecessor, field anthropology – has been widely taught in universities for more than twenty years. A whole generation of students has learned the theory behind this concept and practiced through internships on archaeological digs, to the point where archaeoethanatology is now widely accepted and applied. It can even be considered as a common language for anthropologists, wherever they come from (universities or rescue archaeology). To be properly implemented, archaeoethanatology requires a series of observations on the physical remains, and sometimes on invisible traces; it also requires a time for reflection on these observations. However, the time and financial constraints in rescue archaeology, especially applied to the recovery of human remains, generate the need for compromise between thoroughness and efficiency, between fieldwork and labwork.

How do anthropologists juggle between these constraints, whilst keeping in mind the focus of archaeoethanatology? How do they use other tools available, such as GIS and photogrammetry, to help in reconstructing gestures from the past and funerary practices in a global approach of the deceased and its grave?

Rescue – or preventive – archaeology uncovers every year thousands of burials in France alone; concomitantly, it produces an incredible amount of documentation, be it physical or digital. It has long become the prime source of human remains' collections. As archaeo-anthropologists, we hope that the documentation we produce is available to but also re-usable by other researchers? How can we ensure a sustainable curation of this documentation for the future generations of anthropologists to use as comparisons and case studies?

2 REVISITING OLD EXCAVATIONS WITH AN ARCHAEOETHANATOLOGICAL APPROACH – BENEFITS & CHALLENGES

Malcherek, Anne (NOVA Lisboa, FCSH; CRIA) - **Rodrigues, Zélia** (NOVA Lisboa, FCSH; CRIA; *Arqueologia e Património*) - **da Graça Pereira, Maria** (*Arqueologia e Património*) - **Fonseca, Jorge** (*Arqueologia e Património*) - **Fonseca, Vítor** (*Arqueologia e Património*) - **Alves Cardoso, Francisca** (NOVA Lisboa, FCSH; CRIA)

Archaeoethanatology provides a set of principles and methods for rigorous data collection and analysis of human remains, mortuary contexts and associated taphonomic processes. However, the archaeoethanatomical approach can also be used, post-hoc, to explore field data such as photographs, written and graphic documentation, allowing the reconstruction of past excavation contexts. This option is crucial when dealing with incomplete documentation, lack of excavation reports, and the need to revisit old sites due to changes in the conceptualisation of the past. This presentation focuses on such a case study: the burial site associated with the 3rd Order of Our Lady of Carmo, in Porto (Portugal). The site was excavated twice: first in 2006, for which no final archaeological report was produced, but the existing data includes photographs, written documents, and graphic documentation. However, the information is incomplete and inconsistent, with important details missing and others contradicting each other. Further, no detailed account of the methodology for recording human remains, mortuary practices, and post-depositional events exists. Currently, the second excavation is ongoing with a known field methodological approach, and a detailed excavation process and archaeoethanatomical data collection process.

In the present analysis archaeoethanatomical data is collected on available documentation from the first excavation, using data from the second excavation as a point of comparison. It aims to demonstrate how archaeoethanatomical reexamination of excavation data can support, challenge and add nuance to previous interpretations, as well as adding new information. At the same time limitations and challenges of working with incomplete documentation will be explored and some suggestions on how to address limitations are introduced. This highlights the potential benefits of revisiting old excavation data using archaeoethanatomical methods, while also emphasising the importance of applying these methods during excavation for optimal data collection.

3 EXPLORING THE USE ARCHAEOETHANATOLOGY IN THE HOT CLIMATE OF THE EARLY EGYPTIAN NILE VALLEY: LIMITATIONS, ONGOING DEVELOPMENTS AND FUTURE RESEARCH

Tamorri, Veronica (Leiden University)

Over the past two decades, archaeoethanatology has emerged as a prominent method for excavating ancient human burials and re-examining field documentation from past excavations. This interdisciplinary approach, at the intersection of biological anthropology, taphonomy, and forensic sciences, is essential for reconstructing mortuary practices and identifying any non-ritual related events that may have influenced the taphonomic history of the cadaver.

However, archaeoethanatology was primarily developed based on the analysis of burials decomposing in the temperate and relatively humid climate of Europe, leading to its comparatively limited application to other environmental settings. Consequently, the adaptation of its principles to diverse climatic contexts remains a work in progress, despite recent efforts to expand its use to wider geographical areas.

The aim of this presentation is to discuss the results obtained by applying archaeoethanatology to excavation documentation of burials decomposing in the arid and hot climate of the Egyptian Nile Valley, during the 5th and 3rd millennium BCE. The analysis will focus on how a dry environment, combined with interment in a sandy soil and within distinctive architectural features, create unique spaces of decomposition that influence the taphonomic pathways of human remains.

The case studies presented will provide an opportunity to discuss how the principles of archaeoethanatology can be refined and adapted to better understand past mortuary practices and taphonomic processes from wider geographical contexts.

4 BURIED IN A KIT: DISMANTLED AND INCOMPLETE FUNERARY BEDS IN EARLY MEDIEVAL ENGLAND

Noterman, Astrid (Stockholm University; Uppsala University)

Burial practices represent a key source for understanding early medieval populations, opening valuable windows on ancient ways of life, customs and beliefs. Some of the most spectacular findings of the period are funerary beds known from around fifty graves from southern Germany to southern Scandinavia, England and present-day Slovakia, and dated from the 6th to the early 10th centuries CE.

Wooden beds in early medieval graves have surprisingly been little studied, and most of time disconnected from the human remains. They are generally discussed in terms of the valuable material items they may contain. In England, for instance, the discovery of fine Christian objects associated with them has placed the discussion in the context of the emergence of Christian religion in the seventh century. In this presentation, I will show how the application of archaeoethanatomical methods to bed graves changes our perception of the practice in England. The re-investigation of these graves shows that the reconstructions carried out so far have not always been compatible with the taphonomic observations of the human remains and the fitting elements of the furniture.

The deposit of dismantled beds is a distinctive feature of bed inhumations in England and the practice is usually described as a mere anecdote. The application of archaeoethanatology shows that the practice may have been much more systematic than previously thought, and more varied, with dismantled beds, as well as incomplete ones. These observations open up a whole field of new reflection: Why put so much effort into dismantling the furniture that would otherwise fit perfectly into the grave? How do we explain a mortuary practice that privileged the incomplete over pure wholeness?

5 BURYING THE DEAD: NEW INSIGHTS INTO FUNERARY PRACTICES IN MEDIEVAL AND EARLY MODERN VENETO, ITALY

Fiorin, Elena (Department of Oral and Maxillo Facial Sciences SAPIENZA University of Rome)

This paper discusses selected case studies showing particular funerary practices in medieval and early modern northern Italian contexts, employing data collected in the excavation by archaeologists and biological anthropologists. The analysis focuses on mass graves and double burials excavated in the late medieval and post-medieval city of Verona and early medieval single burials from the Alpine context of San Donato di Lamon. The main objective of this paper is to cross-reference information gathered in the fieldwork, in the laboratory, and in post-excavation documentation to reconstruct in detail how people in the medieval and postmedieval periods treated their dead. An additional goal is to discuss which data can be lost if the archaeologists and biological anthropologists do not work together. From this study, it emerged that if a specialist trained in funerary taphonomy is absent in the fieldwork, digital applications such as photogrammetry are efficient and detailed tools to be employed for the analysis and reconstruction of funerary practices.

6 LET'S ADD A DIFFERENT APPROACH: THE RE-EXAMINATION OF THORIKOS' MORTUARY PRACTICES THROUGH ARCHAEO THANATOLOGY

Patterson, Sydney (Ghent University) - Docter, Roald (Ghent University) - Lagia, Anna (Ghent University)

Archaeo thanatology is an incredibly informative approach in the study of past mortuary practices. Part of this discipline's strength relies on the meticulous nature it requires during excavations and the recording of bones and other finds. However, when reassessing data from past excavations, the researcher must work with the information as it was recorded by the original excavators. While in these cases, approaching the legacy data through the lens of archaeo thanatology may offer new interpretations of previously excavated graves and of the mortuary practices, there may be obstacles in applying archaeo thanatology to its full potential. This paper will present a case study where the principles of archaeo thanatology are implemented for the reinterpretation of mortuary contexts that were excavated decades ago. The site of Thorikos, in southeastern Attica (Greece), was excavated by the Belgian School at Athens (EBSA) from the 1960s-1980s with excavations resuming within the mid/late 2000s. During the earlier excavations, four areas were uncovered that the excavators described as 'necropoleis' that date to 900-300 BCE. These areas contained inhumations and cremations, adult and subadult burials, and burials with and without grave goods. The original excavators recorded their findings through field journals, photographs, scaled drawings, and publications. The clarity and degree of detail recorded in this legacy data can vary greatly between different burial contexts from these early excavations, a hinderance that makes the utilization of archaeo thanatology difficult at times. Yet, it is essential to attempt such a re-examination of older excavations and their documents by employing different methodologies to those originally used, in order to better enhance our understanding of past mortuary practices.

7 ARCHAEO THANATOLOGICAL ASPECTS OF BURIAL PRACTICES AT YUZHNIY OLENIY OSTROV: INSIGHTS AND LIMITATIONS

Batanina, Olga (University of Helsinki)

Over the past two decades, archaeo thanatological analysis has become invaluable for understanding burial practices, ranging from practical considerations to broader themes like perceptions of the deceased and beliefs about the afterlife.

Mesolithic burial sites in Northeastern Europe, such as Skateholm I and II in Sweden, Zvejnieki in Latvia, Vedbaek in Denmark, as well as Tamula, Kivisaare, and a group of other Mesolithic-Neolithic burial sites in Estonia (e.g., Nilsson Stutz 2003, Tõrv 2016), have been extensively studied through archaeo thanatological examination. These studies not only shed light on funeral practices but also address the reliability of such analyses, especially when dealing with incomplete materials.

This paper presents the initial findings of the archaeo thanatological analysis of Yuzhniy Oleniy Ostrov, a Mesolithic burial site on an island in Lake Onega, Karelia, Russia. Despite being excavated over 80 years ago, the site remains crucial for understanding the region's hunter-fisher-gatherer lifeways. While the available materials include drawings and descriptions, detailed information on grave environments and skeletal completeness is lacking. To supplement this, we analyzed the anthropological collection to understand bone preservation patterns and taphonomic processes.

Our research primarily focuses on general burial patterns such as the nature of burials, decomposition spaces, and evidence of wrappings or clothing. Initial findings from the analysis enhance our understanding of funeral practices, despite limitations in descriptions. However, it's important to acknowledge the constraints posed by incomplete sources.

8 ARCHAEO THANATOLOGY AND FORENSIC ANTHROPOLOGY: SOME PRACTICAL EXAMPLES FROM LEGAL CASES TO HIGHLIGHT A VIRTUOUS INTERACTION BETWEEN THE TWO DISCIPLINES

Galassi, Francesco Maria (Department of Anthropology, Faculty of Biology and Environmental Protection, University of Lodz; FAPAB Research Center, Avola (SR), Sicily, Italy) - Varotto, Elena (Archaeology, College of Humanities, Arts and Social Sciences, Flinders University, SA; FAPAB Research Center, Avola (SR), Sicily, Italy)

This talk aims to underline the importance of a constant interaction between forensic anthropology and archaeo thanatology. Both disciplines focus on reconstructing the biological profile of individuals and, where possible, identifying them. Remarkably, a key methodology adopted by both disciplines is represented by taphonomical analysis.

Thus, by showing a set of cases examined by the authors in Southern Italy as consultants to the prosecutor's office, it will be highlighted how a traditional view that identifies forensic anthropology with the drafting of a biological profile is not enough to answer some of the questions that legal prosecutors may ask their consultants. Indeed, taphonomical analysis can shed light on the terrestrial and aquatic postmortem processes that can alter bones and, subsequently, the very examination of them by forensic anthropologists. To a certain extent, it could be affirmed that taphonomy can support a forensic anthropologist in his quest for answers to key questions such as "how long have the found re-

mains stayed in a given environment? or "what is the timing of a specific lesion/alteration?", "what factor caused it?," "is it possible to distinguish between an anthropic and a non-anthropic factor?." Answering such interrogatives may enhance our capacity to decipher the exact nature of the phenomena that occurred and offer a valuable contribution to justice or archaeology. Indeed, with reference to the latter, such examples can be found to be useful also in different archaeological settings where taphonomical analysis can prove to be an important interpretative element.

Combining theoretical and practical aspects, this presentation will show relevant elements of a set of different cases (some from terrestrial contexts and others from aquatic environments) by utilising anthropological, radiological techniques as well as radiocarbon-dating and, above all, taphonomical approaches.

9 NAVIGATING THE CADAVERIC ISLAND: INTEGRATING ARCHAEO THANATOLOGY AND FORENSIC TAPHONOMY IN THE INTERPRETATION OF PALAEO LITHIC MORTUARY BEHAVIOURS

Randolph-Quinney, Patrick (Uppsala University)

The 'Cadaveric Island' may be viewed as the totality of peri- and post-mortem events which impact on the body, from death to recovery. Navigating this island is a complex task, and involves specialised knowledge which the mainstream archaeological community has been slow to adopt, particularly in the interpretation of extremely ephemeral evidence for mortuary behaviours. This has led to heated discussion, and more than a little rancour, in evaluating evidence for the earliest mortuary and funerary behaviours by Homo sapiens and our extinct cousins. Historically Palaeolithic archaeologists have misapplied classical vertebrate taphonomy in order to understand early mortuary behaviours, often being forced to rely purely on the presence or absence of grave goods to separate anthropogenic from natural processes. This is puzzling as two developed fields already exist to assist in the construction of robust evidential interpretations - archaeo thanatology and forensic taphonomy/thanatology. Sadly, both are often afforded little more than lip-service in classical approaches to interpreting the Palaeolithic burial record.

This paper discusses the epistemological issues that surround archaeo and forensic thanatology - one inductive, the other hypothetico-deductive and actualistic. In particular I will raise issues of equifinality and under-determination, which may be addressed through the application of Bayes modelling and likelihood ratios (common approaches in forensic evidence evaluation) to the benefit of both disciplines. Using case examples of purported mortuary behaviours from the Middle and Upper Pleistocene of Africa and Europe I will argue that it is possible to integrate data from both disciplines (complemented by comparative data from forensic casework) to produce comprehensive peri- and post-mortem narratives which address - and explain - the complex interactions of biological, physical and anthropogenic processes which interact with the deceased, such that any narratives are robust and equivalent in rigour and evidential probity as would be acceptable in a forensic context.

1190 AGRO-SILVO-PASTORAL PRACTICES AND MEETING POINTS IN UPPER MONTANE REGIONS. CREATING AND PRESERVING COMMUNITY BONDS

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Aparicio Martínez, Patricia (University of Toronto; Pontificia Universidad Católica del Perú) - Delgado Arcos, José Alberto (Universidad de Oviedo) - Rebollar Flecha, Luis Miguel (Universidad de Oviedo) - Menéndez Blanco, Andrés (Universidad de Oviedo)

Session format: Regular session

Upper montane regions have been significant for the survival of human communities, their economic output, and their social interactions. These areas encompass uninhabited zones with cyclical gatherings involving exchange, pilgrimages, and other activities. These places are key meeting points on the landscape to understanding how communities interact and reinforce bonds.

Recent changes in environmental resource uses and social structures have led these communities to abandon the long-practiced activities in these places. Still, many locales continue to hold religious and ritual purposes for enduring community practices. In addition, several lines of evidence point to these places as points on the landscape for negotiation to settle disagreements and forge alliances throughout time. This, therefore, demands an archaeological lens.

This session is intended as a forum for interdisciplinary discussion on these places, following instances of mountain areas all over the world. The aim is to explore the dynamics of meeting places throughout history, as well as to analyze their role in the development of community and supra-community senses of belonging. Proposals must have a diachronic approach and may be multidisciplinary - whether from social or environmental sciences. In addition, the session will accept proposals using research with new methodologies and approaches as well as essays on conservation and future sustainability.

1 MOUNTAINS, DEITIES AND PEOPLE: THE CASE OF THE CULT OF NYMPHS AND PAN IN ATTIC CAVES

Martino, Maria Grazia (Independent researcher)

Since ancient times, caves have played an essential role in human development: used as a refuge or place of worship, they were landmarks for those communities far from inhabited centers.

Attica is also dotted with caves used as sanctuaries. Some of them were intended as sacred spaces for the Nymphs, at least from the 6th century BC, and Pan, from the 5th century BC, "rural" protectors of the mountains par excellence.

With the exception of the cave of Pan on the Acropolis of Athens or that of Eleusis, it seems the majority of them were not under direct state control. The dedicatees, therefore, could be of different social backgrounds. Having the same role as the sanctuary of Nymph in Athens, female passage rituals connected to marriage were carried out in the caves by girls of humble backgrounds or who inhabited the surrounding area. The presence of men, shepherds or hunters, in some cases also ephebes, is also attested,

An even more particular case is that of the methecus of the Vari cave, Archidamus, socially accepted because he was a nympholept with the gift of prophecy.

From the epigraphic sources, no figures of priests or priestesses emerge and, from Menander's Dyskolos, it seems that the rituals were carried out by the dedicators themselves. The fulcrum of the ceremony was, therefore, the ritual performance that took place inside the cave and the sensations that the dedicatees felt, which not only linked the believer to the divinity, but also to the other members of the group.

So I will attempt to analyze the cult of Nymphs and Pan in Attica and the people who frequented the caves through a theoretical approach in this paper. Additionally, I will demonstrate how this analysis contributes to our understanding of the topic.

2 FROM RESOURCE COLONISATION TO HERITAGISATION AND LOCAL ACTIVISM. THE HISTORY OF A SHIELING IN WESTERN SWEDEN

Johansson, Annie (County Administrative Board (Värmland)) - Pettersson, Susanne (Independent) - Svensson, Eva (Karlstad University)

Scandinavian agropastoral transhumance is organised around shielings and forested grazing. The classic Scandinavian shieling consisted of a fenced site, most often in hilly or mountainous settings on outlying lands, with meadows and structures for dwelling, stabling livestock, and processing milk. Through the dismantling of rural, forested areas, competition for forest use and heritagization, shielings have been marginalized in today's agrarian life and framed as relics of an outdated system. However, interdisciplinary research involving pollen analyses, archaeology etc. has shown that shielings were constructed as part of an innovative system for settlement colonisation. Moreover, during at least a 2000 years long history, shielings have displayed remarkable adaptive capacities, contributing to the resilience of their local communities. That is - until present times.

Today's shieling owners, like small-scale farmers all over Europe, face challenges including economic viability, loneliness in their work, and difficulty recruiting new shieling workers. Nevertheless, shielings possess a number of qualities, and include practices such as silvopasture, that meet urgent societal needs like climate mitigation, increased food security, and rural development of marginalized communities. Instead of being regarded as an outdated agricultural production mode, shielings and shieling practices should be adapted to meet new societal challenges.

This presentation will focus on both the results of interdisciplinary studies of the history of the shieling Kårebolssättern, and on present challenges faced by shieling activists, the Kårebolssäter Preservation Group, and heritage management.

3 FROM THE ARCHAEOLOGICAL PALIMPSEST TO THE MEETING POINT. TWO CENTRAL PLACES IN THE CANTABRIAN MOUNTAINS, L.LINARES AND CUEIRU

López, Pablo (Universidad de León) - Fernández Mier, Margarita (Universidad de Oviedo)

The intense research work carried out by the LLABOR group on the inhabited villages in the Cantabrian Mountains has provided qualitative archaeological data on the territorialization processes of communities that have used or inhabited the territory from the Neolithic Period to the present day.

Nevertheless, certain sites acquire a special significance within these territorialities that makes them central meeting places. The archaeological excavations at these sites have documented a complex superimposition of occupation

levels. These elements go beyond the archaeological palimpsest giving a resilient character to these landscapes that is codified by the diverse communities cosmopolitan's that re-signify and appropriate the space.

Some of these conceptualizations have come down to us thanks to the extensive local knowledge treasured by the current inhabitants of rural territories. Archaeology provides us with new diachronic data that allows us to understand the identity relations of the communities with their pasts or the centrality of the meeting points as places where political relations -both micro-political and multi-scalar- take place.

L.linares and Cueiru are two meeting points where we have excavated and whose results will be present in this session. Both are located on the borders of historical territories, and crossroads and are currently hosting important celebrations for the region. However, they hide an important overlapping Prehistoric, Medieval, and post-medieval occupations site. The comparative and relational study of the two sites allows us to unravel the different strategies deployed to use and re-signify these landscape landmarks.

4 BEYOND THE 'ROYAL HUNTS': CULTURAL TRACES FOR THE COLLECTIVE CAPTURING OF UNGULATES IN THE SOUTH-CENTRAL ANDES

Oyaneder, Adrián (University of Exeter)

The collective capture of ungulates with V or funnel-shaped traps is a phenomenon extensively documented in Africa and Asia (e.g. desert kites). This practice in the South-Central Andes, known as chaco or royal hunts, has been sparingly studied, with few references alluding to its high effectiveness in capturing vicuña (Vicugna vicugna) during the pre-Hispanic era by the Inka and, more recently, by Andean people targeting vicuña and feral donkeys.

The collective practice for the capture of animals is a more complex phenomenon than has been documented so far in the South-Central Andes. Evidence from colonial bookkeeping speaks of an ethnic group of specialised vicuña hunters, Choquela. Under the same name as these hunters, in the southwest of Lake Titicaca, the Aymara people have a ritual collective dance that performs the hunting of vicuña using the chaco trap. Similarly, the Uru Chipaya in the Salar de Coipasa of Bolivia has myths and rituals that evoke the hunting and consumption of vicuña by untamed winds that come from the Pacific, ascending towards the Bolivian highlands. Along the path of the wind from Chile to Bolivia, key toponyms are mentioned, which are associated with the habitat of the vicuña, which also coincides with the largest and denser set of chaco traps known to date in South America with approximately 300 traps.

Utilising this broad range of evidence, the present work complements the biography of V-shaped traps in the South-Central Andes, particularly in Northern Chile. Moreover, it seeks to document the origins and cultural richness of a mode of animal capture in the Andes that persists in Argentina, Bolivia, and Peru, but under official implementation associated with vicuña preservation efforts and fibre exploitation.

5 ANALYZING THE PASTORAL LANDSCAPE IN THE VALLEY OF SONDONDO, PERU. NEW METHODOLOGIES TO INTEGRATE A SEGREGATED AREA

Aparicio Martínez, Patricia (University of Toronto; Pontificia Universidad Católica del Perú) - Delgado Arcos, Jose (Universidad de Oviedo) - Fernández Mier, Margarita (Universidad de Oviedo)

The highlands of the central-southern Peruvian Andes stand out for their exceptionally transformed landscapes. While the abundant terrace systems have been well studied, little is known about the pastoral landscape of the high-altitude Puna. In the Valley of Sondondo, the Puna supported wetlands, which were used by communities to harvest water for camelid grazing and irrigate fields in lower altitude zones of the valley. Archaeological traces of these activities are evidenced by complex livestock corrals. The corrals also served as important meeting points for communities, such as the sacred practice of chaccu, highlighting the complex relationships between productivity and rituality in the past.

In this talk, we will present the preliminary findings of several recently excavated livestock corrals in the Valley of Sondondo. More specifically, we will discuss how microfossil analysis helped us identify the practices undertaken at the corrals, their possible functions, and their place within the agricultural system. We will also discuss some methodological challenges of studying upper montane areas. Ultimately, our study of pastoral corrals will allow us to document the processes of interaction and vertical relationship of the Puna, which served as a supplier not only of meat and fibers but also of crops and fertilizers during the pre-Hispanic history of the valley.

1192 CURATING ARCHAEOLOGY? HOW TO EXHIBIT THE PAST

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Armstrong Oma, Kristin (University of Stavanger) - Nilsson, Per (The County Museum of Östergötland) - Ramberg, Linn (University of Stavanger)

Session format: Regular session

Public outreach is more important than ever, and a poignant way of doing so is by making archaeological exhibitions, in and outside of museums. Communicating archaeology via exhibitions go back to the infancy of archaeology as a discipline and have developed greatly since they were a mixture of curiosity cabinets – Wunderkammern – and an organisation of based on Thomsen's periodisation. This session endeavours to delve into the process of curatorial practices and the making of exhibitions from the inside out, by inviting speakers who are themselves immersed in curatorial practices and can offer an insider's perspective.

The session addresses issues aligned with the production of content, such as the selection of a theme, developing a concept, selection of objects, writing texts, and developing, implementing and producing design. Important questions to reflect upon are: Who commissions exhibitions? How and by whom are topics chosen? Should it be research-based – and could the process of making an exhibition be regarded as a research process in itself? Who makes them – and how? What kind of competence does curatorial work need? How can archaeologists take a greater part in this process, not just as informants, but as deeply involved in the curatorial process?

By addressing these questions our aim is to start a conversation about the plethora of curatorial practices that exist at archaeological museums – to learn from each other and explore best practice development. Museums are institutions that harbour great trust with the public, and as such museum exhibitions have a power of definition. As custodians of this trust, it is imperative that we openly reflect upon our own roles in society. And taking a greater part in the curatorial process of archaeological exhibitions is both a responsibility and an opportunity for showing society the many aspects of archaeology.

ABSTRACTS

1 STRUCTURING ARCHAEOLOGICAL COMMUNICATION: CONNECTING SCIENCE AND AUDIENCES AT THE NATIONAL MUSEUM OF ARCHAEOLOGY, LISBON

de Souza, Carine (Centre for Archaeology University of Lisbon - UNIARQ; Foundation for Science and Technology - FCT; National Museum of Archaeology, Lisbon - MNA) - **Diniz, Mariana** (Centre for Archaeology University of Lisbon - UNIARQ) - **Neto, Filipa** (National Museum of Archaeology, Lisbon - MNA) - **Carvalho, António** (National Museum of Archaeology, Lisbon - MNA)

Museum exhibitions function as vehicles of communication for an increasingly diverse audience – however, the effective conveyance of archaeological collections requires a robust methodological structure to be implemented in the exhibition process. Prehistory, in particular, demands heightened sensitivity due to prevalent non-scientific perceptions associated with this period. Addressing these challenges involves complex procedures that are subject to debate and are still under construction within the field.

Presently, the National Museum of Archaeology (Museu Nacional de Arqueologia - MNA) in Lisbon, Portugal, an archaeological institution with a 130-year legacy, is undergoing an architectural and thorough conceptual redesign within the framework of the Recovery and Resilience Plan (PRR).

This communication aims to elucidate and scrutinise museographic strategies that effectively translate scientific knowledge into a discourse accessible and engaging for museum audiences. It emphasises the necessity of maintaining scientific rigour in presenting archaeological data while ensuring audience involvement. Furthermore, it seeks to explore exhibition narratives that portray Archaeology as a pertinent science in our contemporary context, transcending approaches centred solely on artefact presentation and challenging the culturally normalised preconceived ideas, fostering the construction of new perspectives and discourses.

These reflections are being developed in the course of a PhD scholarship project in Archaeology and Prehistory (UNIARQ/FCT), as part of a collaborative initiative involving the MNA and the University of Lisbon. The primary objective is to contribute to the advancement of a novel museographic approach for the Prehistory collections within a multidisciplinary team. The project integrates knowledge from Archaeology and Museology while emphasising a commitment to both present and past individuals. Whether considering contemporary visitors or honouring the memories of those from the past represented in the archaeological collections, it is dedicated to promoting understanding and appreciation for Archaeology as a resource for social transformation.

2 TO MAKE ARCHAEOLOGICAL EXHIBITIONS - THE MEETING BETWEEN THE SCIENTIFIC SPECIALIST AND THE PUBLIC

Ramberg, Linn (Museum of archaeology, UiS)

To make archaeological exhibitions are both a social responsibility and an opportunity to spread engagement, knowledge and to foster interest in prehistory.

The making of exhibitions is at the Museum of archaeology in Stavanger most often lead by an archaeologist without specific education in dissemination or public engagement. A team of several archaeologists, a designer, graphic designer, pedagogue, conservator and technicians in-house or on assignment might be included in the work from start or at a later point in the process. The reasoning behind putting the scientific specialist in charge are the deep knowledge in the specific subject and by this the exhibition can present and disseminate the latest research and the complex relation between different interpretations.

In this process there are potentially possible contradictions that affect the exhibition and how it is received by the public. When working with exhibitions, questions frequently asked is to what extent should we take into consideration what the public wants to learn and get knowledge about instead of what the specialist wants to share? Is it best to specialise one archaeologist on making exhibitions and then use consultants when needed, or should the concept and content be developed by a group, securing the quality and diversity? And who's voice counts the most in the team of various specialists?

In this paper I will discuss these questions by using two exhibitions in the Museum of archaeology, University of Stavanger, as examples. One Viking Age exhibition, and one exhibition on the Stone Age.

3 THE HISTORY OF BOHUSLÄN - FROM INSIDE THE HEAD OF AN ARCHAEOLOGIST INTO THE HANDS OF A DESIGNER

Toreld, Christina (Bohusläns Museum) - **Hansson, Pia** (Bohusläns museum)

In 2023 the Swedish Television launched the project "The History of Sweden". A series of 10 programmes visualizing Swedish history from the early stone age to present day. Museums and cultural heritage institutions all over Sweden were encouraged to meet up with local and regional history and prehistory events and exhibitions, to be prepared for the supposed huge interest from the public.

Bohusläns museum accepted the challenge and are now in the midst of a "History Year", where we dig deep into our archives, collections, research and personal memories to create an ultimate historic experience for our public. With a team of archaeologists, curators of collections, research networks, curators of education, producers, technicians, and designers we try with different kind of media to compose a multitude of experiences for our public that includes, but also goes beyond exhibition.

In our paper we will describe our process and the public reactions, but also discuss on whose initiative our work came about. Was it outside forces? Was it by orders from our management and board? Was it an urge from archaeologists and historians wanting to tell a story and designers wanting to visualize it? Or was it a mixture of all? We will also address the possibility that the concept "The History of Bohuslän", where the museum's competences, its active work in collections and cultural environments and its research networks can create a fertile ground for larger research projects concerning history and prehistory.

4 EVIDENCE, SOURCE CRITICISM AND CREDIBILITY IN IMMERSIVE EXHIBITIONS

Westin, Jonathan (University of Gothenburg) - **Almevik, Gunnar** (University of Gothenburg)

Digital knowledge transfer, not least through immersive and interactive technologies, has gained a foothold in museum exhibitions as it allows new ways to explore collections and convey contexts. Interactive exhibition elements can provide accessibility to hidden aspects or fragile artefacts and convey tactile, spatial, or emotional depth of the collections. Immersive and interactive technologies bring opportunities but how is source criticism and rigor on science dealt with? The museum as institution, and particularly historical museums, has a long-standing tradition warranting the public authentic and evidence-based narratives and experiences. Recent surveys show that the public regard museums as highly trustworthy (AAM 2021; SOM-institute 2023) but can this trust be taken for granted? We see an increased marketisation of museum's edutaining exhibitions, with temporary large-scale immersive exhibitions and roll-out of digital business-to-business formats for interactivity and display, but how transparent are the references to evidence, sources, and interpretations?

This paper presents preliminary results from a research project "Evidence, source criticism and credibility in museums' digital transition", aiming to deepen the understanding of the museum's role as administrator and educational mediator of evidence-based knowledge in the ongoing digital transition. An inventory of museum exhibitions in Europe, with focus on the uses of technologies and pedagogies, has been carried out to map and analyse different interaction models and pedagogical frameworks. As a case study with a focus on the experiences of producers, pedagogues and

visitors, the project has followed the implementation of a Virtual Reality exhibition of a digitally reassembled stave church in the permanent Viking exhibition at the Swedish Museum of History. We have for this session a keen interest to discuss how immersive and interactive archaeological exhibitions can ensure and establish forms of dialogue around evidence, source criticism and credibility.

5 AN EXPLORATION OF PRESENTATION REQUIREMENTS FOR ARCHAEOLOGICAL EXHIBITIONS WITH THE AIM OF SHAPING COGNITIVE SENSIBILITIES IN PREHISTORIC KNOWLEDGE

Bielinska-Majewska, Beata (District Museum in Torun, Department of Archaeology) - Majewski, Jakub (Kazimierz Wielki University, Bydgoszcz)

Archaeological exhibitions were, and remain even today, one of the key methods for the popularisation of archaeological heritage, with an especially vital role in disseminating cultural heritage on the regional level. Such exhibitions today must fight to present their content in a visually attractive way, and to engage their audience with a variety of methods, including interactivity. To compete for the public's interest, a museum exhibition may not limit itself to conventional elements such as traditional material exhibits, illustrations and photographs. Multimedia elements are also needed, including films and animations, digital interactive games and applications, either in flatscreen, or extended reality formats. Conversely, these elements should support and enhance, rather than overshadow the traditional components of the archaeological exhibition. The present paper represents an initial foray into examining the presentation requirements for the earliest ages of the human story, in the context of new media and communications technologies used in modern archaeological exhibitions. A core question here is the extent to which museums can use new technologies without disrupting their audience's cognitive sensibilities.

6 FRACTURES AND REPAIRS: A CASE STUDY IN INTERDISCIPLINARY CURATORIAL PRACTICES

Armstrong, Felipe (Museo Chileno de Arte Precolombino; Universidad Alberto Hurtado) - Alvarado-Lincopi, Claudio (Museo Chileno de Arte Precolombino; Centro de Estudios Interculturales Indígenas)

Museums, as artefacts bridging times and cultures, have historically functioned within academic paradigms, and Museo Chileno de Arte Precolombino, in Santiago, Chile, has emphasized archaeological narratives over the last 40 years. Today, however, we recognize the museum as an inherently interdisciplinary space, and we are navigating new curatorial avenues that integrate contemporary art, cultural debates, and 21st-century challenges without forsaking our archaeological foundation.

Our recent temporary exhibition, *Fractures and Repairs*, centred on fractured and repaired objects, epitomizes this shift. It transcends traditional boundaries by engaging with broader discussions such as environmental crises and relevant historical reflections, including the 50th anniversary of the Chilean coup d'état. This initiative emerged amidst institutional changes, post-pandemic adjustments, and resource constraints, demanding an innovative research process that balances academic rigor with public engagement.

By fostering an interdisciplinary team from across the museum's departments, we underscored that archaeology, while foundational, must engage in continuous dialogue with contemporary issues to fulfil its role in curation. This case study not only reflects our commitment to rethinking the museum's role but also highlights the necessity of collaborative, research-driven curatorial practices that resonate with diverse audiences.

This paper aims to contribute to the dialogue on curatorial practices in archaeological museums, advocating for a model that embraces interdisciplinary collaboration and addresses the pressing issues of our time, based on our most recent temporary exhibition.

7 OUR WAY HERE. HOW CAN ARCHAEOLOGICAL PERSPECTIVES BECOME PART OF THE CURATORIAL PROCESS?

Nilsson, Per (The County Museum of Östergötland)

In 2022, a new cultural historical exhibition called "Our Way Here" was inaugurated at the Museum of Östergötland, Sweden. The exhibition covers 11,000 years of regional history, and the visitor is led backward through time, like an archaeologist excavating through cultural layers. A group of six people with different professions were responsible for the making of the exhibition, including myself as responsible for research and contact with experts. The group worked together from the very start of the project to the final vernissage of the exhibition. This meant that the group had a constant dialogue on all kinds of subjects, including research, storyline and curation, as well as on the challenging task of making choices between numerous important stories and artefacts. In this paper, I will use my involvement in the exhibition process to discuss how and why the knowledge and experiences of archaeologists can be useful tools during the complex process of creating and curating a large exhibition.

8 EXHIBITION-MAKING AS AN INTERDISCIPLINARY EXERCISE: COMBINING ART, ARCHAEOLOGY AND DESIGN

Danielsen, Marte Moen (University of Stavanger) - Armstrong-Oma, Kristin (University of Stavanger)

Integration of design and academic content can be a success factor when making archaeological exhibitions. A seamless way of making this work is by in-house cooperation between designer and archaeologists-as-curators throughout the production process. In such a set-up, a concept is developed by the academic staff, based on an assignment from the management. The exhibition is hammered out in close collaboration between archaeologists/curators and designers. This approach safeguards that the look and feel of the exhibition directly and, equally important, subtly, conveys the intentions and aims central to the concept.

In this presentation, a designer and an archaeologist will reflect upon such a collaborative process by discussing three exhibitions where a third element is thrown into the mix: art that borders archaeology.

We have curated and designed three exhibitions that in different ways combine art and archaeology, working closely with artists that by their own practice. The first commented on museums and their role as knowledge institutions, the second on prehistoric objects as art objects – inviting the visitors to meet the makers of the past, and the third on the archaeology of the future and how mass material from our culture will form the archaeological record of our time.

Beyond raising the question: "Do artworks have a place in archaeological exhibitions?", these collaborations raised some interesting questions about what archaeological exhibitions are, and what they should be, but also what they could be. The artists reimagined the archaeological collections in fundamental ways and illuminated questions such as how to communicate the formation of the archaeological record, the messy interfaces the objects have been part of.

9 GOLD OF THE GREAT STEPPE: REFLECTIONS ON CURATION, DESIGN, RESEARCH AND ENGAGEMENT FOR AN ARCHAEOLOGICAL LOAN EXHIBITION

Roberts, Rebecca (University of Cambridge) - Amir, Saltanat (University of Cambridge)

In September 2021 to January 2022, the Fitzwilliam Museum, Cambridge, UK, hosted the 'Gold of the Great Steppe' exhibition. Featuring Iron Age artefacts on loan from the East Kazakhstan Regional Museum of Local History, the exhibition aimed to centre the research and interpretations of Kazakh archaeologists for a British audience who were largely unfamiliar with Kazakhstan and its archaeology. The text of the exhibition and accompanying catalogue drew on research by Kazakh archaeologists, and aimed to convey both the beauty and the scientific importance of the artefacts to the public. During the exhibition, a programme of non-destructive research on the materials was carried out in Cambridge, in consultation with colleagues in Kazakhstan. This paper reflects on the curation, design, build, and transportation of the exhibition, which was undertaken during extraordinary times, beginning just before the first lockdowns of March 2020, and ending with the tragic events of Bloody January in Kazakhstan. Two years on we also reflect on the delivery, reception and outcomes of the exhibition, exploring those aspects which worked well, and those we could have done differently, as well as the longer-term impacts that have been generated.

10 THE UNDERGROUND TURKU: 30 YEARS OF URBAN ARCHAEOLOGY EXHIBITIONS IN FINLAND

Aalto, Ilari (Aboa Vetus Ars Nova Museum; University of Turku)

Turku is the oldest town of Finland, founded during the Swedish rule at around the year 1300. It was also one of the few Swedish medieval towns that had stone houses, the ruins of which have been preserved underground to the present day. A remarkable area of these stone houses was excavated in 1990s around the so-called Villa von Rettig, and it was decided then to turn the area into a museum of archaeology and contemporary art, Aboa Vetus Ars Nova (Latin for old Turku and new art). The archaeological section of the museum consists of an underground area exhibiting the ruins of five medieval houses, built in the late 14th century and the early 15th century. The archaeological activity has continued within the museum since 2005, and participatory archaeological excavations are one of the best-known activities at the museum. The museum houses their own archaeological collection that is open both for exhibitions and for research. Simultaneously, the museum has had two permanent exhibitions on archaeology, and the third exhibition is scheduled to open in 2025. How to present a set of large but very fragmentary find material? How to make hundreds of years' worth of urban stratification understandable and accessible to the public? This presentation gives an overview on how the archaeological research and contents have been presented to the public and what has been learned during the three decades in this challenging yet unique environment.

11 PEOPLING ANTIQUITY. COMICS IN EXHIBITION NARRATIVES

Chourmouziadi, Anastasia (University of the Aegean) - Tourtas, Alex (University of the Aegean)

Currently, every archaeological museum exhibition includes the word "narrative" in its description. However, the majority of exhibitions fail to support their narrative aims, disregarding the essential requirements of a presentation in order to be recognised as a legitimate three-dimensional multimedia narrative. The dominant role of ancient objects,

as building blocks of the exhibition, appointing to all other exhibition media a marginal supporting role usually hinders the development of a meaningful and coherent storyline. But most importantly perpetuates the absence of one of the essential narratorial factors: humans. Either we have in mind the people of the past or those who are studying them today.

Exploring the use of comics as a medium can be beneficial in improving the narrativity of an archaeological exhibition and highlighting the role of human actors. Comic components are utilised as decorative embellishments, informative supplements, or expressive devices primarily aimed at children. Nevertheless, these techniques fail to consider the distinctive narrative attributes of the medium and its potential to play a prominent role in the exhibition, effectively addressing the aforementioned issues. In this line of thought, we are working on the idea of an exhibition that is developed as a three-dimensional graphic novel, which instead of augmenting the archaeological objects' is being augmented by them.

12 IS THE MUSEUM A SAFE SPACE FOR THE DEAD? ANALYSIS OF HOW EXHIBITION CHOICES AFFECT OUR UNDERSTANDING OF HUMAN REMAINS

Crescenzi, Nicole (IMT School for Advanced Studies Lucca) - Nilsson Stutz, Liv (Linnaeus University)

Museums are places of learning, communication, and inclusion, with aims to foster diversity. The public is an active participating stakeholder, a necessary interlocutor, and a stream of revenue. Here it is important to strike the right balance between attracting the public with creative, informative, and sometimes provocative exhibitions, while at the same time not alienating or offending it. But who represents the public? What does it want? This question comes into focus when discussing the increasingly contested topic of the exhibition of human remains – once unproblematic and popular, now increasingly called into question. In the European museum community, the dominating view assumes that the public has no issue with the display of human remains from archaeological contexts. This contrasts with other significant debates in the museum world, such as calls for decolonization and repatriation. Since the issue is likely to grow in the coming years, this paper problematizes and engages with its complexity.

To address this complexity, we have developed a model that understands human remains in collections as liminal and situated on a spectrum between “objects of science” and “lived lives”. The way we view them depends on our own positionality, but also their age, level of preservation, our level of familiarity, our perception of their vulnerability, and what we – through research – know about them and how that is communicated. In this paper we apply this spectrum model in the analysis of survey data of museum visitors, and in a case study of exhibition choices made at the Gothenburg City Museum (Sweden). The results allow us to discuss the impact of the process of curatorial practices in the perception of sensitive content – and asks the question: how, if at all, can we ethically exhibit human remains?

13 ETHNOGRAPHIC PERSPECTIVES ON ANATOMICAL SPECIMENS: CURATORIAL PRACTICES AND PUBLIC ENGAGEMENT AT THE MUSEUM MORGAGNI OF HUMAN ANATOMY (PADUA, ITALY)

Cusan, Alice (University of Aberdeen) - Magno, Giovanni (Morgagni Museum of Human Anatomy- University of Padua)

Recognizing human remains as integral components of the archaeological record, this research contributes to understanding past populations, history of medicine, and societal dynamics, examining the curation of anatomical specimens within the Museum Morgagni of Human Anatomy at the University of Padua from an ethnographic perspective. In addition, the perceptions of visitors will be considered, as to navigate ethical considerations regarding the delicate nature of studying human remains. Therefore, the investigation unfolds in two dimensions: an exploration of curatorial methodologies encompassing the cataloging, preservation, and presentation of human remains, and an analysis of visitor dynamics, seeking to bridge the gap between curatorial decisions and public understanding. A critical aspect highlighted is the importance of curatorial profiles with a multi-disciplinary approach. The need for a comprehensive understanding of decision-making processes, especially concerning human remains, underscores the urgency for curators possessing expertise in museum studies, heritage management, and bioarchaeology. This research significantly contributes to scholarship in museum studies, advocating for increased transparency in decision-making processes and stimulating discourse on ethical considerations. It aspires to cultivate an awareness of the multi-faceted aspects inherent in the curatorial practices of human remains, fostering a more informed and ethically grounded approach within museum institutions.

14 CLIMATE STORIES: PAST EXPERIENCES, CURRENT CHALLENGES

Gundersen, Ingar (Department of Archaeology, Conservation, and History, University of Oslo)

What does past climate extremes have in common with modern anthropogenic warming? The Little Ice Age (~1500-1800) contrasts in many ways the current situation. Instead of global warming, it's about global cooling, and as opposed to modern high-tech societies, European societies were at the time mostly agrarian and pre-industrial. In an upcoming temporary exhibition at the Climate House in Oslo, targeting young adults, the research project CLIMCULT

at the University of Oslo nevertheless asks the questions “how did people cope the last time we encountered rapid climate change”, and “what can be learned from past experiences with climate change? Thus, we wish to engage in an active dialogue with the public and demonstrate how knowledge of the past can contribute to current societal issues.

Museums are crucial contact zones linking academic and public discourses and are seen as neutral spaces in an increasingly heated debate. As such they constitute ready-made infrastructures to disseminate climate research. The exhibition will make use of the rich human and natural archives from this period and discuss how past adaptations resonate with current challenges. In doing so, we wish to move away from a one-dimensional crisis narrative and highlight how human agency is a crucial variable for the social consequences from climate extremes. Thus, by moving humanistic research to centre stage of climate research, we wish to communicate an optimistic story that counter climate anxiety and motivates for constructive action.

In this talk, I will discuss our process from idea to concept, and from concept to individual stories and objects, and how these stories can help to bridge between the past and the present. This follows recent suggestions that ‘anthropogenic’ perspectives can assist museums in advancing from information to storytelling. The exhibition is set for early 2025.

15 CURATING IN THE CLASSROOM: ‘LOST AND FOUND: COLLECTING ANTIQUITY AT KENYON COLLEGE’

Kontes, Zoe (Kenyon College)

University archaeological collections serve to educate students and the wider public not only about the artifacts they hold, but also about the process of curation. In Fall 2023, two faculty members at Kenyon College (an archaeologist and an art historian) joined their students together to curate an exhibit of late antique Roman material that had been donated to the college, none of which had a secure archaeological context. The process allowed a valuable opportunity for the faculty to manage the curation of an exhibition, guiding the students’ research and helping them consider how to present their work to the public. One group worked on selecting, studying and displaying the artifacts themselves—primarily objects of everyday use such as terracotta lamp fragments, coins, and textile fragments, and determined what, if anything, they could learn from this material out of its original context. Issues of collecting, provenance, museum ethics, and authenticity formed the basis of the questions the second group asked of the material, and posed to viewers in a series of wall texts. This paper will discuss the process of curation of this exhibit, as well as the important contribution it made in addressing both the larger controversy surrounding the acquisition of unprovenanced objects, and the more local issue of whether a university collection can be the “right” place for artifacts which have potential educational value even if little true scientific value. The exhibition allowed both the student curators and the viewers to question the role of Kenyon College in owning and displaying such objects. Such transparency is key in maintaining the trust between museums (or in this case university collections) and the public.

16 MATERIAL CULTURE IN MOTION: THE TRANSFORMATIVE POWER OF ON-SITE ARCHAEOLOGICAL EXHIBITIONS

Fiano, Francesca Romana (University of Ferrara)

At the edge of the given framework, the proposal aims to share in first person the experience of a scientific advisor in a non-conventional archaeological exhibition of findings from an ongoing excavation, displayed in the excavation site itself: Appia 39. Souvenirs from the Critical Zone (Rome 2022).

One step before museums, how do findings, as fragmented objects from an obsolete time, manifest in their historical contexts? What does this relationship signify for understanding the material and immaterial values of artifacts? As numerous researchers have noted, appreciating the value of any artifact is closely linked to understanding its related context and intertwined past functions. We have an active relationship with objects as long as we interact with them. However, if objects still populate our daily lives as active agents, it does not seem to be the case for ancient ones displayed in museums.

Differently in the excavation sites, laboratories and deposits, the ancient findings are active agents, engaging in restoration, drawings, analytical activities where their informative potential and historical and cultural meanings emerge. Therefore, an artistic project took place in such interactive settings with the aim of engaging with material culture in the meaning-making moment offered by the archaeological context excavation and to communicate cultural heritage values. The exhibition setting was the excavation site, designed to include public participation in archaeological fieldwork as a precondition for engaging with material culture. The artistic research and its outputs as sensorial assemblages, installations, artworks, and relative narratives, dealing with contemporary findings, engaged the public in the archaeological deductive processes leading to a shared interpretative process of value assignment to artifacts and understanding of their cultural meanings.

The paper aims to discuss limits and opportunities of implementing exhibitions on archaeological sites by sharing the creative, methodological, and research processes from the archaeologist’s point of view.

NEW ARCHAEOLOGICAL EXHIBITIONS AT A TRAIN STATION

Paulsen, Charlotte (Museum Skanderborg)

In 2020, Museum Skanderborg's main department moved to a location in a former post office and administration center at the train station in Skanderborg. The museum is named Platform1, as it is placed by track one. A transformation begins summer 2024, renovating the administration building and adding a new entrance building. The museum is ready to be furnished by November 2025 with new exhibitions and activities. Being a museum also in charge of archaeology, several exhibitions of archaeological sites are being planned, working within a concept called "The cultural waiting room". Close to the entrance, with café and museum shop, smaller exhibitions rooms, "compartments", will be placed, housing special exhibitions of up to date themes, e.g. recent archaeological finds. In the basement, two sites of national importance will be displayed: a magnificent golden horse equipment of a Viking chamber grave from Fregerslev and the cult atmosphere around the Holy Valley of the Iron Age. The museum already displays an open lab where visitors can follow the work of the museum staff as archaeological finds are being cleaned and categorized, historical artefacts are registered, and archives material are scanned. Our aim is that there will be no "behind the scenes" in the work with heritage and on special occasions, the visitors will be invited to join in the activities.

In this paper, we will like to share our thoughts on the process of planning these new exhibitions and open lab, implementing user studies, field archaeologists, artists etc. A station is neutral space. Everybody can enter a station. As a museum, this must be exploited, so that even those who could never dream of entering a museum, suddenly finds themselves in a room with stories that they can reflect on and identify with.

1193 A LIQUID CONTINENT. LINKING SEASCAPES, SOCIAL POWER AND ECOLOGY IN THE MEDITERRANEAN

Session theme: 6. The Mediterranean from Within

Session organisers: vanni, edoardo (University for Foreigners of Siena) - Cambi, Franco (University of Siena) - Blasco Nuñez, Soledad (Centre d'Arqueologia Subaquàtica de Catalunya)

Session format: Regular session

This session explores the mobility of people and goods across the Roman Mediterranean and connectivity between different seascapes. The focus will be, geographically, on the North and West Mediterranean, in particular Italy, France, Spain, Morocco, Tunisia and island archipelagos, attempting to explore the network of mobility through inland and coastal landscapes to produce new insights about long-distance movement and cabotage phenomena. Historically, the session aims to collect contributions that deal with contexts from the end of the Roman Republic to the beginning of the Empire when substantial changes occurred in terms of social actors, ecology, war events and economic transformations. Regarding social agency, our interest is to investigate the role of aristocratic élites in activating this Mediterranean mobility and the underprivileged at the passage of the new imperial control. Methodologically, the session also aims to link vertically and spatially the underwater archaeological contexts, represented by several shipwrecks, conceived as privileged information sites, with the networks of material and immaterial infrastructures widespread along the superficial seascapes (harbours, rivers, islands, cultural, social and economic connections). In this perspective, the Mediterranean is not just a sea between lands but a veritable continent that connects.

This session seeks to gather insights into the Ancient Mediterranean as a distinctive realm of interactions, transforming it into a shared arena of coexistence. We invite contributions spanning Italy, France, Spain, Morocco, and Tunisia during the 2nd Century BC and the 2nd Century AD, with a particular focus on the following themes: the significance of islands in Mediterranean dynamics; the impact of technology on the proliferation of maritime travel; cross-maritime and coastal movements; the correlation between mobility and social standing amid seascapes; shifts in ecology; connections between inland and coastal regions; and the role of shipwrecks in shaping the narrative of the Mediterranean.

ABSTRACTS

1 MOVING STONES. THE SPREADING OF GRANITES FROM THE TUSCAN ISLANDS IN THE ROMAN PERIOD

Pagliantini, Laura (Università degli Studi di Siena)

In the 2nd century AD, the exponential increase in demand for white and colored marbles favored not only the expansion of existing quarries but also the initiation of extraction of local marbles, including the gray and red granites of Elba, Giglio, and Sardinia. Elban granite, extracted in the western part of the island, was mainly used for the construction of structural elements of buildings, particularly for the installation of large columns, employed in Rome in numerous public buildings of the imperial age. The quarries of Elban granite therefore experienced moments of

non-marginal activity in the 2nd and 3rd centuries AD, linked to the production not only of structural elements for public and private buildings but also of artifacts connected with the cultic sphere. The enhancement in the exploitation of this resource could be linked to the presence on Elba of prominent figures in Roman politics, including the powerful prefect of the praetorian guard of Hadrian, Publius Acilius Attianus, whose activity also appears to be attested in another important marble basin, such as the Versilia. Analogously to what happens on Elba, also on the island of Giglio, a significant impulse in the exploitation of granite quarries could be attributed to the powerful Domitii Ahenobarbi family. The known information and the results of the most recent research converge in identifying in the 2nd and 3rd centuries AD a period of economic growth for the entire Elban island territory, probably supported by a flow of massive investments by powerful senatorial families. In addition to the exploitation of granite, a considerable boost is certainly to be attributed also to the vitality of maritime commercial traffic within which Elba is inserted with its ports, as evidenced by the presence on the island of sailors from the imperial class.

2 FLUIDITY AND MATERIALITY. LINKING MEDITERRANEAN WATERSCAPES AND LAND THROUGH MATERIAL EVIDENCE.

Vanni, Edoardo (University for Foreigners of Siena - Italy) - Barthélemy, Filippo (Aix-Marseille (MoMarch) - France)

This study investigates the landscape and economic transformations in the western Mediterranean during the 2nd and 1st centuries B.C., emphasizing the crucial role of underwater and maritime archaeology, together with land infrastructures, in deepening our understanding of the Roman economy in a period marked by significant territorial expansions, internal conflicts, and an intensification of commercial exchanges. With particular focus on the Italian peninsula, it examines the landscape modifications linked to changes in agricultural practices, influenced by economic, political evolutions, and the trends of the time. Tangible evidences of such transformations are the amphorae, which, through all levels of their "chaîne opératoire" highlight the intensity of production, distribution, and consumption as well as the profit ambitions of Roman society, increasingly leaning towards individualism. The analysis of these containers reveals not only details about the diet and commercial habits of the Romans but also about the agricultural techniques adopted and the changes in the rural landscapes of ancient Italy. The "boom of wrecks" in this period in the Mediterranean testifies a significant expansion of maritime goods transport, including those rarely survived in the archaeological record such as wood, barrels, slaves, and other perishable materials. Although these goods leave few traces, they are essential for deciphering the complexities of the Roman economy and the trade networks of the era. The interconnected study of terrestrial and underwater contexts, leveraging interdisciplinary studies, aims to return a complex and layered vision of the socio-economic dynamics and landscape changes that characterized the Italian territory and its waterscapes in the late Republican period

3 MARITIME ROUTES AND ROMAN TRADE NETWORKS: INSIGHTS FROM THE CAMAGGI-TOMASELLO SHIPWRECK (2ND -1ST CENTURY BC)

Barthélemy, Filippo (MoMarch - University of Aix-Marseille) - La Rocca, Roberto (Soprintendenza del mare - Regione Siciliana) - Carrera, Francesco (Soprintendenza Nazionale per il Patrimonio Culturale Subacqueo)

Research on the Camaggi-Tomasello shipwreck, located off the coast of Aci Trezza and Capo Mulini (Catania, Sicily), offers exciting insights into the extent of trade and mobility in the Roman Mediterranean between the late 2nd and early 1st centuries BC. Discovered in 2009 by amateur divers, archaeologists first surveyed the wreck in 2016 and employed various methods of documentation, including photogrammetry and sampling of four amphora types found on site. The results of this survey found that amphorae not only make up the bulk of the ship's cargo but also mark the transition from Greco-Italic to Lamboglia 2 type. This marked transition supports a scope of trade activity in the Adriatic that likely originated from central or south-eastern Italy and presumably aimed at redistribution centers in the Western Mediterranean. In partnership with the Soprintendenza del mare - Regione Siciliana new examinations of the Camaggi-Tomasello were undertaken in 2024. Thus far, this research has revealed two varieties of amphorae not found in the initial survey. These particular amphora types reinforce the hypothesis of the cargo's Adriatic origin, further highlighting the complex trade networks and the intensity of short- and long-distance exchanges characteristic of the end of the Republican era - a period marked by significant economic, political, and landscape upheaval. While archaeometric analysis will be necessary to further confirm these findings, current research on the Camaggi-Tomasello wreck continues to underscore Sicily's geostrategic importance in antiquity and affirm its role as an essential passageway and hub of cultural and economic interactions across various regions of the Mediterranean.

4 POPULONIA IN THE EARLY ROMAN PERIOD: THE TOWN, THE GULF OF BARATTI AND THE SEA

Cambi, Franco (, Department of Historical Sciences and Cultural Heritage)

Born between the end of the Iron Age and the first orientalizing age, Populonia represents an anomaly among the cities of the ancient historical Etruria. With the Romanization phase (between the 4th and 3rd centuries BC) an extremely intense period began from the point of view of agricultural, manufacturing and mercantile activities. In this

context the city's port, in the Gulf of Baratti, experienced a series of very deep transformations from the point of view of urban structures, landscape and environmental setups.

Many of these transformations are linked to the changing strategic roles between Carthaginians, Syracusans, Etruscans and Romans in the Northern of the Tyrrhenian Sea. Between the 4th and 2nd centuries BC, the iron production took on an increasingly important role.

The paper intends to describe the steps of evolution in a reading that brings together urban history, the historical geography of the context, the dynamics of the landscapes, the values of the supply basins and the technological and ideal forms of contamination.

1195 PATH TO NEW HORIZONS OR HANDMAIDEN TO HISTORY? ISOTOPIC STUDIES ACROSS THE PREHISTORIC?HISTORIC DIVIDE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Trentacoste, Angela (The British School at Rome, Italy) - Gillis, Roz (Referat für Naturwissenschaften - DAI) - Makarewicz, Cheryl (Institut für Ur- und Frühgeschichte Christian-Albrechts-Universität)

Session format: Round table (without formal abstracts)

Isotopic data offer the possibility to investigate individual life histories, tracking growing conditions, and consumption and mobility of both animals and humans, now with high-resolution sampling strategies that can drill into sub-annual changes. This has dramatically refined the temporal purview of materials typically dealt with on the scale of centuries. Therefore provide a temporal scale that can be integrated with the textual and epigraphic sources that inevitably shape investigation and interpretation of later periods. This brings with it a series of opportunities and challenges as archaeologists, archaeological scientists and historians grapple with a material record often different from previous epochs, ancient communities often organized in new and potentially different ways, and a interpretive narrative often dominated by a corpus of high-resolution but intrinsically biased documentary sources. Are isotopic data opening the door to new horizons and contributing to new interpretive models for understanding of human societies? Or simply providing high resolution data recycled through well-trodden generalizations, assumptions, and simplistic reconstructions of human behavior? What lessons can be learned (or not) from approaches that cross the prehistoric-historic divide, considering the many anthropological and taphonomic differences that come into play?

This session invites prehistorians, Classical/historical archaeologists, archaeological scientists and stable isotope specialists to a mutually constructive dialogue. Discussion will seek to identify primary theoretical and interpretive problems and to construct new frameworks to surmount them, linking anthropologically-informed models with integrative datasets, in order to find new pathways forward in the use of isotopes in examining questions on the formation, transformation, and dissolution of human communities. This may include plant and animal husbandry, human diet, mobility, urbanisation, social complexity and inequality. Overall this session aims to push beyond the status quo, and herald in a new era of integrated archaeological stable isotope investigations that bring new understandings to key questions regarding proto-historic/historical societies.

1208 "BUILDING BRIDGES: ADVANCING ARCHAEOLOGICAL HERITAGE AND TOURISM MANAGEMENT". ORGANIZED BY THE COMMUNITY ON THE MANAGEMENT OF ARCHAEOLOGICAL HERITAGE AND TOURISM

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Fonseca, Sofia (Teiduma, Consultancy on Heritage, Culture and Sustainability) - Thomas, Ben (Society of Architectural Historians)

Session format: Workshop

Join us for an engaging session at the upcoming conference, where the Community on the Management of Archaeological Heritage and Tourism will gather to reflect on the achievements of our working groups over the past year and set our goals for the future. The working groups will present their work on: Communication in Archaeology; Guidelines for Sustainable Archaeological Tourism in Europe; Accessibility at Archaeological Sites; and Climate Change and Its Impacts on Archaeological Sites.

A second part of the session will revolve around organizing the Sense and Sustainability II conference in Croatia, a pivotal event that promises to bring together experts and enthusiasts alike to explore innovative approaches in preserving and promoting our archaeological heritage while ensuring sustainability. Together, let's chart a course towards a harmonious balance between heritage conservation and responsible tourism.

This session, organized as a workshop, offers a unique opportunity to collaborate, exchange ideas, and contribute to the continued growth and development of our field. We look forward to your participation and the collective impact

we can make in advancing the management of archaeological heritage and sustainable tourism. Join us in shaping a better future for our cultural heritage.

1225 GENERAL SESSION

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: European Association of Archaeologists

Session chair: Amanda Chadburn

Session format: Regular session

This is a general session, where authors present papers on diverse topics without a specific theme. The session is overseen by the EAA and as such does not have official session organisers.

ABSTRACTS

1 GREEN MORTARS FOR CONSERVATION: UTILIZING AGRICULTURAL AND INDUSTRIAL WASTE FOR SUSTAINABLE RESTORATION

Adomako, Regina (University of Evora, Portugal; University of Sapienza, Rome)

This research project investigates the feasibility of using agricultural and industrial waste, specifically olive tree stones, to create environmentally friendly green mortars for the conservation and restoration of historical structures. The study employs a multi-faceted approach, beginning with the characterization of waste materials through standardized tests like optical microscopy, FT-IR, SEM-EDS, and XRF. The subsequent formulation and characterization of the green mortar involve assessing its mineralogical composition, chemical properties, and structural integrity.

A pivotal aspect of the research is the compatibility testing of the green mortar with historical mortars to ensure its effectiveness without compromising the integrity of original materials. Compressive strength testing is conducted to evaluate its load-bearing capabilities, and an accelerated weathering test simulates natural environmental conditions to anticipate long-term durability. The research culminates with the practical application of the green mortar on a real restoration site, validating its compatibility and effectiveness in authentic conservation scenarios.

The timeline spans sample preparation, experimentation, and data interpretation, ensuring a systematic and comprehensive investigation. By repurposing waste materials for mortar formulation, this research not only contributes to sustainable conservation practices but also addresses environmental concerns associated with waste disposal. The findings aim to promote eco-friendly alternatives in heritage restoration, supporting the preservation of cultural heritage while aligning with broader sustainability goals.

2 MORTARS IN ANCIENT ROMAN AQUEDUCTS: WHAT IS THE SECRET FOR SURVIVING THROUGH MILLENNIA?

Calzolari, Laura (Departement of Earth Sciences, Sapienza University of Rome) - Medeghini, Laura (Departement of Earth Sciences, Sapienza University of Rome) - Mignardi, Silvano (Departement of Earth Sciences, Sapienza University of Rome)

Ancient Roman aqueducts are known worldwide as a proof of the technological level reached by ancient Romans in the development of an efficient hydraulic system. In the city of Rome, eleven main aqueducts have been built during the Roman times, to guarantee the supply of water according to the increasing needs of the city. But what is more impressive is the fact that two of them, Aqua Virgo and Aqua Traiana, are still working.

Acknowledging this fact, many questions arise. Which materials do ancient Romans used for the formulation of the mortar used in the construction of aqueducts, and in particular in the inner duct that was exposed to water? What allowed the surviving of these mortars through millennia? Moreover, is it possible to take advantage from the information obtained by the archaeometric characterization in order to produce mortars that meet contemporary needs?

In order to try to reply to these questions, we studied mortars coming from the inner ducts of some of the aqueducts built in Roman times in the city of Rome, applying several analytical techniques (such as optical microscopy, scanning electron microscopy, X-ray powder diffraction) to characterize the materials used and the reaction occurred between them. Moreover, to assess the degree of hydraulicity, thermogravimetric analyses have been performed. The most relevant outcome is the discovery of an amorphous binder in some of the samples, that shows also the best value of hydraulicity, and present a composition similar to C-(N,K)-A-S-H, a phase usually found in modern cements.

3 DEVELOPING A PREDICTIVE THEORY IN RECUPERATING COLLECTIVE AND SPECIFIC MEMORY AFTER STRUCTURAL APHASIA & BIAS

Stein, Silvia O

Anthropologists and archaeologists do not often discuss that their research sites involving collective past violence, conflict, death, and human sacrifices subjectively influence them (Luhmann, 2023). Modern events similar to those of the past would be classified a crime scene (Holmes & Holmes, 2008), of a collective nature involving generational coverups and reframing of the act in collective memory (Drzewiecka, 2014). Sites of collective violence elicit at times feelings similar to “the way an anthropologist feels when holding the bones of someone murdered by a brutal regime” (Luhmann, 2023). Anthropology, and archaeology, as spiritual disciplines, require that you or I act as an instrument, a tool, a medium recuperating the aphasic information disconnection still in the past (Drzewiecka, 2014). What anthropologists and archaeologists subjectively experience has real scientific validity, and replicable reliability, though requires accepted forensic measures for reporting these cognitive (spiritual) effects during immersion into a site. My goal is to refine my methodology to develop a predictive theory of researcher motivation and site interaction (Stein, 2017). The perception and self report process can be corroborated through audiovideo recordings of the researcher while they are immersed in the archaeological site, and their insights reading the relevant literature, to further psychophysiological measures and contrast these with the subjective self reports, so that critics cannot say “it’s all in your head”, and consider alternative explanations in the fields of Archaeology and Anthropology (Drzewiecka, 2014, Luhmann, 2023, Stein, 2017 & Stevenson, 1997).

4 VIS AUGUSTA: MONOPOLY ON VIOLENCE AND WEAPON CONTROL BETWEEN LEGAL PRACTICES AND IMPERIAL COMMUNICATION

Boragno, Lorenzo (Le Mans Université)

Since Weber’s *Politik als Beruf*, a monopoly on the legal use of force has been seen as a necessary condition for a state in the modern sense. Perhaps unsurprisingly, the concept does not perfectly translate in ancient Latin: *vis augusta* wants to be just a wordplay on a famous pillar of imperial communication, no more than a way to question how imperial authorities managed to control social violence.

Besides extreme forms of anti-social behaviour, such as brigands and rebels, the tumultuous population of Rome and of other ancient metropolis represented a serious and direct threat for the emperors, whose reigns could rapidly meet an end because of an angry mob or a knife in the dark. Clearly some forms of weapon controls must have existed, and indeed narratives of rebels and outlaws confirm that defying the imperial power was a challenge beyond the reach of many: Florus and Sacrovir’s unsuccessful rebellion in AD 21, the massive and obscure phenomenon of the *bacaudes* during late antiquity, but also Bulla’s legendary criminal exploits are all good case studies to shed some lights on the topic. On the opposite side of the spectrum, not only laws and edicts aimed to implement some form of control over weapon proliferation and to obtain a very primitive monopoly on the legal use of force, but imperial authorities did also put their supreme authority over violence at the very heart of their propaganda. Some recently recovered passages of the long-lost *History of Dexippus* offer a unique perspective on the topic.

Hoping to open an interdisciplinary debate on the topic, the present speech aims to explore Roman imperial authorities’ attitude towards the “monopoly of violence” through narrative and legal texts.

5 ALPHABETICAL NUMBERING (FROM THE ANTIKYTHERA MACHINE) USED IN TRADE SINCE THE BRONZE AGE AS A TOOL FOR MEDITERRANEAN CONNECTIVITY

Fayer, Svetlana (Chercheur indépendant)

It is one of the first great discoveries of underwater archaeology: a calculating device. Its remains were found at the beginning of the XIX^e century by sponge fishermen near the island of Antikythera. It was probably assembled in a workshop in Rhodes or Syracuse or Asia Minor at the end of the 2^e century BC. The Antikythera machine is the oldest known gear mechanism. Its reconstruction includes two plates showing several graduated circles. Our analysis focuses on one of these circles, which contains 30 symbols, presumably to represent a month in the Egyptian calendar.

We hypothesize that these symbols represent part of an ‘ancestor alphabet’ which, in the Bronze Age, formed the basis of numerous writings (Etruscan, Phoenician and others). But before becoming an alphabet, this alphabetical numbering was used for accounting purposes.

It is logical to admit that between the IV^e and III^e millennia, agriculture and animal husbandry, which provided more food than the tribes needed to survive, drove them to trade. This led to the emergence of new skills for quantifying, negotiating and exchanging surplus production. Writing was thus born out of agrarian activity, initially in the service of accounting and religious cults (ensuring that these new human activities were profitable). When trade took on an “international” dimension, a common accounting system had to be invented so that the whole world could agree on sales in a single system. What’s more, the Greek alphabet was insufficient to provide the entire alphabetical number-

ing system, so three “related” letters appeared: digamma (or stigma); koppa and sampi from other languages. These THREE missing letters confirm our hypothesis that this alphabetical numbering system could not be attributed solely to the Greeks, as it represented a common accounting system connecting different Mediterranean cultures.

6 THE CONVERSION OF A FACILITY INTO AN URBAN ENVIRONMENT IN THE WESTERN PYRENEES

Mendizabal Sardonis, Oihane (Université de Pau et des Pays de l’Adour (UPPA); University of the Basque Country; Aranzadi Science Society) - Torregaray Pagola, Elena (University of the Basque Country)

The numerous archaeological investigations carried out over the last decade have made it possible to locate and characterise this thermal complex at Zaldua (Auritz/Burguete, Navarre), on the site of the same name located at the edge of the western Pyrenees. Through analysis of the discovered records we have been able to identify various changes that conditioned the development of the facility built during the first decades of the 1st century AD. The initial thermal functionality began to show certain difficulties from the reign of Claudius onwards, which led to the early end of this activity at the beginning of the 2nd century AD. In this new context, part of the site was converted into a production area, first for pottery and then,

during Late Antiquity, for metallurgy. Taking in consideration all this, the transformations identified in this facility allow us to situate the Zaldua site as a whole in the conceptual field of small towns, and to conclude that we are dealing with a small Roman city in a peripheral and mountainous environment located on the edge of a main road.

7 CREMATION PRACTICES IN ROMAN FUNERARY ARCHAEOLOGY: COMPARATIVE ANALYSIS OF POMPEII AND ROME NECROPOLISES

Miguélez González, Ana (Colegio de doctores y licenciados en letras y ciencias de Valencia y Castellón) - Alapont Martín, Llorenç (University of València) - Gallelo, Gianni (University of València) - Marcelli, Marina (Sovrintendenza Capitolina di Roma) - Mas Hurtuna, Pilar (University of València) - Ruiz López, Juan José (Fundación Antonia Clavel) - Thomas, Mark (University College of London) - Prasad, Aarathi (University College of London) - Macleod, Ruairidh (University of Cambridge) - Alfonso Llorens, Joaquin (Colegio de doctores y licenciados en letras y ciencias de Valencia y Castellón)

The study at the Pompeii and Rome Via Ostiensis Necropolises has proven essential for the research of funerary archaeology and the archaeology of death. It is essential to be able to formulate accurate and objective interpretations of funerary and commemorative rituals. Both necropolises offer the possibility to study and analyse an enormous number of cremations in one space. Through creating a new collections management database system, our research intends to take the analysis of both human and non-human remains from Pompeii and Rome necropolises to the next level. The CMS database automatically computes statistical information, graphics and diagrams relating to the content of urns. We intend the research project to be dynamic, transversal, innovative and collaborative

in nature. Our project’s methods and techniques are constantly evolving in order to obtain the newest and most precise data possible about cremation to support objective interpretations of funerary archaeology and the archaeology of death. This study compares data from two funerary archaeology projects in Pompeii (Porta Nola and Porta Sarno) and Rome’s Via Ostiensis necropolises. Both sites offer exceptional conditions for analyzing well-preserved cremation graves, facilitating the creation of comprehensive databases highlighting grave and individual aspects. Statistical analysis of these databases yields innovative, comparable data crucial for interpreting funerary rituals and materials within urns. A multidisciplinary approach combining archaeological techniques with bioanthropology, archaeobotany, zooarchaeology, and geochemistry reveals insights into cremation processes, bone gathering, and funerary deposition. Osteological and X-Ray Fluorescence analyses provide data on cremation temperatures, biological profiles, and paleopathologies. Comparing data from Pompeii and Via Ostiensis enables testing hypotheses about funerary practices and rituals. Statistical analyses also pave the way for gender-based archaeological studies, exploring potential relationships between funerary customs, grave goods, and the sex of cremated individuals to reconstruct the social identity of ancient Romans.

8 SACRED LANDSCAPE IN ALGERIA: CREATION, DEVELOPMENT, AND CONCEPTUALIZATION OF THE CATHEDRAL SAINT PHILIPPE.

Hadjas, Houria (EAA)

Introduction: Algeria, rich in cultural and spiritual diversity, unveils a sacred landscape echoing its inhabitants’ intricate tapestry across epochs. This exploration focuses on Algiers’ iconic site—the Saint-Philippe Cathedral and the Basilica of Our Lady of Africa. Introduction: Algeria’s sacred landscape encapsulates the rich history of its people. This presentation embarks on a journey through the sacred passage, emphasizing Algiers’ treasures—the Saint-Philippe

Cathedral and the Basilica of Our Lady of Africa. The narrative unfolds through three key dimensions: Creation, Development, and Conceptualization.

Historical Context: The Saint-Philippe Cathedral, once the Ketchaoua Mosque, bears witness to Algeria's religious and cultural history. This section explores its evolution and interconnections with the Basilica of Our Lady of Africa and the Mosque of the Fishery, unraveling shared histories within the sacred landscape. **Architectural and Temporal Links:** Examining mutual architectural influences between the Cathedral, Basilica, and Mosque reveals a shared cultural dialogue. Beyond religious functions, these structures symbolize Algeria's cultural and historical identity. **Archaeological Exploration and Current Challenges:**

Archaeological excavations around the Saint-Philippe Cathedral unearth a mosaic of Roman remnants, traces of the Essayida Mosque, and glimpses into daily life, enriching the historical narrative. Current challenges focus on preserving these findings and ensuring structural stability. **Evolution of a Sacred Site: Traversing Eras:** From the Ketchaoua Mosque to the Saint-Philippe Cathedral, this section explores the significance of this transformation. Examining the Cathedral's contemporary role reveals its enduring impact on Algeria's sacred landscape. **Crisis and Renaissance:** The presentation introduces a pivotal period in Algeria's history, exploring its impact on the sacred landscape. Initiatives for preservation, restoration, and redefinition highlight the resilience of Algeria's societal attachment to its heritage.

Conclusion: In conclusion, this exploration synthesizes the diverse facets of Algeria's sacred landscape. The Saint-Philippe Cathedral stands as a living testament, inviting continuous reflection on the complex dynamics between the sacred, cultural identity, and evolution over time.

9 THE MONUMENTAL ROCK RELIEFS OF HERACLES IN IRAN

Heidari, Ahmad (Azad University, Birjand Branch)

Heracles, the son of Zeus, is one of the legendary figures of Greek mythology who had a particular appeal in the eastern Mediterranean lands. During the Hellenistic period, numerous rock reliefs related to Heracles were engraved in the Seleucid and later Parthian realms. Hercules overcomes many obstacles to achieve immortality; he is a hero in battle and faces many obstacles. The narrative of Heracles bears some resemblance to the narratives of Rostam, the Iranian hero, and Gilgamesh, the Mesopotamian legend, however they have clear differences. Lately, a considerable number of rock reliefs from the Parthian (Hellenistic) period have been discovered in remote mountainous regions of southwestern Iran, some of which depict the likeness of Heracles. The aim of this article is to introduce the monuments related to Heracles in Iran. Two Hellenistic depictions associated with Heracles are studied in this article: one portrays Heracles standing nude with a mace-scepter in right hand, while the other style shows lying Heracles on a the bed and holding a bowl with left hand.

10 NEW HOPES IN THE RESEARCH OF PLEISTOCENE CAVE SETTLEMENTS IN HUNGARY - THE PROJECT KŐLYUK I

Szolyák, Péter (Herman Ottó Museum)

The history of Pleistocene prehistoric research in Hungary was primarily defined by the excavations of caves in the first decades (1906-1951). This kind of archaeological and paleontological researches became rare after the WW II. Since the research was extremely intensive up until then, the upper layers of the caves were completely dismantled at almost every site, and the documentations were often very incomplete. These together made it very hard to "re-read" the history of the sites and to compare the old results with the new ones.

The Kőlyuk I, located in the northern part of the Bükk Mountains, is an excellent and probably the last opportunities to carry out full-fledged excavations. Despite the previous illegal diggings, total stratification remained in a relatively large surface from the past 100 thousand year.

Based on the researches carried out from 1913, it previously seemed that the cave had been visited first by Aurignacian man. The cave and its foreground were regularly in use during from the Neolithic to the Roman Imperial Period.

The field surveys and the revision of the artefacts carried out from 2010 confirmed the human presence up to the Neolithic. The presence of Pleistocene man was not clear. The purpose of the excavations and laboratory tests taking place from 2021 is to find the latter one by introducing new methods and a new approach. The most important aspect is to understand the taphonomic processes in the cave, to continue and improve the detailed geospatial surveys. So far, we have only found indirect evidence for the presence of Pleistocene man, but we excavated new objects and finds of the ceramic ages. We gained ten C14 data for the artefacts and we observed a stratigraphic phenomenon linked to the ancient climate at Pleistocene-Holocene border, which affected the human presence.

11 THE ARENA PROJECT: A PRELIMINARY STUDY OF THE VILLAGE AND ITS CASTLE

Felicioni, Camilla (University of Siena) - Martini, Marco (University of Siena)

The Arena Project is a research that has began in 2019 from the collaboration among University of Siena, SABAP per la città metropolitana di Reggio Calabria e la provincia di Vibo Valentia and the Municipality of Arena with the aim of bringing back to the local community the history of this village in the southern Calabria. Starting from the first surveys in the areas surrounding the village, there have followed three archaeological campaigns inside the castle of Arena, formerly dated to the Norman and Svevian periods, in order to understand the stages of life that have gone through.

The aim of this paper is to present the data of the 2024 campaign matched with the previous ones, to give the first hypothesis regarding the original structure of the castle and its several phases that subsequently formed and transformed until the Contemporary era. In addition to that it will be presented a preliminary study about the origin and development of the village of Arena and its settlement linked to the castle.

POSTER ABSTRACTS

5 ALL SAINTS CHURCH IN FORDHAM, ESSEX, UNITED KINGDOM. THE SEARCH FOR ITS ORIGINS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Balbi, Jose (Colchester Archaeological Group (UK))

Abstract format: Poster

Oral Tradition says that in the old town of Fordham, and after the arrival of the Normans to Britain (1066), a large amount of land was donated by William the Conqueror himself to different abbeys, mainly in the north of present-day France. Many of these stories were confirmed although in reality many of the original constructions were remodelled and even date back to the era of Roman occupation (up to 410 BC). We have carried out research on the origins of the Church of All Saints, to which a foundation is attributed to the year 1086. Our work includes consultations with the library of the Abbey of Bec (France), the Domesday book in the British National Archives and a series of bibliographies and correspondence that confirm actions carried out in the 11th century, added to theories about its Roman origins that are complemented by the nearby excavations that are being carried out actually and that include, without a doubt, antecedents of the Roman Occupation of Britannia. Our research reveals more about our city's heritage and its cultural relationships.

23 AN ARM IN THE SEA: DESCRIPTION, DATING AND INTERPRETATION OF A SCAVENGED HUMAN HUMERUS FROM THE MEDIEVAL HARBOR OF OSLO

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Havard, Hegdal (NIKU - Norwegian Institute for Cultural Heritage Research) - Holmen, Khalil (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Poster

Recent large-scale excavations in the Medieval harbor basin of Oslo have uncovered marine cultural deposits with excellent preservation of organic materials. Among a diverse abundance of structures, shipwrecks, objects and food waste one find stands out as particularly striking: A human humerus, with both epiphyses completely gnawed away by canids. This singular find raises compelling questions: What story does it tell, and what – if anything – does it reveal about conditions in the medieval city?

We here situate this evocative object within its spatial and temporal contexts, and examine the historical record for any evidence relevant to the interpretation. Both stratigraphic evidence and direct dating reveal a deposition date during the 11th or early 12th century, relatively early in the city's history. The place of deposition would have been well out and away from the shoreline and piers at this time. Furthermore, the intense gnawing evident makes it likely that the bone would have had greasy parts intact. A plausible scenario is that the humerus was scavenged from a corpse, likely by a dog, wolf or fox, and dragged out on the ice during winter. This scenario, however, leaves more questions than answers.

28 MOTT-SCHOTTKY ANALYSIS AS AN ARCHAOMETRIC TOOL FOR STUDYING ARCHAEOLOGICAL BRONZES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mödlinger, Marianne (Universität Innsbruck, Austria) - Osete Cortina, Laura (Universität Innsbruck, Austria; Universitat Politècnica de València, Spain) - Doménech-Carbó, Antonio (Universitat de València, Spain) - Doménech-Carbó, María Teresa (Universitat Politècnica de València, Spain)

Abstract format: Poster

This work describes the application of Mott-Schottky (M-S) analysis of impedance data of sub-microsamples extracted from the corrosion patina of copper, bronze, and brass archaeological artifacts attached to graphite electrodes. Studied samples include Renaissance statues from the Hofkirche in Innsbruck and a variety of objects from museums and Archaeological Heritage Office (soprintendenza) in Austria (Bad Aussee, Johanneum Graz and the Tyrolean State Museums), and Italy (Genoa and San Remo), dating from the Bronze Age to the 18th century. The theoretical approach developed exploits the semiconducting nature of cuprite and tenorite, the main copper corrosion products formed under 'ordinary' atmospheric attack and moderate corrosion conditions.

Impedance measurements were carried out at sample-modified graphite electrodes in contact with 0.10 M Na₂SO₄ (pH 6.28) aqueous solution and plots of (capacitance)⁻² vs. applied potential (Mott-Schottky plots) were obtained, whose slopes and intercepts can be related with the semiconducting properties of the metal patina in turn related to the composition, compaction, thickness, porosity, roughness and other textural features. The results obtained enable the classification of the studied archaeological samples, providing information on their composition, manufacturing technique, and age.

31 FOOD, FACES, AND STREETS: ARCHAEOLOGICAL INSIGHTS INTO EARLY 20TH CENTURY LISBON'S MARKETS

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Pacheco, Susana (CFE-HTC Nova University of Lisbon) - Leão, Afonso (CFE-HTC Nova University of Lisbon)

Abstract format: Poster

Markets and trade are topics that have been widely discussed in archaeology. However, there are still gaps in their study, especially concerning the contemporary period. This poster aims to address some issues related to markets and street sales in the city of Lisbon during the end of the 19th century and the first half of the 20th century. By focusing on the sale of food products, the aim is to contribute to a better understanding of the recent social history of the city of Lisbon. Through the case study of the Ribeira Market, the oldest market in Lisbon that still exists today, we intend to analyse the evolution of the building and remains of ephemeral structures, using archaeological methods, in order to understand how it gives us information about the evolution of food sales in Lisbon and how consumer habits have changed in the city over the last century. Besides, we will complement our archaeological research with photographs whenever possible, in order to get as close an idea as possible of what Lisbon's markets were like at the time, and by comparing those with the present, we intend to understand issues related to the evolution of food sales in Lisbon.

35 CULTURAL HERITAGE AND EDUCATIONAL ARCHAEOLOGY IN PRESENT-DAY BULGARIA. TRENDS, METHODS, PERSPECTIVES

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Pramatarov, Kaloyan (National Archaeological Institute with Museum at Bulgarian Academy of Sciences)

Abstract format: Poster

The present poster offers a general review of educational programs, presented by the National Archaeological Institute with Museum at the Bulgarian Academy of Sciences, aiming at the promoting and socialization of the cultural-historical heritage. It traces the contemporary trends and methods, applied by museum pedagogues in their work with kids and students, by displaying leading examples of theoretical projects, and their practical application "on terrain". How are the movable and non-movable cultural heritage presented to the youth? What are the global trends in the respected fields, and to what extent are they applied on the local ground? The poster seeks to answer these questions by analyzing the potential that cooperation between teachers and museum workers can offer in engaging the young generation with the achievements of the civilizations, that had inhabited the present-day Bulgarian lands, and their material manifestation by presenting the knowledge in an approachable, esthetic and amusing way.

39 THE VISITOR CENTRE DEBATE: PEAK DISTRICT'S DILEMMA EXPLORED

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Bowyer-Kazadi, Emily (University of Liverpool)

Abstract format: Poster

This poster addresses the dilemma that unfolded around the Peak Districts Visitor Centres from February 2023 for around 6 months. The main question being, are visitor centres in national parks a burden or a resource for society? The proposal to close the Peak Districts visitor centres were put forward during the reviewing of the operational and staffing structure of the Peak District National Park Authority with soaring inflation and costs being cited as the main reasons for closure. However, in June 2023, an anonymous donor provided funding for the visitor centres to stay open for a further three years. The effects on staff were understandably stressful, as their jobs were at risk and there was also a stress put on local museums such as the Old House Museum in Bakewell which has an exhibition in the visitor centre and runs tours of the town from there, and Castleton Museum, which is housed entirely in the visitor centre.

Visitor centres are focal points for engaging with visitors in any location, especially in rural areas such as the Peak District. They provide services such as weather reports, booking help, safety advice and information amongst others and are used by both visitors and locals, especially where the population is more elderly, as is the case in the Peak District, and doesn't have the access or knowledge of how to use the internet. The main questions that this poster aims to ask are whether funding is the issue, or whether management capacity and capability problems within the Peak District National Park Authority are to blame for this closure? Was the closure an easy way out for redirecting funds to the areas of the Authority that need it?

40 UNVEILING ANCIENT FOUNDATIONS: GPR INSIGHTS FOR CULTURAL HERITAGE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Barone, Pier Matteo (American University of Rome; Forensic Geoscience Italy; ANCRIM (Associazione Nazionale Criminologi e Criminalisti))

Abstract format: Poster

Concordia Temple in Sicily and the Bomarzo Cathedral in Latium demonstrates the validity of the GPR technique to investigate the foundation geometry of ancient monument, where it is undesirable to apply a destructive technique.

The Duomo di Bomarzo is a remarkable historical and architectural masterpiece situated in Bomarzo (VT), Italy. Driven by a deep appreciation of the cathedral's historical context (a harmonious blend of Renaissance and Baroque styles), a ground-penetrating radar (GPR) investigation was deployed to gain insights into its foundations and potentially uncover buried remains beneath the floor and altar. The GPR investigation focused on the cathedral's interior, specifically the central and left naves, altar, and oratory. This revealed the presence of disclosed rectangular chambers beneath the floor and altar, along with unique foundation structures.

If this peculiar foundation configuration is quite unique among coeval and neighboring churches in Latium, it is not uncommon in earlier periods. In fact, it has been utilized since ancient times in various Italian and foreign locations, whenever circumstances demanded the expansion of the foundation plane by integrating the natural substrate with a newly created anthropic element. For example, GPR data acquired at the Concordia Temple in Agrigento (Sicily) show a regular sequence of short reflectors alternating with 'signal blanked' areas in the peristyle and a continuous horizontal reflector within the inner part of the temple (the cell). These results may indicate that the construction technique used in the temple was not a compact and homogeneous retaining wall, consisting of an outside layer of bricks and various grouting materials, as was previously thought. It indicates, instead, that ancient Greeks made use of the geomorphology of the surrounding area, which involved exploiting the surrounding landscape to obtain foundations (artificial and natural) capable of supporting such monumental and stately buildings.

42 TAMING DOUBTS - HOW TO SEMANTICALLY MODEL FUZZY AND WOBBLY GEOREFERENCES IN ARCHAEOLOGY AND IN THE GEOSCIENCES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Thiery, Florian (Research Squirrel Engineers Network; Leibniz-Zentrum für Archäologie (LEIZA)) - Schenk, Fiona (Johannes Gutenberg University Mainz (Institute of Geosciences); Research Squirrel Engineers Network) - Thiery, Peter (Research Squirrel Engineers Network)

Abstract format: Poster

Data modelling in archaeological research must handle uncertainty and ambiguities, especially in georeferencing. This enables re-using research data using the FAIR principles (Findable, Accessible, Interoperable, Reusable) and Open Science while guaranteeing data quality. Furthermore, for linking data, modelling vagueness, georeferencing methods and events, and FAIRification, graph-based modelling as Linked Open Data (LOD) proposed by Berners-Lee is the method and technique of choice. However, due to the enormous variety of research domains, an interdisciplinary, commonly understandable modelling of uncertainties and vagueness in research data is highly challenging. We will present two data-driven interdisciplinary use cases for dealing with and modelling vague and uncertain georeferenced findspots as LOD from the archaeological and geosciences domains.

Graph-based data modelling uses three technologies: (I) Wikidata, (II) ontologies and Linked Open data using the Fuzzy Spatial Locations Ontology (FSLO), and (III) Wikibase. The main modelling idea is to publish and model the following georeferencing information as Linked Open Data: (1) describe where the geoinformation comes from, (2) describe the method of how the coordinate was created, (3) describe the uncertainty issue(s), and (4) use references into the Semantic Web. Methods I-III can be applied to at least use cases from the archaeological and geosciences domain: Ogham Stones in Ireland and the Eruption of the Campanian Ignimbrite.

This poster presents exemplary modelling approaches for archaeology and geosciences, demonstrating the importance of dealing with doubts in the georeferencing process.

48 HOW WE DEALT WITH MOULD IN THE ADBOU BONE COLLECTION

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Theilade, Bodil (University of Southern Denmark)

Abstract format: Poster

The Anthropological Unit at the University of Southern Denmark (ADBOU) curates a collection of around 16.500 human skeletons, mainly from the Mediaeval Period. End of 2018, mold was discovered in the building housing the bone collection. Black spots appeared on the white walls, and an increasing thick layer of dust covered all surfaces.

Cleaning was intensified, floors were swept often, but even inside the boxes with the remains the amount of white dust was increasing.

A consulting engineering company tested different areas, distributed over the whole building, as well as in the boxes and on the remains. The results showed that the concentration of mold in the air inside the building was alarming. All offices were immediately abandoned, and personnel re-housed on the campus, but the large bone collection had to stay in the contaminated building until a solution for gentle, but thorough cleaning of the remains could be found. Luckily, the mold proved to be concentrated in the thick layer of dust on the surface of the remains, while the inside of the bones remained unaffected.

We tested different techniques of cleaning: (1) spraying with hydrogen peroxide, (2) dipping briefly into an ethanol bath, and (3) wiping with a cloth soaked in ethanol, among other things. None of these methods proved to be efficient in killing the fungi, or to be well suited to the fragile and partly fragmented material. After more testing, the most effective way to clean the bones turned out to be blowing off the dust. Trained anthropology students, covered in protective suits and full-face masks, use compressed air to clean the remains before they can be relocated to the newly established climatized storage facilities on campus.

50 PERSONAL ORNAMENTS/AMULETS OF ROMAN SOLDIERS FROM LEGIONARY CAMP BURNUM

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Jadric-Kucan, Ivana (University of Zadar)

Abstract format: Poster

Burnum, a Roman Legion camp and town 2.5 km north of Kistanje in inland Dalmatia, Croatia, holds many archaeological treasures. These include a praetorium, an amphitheater, a campus, and an aqueduct. Among these remarkable remnants, we can single out the unique decorative pendants, a testament to the site's rich history. A total of 22 pendants were found, divided according to the material into pendants made of metal, rock crystal, shell, and stone and further according to the object's shape in medallions, figural, geometric shapes, round box-bull, and baskets. They were found in a specific archaeological context, originating from the western peripheral area of the Burnum Legion camp, where the amphitheater and the military training ground (campus) were located. According to the archaeological material found, they date to the first half of the 1st century, ending with the early phase of Claudius' reign.

We can conclude that the great variety and character of the pendants point to their profound importance and personal meaning for the people who lived in the military camp, which were Roman soldiers, and around the camp, in the canabae of their families. Although women inevitably decorated themselves more and wore jewelry, a specific part of jewelry was also worn by men, i.e., Roman soldiers. This is evidenced by the simple pendants made of natural material that was easily available and cheap to them, stone or shell, as well as those of higher quality material such as bronze and rock crystal, which they wore daily.

In addition to their decorative role, these pendants also functioned as amulets, a testament to their versatility and significance. They not only provided personal protection but also enabled personal communication with the deity. Their apotropaic power provided them protection and security and followed them through their military and later civilian lives.

60 INTESTINAL PARASITES FROM FUNERARY CONTEXTS: AN APPROACH TO HEALTH AND DISEASE IN AL-ANDALUS

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Gijón, Ramón (Universidad de Granada) - Castano-Aguilar, José (Independent archaeologist) - Sarr-Marroco, Bilal (Universidad de Granada)

Abstract format: Poster

The discovery of parasites from archaeological contexts allows us to learn about the socio-economic conditions and dietary habits of past populations, providing new insights into the study of these societies. Despite the smaller number of parasite evidences (especially when we are talking about skeletonised remains), the palaeoparasitological study of sediment associated with individuals allows us to individualise the parasitosis, as well as to know the biological origin of the parasitosis found. This advantage makes it possible to carry out multiple studies, such as the prevalence of parasitosis in a population group, and the approach to the type of parasite that occurs in each sex and age range.

This paper presents the palaeoparasitological results obtained from the analysis of sediment samples from fourteen Andalusian individuals found in the locality of Ronda (Málaga, Spain). The findings provide evidence of the existence of geohelminths in this society, in addition to the multidisciplinary study of variations according to age and sex.

63 THE HOARD FROM SANOK (BIAŁA GÓRA) AND OTHER NEW FINDS FROM THE CARPATHIAN FOOTHILLS IN THE SANOK AREA (POLAND)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Maciejewski, Marcin (Institute of Archaeology Maria Curie-Skłodowska University) - Kotowicz, Piotr (The Historical Museum in Sanok) - Blajer, Wojciech (Institute of Archaeology, Jagiellonian University, Kraków) - Bochnak, Tomasz (Institute of Archaeology, University of Rzeszów, Rzeszów) - Cywa, Katarzyna (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Kuroпка, Piotr (Department of Biostructure and Animal Physiology, Wrocław University of Environmental and Life Sciences, Wrocław) - Łucejko, Jeannette (Department of Chemistry and Industrial Chemistry, University of Pisa, Pisa) - Mueller-Bieniek, Aldona (Faculty of Archaeology, University of Warsaw, Warszawa) - Przybyła, Marcin (Dolmen Marcin Przybyła, Michał Podsiadło s.c., Kraków) - Skowron, Katarzyna (The Historical Museum of the City of Kraków, Kraków)

Abstract format: Poster

Many new, "accidentally discovered" hoards of metal items and coins have entered Polish museums in recent years. Most of them were extracted from their deposition contexts by non-professionals. Sometimes, information on the exact place of discovery was not even provided or false circumstances of the discovery were given. On the other hand, amateur investigators conducting metal detector surveys are increasingly aware of the significance of the archaeological contexts and some hoards are excavated by archaeologists cooperating with non-professionals.

A hoard from Sanok (Biała Góra) is an example of such a deposit. Not only was it excavated following the principles of archaeological methodology, but also using extraordinary methods. The extracted block of soil containing the hoard was later handled in controlled laboratory conditions. The exploration method made it possible to acquire information on the arrangement of even very fine metal artefacts and to take various samples of organic substances.

The hoard from Sanok (Biała Góra) and four other hoards recently discovered in the Carpathian Foothills near Sanok went through multi-faceted studies. The poster will present the find circumstances of the Sanok (Biała Góra) hoard, methods of its examination and study results, as well as refer to other deposits, especially in terms of the lost scientific information.

69 PASTCLIM AND TIDYSDM: TWO NEW R PACKAGES TO INTEGRATE PALAEOECOLOGICAL ANALYSES IN ARCHAEOLOGY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Leonardi, Michela (Department of Zoology, University of Cambridge, United Kingdom) - Colucci, Margherita (Max Planck Institute of Geoanthropology Jena, Germany) - Manica, Andrea (Department of Zoology, University of Cambridge, United Kingdom)

Abstract format: Poster

In recent years, the release of large datasets of archaeological occurrences and palaeoclimatic data series covering hundreds of thousands of years opened the door to exciting new possibilities for integrating palaeoclimate in archaeological analyses. Here, we will present two new R packages released by our lab that facilitate the use and analyses of archaeological "big data" with a palaeoecological perspective.

pastclim (Leonardi et al. 2023a) allows easy access and manipulation of several sets of palaeoclimatic reconstructions covering the whole world between 5 million years ago and future climate projections. It can also work on custom data, if properly formatted, and contains a set of functions to recover the climate for periods of interest for the whole world or specific areas; extract data from locations scattered in space and/or time; retrieve time series from individual sites; and visualise and handle the ice or land coverage.

tidysdm (Leonardi et al. 2023b) is the first software to natively perform species distribution/habitat suitability/ecological niche modelling based on time-scattered data. Given a set of observations and the associated palaeoclimate, it identifies the relationship between the species of interest and the environment; and reconstruct the potential distribution through time. The integration with pastclim allows hassle-free access and handling of palaeoclimatic data.

These easy-to-use and freely available tools can offer exciting new possibilities to test for the role of palaeoclimate in cultural or biological processes to scholars studying the past from any field (archaeology, palaeoecology, palaeoanthropology, archaeozoology, archaeobotany, linguistics, etc.).

73

STABLE ISOTOPE ANALYSIS AS A TOOL IN FORENSIC ARCHAEOLOGICAL CASEWORK: CURRENT STATUS AND A WAY FORWARD

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Sehwat, Jagmahender (Panjab University, Chandigarh, India)

Abstract format: Poster

Human bones and teeth have the longest post-mortem longevity and serve as crucial markers of human form and identity even after death as they harbor deceased's identity markers in the form of their individualistic physical structures, molecular signatures and chemical compositions. These human tissues have been increasingly used for biological profiling of past individual/s. Stable isotope analysis of such remains retrieved from forensic or bio-archaeological contexts has proven a powerful tool to reveal their geolocations, migration patterns/residential mobilities, dietary practices and food sources and thus, contributing towards their provenance in archaeological sciences (Richards, 2020).

Most of the stable isotope research from India has been reported from geological, water and grain samples discussing about the origin theories of such samples to the past times. Also, a plethora of fossilized remains have been reported from different strata of Siwalik hills in Himalayan region; lying un-investigated in academic museums, university laboratories and research institutes. If such specimens are studied using the advanced techniques of stable isotope analysis, it can provide crucial evolutionary information about ancient life in the region. Hundreds and thousands of human skeletal remains, belonging to the past individuals/populations, have been retrieved from different bio-archaeological or forensic anthropological sites in India like Rakhigarhi, Vadnagar, Karnataka, Ladakh, Ajnala etc. However, only a very few of them has been analyzed using stable isotope analysis to reconstruct their life-histories and past events as pace of such analyses has not gained momentum in India. There is a huge scope for use of stable isotopes for forensic and archaeological purposes in India, provided traditional analyses are seriously extended to the advanced chemical technologies. Indian population is represented by several heterogeneous clusters, thus development of isoscapes of different geographical regions is urgently needed for identification of any unknown human remain retrieved from any part of the country.

79

DEALING WITH PAIN; SURVIVE; REPEAT. ANCIENT AND MEDIEVAL DENTAL PATHOLOGIES IN BOURGES FROM 3RD TO 16TH CENTURY (CHER, FRANCE)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Durand, Raphaël (Service d'archéologie préventive Bourges Plus; UMR 5199 PACEA)

Abstract format: Poster

Since the 1980s, the late Antiquity and Middle Ages occupations of Bourges/Avaricum have benefited from numerous archaeological interventions having uncovered funerary sites which dimensions vary from modest to extensive. If we are particularly interested in Antiquity and the Middle Ages, accumulating more than 2000.

The archaeo-anthropological examination of the individuals it hosted makes it possible to establish diagnoses indicating the presence of recurrent dental or periodontopathic diseases, some of which could be the cause of the death of their victims. Above all, these disorders reflect a broad pathological spectrum whose etiology is probably multifactorial. During ten centuries of history of a city regularly changing, such a large number of graves also offers the possibility of observing the numerical, topographic and lesional evolution of oral diseases.

The options of research that are emerging call for the development of protocols making it possible to assess the degree of pain, sometimes chronic, caused by some of these lesions and, in fact, to assess the necessity, even the obligation, to resort to knowledge and/or techniques, if not therapeutic, at least analgesic in order to live and sometimes survive.

81

TOUMBA SERRON RESEARCH PROJECT IN NORTHERN GREECE - PRELIMINARY RESULTS OF THE 2021-2023 SEASONS

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Zorzin, Nicolas (National Cheng Kung University; Paris 1 Panthéon-Sorbonne, UMR 8215 Trajectoires)

Abstract format: Poster

This poster consolidates the outcomes of surveys conducted since October 2021, along with the results from the initial two excavation seasons carried out in July 2022 and 2023 by a diverse international team comprising members from Taiwan (National Cheng Kung University), Greece (Direction of Antiquities of Serres), the United Kingdom (University of York), France, Bulgaria, and Italy. Here, we aim to concisely present the initial findings related to the Late Neolithic site of Toumba Serron (5500-4000 B.C.). The recent discoveries have exceeded our expectations, notably by: 1) revealing the presence of a 2.7m large enclosure wall, constructed from burned clay and spanning ap-

proximately 900m in length, encircling the settlement; 2) confirming the existence of a ditch located just outside the enclosure wall; 3) uncovering two circular burials, with one exceptionally well-preserved, situated approximately 4 meters beyond the settlement's wall to the north. These burials likely date back to the Late Neolithic period, holding great historical significance as the first known burials in Eastern Macedonia from that era.

83

MAKING TEXTILE TOOLS FROM SCRATCH: POT SHERDS AND FRAGMENTS OF BRICKS RECYCLED FOR SPINNING AND WEAVING

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Iancu, Alina (National Institute of Heritage of Romania; The Hellenic Centre for Research and Conservation of Archaeological Textiles (ARTEX)) - Sarri, Kalliope (University of Peloponnese)

Abstract format: Poster

In the archaeological record, certain prehistoric and ancient textile tools are clearly identifiable, while others take on less obvious forms and designs. This is because the original purpose of the materials in which they were made was not to produce textiles. Such tools were made when different types of clay vessels and building materials were abandoned from their initial use.

This led to the creation of tools of poorer qualities that were cut up using discarded brick fragments and pot sherds. Sometimes they were embellished or marked through simple incisions. Although brick loom weights and potsherd spindle whorls, resembling the most common discoidal loom weights and cylindrical whorls modelled in clay are frequently found at Mediterranean and European sites, they are often misinterpreted as fishing net weights and tokens.

We propose that many of these should be seen as cheaper and therefore more affordable versions of more conventional tools, being preferred by craftspeople during harsh times.

This contribution aims to offer a critical revision of the topic, arguing for the importance of the reevaluation of the flourishing material of this type in the context of the recent progress in the field of textiles. Some of the main aspects to be discussed are: how to correctly assess the role of such objects based on their morphological features, the importance of the archaeological context and what can we learn about prehistoric and ancient societies that used such textile implements. A set of methods and instruments for an easier identification of textile tools made of recycled pottery will be given too.

85

SUSTAINABILITY IN THE NARRATIVE OF THE ARCHAEOLOGICAL MUSEUM OR IN THE NARRATIVE OF HISTORY?

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Peláez, Agustín (Universidad Rey Juan Carlos)

Abstract format: Poster

Our poster aims to present and raise awareness of the fundamental aspects that must be taken into account for sustainability to be effective not only in the construction or maintenance of a museum (as a building), but also in its collections, in the museographic development and temporary exhibitions, specifically in an archaeological museum.

Among the sustainability narratives, it is essential to develop values and objectives such as sustainable rehabilitation, responsible management of waste generated in the emptying and demolition, optimizing the use of materials to cause the least impact on the environment, improving insulation to reduce energy consumption, and sustainable maintenance once the work is completed.

On the other hand, responsible management and sustainable art. The construction and sustainable rehabilitation of listed buildings is an exciting challenge. It is the best way to take care of heritage and resources for future generations and contributes to the work of raising awareness about environmental protection.

The discourse we want to open is how from the beginning of the project it is possible to define some theoretical guidelines that serve as a basis for a more complete and in-depth study of the elements that will make up the museography and its possibilities, establishing a series of compositional laws that go beyond the mere presentation of a collection at a given juncture and can lead to an efficient and lasting museography, beyond its first implementation.

What is sustainable rehabilitation?

For a rehabilitation process to be considered sustainable, this criterion must be present during all phases of the process. There are four key moments in these actions, which the National Archaeological Museum of Madrid has also undergone.

- Waste generated
- Materials used
- Improving insulation

- Subsequent maintenance of the building

87 THE INTRODUCTION OF TIN BRONZE IN SCANDINAVIA - ARTEFACT METAL AS RAW MATERIAL SOURCE IN THE NEOLITHIC AND BRONZE AGE.

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Noergaard, Heide (Moesgaard Museum, Department of Archaeology)

Abstract format: Poster

Southern Scandinavia had no Copper Age! This is due to the way metal reached the Scandinavian south in the early Bronze Age.

No traces of raw material trade have been visible in southern Scandinavia's earliest bronze-using periods, beginning at around 2100 BC in the Late Neolithic. There were also no deposits of ingots, as they are known in southern Germany. Instead, the targeted import of artefacts with certain material properties seems to be the basis for local material production. It will be demonstrated that axe- and ringmetal was traded to Scandinavia for further production. In addition to the actual use of the artefacts, large quantities have been withdrawn from use to be reused in a targeted manner.

Case studies that demonstrate the use of artefact metal instead of raw material in local metalcraft are presented, such as the import of high-tin bronze axes from the British Isles in the Late Neolithic. These axes contributed significantly to the early production of bronze in southern Scandinavia. Together with large amounts of axes made of Ni-fahlore from the Unëtician region and ring-metal of low-Ni-fahlore from the central Alps, they form the material base for the first local metalwork. The appearance of new artefact types, as the spearheads in NBA IA, seems accompanied by an inflow of new metal, again only visible in a specific axe type, and related to the local production of several artefacts with similar metallurgical fingerprints.

This study draws upon the combination of typological studies, trace element and isotopic analyses to reveal the framework of the early metal trade. The targeted trade of specific artefact types seems to be the foundation for early metallurgy in the Nordic Bronze Age.

94 NARRATING THE PAST: THE ROLE OF COMICS AND ILLUSTRATION IN ARCHAEOLOGICAL AND EDUCATIONAL DISSEMINATION

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Tobalina-Pulido, Leticia (Incipit - Institute of Heritage Sciences)

Abstract format: Poster

The fusion of imagery and text holds immense potential as an educational tool, particularly in archaeological outreach and education. This poster delves into the utilization of comics and illustrations to convey archaeological concepts effectively. It underscores their capacity to captivate diverse audiences, fostering a creative approach to archaeological communication.

The emphasis is on the educational prowess of comics and illustrations in elucidating archaeological methods and techniques in visually appealing ways. By integrating visual elements, these materials not only enhance comprehension but also inspire curiosity and engagement among learners.

The poster features two comics from the "Triana and Archaeology" series, serving as examples of how these mediums can be harnessed for didactic purposes. Additionally, an activity booklet within the same initiative is showcased, exemplifying the commitment to presenting archaeological techniques with scientific rigor while employing engaging educational resources.

These materials are designed to strike a balance between academic integrity and accessibility, ensuring that complex archaeological concepts are conveyed in an engaging and comprehensible manner.

96 DETECTING DISABILITY: AN INTERDISCIPLINARY OSTEOARCHAEOLOGICAL PILOT STUDY APPLYING THE INDEX OF CARE TO A ROMANO-BRITISH POPULATION

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Serrano Ruber, Maria (University College Dublin)

Abstract format: Poster

While archaeological investigations often overlook the lives of disabled individuals, it is crucial to recognise that impairment was an integral part of life in the past, just as it is today. One valuable tool for investigating this overlooked demographic is the Index of Care, which investigates the type of care individuals may have needed through interpreting paleopathological lesions. Although this method was developed for prehistoric populations, these contexts lack the

richness provided by textual records that can offer insight into historical medical practices, healthcare traditions, and understandings of disease and identity.

In this pilot study, I draw upon one such contextualised case study from Roman Irchester, UK: A 3-4th Century CE skeletal collection excavated from a Romano-British cemetery in modern-day Northampton, a region with an abundant archaeological record of Roman occupation. I combine the Index of Care strategy with methodologies from archaeological science, including paleopathology, dietary isotope analyses, and biomechanical load bearing to facilitate a holistic understanding of disabled lives in the past. Here, I present the results of a pilot study that will be used as a foundation for a wider population-wide analysis that will contribute to our understanding of disability and identity in Roman Britain.

100 FAR AWAY FROM HOME: THE PRE-COLUMBIAN COLLECTION IN THE NATIONAL GALLERY OF BULGARIA

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Parvanov, Petar (National Archaeological Institute with Museum - BAS)

Abstract format: Poster

The National Gallery of Bulgaria holds a relatively small but varied collection of Pre-Hispanic artifacts. Although regarded as a peculiarity in its permanent exhibition, the existence of this collection is practically unknown in Bulgaria and abroad. The lack of local expertise in Pre-Columbian Studies has been one of the reasons why the collection remains underappreciated by specialists and the wider public alike. While the collection consists of various object types (pottery, clay figurines, an incense burner, funerary masks etc.) with quite diverse origin (Mesoamerican, Peruvian, Brazilian) holding a marked archaeological and ethnological significance, so far they have been contemplated solely through their aesthetic value.

The poster will present the acquisition and institutional history of the collection in the milieu of the cultural program and diplomacy during the late Communist period set by Lyudmila Zhivkova, the daughter of the Bulgarian dictator at the time. In the process some inaccuracies in the identification were recognized, as well a number of artifacts were listed as possible fakes. These aspects of representation and imitation of Pre-Columbian heritage in Eastern Europe offer an alternative insight into the ideological and economic base of collecting practices. This is the foundation for further studies that can understand the assemblage in its proper cultural and historical context.

101 ORNAMENTS FROM ANIMAL TEETH IN THE BRONZE AGE MAROS CULTURE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Vitezovic, Selena (Institute of Archaeology, Belgrade)

Abstract format: Poster

Perforated animal teeth were widely used for personal ornaments since the early Upper Palaeolithic and throughout the prehistoric times. They were modified usually by simple perforating at the upper part, and then combined into jewellery pieces (necklaces, bracelets), or were part of clothing. This poster will present the usage of animal teeth as ornaments in the Bronze Age Maros culture, from two necropolises excavated in northern Serbia, Ostojićevo and Mokrin. Predominantly were used canines from dogs, but other teeth may be encountered as well, such as teeth from horse, residual canines from red deer, etc. Their frequency differs from grave to grave; some contain only few teeth, while in some there are dozens of perforated teeth. They were mainly associated with female graves. Their use wear is particularly interesting – some teeth are completely worn, with broken and repaired perforations, while at some the use wear is rather limited. This shows that these items were indeed worn during the lifetime of the individuals buried with them, but also suggests that the ornaments with teeth were enriched with time, i.e., additional parts were added over time, and it is possible that some of these pendants were inherited.

104 RECYCLED AND INNOVATIVE MATERIALS FOUND IN A ROMAN MOSAIC FLOOR MORTAR

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Baragona, Anthony (University of Applied Arts Vienna) - Fernandes, Isabel (University of Lisbon) - Bugalhão, Jacinta (University of Lisbon) - Mário Cachão, Mário (University of Lisbon) - Fernandes, Lídia (Coordinator of Lisbon Museum - Roman Theater / EGEAC (Lisbon City Council)) - Weber, Johannes (University of Applied Arts Vienna)

Abstract format: Poster

Archaeometric investigations performed during the conservation and restoration of a Roman-era floor mosaic in Lisbon, Portugal (Felicitas Iulia Olisipo, Lusitania) revealed both a high level of recycled material in the preparation layers (a common feature of Roman construction) as well as evidence for the intentional selection of an extraordinary lime

source stone (an aeolianite) for use as the binder material for the mosaic's nucleus. Analysis by polarising light microscopy (PLM) and scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy (SEM-EDS) found that lime made from this carbonate-bound, siliceous stone would have increased the hydraulicity of an already pozzolanic mortar in a location where this effect would have been beneficial. Whether this stone was selected for these exhibited properties intentionally or out of convenience is perhaps unknowable in the absence of written documentation, however there were other potential building lime source materials (for example recycled marble tesserae).

This submission presents evidence supporting the hypothesis that this material would have enhanced the performance of the support layers for the floor mosaic studied, as well as qualitative and quantitative data, based on digital image analysis, for both the recycled and novel materials found within these layers.

119 TURNING UP THE HEAT: FIRE CONTROL IN CERAMIC KILNS AND THE DEVELOPMENT OF TRADE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Asscher, Yotam (Department of Conservation of Material Culture, School of Archaeology and Maritime Cultures University of Haifa, Israel; Department of Artifacts Treatment and Laboratories, Israel Antiquities Authority, Jerusalem, Israel) - Golani, Amir (Department of Archaeological Research and Specializations, Israel Antiquities Authority)

Abstract format: Poster

Fire control and resultant heat management in ancient pottery kilns allowed for better quality control of ceramic production by specialists, allowing production of standardized, durable ceramics of lighter weight that could be more easily transported in larger amounts over longer distances. Two-story updraft ceramic kilns made of mudbrick and clay, known in the southern Levant from the end of the 4th millennium BCE if not earlier, greatly improved control over the firing temperature by its diffusion from the combustion chamber to the upper firing chamber. Such kilns made more efficient use of fuel and improved regulation of the firing process. Technological development of fire control in two-story updraft kilns may have been one factor revolutionizing ceramic trade and apparently accompanied the first urbanization in the Southern Levant, expressing a growing need for efficient and standardized production of well-fired ceramics for a growing market economy that was able to move large volumes of goods over distances.

In this paper we report on an Early Bronze IB two-story pottery kiln from Lod in central Israel, dated to the end of the 4th millennium BCE. Mineralogical analysis based on Infrared spectroscopy demonstrates that temperatures between 700 and 800 °C were achieved in this installation and thin section analysis shows that the mudbricks of the walls were intentionally enriched with quartz, a mineral known for its refractory properties, thus preserving the kiln from thermal shock so that it could be used several times. These findings indicate an advanced level of craft specialization producing quality standardized ceramics for a developing market economy.

121 RURAL ARCHITECTURE IN THE NORTHERN VALLEYS OF BERGAMO: THE FORMATION OF MEDIEVAL HAMLETS IN THE FOOTHILL AREAS

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Matteoni, Federica (Università Cattolica di Milano)

Abstract format: Poster

The province of Bergamo is a privileged context to study rural architectures: in the hilly area near Orobic Alps there are several villages in a good state of conservation, arose in medieval times. The original architectural layout of these hamlets is recognized in the landscape organization, respected in the evolution over centuries until recent times.

Since 2017, a systematic study entitled "Archeologia dell'edilizia storica in provincia di Bergamo. Studio per la valorizzazione e la programmazione urbanistica nel territorio" has been ongoing: this research is about the survey of historic buildings – from 12th to 16th century- to study their urban evolution in a rural area so rich in architectural testimonies.

The extensive development of this research –including over 40 municipalities in the mountain area in the of Bergamo – allowed to study the methods of occupation of the rural community in a highland context, to outline different types of settlement and construction techniques in the territory. This poster aims to relate archaeological and landscape data, mostly linked to the stratigraphic study of architectures and about landscape's organization with ancient roads and field's cultivation.

The results allow us to define the construction peculiarities of this area, with insights on the organization of settlements, which are different in the Bergamo's valleys, and to compare them with data known for the medieval rural buildings in Northern Italy.

126 THE VALUE OF COPROLITES IN UNDERSTANDING ANCIENT ENTOMOPHAGY

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Shillito, Lisa-Marie (Newcastle University) - Blong, John (Washington State University) - Whelton, Helen (Bristol University)

Abstract format: Poster

We reject nutrients that our cultures deem unacceptable - no insects, dog meat or human flesh for us... (Twiss 2019:5)

Entomophagy, the consumption of insects, is a well known phenomenon in cultures around the world, and is being promoted by the FAO to enhance nutrition and food security. Yet, it is rarely considered in archaeological studies on food procurement and subsistence strategies. As Twiss suggests, this may be a result of the cultural taboo against certain foodstuffs in western societies that have dominated archaeological discourse, but another major factor perhaps is visibility. Insect remains only preserve under specific conditions and are not encountered as frequently as other food proxies such as bone and charred plants. When insects are found, they are often interpreted as an environmental proxy, as indicators of past ecosystems and local habitation conditions. This paper highlights the potential of coprolites as a lens into ancient entomophagy. Insect remains are commonly encountered in coprolites; together with bone fragments and plant remains, insects in coprolites indicate not only the variety of things people were consuming, but the wide range of environments they encountered. Using the example of the Paisley Caves human coprolite assemblage (spanning the late Pleistocene - mid Holocene), this paper examines the role of insects, both macrofossils and biomolecular signals recovered from coprolites, and how this data can help us refine our understanding of the seasonality of subsistence strategies, and the value of opportunistic gathering as a key part of food procurement in the past.

137 CITIZENS MAKING MUSEUMS? THE CASE OF THE ARA CONCORDIAE REENACTMENT ASSOCIATION IN THE NATIONAL MUSEUM OF ROMAN ART (MÉRIDA, SPAIN)

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Martín, Nova (Museo Nacional De Arte Romano) - León, Abel (Ara Concordiae Association. Reenactors of Roman Mérida) - Calzado, Miguel (Consortium of the Monumental City of Mérida) - Castro, Pilar (Ara Concordiae Association. Reenactors of Roman Mérida)

Abstract format: Poster

The sustainability of archaeological museums and the heritage they guard depends largely on the appropriation of them by the society that supports them. The case of the National Museum of Roman Art (Mérida, Spain) is very unique. The Museum's collections come exclusively from the former Augusta Emerita colony. The museum has the category of national museum, with an international vocation but located in a city, capital of the region (Extremadura), but a small size, with barely 58,000 inhabitants. Its archaeological heritage is monumental and palpable in every corner of it. For this reason, the collaboration of the Museum with the society in which it is inserted and, especially with the Ara Concordiae Association. Reenactors of Roman Mérida, is a fundamental line of work. The activity of the Association in the Museum allows the development of training programs and historical dissemination activities. This means the direct participation of citizens in the Museum. The activities carried out by the Reenactment Group cover both the military and civil spheres, with special attention to the world of women. Presenting the main lines of work and activities developed in relation to the Museum is the objective of this presentation.

141 SINUSITIS IN THE POPULATION OF SARILHOS GRANDES, PORTUGAL (14TH-19TH CENTURIES)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Magalhaes, Bruno M. (Department of Life Sciences, University of Coimbra, Portugal; CIAS – Research Centre for Anthropology and Health, University of Coimbra, Portugal) - Pereira, Paula (Archeologist; Project coordinator of SAND – Sarilhos Grandes Between Two Worlds; Montijo City Council) - Godinho, Ricardo (ICArE-HB (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour), University of Algarve) - Santos, Ana (Department of Life Sciences, University of Coimbra, Portugal; CIAS – Research Centre for Anthropology and Health, University of Coimbra, Portugal)

Abstract format: Poster

Two burial areas associated with the São Jorge church in Sarilhos Grandes (Portugal) were excavated as part of the project 'SAND - Sarilhos Grandes Between Two Worlds'. A minimum number of 181 individuals (145 adults [80.1%], 36 non-adults [19.9%]; 58 [40%] males, 26 [17.9%] females, 61 [42.1%] indeterminate) who lived during the so-called Little Ice Age (14th-18th centuries) next to the Tagus River was identified. This study hypothesizes that in such moisty and cooler conditions, individuals present higher prevalence of sinusitis compared to the individuals living in warmer temperatures during the 19th-20th centuries. Maxillary sinusitis was macroscopically inspected with the naked eye and with a videoscope searching for spicule-type bone formations, remodelled spicules, lobules of white bone, and plaque. Fifty-two point seven percent (48/91) of the individuals show bone formations associated with

sinusitis, at least 8 non-adults and 29 adults (of whom at least 12 males, 14 females). Prevalence is similar to the ones investigated in the identified collections from Coimbra (Medical Schools collections=53%[105/198]; International Exchange Skull collection=48.3%[248/513]) and Lisbon (Human Skeletal collection=50.6%[435/873]) (19th-20th centuries), showing that the occurrence of sinusitis appear to have been similar during the different historical periods studied. Although literature shows that the etiology of sinusitis may be multifactorial (factors such environmental and hygienic conditions may play an important role), the present results are in accordance with clinical studies in recent years showing that the individuals' mucosal immune responses and mucociliary dysfunctions may be primary factors in chronic sinusitis.

146 AN ANCIENT CRANIAL ENIGMA: 2D/3D ANALYSIS OF CRANIAL MODIFICATION AT THE HIROTA SITE, JAPAN

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Loftus, James (Institute for Liberal Arts, Tokyo Institute of Technology) - Yonemoto, Shiori (The Kyushu University Museum, Kyushu University) - Murphy, Mary-Margaret (Department of Anthropology, The University of Montana) - Seguchi, Noriko (Faculty of Social and Cultural Studies, Kyushu University; Department of Anthropology, The University of Montana)

Abstract format: Poster

Cranial modification is a ubiquitous practice across countless cultures and times in antiquity. Cranial modification is not always an intentional act, but could be the result of habitual action, such as wearing constricting bindings for a prolonged period for one's occupation, however the delineation is still fuzzy at this juncture. In most well-known cases of intentional cranial modification, modifying the shape of an infants skull is a means of establishing societal rank or group identity, through a stark and prominent means - shaping ones skull into a variety of shapes.

The Hirota site, Tanegashima island, Japan (approx. 3rd CE to approx. 5th-7th C CE), was long thought to be such a case of cranial modification, whether it was intentional or not remained unclear until now. Dozens of crania excavated from the Hirota burial site are square in shape, showing extreme flatness of the occipital bone in particular. No such practice has been sufficiently recorded in Japanese prehistory until now.

Utilizing 2D Geometric Morphometric analysis and novel 3D scanning methods, results show a statistically significant morphological difference between Hirota site crania and contemporaneous as well as prior groups. Furthermore, when comparing to examples in Andes and pre-Columbian Mesoamerica civilizations, micro-abnormalities along cranial sutures showcase the strong likelihood that Hirota crania were intentionally modified, without regard to age or sex.

The motivations behind this practice remain a mystery, but due to the individuals being buried with thousands of ornate shell artifacts from hundreds of kilometers away, it is hypothesized that cranial modification was a means of manifesting group identity in aid of a thriving shellfish trade.

156 ARA PACIS AVGVSTAE: AN ASTRO-ARCHAEOLOGICAL ANALYSIS

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Tiede, Vance (Astro-Archaeology Surveys; Yale University, Alumnus)

Abstract format: Poster

The Ara Pacis Augustae is examined according to Vitruvius' astro-architectural precept that "[O]ne who professes himself an architect should be well versed in...astronomy and the theory of the heavens" (De Architectura, l.i.3; IX). In relocating the Ara Pacis so that its magnificent marble sculptures could be displayed in the new Museo dell'Ara Pacis (1937-1938), the altar was rotated by 75°, thereby erasing any original astro-architectural alignment. Because archaeologist Guglielmo Gatti's 1938 site map preserves the altar's original orientation, the author was able calculate the original astro-horizon declination (δ) vector (+11.3° δ) of the altar's northeast opening with Program STONEHENGE (Hawkins 1983, 328-330) and Google Earth Pro imagery/DEM, viz.: True Azimuth \approx 75°; Latitude/Longitude = 41°54'10.47"N/ 12°28'44.60"E; Elevation \approx 10m ASL; and Horizon Altitude \approx +1.1°. Given that the Ara Pacis was dedicated sometime in 9 BC (Moretti 1947, 7), Starry Night Pro digital planetarium calculated that the astro-horizon vector of the Ara Pacis' northeast opening was originally oriented to the rising Sun (+11.0° δ) on both 21 April and 27 August 9 BC. However, the iconography on the northeast exterior's "Tellus" frieze supports an interpretation that only April 21st was intended, because all the sculptural elements form an astrological tableau — flowing amphora (Aquarius), pair of fishes (Pisces), ram (Aries), young woman (Venus), bull (Taurus), infant twins (Gemini) — mirroring Venus/Morning Star's heliacal rise in Aries amid the Vernal Zodiac constellations viewed from the interior sacrificial altar at dawn on the Palilia/Parilia Festival (Pales, goddess of shepherds), 21 April 9 BC. This day commemorates the founding of Rome on 21 April 1 ab urbe condita (AUC) in the chronology of Marcus Terentius Varro, i.e., the 93rd iteration in the 8-year Earth-Venus Synodic Period of Venus/Morning Star's heliacal rise in the constellation Aries on the Dies Natalis Romae, 21 April 753 BC.

160 RECONSTRUCTION THE WORKED-BONE CRAFTING IN MIDDLE NEOLITHIC CHINA THROUGH RESIDUE, USE-WEAR, AND EXPERIMENTAL APPROACHES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Shen, Jie (Stanford University)

Abstract format: Poster

My work focuses on the production and use of bone artifacts discovered at the Jiangliu site, a Middle Neolithic settlement in North China. The study involves three aspects: 1) the excavated bone tools as well as turquoise beads will be examined with residue analysis to explain the potential uses of these objects and the relation between worked bone and the textile industry; 2) I will use a stereomicroscope to observe the use-wears on bone artifacts to uncover the production process and use of them; 3) a series of replicate experiments will help to build up the chaine operatoire in production and provide a piece of macro-perspective evidence to supplement the results of the use-wear analysis.

This research will help to understand the bone artifact and textile industry in Neolithic China, which are both inexplicit to archaeologists yet. On the other hand, the high intensity of bone artifacts and low density of hunting tools in the site suggest a possibility that the artisans acquired raw materials from other communities. A network between multiple contemporary sites may include raw materials and final product trades. This trans-regional network may to some extent boosted the emergence of the state in the Bronze Age.

165 FLAX FIBRE EXTRACTION PROCESSES IN EUROPEAN PREHISTORY: NEW METHODOLOGICAL APPROACHES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Ambrosioni, Cristina (University of Padua)

Abstract format: Poster

Flax (*Linum usitatissimum* L.) is one of the most important plants in human history. Its fibre was the most used in Italian and European prehistory, but its extraction processes are not well known. Recent published studies on flax textiles from Italian and European archaeological contexts have demonstrated, that at least until 600 BCE flax was spliced, requiring a different processing procedure. Splicing is a form of thread technology where plant fibre ultimate bundles are manually removed from individual stems and joined together either end to end or continuously to make single yarns.

The poster presents the results of microscopic analysis of flax samples collected during the experimental study on the manual processes extraction of flax fibre.

A new methodological approach is proposed for the study of fibres and processing debris (for example the flax stem) observed at various stages during experimental analysis. This work will identify the potential dichotomous keys for identifying this process in archaeological contexts.

The scarcity of archaeological evidence of flax processing makes these preliminary experimental data an important source for a more detailed understanding of the production process of flax fibre and the choices made during the different stages of processing in the past.

166 STUDY OF THE EARLY NEOLITHIC SOCIETY OF "LA MARMOTTA" THROUGH LAKE SEDIMENTARY DNA AND GENETIC MATERIAL FROM ANCIENT TOOLS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Victoria Nogales, Luis (Technische Universität Braunschweig. Institut für Geosysteme und Bioindikation, Braunschweig, Germany) - Truffi, Michele (Universita degli Studi Roma Tre) - Gibaja, Juan Francisco (Escuela Española de Historia y Arqueología en Roma (EEHAR-CSIC)) - Iriarte Avilés, Eneko (University of Burgos, Department of History, Geography and Communication, Laboratory of Human Evolution-IsoTOPIK Lab, Spain) - Mineo, Mario (Museo delle Civiltà, Rome, Italy) - Nomi, Federico (Scuola Superiore Meridionale, Napoli, Italy) - Mazzuco, Niccolò (Dipartimento di Civiltà e Forme del Sapere, Università di Pisa, Pisa, Italy) - Dulias, Katharina (Technische Universität Braunschweig. Institut für Geosysteme und Bioindikation, Braunschweig, Germany)

Abstract format: Poster

The site of "La Marmotta", submerged under the waters of the Lake Bracciano, represents one of the most important and earliest examples of the Early Mediterranean Neolithic, whose inhabitants abruptly abandoned the settlement due to a probable rise of the water levels and flooding of the village. Nearly four decades of study have revealed a dynamic society with complex agricultural techniques. Research was based on archaeological studies and the study of macro- and microscopic remains, which showed a remarkable state of preservation. However, molecular methods have not been widely applied on "La Marmotta". Here, we employ paleogenetic approaches, including sedimentary

ancient DNA (sedaDNA) from the lake sediments, to expand the knowledge about ancient agricultural practices, animal husbandry techniques and ancient environmental conditions to unravel the past dynamics of Lake Bracciano and the Neolithic settlement. Furthermore, DNA extraction techniques have been tested on the adhesive substance from replicas of harvesting sickles to establish a working protocol for the ancient material. As a result, we successfully obtained and characterized genetic material from replicas revealing great capacity of resin to retain DNA, not only from the harvested crop but also from the surroundings at the moment of use, and analysis of the ancient resin DNA is currently ongoing.

MODELLING RELIGIOPOLITICS. THE IMPERIUM CHRISTIANUM VIA ITS COMMONERS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Vargha, Maria (University of Vienna)

Abstract format: Poster

The present poster introduces the ERC StG RELIC, which proposes a complex, comparative analysis and contextualisation of archaeological and historical remains of the rural population living on the eastern fringes of the later Holy Roman Empire during the Ottonian and Salian periods (10th -12th c.), exploring the influences of centres and networks of secular and ecclesiastical lords, of the natural environment, and of the economic infrastructure. Investigating this often-overlooked segment of the population, its hitherto unexplored or neglected role allows us to study how (top-level) changes in political and ecclesiastical organisations can be reflected in the evidence concerning the lower levels of society and of the local church network; how different strategies worked in different political settings, and what role local initiatives/agencies could have played in religious and political shifts.

In short, RELIC proposes supplementing large-scale spatial-quantitative analysis of site level historical, art historical and archaeological data with in-depth qualitative comparative analysis of thoroughly-researched and published churchyard cemeteries. The spatial-comparative approach will identify the spatial configuration of social and religious networks of institutionalised Christianisation, and this spatiality will be interpreted also as a proxy to the chronology of the process – of adaptation and expansion, beyond the point of view of the elites exposed in the chronicle tradition. Different regional patterns will point to different dynamics, hinting at the respective causes, for example, different levels of influence of the Church and the secular state, the problems of centralised coordination, of gradual or rapid expansions, how this process potentially influenced the later reorganisation of social structures, of settlement networks and their nucleation processes. Answers to these thematic questions will contribute to a better understanding of rural society and its adaptation to the new social and religious systems and offer a ‘view from below’ on major political and religious processes.

170

EXPLORING THE PROTOAURIGNACIAN TECHNOLOGICAL VARIABILITY AT FUMANE CAVE (ITALY) THROUGH CORE REDUCTION INTENSITY APPROACHES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Lombao, Diego (GEPN-AAT, Dpto. Historia, Facultad de Xeografía e Historia, USC, Praza da Universidade 1, 15782, Santiago de Compostela, Spain.; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; UMR7194 Histoire naturelle de l'Homme préhistorique (HNHP), Museum National d'Histoire Naturelle (MNHN), CNRS, Université Perpignan Via Domitia, Alliance Sorbonne Université, - Musée de l'Homme, Place du Trocadéro 17, 75016 Paris, France) - Falcucci, Armando (Department of Geosciences, Prehistory and Archaeological Sciences Research Unit, Eberhard Karls University of Tübingen, Tübingen, Germany) - Peresani, Marco (Department of Humanities, Prehistoric and Anthropological Sciences Unit, University of Ferrara, Ferrara, Italy; Institute of Environmental Geology and Geoenvironment, National Research Council, Milano, Italy)

Abstract format: Poster

This study focusses on exploring the intensity of core reduction in the lithic assemblage from early Protoaurignacian levels (A1, A2) in Fumane Cave, located in northeastern Italy. Reduction intensity is vital for comprehending blank selection strategies, raw material management, and revealing variability in knapping techniques during the reduction sequence, helping decipher the relationship between blades and bladelets production and understanding their behavioral significance. In this work, we employ various approaches and variables for measuring reduction intensity, such as the percentage of non-cortical surface, the Scar Density Index (SDI), and an adapted Volumetric Reconstruction Method (VRM).

Our results reveal subtle variations influenced by factors like the abundance and proximity of selected raw materials for blank production. Notably, the predominant raw material, Maiolica, results in a higher number of less reduced cores, while overall reduction levels across all discarded cores at the site remain relatively high. The observed variability in the operatory field and the interrelation between blade and bladelet productions highlight the intricate and flexible nature of Protoaurignacian behavior, challenging the definitive separation between the operatory fields of

these productions. These findings underscore the significance of considering reduction intensity in the examination of technological variability and human behavior in Aurignacian studies.

In this sense, this adaptation of the VRM to laminar cores, combined with other reduction intensity proxies, promises to provide a further step in the characterization of stone tool production, offering a pathway to a deeper understanding of Homo sapiens' adaptive behaviors and a clearer framework for framing the development of the Upper Paleolithic.

NEW DATA ON THE MESOLITHIC IN THE BASQUE COUNTRY: MARINE INVERTEBRATES FROM THE LANGATXO CAVE (MUTRIKU, GIPUZKOA)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Marchán-Fernández, Alberto (Universidad de Salamanca) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Álvarez-Fernández, Esteban (Universidad de Salamanca)

Abstract format: Poster

This poster presents the archaeofaunistic study of the archaeological remains of marine origin from the Langatxo cave, one of the caves located at the mouth of the river Deva. It was discovered in 1981 and excavated between 1990 and 1993. Inside the cavity, the remains of a shell midden were found, which has been dated during the Mesolithic period (ca. 7,500 cal BC), in which gastropod shells (different species of the genus *Patella* and *Phorcus lineatus*) and bivalves (*Mytilus* sp.) have been documented, as well as crab pincers. This analysis has made it possible to determine that the groups of hunter-gatherers collected these types of resources from rocky substrates in the intertidal zone close to the cavity. The exploitation of the marine environment by Mesolithic groups is compared with other contexts of the same chronology documented in the Basque Country in general, and in the lower course of the river Deba, in particular.

176

HIDDEN, SUBMERGED AND OBLITERATED CONTEXTS FROM THE LIS BASIN

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Pereira, Telmo (C.E.U.-Cooperativa de Ensino Universitário. Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar, Portugal; CGeo – Centro de Geociências da Universidade de Coimbra, Portugal; UNIARQ, Centro de Arqueologia da Universidade de Lisboa. Abstract format: Poster

The fluctuations between global cold-dry and warm-wet periods have had a profound impact on territories and resources worldwide. In the Portuguese Estremadura region, located on the central western coast of the Iberian Peninsula, these shifts resulted in the exposure of vast landscapes during cold-dry periods, which are now submerged. This lost territory likely held significant importance for prehistoric communities, evident from findings in certain sites within this region.

Conversely, the transition to warm-wet periods led to the erosion of cliffs abundant in rock shelters, many of which have since been completely washed away. Nevertheless, those rock shelters that have preserved sediments offer crucial insights into understanding the cold-dry periods. Additionally, the erosion of these valleys has formed wide deposits, dozens of meters thick, which bury Pleistocene layers containing archaeological evidence.

These factors, coupled with the extensive construction of public and private infrastructure, pose challenges to the study, interpretation, and reconstruction of prehistoric populations. In this poster, we explore various case studies aiming to contribute to the discourse on sustainability amidst the crises of the 21st century.

177 LIVESTOCK IN PHOENICIAN GADIR. ZOOARCHAEOLOGY AND TAPHONOMY OF THE SAGASTA-TINTE 1 SITE (CÁDIZ, SPAIN)

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Portero Hernández, Rodrigo (Universidad de Salamanca) - Niveau de Villedary y Mariñas, Ana (Universidad de Cádiz) - Rufà, Anna (ICArEHB, Universidade do Algarve; PACEA-UMR5199, Univ. Bordeaux/CNRS/MCC.) - Martelo Fernández, Marcos (Balteus S.L.)

Abstract format: Poster

Faunal remains from archaeological sites are a fundamental element for understanding the livestock farming practices of past societies. Through archaeozoological and taphonomic analysis it is possible to determine, among other, food production processes, maintenance activities, the type of meat consumption associated with livestock practices and the cultural aspects of animal processing. In this poster, we present a small assemblage recovered during the emergency archaeological excavation of the site on the corner of street Sagasta and street Tinte in Cádiz. This excavation revealed the existence of structures dedicated to copper mining and metallurgical activity in the Phoenician period, the context of which has been radiocarbon dated to between the end of the 9th and the beginning of the 8th century BC.

Archaeozoological analysis has revealed the importance of sheep, goat, and cattle in the livestock economy of Sagasta-Tinte. Other domestic species such as dogs and ducks have also been found. From a taphonomic point of view, we have documented evidence of anthropic manipulation in mammals and birds, being able to determine different tasks within the animal meat processing chain. Among the anthropic alterations, we have documented the use of bones for the manufacture of bone industry. We have also analysed the presence of carnivore marks, as well as the natural agents that have affected the archaeofaunal record. In this aspect, we should highlight the presence of staining of the bone surfaces with green and bluish colouring due to the dissolution of the copper mineral in a humid environment, which seems to be distributed throughout the stratum, completely staining the surface of the bones, and even covering other previous taphonomic alterations such as cut marks.

179 FROM THE SPARK TO THE BLAZE: FIRE-STONES IN THE SEPULCHRAL CAVE OF FORAT DE LA CONQUETA (EASTERN PREPYRINEES, IBERIAN PENÍNSULA)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Cousillas Rúa, Ana (Department of Prehistory, Universitat Autònoma de Barcelona (UAB)) - Roda Gilabert, Xavier (Department of Prehistory, Universitat Autònoma de Barcelona (UAB)); CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra (UPF)) - Mora Torcal, Rafael (Department of Prehistory, Universitat Autònoma de Barcelona (UAB))

Abstract format: Poster

Excavations at the Neolithic site of Forat de Conqueta (Eastern Prepyrenees, Iberian Peninsula) have documented the presence of a large number of spherical and subspherical flint cobbles with evidence of percussion and friction on their surfaces. The presence of this type of stone tool, classified here as a fire-stone, is not exclusive to this site and occurs in the prehistoric archaeological record from the Late Neolithic to the Late Bronze Age. Analysis of the technological characteristics and use-wear patterns of the fire stones, coupled with the result of an experimental programme, confirms that these tools are suitable for making fire by direct percussion and friction. The abundance of fire altered bone, ceramic and lithic remains recovered from the excavation supports this hypothesis and is consistent with the use of the cave as a burial site for the deposition and cremation of human remains. The results obtained show the importance of this type of tool in the funerary field of this community and provide information on local burial practices within the general Neolithic framework of the area.

183 CULTURAL DYNAMICS IN DYNASTIC TRANSITIONS: EXPLORING FOOD AND ALCOHOL AT THE ZHOUYUAN SITE DURING THE WESTERN ZHOU PERIOD IN CHINA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Li, Jingbo (Stanford University)

Abstract format: Poster

This study investigates food and alcohol production and consumption during the Western Zhou period, focusing on the Zhouyuan site. Following the collapse of the Shang Dynasty, its descendants migrated to Zhou territory, including Zhouyuan. However, their dietary and drinking practices remain unclear. To address this gap, we examined residue from pottery vessels using microfossil analysis to investigate their staples, food and drink for rituals, fermented beverage production, and relevant crafts. We explored the role of non-traditional crops like wheat and rice in food and drink. Analyses of pottery artifacts potentially associated with alcohol-making revealed vessel functions and brewing

techniques used during the Western Zhou period. Comparing alcohol-making methods between the Western Zhou and late Shang periods, we discussed technological and cultural similarities and differences. Additionally, we explored the social identities of Shang descendants in Zhouyuan, shedding light on cultural dynamics in the Shang and Zhou dynastic transition. This study offers new insights and evidence into foodways and drinkways during the Bronze Age in China.

185 DIGITALIZING THE EARLY CHRISTIAN ARCHAEOLOGY IN KOSOVO

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Hoxha, Zana (Institute of Albanology)

Abstract format: Poster

The exploration of Early Christian archaeology in Kosovo offers a unique window into the cultural and religious heritage of the region. This poster presentation aims to present the transformative impact of digital technologies on the study and preservation of this precious heritage. Through a comprehensive digitalization effort, encompassing advanced imaging techniques, a detailed database, and data visualization; we endeavor to preserve Kosovo's Early Christian sites.

By digitizing artifacts, monuments, and archaeological sites, we aim to create an immersive digital database that allows scholars and enthusiasts to explore and analyze these treasures remotely. Moreover, digital reconstructions offer insights into the architectural intricacies and spatial arrangements of Early Christian structures, shedding light on their religious and social significance. Furthermore, by employing digital tools for conservation and documentation, we contribute to the sustainable preservation of these fragile archaeological remains for future generations.

In conclusion, the digitalization of Early Christian archaeology in Kosovo represents a groundbreaking endeavor that harnesses the power of technology to illuminate the past, connect cultures, and safeguard heritage. Through collaboration and innovation, we aspire to create a lasting legacy that celebrates the rich tapestry of Kosovo's cultural heritage.

186 REVEALING A NEW RECORD OF GLACIAL-INTERGLACIAL CYCLES 1 MILLION YEARS AGO, A KEY TIME FOR EARLY HUMAN DISPERSALS IN EUROPE

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Piñero, Pedro (IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social; Àrea de Prehistòria, Universitat Rovira i Virgili (URV)) - Laborda-López, Casto (IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social) - Martín-Perea, David M. (Departamento de Geodinámica, Estratigrafía y Paleontología, Facultad de Ciencias Geológicas, Universidad Complutense de Madrid; IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social; Institute of Evolution in Africa) - Elia, Del Castillo (Departamento de Química Agrícola, Geología y Edafología, Facultad de Química, Universidad de Murcia) - Alías Linares, M. Asunción (Departamento de Química Agrícola, Geología y Edafología, Facultad de Química, Universidad de Murcia) - Iannicelli, Claudia (IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social) - Pal, Shubham (Departament de Geologia, Universitat Autònoma de Barcelona; ICP-CERCA, Institut Català de Paleontologia Miquel Crusafont, Universitat Autònoma de Barcelona) - Muñoz-Gómez, Balder (Departament d'Arts i Conservació-Restauració, Universitat de Barcelona) - Navarro-Gil, Albert (IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social; IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social) - Agustí, Jordi (ICREA, Institució Catalana de Recerca i Estudis Avançats; IPHES-CERCA, Institut Català de Paleoeologia Humana i Evolució Social)

Abstract format: Poster

The Early Pleistocene site of Quibas (southern Spain) represents the longest and most complete pre-Jaramillo to post-Jaramillo continental vertebrate succession in Europe. The whole sequence has been dated to approximately 1.1–0.9 Ma, immediately post-dating the oldest hominin record in Europe. Quibas stands out as one of the rare European sites where the Jaramillo subchron has been surely identified. This paleomagnetic episode characterizes the onset of the Early-Middle Pleistocene transition, a time span that presents major changes in the Earth's climatic cyclicity. Moreover, this interval is particularly relevant regarding the earliest hominin presence in Western Europe. Paleoclimatic proxies, inferred from sedimentological analyses conducted on the various lithostratigraphic units of Quibas, revealed a record of up to seven alternating humid and arid phases resulting from the Early Pleistocene glacial-interglacial dynamics. The high-precision chronology of Quibas allowed a correlation of the succession of the continental paleoenvironmental shifts to the marine oxygen isotope record (MIS). The lowermost pre-Jaramillo units (1.1–1.07 Ma) were deposited during a long-lasting interglacial, correlated to MIS 33–31. It was followed by an increase in aridity in the Jaramillo units of Quibas (1.07–0.99 Ma), revealing the beginning of a glacial period, which can be correlated to MIS 30. The vertebrate succession from these units agree with a significant environmental change, with the disappearance of forest species. The upper Jaramillo (1 Ma) and post-Jaramillo units (0.99–0.9 Ma) suggest these were deposited in alternating periods of aridity and humid conditions, although less humid than the pre-Jara-

millio period, probably representing the MIS 29 interglacial, the MIS 28 glacial and the MIS 27 interglacial. With this, Quibas emerges as a key reference site for advancing our understanding of the climatic events that occurred around 1 Ma in the Iberian Peninsula. Furthermore, it enhances our comprehension of the paleoenvironmental context of early humans in Europe.

188 THE EARLY MEDIEVAL ST. GEORGE'S ROTUNDA IN NITRIANSKA BLATNICA (WESTERN SLOVAKIA)

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Robak, Zbigniew (Institute of Archaeology, Slovak Academy of Sciences)

Abstract format: Poster

The neglected Rotunda of St. George, located in the forests of Western Slovakia, was for centuries just a local place of worship with a late medieval tradition. With the discovery of the nearby archaeological site of Bojná, it became clear that the rotunda could be much older and part of an incredibly rich complex. The complex seems to comprise a stronghold, manor, and secondary fortresses, and represents one of the centres of power of Great Moravia. The rotunda immediately became an object of interest for politicians, the media, the Church, and, of course, scientists. Money was found for conservation, and (partially) its early medieval appearance was restored. The entire process was accompanied by misunderstandings and convenient legends as to who its founders were. Moreover, the rotunda and the entire archaeological site have also become objects of competition between the two municipalities in which they are located which heated the debate even more. The poster aims to debunk myths that aroused around the rotunda and communicate results of reliable research that has confirmed that the construction may date from the late 9th to early 10th century, making it one of the oldest still existing churches in Central Europe. Finally, I will discuss a consensus that now seems to have been reached on the presentation of these monuments – the rotunda and the associated archaeological site – and the joint organisation of tourism.

191 THE SORGHUM IN NORTHERN ITALY: FIRST EVIDENCES, SPREAD AND USES

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Bosi, Giovanna (University of Modena and Reggio Emilia; NBFC, National Biodiversity Future Center, Palermo) - Rottoli, Mauro (ARCO Como) - Castiglioni, Elisabetta (ARCO Como)

Abstract format: Poster

Sorghum [*Sorghum bicolor* (L.) Moench], which is a taxon of African origin (probably in the South Sahara area) known to Pliny (N.H., XVIII, X, 55), has faint signals in Italy during the Roman Period (e.g. at Pompeii it is reported to have been found only in the form of straw, used for plaiting).

It seems to have been cultivated just in Northern Italy, from Late Roman (5th-6th century AD) onwards, becoming quite widespread in the Middle Ages (Castiglioni & Rottoli 2010, 2013 and unpublished data).

Starting on the most recent archaeobotanical data (charred and uncharred caryopses and lemmas/paleas; Bosi et al. 2016, 2023 and unpublished data), we would like to understand the history and economic importance of sorghum in Northern Italy, also pointing out some long-lived ethnobotanical regional traditions.

Funder: Project funded under the National Recovery and Resilience Plan (NRRP), Mission 4 Component 2 Investment 1.4 - Call for tender No. 3138 of 16 December 2021, rectified by Decree n.3175 of 18 December 2021 of Italian Ministry of University and Research funded by the European Union – NextGenerationEU;

Award number: Project code CN_00000033, Concession Decree No. 1034 of 17 June 2022 adopted by the Italian Ministry of University and Research, CUP E93C22001090001, Project title “National Biodiversity Future Center - NBFC”.

193 ASSESSING THE VALIDITY OF DIGITAL METHODS IN DISCUSSING HOMININ PHYLOGENETICS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Davis, Chloe (University of Bradford)

Abstract format: Poster

This poster presents the use of 3D structured-light scanning as a method of collecting cranial metrics on a selection of hominin casts, comparing this to a selection of online scans from sources such as Sketchfab and MorphoSource, and to the reports from the original specimens. This is then used to assess the reliability of current suggestions of phylogenetic trees, exploring cranial landmarks as a method of measuring dimorphism amongst a species. As a comparison to the hominin casts, a modern sample of *Homo sapiens* was used to provide a baseline. Results indicate that digital methods are not statistically different from the original specimens, although interpretations over metric landmarks is a point of debate. Using quartile data, percentage variation is calculated in comparison to a known modern human population. No significant difference is shown between the quartiles for the modern human sample in comparison to some of the species of hominins. The study concludes by providing a potential for the use of 3D technology in determining variation within species, and in the wider picture of allowing online sources as a reliable resource for use in studies.

199 THE USE OF MINIUM IN THE 8TH C. PAINTED STUCCO OF ST. MARTIN'S CHURCH IN DISENTIS, SWITZERLAND

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Cavallo, Giovanni (University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Switzerland) - D'Erme, Chiara (University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Switzerland) - Cassitti, Patrick (Foundation pro Monastery of St. John, Münstair, Switzerland; Albert-Ludwigs-Universität Freiburg, Abteilung für Frühgeschichte und Archäologie des Mittelalters - Otto-Friedrich-Universität Bamberg) - Villa, Luca (Foundation pro Monastery of St. John, Münstair, Switzerland)

Abstract format: Poster

Archaeological excavations carried out in the Monastery of Disentis (Canton of Grisons, Switzerland) during the years 1906-07 brought to light the remnants of a group of churches from the 8th century. Among the finds made during these and subsequent excavations are c. 12.000 painted stucco fragments, attributed to the second phase of the church of St. Martin, dated to the mid-8th century. This unique complex is being studied within the project “Forgotten Colors”, funded by the Swiss National Science Foundation.

The microstratigraphic research on microsamples was conducted after a detailed non-invasive campaign that allowed for the identification of the pigments used (i.e. red and yellow ochre, lead white, C-based pigments) and, in particular, of very well-preserved minium. This pigment was extensively used on the painted surfaces and exhibits different hues ranging from the typical orange to pink and light pink as in the incarnates.

Optical (Vis, UV incident light; PLM) and electron microscopy (Scanning Electron Microscopy coupled with an X-ray Spectrometer, SEM/EDX) were used on polished cross-sections for the microstratigraphic research and microanalysis of the individual paint layers.

Minium was applied both over a lime-based preparation layer and directly on the ground mortar. It was generally mixed with lime (which is quite surprising considering the instability of this pigment with the alkaline environment of the lime). In one case, it was found associated with white phases containing Ca, P and Pb. In a few samples, the association of Pb-Sn-(Si) elements in different proportions associated with minium suggested the presence of lead-tin yellow confirmed by micro-Raman Spectroscopy. The results provide interesting clues, that will be discussed, related to the technology of production of Pb-based pigments in the 8th century.

200 HIGH-RESOLUTION GENOMIC ANCESTRY REVEALS MOBILITY IN EARLY MEDIEVAL EUROPE

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Skoglund, Pontus (Francis Crick Institute) - Speidel, Leo (Francis Crick Institute) - Silva, Marina (Francis Crick Institute) - Booth, Thomas (Francis Crick Institute) - Raffield, Ben (Uppsala University) - Anastasiadou, Kyriaki (Francis Crick Institute) - Barrington, Christopher (Francis Crick Institute) - Götherström, Anders (Stockholm University) - Heather, Peter (King's College London)

Abstract format: Poster

Ancient DNA has unlocked new genetic histories and shed light on archaeological and historical questions, but many known and unknown historical events have remained below detection thresholds because subtle ancestry changes are challenging to reconstruct. Methods based on sharing of haplotypes and rare variants can improve power, but are not explicitly temporal and have not been adopted in unbiased ancestry models. Here, we develop Twigstats, a new

approach of time-stratified ancestry analysis that can improve statistical power by an order of magnitude by focusing on coalescences in recent times, while remaining unbiased by population-specific drift. We apply this framework to 1,151 available ancient genomes, focussing on northern and central Europe in the historical period, and show that it allows modelling of individual-level ancestry using preceding genomes and provides previously unavailable resolution to detect broader ancestry transformations. We infer detailed ancestry portraits integrated with historical, archaeological, and stable isotope evidence, documenting mobility at an individual level. Overall, our results are consistent with substantial mobility in Europe in the early historical period, and suggest that time-stratified ancestry analysis can provide a new lens for genetic history.

201 RECYCLED PAST: A CIRCULAR ECONOMY PROJECT FOR THE STUDY OF PREHISTORIC METALLURGY

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Lackinger, Aaron (University of Granada) - Ruiz Soto, Alonso (University of Granada) - Cárdenas Paiz, Carolina (Unidad de Calidad Ambiental - University of Granada) - Comendador Rey, Beatriz (GEAT - University of Vigo)

Abstract format: Poster

Metallurgy includes various technological processes, ranging from extractive metallurgy to the manufacture, repair and recycling of metal objects.

Of all the metals used in prehistoric times, copper and its alloys were the most important in terms of quantity, being used to make everything from ornaments to weapons. Copper has remained important from prehistoric times to the present day.

One reason for its importance is that it can be recycled without changing its properties. This property has led to a significant amount of prehistoric metallic heritage being recycled, first by the societies that originally produced it and then by others, making it impossible to quantify the amount that has disappeared. Similarly, prehistoric mining landscapes associated with copper mining have been totally or partially destroyed by the increasingly aggressive nature of the extraction processes.

We have used the method of experimental archaeology to study different prehistoric metallurgical processes using mining and metallic waste as raw materials. Using mining waste, we have conducted smelting experiments to extract metals from their ores. We have cast replicas of various shapes of prehistoric objects (axes, daggers, halberds...) from scrap metal in order to approach their production processes and to study their use and mechanical properties. Methodologically, this work has been carried out in both realistic and laboratory conditions. Our field of study has been the metallurgical technologies of prehistoric times (Copper and Bronze Ages) in the Iberian Peninsula.

Our work has had a dual objective: archaeometallurgical research on the one hand, and a social and educational vocation on the other. We have contributed to the latter by carrying out performative activities aimed at different types of public. With this type of activity, we manage to recycle, research and disseminate, generating an environmental and social return through research based on waste.

204 EASTERN POTTERY IN A WESTERN WORLD: NEW INSIGHTS ON EASTERN SIGILLATA FROM PISA THROUGH THE LENS OF ARCHAEOMETRY

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Madrid i Fernández, Marisol (University of Barcelona) - Ortega Palacios, Clàudia (University of Barcelona) - Menchelli, Simonetta (University of Pisa) - Maiorana, Helga (University of Pisa) - Camilli, Andrea (Ministero della cultura, Direzione regionale musei della Toscana)

Abstract format: Poster

Our understanding of the productions known as Eastern sigillatas needs to be completed, both from an archaeological and archaeometric perspective. The archaeological lack of knowledge is more pronounced in the western Mediterranean, sometimes caused by difficulties recognising its physical characteristics. However, there is a practically total archaeometric knowledge gap, especially regarding the consumption centres of the central-Western Mediterranean.

To fill this gap, an archaeometric research focusing on 30 Eastern sigillata samples from the ancient port of Pisa is presented to enhance our understanding of Eastern productions. The samples come from the archaeological site of Pisa-San Rossore (Tuscany-Italy), where the remains of approximately 30 Roman shipwrecks were found in 1998. The excavation brought to light an ancient bed of the Auser/Serchio river, equipped with a river port which in Roman times constituted part of the harbour system of the ancient city of Pisa. The boats have been variously dated (between the 2nd century BC and the 5th century AD) and were shipwrecked due to a series of flood events that periodically affected the paleo riverbed, with an average frequency of one flood every 100 years. Among the types of boats, some merchant ships were found with their cargo, from which the materials taken into consideration come.

For this purpose, all the individuals were analysed by means of X-ray fluorescence (XRF) for the studies of provenance and X-ray diffraction (XRD) for the studies on the technology used for their production. A selection of them has been further analysed under Scanning Electron Microscopy (SEM) to complement the technological research. These results were compared with those already achieved for the same period and the same materials on the Catalan Coast in the Iberian Peninsula to deeper into the role of the workshops involved in commercialising these products in the Western Mediterranean.

213 "A LOOK IS WORTH A THOUSAND WORDS". HISTORY AND 3D MODELING OF THE ROCK ART PANEL OF EIRA DOS MOUROS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Carrero-Pazos, Miguel (University of Santiago de Compostela)

Abstract format: Poster

The Petroglyph of the Eira dos Mouros, nestled within the Cividade hillfort in San Xurxo de Sacos (Cerdedo-Cotobade), Galicia (NW Iberian Peninsula), has long intrigued scholars and archaeologists due to its enigmatic motifs and unique placement. We carried out a comprehensive investigation of this Bronze Age rock art panel, employing a multidisciplinary approach that shed light on its cultural significance, stylistic attributes, and historical context.

Through a combination of archaeological fieldwork, digital photogrammetry, and analysis of historical documentation, we documented the intricate motifs adorning the large, flat stone known as the Eira dos Mouros. Our research revealed a rich tapestry of over a hundred motifs, including geometric patterns, human figures, animals, and abstract symbols, reflecting a diverse array of artistic styles and techniques. Drawing on historical accounts from early researchers such as Manuel Murguía, Enrique Campo, Juan Cabré, and Ramón Sobrino Buhigas, we explored the evolving perceptions and interpretations of the petroglyph over time. These accounts provides valuable insights into the shifting scholarly discourse surrounding the Bronze Age rock art in Galicia and beyond.

215 WASTE DISPOSAL PROCESSES AND LANDFILL MANAGEMENT REFLECTED BY COMBINATION OF ANALYTICAL METHOD: LATE BRONZE AGE BŘEZNICE SETTLEMENT SITE (SOUTH BOHEMIA)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Šálková, Tereza (Faculty of Arts, University of South Bohemia in České Budějovice) - Budilová, Kristýna (Laboratory of Archaeobotany and Paleoecology, Faculty of Science, University of South Bohemia in České Budějovice) - Kovárník, Jaromír (Faculty of Fisheries and Protection of Waters, University of South Bohemia in České Budějovice) - Novák, Jan (Department of Botany, Faculty of Science, Charles University) - Pavelka, Jaroslav (Centre of Biology, Geosciences and Environmental Education, University of West Bohemia) - Strouhalová, Barbora (Department of Physical Geography and Geoecology, Faculty of Science, Charles University) - Vobejda, Libor (Faculty of Arts, University of South Bohemia in České Budějovice) - Štastný, Ondřej (Faculty of Arts, University of South Bohemia in České Budějovice) - Kuna, Martin (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Chvojka, Ondřej (Faculty of Arts, University of South Bohemia in České Budějovice)

Abstract format: Poster

Waste disposal processes and landfill management are crucial subjects in the field of settlement archaeology. Our study is focused on the reconstruction of the community economy in the context of the Late Bronze Age; understanding the processes that led to the filling of settlement features; reconstruction of the recycling system of building materials (daub and wood) and the waste management. These research questions were addressed based on plant macroremains, charcoals, phytoliths, starch, micromorphology, phosphates and magnetic volume susceptibility. The results showed the waste character of features infills which reflected specific economy and habitats around the single households. The composition of the archaeobotanical assemblages was not determined by the type of feature, however similarities in the plant spectra could often be observed in the infill of features that were located close to each other. Charred remains of firewood inside the assemblages, also contained a proportion of burnt oak structures. The remains of various parts of uncharred plants were detected by phytolith and starch analyses. Animal proteins detected the presence of livestock meat and dung. Anomalies in soil phosphate contained different amounts of organic matter in single features. Magnetic susceptibility measurements showed that the features were backfilled in a one-time event. Sedimentological analysis showed that the infills of the different types of features were similar, but only the infills of the trenchlike features were compacted, unlike the other features.

216 ARCHAEOLOGICAL RELICS AND COLLECTIVE MEMORY: AN URBAN LANDSCAPE CASE-STUDY FOR A HOLISTIC CULTURAL HERITAGE MANAGEMENT

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Chroni, Athina (Hellenic Ministry of Education, Religious Affairs and Sports; National Technical University of Athens)

Abstract format: Poster

Ioannina, Epirus, Greece, is a city with a high dynamic; it constitutes a neuralgic node for the wider region, both in the past as well as in contemporary times. Nowadays, a large part of the population, directly related to the University of Ioannina, such as students and staff, is constantly changing, showing, in fact, an upward trend, followed by a corresponding upward trend in the city's commercial activity, as well as in tourism. The afore-mentioned result in pressing short-term or long-term housing requirements, a fact that entails a high risk for the historical buildings, still existing, which, due to their size and layout, do not meet current needs, while at the same time they occupy high-value plots within the urban web.

The combined application of remote sensing, photointerpretation and GIS methodology with archaeological, bibliographical and imagery data, have successfully contributed in locating destroyed architectural assets (landmarks) within the dense urban web of the modern city of Ioannina, along with achieving, also, the cultural relics' qualitative and quantitative documentation.

Under the perspective of a holistic cultural heritage management model proposal, crowdsourcing open call, buildings-at-risk cultural interactive procedure, open-data/open-access mentality, educational seminars at different levels of the educational sector, open workshops for people of various backgrounds, are practices already applied in the framework of IASIS Postdoctoral Research Project. Final goal, the active involvement in cultural procedures of young people, the local community and non-traditional audiences, such as elder people and refugees hosted in the city, ending up in raising the feeling of "belonging", "sharing", "feeling useful and creative".

218 APPLIED SCIENCES FOR A HOLISTIC ARCHAEOLOGICAL DOCUMENTATION MODEL

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Megalooikonomou, Pavlos-Stylianos (National Technical University of Athens) - Chroni, Athina (Hellenic Ministry of Education, Religious Affairs and Sports; National Technical University of Athens)

Abstract format: Poster

The high number of archaeological finds, movable or immovable, of various cultural periods of the past, combined with their wide typological variety, require effective holistic systems for recording and documenting, while ensuring, at the same time, the scientific character of the process and enabling data exchange among the scientific community.

Consequently, open data and free software, such as the QGIS software, are proposed for the overall archaeological research process, field work-laboratory work-communication to the public, thus enhancing the notion of public archaeology.

Furthermore, the use of digital systems for the integrated management of cultural heritage by a multitude of bodies and institutions, public or private, highlights the need to harmonize the different documentation systems in order to enable the communication and exchange of data, thus ending up in linked open data. Applying standardized documentation models, such as the VRA Core, and controlled vocabularies, such as the Getty vocabularies, already developed, on a global scale, in combination with GIS, effectively contributes to increasing the degree of flexibility of the procedure, as well as to the revelation and interpretation of correlations between different geospatial points of interest.

220 WOMEN, ART AND ANTIQUITY. BREAKING CLICHÉS THROUGH ARCHAEOLOGICAL RESEARCH

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Vidal Lorenzo, Cristina (Universitat de València) - López-Bertran, Miriea (Universitat de València) - Vázquez de Ágredos, María Luisa (Universitat de València) - Horcajada Campos, Patricia (Universidad Complutense de Madrid) - Muñoz Cosme, Gaspar (Univeristat Politècnica de València) - Parpal Cabanes, Esther (Universitat de València) - Feliu Beltrán, Núria (Universitat de València) - García López de Andújar, Vanesa (Universitat de València)

Abstract format: Poster

This poster presents some of the historical recreations we have made as part of the project Women, Art and Antiquity. Breaking clichés. The aim of this project is to highlight the role played by women in the societies of the past, and thus contribute to breaking down certain stereotypes with which they have traditionally been associated. The images were created by the artist Érika Meijide Jansen, drawing on archaeological and anthropological data obtained during our research in the field of pre-Columbian and ancient Mediterranean archaeology. The result is a corpus of images of

great artistic quality, featuring female protagonists from different cultures, social status and ages. In this poster we describe the research methodology used in the production of three scenes in which women are the protagonists of ritual activities, accompanied by other members of the society of their time who have only rarely been represented: namely, the children and the elderly.

227 LANDSCAPE ARCHAEOLOGY IN MIDDLE VJOSA VALLEY (ALBANIA)

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Shehi, Eduard (Albanian Institute of Archaeology) - Fioriello, Silvio (Bari University) - Rama, Taulant (Albanian Institute of Archaeology) - Veseli, Sabina (Albanian Institute of Archaeology)

Abstract format: Poster

This presentation offers a preliminary overview of the findings from the inaugural archaeological campaign conducted between September 10th and October 8th, 2023, in the Middle Vjosa River Valley, Albania. The interdisciplinary team undertook a comprehensive topographic survey covering a vast area along the SH4/E853 State Road.

The survey employed systematic intensive reconnaissance techniques, with direct on-site verification facilitated by a team of surveyors positioned at regular intervals. In the span of 26 days, approximately 80 hectares were surveyed, resulting in the identification and documentation of 67 Topographic Units and 22 Sites. Notable discoveries include a Roman imperial-era building complex with thermal rooms, a potential villa or religious site, and five Roman farms.

One of the most remarkable findings was the unexpected discovery of a significant quantity of fragmented pottery and lithics buried in recently plowed fields near the riverbed, suggesting the presence of a Neolithic village site of potential regional significance.

This presentation serves as a preliminary glimpse into the rich archaeological landscape of Qesarat, Albania, and sets the stage for further exploration and scholarly inquiry into this historically significant region.

229 CREMATION AS A "TOTAL EXPERIENCE". CONTRIBUTION OF A HOLISTIC APPROACH TO UNDERSTANDING THE GESTURES AND STAGES OF ROMAN CREMATIONS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Granier, Gaëlle (UMR 7268 ADES, CNRS - EFS- Aix-Marseille University, Marseille, France)

Abstract format: Poster

Archaeoethnology, in its study of death in past societies in all its dimensions, whether social, biological or cultural, makes it possible to considerably renew our understanding of cremation and extend the scope of our knowledge of the different stages in the 'operating chain' when a community chooses to transform the dead body by fire. Using several examples from the Roman period, we propose to demonstrate the contribution of close collaboration between biological anthropology, anthracology, archaeology and environmental sciences, which have enabled us to reconstruct many aspects of this practice. Firstly, the way in which the pyres were built, which shows that they were both the product of specific skills (which allowed a degree of standardisation of the elements needed to ensure the solidity of the structure and to promote use) and the reflection of individual choices. The various elements used on the structure, whose precise nature, topography and seasonality have been determined, show that at the time of cremation, in addition to the active participation of the living by performing certain gestures, interaction with them was maintained by appealing to all their senses: certain elements were chosen for their odour, visual or sound properties. Alongside the study of the bone remains, all of this is part of the staging intended by the deceased himself and/or those responsible for his funeral, at every stage of the cremation process. These examples will also lead us to discuss the practical and technical aspects of the gestures, as well as their possible symbolic and therefore ritual aspects.

231 ARCHAEOLOGICAL WORKSHOPS AS TOOLS TO EDUCATE ON EQUALITY AND HERITAGE CONSERVATION

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Rodríguez-Caraballo, Selene (University of La Laguna)

Abstract format: Poster

Archaeological workshops are a teaching tool for secondary education groups, fundamental in developing awareness of heritage conservation and promoting gender equality in past and current populations. The aim is to eliminate some preconceptions in addition to promoting values related to equality, the preservation of heritage and encouraging a scientific vocation in girls from Canary Islands. These are carried out in two parts, first there is an expository talk to explain basic concepts and then a practical part of anthropological work with human remains. Throughout the expository part, questions are asked about the previous ideas related with it means to be a scientist or if they know women scientists. In the practical part, the student oversees carrying out a brief anthropological study in small groups, which

allows them to have a direct experience with human remains. An attempt is also made to address the importance of preserving protected areas both for their natural or heritage character in the Canary Islands. The material that we analyse in this work is the result of the preparation of surveys that we conducted prior to the beginning of the talk and at the end of the practical part of the workshop. Thus, some prior knowledge that the student had is evaluated to see if it has been beneficial to them subsequently, in addition to evaluating whether the care of heritage or scientific vocations has been promoted among groups of children. The results of the 159 surveys reveal data on the knowledge that secondary school students have about archaeology and evidence that there are gender differences in groups of adolescents. These workshops can be a teaching tool in equality and sustainability in our societies, where debates are frequently generated around the sustainability of the tourist economic model compared to the conservation of heritage assets.

233 THE STRATEGIC ROLE OF THE GUADIANA RIVER FOR CERAMIC TRADE IN SOUTHERN LUSITANIA: STATE OF KNOWLEDGE AND FUTURE PROSPECTS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Martins, Ana (CHAIA - Universidade de Évora; Universidad de Granada; FCT - Fundação para a Ciência e a Tecnologia)

Abstract format: Poster

The Guadiana River is one of the most important communication and supply routes to the southern interior of Lusitania. Although it is not completely navigable, it played a fundamental role in the dynamics of trade, supply and circulation of products during the historical periods of the Roman Empire and Late Antiquity.

The aim of this work is to review the state of knowledge about the strategic role of the Guadiana River in the trade of terra sigillata in southern Lusitania (which includes some regions that today correspond to southern Portugal and Spain) between the 1st century BC and the 7th century AD, by identifying the scientific work carried out on the geographical area studied and the different methods used. Another aim is to understand the consumption patterns of the imported pottery and the preferred economic cycles of the archaeological sites along the Guadiana River based on the available data. In addition, it is proposed to identify some future perspectives for the study of this topic.

234 RITUAL HORSE BURIAL OF THE LATE AND FINAL BRONZE AGE IN PRAGUE-STODŮLKY A NEW STORY ABOUT ONE OLD FIND

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Petriscakova, Katarina (The City of Prague Museum) - Trojáňková, Olga (Institute of Archaeology of the Czech Academy of Sciences, Prague; Charles University, Prague)

Abstract format: Poster

Horse burials started to appear in any significant number on the European continent only towards the end of the Bronze Age, in 13th century BC. This phenomenon is usually associated with the animal's growing importance in society. Archaeologically, this is reflected by horse remains in what is known as a form of burial - i.e. deposition of a whole skeleton or its part in a pit of its own. An example of such a practice can be also the horse burial in a storage pit, covered with cervical spine of a cow, excavated in 1979–1981 in Prague-Stodůlky (Central Bohemia). The AMS radiometric analysis estimated the date of the horse skeleton to be cal. 1216–1056 BC. According to Reinecke's chronology, these values roughly correspond to phases Ha A1 or Ha A2. A complete osteological analysis of the animal skeleton showed basic physiological features and no traces of intentional alterations, such as cutting, scratching, or burning, were found on the skeleton. Based on similar contemporary finds elsewhere, several interpretations of such a find can be offered, all pointing to deliberate deposition for symbolic reasons. The relationship between man and horse in the given period can be analyzed from many different viewpoints. For example, in mythology the horse is traditionally associated with two basic principles - of life and death. The horse is linked to death through its alleged role as a guide to the afterlife, and the principle of life is linked to the Sun, which, seated on a chariot pulled by a horse, travels on the sky every day. This sun symbolism was quite widespread during the Late and Final Bronze Age.

237 FROM PENCILS TO DRONES. A MULTI-SCALAR APPROACH TO THE STUDY OF KHIRBET AL-KHALDE (AQABA GOVERNORATE, SOUTHERN JORDAN)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Intagliata, Emanuele (Università degli Studi di Milano) - Harvey, Craig (University of Alberta) - Raja, Rubina (Centre for Urban Network Evolutions and Classical Studies, Aarhus University)

Abstract format: Poster

Except for limited occasional visits, Khirbet al-Khalde, situated in the Wadi al-Yutm - 26 km northeast of Aqaba - had never been the object of systematic investigations until recently. However, the site's research potential has been evident since the first explorations of its remains in the late 19th century. Located along a major trade artery connecting Petra to Aqaba, Khirbet al-Khalde was a crucial stopping point for people and goods moving from the Red Sea to the Hisma desert and beyond. The remains at this site, which date from the Nabataean period to Late Antiquity, include a fortlet next to a presumed caravanserai. The fortlet-caravanserai combo is not new in the region. Still, it is only attested once in the Wadi al-Yutm and speaks of the symbiotic relationship between long-distance trade and the Roman army in the empire's borderlands.

In July 2023, a new international project was established to explore the history and remains of this poorly researched site. The methodology to document the remains included traditional surface collections coupled with the study of satellite imagery and old reports, drone photography, 3D modelling, laboratory analyses, and a damage and risk assessment. This variegated toolkit has contributed to casting light on the site's history from antiquity to the modern day. This paper aims to present the methodology used for the study of this site while also reflecting on the different types of data collected during our survey season.

238 WEAVING STORIES: COMMUNITY ARCHAEOLOGY AND COLLECTIVE MEMORY AT CASTILLO DE GUZMÁN (BURGOS, SPAIN)

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Polo-Romero, Alberto (Rey Juan Carlos University)

Abstract format: Poster

The research project "Fortified Landscapes of Guzmán" (Burgos) is coordinated by the Archaeology Area of the Rey Juan Carlos University (Spain). The initiative comes from the local community itself, located in the Ribera del Duero area in Burgos, a space characterized by low population density. Beyond the scientific results, in this poster, we will address how Public and Community Archaeology enables the participation of the local population in research projects. We rely on the theoretical models of Community Archaeology (Marshall, 2002; Tully, 2007) and Public Archaeology (Moshenska, 2017), with implementation in rural areas through heritage socialization.

This is a didactic and informative project that values the archaeological heritage from the interests of the local population. How is the local population involved? Through the collaboration of local people in archaeological excavation or tasks such as collective mapping, which allows the creation of heritage cartographies. Additionally, a series of scientific conferences have been held in the local communities, book presentations, intergenerational educational workshops on archaeology, guided visits to archaeological sites, or visits to nearby heritage sites.

Finally, all generated resources are made available to the general public in open access. Thus, resources in extended reality, storymaps, and audiovisual material about the projects have been created.

240 GENDER, IDENTITY AND SPACE: STUDYING EARLY MEDIEVAL SOCIETIES IN THE NORTHWEST OF THE IBERIAN PENINSULA FROM ANOTHER PERSPECTIVE

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Rodríguez-González, Celtia (Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais (CISPAC), Universidade de Santiago de Compostela)

Abstract format: Poster

The study of gender through archaeological materiality has not been addressed in the context of the northwestern Iberian Peninsula for the period covering the transition to the Early Middle Ages. During the 4th to 6th centuries AD, a series of changes began to occur that immediately affected everyday life and the people who lived in these contexts. All of this has been demonstrated thanks to new ways of analyzing the period and surpassing the limitations of written sources, which are often insufficient for a comprehensive study of this context. The considerable increase in archaeological excavations has enabled the development of new analytical proposals for this period. Within these new contributions, this proposal is included, aiming to present the theory and methodology associated with gender archaeology that has facilitated a pioneering study to examine women, as well as the gender relations existing within contexts associated with the transition to the Early Middle Ages.

243 OBJECTS OF IDENTITY AND ADORNMENT: VIEWING FEMALE IDENTITY THROUGH INVESTIGATIONS INTO ISLAMIC GLASS BANGLES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Nash-Pye, Charlotte (British Museum; University of Kent)

Abstract format: Poster

By the 14th century, Islamic glass bangles had become an ubiquitous part of female material culture across the Islamic world. These ornaments are intriguing objects of adornment, offering rare insight into many aspects of the cultural, female and personal identity of both elite and non-elite women throughout the Islamic world.

Glass bangles uniquely represent an element of medieval cultural transfer from the Christian Byzantine Empire into the early Islamic Middle East and further transfer of such traditions to Muslim and Hindu communities in South Asia. There is also tantalising evidence for deeper symbolic cultural and regionalised meanings to these enigmatic objects, demonstrated by different colours, combinations and designs. Evidence for such can be drawn from detailed ethnographic research on traditional glass bangle wearing practices in South Asia, which find many roots from earlier Middle Eastern customs. This study also explores the evolution of female fashions from an early Islamic glass bead, to a primarily medieval-Ottoman glass bangle, wearing culture and the development of imports and local manufacturing, such as west African imitations.

Following vigorous research into the periodic and regional trends of these decorative and typological styles, along with archeometric analysis of the chemical compositions of the glass, interesting insights into trade and cultural transfer has been ascertained. Now, this research attempts to go one step further by exploring the more intangible aspects of the value, meaning and cultural identities that may lie behind these objects of female adornment. It discusses their wide adoption across the Islamic worlds, how they may have varied across periods and places and attempts to interpret the possible values and meanings behind these symbolically charged aspects of female diaspora.

249 3D DIGITIZATION TECHNIQUES AND ARCHAEOBOTANICAL ANALYSIS OF WOODEN ARTIFACTS RECOVERED IN WATERLOGGED CONTEXTS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Gibaja, Juan (IMF-CSIC) - Caruso-Fermé, Laura (Instituto Patagónico de Ciencias Humanas y Sociales (IPCSH-CONICET)) - González-Bagur, Ivana (Instituto Patagónico de Ciencias Humanas y Sociales (IPCSH-CONICET)) - Monteiro, Patricia (Laboratório de Arqueociências. Divisão do Patrimônio Arqueológico e das Arqueociências) - Remolins, Gerard (Regirarocs, S.L.) - Mozota, Millán (Laboratorio Agroalimentario de Santander. Ministerio de Agricultura, Pesca y Alimentación)

Abstract format: Poster

The 3D scanning of wooden artifacts allows to obtain high resolution geometrical and radiometric information which is used to make quantitative and qualitative comparative analysis. The processed digital models can store geometrical information about texture and register the artifacts' state of conservation. These data allow to create virtual collections which can then result in further studies of the artifacts at archeometric level in a remote way.

The objective of this work is to present the combination of 3D scanning techniques with the archaeobotanical analysis of wooden artifacts recovered in waterlogged contexts. With this purpose, we studied wooden artifacts recovered under the waters of Bracciano lake (Anguillara Sabazia, Italia). These artifacts belong to La Marmotta Neolithic site -5700 and 5300 cal BC-.

We worked with two 3D scanning techniques: digital photometry and 3D laser scanning with the objective of presenting the scope and limitations of both techniques and their usefulness in the analysis of woody raw material. The analysis of 3D triangular meshes, with different software bring a new perspective to discuss methods and techniques applied to the study of wooden archaeological artifacts. The methodology of analysis developed in this work makes it possible to apply it to the study of different woody materials regardless of their chronology and recovery site.

255 GEOMETRIC MORPHOMETRICS IN LITHIC CLASSIFICATION: ANALYSING THE LITHIC INDUSTRY OF STRUCTURE I-A IN THE LOWER GALLERY OF LA GARMA (SPAIN)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: García-Noriega, Carlos (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC)) - Portero, Rodrigo (University of Salamanca) - Ontañón, Roberto (International Institute for Prehistoric Research of Cantabria (IIIPC); Prehistory and Archaeological Museum of Cantabria (MUPAC)) - Arias, Pablo (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC))

Abstract format: Poster

The traditional classification of lithic industry, based mainly on visual and morphological characterisation, is limited by its inherent subjectivity. However, technological advances in recent decades are propelling the development of new digital analyses in this field. Among these innovations, three-dimensional geometric morphometrics is notable for its ability to geometrically characterise lithic artefacts, allowing for a quantitative analysis of their shapes. This innovative approach establishes the foundations for a more objective classification based on geometric principles.

Within this framework, the work carried out inside a Palaeolithic dwelling structure in the Lower Gallery of La Garma has been crucial. This work has enabled the documentation of lithic knapping processes in situ, with an exhaustive analysis of more than 600 objects. The high quality of the sample has facilitated the development of a new classification method. Through the digitisation and analysis of 410 lithic artefacts, we have gained a preliminary understanding of how such analysis can contribute to a more accurate classification of lithic artefacts. Among the most significant advances of this method are the precise definition of geometric types, the development of new typologies, the detailed characterisation of fractures or technical gestures and the efficient automation of the classification process.

256 WHAT IS BEHIND 'EARTHEN' IN PREHISTORIC CONSTRUCTION? THOUGHTS ABOUT THE SOURCES OF BUILDING MATERIALS AND THE CHAÎNE OPÉRATOIRE OF CONSTRUCTION

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Peto, Ákos (Hungarian University of Agricultural and Life Sciences) - Kovács, Gabriella (Hungarian National Museum, National Institute of Archaeology) - Röpke, Astrid (Institute for Prehistoric Archaeology, University of Cologne) - Anvari, Jana (Institute for Prehistoric Archaeology, University of Cologne) - Vicze, Magdolna (Hungarian National Museum, National Institute of Archaeology) - P. Fischl, Klára (University of Miskolc, HUN-REN HRC Institute of Archaeology) - Kienlin, Tobias L. (Institute for Prehistoric Archaeology, University of Cologne) - Kulcsár, Gabriella (HUN-REN HRC Institute of Archaeology)

Abstract format: Poster

Earthen architecture is known in many regions of the world, and it has a long tradition even in the more humid climate zone of Central Europe. Earth as building material is a rather open umbrella term including different parts of the soils and sediments of varying origin and genesis. The term 'earth' or 'earthen' is often associated with the uppermost humic substance of the land surface, the 'living skin under our feet', pedologically speaking: the topsoil or humic horizon. Having a closer look at the archaeological literature, most of the so-called 'earthen floors' are made out of very different materials. They are brownish-greyish informal floors, easily prepared from the soils nearby, or formal floors produced from recycled materials, from mud of fluvial origin or unweathered sediments. The texture varies from sandy loam to clayey silt, but in some of the cases they are generally termed as 'clay', referring to a very fine composition. Based on our results there is a lot to be explored in this topic, as via the proper characterization of the building materials, local, regional or cultural similarities and differences can be detected. According to pedological classifications only floors made from soil or its recycled mixtures would deserve the phrasing of 'earthen' but not those made out of unweathered sediments such as loess or alluvial deposits, for example. Another important aspect is the temper of the construction materials, which seems to be crucial and was well selected to stabilise the construction. Using examples from different archaeological sites in the Carpathian Basin we will illustrate the different floor and wall preparation 'recipes' and techniques based on the local given soil and sediment sources. Furthermore, construction materials will be looked at as artefacts and an attempt will also be made to reconstruct their chaîne opératoire.

258 USE OF LOW-COST LIDAR TO DOCUMENT ARCHAEOLOGICAL FINDS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Hiltcher, Tomáš (Prácheňské muzeum v Písku) - Jiřík, Jaroslav (Prácheňské muzeum v Písku; Charles University in Prague) - Pixová, Erika (Prácheňské muzeum v Písku; University of South Bohemia in České Budějovice)

Abstract format: Poster

In archaeology, it's customary to leverage technologies originally designed for other purposes. Presently, certain mobile phones are equipped with LiDAR technology, enabling the generation of straightforward yet precise 3D models. Given its integration into widely used devices, LiDAR technology offers affordability and accessibility. Its efficacy in documenting stationary archaeological findings is remarkable, potentially supplanting traditional photogrammetry methods. Key advantages include rapid processing, repeatability of capture, and modest hardware requirements. This post will showcase several specific instances of mobile LiDAR documentation. It has been employed to document commonplace archaeological finds, expansive sites, and sections of extant structures. Preserving the exact visual representation of monuments holds significant importance in salvage archaeology. LiDAR not only captures the forms of objects but also their spatial relationships, making research cheaper and faster. Furthermore, it opens avenues for future investigations and offers an appealing presentation to the public, therefore, it could become one of the basic forms of archaeological documentation..

260 CROSSING BORDERS BETWEEN THE CROSSFIRE OF ENEMIES. RHENISH STONWARE FROM LOUISBOURG (NOVA SCOTIA, CANADA)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Prieto-Martínez, M. Pilar (University of Santiago de Compostela; CISPAC)

Abstract format: Poster

Rhine stoneware is manufactured in the Rhine area of Europe, managed by Dutch intermediaries on this continent, with great success, especially in English taverns and homes, it is not manufactured in America in its beginnings, but is carried through a series of routes maritime, usually linked to the English colonists. However, it is frequently found in Louisbourg, a territory colonized by France. The fortress of Louisbourg (Nova Scotia, currently in Canadian territory) is an important site for the study of ceramics from the first half of the 18th century and the Rhenish stoneware is a small but significant set of pieces that does not reach 10,000 fragments in this site. In particular, the high quality of the manufacture of Westerwald Rhine stoneware together with a certain typological and decorative variety makes this ceramic very attractive for everyday use in different environments of social life. I present a first approach to the study of this ceramic from a selection of pieces studied in the fortress museum (highlighting jugs, mugs, chamber pots,...) with the aim of making an interpretation in a social key. In this case, this ceramic seems like interesting evidence that is testimony to a more intense contact than expected between enemies and in a period of intense conflict.

270 WASHED ASHORE: THE FIRST MESOLITHIC BARBED POINT IN COASTAL LITHUANIA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rimkus, Tomas (Institute of Baltic Region History and Archaeology, Klaipėda University) - Pranckėnaitė, Elena (Institute of Baltic Region History and Archaeology, Klaipėda University) - Urbonaitė-Ubė, Miglė (Institute of Baltic Region History and Archaeology, Klaipėda University) - Ubis, Edvinas (Institute of Baltic Region History and Archaeology, Klaipėda University) - Piličiauskienė, Giedrė (Faculty of History, Vilnius University)

Abstract format: Poster

The Mesolithic (ca. 9 000–5 000 cal BC) in coastal Lithuania was marked by intense environmental change. Fluctuations in the Baltic Sea water level and dynamics of the coastline affected coastal hunter-gatherer societies. Environmental dynamics are thus one of the main reasons why so little is currently known about the Mesolithic people in coastal Lithuania. Known old osseous collections from this region provided more data on the Late Mesolithic organic tool types. However, no tool types concerning the coastal hunting techniques were available. In 2023, a stray find was found on the beach adjacent to Klaipėda city. It is a 24.9 cm long, 1.3–2.4 cm wide and 0.9 cm thick complete uniserial barbed point. The artefact has three large barbs and a hole in the proximal part. It is made from the metatarsal bone of Eurasian elk (*Alces alces*). AMS 14C dating has shown that the artefact dates to the end of the 6th millennium cal BC, thus making it the first known Mesolithic barbed point in coastal Lithuania. The tools surface is smoothed and shiny, indicating that it has been heavily affected by seawater. Therefore, it is likely that it was washed away from a submerged Mesolithic landscape, known in Lithuanian waters. In this paper we present the barbed point and its latest research, highlighting it as an important object providing new data on the Mesolithic coastal hunter-gatherers.

271 ARKEOPEN AND THE MASAPLUS CONSORTIUM RESOURCES TO LINK OPENDATA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Bernard, Loup (MASAplus; Université de Strasbourg; CNRS)

Abstract format: Poster

For over a decade, French archaeologists and archivists work together in order to promote standards, interoperability and tools for their communities. The former MASA consortium of the french infrastructure HUMA-NUM has evolved in MASAplus Consortium-HN, and keeps promoting several platforms, standards and best practices. This poster will focus on the open platform ArkeOpen to highlight how the ecosystem works.

Indeed, once a dataset is shared on the ArkeoGIS platform -and declared open in ArkeOpen-, it implies the use of the thesauri (Pactols / Opentheso), ontologies (CIDOC CRM), server hosting (HUMA-NUM), data warehousing (NAKALA) and can be requested online using OpenArcheo.

All those elements are of course great resources for the Data Management Plan, from the excavation to the long term archive. Once data has been shared on one of the platforms, it becomes FAIR, and with the help of the semantic web widely interoperable and also machine readable.

This poster will invite any interested researcher or research group to access those tools, standards and invite them to exchange with other europeans projects having the same interests in order to enlarge the FAIR and open communities.

273 EGYPTIAN FAIENCE IN THE LAB: AN EXPERIMENTAL APPROACH

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Muñoz Sogas, Judith (University of Barcelona; Universitat Pompeu Fabra) - Moretó, Elisabet (Eli Moretó Ceràmica)

Abstract format: Poster

Ancient Egyptian faience is a type of non-clay ceramic material that was widely produced and used in Egypt from as early as the Predynastic period (c. 4000 BCE) until the Roman period (c. 30 BCE - 395 CE). The production of faience involved a complex process that required skilled craftsmen. The raw materials, including ground quartz or sand, natron, and other mineral additives, were mixed together to form a paste, which was shaped into the desired form and heated at high temperatures to induce vitrification, resulting in the formation of a glassy surface.

An examination of several faience objects currently found at Museu de Montserrat, including ushabtis, figurines of divinities, beads and scarabs, provided information of their manufacturing process. The replication of this procedure has been made by the experimentation of several techniques, including efflorescence, cementation, manganese application and hole perforation. Ash and sand were used as ingredients for certain pieces and frits were manufactured as well and used to cover pieces made of other materials. The results, observed through binocular loupe, vary with the techniques implemented, the amounts and quality of raw materials used, as well as with exposure to humid environments.

275 EPHESIAN POTTERY ON DELOS: TRACING ECONOMIC AND CULTURAL EXCHANGE IN THE LATE HELLENISTIC PERIOD

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Marzec, Edyta (Fitch Laboratory, British School at Athens) - Kajzer, Małgorzata (Institute of Archaeology and Ethnology of the Polish Academy of Sciences) - Gros, Jean-Sébastien (Independent Researcher)

Abstract format: Poster

The paper presents the results of an interdisciplinary study of Late Hellenistic fine wares from Aphrodision of Stesileos and Sarapiea A, B and C on Delos. Examination of the pottery assemblages from the sanctuaries integrated with laboratory analysis of selected samples indicates that Ephesian fine pottery found on the island is more varied in terms of the appearance of fabric and shape than reported so far. The macroscopic variability of Ephesian fabric seems to be a result of varied firing processes, including different atmospheres, temperatures as well as arrangements of vessels in kilns. Today, this causes difficulties in identifying Ephesian pottery and its underestimation on Delos and beyond, and for this reason, this paper presents its macroscopic, technological and compositional characterization. Furthermore, the paper discusses the role of Rome as a political and economic agent influencing the production and flow of goods from Asia Minor to the West through a duty-free commercial hub on Delos.

277 THE FORMS OF LIVING IN THE MEDIEVAL MEDITERRANEAN. THE CASE OF SARDINIA**Abstract theme:** 4. Persisting with Change: Theory and Archaeological Scrutiny**Abstract authors:** Panetta, Alessandro (Institute of History of Mediterranean Europe (ISEM), National Research Council (CNR))**Abstract format:** Poster

This paper aims to propose a reflection on the theme of living (as a set of practices, objects, spaces and family/social relationships) in the Mediterranean area between the Middle Ages and the Modern age, taking inspiration from the case of Sardinia. The objective of this paper is to build a general picture of the state of research concerning Sardinia, for which the strong and peculiar tradition of geographical and anthropological studies perhaps not has so far found solid support in the historical-archaeological evidence. The contribution will focus mainly on the comparative analysis of the two largest Sardinian cities, Cagliari and Sassari, in the late Middle Ages, broadening the analysis to other minor urban and rural realities of the period, to investigate not only the formal aspects of the archaeological evidence but also the broader dynamics of the population (dwelling), the relationship between internal and external spaces, the internal partition on a functional basis but also linked to the gender/age of the occupants of the house, the relationships with environmental resources (animal, agricultural, pastoral) and the possible place of the latter inside the houses, the negotiation between public and private space, the important social role of the neighbourhood as it emerges from the archival and archaeological evidence and the possibility of identifying different processes for the different social and ethnic groups who inhabit the cities in this period. At the basis of these reflections is the consideration that structural/material transformations are the result (and at the same time a trace) of broader social transformations in communities or of even broader historical events, which in the Sardinian case can directly concern the possible influence of the various political entities that compete for control of the island and succeed each other in its government.

281 A STUDY ON THE ANIMAL REMAINS UNEARTHED FROM THE SHENGJINDIAN CEMETERY IN TURPAN, XINJIANG, CHINA**Abstract theme:** 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps**Abstract authors:** Yu, Xin (Jilin University; University of Bologna) - Liu, Hailin (Jilin University) - Wang, Chunxue (Jilin University)**Abstract format:** Poster

The custom of burying animals has continued in Xinjiang since the Bronze Age. Shengjindian cemetery is located in the southern suburb of Shengjindian Village, Turpan City, on the slope between the reservoir and Flaming Mountain, about 40km away from Turpan City in the West. The existing cemeteries are oval, and the tombs are evenly distributed and orderly arranged. The cemetery was in the Western Han Dynasty, between 2200 and 2050. In this paper, the animal remains unearthed in the tombs were identified and preliminarily studied. The phenomenon of sacrifice in tombs is common, but there were only sheep, fewer goats and more sheep. Sacrificed animals mostly occurred in the multiple burials, and there were two-story platform in the tomb. Animals were usually placed on the container in the tomb. The sacrificial animals were not a complete individual and were used more skulls. The sex ratio and age distribution of sacrificial animals were balanced, and there was no clear selective tendency.

291 PERCEIVING THE LANDSCAPE AT GINOSA: SETTLEMENT STRUCTURE IN THE LOWER REACHES OF THE BRADANO VALLEY**Abstract theme:** 4. Persisting with Change: Theory and Archaeological Scrutiny**Abstract authors:** Piccenna, Simona (University of Bari Aldo Moro) - Moro, Angelo (Freelance Archaeologist) - Fioriello, Custode (University of Bari Aldo Moro) - Nardò, Livio (University of Bari Aldo Moro) - Stasolla, Vincenzo (Archaeological Society Ethra - Taranto; University of Bari Aldo Moro)**Abstract format:** Poster

The progressive census of the archaeological sites in the Ginosa (Taranto-Puglia-Italy) area, supported by GIS implementation over the past few years, has revealed the recontextualisation of the sites of human frequentation and occupation in the lower valley of the Bradano river.

The analysis of the known sites makes it possible to restore the hypothesis of the roads and river routes in ancient times in the area under study; this road network connects the area with the nearby Peucezi settlements of Montescaglioso, Ginosa (urban centre), Passo di Giacobbe and the colony of Taranto, which played an extremely interesting role both in the Magna Graecia period and in the Roman and medieval periods. Furthermore, the presence of the nearby colony of Metapontum, with its port landing, allows the area to interact with the rest of the Mediterranean.

The study proposes the possibility of undertaking additional identification, integration and interpretation of new findings concerning the road system of the past, through a process of archaeological investigation involving the re-ex-

amination of bibliographic and archival data. A new and more systematic topographical mapping of the known settlements and surface finds highlights and more accurately delineates their spatial distribution and relationships with the surrounding landscape.

293 ESPAI MAMMUTHUS: EXPLORING THE EARLY PLEISTOCENE AT THE EL BARRANC DE LA BOELLA SITE (LA CANONJA, SPAIN)**Abstract theme:** 3. The Life of Archaeological Heritage in Society**Abstract authors:** Saladie, Palmira (IPHES) - Fontanals, MArta (IPHES) - Vallerdú, Josep (IPHES) - Lopez-Polin, Lucia (IPHES) - Orellana, Miquel (Ajuntament Canonja) - Plneda, Antonio (Muséum National d'Histoire Naturelle) - ROsas, Antonio (Museo de ciencias Naturales de Madrid) - Garcia Taberner, Antonio (Universidad de leon) - Caceres, Isabel (URV) - Garcia Medrano, Paula (Muséum National d'Histoire Naturelle)**Abstract format:** Poster

The Centre for Interpretation of the Archaeological Site of Barranc de la Boella (La Canonja, Spain) is an unprecedented museum facility in Catalonia primarily addressed to families and school groups, mainly aimed to generate a hub for cultural tourism in the regions of Camp de Tarragona and Terres de l'Ebre. Among the visiting public are families, students of different ages, specialized audiences, and anyone interested in enjoying and learning about our ancestors. The project has been funded by the City Council, the Tarragona Provincial Council, and the European Union.

The archaeological findings and the derived scientific studies have propelled the research project at the Barranc de la Boella site. Visitors could enjoy a throw-back journey to a million years ago to understand and experience life in this prehistoric period while exploring human evolution. The new interpretive center will be equipped with museum resources and interactive exhibitions tailored to different audiences, combining archaeological and scientific information and communication technologies together with recreations, audiovisual presentations, displays of original fossils recovered from the site, replicas for hands-on exploration, and sounds.

MAMMUTHUS aims to be a unique and singular space for understanding prehistory and the early human populations on the Iberian Peninsula. Since the campaign of 2007, the Barranc de la Boella site has become an international reference for the knowledge of Europe's earliest human populations. MAMMUTHUS Space offers a genuine prehistoric experience.

297 LOCAL COINAGE IN THE CITY OF OSSONoba (FARO, PORTUGAL) AS A SIGN OF ISOLATION AND INTEGRATION**Abstract theme:** 6. The Mediterranean from Within**Abstract authors:** baeta, Alice (UNIARQ; University of Lisbon)**Abstract format:** Poster

During the Late Republic, several cities on the Iberian Peninsula produced their own currency for local circulation to sustain their economies in everyday trade. Being in the periphery of Rome's domain, this happened due to the lack of official Roman coins in circulation to supply the local demand, which was already adapted to a monetary economy. The isolation from the capital allowed for a bigger independency, with the production of local coinage.

This poster is centered in the city of Ossonoba, today's Faro in the south of Portugal, and its monetary production and circulation. Of Turdetan origin with an agricultural and fishing economy, it developed greatly during the Roman occupation with fishing and canning activities, which is why the iconography on the coins is mostly maritime motifs. Based on known coins made of copper and lead alloys: the different types will be analyzed first, to try to identify the number of dies, and secondly by their dispersion according to each series of coinage. This study is part of the PhD project in progress in the University of Lisbon, in which the main goals are to determine the number of dies and therefore the number of coins that were made in this and other cities, and the importance of this mint to local economies.

299 THE DEMISE OF THE ATLANTIC GREY WHALE; NEW BIOMOLECULAR ARCHAEOLOGICAL FINDINGS ON AN EXTIRPATED WHALE POPULATION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: van den hurk, Youri (Norwegian University of Science and Technology; Natural History Museum Paris) - Buss, Danny (Norwegian University of Science and Technology) - Seiler, Martin (Norwegian University of Science and Technology) - Philippsen, Bente (Norwegian University of Science and Technology) - Barrett, James (Norwegian University of Science and Technology)

Abstract format: Poster

Understanding the extirpation of the grey whale (*Eschrichtius robustus*) from the North Atlantic is more vital than ever, as four individuals from the North Pacific have re-entered the North Atlantic in recent years, possibly signalling a recolonisation of the species in the Atlantic Ocean. Although, the grey whale now only resides in the North Pacific, historical, palaeontological, and archaeological evidence suggest that this species used to be present in the North Atlantic but was extirpated from this ocean basin at some point during the late Holocene. Here, using radiocarbon dating of archaeological and palaeontological grey whale specimens from the eastern North Atlantic, we reconstruct when the grey whale disappeared from the eastern North Atlantic. Results from radiocarbon dating suggest that extirpation of the grey whale from the North Atlantic directly correlates with medieval whaling activities, indicating that early whaling was even more destructive than previously assumed. Moreover, using stable isotope analysis we infer the past foraging behaviour of the grey whale and use this to infer the ecological niche that they would have occupied in the North Atlantic in the past.

319 OIKOS BUILDINGS IN SICILY BETWEEN OLD RESEARCH AND RECENT DISCOVERIES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Pisani, Marcella (University of Rome Tor Vergata) - Fasoli, Fabrizio (University of Rome Tor Vergata)

Abstract format: Poster

Since 2021, the University of Rome Tor Vergata, in collaboration with the Archaeological Park of Leontinoi and Megara, is bringing to light a Greek archaic temple on the northern part of Colle San Mauro in Leontinoi. The building, which has undergone various transformations over time, falls into the typology of temples without peristasis, a very widespread typology in this period and documented in Leontinoi itself by the less preserved temple discovered on the Colle Metapiccola. This discovery, in addition to increasing knowledge on the sacred topography of the ancient colony, constitutes a significant addition within the framework of sacred buildings without colonnade in Sicily, providing an opportunity to rethink the discussion on the subject. A more recent review of these sacred structures, in fact, invites us to reconsider the great variety of planimetric and architectural solutions currently included in the oikos building typology and to discard the hypothesis of exclusive ownership by some deities.

321 BROOCHES AND IDENTITY IN EARLY MEDIEVAL BURIALS IN BRITAIN

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Christopher, Elizabeth (University of New Hampshire) - Fry, Megan (University of Florida) - McCrane, Samantha (University of New Hampshire)

Abstract format: Poster

One of the many ways to learn about past societies is through the study of funerary objects. For cultures that lived during the early medieval period of Britain, especially before the widespread adoption of Christianity, there are few preserved, written records of how people interacted with each other. Therefore, these types of analyses are especially important for illuminating past cultural practices. While brooches were primarily a way to secure clothing, they provided a secondary aspect of being able to ascertain an individual's social standing, which community they are associated with, and aspects of their personal identity. In addition to typologies, here we examine the spatial distribution of brooch placement within the grave in the early medieval burials. This research sheds light on more nuanced aspects of funerary practices, specifically focusing on individual agency of the deceased as well as the role funeral dress played in signaling social status, identity, and community. Analysis of brooches can inform on mobility, ceremony, and identity more broadly during the 5th-9th centuries, providing insight into a period with little written documentation.

322 THE CONTRIBUTION OF DECORATED CERAMICS TO UNDERSTANDING THE DYNAMICS OF CHALCOLITHIC COMMUNITIES: BETWEEN ESTREMADURA AND ALENTEJO (PORTUGAL)

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: PEREIRA ROCHA, LEONOR MARIA (CHAIA/Universidade de Évora) - Branco, Maria Gertrudes (CHAIA/ Universidade de Évora)

Abstract format: Poster

Ceramic vessels are part of the visual environment of human behavior. One of the characteristics of the European culture of the Neolithic or later Copper Age is the appearance of special types of pottery indicating a particular concern with the presentation of food and drink, presumably for consumption in special social contexts.

In fact, if a piece's functionality is attributed by its shape, its decoration, applied to pieces and in places that allow visualization, carry a communicative intension, constrained by the social and symbolic environment of the potter, destined to be understood in contexts of specific consumption.

It is in this context that the ceramic decorated with «folha de acácia» appears in the archaeological record, whose presence is understood as one of the «fossil director» of the communities that inhabited Portuguese Estremadura, during the Chalcolithic.

This type of ceramic decoration, a minority among the ceramics collected in the habitat of Estremadura, is present in a large number of habitat (about 20), witnessing the existence of an extended community that shares a message expressed in a restricted set of ceramic recipients, which makes them eminently symbolic.

Recent works, carried out in the habitat of Santa Cruz 13, in Central Alentejo, allowed the picking of some ceramic fragments with «folha de acácia» decoration. These fragments are one of the elements that evidence the intensification of inter-regional interaction during the Chalcolithic, present in the circulation of ideas, people and objects, their true dimension will be apprehended, always in a tiny way, through the study and continuity of archaeological works.

323 BEFORE THE ROMANS. ADDRESSING THE INTERPLAY BETWEEN GENETIC AND CULTURAL VARIATION IN PRE-ROMAN ITALY

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Scorrano, Gabriele (University of Copenhagen) - Sabatini, Serena (University of Gothenburg)

Abstract format: Poster

In recent years, studies of the European Bronze and Iron Age have experienced a paradigm shift in which interdisciplinary approaches have taken centre stage in an effort to produce new knowledge. In particular, the study of ancient genomics has seen a dramatic boost adding dimensions to our understanding of prehistoric societies that previously were unimaginable. Critical voices have raised as to the interpretative models used to present the attained results and as to the danger of uncritically linking culture and genetics.

We present the ongoing project "Before the Romans. Addressing the interplay between genetic and cultural variation in Pre-Roman Italy". Ancient Italy offers a unique wealth of archaeological and textual evidence suggesting a sizable cultural and linguistic variety prior to the Roman Era. It is therefore an outstanding case to investigate the complex interplay between cultural

and genetic variation. The project aims to combine in a synergic interdisciplinary approach, the study of archaeological and genetic evidence with data about dietary customs, and life style/health, adding a new depth to our assessments of cultural characterization. The aim is to produce a novel methodological approach for the investigations of the relationship between culture and genetics widely applicable to the study of past societies.

324 ARCHAEOGENETICS AT THE BRONZE AGE NECROPOLIS OF OLMO DI NOGARA, ITALY

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Sabatini, Serena (University of Gothenburg) - Canci, Alessandro (University of Udine) - Eylem Yediay, Fulya (University of Copenhagen) - Kristiansen, Kristian (University of Gothenburg)

Abstract format: Poster

The poster presents the results of a unique in-depth study of the archaeogenetics of the Bronze Age community from Olmo di Nogara in northern Italy.

Olmo di Nogara is located in the Veronese valleys not far from the current city of Legnago (Verona province) and occupy a strategic position dominating several main waterways crossing the region and linking, among other things, the Po valley with the Alps and their rich minerary resources.

Continuous excavation campaigns (between the 1990ies and 2009) have returned 533 tombs, 471 inhumation burials and 62 for cremation and both adult and child burials. 14C and chrono-typological analyses of the grave goods

suggest that the necropolis was in use between approximately the Italian Middle Bronze Age 2 and the Recent Bronze Age (c. 1550-1150 BCE). Three graves dated to c. 800 AD suggest that the area was to some extent used for burials also in medieval time. We carried out a thorough genetic study of over 80 individuals and discovered a complex picture with multiple ancestries being represented in the community. We aim to present our innovative approach and disclose the potential implications that large datasets from single communities represent for our understanding of Bronze Age communities in northern Italy and beyond.

325 THE SCIENCE OF RELIGION: SELECTED ANIMAL REMAINS FROM KYIVAN RUS' SACRED CONTEXTS. THE FIRST RESULTS OF THE INTERDISCIPLINARY PROJECT

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Khamaiko, Natalia (Leibniz Institute for the History and Culture of Eastern Europe (GWZO), Germany; Institute of Archaeology, National Academy of Sciences of Ukraine) - Lundgren, Magnus (Uppsala University, Sweden) - Philippsen, Bente (NTNU, National Laboratory for Age Determination, Norway) - Gol'din, Pavel (Schmalhausen Institute of Zoology, National Academy of Sciences of Ukraine) - Mazza, Selene (University of Cambridge, Great Britain) - Kublii, Mykhailo (Institute of Archaeology, National Academy of Sciences of Ukraine) - Yanish, Yevheniia (Schmalhausen Institute of Zoology, National Academy of Sciences of Ukraine) - Barrett, James (NTNU, University Museum, Norway) - Woloszyn, Marcin (Leibniz Institute for the History and Culture of Eastern Europe (GWZO), Germany; Rzeszow University, Poland)

Abstract format: Poster

Sacred animals have been used in various ritual practices by diverse peoples across different eras. Two of the most renowned research sites in Ukraine were selected to investigate sacred animals used as sacrifices within the territory of Kyivan Rus'. One site features a cat skeleton unearthed in a grave in Shestovytsia, possibly constituting the oldest regional evidence of a domesticated cat. The second site reveals an oak trunk with the lower jaws of pigs embedded within it, discovered in the Dnipro River near its confluence with the Desna. The cat served as a funerary offering, while the oak trunk with pig jaws suggests a ritualistic context. Oaks are associated with the Slavic worship of Perun, the patron of thunder and lightning. However, the Scandinavians, upon their arrival in the region, brought with them a rapid surge of trade and state-building, incorporating animals and trees into their ritualistic practices as well. Both instances are linked to the formative period when the early state of Kyivan Rus' was emerging. They both provide insights into the worldview of the people who left them and raise numerous questions, ranging from dating accuracy to genetic and ecological affinities of the animals, as well as identifying the individuals who performed the sacrifices. Modern interdisciplinary research, combining archaeology, zooarchaeology, genetics, isotopic analysis, and radiocarbon dating, can offer solutions to various queries, from precise dating to comprehending origins and ecology. Comparing this data with finds from European studies will enable us to position these artefacts within their broader European historical context.

329 BROKEN, SPLIT, OR KNAPPED STONES: THE VERSATILITY OF THE BIPOLAR TECHNIQUE IN ETHNOGRAPHIC DATA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Yesilova, Gökem (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Tarragona, Spain; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili, Tarragona, Spain)

Abstract format: Poster

The first chapter of his book, titled "Palaeolithic Reflection" by Brian Hayden, concluded with the statement, "Again, comparative data on ethnographic campsites where only stone tools were used is very important, for if it is not done in the next 5 years, it will be too late. This assertion underscores the significance of the material culture not only of Australian Aborigines but also of the tribes within the Oceania. Until 1945, indigenous tribes in the New Guinea Highlands exclusively utilized stone tools. From this perspective, the contribution of ethnographic and ethnoarchaeological materials to archaeological studies from an analogical standpoint cannot be denied. Building upon these premises, our poster presentation seeks to review all ethnographic research concerning the bipolar technique and introduce its technological and functional aspects. The bipolar technique has been extensively documented by pioneering researchers in various ethnographic studies conducted among indigenous peoples across the Americas, Africa, South Asia, and Oceania. Historical records demonstrate the versatile nature of the bipolar technique, as it was employed to fulfill a diverse array of functional purposes. While some researchers have interpreted its simplistic mechanics as indicative of gender bias or a low level of technical skill, the bipolar phenomenon instigates significant discourse regarding technological proficiency and complexity.

332 LIDAR-BASED TARGETED DETECTION AND SPATIAL ANALYSIS OF NE ROMANIA'S BURIAL MOUNDS. CASE STUDY: THE JIJIA RIVER'S CATCHMENT

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Brasoveanu, Casandra (Alexandru Ioan Cuza University of Iasi) - Brunchi, Radu-Alexandru (Alexandru Ioan Cuza University of Iasi, Institute of Interdisciplinary Research, Arheoinvest Centre)

Abstract format: Poster

Nowadays Romania's territory benefits of an impressive number of burial mounds, erected since the beginning of the Bronze Age and used up until the early medieval stages. Focusing on the Jijia River catchment, an area encompassing approximately 5750 sq. km, the objective of our research was to precisely pinpoint and characterize the micro-morphology of the tumuli monuments, in the quest for establishing their chronology. In this sense, we should mention that so far was noticed a significant lack of organized initiatives to document these sites, ascertain their chronology, or study their geomorphological characteristics. By employing an innovative methodological approach centered on high-resolution airborne sensing techniques, our study has been able to identify 1600 such sites and reevaluate their spatial distribution across the Jijia River catchment landscape.

This endeavor has significantly increased the number of burial mounds known in the territory of interest while, also, obtaining novel datasets regarding their morphological characteristics and spatial location, providing important clues in establishing their potential chronology. We consider the results obtained as more than important, especially since the sites are constantly under threat by intensive modern agricultural practices, most of them being already flattened.

333 CARVING OUT COMMUNITIES IN PRE-NURAGIC SARDINIA

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Lilley, Kirsty (University of Edinburgh)

Abstract format: Poster

Pre-Nuragic Sardinia (c. 4400-2300 BC) was a period of changing social and cultural practices, characterised by both insular developments and external influences. This is epitomised by the domus de janas: rock-cut tombs that were, uniquely for this period in the Mediterranean, increasingly embellished with architectural, representational, and abstract art. Traditionally, these monuments have been the subject of many typo-chronological and cultural-historical studies, and yet the social role of the tombs in their wider prehistoric contexts has been largely neglected.

This research explores the hypothesis that the domus de janas were central in the creation and articulation of group social identities in the pre-Nuragic period, and attempts to construct a 'social geography' of Sardinia based on the tombs' artistic embellishment. To do so, this study generates spatial clusters and connections from databases of the 492 decorated domus de janas and of all rock-cut tomb cemeteries across the island, employing statistical and computational methods combined with comparative approaches. In particular, it suggests that statistical similarity can be used to consider difference, which, when placed in its geographical, political, and socio-cultural context, may indicate not only the nature of distinctions present between communities, but also the reasons for their development. Analysing and evaluating data at different scales, the study generates an island-wide view of cultural difference – and similarity – in this period, as well as regional variations in the social roles of tombs.

Overall, it argues that distinct identity constructions and expressions are visible across the island through funerary architecture, and that these resulted from several factors including cultural traditions, trade and exchange, and topography. Placing the tombs and their social functions in the wider context of Mediterranean rock-cut tombs, it also contributes to debates surrounding connectivity and insularity in the Late Neolithic and Chalcolithic periods.

335 UNVEILING THE DRUMBEAT: EXPLORING DRUM MOTIFS IN SOUTH AFRICA AND ZIMBABWE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kumbani, Joshua (Institut d'Arqueologia UB (IAUB), Universitat de Barcelona; Departament d'Història i Arqueologia, Universitat de Barcelona) - Díaz-Andreu, Margarita (Institut Català de Recerca i Estudis Avançats (ICREA); Institut d'Arqueologia UB (IAUB), Universitat de Barcelona; Departament d'Història i Arqueologia, Universitat de Barcelona)

Abstract format: Poster

The presence of musical instruments in the rock art of southern Africa offers a compelling window into the cultural practices and beliefs of ancient societies. While extensive research has been dedicated to various aspects of southern African rock art, the examination of musical instruments, took a slow trajectory. This poster aims to shed light on the occurrence of drum motifs within southern African rock art, focusing specifically on two sites in South Africa and Zimbabwe. The drum motifs are found at Grootvlei 158 in the Eastern Cape of South Africa and at the Bushman Point site in the Mashonaland West province of Zimbabwe. Through a desktop-based analysis of published data and rock art

databases, this research explores the contextual significance of drum depictions within these regions. Comparative analysis between the two sites is conducted, accompanied by an examination of the ethnohistorical background surrounding the use of drums in African communities. Drums held various roles, serving as instruments for musical expression, integral components of rituals, and even mediums for communication. By delving into the portrayal of drums in southern African rock art, this study contributes to a deeper understanding of the cultural heritage and traditions of these ancient societies, enriching our knowledge of their spiritual and social practices.

This research is part of the ERC Artsoundscapes project (Grant Agreement No. 787842) that has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme. PI: Margarita Díaz-Andreu.

343 MOSAIC TILE FLOORS IN 12TH CENTURY ROSKILDE (DENMARK) – A LINK TO ROMAN ANTIQUITY?

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Langkilde, Jesper (Roskilde Museum)

Abstract format: Poster

In the town of Roskilde, Denmark, archaeological excavations at two ecclesiastical sites, one of them with relation to the first Cistercian monasteries in Denmark, have brought forward remains of some of the earliest tile floors in Denmark and Scandinavia. The tile floors date to the mid- or late 12th century when the art of brick and tile making was at the very beginning in Denmark. The design and fabric of these tile pavements are hitherto unparalleled in Denmark and Scandinavia, even in later medieval ornamented tile floors, which came in to widespread use from the mid-13th century. The inspiration – and maybe even production – of these pavements can be linked to central and southern Europe, and even far back in time to Roman mosaic pavements. These floors thus appear as an example of links between the figurative language in Roman antiquity and high medieval northern Europe and the explicit Roman heritage in medieval Romanesque architecture. In addition these floors contribute to our understanding of the Church as a decisive agent in the introduction of revolutionizing technologies and architectural ideas in medieval Northern Europe. The poster will present the archaeological finds and the design of these tile floors along with comparative material and results of scientific compositional analysis of the provenance of some of the Roskilde tiles.

350 ARCHAOMETRICAL ANALYSES, EXPERIMENTAL ARCHAEOLOGY AND CONSERVATION OF AN EARLY IRON AGE HELMET

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Grahek, Lucija (Institute of Archaeology, ZRC SAZU) - Petrič, Mitja (University of Ljubljana, Faculty of Natural Sciences and Engineering) - Fajfar, Peter (University of Ljubljana, Faculty of Natural Sciences and Engineering) - Muck, Deja (University of Ljubljana, Faculty of Natural Sciences and Engineering) - Žužek, Borut (Institute of Metals and Technology) - Batič, Barbara (Institute of Metals and Technology) - Nemeček, Nataša (National Museum of Slovenia)

Abstract format: Poster

Bronze helmets are among the most prestigious objects of the Early Iron Age (Hallstatt period). A poorly preserved, ritually damaged Negova-type helmet was recently discovered at Pezdričeva njiva, Slovenia. A detailed study was carried out to further understand the significant elements of the helmet. The study included determining the helmet's composition and state of preservation, which are crucial factors in determining the best conservation techniques for the artefact. A metallurgical analysis was also carried out to gain insight into the manufacturing processes and craftsmanship of Iron Age metalworkers.

The helmet is now part of the permanent archaeological exhibition at the Bela Krajina Museum in Metlika and a valuable part of the local cultural heritage. In addition to experiencing the multi-sensory nature of the helmet, a replica has been made, providing visitors with a unique opportunity to gain a deeper understanding of material culture.

The importance of past craftsmanship and manufacturing processes is highlighted through the interdisciplinary collaboration of experts from different fields. It demonstrates the need for further multidisciplinary research and the importance of preserving our material and intangible cultural heritage.

351 GOTLANDIC PICTURE STONES – THE ONLINE EDITION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Helmbrecht, Michaela (archäotext) - Oehrl, Sigmund (Stockholm University; Universitetet i Stavanger)

Abstract format: Poster

The Gotlandic picture stones are among the most famous archaeological monuments of Scandinavian history. The particularly rich imagery of the Gotlandic picture stones, dating to ca. 400 to 1100 AD, offers a unique source for studies of Late Iron Age material culture – e.g. male and female dress, architecture, ship technology as well as carriages, weaponry and combat, hunting and fishing. The picture stones from Gotland are an unparalleled source for information on Scandinavian pre-Christian religions and Old Norse myths, as they depict ritual and cultic acts like horse fights, drinking ceremonies, human sacrifices, and funeral rites. Nearly 700 picture stones are known today.

From 2018 to 2024, a project aiming for a new digital edition of Gotland's picture stones was conducted at the University of Stockholm and Gotland's Museum in Visby. This new edition, fully accessible online, contains all available information about each Gotlandic picture stone, including high-resolution 3D models, photos, archival material, and a bibliography.

With our poster, we would like to draw attention to the upcoming launch of the website.

357 EXPERIMENTAL TEXTILES ARCHAEOLOGY: STUDY OF "RIBBED ARMOR" FROM THE LONGOBARD PERIOD

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Belletti, Clara (Università Cattolica del Sacro Cuore - Milano)

Abstract format: Poster

This work deals with textiles archaeology and examines, at an experimental level, a particular armor found recurrently within Longobard culture burials in Italy: it is a pattern that determines the creation of a fabric called 'ribbed': that presents an alternation of reliefs and grooves on the fabric.

The starting elements are preserved through the mineralization process and have been studied by the Laboratorio di Archeobotanica di Como (by Mauro Rottoli and Elisabetta Castiglioni)

From the observation of the finds, an experimental procedure was developed by evaluating the tools and materials to be used to reproduce the armor under study.

Next, the phase of assembling the healds to compose the specific armor is analyzed, the variables are evaluated and the critical issues are presented; a portion of fabric is then worked to reproduce the weave*.

Finally, the fabric created can be compared with the archaeological originals to evaluate the effectiveness of the procedure.

*For the practical part of the experimentation I took advantage of the collaboration of Paola Boerci, weaver.

358 RETHINKING THE USE OF GAULISH LANGUAGE IN EASTERN GAUL : ARCHAEOLOGICAL AND EPIGRAPHIC ASPECTS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Janin, Marie-Anais (PhD in Roman History, Université de Bourgogne)

Abstract format: Poster

For those scholars who wish to study the spread and use of this language with fragmentary evidence, the ancient written sources on Gaulish are rather scarce. In fact, until the 19th century, the idea of a common written use of Gaulish was not taken for granted. All epigraphic records were considered to be corrupted Latin. With improvements in linguistics and archaeology, scholars are now aware of the extent of the written record in Gaulish. During my doctoral thesis, I worked with literary, archaeological and epigraphic data from Eastern Gaul (Senoni, Aedui, Lingones and Sequani tribes) in order to add elements about the use of the Gaulish language (personal/official use, chronological expansion, possible dialects).

Between the La Tène period and the 3rd century AD, these Gallic tribes, as well as southern Gaul and the Rhone basin in particular, were well connected with Rome and southern Gaul, where the Gaulish language is attested in Etruscan and Greek scripts. The privileged relations between the Aedui and Rome implied diplomacy and trade and, consequently, a habit of epigraphy much earlier than in other parts of Gaul (except the South).

This case of study, which was the subject of my doctoral thesis and in which several approaches and methodologies were used, needs to be further investigated, taking into account the other Gallic tribes and the archaeological data, in

order to map and better understand the spread and the persistence of the written habit in the Gallic language during the Principate.

370 A MUSEUM BY THE EYES OF WOMEN ARCHAEOLOGIST: A PERUVIAN CASE

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Tavera-Medina, Carito (Departament d'Història i Arqueologia, Universitat de Barcelona (UB), Barcelona, Spain; Instituto Peruano de Estudios Arqueológicos; Universidad Nacional Mayor de San Marcos)

Abstract format: Poster

While museums have historically been among the initial material power institutions created by archaeologists, the distancing that the discipline took with collecting weakened the museums from the perspective of 'the form in which we produce science.' This shift has led to a change in the status hierarchy of what the academy recognizes as a prestigious position. In this way, universities become the primary locus of prestige and power for male archaeologists. However, in the context of the early stages of Peruvian archaeology, a resilience process is evident, wherein women archaeologists redefine the museum as a space for creating and disseminating archaeological knowledge to non-specialist communities.

This poster presents the contributions of three different generations of Peruvian women archaeologists who served as directors of the Archaeological and Anthropological Museum at San Marcos National University during the 20th century: Rebeca Carrion Cachot, Rosa Fung, and Ruth Shady. This investigation reveals their strategies, alliances and achievements during their time as directors.

372 SANDARNA CULTURE THROUGH ARTIFACTS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Zerue, Amanuel (National Historical Museums, Arkeologerna) - Nieminen, Johannes (National Historical Museums, Arkeologerna) - Andersson, Jessica (National Historical Museums, Arkeologerna)

Abstract format: Poster

The Sandarna culture is a Mesolithic culture group that covers an area that extends along parts of the Swedish west coast. It has primarily been defined based on its specific flint industry, dated traditionally to a period from 7,700 BC to 6,000 BC.

Our poster will present the technological analysis of lithic artefacts from two prehistoric settlements belonging to the Sandarna culture that were excavated in 2022 and 2023 in the Gothenburg area. The purpose of our analysis has been partly, to highlight the chronological aspects of the flint materials and partly to illustrate which lithic reduction techniques and processes are represented in the material remains through a chaîne opératoire analysis.

Analyses were made on several attributes of the lithic artefacts, such as dimensions, platform's preparations and facets, bulb of percussion, flaking angles, etc. These attributes often tell us something about the reduction techniques and processing. In such a classification, all artefacts belonging to the same reduction process are compiled and assessed. The results of the analysis are then obtained by interpreting the process of manufacturing and the execution of one or more orders of removal in a lithic reduction process.

The poster will further present the results of our analysis as well as comparisons with previously published studies at the local, regional, and supra-regional levels. Our focus is to try to relate our results to new research which demonstrates that the Sandarna culture's flint technology should be seen as a parallel phenomenon to the Maglemose culture in Southern Scandinavia (Aldén Rudd et al. 2019). In that case, the Sandarna culture would therefore be placed in a larger northern European Mesolithic context. With time, this can lead to a further discussion about mobility and cultural contact networks over the greater area of Northern Europe during the Mesolithic period.

376 WHO LIVED THERE? STUDYING THE TERRITORY FROM THE PERSPECTIVE OF THE ARCHAEOLOGY OF DEATH (5TH-7TH CENTURIES AD) IN SOUTHERN SPAIN

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Sánchez, Irene (Universidad Rey Juan Carlos)

Abstract format: Poster

This proposal arises from the question: Who lived there? When we do not have sites of a residential nature located in the rural sphere, we have to study the territory from another perspective, based on the funerary record. The selected chronology under study ranges from the 5th-7th centuries AD, since it is known that some necropolises were in use since the 5th century AD, being reused during the following centuries. Furthermore, in the region under study, southern Spain, three population groups -Hispano-roman, Visigoths and Byzantines- 'coexisted' from the 6th century AD onwards. For these two reasons, this chronology has been chosen as the focus of this research.

The aims of this research are summarised in the following objectives:

- To carry out a study based on the population density of the southern area of Spain from the graves of the rural necropolises during the chronology under study.
- To observe the evolution of the funerary spaces themselves.
- To see the articulation of the sites in the territory (visibility between the funerary sites, communication routes and even the elements that make up the landscape in its orographic sense).

Once the selection of rural funerary sites has been made, we will proceed to use Geographic Information Systems (GIS), as this will allow us to carry out the relevant analyses of territorial visibility between the sites and the territory. The aim is also to understand the interactions between different human groups and their impacts through geospatial analysis.

Finally, and in line with the above, we will proceed to the analysis of the material culture and its chronotypological distribution in the necropolis under study.

In this sense, with the factors described above, we will be able to better understand the territory and estimate the population density based on the burial sites.

383 THE STRAIT OF GIBRALTAR IN THE MIDDLE AGES: HOW TO FORTIFY THE GATES OF THE MEDITERRANEAN

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Biro-Sarrias, Matthias (Universidad de Granada)

Abstract format: Poster

The proposed study will focus on the state of research of architectural archaeology of the fortifications around the Strait of Gibraltar (Spain) between the 9th and the 15th centuries. While many of these fortified sites have been studied in the past (Tarifa, Gibraltar, Algeciras, Castellar de la frontera, etc.), few have undergone in-depth architectural analysis, and some have not been studied at all (Casares, Gaucin). The study of these sites, the collection of new data, and the compilation of architectural data from previously studied sites will enable a large-scale chronological analysis of the evolution of architecture and its relationship with the evolution of borders. Therefore, the objective of this work is to provide a visual overview of significant architectural studies undertaken in the study area, as well as to identify buildings that have not been previously studied. The proposed poster will thus, after a brief contextualization of the research topic and key elements, present, through maps and site photos, the state of research on medieval defensive architecture around the Strait of Gibraltar, as well as future work to be undertaken during the author's investigation.

384 ARCHAEOETHANOLOGY OF THE POSTMEDIÉVAL CEMETERY AT POBĚŽOVICE (THE CZECH REPUBLIC)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Pruchová, Erika (University of South Bohemia; Prácheň Museum in Písek) - Chroustovský, Luboš (University of West Bohemia) - Hiltšcher, Tomáš (Prácheň Museum in Písek)

Abstract format: Poster

The current research of archaeological burial contexts requires interdisciplinary collaboration. Here we present the significant benefits of biological anthropology engaged not only in post-excavation data gathering and processing, but in the collection of the primary data during the fieldwork. This archaeoethanological endeavour aims to reconstruct and characterize burial rite and following formation processes impacting skeletal remains as well as grave goods or grave construction. During the salvage excavation of the postmedieval church cemetery at Poběžovice in the southwestern part of the Czech Republic the detailed taphonomic investigation together with precise 3D spatial documentation of individual objects (skeletal remains and grave goods) were engaged. When these methods are formalized, they enable to reconstruct the spatial distribution of graves (even if grave boundaries cannot be recognized), the original positions of interred bodies (burial rite) or various taphonomic processes and they don't slow fieldwork significantly. Moreover, they produce data that can be easily analysed even when the rigorous post-excavation processing is postponed or abandoned due to the weak financial support.

385 GLASS IN PROGRESS: CRAFT COMPLEXES OF MEDIEVAL KYIV

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Zhurukhina, Olena (The Museum of History of the Desiatynna (Tithe) Church (Kyiv, Ukraine); Leibniz-Institut für Geschichte und Kultur des östlichen Europa (GWZO) (Leipzig, Germany))

Abstract format: Poster

During the Middle Ages, the territory of Kyiv, as the administrative, political, cultural, and economic centre of Rus', accumulated processes that contributed to the development of crafts, internal and external trade relations.

The emergence and development of local glassmaking production became possible after accepting of Christianity and intensifying of the connections to Byzantium through the import of glass products, and of course, the skills and knowledge of the Greek craftsmen. The workshops to produce glassware can be divided into two groups. The first group was located near the temple-building places. These workshops probably appeared in the 11th century and produced glassware for temple decoration (mainly smalt for mosaics, and windowpanes). However, at the beginning of the 12th century, the need to decorate temples with mosaics gradually disappeared. Step by step, mosaics were replaced by a mural.

The second group of workshops appeared in the 12th century and thanks to technologies such as serial winding, focused on a wide market. Most of them are fixed on the Podil district – the craft and trade centre of Kyiv. Glassware from the 12th to the first half of the 13th century is the most numerous and diverse group with new product categories (beads, bangles, finger-rings, inserts for rings and vessels). The glassmaking complexes worked with both imported glass/raw materials and recycled glass products and may have used their own raw materials.

To ascertain the chemical composition of Kyiv workshops glass is important, as well as the comparison it with medieval glass from the lands related to ancient glassworks and traditions. A study found out, that Kyiv glassmaking was based on lead and potassium-lead glass, which is evidenced by the findings of lead ingots, chipped glass, analyses of finished products.

387 ARCHAEOLOGY AND SCIENCE: A DIGITAL TOOL TO FACILITATE THE INTERPRETATION AND SPREAD THE KNOWLEDGE OF FINDS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Chirco, Gabriella (Dipartimento Scienze Tecnologie Biologiche, Chimiche Farmaceutiche – STEBICEF, Università degli Studi di Palermo, Parco d'Orleans II, Viale Scienze 17, Palermo I-90128, Italy; Dipartimento Culture e Società, Università degli Studi di Palermo, Viale delle Scienze 15, 90128, Italy) - Chiari, Giacomo (Getty Conservation Institute (Retired), S. Tommaso 29, 10121 Torino, Italy) - Chillura Martino, Delia Francesca Chillura Martino (Dipartimento Scienze Tecnologie Biologiche, Chimiche Farmaceutiche – STEBICEF, Università degli Studi di Palermo, Parco d'Orleans II, Viale Scienze 17, Palermo I-90128, Italy; ATeN Center-Laboratorio Caratterizzazione Struttura Atomico-Molecolare, Università degli Studi Palermo, Parco d'Orleans II, Viale Scienze 17, Palermo I-90128, Italy; Consorzio Interuniversitario Nazionale per Scienza e Tecnologia dei Materiali (INSTM) - UdR Palermo, Viale delle Scienze 17, Palermo I-90128, Italy) - Portale, Elisa Chiara (Dipartimento Culture e Società, Università degli Studi di Palermo, Viale delle Scienze 15, 90128, Italy,)

Abstract format: Poster

In recent decades science has made giant strides in every field, including archaeological studies.

Archaeometry employs digital media diagnostic tools, enabling the understanding of the composition of materials. This provides information about execution techniques, materials used, and conservation conditions.

However, the data obtained is not always immediately understandable to all professionals collaborating on an interdisciplinary study, and often even less so to the end-users. This limits diffusion of information.

The applications presented here show how low-cost digital tools can facilitate scientific information. Noninvasive tools preserve the object's integrity by eliminating sampling for laboratory analysis, including micro sampling.

The SmART_Scan software, which statistically combines a high-resolution visible image with a relatively small number of X-ray fluorescence spectra acquired at selected points, produces false-color maps showing the distribution of the chemical elements present.

Visualizing the distribution of each element in the painted layer greatly enhances its comprehension. When an element is not indicative of a single pigment, Boolean operators can combine more than one element to build a compound.

In this way, the results are not confined to the sphere of science but can be a good source of dissemination among archaeologists and art historians.

388 INSIGHTS INTO PRODUCTION OF POTTERY FROM THE END OF THE LA TÈNE PERIOD IN CENTRAL EUROPE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Volf, Jan (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic; Department of Archaeology, Faculty of Arts, Charles University) - Slavíček, Karel (Department of Geological Sciences, Faculty of Science, Masaryk University) - Thér, Richard (Department of Archaeology, Philosophical Faculty, University of Hradec Králové) - Trnová, Kristýna (Department of Geological Sciences, Faculty of Science, Masaryk University)

Abstract format: Poster

Pottery surveys enable to study not only manufacturing process but also contacts between communities and organization of societies. Manufacture of ceramic vessels was influenced by multiple factors, such as the raw material used, function of vessels in the society, organization of their production, and cultural conventions. The research of pottery represents an important source of information about changes of society during the late La Tène period in Central Europe. At the end of this period and the beginning of the Roman period, in the first century BC, settlement network and material culture, including pottery, underwent a significant transformation. To understand the characteristics of this transformation, it is necessary to study ceramic assemblages from the end of the La Tène period, specifically from the phase LT D1b. In Bohemia, one of these assemblages is represented by pottery from Křinec in Central Bohemia. Our study of the assemblage from Křinec incorporated macroscopic survey, x-ray fluorescence analysis, thin section analysis and computed tomography. Using these analyses, we have obtained new data on the settlement's position in the regional economic and social network which suggest that at the end of the La Tène period contacts between settlements in the region included the transportation of ceramic vessels or material for their manufacture, but potters from different communities did not share knowledge about pottery production. The presented approach offers a deeper understanding of the organization of society at the end of the La Tène period and demonstrates the potential of multifaceted pottery research in archaeological studies.

389 CULTURAL HERITAGE INSTITUTIONS OF SMALL MEDITERRANEAN ISLANDS. FRAMING AND FACING THE DIGITAL DIVIDE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Di Biase, Federica (University of Cyprus)

Abstract format: Poster

In today's digital era, numerous cultural heritage institutions grapple with a diverse array of technologies to enrich the promotion of their collections and enhance visitors' experiences. Recent reports have highlighted the efforts of well-resourced cultural institutions to bolster their digital presence, while museums and scientific publications have showcased exemplary digital storytelling. The majority of these success stories come from larger, well-resourced institutions and with the capacity to implement robust digital strategies. In contrast, several reports have highlighted the digital divide within cultural heritage institutions networks, but scant evidence exists regarding this issue from small Mediterranean islands. This presentation discusses preliminary results derived from the analysis of the digital portfolios of cultural heritage institutions located on small Mediterranean islands. A detailed examination of the digital assets of each institution is crucial for identifying their skills' gap and charting a tailored learning path built on a needs-based analysis. This digital portfolio analysis, indeed, serves as the initial milestone in a broader project that aims at developing practical, step-by-step guides for creating digital content promoting museums and other cultural institutions in areas that are not easily accessible to the wider public.

395 A VIKING AGE BURIAL GROUND IN TVÅÅKER, COUNTY HALLAND, SWEDEN

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Nordin, Petra (National Historical Museums) - Kjellin, Anders (National Historical Museums)

Abstract format: Poster

This poster is about a Viking age burial site in Halland, Western Sweden. The burial ground is nearly totally destroyed by agriculture and other disturbances. Part of the burial ground was discovered during a pre-excavation survey in 2017. The subsequent excavation uncovered approximately 139 burials or parts of burials, with the help of a systemic method of looking for burials and metal finds. Burials and burial related layers had to be interpreted based on negative impressions in the ground: bone layers on cremation sites, robbed out standing stone pits. Interpretation was further complemented by the finds recovered from the graves, these were mainly Viking-era metal objects and early medieval ceramic sherds from 246 vessels. Metal objects reflect a world of symbolism that we find at this time in Northern Europe. The period around 1000 AD Sweden was changing from hedonism to Christianity, but when exactly did that change take place? The burial ground is only partially excavated (approximately 6%). The overall picture with finds and

symbolic graves with ship shape stone settings, tridents, mounds and standing stones plus a water well indicates that a relatively large population lived here during the Viking Age (Late Iron Age). Technical advances in hydropower and iron making in the area can be traced back to the Viking Age. The oldest traces are located along the river Tvååkersån.

400 TRACKING AN EARLY ATTIC ROAD

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Wagman, Robert (University of Florida) - Nichols, Andrew (University of Florida)

Abstract format: Poster

In this presentation we offer a preliminary investigation of a little known early road in northwest Attica linking the Eleusinian Plain to the highland of Chasia along the southern foot of the central Parnes range. Several elements in this road's construction and layout point to its continuous use from antiquity to modern times as the northernmost connector between the west and east Athenian plain across the Aegaleos-Parnes barrier.

Today the easiest way to access the road is from a trailhead off the main Fyli motorway, in the location known as 'Farangi'. As the name suggests, here a stream called Iannoula carves a narrow defile between the lower folds of the Parnes massif and the hill ridge of Vouno Fylis. Upon approaching the defile, the traces of a low embankment begin to appear underneath the thick shrubbery covering the base of the ridge. Since they are all arranged on the same line, with no further walling above or below them, the remains of this embankment do not seem to be part of a terracing system. Also, instead of running close to the contours of the ridge as an agricultural terrace would do, the embankment follows the course of the modern hiking path as this meanders across the defile on both sides of the streambed. The construction method and the building materials closely resemble those of the surviving sections of the ancient Phyle road, as they can be observed, for example, near the Kleiston Monastery. Most interestingly, a variety of ruined structures are found along the edge of the road, from lime kilns and animal enclosures, to a large settlement with buildings in dry rubble work. Our presentation will cover the topographical and archaeological features of this little-known early road, along with essential information on the hitherto unexplored buildings along its route.

402 A COMPARISON OF TWO APPROACHES FOR ESTIMATING TRAUMA PREVALENCE FROM INCOMPLETE HUMAN SKELETAL REMAINS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Beier, Judith (DFG Center for Advanced Studies 'Words, Bones, Genes, Tools', University of Tübingen, Tübingen, Germany; Paleoanthropology, Institute for Archaeological Sciences, Department of Geosciences, University of Tübingen, Tübingen, Germany) - Santon, Matteo (Ecology of Vision Group, School of Biological Sciences, University of Bristol, Bristol, United Kingdom) - Rathmann, Hannes (Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen, Tübingen, Germany; Paleoanthropology, Institute for Archaeological Sciences, Department of Geosciences, University of Tübingen, Tübingen, Germany)

Abstract format: Poster

The preservation of archaeological human skeletal remains significantly influences the assessment of past trauma prevalence, as trauma that was once present may be obscured. In this study, we evaluated the performance of two approaches for estimating trauma prevalence from incomplete samples: crude frequencies (CFs) considering only specimens with $\geq 75\%$ completeness, and generalized linear models (GLMs) incorporating specimen completeness as a covariate. Using a simulation framework, we assessed how closely CF- and GLM-based trauma prevalence estimates matched the known prevalence levels of two cranial samples (with benchmarks of 10% and 30%, respectively), after introducing increasing amounts of missing values (resulting in about 20%, 40%, 60%, and 80% incompleteness). Our simulations incorporated empirical data on cranial fracture patterns from real-life forensic and clinical cases alongside patterns of varying completeness observed in archaeological cranial remains. Our results show that at 20% and 40% missing values, CFs and GLMs generated trauma prevalence estimates of comparable accuracy. However, with 60% to 80% missing values, CFs tended to increasingly underestimate the benchmarks, while GLMs tended to overestimate them. CF estimates consistently exhibited a lower precision than GLM estimates across all levels of incompleteness. Additionally, as skeletal preservation decreased, CFs increasingly often yielded incorrect reversed relative prevalence patterns between the two samples, provided estimates of 0% prevalence, and occasionally failed to produce estimates. Owing to their superior performance and analytical versatility, we recommend using GLMs or, preferably, generalized linear mixed models (GLMMs) over CFs, especially when dealing with largely incomplete samples. Furthermore, when skeletal remains are highly incomplete, we suggest focusing on relative GL(M)M prevalence patterns between samples rather than on absolute GL(M)M estimates.

404 REDISCOVERED GLASSES FROM THE NATIONAL MUSEUM IN PRAGUE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Svobodová, Helena (National Museum Prague) - Rohanová, Dana (University of Chemistry and Technology Prague)

Abstract format: Poster

During the study of the collection of Gothic and Renaissance glass in the National Museum's repository, one of the authors noticed glass fragments attached to two cards (numbered 84 and 85), lying on top of a box marked for disposal. It was a surprise to find that one of the fragments belonged to a cage cap, which was a lost piece originally belonging to the Bartholdy collection in Rome. It was drawn among other items in his catalogue created in 1820. We tried to hypothesize how these fragments ended up at the National Museum: Already in 1867, the cage cup fragment appeared in the National Museum in Prague together with four other glass fragments when the archaeological exposition was being prepared. After the exhibition finished, these fragments remained forgotten until their rediscovery in 2020. The other glass fragment attached to card number 84 was a part of flat pane glass. On card number 85, there were two fragments of ancient glasses – a dish decorated with two rows of wheel-cut facets (AR 16.2) and a fragment of a deep bowl with a horizontal handle (Isings 75), both made from natron glass (sodium-calcium). The last piece of glass on card 85 was the bottom of a Gothic Bohemian-type beaker, made from the Regional Gothic type of potassium-calcium glass.

405 MULTICULTURALITY, ECONOMIC PATTERNS AND TRADE DYNAMICS IN THE NEW CARTHAGINIAN CITY OF IBERIA: THE PROJECT #PRODUCINGANDSUPPLYINGQART-HADASHT

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Cutillas-Victoria, Benjamin (Universidad de Murcia; Institute of Nanoscience and Nanotechnology, NCSR Demokritos.) - Ramallo Asensio, Sebastián (Universidad de Murcia) - Martín Camino, Miguel (Museo Arqueológico Municipal de Cartagena)

Abstract format: Poster

This poster introduces the main objectives of the project "Producing and supplying the new Punic capital of the Western Mediterranean: contextualisation and archaeometric characterisation of ceramic materials from Qart-Hadasht". We focus on the ceramic assemblages assigned to Qart Hadasht, the town founded by the Carthaginians in 228 or 227 BC, identified under present-day Cartagena (Spain). Scholars to date have mainly focused on typological and descriptive issues. However, our main objective is to complete this perspective with the application of characterisation analyses (e.g. XRF, pXRF, XRD, SEM-EDS, OM, TG) to determine the consumption, production and exchange patterns of the Punic city. This approach allows us to go deeper into the possibilities of the archaeological record, being able to explore specific questions such as the areas of production, the raw materials selected, the technological strategies and chaînes opératoires, or the trade networks that were established at local, regional and trans-Mediterranean scale. The presentation will address the objectives of the project and present the preliminary data and its archaeological implications.

408 DRIFT CAPACITY OF RIVER CURRENTS FROM THE POINT OF VIEW OF ARCHAEOLOGICAL ARTIFACT TRANSPORTATION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Machová, Barbora (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Hradilek, Václav (Faculty of Environmental Sciences, Czech University of Life Sciences Prague)

Abstract format: Poster

The issue of transporting archaeological river finds due to the transporting capacity of river currents is crucial in any attempt to assess the distribution of archaeological artifacts within riverine cultural landscapes. The transporting capacity of the current depends on many factors, and its simulation is not straightforward. The main factors include hydrological and geomorphological characteristics of the watercourse on one hand, and the material, shape, and weight of the archaeological artifact on the other. In order to better understand the distribution of river finds in a specific area, we have decided to conduct an experiment aimed at evaluating the transporting capabilities of the Jizera River in selected sections. Three main variables were introduced into the experiment: (i) Locations of fords in as natural a state as possible; (ii) Several types of archaeological artifacts commonly found in watercourses; (iii) Time.

For the implementation of the experiment, we selected three fords in chosen sections of the Jizera River. Bathymetric measurements were conducted at all sections using the RiverSurveyor M9 sonar, confirming the suitability of the selected sites. As test artifacts, replicas of an iron horseshoe, bronze axe, silver coin, ceramic vessel, and stone beads on a natural string were selected. The first phase of the experiment took place during suitable hydrological conditions,

when it was possible to ford the river without difficulty. The primary goal of the first phase was to select the placement of objects in the fords. The positions of the placed objects were then monitored every two months.

The presented contribution aims to acquaint readers with the first phase of the experiment, which focused on establishing a method for describing bedload transporting processes of the river. Furthermore, it highlights the actual placement of objects at the ford locations and the initial monitoring of their transport.

409 ENHANCEMENT OF GEOPHYSICAL DATA USING DATA SCIENCE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Oliveira, Rui (University of Évora - Institute of Earth Sciences; University of Évora - Physics Department; University of Évora - Earth Remote Sensing Laboratory) - Caldeira, Bento (University of Évora - Institute of Earth Sciences; University of Évora - Physics Department; University of Évora - Earth Remote Sensing Laboratory) - Borges, José (University of Évora - Institute of Earth Sciences; University of Évora - Physics Department; University of Évora - Earth Remote Sensing Laboratory) - Bezzeghoud, Mourad (University of Évora - Institute of Earth Sciences; University of Évora - Physics Department; University of Évora - Earth Remote Sensing Laboratory)

Abstract format: Poster

In geophysical prospection it is quite common that the results are not very clear regarding the existence of buried structures, despite the good terrain conditions and the efficiency to carry on the methods. A detectability problem related to low signal-to-noise ratio has been identified. The problem can be caused by excessive overturning of structures and ceramic remains, or soil properties that are averse to methods such as ground-penetrating radar and magnetic. Standard processing for both methods is unable to effectively eliminate or mitigate this effect. Therefore, advanced, and customized processing can contribute to solving the problem. We highlight the use of mathematical transformations combined with matrix factorization techniques, which allow easier and less computationally intensive data manipulation. The application of these operations allows the improvement of geophysical data despite an apparent lack of information.

Acknowledgment: The work was supported by the Portuguese Foundation for Science and Technology (FCT) project UIDB/04683/2020 - ICT (Institute of Earth Sciences).

412 NEANDERTHALS AND ANATOMICAL MODERN HUMANS AT CUEVA DEL ARCO (MURCIA, SPAIN). COMPARISON OF THEIR HUNTING AND CONSUMING PATTERNS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Real, Cristina (Universidad de Valencia) - Román, Dídac (Universitat Jaume I) - Martín-Lerma, Ignacio (Universidad de Murcia)

Abstract format: Poster

Cueva del Arco is an archaeological site situated in the Mediterranean region of the Iberian Peninsula. The site comprises several cavities, named A to E, which contain a sequence from the Palaeolithic to the Neolithic period. Cavity D is particularly noteworthy for its Palaeolithic art. The most comprehensive and well-represented sequence from the site is found in cavity A, where levels from the Middle Palaeolithic and Upper Palaeolithic have been identified. This study presents the analysis of faunal remains from level III (Mousterian, older than c. 55 ka BP) and level II (Gravettian, ca. 33.8–32.0 ka cal BP) found in this cavity.

The main objective of this work is to compare the subsistence behaviour of two distinct human groups, Neanderthals and Anatomical Modern Humans, who used the same dwelling. A zooarchaeological and taphonomic analysis was conducted to achieve this goal.

The assemblages consist of several species of ungulates, carnivores, and leporids. Leporids are the most abundant group (ca. 90%), while ungulates mainly comprise *Capra pyrenaica*, with few remains from *Bos primigenius*, *Equus ferus*, and *Cervus elaphus*. The assemblage is highly fragmented and diagenetically altered, though some anthropogenic and non-anthropogenic modifications could be identified.

The comparison reveals minor variations in the taxonomic composition, age-at-death, and resource exploitation, including thermal alterations, percussion marks, cut-marks, and non-anthropogenic modifications. Additionally, the study of the material culture suggests that both Neanderthal and Gravettian human occupations were brief and infrequent, and faunal study should help to better understand their nature.

413 PITS AND PEOPLE: BIOMOLECULAR, OSTEOLOGICAL AND FUNERARY APPROACHES TO THE HUMAN REMAINS FROM DANEBURY IRON AGE HILLFORT

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Bleasdale, Madeleine (University of York) - Fischer, Claire-Elise (UiT - Norges Arktiske Universitet; Tromsø Museum - Universitetsmuseet) - Metz, Sebastian (University of York) - Castells Navarro, Laura (University of York) - Büster, Lindsey (Canterbury Christ Church University; University of York) - Legge, Michael (University of York) - Evans, Jane (National Environmental Isotope Facility, British Geological Survey, Keyworth) - Wagner, Doris (National Environmental Isotope Facility, British Geological Survey, Keyworth) - Reich, David (Department of Genetics, Harvard Medical School) - Armit, Ian (University of York)

Abstract format: Poster

Danebury Hillfort (c. 550 - 100 BC) is one of the best known Iron Age sites in Britain and has served as a focal point for discussions surrounding social organisation at this time. Excavations led by Barry Cunliffe (1969-1988) unearthed approximately 300 deposits of human remains (e.g. pit 'burials', partially articulated remains, isolated bones). Despite the significance of Danebury within its regional context and its vital contribution to our wider understanding of Iron Age society, questions remain about the interconnectedness, residential origins and social structure of the buried community. Here we present new multiproxy results (DNA, isotopes, osteology) to tackle these important questions.

Previous isotope results of animals from Danebury show significant levels of mobility (Hamilton et al. 2019). These data have been used as a proxy for human mobility to challenge concepts of Iron Age communities as predominantly sedentary. To further explore this, we generated genetic data (n = 90) and applied a multi-isotope (Sr-Pb-O-C) approach to over forty (n = 41) individuals. We confirm the presence of non-locals who spent their childhood elsewhere but came to be buried at the hillfort as adults. We also identified a core local group who likely lived and died at Danebury. This multidisciplinary approach has offered fresh insights into the lives of the Danebury community and through comparisons with neighbouring sites (e.g. Suddern Farm) will be woven into broader narratives of mobility and connectivity during the British Iron Age.

414 PRYSSGÅRDEN - SUSTAINABILITY AND CHANGE OVER 5 000 YEARS OUTSIDE THE MODERN CITY OF NORRKÖPING, SOUTHERN SWEDEN

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Sjölin, Marita (National Historical Museums) - Larsson, Fredrik (National Historical Museums) - Asserstam, Marcus (National Historical Museums)

Abstract format: Poster

In the early 1990's vast archaeological excavations in Pryssgarden, Norrköping, revealed a substantial settlement with 90 well-preserved remains of post-structured buildings dating from 4000 BC - 1200 AD. Alongside the buildings were numerous activity areas dedicated to cooking and crafts as well as a large number of enclosures. There was also a considerable ceramic material with various pots and a unique tuyères.

Pryssgarden is located near the important river Motala Ström which provided excellent communications to the inner of Sweden as well as the Baltic Sea. Within 1 km lies one of Sweden's most significant rock carving sites, Himmelstalund. Alongside the river were easy manageable soils and fruitive pastures.

Currently new excavations 2022-2024 have so far revealed at least 10 farms consisting of more than 100 post-structured buildings and 6 pit-houses from approximately 4000 BC-1200 AD. Furthermore 10 sill-stone houses from 1200-1600 AD. The latter are the remains of a well remained rectory farm.

The current excavations focus on the farms and the household as well as the surrounding landscape and the local society in the form of extended villages. The questions of the project center on sustainability and change over a long period of time. This deals with questions of how long the individual farms has survived, strategies for their survival in time of crises, for instance times of pest, war or climate change. Other questions concern strategies for crops, husbandry, various handcrafts, trade and other subsidiary incomes.

In this poster we will present two distinctive farms; First a late bronze Age farm with a three-aisled longhouse containing a large underground storehouse; Second an Iron Age farm with a 30 m long three-aisled longhouse, a well-preserved fenced courtyard, corrals and an associated economy building.

MODELLING (AND SIMULATING) ANCIENT LANDSCAPES AND IDENTITIES RETHINKING LIMINALITY OPEN ACCESS DATA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Limina, Valentina (Université Catholique de Louvain)

Abstract format: Poster

RELOAD is a post-doctoral project funded by FNRS at UCLouvain. The aim of the project is to re-evaluate the marginal areas of northern Tuscany through Volterra's case study. The ultimate aim of the project is to contribute to the re-evaluation of the role of 'liminal' areas - in the wider sense of the term, that is, marginal as border areas, but also as real or perceived physical barriers - in landscape studies to demonstrate their pivotal role in space perception and in the expressions of identities between the Roman conquest and late antiquity. The project's ambition is to propose an innovative interpretative model thanks to the integration of legacy data, the collection of new data from archaeological field survey campaigns, data management on the GIS platform and the application of Agent-Based Model Simulation in NetLogo. Indeed, RELOAD intends to be part of the wider debate on Resilience theory and it adopts, for the first time, the concept of Anti-fragility in archaeology. The elaboration of archaeological data and the simulation of social dynamics within a virtual environment will allow analysis of complex behaviours, prompting a deeper understanding of how social groups perceived boundaries and shaped their identities along with the landscapes. In the end, the project shows how an integrated approach to the complexity of ancient landscapes, assisted by ABMS techniques, could help bridge the gap between disciplines, promoting sharing, reproducibility and standardisation of data and practices.

HIPPONION - VIBO VALENTIA: ONE HUNDRED YEARS AFTER PAOLO ORSI, NEW DATA FROM THE "BELVEDERE TELEGRAFO" SANCTUARY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Mazza, Michele (Ministry of Culture)

Abstract format: Poster

In this paper we will present the data that emerged from a brief archaeological survey carried out during the redevelopment of the area of the municipal administration of Vibo Valentia, on the area of the sanctuary of Belvedere Telegrafo. The sanctuary on the hill of Belvedere-Telegrafo (today the Park of Remembrance), stood to the north of the plateau on which Hipponion was founded. Here, in 1916, P. Orsi brought to light the remains of the base of the most monumental of the hipponiate buildings known so far, spared by the stone quarrymen only in the eastern part of its foundations. From the evidence collected, however, P. Orsi was able to reconstruct a Doric temple measuring 37.45 x 20.50 m, built in limestone, with a cella (naos) preceded by an atrium (pronaos) and a deep room behind it (adyton). The cella was surrounded by a colonnade with a single row of columns (peripterus). The proportions of the temple, slightly elongated, are unparalleled by contemporary sacred buildings in Western Greece. The excavation was carried out in a hurry, and the data collected did not allow us to better understand the limits of the sanctuary, but above all to identify its tutelary divinity. With the excavation conducted in 2023, additional elements have emerged that allow us to provide further data on the chronology of the sanctuary.

THE BELL BEAKER PHENOMENON IN LIGURIA (ITALY): CURRENT STATE OF RESEARCH AND NEW PERSPECTIVES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Doderò, Chiara (University of Genoa)

Abstract format: Poster

During the late phases of the Copper Age, traces of the Bell Beaker phenomenon are also known in Liguria. Its spread is attested in at least nine sites, most of which are located in the western part of the region. The evidence in question comes from sporadic discoveries, from the results of old or not yet fully published research, from preliminary studies or, finally, from contexts in non-primary deposits. Rare are the more substantial traces from stratified contexts. A recent study, by re-examining the Bell Beaker and the common pottery from one of these sites, Pianaccia di Suvero (SP), has made it possible to clarify the characteristics, chronology and relationships with neighbouring areas of this context during the Bell Beaker phase. In the light of these results, a broader research project has been launched, which aims to provide a global description of the characteristics and dynamics of the spread of the Bell Beaker phenomenon in Liguria, through a complete analysis of the material culture of the Bell Beaker sites and of some sample sites that can be broadly attributed to the Copper Age. The aim of this paper is therefore to describe the current state of research on this important phenomenon, to provide an initial framework for reading, and to outline the current prospects for ongoing research on the available material evidence.

FOOD TECHNOLOGY AND DIETARY HABITS IN THE IRON AGE: NEW GAS-CHROMATOGRAPHIC DATA FROM THE VERONA AREA (NORTHERN ITALY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Migliavacca, Mara (Department Cultures and Civilization University of Verona) - Bandera, Silvia (Department Cultures and Civilization University of Verona) - Donadel, Valentina (Department Cultures and Civilization University of Verona) - Pogietta, Luigi (Department Cultures and Civilization University of Verona)

Abstract format: Poster

The gas chromatographic analyses carried out by University of Verona on the selected samples from Iron Age settlements in the Verona area have provided valuable insights into the dietary habits of the inhabitants during that time period. By analyzing the residues found on the pottery items, we have been able to reconstruct the types of foods and beverages that were consumed, as well as the methods of food preparation and preservation.

In particular, the results of the analyses suggest that there was a wide variety of foods consumed by the Iron Age population in Verona. The presence of plant and animal lipids on the pottery items indicates that both plant-based and animal-based foods were part of their diet. Additionally, the presence of dairy lipids suggests that dairy products such as milk and cheese were also consumed.

Furthermore, the different shapes and functions of the pottery items provide insights into the food technology used during the Iron Age. For example, the presence of dolia for conservation, plates and jars for preparation, and bowls and cups for consumption suggest that the inhabitants had developed sophisticated methods for storing, preparing, and consuming their food.

Overall, the results of the analyses shed light on the food choices, dietary habits, and food technology of the Iron Age inhabitants of the Verona area. Future research will continue to explore these aspects in order to gain a better understanding of the culinary practices of this ancient population.

POOR WOMEN, RICH MEN? WHEN SEX AND SOCIAL STATUS INTERTWINE: THE CASE OF THE LINEARBANDKERAMIK CULTURE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Waldvogel, Laura (Université de Strasbourg)

Abstract format: Poster

In archaeology, assessing the wealth of graves often relies on counting the number of objects and/or object categories they contain, although ethnological data has long shown the limits of this approach. In fact, in traditional societies with "socially useful wealth", comparable to Neolithic societies due to their practice of storage, objects requiring a great deal of labor and made from distant raw materials are socially valued and perceived as wealth ("precious" goods).

With this framework in mind, I used a points-based method which considered these two criteria and applied it to the 6 main graveyards of the Linearbandkeramik culture (LBK). The results showed a partition of the buried population into three wealth groups. The first one is the poorest, and the tombs related to it are devoid of "precious" goods: those only belong to the two richest groups (groups 2 and 3), which are distinguished between themselves by the greater number of such objects in group 3. By comparing these data with the biological sex of the dead, I found that these two groups systematically included a majority of male individuals, as long with a smaller number of females and immatures. Furthermore, among the "precious" goods found in groups 2 and 3, specific types of adornment were worn only by a fraction of the deceased, with sex being one of the archaeologically discriminating criteria behind this divide. The most notable case is that of V-shaped Spondylus and bifurcated Spondylus shells, whose systematic location around the pelvic area suggests similar use for both sexes: while the former are worn by men, the latter are associated with women. These elements therefore show that, in the LBK societies, there were groups of individuals who distinguished themselves from one another through social status. However, these groups also knew internal differentiation based on their sex.

MEALS FOR THE DEAD? INVESTIGATING THE INTERSECTION OF FOODWAYS AND FUNERARY PRACTICES IN ROMAN BRITAIN VIA ORGANIC RESIDUE ANALYSIS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Jones-Williams, Medi (University of Bristol)

Abstract format: Poster

In my research project, I am exploring the intersection of foodways and funerary practices in Roman Britain by conducting the first large-scale study of Romano-British accessory vessels, employing organic residue analysis (ORA). My samples derive from distinct 3rd-century funerary contexts at Brougham, York, and Colchester. My case studies

will offer unique insights into the contrasting characters of Romano-British sites, from remote military cemeteries to cosmopolitan urban centres. Based on ceramic variability at each site, the chosen methodology ensures a nuanced exploration of vessel function across settlement hierarchies and regions. Results will be compared with new residue data from domestic assemblages, contributing to our understanding of these key Romano-British sites.

Research on archaeological biomarkers has revolutionised our understanding of ancient foodways. Utilising gas chromatography (GC), gas chromatography-mass spectrometry (GC-MS), and GC-combustion- isotope ratio MS (GC-C-IRMS), I will identify biomarkers that characterise the nature of substances, both food and non-food, stored or prepared within the vessels before deposition. Results from ORA are particularly powerful in contexts lacking historical evidence of non-elite lifeways, like Roman Britain. Moreover, highly acidic soils on the frontier limit skeletal and zooarchaeological evidence.

Using a novel multidisciplinary approach, my research will enrich our understanding of later Roman Britain, a culturally complex society undergoing social, economic, and environmental changes. The findings will contribute to the reconstruction of vessel function, patterns of consumption, and diversity in burial traditions on an inter- and intra-site level, considering the economic, political, and cultural position of Britannia in the wider context of the Roman empire.

This poster will introduce the research aims, case study sites, and material being investigated for this project. Methodologically, my project combines material culture analysis with new organic residue data and the existing archaeological and zooarchaeological evidence, providing a comprehensive understanding of foodways, and the function(s) of accessory vessels.

436 WIVES, WIDOWS AND UNMARRIED – WOMEN'S AGENCY IN EARLY MODERN TOWN

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Niemelä, Tia (University of Helsinki) - Uotila, Kari (University of Helsinki; University of Turku; Muuritutkimus Oy)

Abstract format: Poster

In the early modern period Finland (in this case, from AD 1650 to the early 19th century), women were unable to run businesses or have merchant status. Nonetheless, in some cases, widows took responsibility for their late husbands' businesses and retained autonomy to remarry or remain widowed. Historical archaeology within the feminist framework provides an opportunity to investigate women's agencies using archaeological data from excavations, together with archival material. This study aims to combine materials from recently excavated large-scale urban site in Turku Market Square in Southwest Finland with historical written sources, such as probate inventories from the early 19th century.

Early modern women were not mentioned in archival materials as much as were men. The underrepresentation of women can be explained simply by the fact that written sources usually contain only those in power who were men at that time. To overcome this challenge, this poster presents five case studies in which probate inventories are used together with archaeological material to research the complexities of women's agencies in the early modern period at the micro-level through material culture.

438 SICULI (RESNIK, CROATIA) IN UNDERWATERMUSE PROJECT

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Bralic, Anamarija (Muzej grada Kaštela) - Kamenjarin, Ivanka-Katya (Muzej grada Kaštela)

Abstract format: Poster

The Adriatic Sea has been, for thousands of years, an important traffic link. This traffic left numerous traces of ancient routes, ruins, harbors, and cities. The Underwater Muse project includes several sites in Croatia and Italy (Torre Santa Sabina, Grado, Siculi/Resnik, Venice Lagoon). These sites exhibit strong diversity and are characterized by their rich cultural heritage. Through innovative and experimental methodologies, the project's objective is to transform these sites into an underwater archaeological park. In Siculi/Resnik, for almost three decades, the Museum of the Town of Kaštela has conducted research on the mainland. But now, with underwater archaeology, we are able to reach new comprehension about the Hellenistic settlement, Roman harbor, and remains of Neolithic settlement.

The UnderwaterMuse project extends beyond just archaeological preservation; it also offers a new model for engaging with our underwater cultural heritage. The initiative aims to make these underwater sites more accessible and understandable to a broader audience, ensuring that the legacy of these maritime landscapes is preserved for future generations while also promoting regional economic development.

By combining cutting-edge technology with experimental methodologies, the project seeks to reduce the loss of cultural heritage and enhance the tourist-cultural promotion of the areas involved. The UnderwaterMuse project represents a unique blend of archaeology, technology, and tourism, offering a sustainable and inclusive approach to engaging with underwater cultural heritage.

447 COME TOGETHER. CONNECTING DEMOGRAPHY AND CENTRALIZATION PROCESSES IN THE EUROPEAN IRON AGE

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Quatrelivre, Carole (SFB 1266, Christian-Albrecht Universität zu Kiel (DE); CNRS UMR 8546 Aoroc (FR)) - Bilotti, Giacomo (SFB 1266, Christian-Albrecht Universität zu Kiel (DE)) - Scholtus, Lizzie (SFB 1266, Christian-Albrecht Universität zu Kiel (DE)) - Zeviani, Camilla (SFB 1266, Christian-Albrecht Universität zu Kiel (DE); McDonald Institute for Archaeological Research, University of Cambridge (UK)) - Nakoinz, Oliver (SFB 1266, Christian-Albrecht Universität zu Kiel (DE))

Abstract format: Poster

Since Arlinghaus, central place theory relies on a Zipf or Pareto distribution, which states that the hierarchical level of a central place in a system is correlated to its size in population. The more people a place has, the more it is likely to expand its central functions. The archaeological translation of this distribution, called the rank-size rule, uses the spatial extent of sites as a proxy for population. However, recent regional studies imply that centralization processes may have been out of sync with demographic evolutions. This discrepancy points to more diverse paths to centrality taken by past societies. We analyze this inconsistency by assessing centralization and population dynamics separately and by looking at variations in the relationship between these two indicators.

Three windows into the European 1st millennium allow us to compare how both criteria behave, independently and together, in different socio-political and cultural contexts: 1. Central Italy, 2. South-West Germany and Eastern France, 3. Northern Germany and Denmark.

Integrating central place theory and network theory, our method for assessing centrality focuses on the intensity of interaction on a local and global scale, in different areas of central functions, such as economy, politics, military and symbolic. The resulting empirical model of centralization process for each window will be compared to demographic estimations. Relative population fluctuations are analysed combining the available archaeological data. Radiocarbon data is used whenever available, comparing it to site count and variation in settlement dynamics (house size variation and houses per settlements) in order to identify significant patterns of boom and bust.

By testing centralization and population growth as individual variables, we will characterize contrasting trajectories of State formation north and south of the Alps, from Etruscan cities to Celtic Princely Seats, and we will consider the integration of the Cimbrian peninsula in global European phenomena.

448 QUARTZ EXPLORATION AND USE DURING THE MIDDLE PALEOLITHIC: INSIGHTS FROM CARDINA-SALTO DO BOI (GUARDA) AND FIGUEIRA BRAVA CAVE (SETÚBAL), PORTUGAL

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Melo, Maria (UNUARQ - Centre for Archaeology. School of Arts and Humanities. University of Lisbon) - Ramos, Patrícia (CITCEM - School of Arts and Humanities. University of Porto)

Abstract format: Poster

Throughout the Middle Palaeolithic, human groups adapted to different environmental constraints. This can be acknowledged when considering the diverse array of raw materials chosen to produce tools, as evidenced by the studies of multiple assemblages of knapping remains recovered from all over Europe. Technological analysis of assemblages is well established for flint, whereas lithic industries in quartz have been largely neglected by scientific researchers until recently.

Although it has been considered a "second-rate" raw material, due to its susceptibility to fracture, quartz emerges as the main resource exploited at numerous sites across the Iberian Peninsula. Such is the case of the Cardina-Salto do Boi and Figueira Brava cave, in Portugal. These two sites, with occupations ranging from MIS 6 to MIS 3, hold significant potential, not only for providing very complete lithic assemblages but also for providing insight into the diachronic variation of the chaîne opératoire of quartz knapping. The archaeological findings from these sites can enhance our understanding of knapping behaviours among Neanderthal groups, particularly because their disparate geographical locations—inland and coastal, respectively—imposed different adaptation requirements.

Here we discuss the data from an investigation that involved a comparative analysis of knapping techniques and raw material use across various phases of occupation at both sites. Overall, our findings indicate that the challenges posed by the high fragmentation rate of quartz can be overcome through the application of specific techniques and their diversification, emphasizing the inherent adaptability and versatility of this raw material.

449 TEXTILE ECONOMIES IN TRANSITION FROM PLANT FIBRES TO WOOL IN BRONZE AGE NORTHERN ITALY: EXPERIMENTAL AND ARCHAEOLOGICAL EVIDENCE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Bertoli, Maria Elena (University of Glasgow)

Abstract format: Poster

The transition from plant to wool fibre textile economies in northern Italy during the Bronze Age (c. 2200-1200 BCE) is a crucial economic juncture. The adoption of wool would have affected many aspects of daily life, such as the social organization of textile production, animal husbandry, and breeding forms.

In northern Italy, Bronze Age pile dwellings allowed optimal preservation of plant fibre textiles. However, they are humid alkaline environments, which result in the near complete decay of the protein matter, such as wool.

Rare wool fabrics in northern Italy come from a few sites of the Middle-Late Bronze Age, such as Molina di Ledro (TN) and Castione dei Marchesi (PR).

However, numerous textile tools, such as spindle whorls and loom weights, found in the pile dwellings and Terramare sites suggest from the Early Bronze Age, wool played a consistent role in their economy. Changes in these textile tools in the transition from the Early Bronze Age to the Middle Bronze Age have been linked to the adoption of wool, but this hypothesis has never been verified.

To address this gap in academic knowledge, I will present an early stage of the research, focusing on the analysis of the textile tools discovered in the Bronze Age pile dwellings and Terramare sites in northern Italy. To date, these textile tools have been mainly studied through a typological analysis.

In the paper, I will present the preliminary results of the functional analysis conducted on clay replicas of archaeological loom weights, used in weaving experiments on a warp-weighted loom.

451 DEATH IS NOT THE END - A CASE STUDY OF 'COFFIN WEAR' ON BRONZE AGE DISARTICULATED HUMAN REMAINS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Grzybowska, Milena (Archaeological Research Services Ltd)

Abstract format: Poster

The recognition and investigation of taphonomic effects is woefully underrepresented in analyses of human remains. When pursuing an understanding of osteobiographies, investigation of the skeletal remains often fails to address the question of post-depositional history of any studied individuals. This case study attempts to demonstrate the value of the most basic examination of post-depositional changes to human bone, while addressing a poorly understood history of disarticulated bone from prehistoric contexts.

Analysis focuses on the spatial distribution of areas of cortical and trabecular erosion across disarticulated skeletal elements of a male individual recovered from a Bronze Age ditch terminus in Kent, United Kingdom. When zones of skeletal erosion are correlated with recovery position and orientation of the skeletal elements, it becomes evident that the individual was redeposited having initially been placed in a 'coffin-like' environment with the erosion zones appearing after the decomposition of soft tissues and cortical erosion. The structure and distribution of the eroded areas is characteristic of 'coffin wear' (e.g. Pokines et al. 2016) with the implied deposition of the male in a supine extended position within a non-homogenous and relatively non-permeable environment, likely a wooden coffin, prior to the redeposition of his disarticulated remains in a ditch. Contextualised macroscopic observations of post-mortem bone erosion point towards an intentional reworking of these skeletal materials and highlights the value that human remains were afforded likely years after death of an individual.

452 (DE)CONSTRUCTING CULTURE - P-XRF AND ARCHAEOLOGICAL STUDIES ON LA HOGUETTE POTTERY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Schauer, Michaela (Vienna Institute for Archaeological Science (VIAS); CIfA Deutschland)

Abstract format: Poster

Pottery is a key artefact in archaeology, providing insights into past cultures. Among these, the La Hoguette (LH) pottery stands out, appearing between the late 6th and early 5th millennia BC across a wide geographical area encompassing regions from the Atlantic coast to northern Bavaria, the Rhone valley and the Netherlands. Contemporary with the Linear Pottery Culture (LBK), LH pottery has been the subject of ongoing debate as to its origins and cultural significance.

Scientific research has presented two main contrasting theories regarding the origin of LH pottery: A) attributing it to a Western European Mesolithic society based on typological analysis, and B) considering it as a special type of pottery within the LBK repertoire due to its frequent occurrence alongside LBK artefacts. Recent archaeological studies have also revealed common technological features between LH and LBK, with clear similarities in tempering and shaping techniques. In addition, the newly discovered possible common origin in the Balkans suggests a close relationship between the two.

To help resolve the debate portable X-ray fluorescence (p-XRF) analysis was used to examine the chemical composition of LH and LBK pottery, daub and clay from three key settlements. The results indicate that LH and LBK pottery in all cases was produced locally, using local clays or loess. In addition, the study revealed different technological approaches within the same settlement, which were nevertheless used to produce both LH and LBK pottery. Therefore, the results support the hypothesis that LH pottery was likely produced by specific cultural lineages of the LBK, indicating LH as a subculture or specialised pottery technology within the broader LBK pottery tradition.

455 USING POLLUTION AS A SOLUTION: NOVEL APPLICATIONS OF SULPHUR ISOTOPES IN EIGHTEENTH AND NINETEENTH CENTURY KINGSTON-UPON-HULL, ENGLAND

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Hinch, Noel (Durham University) - Montgomery, Janet (Durham University) - Kendall, Ellen (Durham University) - Rogers, Bryony (University of Bristol) - Moore, Joanna (Durham University) - McIntyre, Lauren (Oxford Archaeology) - Loe, Louise (Oxford Archaeology) - Gröcke, Darren (Durham University)

Abstract format: Poster

Stable sulphur isotopes are a relatively underutilised tool in archaeological studies, with limited research reconstructing mobility patterns and/or subsistence strategies prior to industrialisation. Due to the marginal isotopic fractionation when metabolised and incorporated into food chains, sulphur isotopes provide direct evidence for the environmental provenance of consumed resources with generally marked differences between terrestrial and marine origins. However, these interpretive pathways remain highly contested and understudied given the complexity of the sulphur cycle when factoring in biogenic and anthropogenic sources—the latter being completely neglected in bioarchaeological research. A primary concern when measuring archaeological samples for sulphur stems from the issue of industrial pollution likely altering the isotopic values, which hinders the viability of proxies and comparative data geo-temporally. To better understand the impact of pollution on sulphur isotopes, this study explores a unique population of 61 individuals from the port-city Kingston-Upon-Hull, England during the Industrial Revolution. Sulphur isotopic data from the rib collagen of the Trinity Burial Ground (c. 1785-1861) assemblage demonstrates how the interpretive value of sulphur can be strengthened and supplemented to incorporate novel investigations into urban industrialisation, pollution exposure, and subsequent diseases. The findings indicate that females possibly experienced more vulnerability to sulphuric pollution than males, possessing values similar to those in the population with evidence of respiratory disease. While a pioneering implementation of sulphur isotopes, this study acknowledges the lingering complications, namely: the unestablished proportionality of sulphuric inputs to human collagen biochemistry. Nevertheless, the results show a successful means of attempting to remodel these persistent challenges into a notable advantage, as it is the first to address the presence and impact of industrial pollution on humans in the past using sulphur isotopes.

459 EXPLORING IRRIGATION AND INTENSIVE LAND-USE IN SOUTHERN HISPANIA TARRACONENSIS: THE STILLA ARCHAEOLOGICAL PROJECT

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Mateo Corredor, Daniel (University of Alicante; Catalan Institute of Classical Archaeology (ICAC)) - Grau Mira, Ignacio (University of Alicante) - Molina Vidal, Jaime (University of Alicante) - Sarabia Bautista, Julia (University of Alicante)

Abstract format: Poster

In recent years, the field of Roman landscape studies has witnessed a significant paradigm shift, challenging long-held agrarian theories centred on the villa system. The STILLA project aims to address this historiographical gap by investigating the Intensive land-use and agro-hydraulic systems in the southern region of Hispania Tarraconensis from 1st century BCE to 5th century CE. This research focuses on examining the intricate relationships between cultivated terrains, hydraulic structures, and socio-economic factors.

Employing a diverse range of methodologies, including cutting-edge geospatial technologies, non-invasive archaeological techniques (such as LiDAR, comprehensive surveys, and geophysical surveys), and excavations, we seek to uncover the underlying connections among irrigation systems, agricultural productivity, and local distribution networks, overcoming the traditional view of the ancient agrarian space as subsidiary to the urban nuclei and networks.

Additionally, this investigation involves specialised analytical methods like geochemical, micro-stratigraphic, and palaeobiological analysis.

This poster will present the main characteristics and objectives of the project, as well as the initial steps taken.

462 ABOUT THE FUNCTIONAL USE OF PICKS BY THE LINEAR BAND POTTERY CULTURE COMMUNITIES IN THE UPPER VISTULA BASIN (S POLAND)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Szeliga, Marcin (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) - Osipowicz, Grzegorz (Institute of Archaeology, Nicolaus Copernicus University in Toruń) - Bosiak, Mariusz (Faculty of Chemistry, Nicolaus Copernicus University in Toruń)

Abstract format: Poster

Picks are extremely rare artefacts associated with flint inventories of the Linear Band Pottery (LBK) culture in central and western Europe. This situation is also very clearly legible in the northern foreland of the Carpathians. Previously, only three such artefacts attributed to this culture were found in the drainage basins of the Vistula and Oder Rivers. Discovery contexts of picks dated to slightly later times indicated that they should be linked with mining activities of early agricultural societies. The presented research results concern collection of this type of tools from the LBK settlement in Wólka Wojnowska (S Poland). Currently, it is one of the most numerous typological series of picks found at a single site within the entire range of the LBK. The results of traceological and chemical SEM-EDX analyses of residues preserved on their surfaces indicate that these tools were used in processing hematite in order to produce ochre. The obtained data considerably broaden the scope of the functions of picks used during the Early Neolithic and allow us to question the interpretation that they were employed only in mining for siliceous materials.

463 SEA-LEVEL RISE IN APULIA: MAPPING THE CULTURAL HERITAGE OF THE GULF OF MANFREDONIA AND IONIAN COAST AT RISK

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Lobascio, Arianna (University of Bari) - Fioriello, Custode (University of Bari) - Martinez, Gianluca (University of Bari) - Nardò, Livio (University of Bari) - Scardino, Giovanni (University of Bari) - Scicchitano, Giovanni (University of Bari) - Zingaro, Marina (University of Bari)

Abstract format: Poster

The rising sea levels caused by climate change pose a severe threat to cultural heritage sites worldwide. However, the potential impact on Apulian sites is widely overlooked due to the slow progression of the phenomenon. To effectively conserve and protect these sites, it is crucial to identify which ones are at risk of flooding or submersion by 2050 and 2100. To achieve this, the following research study reviews the scientific literature regarding the coastal dynamics in Apulia, focusing on the Gulf of Manfredonia and the Ionian coast between Ginosola and Taranto. Consequently, the vulnerable coastal assets located within these areas were mapped in a GIS by combining submersion projections and heritage census databases. Among the others, flood maps created by the Earth Sciences Department of the University of Bari Aldo Moro and territorial information systems created by other institutions were utilized as data sources. The results provide a foundation for defining a methodological standard that could assess endangered Italian heritage and aid in communal risk management planning. Publishing these maps is essential to increase awareness of the impacts of climate change on cultural heritage and enable effective risk communication.

465 USING STABLE ISOTOPES TO RECONSTRUCT ANIMAL HUSBANDRY AND ANIMAL-HUMAN INTERACTION AT THE EARLY NEOLITHIC SITE OF GOVRELEVO, NORTH MACEDONIA

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Feichtinger, Miriam (University of Vienna, Vienna, Austria) - Blanz, Magdalena (Vienna Institute of Archaeological Science (VIAS), University of Vienna, Vienna, Austria; Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Vienna, Austria) - Fidanoski, Ljubo (Museum of the City of Skopje, Skopje, Republic of North Macedonia) - Fidanoska, Aneta (Museum of the City of Skopje, Skopje, Republic of North Macedonia) - Balasse, Marie (Muséum national d'Histoire naturelle (MNHN), Paris, France; Centre national de la recherche scientifique (CNRS), Paris, France) - Ivanova-Bieg, Maria (Johannes Gutenberg Universität, Mainz, Germany)

Abstract format: Poster

The objective of this study is to reconstruct the dietary patterns and potential husbandry techniques employed in the Early Neolithic settlement of Cerje-Govrelevo (early 6th millennium BC) in North Macedonia, based on the analysis of stable isotope ratios (C, N) in 65 animal bones. The examined fauna comprised both wild and domestic animals,

including herbivores and carnivores. While the Balkans play a pivotal role in understanding the spread of the Neolithic throughout continental Europe, bioarchaeological investigations in this region are scarce. Through the findings of this research and comparisons with data from neighbouring regions, we aim to shed light on husbandry practices during the Early Neolithic in North Macedonia and the level of domestication present during that era. The results indicate that sheep and goats were managed similarly by the initial settlers of Govrelevo, with differences in $\delta^{13}\text{C}$ values primarily attributed to varied feeding habits. Conversely, cattle and domestic pig $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values show differences in nutrition and thus husbandry practices. Particularly cattle exhibited a wide range in $\delta^{13}\text{C}$ values (-22.61‰ to -15.34‰). Furthermore, the data on Govrelevo domestic pigs reveals a narrow range of stable isotopic values for carbon and nitrogen, especially the $\delta^{13}\text{C}$ values overlapping with those of wild boar. Instead, the maximum domestic pig $\delta^{15}\text{N}$ value (9.44‰) even tops those of dogs (8.54‰) at the site, indicating a large amount of animal protein in the domestic pig's feed. Accordingly, this suggests a close relationship between domestic pigs and humans.

466 THE CONSERVATION SOFT BOX (CSB): AN INNOVATIVE, EFFICIENT AND LOW-COST TECHNIQUE TO PRESERVE BIOLOGICAL REMAINS

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Samadelli, Marco (EURAC Research - Institute for Mummy Studies) - Paladin, Alice (EURAC Research - Institute for Mummy Studies) - Donegá, Massimo (Eco Research) - Lara Ibeas, Irene (Eurac Research-Institute for Renewable Energy) - Zink, Albert (EURAC Research - Institute for Mummy Studies) - Tirlir, Werner (Eco Research)

Abstract format: Poster

The long-term preservation of biological remains within conservation parameters in museum collections is a challenge that confronts specialists with multiple issues from both a conservation and an ethical perspective. In particular, the human remains, which encompass mummified remains, but also bones, soft tissue, ashes, hair, and teeth require special measures to be taken due to their delicate organic nature to prevent chemical and microbiological deterioration processes.

Currently, there are several techniques for the preservation and display of human remains categorized into two logical-constructive types: 1. active and 2. passive systems. However, these types were never designed for truly effective long-term preservation.

Therefore, the aim of our study is to develop an innovative solution for the long-term preservation of human remains, that not only meets conservation parameters, but also has the advantage of being multifunctional and low-cost.

We have thus designed the Conservation Soft Box (CSB), which is a durable and airtight structure made of various inert and low-emission polymeric materials (e.g., PTFE, Polyethylene).

Within the CSB, environmental parameters are customized in order to optimize conservation treatment: for example, an oxygen-free atmosphere with stable relative humidity can therefore be realized.

Each individual element composing the CSB was chemically analyzed in order to determine its VOCs emissions and evaluate the level of hazardousness. Emission analysis results allowed us to select the most suitable materials to use thanks to the very low emission values obtained. In addition, the versatility of construction and low structural weight give the CSB a great advantage over classical conservation solutions. The CSB also allows mummies to be CT-scanned directly inside it, due to the absence of metal elements. In conclusion, our conservative solution is a safe and suitable tool for the long-term storage, handling and treatment of biological remains.

469 THE SACRED SPACE OF MOUNT OF VISO (CELORICO DE BASTO, PORTUGAL)

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: de Oliveira Teixeira, Luisa (Universidade Autónoma de Lisboa)

Abstract format: Poster

This paper explores the long-standing connection between human communities and the mountain-top places of worship. The impressive landscape of Monte do Viso, composed of massive and distinct granite blocks and offering a wide visual range, is believed to have sparked the imagination of ancient communities. The goal of this paper is to demonstrate the persisting and evolving sacralization of Monte do Viso from prehistoric times to the present day.

In the vicinity of the sanctuary, various objects signify worship and remembrance, ranging from megalithic tombs to the chapel of Our Lady of Viso, situated at the mountain's peak. The proximity of these elements highlights the continued importance of this symbolic space. It possesses unique topographical features where the ancient rites and beliefs of the Mother Goddess, who served as the protector of the community and territory, endured throughout the ages. These beliefs were both mythical-religious and cosmological and gave way to new collective altars and rites.

Our Lady of Viso is part of a group of seven sisters, situated on high points and visible to each other, who serve as protectors of the communities and have the responsibility of watching over the land and its inhabitants, much like the Mother Goddess.

470 QUBBET EL-HAWA NORTH, EGYPT: ONGOING BIOANTHROPOLOGICAL STUDY ON THE HUMAN REMAINS FROM THE OLD KINGDOM TOMB 9 (QHN 9)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Paladin, Alice (Institute for Mummy Studies, Eurac Research, Bolzano, Italy.) - Teßmann, Barbara (Museum für Vor- und Frühgeschichte, Staatliche Museen zu Berlin, Germany.) - Seyfried, Friederike (Ägyptisches Museum und Papyrussammlung, Staatliche Museen zu Berlin, Germany.) - Konert, Sarah (Ägyptisches Museum und Papyrussammlung, Staatliche Museen zu Berlin, Germany.) - Kuhn, Robert (Ägyptisches Museum und Papyrussammlung, Staatliche Museen zu Berlin, Germany.)

Abstract format: Poster

The necropolis of Qubbet el-Hawa Nord (QHN) in Aswan, Egypt, is located about one kilometre away from the renowned burial site of the ancient city of Elephantine, Qubbet el-Hawa (QH). Recent scientific excavations, part of a joint-rescue project by the Ägyptisches Museum und Papyrussammlung Berlin and the Aswan Inspectorate, have uncovered and are currently preserving ten elite tombs, dating back to the Old Kingdom (T.9, possibly T.10) and New Kingdom (T.1-T.8). This was an effective intervention as, prior to the Egyptian-German Mission, the necropolis experienced significant looting, causing partial damage to structures, cultural materials and to human remains. Therefore, for the first time, a bioanthropological investigation was also launched to preserve the osteological remains and to provide deeper insights into the individuals living in this region, aiming to reconstruct their biological (e.g., sex, age at death) and paleopathological profiles.

This study focus on tomb 9 (QHN 9), the oldest one, that faces east towards the Nile, including an external courtyard with a long staircase where single burials, possibly belonging to officials serving the tomb owner, have been discovered. From the preliminary analysis, a minimum number of at least 19 individuals (8 adult males, 6 females, 5 subadults) were identified, including those buried in single graves along the staircase as well as the remains scattered by the looters' actions. Paleopathological observations revealed severe oral, degenerative diseases and traumas. Additionally, a small coffin found left to the main entrance contained a cranium with evidence of sharp forced traumas, indicating a case of decapitation. Musculoskeletal stress markers also suggested evidence for long-distance walks on the sand.

Next project plans include performing further anthropological and paleopathological analyses of the commingled osteological remains found within the internal rooms of QHN 9, as well as in the other tombs.

471 ANCIENT GOLDSMITHING IN THE NILE VALLEY FROM ARCHAEOMETRIC INVESTIGATIONS TO EXPERIMENTAL ARCHAEOLOGY

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Patrevita, Maria (University of Bari Aldo Moro; National Research Council of Italy, Institute of Heritage Science, CNR-ISPC, Rome)

Abstract format: Poster

My research focuses on the study of ancient gold working and goldsmithing practices along the Nile Valley, mainly in Egypt, but also integrating the evidence from ancient Sudan, dating from the Egyptian Middle Kingdom and the Middle Kerma period in Upper Nubia (ca. 1980-1760 BCE) to the Meroitic Kingdom, contemporary to the Ptolemaic Period in Egypt (332-30 BCE). In order to highlight the mutual influences and diversities of Egyptian jewellery and Nubian goldsmithing, the research will use an interdisciplinary approach, which will unite archaeology, goldsmithing, archaeometric investigations, ethnoarchaeology and experimental archaeology.

On a stylistic and technological basis, the most interesting jewels will be selected and studied through SEM Scanning Electron Microscope and EDS Energy Dispersive X-ray Spectrometer, to investigate the following aspects: elemental composition of the gold foil used; production techniques and creative processes; elemental composition of the welding formulas.

The jewellery which will be examined is of Egyptian origin, currently kept at Museo Egizio, Turin. In particular, jewellery dating to the New Kingdom (1550-1070 BCE) will be studied, but also some gold appliques belonging to the Third Intermediate Period (ca. 1076-723 BCE) and the Late Period (ca. 722-332 BCE) shall be examined, opening the possibility of comparison with Nubian techniques and typologies.

Thanks to the collaboration of Museo Egizio and my co-tutor Dr. Johannes Auenmüller, a group of about 50 gold jewels will be study, including funerary amulets in gold foil, but also technically and stylistically more complex pieces, such as: a Royal child amulet, made by two embossed and chiseled halves and then welded together (New Kingdom, 1540-1076 BC); a Lotus flower pendant, gold and enamel (New Kingdom, 1550-1292 BC).

The main research goal is creating a protocol for the study of gold jewellery, supported by archaeometric analyses, ethnoarchaeological data and experimental approaches.

474 A BIOAVAILABLE STRONTIUM ISOSCAPE MAP FOR CENTRAL EASTERN ARGENTINA FOR PROVENANCE STUDIES

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Scaggion, Cinzia (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) - Loponte, Daniel (Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET), Instituto Nacional de Antropología y Pensamiento Latinoamericano) - Carbonera, Mirian (Centro de Memória do Oeste de Santa Catarina, Universidade Comunitária da Região de Chapecó) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt) - Armaroli, Elena (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) - Bernardini, Sara (Department of Cultural Heritage, University of Bologna) - Marciani, Giulia (Department of Cultural Heritage, University of Bologna; Research Unit Prehistory and Anthropology, Department of Physical, Earth and Environmental Sciences, University of Siena) - Cipriani, Anna (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) - Bortolini, Eugenio (Department of Cultural Heritage, University of Bologna) - Giovanardi, Tommaso (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia)

Abstract format: Poster

Over the last 40 years, the use of bioavailable strontium isotopes has become increasingly frequent when applied to archaeo-anthropological contexts being a powerful tool for provenance and mobility studies. Determining the provenance of biological materials through the use of strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotope ratios requires a reference isoscape (i.e., a map of isotopic distribution) of a specific geographic area, useful for the correct interpretation of the isotopic data obtained. In the present work, we propose a first isoscape map of strontium isotopic signatures and their spatial variation in central eastern Argentina using new bioavailable data. The isotopic map, created using a Random Forest model, will aim to fill a gap in the study of the provenance of pre-Columbian hunter-gatherer peoples who inhabited the Paraná delta region. The work is extended to the Pampa and Entre Ríos region of Argentina and to the western part of Uruguay across the Uruguay river, with the main objective of creating an isotopic domain mapping with a high enough resolution to create archaeological mobility models of ancient South American skeletal remains. This work is part of the Habits PRIN 2022 project, number 2022BC2Z5F, included within a broader archaeological research program taking place in southeastern South America (www.assaprogram.com), focused on studying the cultural evolution and lifestyle of local pre-Columbian populations together with their mobility and residence patterns.

475 FACIAL DEPICTIONS OF PRE-COLUMBIAN BOLIVIAN MUMMIES AND ETHICAL MUSEUM APPROACHES: AN INTRODUCTION TO THE PROJECT

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Conti, Viviana (Face Lab, Liverpool John Moores University; Institute for Mummy Studies, Eurac Research) - Liu, Jessica (Face Lab, Liverpool John Moores University) - Valverde, Guido (Institute for Mummy Studies, Eurac Research) - Castedo, Luis (Ministry of Cultures, Decolonization and Depatriarchalization of Bolivia) - Maixner, Frank (Institute for Mummy Studies, Eurac Research) - Zink, Albert (Institute for Mummy Studies, Eurac Research) - Paladin, Alice (Institute for Mummy Studies, Eurac Research) - Wilkinson, Caroline (Face Lab, Liverpool John Moores University)

Abstract format: Poster

The exhibition of human remains in museums poses a controversial cultural challenge within public discourse and academic investigation. Facial depictions of individuals from the past help contextualising human remains and communicating complex data derived from interdisciplinary studies, making them a valuable tool for museums and research institutions addressing this issue. However, further problematisation arises when dealing with remains from under-represented cultural communities in countries with a history of colonisation.

In 2021, an international collaboration between the Ministry of Cultures, Decolonization and Depatriarchalization of Bolivia, the National Museum of Archaeology - MUNARQ, and Eurac Research set the ground for scientific research. This collaboration aimed to develop an interdisciplinary project (MumBo, PI Valverde) focused on the first bioarchaeological study of pre-Columbian human remains from Bolivia. The MUNARQ collection comprises over 50 bodies, and over 500 human skulls linked to the Late Intermediate Period (1100-1450 CE) and potentially to the Inca Period (1450 - 1532 CE), many showing signs of artificial mummification and cranial modifications.

The present project aims to investigate the use of facial depictions as a tool to facilitate the ethical dissemination of ancient human remains. For this project, a combination of anatomical modelling and application of average tissue depth data will be employed. Information on genetically predicted phenotypic traits pertaining to selected individuals

(gathered through MumBo) will be considered to maximise accuracy of the facial depictions. The project will utilise participatory co-design methods to ensure that the relevant communities are considered and involved throughout the process of investigation and dissemination.

The use of facial depictions will implement existing knowledge of pre-Columbian population history, foster public interest in the cultural heritage represented by the MUNARQ collection, and, by involving local descendant communities, support ethical approaches to address scientific research for the study of human remains in Bolivia.

476 **WOVEN CRAFT PRODUCTS FROM TWO BURIAL MOUNDS IN SOUTH-EAST BULGARIA (4TH-2ND CENTURY BC)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Dimova, Bela (University of Padua) - Andonova, Mila (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences) - Agre, Daniela (National Archaeological Institute and Museum, Bulgarian Academy of Sciences)

Abstract format: Poster

Burial mounds were a long-standing part of funerary traditions in ancient Thrace and thousands of mounds have been excavated throughout the region. The use of organic materials in funerary and commemorative rites has been evident since the earliest archaeological discoveries, but few monuments have preserved organic remains.

This paper presents evidence for woven mats and textiles from two mounds: at Sinemorets on the Black Sea coast (late second century BC) and at Malomirovo - Zlatinitsa, some 150 km inland (mid-fourth century BC). At Malomirovo - Zlatinitsa a young ruler was buried in an underground wooden chamber. Fragments of various mineralised and organic textiles were found in the grave, including plain weaves, tapestries, weft-faced tabby and gilded silver threads. Two horses were buried at ground level near the burial chamber, on a plaited plant fibre mat. At Sinemorets, the in-situ cremation of a woman preserved carbonised fragments of a mat made of monocotyledonous and woody plants. Mineralised textile remains were also preserved on an iron object from the pyre. This poster focuses on the weaving techniques of the mats, their raw materials, their use in burials and their comparanda.

480 **CEREAL CULTIVATION PATTERNS IN THE FOREST AND FOREST-STEPPE OF EASTERN EUROPE OF 1000 BC-1000 CE**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Salova, Julia (University of South Bohemia) - Viazov, Leonid (University of Ostrava; Centre for Baltic and Scandinavian Archaeology - ZBSA (Schleswig, Germany)) - Beneš, Jaromír (University of South Bohemia)

Abstract format: Poster

We have compiled data on over 800.000 plant macroremains and their inclusions in pottery from 321 archaeological sites in the forest and forest-steppe zones of Eastern Europe, spanning from the Baltic to the Urals and collected and studied over a century of archaeobotanical research. The spatiotemporal distribution of these remains was analysed using multivariate statistics, unveiling intricate cultivation patterns influenced by both geoclimatic and historical factors. In the timeline, millet-dominated agriculture was prevalent in Eastern Europe from approximately 2.8 to 1.8 kya, followed by the increase in barley production at around 1.7 kya, potentially associated with western migrations. During the Migration Period (approximately 1.6 to 1.3 kya), barley-focused agriculture peaked in the northern part of the region, while the forest-steppe regions continued to exhibit millet-rich macroremains. Around 1.3kya, wheat gained prominence in the steppe-bordered regions, and rye production increased in the north. We notice a gradual rise in the proportion of weed species over two millennia, leading to the growth of "mixed" cereal compositions. Our analysis demonstrates the potential to discern trends in cereal production by combining data from various research methods. However, data gaps hinder our understanding, underscoring the importance of intensive sampling.

485 **"THE UGLY DUCKLING" IN THE SOUTHERN CARPATHIANS. A BRONZE AGE HALBERD FROM SĂLĂTRUCU (ROMANIA)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Mandescu, Dragos (Arges County Museum Romania) - Ștefan, Cristian ("Vasile Pârvan" Institute of Archaeology Bucharest) - Mărgărit, Monica ("Valahia" University of Târgoviște) - Mirea, Dragos Alexandru ("Horia Hulubei" National Institute for Research and Development in Physics and Nuclear Engineering, Bucharest; Bucharest Municipality Museum)

Abstract format: Poster

The Bronze Age golden halberds from Perșinari and Măcin (Romania) are already well-known and as exceptional items for the South-Eastern Europe prehistory. Recently (summer of 2023) a massive halberd of such kind, not in gold but in copper-based alloy, was found by chance in the Carpathian mountains area, in Sălătrucu, Argeș County, Romania. This copper replica of the exceptional gold specimens is added to a fragment also in copper-based alloy found few years ago in Urlați (South Romania). The poster introduces the implement found at Sălătrucu, detailing on their morphology and functional traces, on its copper-based alloy composition characterized by an intriguing high percentage of Bismuth, but also on the strange peculiarities of the findspot (part of a possible passage landscape). Several aspects are also discussed in the background, such as origin and chronology of these kind of Bronze Age implements in the area between the Carpathians and the Lower Danube, their analogies and presumed function. The halberd from Sălătrucu constitutes a valuable source of information on metallurgy and depositional practices specific to the mid-3rd millennium BC of the Southeast Europe Bronze Age.

489 **THE FIRST NEANDERTAL THUMB PHALANX DISPLAYING OSTEOARTHRISIS**

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Voisin, Jean-Luc (UMR 7268 ADES, Aix-Marseille Université/EFS/CNRS, Faculté de Médecine - La Timone, 27 Bd Jean Moulin, 13385 Marseille Cedex 05, France) - Condemni, Silvana (UMR 7268 ADES, Aix-Marseille Université/EFS/CNRS, Faculté de Médecine - La Timone, 27 Bd Jean Moulin, 13385 Marseille Cedex 05, France)

Abstract format: Poster

In this study we present an adult Neandertal first thumb proximal phalanx (I2-104) from the Baume de Moula-Guercy (Ardèche, France). This phalanx displays an asymmetric eburnation on the distal epiphysis associated with an osteophyte on the palmar surface, without any periosteal bone reaction visible on CT images. All of these characteristics taken together are consistent with osteoarthritis.

Osteoarthritis has a complex etiology depending on extrinsic (i.e. obesity) and intrinsic (i.e. previous joint damage) joint factors as well as on systemic factors (i.e. age). The osteoarthritis of the Moula-Guercy I2-104 phalanx may also be due to a genetic predisposition for osteoarthritis known in Neandertals and associated with short limb bones. The osteoarthritis could have been aggravated by the age of this individual and by an inflammatory reaction caused by repeated movements and intense vibrations provoked by high-frequency knapping or by some other unknown use of the hands.

The I2-104 phalanx is the first Neandertal thumb phalanx known to display osteoarthritis, although in modern humans (both ancient and current populations) joints of this bone are frequently affected by this pathology. We propose an explanation of this difference between the two human populations.

490 **PORTSALT - THE BEGINNING OF SALT EXPLOITATION IN PORTUGAL**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Jesus, Luís (Autonomous University of Lisbon; Estoril Higher Institute for Tourism and Hotel Studies) - Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa)

Abstract format: Poster

Sayings such as "He is not worth his salt" or "salarium argentum" show that salt has been a fundamental resource since the invention of writing. Therefore, it is possible to assume that it was already vital before that. Despite being a fundamental resource for millennia, the evolution of Archaeology made the investigation about salt during Pre- and Protohistoric times to be neglected for decades with very few studies of this kind in Portugal. The increasing of multidisciplinary studies, the development and democratization of instrumental equipment, the investigation beyond the traditional artefact typological and technological analysis, and the search for answers to new questions made the investigation of salt interesting and feasible in recent years. In the Portuguese territory, salt has been highly exploited across historical times. It started at least in the Roman period when the production of garum across the basins of the

Tejo and Sado rivers and the Algarve coast to serve the entire empire demanded its extensive exploitation. However, several sites have indirect evidence that has been (humbly) suggested to be related to salt exploitation through brine. The PortSalt project seeks to understand how salt was introduced, exploited, used, and transported into the diet, economy, and life of Proto- and Prehistoric populations from western Iberia. In this regard, ceramic fragments from various archaeological sites, dated chronologically between the Early Neolithic and the Iron Age, will be used. This study will encompass three main components: experimental archaeology with ceramics, geochemical analysis of both prehistoric and experimental ceramics, and geochemical analysis of the deposits from which these ceramics originate. Ultimately, it aims to find possible continuities and ruptures that characterized the food patterns of these communities, contributing to the knowledge about eating habits and taste that guided food choices over time.

492 **A FRAGMENT OF A HANDLE FROM A ROMAN JUG WITH A DIONYSIAN HANDLE ATTACHMENT FROM VANOVICE (MORAVIA): POSSIBILITIES OF INTERPRETATION**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kirilová, Terézia (Masaryk University) - Jílek, Jan (Masaryk University)

Abstract format: Poster

A remarkable discovery has been made in Vanovice (Moravia, Czech Republic): a fragment of a Roman bronze jug handle from the 1st century AD, probably Augustan period. The craftsmanship of the bronze handle attachment far exceeds the typical finds from the Moravia region. The style of handle attachment is connected to the Hellenistic toreutics traditions. The head depicted on the handle is believed to be that of Dionysus or Silenus, as determined through iconographic analysis and comparison with other works from Roman sculpture (mostly Double herms) and craftsmanship. The context of this discovery raises intriguing questions. The artifact was found on the periphery of the Barbarian settlement from the Roman period. The main characteristic of the site is the hilly landscape without any settlement or funerary activities from the Roman period. Could this be an isolated find, or does it indicate evidence of ritual practices during the Roman Period in Barbaricum?

494 **EMERGING LANDSCAPES AND IDENTITIES: MODELLING MODIFICATIONS IN CENTRAL ROME THROUGHOUT THE 1ST MILLENNIUM BC**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Antler, Chen (University of Glasgow)

Abstract format: Poster

At the beginning of the 1st millennium BC, the city center of Rome was the home of a small community(ies), its natural environment still mostly uninhabited and unchanged. Over the following centuries, this area, which would become the center for one of the most important cities in the Mediterranean, will continuously change through building and rebuilding projects - some small, some monumental- from the river's valley to its surrounding famous hills.

The substantial and prolonged effort made by the habitants of central Rome throughout the millennium, not only resulted in a new anthropogenic landscape but also a new sense of communal identity, built on a narration of these changes. This study explores how people built and maintained a resilient collective Roman identity around their activity of modifying and change their natural environment. The poster will present a portion of this research, in which the extent change to the natural environment is quantified via a computational model of the methodologically challenging urban environment of Central Rome. It will discuss integrating various sources of information (archaeological, geological etc.), challenges in standardizing data and interpolation on various geographical scales.

Beyond providing a clearer understanding of how the complex human-environment relationship played out during the first millennium BC in Rome, this study makes the case for reframing the environment as an active agent in the formation of human identity and makes critical contributions to current debates on how collective identities were formed in the past and how they are maintained today. It argues that as we look forward and make new policies to address critical environmental challenges, we should acknowledge how intrinsically human identity is intertwined with features of the biophysical landscape and highlight the shared roles of natural and cultural heritage to maintain resilient communal identities in a changing world.

496 **RURAL SETTLEMENTS OF ADAL SULTANATE: THE CASE OF AIYANLE (AWBARRE, ETHIOPIA)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rouco Collazo, Jorge (INCIPIT)

Abstract format: Poster

This paper aims to present the preliminary results of the 2023 excavation campaign at the medieval site of Aiyarle, in the Ethiopian town of Awbarre, very close to the Somaliland border. This intervention is part of the ERC pro-

ject "Statehorn: Pathways to Statehood. Authority, Legitimacy and Social Diversity in the Horn of Africa (11th-16th centuries)", which aims to study the formation, development and disappearance of Islamic sultanates in the Horn of Africa during the Middle Ages.

In the specific case in question, the main research question was how settlement was organised in the border region between Somaliland and Ethiopia in the time of Adal Sultanate. To address this question, we carried out in October 2023 the first archaeological intervention on a medieval site in the Somali Region of Ethiopia, the rural settlement of Aiyarle with the aim of characterising one of the settlements in this area and its material culture. The intervention has yielded interesting results on the domestic spaces of this rural site, occupied between the 14th and 16th centuries, i.e. during the Adal sultanate. Evidence has also been found that the settlement was part of the trade routes from the Indic trade to the interior of Ethiopia from imported pottery and glass beads.

502 **ZOOARCHAEOLOGICAL INSIGHTS INTO CHALCOLITHIC LIFEWAYS: EVIDENCE FROM YEGHEGIS-1 ROCK SHELTER IN SOUTHERN ARMENIA**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mkrtchyan, Satenik (Institute of Molecular Biology, NAS, RA; Department of Archaeology, Max Planck Institute of Geoanthropology) - Nazaryan, Gayane (Institute of Molecular Biology, NAS, RA) - Saribekyan, Mariam (Institute of Archaeology and Ethnography, NAS, RA) - Azatyan, Karen (Yeghegnadzor Regional Museum, Armenia) - Yepiskoposyan, Levon (Institute of Molecular Biology, NAS, RA) - Amano, Noel (Department of Archaeology, Max Planck Institute of Geoanthropology) - Antonosyan, Mariya (Department of Archaeology, Max Planck Institute of Geoanthropology)

Abstract format: Poster

The Chalcolithic in the South Caucasus, spanning from 5,500 to 3,500 BCE, is considered a period marked by heightened social differentiation and connectivity. Despite being represented by a limited archaeological record concentrated at a few sites, this epoch is believed to be characterized by dynamic and mobile human communities engaging in animal herding, particularly of goats and sheep.

The Yeghegis-1 rock shelter is a newly discovered site, located in southern Armenia, that was occupied between the 5th to the 4th millennium BCE, allows to reveal new insights into Chalcolithic lifeways in the region.

Here we discuss human subsistence strategies through detailed morphometric and mass-spectrometry-based identification of the recovered fauna, with a focus on large ungulates. Additionally, we analyze the taphonomic history of the assemblage accumulation, coupled with the age of death profiles and killing patterns of the ungulates.

Our results revealed that the groups utilizing the site mainly focused on sheep and goat herding, with little evidence of cattle in the herds, demonstrating the importance of Caprines in the subsistence economy. Additionally, we demonstrate that Caprines of all ages were culled, suggesting that the animals were utilized for a range of their primary and secondary products.

503 **INFERRING GENOMIC ANCESTRY AND PHENOTYPIC TRAITS OF MARCUS VENERIUS SECUNDIO, A FREEDMAN AND FORMER SLAVE FROM THE POMPEII CITY**

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Modi, Alessandra (Department of Biology, University of Florence, Florence, Italy) - Cannariato, Costanza (Department of Biology, University of Florence, Florence, Italy) - Diroma, Maria Angela (Department of Biology, University of Florence, Florence, Italy) - Amoretti, Valeria (Parco Archeologico di Pompei, Naples, Italy) - Macleod, Ruairidh (Research Department of Genetics, Evolution and Environment, University College London, London, UK) - Alapont Martin, Llorenç (Universitat de València, Valencia, Spain) - Osanna, Massimo (Ministry of Cultural Heritage and Activities and Tourism, Rome, Italy) - Thomas, Mark G (Research Department of Genetics, Evolution and Environment, University College London, London, UK) - Zuchriegel, Gabriel (Parco Archeologico di Pompei, Naples, Italy) - Caramelli, David (Department of Biology, University of Florence, Florence, Italy)

Abstract format: Poster

Pompeii became a Roman colony during the Republican period, developing into one of the most prosperous Mediterranean harbors and attracting people from all over the empire, as attested by the numerous archaeological evidence. Among these, one of the most exceptional findings is the tomb of Marcus Venerius Secundio, discovered in July 2021 in the necropolis of Porta Sarno. The tomb structure and the inscription, the burial, the painted facade, and the mummified remains recovered, allow us to reconstruct the biographical profile of Marcus Venerius Secundio. He was a public slave and custodian of the Temple of Venus, and upon being freed, he reached a certain social and economic status applying himself to organize theatrical performances in the Greek language. Moreover, Marcus Venerius' mummy shows well preserved organic remains including hair, cartilage, and internal organs that allow the

application of an integrated “multi-omic” approach to reconstruct his life history, including his ancestry, diet, health and pathogen load.

Here we present the results of the genome wide analysis carried out on a premolar tooth. We reconstructed 86% of the nuclear genome with an average depth of 5.44X. We were able to identify the remains to be of male origin, showing sufficient DNA damage, deriving from a single person and being thus likely authentic. Furthermore, we investigated functional and phenotypically informative SNPs and searched for the presence of possible pathogens. The maternal haplogroup was determined to be U3b3, a subclade of the U3 haplogroup that is today present at highest frequencies in the Middle East and Caucasus. Furthermore, genomic data indicate high genetic affinities with present-day people living in the Caucasus, supporting a foreign origin of Marcus Venerius, as suggested by the nature of the burial and the documentary records.

504 MEGALITHS OF CENTRAL LEVANT: PETROGRAPHY OF SHARDS FROM EARLY BRONZE AGE TOMBS OF MENJEZ (AKKAR, LEBANON)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Carloni, Delia (Groningen Institute of Archaeology, University of Groningen, Netherlands) - Wygnańska, Zuzanna (Institute of Mediterranean and Oriental Cultures, Polish Academy of Science, Poland) - Steimer-Herbet, Tara (Laboratoire d'archéologie préhistorique et anthropologie, Department F.-A. Forel for Environmental and Aquatic Sciences, Université de Genève, Switzerland)

Abstract format: Poster

Over the past two years, a Swiss-Polish team of archaeologists led by Dr Tara Steimer-Herbet and Dr Zuzanna Wygnańska has been investigating the megalithic culture in the Akkar district of northern Lebanon. The MEG-A project focused on the emergence of the megalithic tomb-building communities in the region as well as their significance in the development of the first urban centers. A key objective of current research is to ascertain the megalith builders living area and to identify their material culture for accurate chronological placement. Early field data suggest that some of the graves were probably not linked to the housing structures discovered nearby. Path and agricultural terraces were abandoned at the time the tombs were built. The chrono-classification of the tombs, currently under study, will enable us to distinguish between a pastoral society and one in transition. The scientific team has embraced a comprehensive and interdisciplinary approach to further investigate the significance of the megalithic monuments and the material culture.

The petrographic analysis regarded 26 potsherds from Tombs of both 'Kroum Metowmeh' and 'Haklet Bou Dib' sectors, selected considering archaeological information and paste characteristics. Optical microscopy allowed to define five fabrics, characterized by presence of 1) basalt, 2) carbonates, 3) quartz, 4) quartz and argillaceous rock fragments, and 5) quartz and plant matter. Evidence suggests the exploitation of clay-rich sediments that formed from basalt and/or argillaceous rock bodies and a moderate degree of transport. These resources may be found in the vicinity of the Menjez necropolis, whose geology is dominated by Late Cenozoic basalts of the Tripoli-Homs Depression and Early and Middle Cretaceous sandstone-limestone sequence, along with Quaternary colluvial and alluvial sediments. Interestingly, some of the pottery fabrics from Menjez find comparisons with the Early Bronze Age II ceramic assemblage from Tell Arqa, located further west in the Akkar plain.

507 FOSSILIZED SECRET OF GRAVE 12

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Jurkovic Pešić, Filipa (Sveučilište u Zadru)

Abstract format: Poster

During protective archaeological excavations in Zadar (Croatia) conducted in 2021 and 2022 at the area of Roman era necropolis, grave number 12 attracted special attention. It is a burial of the cremated remains of two individuals; one female person who died in young adulthood and another, probably a female adult. Seemingly, it is a classic Roman era grave with all the characteristic of the 1st century AD period. What is more, if we take into account that graves of this type can often be extremely rich in finds, it could be said that this burial has relatively poor grave goods. The reason why we singled out Grave 12 is a finding of two fossilized sea urchin spines from species *Balanocidaris glandifera*, surely put inside the urn as grave goods. This kind of object is extremely rare in the archaeological context, and so far, unrecorded in the area of the ancient Zadar (Iader) necropolis. However, the known symbolic and utilitarian meaning or usage of these objects has opened a gate to a world of Roman magical and healing utilisation of these long-extinct sea creatures.

510 INVESTIGATING SEASONALITY OF SHELL COLLECTION BY NEANDERTHAL GROUPS FROM RIPARO BOMBRINI (VENTIMIGLIA, ITALY)

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Gazzo, Silvia (Department of Antiquities, Philosophy, History, University of Genoa, Via Balbi, 2 - 16126 Genoa- Italy) - Gutiérrez-Zugasti, Fernando Igor (Instituto Internacional de Investigaciones Prehistóricas de Cantabria (Universidad de Cantabria, Gobierno de Cantabria, Santander), Avda. de los Castros s/n, 39005 Santander, Spain) - Marin-Arroyo, Ana Belen (Grupo de I+D+i EVOADAPTA (Evolución Humana y Adaptaciones durante la Prehistoria). Dpto. Ciencias Históricas. Universidad de Cantabria. Avda. de los Castros 44, 39005 Santander, Spain) - Negrino, Fabio (Department of Antiquities, Philosophy, History, University of Genoa, Via Balbi, 2 - 16126 Genoa- Italy) - Riel-Salvatore, Julien (Département d'Anthropologie, Université de Montréal, Montréal, Canada)

Abstract format: Poster

In this study we explore Neanderthal adaptations to coastal environments through stable oxygen isotopes analysis on the malacological remains from Riparo Bombrini (Ventimiglia, Italy), a collapsed rockshelter in the Balzi Rossi Palaeolithic site complex. These new data provide a better understanding of human-environment interactions during the Late Mousterian along the Mediterranean coast. The Late Mousterian and Protoaurignacian levels from Bombrini have yielded abundant lithic artifacts and faunal remains, including many marine molluscs from intertidal rocky shores (e.g., *Phorcus turbinatus*, *Mytilus galloprovincialis*, *Patella* sp.). We focus here on some of the Late Mousterian levels (M2-M5) from the site, which reveal evidence of intense exploitation of marine molluscs, providing new insights into the diversified diet adopted by Neanderthals in the region. The highly fragmented nature of the malacological record required careful planning of suitable sampling strategies. Calcium carbonate (aragonite) microsamples were extracted using standard procedures. A long sequence of $\delta^{18}\text{O}$ values was obtained on one complete shell, while shorter sequences were analysed in fragmented shells. Variations in $\delta^{18}\text{O}$ values in specimens of the rocky-shore intertidal gastropod *P. turbinatus* (Born, 1778) from these levels allowed for the inference of the seasonality of harvest, providing information on Neanderthal's dietary habits, subsistence strategies and their variation across the different phases of occupation. Furthermore, oxygen isotope analyses provided data for estimating seawater temperatures during shell growth, offering new insights into the paleoenvironmental reconstruction of the western Liguria coastal area throughout the Late Pleistocene.

Acknowledgements

Stable isotopic analyses were funded by the European Research Council under the European Union's Horizon 2020 Research and Innovation Programme (grant agreement number 818299; SUBSILIENCE project; <https://www.subsilience.eu>).

511 INTRODUCING ARTIFACTS' VOLUMES AND SUPERIMPOSITION IN STRATIGRAPHICAL ANALYSIS: INTEGRATING 3D-MODELING AND SPATIAL ANALYSIS AT THE ABRIC ROMANÍ MIDDLE-PALEOLITHIC SITE (SPAIN)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Zangrossi, Filippo (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Chacón, M. Gema (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; UMR7194 Histoire naturelle de l'Homme préhistorique (HNHP), Museum National d'Histoire Naturelle (MNHN), CNRS) - Lombao, Diego (GEPN-AAT, Dpto. Historia, Facultade de Xeografía e Historia, USC; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); UMR7194 Histoire naturelle de l'Homme préhistorique (HNHP), Museum National d'Histoire Naturelle (MNHN), CNRS) - Saladié, Palmira (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Vallverdú, Josep (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Vaquero, Manuel (Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA))

Abstract format: Poster

Archaeological layers often represent complex palimpsests, reflecting depositional processes that span over extended periods of time. Discerning distinct phases within these layers is crucial for the interpretation of human occupation patterns and cultural changes. The rapid advancements in informatics, such as Geographic Information Systems (GIS) and 3D modeling, offer increasingly automated and efficient methodologies to investigate formation processes, commonly based on Cartesian coordinates and/or orientation and inclination.

In this study, we present the first steps of a novel approach aimed at incorporating the artifacts' volume and their superimposition in spatial analysis to clarify the depositional processes within the archaeological layers. Our methodology involves the automatic generation of 3D models, cluster detection, determination of artifact accumulation sequences, tridimensional visualization, and the production of flowcharts representing superimposition relationships. These analyses are conducted within the "R" environment using standard excavation documentation, including XYZ coordinates and orientation/inclination data. Applying this approach to Level M of the Middle Paleolithic site of Abric Romaní (Spain), reveals a significant presence of distinct artifact clusters of varying natures, involving more than one fifth of all finds.

This research highlights the potential of computational methods and 3D modeling, when combined with traditional approaches, for spatial analysis. Future improvements of the method, which include integrating attributes such as refittings, raw materials, and post-depositional alterations, will potentially enable the stratigraphic division of Level M into sub-levels. This approach will serve as a new tool for investigating formation processes and refining the stratigraphy of archaeological sites as well as to the study of occupation dynamics.

512 HARVESTING CEREALS WITH OBSIDIAN TOOLS: WEAR MECHANISMS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Astruc, Laurence (CNRS-VEPMO-ArScan) - Vargiolu, Roberto (LTDS/ECL) - Anderson, Patricia (CNRS-CEPAM) - Zahouani, Hassan (LTDS/ECL)

Abstract format: Poster

Obsidian is a silica-rich volcanic glass. Wear on obsidian tools has been studied for the first time in an article of Semenov, the founder of the discipline of traceology. Since then, the literature developed far less than for flint. Wear on obsidian has its own specificity. The four main wear attributes are like for other rocks: scaling, striation, smoothing/abrasion and polish. We will focus more in this poster on two of them: striation and polish. Striation develops quite rapidly. Thus, after short duration of use even on soft material, the tool motion can in general be identified. Linear components and striae show a larger variability of morphologies than on flint tools. Experiments have demonstrated that polishes also develop on obsidian tools. They are less visible as the surface of the obsidian is highly reflective. The polish is perceptible by slight changes in surface microtopography. Parameters used for other kinds of raw materials such as the 'trame', the limit or the extension of the polish, can difficultly be observed.

To better understand the processes of wear on obsidian tools, we collaborate with tribologists from the LTDS of the Ecole Centrale de Lyon. Tribology is the science of friction and wear, and it is usually used for industrial or pharmaceutical applications. Our first case-study is the processes of wear during the harvesting of cereals. Experiments in laboratory (simulation of use by scratch, simulation of friction with a linear tribometer) allow us to follow and analyse the development of striae and polish. In fine, a model presenting the three wear phenomena going on during the cut of cereal straws was proposed.

513 FINGERPRINT ANALYSIS IN TERRACOTTA FIGURINES: A CASE STUDY FROM AGRIGENTO, SICILY (FROM CA. MID 6TH CENT. BC)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Palumbo, Federica (Department of Cultures and Societies, University of Palermo) - Fiorentino, Claudia (Department of Cultures and Societies, University of Palermo) - Henneberg, Maciej (School of Biomedicine, The University of Adelaide) - Sineo, Luca (Department of Biological, Chemical and Pharmaceutical Sciences and Technologies (STEBICEF), University of Palermo) - Galassi, Francesco (Department of Anthropology, University of Lodz) - Varotto, Elena (Department of Cultures and Societies, University of Palermo)

Abstract format: Poster

Hand modelling is a crucial aspect of coroplastic production and, subsequently, of its retrospective analysis. It provides valuable insights into an artisan's techniques, crafting sequence, and stylistic choices. The present study explores the application of fingerprint analysis on terracotta figurines from the Sanctuary of the Chthonic Deities (Agrigento, Southern Sicily, Italy). By analysing pressure variations and distribution patterns of fingerprint impressions, one can attempt to reconstruct the ancient artisan's shaping sequence and the techniques which were employed. These markings are more commonly found on the inner surfaces of the figures – which are hollow on the inside – due to the clay adhering to the mold, although they can also be present on the figures' back. Notably, dermatoglyphic analysis on an archaic terracotta figurine can highlight the potential of these markers as a tool for investigation in both archaeology and anthropology.

A preliminary anthropological analysis of these fingerprints was performed. From among the three identified fingerprints, only one had clear enough visibility of sufficient number of ridges, namely the AG8624 print. It is likely a print of the right thumb and has areas indicating movement of the digit while it was printed – the upper part is too large as

if the thumb was slightly elevated while making contact with the clay, and later slid down to settle making a clear print, but, at the bottom, ridges are somewhat misplaced as if the digit after printing was pulled to the right. By calculating the Finger Print Ridge Density (FPRD), the most likely conclusion is that the fingerprint is that of an adult male individual, since ridge count is directly influenced by body size, which will remain a preliminary assessment without having more data on the distribution of male and female body sizes in the population to which this individual belonged.

515 COMMUNITY BUILDING FOR INCREASING DATA SCIENCE SKILLS IN ARCHAEOLOGY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Karoune, Emma (The Alan Turing Institute)

Abstract format: Poster

Data Science is gradually permeating through the different sub-disciplines of Archaeology but many archaeologists currently lack the skills to implement data science best practices. This lack of skills is affecting the speed of this transition to data science practices leaving Archaeology behind other disciplines and therefore hindering greater impact such as reuse of data and other research outputs and the adoption of new technologies such as AI.

So how can we support this transition to greater use of data science in archaeology?

Community Building is one way to do this and can be used to upskill and support the adoption of new data science skills such as FAIR data management and stewardship, open source coding, and reproducible workflows. Training courses are often not sufficient to help researchers implement best practices as they need greater peer-support and mentoring to put what they have learnt into practice.

This poster will highlight a number of initiatives that have started to do this community work such as the FAIR Phytoliths Project – a project that aimed to raise awareness and knowledge of the the FAIR data principles in phytolith research, Open Phytoliths Community – this community has been offering training and advise in open research practices, and also the recently funded People in Data project, which aims to convene existing data professional communities to share knowledge, tackle challenges and build capacity across domains and sectors.

517 MATERIALITY AND THE RELIGIOUS CHANGE ON THE POLISH – POMERANIAN BORDER IN THE 11TH – 12TH CENTURIES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Sikora, Jerzy (Institute of Archaeology University of Lodz)

Abstract format: Poster

Long-term interdisciplinary fieldwork, including archaeological excavation, non-invasive prospection and metal detecting, in Ostrowite, a small village in northern Poland, led to the discovery of a large medieval settlement complex dating from the 11th-14th centuries. In the Middle Ages, the complex was an important point on the border between Piast Poland and Pomerania. It was a witness of turbulent events connected with the long process of military and cultural pressure from Poland on Eastern Pomerania in the 11th and 12th centuries, which led to the development of the semi-independent Duchy of Gdańsk and the adaptation of Christianity. The paper aims to show how this change is represented in the archaeological record, with particular attention to material culture and objects. Three categories of finds will be highlighted:

1. Features discovered on the island of Ostrowite Lake, which may represent material traces of pre-Christian ritual activity.
2. The inhumation burials, which reflect complex rites with Christian disposition of the body, rich grave goods, Christian symbols and traces of highly unorthodox animal sacrifices.
3. Small finds associated with Christian worship and the alleged, still uncovered, church building.

520 CURRENT LIFE IN A ROMAN COLONY – WELCOME TO CASTRUM NOVUM!

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Mackiewicz, Klementyna (University of West Bohemia in Pilsen) - Preusz, Klára (University of West Bohemia in Pilsen) - Preusz, Michal (University of West Bohemia in Pilsen) - Enei, Flavio (Museo Civico di Santa Marinella “Museo del Mare e della Navigazione Antica”)

Abstract format: Poster

Castrum Novum (Santa Marinella, Italy) is the roman maritime colony, dated from the 3rd century BC to 5th century AD. Since the 1970s, archaeological excavations have been taking place and over the years, researchers from whole Europe (France, Czech Republic, Finland, Germany or Poland) have joined the Italian project. However, what sets Castrum Novum apart is the group of excavation volunteers – mostly elderly, often retired community from Il Gruppo

Archeologico del Territorio Cerite. The organization tries to physically bring the local history and archeology closer to tourists and city residents, enabling commented tours and offering the souvenirs devoted to the location. Due to their passion, in 2023, the municipality of Santa Marinella, awarded participants of the project with the honorary citizenship of Castrum Novum as a sign of the "new life of the colony". However, with technology development, Castrum Novum has gained a new life also in a virtual world.

Last years, the site has been mostly promoted on television, radio and social media. For those interested in archeology and architecture, 3D reconstructions of the colony are available on YouTube. However, the tribute to younger generations is the computer game.

In cooperation with TECRON VR and iINFINITE PRODUCTION, a computer simulation "Castrum Novum VR - Life in a Roman colony" was created (available on the Steam platform). Users can feel how life was in a typical ancient colony of Rome. They can move directly to 153 AD and explore the whole area, meet the locals and feel the Roman power in its heyday.

See the role of heritage in society and its imagination. Welcome to Castrum Novum!"

521 AS A WITNESS OF THE PAST FIVE THOUSAND YEARS: THE LUDAS-HALOM MOUND IN HUNGARY

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Bede, Ádám (HUN-REN Centre for Ecological Research) - Csathó, András István (Independent researcher) - Valkó, Orsolya (HUN-REN Centre for Ecological Research) - Deák, Balázs (HUN-REN Centre for Ecological Research)

Abstract format: Poster

The Ludas-halom (meaning 'Goose Mound') is a Yamnaya kurgan from the Late Copper Age, near Mindszent (Csongrád-Csanád County, Hungary). This burial mound has many historical traces from the past five thousand years, as evidenced by its more than twenty variants of names. Within an interdisciplinary project we taken geomorphological, landscape historical and botanical researches on the kurgan. We collected all of the historical maps, aerial photos, local and archaeological literature for the landscape historical investigation. A complete list of vascular plants was prepared with attributes of frequency. The kurgan is located on a loess remaining surface of the Maros river from the Pleistocene Age. It has been inhabited almost continuously since the Bronze Age; in the Middle Ages a church was built on it. At the early 18th century, the deserted site was used for occult religious purposes, where witches gathered for séances (we can read about this in an investigation from 1730). After that, presumably for exorcism, a crucifix was erected on the top, which still stands today. Since 1921, on the feast of Peter and Paul, a mass is celebrated here. The borders of three settlements (Mindszent, Szegvár, Derekegyház) still meet here, marked by three small border hills on the top of the kurgan. In the 19–20th centuries, the sides of the Ludas-halom and its surrounding area were ploughed, but the central part was always covered with grassland. Unfortunately, the ploughing of the southern side is still going nowadays, and the human bones found here are considered by local people to be a memory of old wars or epidemics. The mound is not only significant for the heritage protection, but it has also outstanding nature conservation importance, as its surface has disturbed, but valuable loess vegetation, with typical dry grassland species and rare weeds.

523 LJUBAČ - LJUBLJANA, CROATIA: NEW PERSPECTIVES AND INSIGHTS

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Gusar, Karla (University of Zadar, Department of Archaeology) - Šimičić, Marina (University of Zadar, Department of Archaeology) - Glavaš, Vedrana (University of Zadar, Department of Archaeology)

Abstract format: Poster

It is assumed that Ljubljana site in Ljubač, near Zadar, has been inhabited since the Iron Age. The site is located on a promontory just above the Adriatic Sea. Due to its strategic position on the Adriatic coast, from the site it was possible to monitor both maritime routes along the Adriatic and those leading towards the Velebit mountain. The first mention of Ljubač in historical sources is from 1205, when king Andrew II demarcates the territory of the diocese of Nin, excluding the lands of the Liuba castrum, which then belonged to the knights Hospitalier. At the beginning of the 15th century, in the dramatic battles for the Croatian - Hungarian throne between Louis I of Anjou and Ladislaus of Naples, Ljubač was conquered by the Neapolitan captain Aldemarisco. Since 1409, Ljubač has been formally under the rule of Venice, but in reality, under the rule of the noble Matafar family. After the extinction of Matafars, Ljubač once again passed into the hands of Venice, after which it briefly came under Ottoman rule in the middle of the 17th century and later returned to Venetian administration.

This poster presents methods and results of three research campaigns at Ljubač during which archaeological excavations were carried out at several different positions on the site which revealed remains of the ditch, ramparts, tower, cistern, dwellings and two churches. For locating burial sites, HRD dogs were successfully used so cemeteries could

be mapped and also partially excavated. All unearthed structures at the Ljubljana site were 3D modeled by the use of photogrammetry method which helped to better understand the dynamics of this coastal settlement.

525 THE PRESENCE OF CHILDREN IN MONUMENTAL TOMBS IN THE LATE BRONZE AGE ON THE ISLAND OF KEFALONIA, GREECE

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Albanese, John (University of Windsor) - Johnstone, Brenna (University of Windsor)

Abstract format: Poster

During excavations in the mid-1990s, human remains were recovered from a unique combination of a tholos tomb and an adjacent ossuary from the Late Bronze Age at Tzannata on the Island of Kefalonia, Greece. A systematic analysis of the osteological remains has been on-going since 2015. We present some of the results with a focus on the remains of juveniles. The commingled and fragmentary nature of remains confounds the construction of a demographic profile for each tomb. However, it was possible to assess the range of ages of children present in each tomb using three overlapping approaches. First, long bones with unfused epiphyses were seriated based on size. Second, the stages of growth and development were assessed using partially fused epiphyses. Third, the development of the deciduous and permanent dentition was assessed. There is clear skeletal evidence that individuals ranging in age from neonates to young adults were included in both tombs. The analysis of the juvenile remains is complementary to other archaeological approaches for reconstructing the concept of childhood and roles of children during this period. There is evidence that, at least in these monumental tombs, mortuary practices were similar for children and adults regardless of age and gender. These data, along with other evidence of contact, from what is often referred to as an island on the "Mycenaean periphery" are an asset for better understanding of the Late Helladic in general.

526 ENCOSTA DA LAGOA: FIRST BIOANTHROPOLOGICAL RESULTS FROM A SAMBAQUI IN GAROPABA, SANTA CATARINA, ATLANTIC COAST OF SOUTH BRAZIL

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Bianchi, Vittoria (University of Bologna) - Schneider, Bruna (Unochapecô) - Mazza, Barbara (CONICET) - Carbonera, Mirian (Unochapecô) - Silveira Costa, Silvano (Arqueoste Consultoria) - Marciani, Giulia (University of Bologna) - Loponte, Daniel (CONICET) - Vazzana, Antonino (University of Bologna) - Bortolini, Eugenio (University of Bologna) - Benazzi, Stefano (University of Bologna)

Abstract format: Poster

The Encosta da Lagoa Archaeological site is a shallow Sambaqui that yielded materials which were first excavated in 2022 and are currently undergoing a variety of analyses through the international research programs named "Biogenetic profile, diet and mobility of the prehistoric population of southern Brazil: Research and Training" (HABIT-MAE-CI), and Archaeology of Southeastern South American project (ASSA).

The archaeological excavation was carried out in three sectors corresponding to 28.3 m², where the funerary structures were documented and removed to complete their excavation in the laboratory.

The anthropological analyses were focused on the determination of the minimum number of individuals and, for each, the sex and age estimation, the registry of morphometric and biomechanical variables, together with the observation of taphonomic traces and bone and dental pathologies.

The skeletal sample consists of 36 individuals of which 13 were identified as sub-adults and 23 as adults. Extramastatory tooth wear is common across the sample. The individuals present low to medium enthesal changes and some cases of osteoarthritis mainly in the vertebral column. Some individuals exhibit a more complex pathological and taphonomic situation, which are currently under study.

In addition to human remains, excavations documented a conspicuous amount of diverse terrestrial and marine faunistic remains. It is attested the production of material culture involved polished and flaked lithic instruments and bone tools. Associated with the burials there was a great amount of ochre and other grave goods but no pottery. Direct dating of these remains is ongoing, but current findings suggest 5000-3000 years BP as the most likely chronological interval for this occupation.

Current results confirm the relevance of Encosta da Lagoa as one of the key sambaquieira in the southern coast of Santa Catarina which will shed light on change over time in adaptive strategies and population structure in the region.

528 ALTERNATIVE ARCHAEOLOGIES. AN ENQUIRY ON UNCONVENTIONAL VISITORS TO ARCHAEOLOGICAL SITES

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Michalopoulou, Maria (University of Bologna)

Abstract format: Poster

The poster summarizes the titular master thesis on the unconventional visitors to the archaeological sites of Stonehenge; Delphi; and Machu Picchu, as part of alternative archaeology. Unconventional visitors are defined as visitors who engage in activities such as meditation and yoga and have an alternative interpretation of archaeology. The purpose is to present the perspectives of such visitors, by highlighting the often-ignored multivocality of archaeological sites, introduce consequent matters and reveal their relationship to archaeological authorities. With the aid of interviews and bibliographical sources, comparative results of the sites are presented. The correlation of politics and alternative tourism is examined, as well as the importance of archaeological narrative. Finally, proposals on cultural heritage strategies are given, focusing on the protection of the sites and the inclusivity of all visitors by encouraging a fruitful dialogue among them, archaeologists, and cultural heritage managers. The proposals are accompanied by results of archaeoacoustics experiments and projects on the improvement of mental health, which demonstrate a positive impact on the human brain by visiting archaeological sites and interacting with them.

532 SEEING RED: USE OF IRON-OXIDE RICH COLORING MATERIALS AT ISTURITZ AND GATZARRIA CAVES DURING THE AURIGNACIAN IN THE PYRENEES, FRANCE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Querenet Onfroy de Breville, Iris (University of Connecticut; TRACES UMR 5608)

Abstract format: Poster

The Pyrenees region holds significant importance for investigating the early migrations of Homo sapiens into Europe, particularly during the Proto- and Classic Aurignacian periods. Among the notable sites within this area, Isturitz and Gatzarría caves stand out for their in-situ archaeological layers, offering valuable evidence of iron-oxide exploitation during these chrono-cultural phases.

My combined scientific, experimental, and social research explores the different ways that the Proto- and Classic Aurignacians in the Pyrenees exploited iron-rich coloring materials and to understand the cultural contexts in which this material was used. Whether due to scraping, abrading, or grinding, the evidence of exploitation, or use-wear, is detectable on well preserved artifacts. But, contrary to much of the literature around coloring materials, the presence of use-wear marks on coloring material artifacts is not necessarily evidence of symbolically mediated behavior, since the selection, collection, and transport of coloring materials is also evidence of forward planning and intentionality.

To gain a comprehensive understanding of these coloring materials, my research integrates archaeology, geology, and traceology. Each discipline complements the others, utilizing observations ranging from macro- to micro-scales to unveil insights into iron-oxide rich rocks. By progressively assembling a detailed picture of these materials and their chaîne opératoire—the social acts involved in their production, use, and disposal—we gain valuable insights into the evolution of tool technology within culturally specific lifestyles.

This poster aims to outline the methodological approach employed in studying the coloring material collections from these two sites, while also providing preliminary data gleaned from these investigations.

537 FROM THE LAND OF FIRE: ISOTOPIC ASSESSMENTS ON MARITIME LIFESTYLES AND SEXUAL VARIATIONS IN DIET, SOUTHERN PATAGONIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Kochi, Sayuri (Johannes Gutenberg-Universität Mainz) - Tessone, Augusto (Instituto de Geocronología y Geología Isotópica; Consejo Nacional de Investigaciones Científicas y Técnicas; Universidad de Buenos Aires) - Zangrando, Francisco (Centro Austral de Investigaciones Científicas; Consejo Nacional de Investigaciones Científicas y Técnicas; Universidad de Buenos Aires)

Abstract format: Poster

Research about prehistoric dietary variations in Patagonia is frequently structured by optimal foraging models, as for small hunter-gatherer groups is expected dietary homogeneity between individuals. Several ethnographical examples about the central place provisioning also reinforce the notion that sexual dietary variations among adult individuals are mainly relevant to short-term dietary patterns in the life cycle. Stable isotope analyses of human remains have unmatched resolution power to test these assumptions because they reflect an average of the groups of resources assimilated by an individual over the last decades of life. In this poster, we discuss, from an isotopic perspective, the sexual dietary variations in the southern coast of Tierra del Fuego (Argentina) during the late Holocene (2000 yr cal.

BP-first decades of the 20th century). Carbon and nitrogen stable isotope analyses were performed on bone collagen and bioapatite samples from 58 adult individuals, comprising 25 females and 33 males. Dietary interpretations are framed within a local isotopic ecology that encompasses several organisms from marine and terrestrial environments (n=238). Female adults have consistent and homogeneous marine diets, while isotopic values have a dispersed and asymmetrical distribution in the subset of male individuals. These patterns may be related to differences in logistical movements and food consumption outside the base camps. However, in a regional scale of analysis, Tierra del Fuego presents a pronounced bimodal trend in dietary isotopic markers. Therefore, another possibility is the existence of exogamic patterns; where a few male individuals circulate between different subsistence systems. This phenomenon also has some support in local ethnographies regarding the relationships between the northern Selk'nam groups and coastal Yagán groups. From these results, we highlight the possibility of detecting not only interindividual dietary variations among maritime hunter-gatherers but also issues related to mobility and the maintenance of social networks in the past.

538 THE SOLANA DEL ZAMBORINO: REDISCOVERING A LATE MIDDLE PLEISTOCENE OPEN-AIR CAMPSITE HALF A CENTURY LATER (GRANADA, SPAIN)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Solano García, José (University of Granada) - Serrano-Ramos, Alexia (University of Granada) - Sánchez-Bandera, Christian (Institut Català de Paleoecologia Humana i Evolució Social) - Herranz-Rodrigo, Darío (University of Granada) - Ortiz-García, Elisabeth (University of Granada) - González-Quirónes, Juan (University of Granada) - Ochando, Juan (University of Murcia) - Gutiérrez-Rodríguez, Mario (University of Jaén) - de Lomberra-Hermida, Arturo (University of Oviedo) - Jiménez-Arenas, Juan (University of Granada)

Abstract format: Poster

Mesopleistocene open-air sites with good preservation are rather scarce. These types of locations provide us with information about human activity and its interaction with the environment, which is different and complementary to cave sites.

La Solana del Zamborino is a rich multi-layered site, with nearly 10 meters of archaeological depth, located in the centre of the Guadix endorheic basin (Fonelas, Granada). Between 1972 and 1978, six excavation seasons were conducted, of which only the first two were published, along with a few subsequent studies of paleontological and archaeological research. These pioneering multidisciplinary works highlighted the significance of the site due to its rich archaeological and faunal record within a fluvial-marshy paleoenvironmental context during the Middle Pleistocene. Moreover, not only were traces of fire detected, but also a possible hearth structure delimited by stones was documented.

Recognising the importance of the site, various attempts at magnetostratigraphic dating have sparked lively ongoing debates, yet no archaeological excavation activities had been undertaken until 2024. Through a new stratigraphic survey, our overarching goal aims to address questions regarding human behaviour and activities outside their shelter/habitat zones and their interaction in open environments. To achieve this, we have implemented archaeological interventions primarily focused on recovering all analytical samples that allow us to reconstruct the formation of the site and the paleoenvironment in its diachronic development.

We present the new multidisciplinary project that has been launched and a preliminary report on the first excavation campaign, during which a substantial amount of lithic industry has been recovered and the initial sets of analytical samples have been taken.

540 THE WHEELS ARE TURNING. THE INTRODUCTION OF THE POTTER'S WHEEL IN LATE BRONZE AGE CYPRIOT SOCIETY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Peri, Elena (Göteborg Universitet)

Abstract format: Poster

The aim of this poster is to present my PhD project, which investigates the impact of the introduction of the pottery wheel during the Late Bronze Age in Cyprus (17th to 11th centuries BC). This technological innovation has implications for social, economic, and cultural change. The focus is on Plain White Ware, a type of pottery both hand and wheel-made, which requires in-depth study.

Unlike traditional pottery studies, which focus on typologies and decoration, this research shifts the focus to technological aspects. The aim is to understand the links between the introduction of the wheel and the resulting changes in society, economy, and culture.

To achieve this, the study will analyse pottery from Enkomi, Kition and Hala Sultan Tekke using macro-, meso- and microscopic methods. By examining these archaeological materials, the research aims to provide valuable insights

into the wider implications of the introduction of the pottery wheel. This approach enhances our understanding of the socio-cultural changes influenced by technological advances in ancient pottery production.

542 TECHNIQUES, TOOLS AND BOUNDARIES: THE IMPRESSED CORDED WARE AND THE WHITE NILE MESOLITHIC

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Usai, Donatella (Centro Studi Sudanesi e Sub-Sahariani - Treviso) - Maritan, Lara (Department of Geosciences, University of Padova, Via Gradenigo 6, 35131 Padova, Italy) - Roma, Sara (Centro Studi Sudanesi e Sub-Sahariani - Treviso)

Abstract format: Poster

Pottery production, in the Nile valley, south of the First Cataract down to the White and Blue Nile rivers, dates back to the 9th millennium BC. This production takes place in a context of hunter-gatherer-fishers and, although it shows some common characters, it also diversifies greatly from north to south. Although pottery manufacturing is family-based, and therefore highly variable, analytical studies enable to define some macro-areas with their own specificity, especially considering the technique, the tool and the final decorative motifs. Impressions realised with a tool composed of a cord element are reported in the literature but were never studied in detail. This kind of impressions is frequent in the pottery production of al-Khiday sites, located on the left bank of the White Nile, and dating to the 7th millennium BC. Considering some important observations made on the ceramic fragments, we explored, through experimentation, the possibility of tracing back to the specific tool and reproducing the motifs identified in the ancient material.

Finally, the "formal" analysis of these decorative motifs has demonstrated, once more, to be a key tool in defining the dynamics of Nile Valley peopling as the study contributed to identifying the cord-impressed decorations documented at al-Khiday as characterizing a specific macro-area along the White Nile.

544 CHRONOLOGICAL AND SPATIAL ANALYSIS OF ROMAN AREA DURING IV-III MILLENNIUM BC

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lucchini, Francesco (Sapienza University of Rome) - Rizzitano, Filippo (Sapienza University of Rome) - Bucci, Laura (Sapienza University of Rome) - Pascale, Ilaria (Sapienza University of Rome) - Balbo, Eugenia (Sapienza University of Rome) - Daniele, Annamaria (Sapienza University of Rome) - Di Renzoni, Andrea (Institute of Heritage Science - National Research Council of Italy)

Abstract format: Poster

The occupation of the Roman area during the Eneolithic (4th and 3rd millennium BC) is a rather complex reality characterised by different archaeological and cultural aspects (Rinaldone, Conelle-Rinaldone, Gaudio, Laterza, Ortucchio). The chronological sequence of these material cultures is difficult to understand. Therefore, this study attempts to shed light on the settlement patterns and on the possible coexistence of these groups. Starting from the digitization of data provided in Anzidei and Carboni 2020 "Roma prima del mito: Abitati e necropoli dal Neolitico alla prima età dei metalli nel territorio di Roma (VI-III millennio a.C.)", a chronological and spatial analysis was carried out to explore the link between coeval settlements and necropolises related to different cultural aspects. The results show how, during the analysed period, groups adopting different cultural elements lived next to each other in the area at certain times. These data make an important contribution to the study of the Italian Copper Age, expanding our understanding of the spatial distribution of these communities.

551 DON'T WASTE THE GARBAGE! DATA FROM SOME MEDIEVAL AND POST-MEDIEVAL DISCARD PITS IN NORTHERN LATIUM (ITALY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Alhaique, Francesca (Museo delle Civiltà, Rome Italy) - Brancazi, Luca (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma, Rome, Italy) - Cerafoli, Eleonora (Dipartimento di Scienze della Terra, Sapienza Università di Roma, Rome, Italy; Dipartimento di Biologia Ambientale, Sapienza Università di Roma, Rome, Italy) - Liberali, Giulia (Scienze e Tecnologie per la Conservazione dei Beni Culturali, Sapienza Università di Roma, Rome, Italy) - Masci, Lucrezia (Dipartimento di Biologia Ambientale, Sapienza Università di Roma, Rome, Italy) - Moricca, Claudia (Dipartimento di Biologia Ambientale, Sapienza Università di Roma, Rome, Italy) - Piermartini, Lavinia (Dipartimento di studi linguistico-letterari, storico-filosofici e giuridici, Università degli Studi della Tuscia, Viterbo, Italy) - Romagnoli, Giuseppe (Dipartimento di studi linguistico-letterari, storico-filosofici e giuridici, Università degli Studi della Tuscia, Viterbo, Italy)

Abstract format: Poster

The aim of this poster is to emphasize the informative value of refuse, not only as evidence of ancient discard practices, but also as an indicator of lifestyle and social status. It will present archaeological, archaeozoological, and - where available - botanical data from a dozen of waste pits situated in several localities in northern Latium (Central Italy). Some of the sites under examination are situated within the boundaries of Viterbo (Via di Valle Piatta and Via Zelli Pazzaglia), while others are located in smaller settlements related to a church (Tessennano), an affluent residence (Celleno Vecchio), and a castle (Graffignano), spanning from the 13th to the 16th century. Through comparative analysis of the contents of these pits, considering both chronology and context, it is possible to infer valuable insights into the lives of those who utilized these discard features, including details about their diet, related to personal preferences, religious prescriptions, as well as observations on waste management practices.

This research not only highlights the advantages of combining archaeozoological and archaeobotanical data, but also emphasizes the potential of applying palynological analyses on archaeological samples, yielding information about "missing plants", seasonality, land use and diseases in the Middle Ages.

556 NOT EVERYTHING IS LOST - THE CASE OF THE ROBED THRACIAN WARRIOR'S TOMB NEAR BOTEVO VILLAGE, YAMBOL DISTRICT, BULGARIA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Valchev, Todor (Historical museum - Yambol) - Trautmann, Martin (University of Helsinki)

Abstract format: Poster

In the spring of 2020, a group of treasure-hunters dug on a Thracian burial mound near Botevo village, Yambol district, Bulgaria. It is 5.0 m high and has a 50.0 m diameter at the base. The mound is part of a bigger necropolis situated at the base of a rock ridge.

Treasure-hunters' managed to reach the central tomb and rob it. The tomb is created by large stones. It has a trap-ezoidal shape. The roof is made from 3 big, flat stones. The base and lower parts of the walls are covered with white putty. The treasure-hunters removed one of the roof's stones and entered the tomb. They stole all the grave goods and threw the skeleton remains in a hole.

The aim of the poster is to present the anthropological research on the skeleton remains. Unfortunately, we will never know what the grave goods were, but the anthropological data show us interesting moments from the military life of the Thracian nobleman.

557 ARCHITECTURAL DREAMS: EXPLORING THE ARCHITECTURAL SETTINGS IN ETRUSCAN MIRRORS BETWEEN REAL AND FANTASY BUILDINGS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Tulipano, Jacopo Francesco (Università degli Studi di Roma La Sapienza)

Abstract format: Poster

Etruscan mirrors serve as invaluable artifacts shedding light on various aspects of Etruscan society, culture, and artistic expressions. Among the diverse motifs depicted on these mirrors, architectural settings stand out as significant representations providing insights into Etruscan architectural practices, urban landscapes, and socio-cultural contexts. This poster aims to provide a concise overview of the architectural buildings portrayed in Etruscan incised mirrors, especially temples or sacred buildings, emphasizing their typology, nature and structural characteristics, delving into the possibility that the architectural structures depicted may represent real or, alternatively, fantastical monuments.

Through comparative analysis of the images depicted on the mirrors, published within series like the CSE or the Etruskische Spiegel, and the temple models known to us, both from archaeological and art evidence, the aim is to identify the elements attributable to real structures and those characterized by features of fantasy. It can indeed be hypothesized that the Etruscan or the more famous Greek sanctuaries could have been a source of influence for iconographies. Conversely, an alternative perspective posits that many architectural motifs depicted may represent fantastical or idealized constructions

Through the analysis of recognizable elements pertinent to the depicted architectural features, this poster will endeavor to elucidate with greater clarity the typology and architectural orders represented in the mirrors, juxtaposing them with insights gleaned from archaeological documentation, written sources, and known temple structures, particularly prevalent in Etruria and Central Italy. This will further enable a critical examination of previous literature on the subject, verifying interpretations historically attributed to the architectural representations depicted in Etruscan mirrors when available. Notably absent within dedicated studies of Etruscan architecture are precise and substantive references to this aspect.

In conclusion, this study also aims to preliminarily delineate the boundaries and possible future prospects of such analyses, thereby highlighting potential challenges therein.

559 TRANSCRIPTION OF THE MEDIEVAL BIRCH-BARK MANUSCRIPT FROM TURKU

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kinnunen, Jussi (University of Turku, Department of archaeology) - Harjula, Janne (University of Turku, Department of archaeology)

Abstract format: Poster

The poster focuses on the paleographical analysis of the first medieval birch-bark manuscript found in Finland. The document was found from an archaeological excavation carried out in the medieval town area next to the Turku Cathedral in 2005–2006. The object was C14-dated to the 14th century, and named after its finding spot as ‘the birch-bark letter of the Turku Cathedral Square’. In this poster, we present the analysis and transcription of the manuscript. Firstly, the birch-bark document was scanned using microscope photography. Secondly, digital microphotographs were combined digitally, and the contrasts on the script were amplified with digital image processing. The text is an extremely rare example of medieval non-formal language use in medieval Finland as it seems to enlighten the thoughts of a medieval common citizen. The meticulous documentation and paleographical analysis of the find carried out leaves the opportunity for alternative interpretations of the text in the future.

561 EXPLORING A POSSIBLE SCHEUERMANN'S DISEASE IN A HUMAN SKELETON OF 16TH CENTURY, FROM IASI (ROMANIA)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Groza, Vasilica-Monica (“Alexandru Ioan Cuza” University of Iasi, Faculty of Biology, (Romania); Romanian Academy, Iasi Branch, “Olga Necrasov” Center of Anthropological Research, (Romania)) - Popovici, Mariana (“Alexandru Ioan Cuza” University of Iasi, Faculty of Biology, (Romania); Romanian Academy, Iasi Branch, “Olga Necrasov” Center of Anthropological Research, (Romania)) - Ciorpac-Petraru, Ozana-Maria (“Alexandru Ioan Cuza” University of Iasi, Faculty of Biology, (Romania); Romanian Academy, Iasi Branch, “Olga Necrasov” Center of Anthropological Research, (Romania)) - Văleanu, Mădălin-Cornel (“Moldova” National Museum Complex of Iasi, History Museum of Moldova, Iasi, (Romania)) - Bejenaru, Luminița (“Alexandru Ioan Cuza” University of Iasi, Faculty of Biology, (Romania); Romanian Academy, Iasi Branch, “Olga Necrasov” Center of Anthropological Research, (Romania))

Abstract format: Poster

Analysing pathological conditions in archaeological contexts is often a challenge, as there are far fewer resources to call upon compared to the modern clinical setting.

This study details a case of a possible Scheuermann's disease (SD) in a skeleton dated to 16th century, discovered at the “Frumoasa” Monastery from Iasi (Iasi County, Romania), during the preventive archaeological research in 2018-2019. The case of Scheuermann's disease, described in this study, was identified in a skeleton belonging to a male of about 25-30 years (young adult). The skeleton was discovered in a partially disturbed tomb, with 14 gold coins of 16th century. It was incomplete and poorly preserved showing signs of old cracks in some bones (i.e., parietal, femur).

The macroscopic analysis of the disease affected bones was followed by the X-rays and computed tomography (CT). Osteometry was performed at the level of vertebral bodies using the digital calliper. The teeth were analyzed using a Carl Zeiss Stemi 2000-C stereomicroscope with a Canon Power Shot SX70 HS attached.

The analysed skeleton shows signs of Scheuermann's disease, mainly identified by the modification of the thoracic vertebrae, which caused an excessive curvature in the dorsal region, with a visible deformity of the back in the shape

of a hump. This condition usually occurs during the period of growth and development, before puberty, being more common in males. Although the Scheuermann's disease is well known through current clinical cases, few findings have been reported in archaeological skeletal remains.

Spina bifida occulta in the sacrum bone was also identified. At the dentition level, they are found multiple caries, calculus, and enamel hypoplasia (linear transversal type, on incisors, canine, and premolar teeth).

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

563 HUMAN POPULATION DYNAMICS IN LATE NEOLITHIC AND CHALCOLITHIC ANATOLIA - PRELIMINARY INSIGHTS FROM ARCHAEOGENOMICS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Aydogan, Ayca (Department of Anthropology, Hacettepe University)

Abstract format: Poster

The Chalcolithic in Anatolia was a period that served as a link between the Neolithic Transition and the emergence of Urbanization. Archaeological research suggests significant cultural interactions in this period between Anatolia and neighbouring regions, and more distant areas. While the societies from southeastern Anatolia were influenced by Hassuna-Samarra and Halaf cultures of Mesopotamian origin, north and western Anatolian populations display cultural similarities with the Balkans and the Aegean region. By the end of the Chalcolithic, technological advancements further facilitated interaction networks with distant regions. However, whether this picture of widespread cultural interaction was accompanied by genetic changes in the human gene pool is not well understood. Here we present 40 new genomes from 11 previously unsampled settlements to analyse population dynamics during the Late Neolithic/Chalcolithic era (c.6000-3000 BCE). Our findings suggest a correlation between cultural and genetic association among the populations and also multiple gene flow events from its eastern regions, possibly Caucasus, into Anatolia, with varying genetic impacts in different regions. We find that populations linked with the Hassuna-Samarra culture show genetic separation from Early Neolithic Upper Mesopotamian groups, suggesting admixture. We also find genetic differentiation between Central Anatolia and Eastern Thrace by the 6th millennium BCE, with Central Anatolia exhibiting closer associations with eastern populations and Eastern Thrace sharing similarities with the Aegean islands and Balkan sites. Although association with the Caucasus continued in the following millennium, genetic heterogeneity among Anatolian regions remains. Finally, by the Bronze Age, populations from both Anatolia and Upper Mesopotamia became genetically relatively homogeneous.

564 DIVING INTO CENTRAL EUROPEAN NEOLITHICS' SUBSISTENCE. 25 YEARS OF SLASH AND BURN EXPERIMENT FORCHTENBERG, GERMANY - RESULTS AND FUTURE PERSPECTIVES

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Nelle, Oliver (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart) - Marinova, Elena (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart) - Dreibrodt, Stefan (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart) - Pickartz, Natalie (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart) - Ehrmann, Otto (Büro für Bodenmikromorphologie und Bodenbiologie Creglingen) - Schlütz, Frank (Christian-Albrechts-Universität zu Kiel) - Knapp, Hannes (CEZA Mannheim) - Eckmeier, Eileen (Christian-Albrechts-Universität zu Kiel) - Gerlach, Renate (LVR-Amt für Bodendenkmalpflege im Rheinland) - Rösch, Manfred (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart)

Abstract format: Poster

This contribution provides quantitative data on the application of fire in subsistence practices of a Central European landscape and their potential visibility in paleo-environmental archives based on the results of a multidisciplinary experimental approach. In a forest near Forchtenberg, Baden-Württemberg, Germany, over the last 25 years, plots of 300-900 m² were cleared (on some occasions with “Neolithic” tools) and burned in subplots of 50-100 m² using a rolling fire blast technique, developed by the Forchtenberg experimental fire team. This resulted in a satisfactory burning of the branches and smaller diameter stems of the felled trees and an even distribution of the combustion products over the plots and is therefore considered a possible model for Late Neolithic slash-and-burn applying fire to extend cultivation in Central European mixed deciduous forests. The amount of wood burned and the amount of charcoal and ash produced during the fires is documented. The change in soil properties is examined immediately after the fire. The long-term change in soil properties is being monitored by sampling and analysing all previously burned areas. The burnt areas were planted with old cereal varieties over a period of one year, the respective yields were documented, and compared with the yields of permanent cultivation with and without previous burning. The visibility of the areas in the pollen count of the surrounding landscape is documented in pollen traps and the natural succession of the forest on the areas after the end of agricultural use is documented by vegetation relevés as well as tree ring

data. Isotope analyses of cereals and soils were included in the last years to evaluate isotopes from archaeobotanical material as possible markers for slash-and-burn in the past. We are also investigating the fate of charcoal in the soil to allow comparisons with Neolithic black soils.

565 PLANT AND ANIMAL USE IN LATE MEDIEVAL AND MODERN RELIGIOUS CONTEXTS IN CENTRAL ITALY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Moricca, Claudia (Sapienza University of Rome) - Alhaique, Francesca (Museo delle Civiltà, Rome Italy) - Barelli, Lia (Sapienza University of Rome) - Brancazi, Luca (Sapienza University of Rome) - Masi, Alessia (Sapienza University of Rome) - Picuti, Maria (Sapienza University of Rome) - Piermartini, Lavinia (Università degli Studi della Toscana) - Pugliese, Raffaele (Independent researcher) - Romagnoli, Giuseppe (Università degli Studi della Toscana) - Sadori, Laura (Sapienza University of Rome)

Abstract format: Poster

Excavations carried out between 1996 and 2016 in Latium and Umbria (Central Italy) allowed the recovery of faunal and, sometimes, plant remains from religious contexts spanning from the 13th to the 17th century. The analysis of these organic materials, as well as their comparison, allowed us to investigate how these resources were used not only by the monastic communities but also by laypeople who lived in and around these religious complexes. The examined assemblages represent, in most cases, food waste but also include plants and animals employed for other purposes. The diet was, of course, influenced by religious rules; however, it differed, for example, according to the monastic order, the chronological period, the local availability of resources, and the social status. In this sense, noteworthy is the retrieval of *Cucurbita* sp. (pumpkin) seeds and a *Cavia porcellus* (Guinea pig) pelvis in Early Modern contexts from the Santi Quattro Coronati complex (Rome), products imported from the newly discovered Americas, thus available only to the elite.

566 GEOPHYSICAL AND GEOCHEMICAL PROSPECTION AT THE RINGFORTS ON ÖLAND, SWEDEN

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Hedberg, Ellinor (Archaeological Research Laboratory, Stockholm University) - Lidén, Kerstin (Archaeological Research Laboratory, Stockholm University) - Viberg, Andreas (Guideline Geo AB) - Isaksson, Sven (Archaeological Research Laboratory, Stockholm University) - Papmehl-Dufay, Ludvig (Linnaeus University)

Abstract format: Poster

The use of the ringforts on Öland, dated to the migration period (200-800 CE) have long been debated with many different interpretations, such as defence systems, meeting places, cult places and that it reflected turbulent times. One method to quickly gain more information about the ringforts is different archaeological prospection methods, e.g. LiDAR, ground-penetrating radar, magnetometry and soil samples. The project CrisConClimate aims to study archaeological change related to crisis, conflict, and climate with the ringforts on Öland as a case study. A wide range of archaeological research methods will be used and one of them is archaeological prospection that will be carried out as an initial step before turning to other materials and methods. The aim of the prospection is to gain information about the spatial layout, structures, wells, defence systems and other features of interest that can be used in the forthcoming research. The methods that have been used are LiDAR, ground-penetrating radar and pXRF element analysis of soil samples. The LiDAR data gave high resolution pictures of the ringforts, something that was not available before and will help the interpretation of the sites. The result from the ground-penetrating radar survey was more difficult to interpret but could confirm that most of the archaeological structures have been removed, maybe due to ploughing. The soil samples showed the mineral content of the ringforts that was compared to divide them into different types and indicate different activity areas. All these methods show that archaeological prospection is highly relevant and can give a lot of new information about archaeological sites without having to damage the sites and do archaeological excavations, something that is not possible to do over such large areas.

571 GEORGIAN MONASTERIES BETWEEN INVASION AND RESILIENCE DURING MIDDLE AGES

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Bertoldi, Francesca (Ca' Foscari University Venice, Dipartimento di Studi Umanistici) - Fabbri, Pier Francesco (Museo e Istituto Fiorentino di Preistoria) - Cameriere, Roberto (Università degli Studi del Molise) - Piano, Denise (Università Politecnica delle Marche, Dipartimento di Scienze Biomediche e sanità pubblica) - Catalini, Leonardo (Università del Molise, Medicina Legale) - Laliashvili, Shorena (Tbilisi State University Ivane Javakhishvili, Institute of History and Ethnology) - Bitadze, Liana (Tbilisi State University Ivane Javakhishvili, Institute of History and Ethnology) - Rasia, Piera Allegra (Università Ca' Foscari Venezia) - Rova, Elena (Università Ca' Foscari Venezia)

Abstract format: Poster

This paper wants to offer a preliminary glimpse into a recently discovered human bone assemblage discovered in the area of Borjomi (Georgia) in July 2023. These huge bone assemblages come from three monasteries: Berisaqdrebi, excavated in 2020, Potoleti, recently restored in 2007 and Mtsvane-Chitakhevi or Green Monaster. The human remains from Berisaqdrebi come both from seven early middle age (Xth century AD) burials in stone coffins located along the church's walls and inside the structure and from an underground crypt with few articulated burials on stone shelves and an enormous mass of disarticulated remains in the ossuary. At present they have been removed and preserved at the Nunnery of the Holy Virgin of Borjomi where they are devoutly venerated as witness of martyrdom. Potoleti remains are still preserved in plexiglass case at the site as few remains at the Green Monastery, still site of pilgrimage for the "blood" coloured stones in the river outside the monastery, according to legend left by the monks murdered and tortured by the soldiers of Shah Tahmasp. A preliminary survey of the Berisaqdrebi collection allowed us to number more than 600 skulls and post-cranial remains and around 20% of them shows wounds and injuries consisting in blunt force and sharp force traumas both ante-mortem and peri-mortem and most probably due to episodes of inter-personal violence; decapitated skulls have also been found as also other pathologies have been recorded (tumours, metabolic bone diseases, fractures, ankylosing spondylitis, congenital malformations). Samples have been taken for aDNA and isotope analysis (nutritional patterns and eventually origin of the subjects) and a preliminary sample of around 50 subjects will be diagnosed by traditional (cranial sutures, dental wear) and experimental radiographic Cameriere Method on teeth for age determination.

572 DEPICTING THE EQUINE EMOTIONAL STATES COMPARATIVE ANALYSIS OF THE BEHAVIOUR AND ATTITUDES OF HORSES IN THE ALEXANDER MOSAIC

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Cecconi, Niccolò (Sapienza. Università di Roma) - Sollevanti, Gaia (Università degli Studi di Perugia (graduating student))

Abstract format: Poster

In the Alexander mosaic of the House of the Faun in Pompeii, the relationship between horse and human being is perfectly illustrated. In this mosaic, dated back to 100 BC, but inspired by a painting by Philoxenus of Eretria from the 4th century BC, we can observe the realism, typical of the Hellenistic age, with which horses are represented.

The artists have reproduced in detail the poses of the body, the attitudes (raised tail and rotated head with tensed neck muscles) and the expressions of the muzzle of these animals (flared nostrils, exposed teeth, barred eyes, straight and rotated ears).

Observing the mosaic images, we note that the emotional states of the horses are, together with Alexander, the main characters of the scene.

In this poster we would like to propose an approach to analyzing the emotional states of the horses in the Alexander mosaic.

We will consider ancient sources (e.g. Xenophon), other ancient objects (e.g. horse-jockey from Artemision) and, above all, research in veterinary medicine that analyses the ethology of these animals in situations of excitement, stress, anxiety, and fear.

Through this comparison, we will observe that the attitudes of the horses in the Alexander mosaic have been reproduced in an extremely naturalistic style.

Through this analysis, in fact, we will demonstrate that the body postures and facial expressions of the horses in the Alexander mosaic are not simply caricatured images from the artist's imagination but are the outcome of the symbiotic relationship between ancient humans and horses and the profound knowledge that Greek aristocratic man had of this animal.

573 EXPLORING THE ROLE OF ARCHAEOLOGY AND AFTERSCHOOL ENGAGEMENT: INSIGHTS FROM THE YOUNG ARCHAEOLOGISTS' CLUB

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Stejskalová, Johana (National Museum in Prague)

Abstract format: Poster

What is the potential and the role of archaeology and archaeological heritage with regards to afterschool entertainment for children? The Young Archaeologists' Club, organized by the National Museum in Prague, serves as a weekly afterschool activity targeting pupils interested in classical archaeology. Through this initiative, participants engage in learning about the ancient Greece and Rome, cultivating critical thinking skills while also partaking in crafting activities and games. The initial course centered on archaeological finds from Greece and Rome, while the subsequent course focused on mythology. Collectively, there were nineteen participants enrolled in both courses. A survey conducted in 2023 among club participants sought to gauge their perspectives on archaeology, the club itself, and museums in general. Initial inquiries delved into their motivations for joining the club and their perceptions regarding the relevance of classical archaeology in contemporary society. Subsequently, participants provided comprehensive evaluations of each club meeting's activities and topics. Additionally, changes in attitudes towards museums were measured pre- and post-club participation, comparing participant responses with those of a control group of pupils who did not partake in the club. This comparative analysis aimed to assess the potential influence of archaeology and regular afterschool engagement on attitudes towards museums. Furthermore, parental perspectives on archaeology were also surveyed to elucidate familial attitudes towards the subject matter. The outputs of this survey can not only contribute to the improvement of the presentation of archaeological topics in the context of museum education but also illuminate the relationship of participants with the institution and the effect of a long-term activity related to archaeological heritage on such a relationship.

574 STRONTIUM ISOTOPES IN HUMAN MOBILITY RESEARCH: BASR PROXIES IN AN ANTHROPOLOGICALLY MODIFIED LANDSCAPE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Vytlačil, Zdenek (Národní muzeum) - Ackerman, Lukáš (Institute of Geology of the Czech Academy of Sciences) - Loskotová, Zuzana (Institute of Archaeology of the Czech Academy of Sciences, Brno)

Abstract format: Poster

Establishing local $87\text{Sr}/86\text{Sr}$ range is a vital requirement for identifying non-locals in the bioarchaeological mobility studies using strontium isotopes. In regions heavily influenced by modern human activities, however, obtaining a reliable reference material might be challenging. To establish this range in the Nové Mlýny reservoirs area of the Southern Moravia region of the Czech Republic, 56 reference samples were collected. This included 15 surface water samples, 15 homogenised plant samples, 12 tooth enamel and 1 dentine and bone sample of archaeofauna, 6 snail shells and 6 human bones. The measured $87\text{Sr}/86\text{Sr}$ ratios revealed a major influence of exogenic strontium on the local waterscape, further increased by the changes to the waterscape introduced during the 20th century. Influence of this strontium, carried by the Jihlava river, was also detected in other sample libraries. The presented results demonstrate that a proper care in selection of the reference samples is needed to allow for an understanding of the prevailing conditions in the BASr and to ensure a reliable BASr range estimation.

576 UNVEILING USE-WEAR DEVELOPMENT ON GROUND STONE TOOLS: A DIGITAL APPROACH

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Sorrentino, Giusi (University of Turin; Department of Environmental Sciences, Informatics and Statistics - Ca' Foscari University of Venice) - Remondino, Fabio (3D Optical Metrology Unit, Bruno Kessler Foundation (FBK)) - Paggi, Marco (IMT School for Advanced Studies Lucca) - Longo, Laura (Department of Environmental Sciences, Informatics and Statistics - Ca' Foscari University of Venice) - Borghi, Alessandro (University of Turin) - Re, Alessandro (University of Turin) - Lo Giudice, Alessandro (University of Turin) - Menna, Fabio (3D Optical Metrology Unit, Bruno Kessler Foundation (FBK))

Abstract format: Poster

The digital reproduction of archaeological materials has experienced significant growth in recent decades, owing to the increased accessibility of digitization tools in terms of both user capacity and cost-effectiveness. While there has been a proliferation of 3D replicas of artifacts with cultural and historical significance, the field of "digital archaeology" has primarily focused on information and communication, often overlooking the full analytical potential of the various methods available for digitalizing archaeological evidence. Scientific applications aimed at addressing research questions have been somewhat constrained, in part due to the inherent nature of these tools, which emphasize immediate communication capabilities.

Employing photogrammetric techniques and digitization processes to analyse the surfaces of ground stone tools offers valuable insights into the tribological mechanisms underneath the damage pattern development and support the quantification of wear formation. In our investigation, we developed an analytical protocol using slabs and pebbles to replicate observed use-wear traces on Upper Palaeolithic tools. Testing various photogrammetric acquisition setups and processing methodologies, we assessed alterations in lithic tool geometry and surface depletion after their experimental use. By exploring diverse acquisition strategies, we conducted a thorough evaluation of potential biases in data collection and analysis, adapting our methodology to enhance the reliability of our output. As a result, we devised and implemented a purpose-designed setup to ensure precise analyses and validate robust interpretations.

577 ARCHAEOLOGICAL RESEARCH IN LITHUANIAN MANORS. THE CASE OF THE ŠIAULIAI MANOR

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Ostasenkoviene, Virginija (Klaipeda University Institute of Baltic Region History and Archaeology; Daugvyne Cultural History Museum-Reserve)

Abstract format: Poster

Lithuania's manors are a very important historical and heritage area. More than 3000 surviving manors and their remains were counted, but only about 600 manors are currently protected. The perception of manor complexes as the objects of archaeological investigations has appeared in Lithuanian archaeology science only recently. The archaeological investigation of Lithuanian manors has steadily intensified during recent decades. During 1990-2022, more than 170 manors were investigated, but the nature and extent of their research are very different. Nevertheless, more than half a hundred of the manors have been investigated in more detail (Anykščiai, Dubingiai, Kelmė, Kretinga, Kurtuvėnai, Mantagailiškis, Plungė, Rietavas, Rokiškis, Šiauliai, etc.). On the basis of new and valuable data collected during archaeological investigations, it is possible to make judgments about the structure, material culture, lifestyle and economy at only the better investigated manor complexes. One of them is Šiauliai Manor complex in Northern Lithuania. Its history is connected with the Šiauliai Crown Estate, which were founded in 1589 and were meant to maintain the personal manor of the ruler. During 2010-2022, a total area of 533 m² was excavated in Šiauliai Manor, more than 8,000 16th-18th century every-day finds (coins, sherds of pottery, stove tiles, glass artefacts, roof tiles, etc.) and abundant zooarchaeological material were collected. The most interesting and valuable finds are the remains of 11 archaeological structures - outbuildings and remains of dwellings with stone foundations, and the remains of stoves. Archaeological research shows that in the 16th-18th centuries, residential and commercial buildings were built in the northeastern part of the Šiauliai manor. Both historical and archaeological studies show that in the 19th century the buildings of the manor are moved to the south-western side of the manor.

578 WRITTEN IN THE TEETH: INSIGHTS INTO ENVIRONMENTAL AND SOCIAL DYNAMICS IN PONTECAGNANO (CAMPANIA, ITALY, 7TH-6TH CENTURY BCE) THROUGH DENTAL HISTOMORPHOMETRY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Germano, Roberto (Department of Environmental Biology, Sapienza University of Rome, Rome, Italy) - Higgins, Owen (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome, Rome, Italy; Department of Cultural Heritage, University of Bologna, Ravenna, Italy) - Galbusera, Alessia (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome, Rome, Italy) - Esposito, Carmen (Department of Cultural Heritage, University of Bologna, Ravenna, Italy) - Bondioli, Luca (Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music, University of Padua, Italy) - Pellegrino, Carmine (Department of Cultural Heritage Sciences, University of Salerno, Salerno, Italy) - Sperduti, Alessandra (Bioarchaeology Service, Museum of Civilizations, Rome, Italy; Asia Africa and Mediterranean Department, University "L'Orientale" of Naples, Italy) - Manzi, Giorgio (Department of Environmental Biology, Sapienza University of Rome, Rome, Italy) - Nava, Alessia (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome, Rome, Italy)

Abstract format: Poster

Histomorphometric analysis of dental crowns allows the study of non-specific physiological stress, observable as Accentuated Lines (ALs) in enamel thin sections, with almost daily precision. This approach, when applied to ancient human populations, allows for the correlation of stress prevalence with environmental and subsistence factors, also in terms of diet and health.

This study aims to investigate the prevalence of ALs in a sample of 33 permanent teeth (canines, first and second molars) of 11 adult individuals from the Iron Age necropolis of Pontecagnano (7th-6th century BCE, Campania, Italy) and perform a quasi-longitudinal analysis of non-fatal stress prevalence during the first 6-7 years of each individual's life. All teeth were thin-sectioned and assessed for individual chronologies of ALs across dental series by matching similar ALs intervals.

All teeth show a significant number of ALs. The distribution of stresses increases after the sixth month of life, potentially in relation to the initial phases of weaning, and is then unevenly distributed throughout the following years. The analysis of each tooth class demonstrates a differential recording of stresses within the crowns, with the cervical parts showing less sensitivity to stress recording.

This study offers a contribution to the field of human ecology by enhancing our understanding of the interactions between past communities and their environment and social contexts, providing a detailed image of infancy and development in individuals who survived into adulthood, ultimately overcoming the limitations presented by the Os-teological Paradox and the constraints inherent in inferring general aspects on infancy from individuals who did not survive this early life stage.

580 TRANSHUMANCE AND TRANSFORMATION: THE ENVIRONMENTAL IMPACT OF THE TRANSHUMANCE SYSTEM IN SVARFAÐARDALUR, NORTH ICELAND

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Thorlacius, Snædís (University of Iceland) - Erlendsson, Egill (University of Iceland) - Hreiðarsdóttir, Elín (The Institute of Archaeology of Iceland) - Möckel, Susanne (University of Iceland) - Júlíusson, Árni (University of Iceland)

Abstract format: Poster

For over a millennium, a transhumance system was practised in Iceland where herders brought livestock to shielings for grazing over the summertime. The shielings were usually located in higher elevation and/or further inland and the animals were brought there to spare the hayfields in vicinity to the farms in the lowlands and by the coast. This system has only been researched superficially and its environmental impact on land and ecosystems has not been investigated in any depth. In this research, two shieling sites in Svarfaðardalur, N-Iceland, serve as case studies for an environmental study using palynology, sedimentology and tephrochronology to reconstruct the past environments of the shieling sites and their surroundings. The research is aided by data from archaeological and historical investigations regarding the shielings in question, and their associated farmsteads. Some of the questions we aim to answer are when the shieling sites were established and abandoned, how they operated, if there was continuity in their operation and how the grazing impacted the environment. Peat cores were retrieved from the vicinity of the shieling sites, which yielded palaeoenvironmental data spanning from early modern times back to before human arrival in Iceland in the late 9th century AD. Environmental proxies for the presence of humans and domestic animals, in association with dated tephra layers, are used to estimate the timing of the beginning and end of intensive grazing. Differences and similarities in the environmental, historical and archaeological data between the two sites will be discussed and possible explanations presented.

581 UPDATES ON THE FAUNAL ASSEMBLAGE OF VIA SAN FRANCESCO, SANREMO

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Silvestrini, Sara (Department of Cultural Heritage, University of Bologna, Italy) - Marciani, Giulia (Department of Cultural Heritage, University of Bologna, Italy) - Arrighi, Simona (Department of Cultural Heritage, University of Bologna, Italy) - Armadori, Elena (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia, Modena, Italy) - Lugli, Federico (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia, Modena, Italy; Institut für Geowissenschaften, Goethe-Universität Frankfurt, Frankfurt Am Main, Germany) - Harvati, Katerina (Institute for Archaeological Sciences and Senckenberg Center for Human Evolution and Paleoenvironment University of Tübingen, Germany; DFG Center for Advanced Studies 'Words, Bones, Genes, Tools', University of Tübingen, Germany) - Negrino, Fabio (Dipartimento di Antichità, Filosofia, Storia, University of Genoa, Italy) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna, Italy)

Abstract format: Poster

The site of Via San Francesco was discovered in 1960 in the heart of the town of Sanremo (Liguria, Italy) during the construction of a new building. Located at the base of the Flysch Unit outcrops near the present seashore, the site was discovered through a stratigraphic test trench conducted during a rescue excavation. This trench exposed a singular occupation layer containing a significant number of lithic artifacts and faunal remains. The initial dating of the site referred to MIS 6 and has recently been validated by a new OSL dating, currently being published. Our reanalysis of the site remains took into account previous studies, incorporating further insights into the faunal assemblage, climatic and environmental reconstructions, and animal exploitation. The faunal assemblage is predominantly characterized by *Cervus elaphus*, in line with the faunal spectrum of other Ligurian sites. However, unlike other sites in the area, no carnivores are attested. The low species diversity suggests a hunting strategy focused on a single species (*Cervus elaphus*) and, consequently, a narrow diet. Carcass transportation data suggests that Neanderthals selectively transported specific parts of the skeleton, such as appendicular elements. Additionally, the presence of numerous

fresh fractures and butchering marks on long bones provides evidence of Neanderthal exploitation of this animal to recover and consume marrow. Both bulk and sequential oxygen ($\delta^{18}\text{O}$) and carbon ($\delta^{13}\text{C}$) stable isotope analyses on the carbonate moiety of enamel hydroxylapatite of different species are currently underway by IRMS. The aim is to better constrain the paleoecology of the animals and the local environment. Preliminary results suggest no significant seasonal climatic fluctuations in an open forest environment.

582 A COMPARISON OF THE TRANSITION AND SPREAD OF AGRICULTURE TO JAPAN WITH OTHER PARTS OF EASTERN AND FAR WESTERN EURASIA

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Stevens, Chris (McDonald Institute, University of Cambridge) - Crema, Enrico (McDonald Institute, University of Cambridge)

Abstract format: Poster

The spread of agriculture marks a major shift in subsistence, laying the foundations of ensuing societies across Eurasia. This poster compares Japan with the British Isles, representing the eastern and northwestern extremes respectively, of Eurasian agricultural diffusion. We examine the stability and robustness of subsistence systems in early agricultural societies, through evidence for diversity (the use of wild foods), the establishment of storage, and evidence for exchange systems.

The 4th millennium BCE spread of millet agriculture into eastern Eurasia, with a single animal domesticate, saw a strong reliance on wild foods, supporting only low levels of demographic growth, which were too small to carry millet agriculture to Japan. The subsequent spread of rice agriculturalists into Korea and across Japan, in the 2nd to 1st millennium BCE was rapid by comparison, and can be related to the higher carry capacity of rice farming over millet farming. As with millet farming in Korea, the initial millennium of rice farming in Japan saw a high reliance on wild foods until the early to mid-1st millennium AD. It is argued that the absorption of pre-existing Jomon peoples helped sustain early rice farming populations, but that Jomon communities themselves never adopted rice cultivation.

A similar situation is seen for early agricultural societies in western Eurasian, where the spread of agriculture, supported by aDNA evidence, was through demic-diffusion not adoption. As with eastern Eurasian initial agricultural subsistence had a strong reliance on wild foods, with delayed dispersal into parts of West and Northwest Europe. For much of the British Isles, reliance on cereal agriculture relative declined in the 4th millennium BCE to the point that cereal agriculture was likely abandoned. It is not until the Early-Middle Bronze Age, that cereal agriculture became fully established, when more established storage facilities, and field systems are evident.

584 VIRTUAL RECONSTRUCTION FOR EDUCATION: THE IBERIAN SITE OF CUEVA DE LA LOBERA (CASTELLAR, JAÉN, SPAIN)

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Sánchez, Alberto (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Cubero, Inmaculada (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Segura, Rafael (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Rueda, Jesús (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Ogáyar, Carlos (CEATIC, University of Jaén, Spain) - Rueda, Carmen (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Rísquez, Carmen (University Research Institute for Iberian Archaeology, University of Jaén, Spain) - Fuertes, José (University Research Institute for Iberian Archaeology, University of Jaén, Spain)

Abstract format: Poster

The rapid advancement of new technologies alongside the refinement of 3D modeling tools, sourced from data captured through environmental digitization devices like photogrammetry, structured light scanners, or LIDAR technologies (utilizing ALS or MMS), has notably broadened access to Virtual Reality (VR) infrastructures. This progression, coupled with the emergence of sophisticated 3D modeling software, has significantly bridged the gap between VR infrastructures and society at large.

The University Research Institute for Iberian Archaeology (IUIAI) at the University of Jaén (Spain) is deeply immersed in various research endeavours spanning multiple disciplines, all with the overarching aim of acknowledging and comprehending the significance of Iberian history through an interdisciplinary lens. Within the confines of the IUIAI's Computational Archaeology Laboratory, exploration into VR devices has paved the way for the meticulous reconstruction and immersive simulation of Iberian landscapes, serving to streamline their dissemination and enhance understanding.

This work is developed in the context of the European project 5DCulture (Deploying and demonstrating a 3D cultural heritage space), which aims, among other objectives, to highlight the usefulness and applicability of VR technologies in the digitization of archaeological heritage and its subsequent use in various educational contexts.

An innovative serious game, grounded in VR technology, has been meticulously crafted to showcase the 3D reconstruction of the Iberian sanctuary nestled within La Lobera cave (Castellar, Jaén, Spain). This location was handpicked due to its profound archaeological significance and for being a constant reference for education about the heritage and culture of the Iberians. Through the meticulous construction and museumification of the prototype, the primary objectives are twofold: to underscore the intrinsic value of the site and to catalyse the widespread dissemination of archaeological heritage to a broader audience.

585 POST-MEDIEVAL FUNERARY STRUCTURES IN SOUTHERN ITALY: THE CASE OF THE CHURCH OF SAN PIETRO BARISANO, MATERA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Bruno, Brunella (University of Salento)

Abstract format: Poster

In 1999 the team of Medieval Archaeology of the University of Lecce (now University of Salento) was involved in a restoration project of some churches in the Rione Sassi, the historical centre of Matera, in the southern region of Basilicata.

Excavations in the rupestrian church of San Pietro Barisano revealed the long history of the building. Under the floor of the current eighteenth-century church, archaeological investigations brought to light the burials from the Middle Ages until the mid-19th century.

From the excavation is emerged how the burials of post-medieval period are complex. Due the rise in population, in 15th-16th centuries were built deep rectangular structures divided into sectors by lithic slabs. This typology, the so-called "a caditoio" or "a colatoio", is attested also in other post-medieval cemeteries of Apulia and Lucania.

In Modern Age (18th- mid-19th centuries) were built special crypts for burials, the so-called "strainer rooms", with niches along the walls used to treat the bodies according to a precise and complex funerary ritual. This took place in communicating environments, provided for the double treatment of the body. This particular kind of funerary structures is attested not only in other churches in Matera, but in other regions of Southern Italy. Probably, these funerary crypts were intended for individuals of high status social, families and members of religious institutions.

587 FIELDS OF TRANSFORMATION: THE CASE OF THE FUNERARY FIELD OF KNOSSOS DURING THE LATE MINOAN IIB – IIIA TRANSITION

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Gourgouleti, Eleni (National and Kapodistrian University of Athens)

Abstract format: Poster

The transition towards the Post – Palatial period in Crete, is characterized by successive episodes of destructions, demographic shifts as well as innovations and experimentations on the material culture across the island. Combined with the increasing evidence for the use of Linear B script, they have been all considered indications for the establishment of a new status quo. The only palace surviving after the LM I B period, is the palace of Knossos, although not without deviations from the past. This is why, the question of the "Minoan" or "Mycenaean" origin of the group(s) occupying the palace in its last phase and by extension are buried around it, from early on in the spotlight, continues to divide archaeologists to this day.

Although recent research tends not to equate cultural with population changes, the funerary field of Knossos and especially the changes occurring during the LM IIB – IIIA transition have been systematically employed in favor of either continuity with the past or discontinuity, reigniting the aforementioned question. However, the traditional approaches on change entail interpretational and methodological constraints, since they underestimate the fact that both the terms "Minoan" and "Mycenaean" are modern conventions that are not directly reflected on burials and that their uncritical reproduction leads the research rather to a dead-end.

Consequently, there lies the need for the search of an alternative that would explain the dynamic process of change, the factors and conditions that encouraged firstly its emergence and secondly its incorporation to the final palatial modus vivendi of Knossos. For this purpose, this paper proposes a shift to the funerary ritual itself, stemming from theoretical approaches promoting its crucial role in a more fluid and mutually (re-)constructive model of social reproduction.

589 PALEODEMOGRAPHY AND OLDER ADULTS: ANTHROPOLOGICAL SCIENCE AND HISTOLOGY IN THE DIGITAL AGE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Robbins Schug, Gwendolyn (Department of Biology, University of North Carolina Greensboro) - Love, Emma (Department of Biology, University of North Carolina Greensboro) - Semaan, Michelle (Department of Biology, University of North Carolina Greensboro) - Williams, Kimberly (Department of Anthropology, Temple University) - Douglas, Khaled (Archaeology Department, Hashemite University) - Al-Jahwari, Nasser (Archaeology Department, Sultan Qaboos University)

Abstract format: Poster

Basic questions remain unanswered about older adults in the past - their representation, lifestyles, and contributions to shaping our evolution. One principal barrier to understanding these questions is inaccurate, imprecise age estimation methods for older adult skeletons (50+). Cementum annulations are the only chronometric measure of age, with 98% accuracy and +/- 2 years precision even in older age groups, whose morphological and chronological ages can differ by decades. However, this method is not widely adopted because of perceived difficulty in preparing sections and counting the annulations. Digital approaches to dental histology have the potential to improve the accessibility of this method for archaeologists. Serial sections were prepared for a sample of 10 human teeth from the commingled, fragmentary mortuary context at Dahwa, in Bronze Age Oman (c. 4200-4000 BP). We assessed intra and inter-observer error in counts of cementum annulations using anthroposcopic observations in polarized Light Microscopy, semi-quantitative elemental analysis using SEM EDX, and counts of cementum annulations made by training an AI with deep learning algorithms. Results demonstrate challenges and prospects for using SEM EDX and deep learning models to estimate age at death from cementum annulations, a method with potential to enhance the accuracy of paleodemography and improve our ability to detect, represent, and include older adults in archaeological reconstructions of life and death in past populations.

592 THREE-DIMENSIONAL COMPUTER-AIDED VIRTUAL RECONSTRUCTION OF LATE HELLENISTIC KERNOS FROM VODITSA, NORTHEAST BULGARIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Raykovska, Miglena (Institute of Information and Communication Technologies, Bulgarian Academy of Sciences) - Petkova, Kalina (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) - Raykovska, Miryana (Institute of Information and Communication Technologies, Bulgarian Academy of Sciences) - Petkov, Nikolay (Institute of Information and Communication Technologies, Bulgarian Academy of Sciences)

Abstract format: Poster

The graphical reconstruction of partially preserved archaeological artefacts poses considerable challenges for researchers. Efforts to restore these artefacts to their original form may take years and often lead to impasses, particularly in cases where there is a lack of comparable or well-preserved artefacts.

In the present case study, the authors aim is to offer an approach towards a three-dimensional computer-aided virtual reconstruction of a Late Hellenistic kernos, found during the archaeological excavations at the Site 5012-West at Voditsa village, Northeastern Bulgaria.

By its characteristics, the site can be defined as a settlement with dug-in dwellings and their synchronous pits, which cover a large chronological period - from the Late Chalcolithic to the end of the Hellenistic era. Structures from the late 3rd to mid-2nd centuries BC predominate. It was in a pit dated to this chronological period that the vessel discussed here was found.

The authors use a methodology designed to generate a precise digital twin of an uncovered fragment of the vessel, thereby establishing a robust basis for the formulation of objective hypotheses. This methodology incorporates a suite of techniques including micro-computed tomography (Micro-CT), 360-degree photogrammetry, and 3D modelling. Past studies have underscored the potential synergy between computer tomography and photogrammetry, as these methods mutually complement each other in terms of the data they yield.

The sample was scanned with a micro-CT and information about the dimensions and structure of the material was extracted. Porosity analysis was conducted and the results were used in the reconstruction of the artefact. The texture information was gathered through photogrammetric documentation. The resulting data was combined and the final model was transferred to three-dimensional modelling software, where a virtual reconstruction was performed based on similar objects from the same period and tailored to the individual characteristics of the studied artefact.

597 GLASS AND FAIENCE BEADS IN CHILD BURIALS: VITREOUS TECHNOLOGY AND FUNERARY PRACTICES IN MYCENAEAN GREECE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Nikita, Kalliopi (Hellenic Ministry of Culture, Ephorate of Antiquities of East Attica)

Abstract format: Poster

Children in Mycenaean Greece were almost always furnished with jewellery and small beads of various materials, amongst which glass and faience have an outstanding position. The case of vitreous jewellery in child burials is examined in its evolutionary perspective, namely from its earliest occurrence in the Shaft Graves at Mycenae throughout the three phases of the Mycenaean Period. Glass and faience beads in child burials are explored with special emphasis on distinctive assemblages from burials in the Peloponnese, namely the Argolid, Corinthia, Elis, Messenia and Laconia. The range of glass colours and bead forms, the diversity of decorative designs on moulded relief plaques as well as the modes of their stringing and arrangement in association with their burial deposition are presented and discussed. To interpret this burial practice a theoretical approach is followed on the basis of technological and archaeological factors that determine the manufacture and prospective function of vitreous artefacts in Mycenaean society. The study aims to elucidate the role of vitreous jewellery that were offered to children and intended for the ritual of dressing and ornamentation of the dead in conjunction with the distinctive predilection for the use of cobalt and turquoise blue glass by the Mycenaean.

598 BEYOND WORDS: USING BIOCODICOLOGY TO READ BETWEEN THE LINES OF PARCHMENT DOCUMENTS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Sacristán, Luisa (Universidad de los Andes) - Rangel, Guillermo (University of Copenhagen) - Reyes, Alejandro (Universidad de los Andes) - Collins, Matthew (University of Cambridge; University of Copenhagen)

Abstract format: Poster

Parchment, a material made of collagen extracted from animal hides, was the primary writing support for manuscript production in the Middle Ages in Europe. Parchment production methods depend on the geographic region and the era in which it was produced. Researchers have been able to reconstruct human history, and study the culture of civilizations by using the information contained in these ancient documents. The development of Next-Generation Sequencing (NGS) techniques prompted the establishment of a new research field: biocodicology, which involves the study of the biological information found in these manuscripts. In this study, we analyzed and compared the bacterial communities present in 57 parchment manuscripts (dating from the 10th to the 18th century) from archives located in Iceland, England, and Spain. We found that microbiome analysis serves as a predictor of parchment-making methods, as evidenced by the clustering of bacterial communities from manuscripts that had undergone similar production methods. The bacterial communities provided valuable insights into the parchment-making processes, including the use of salt, evidence of manipulation, and distinctions in processing techniques, while also indicating the potential presence of pathogens. Based on the analysis of all processed samples, microbiome analysis holds a promising future for advancing our understanding of parchment characteristics and origins.

600 THE PREHISTORIC SETTLEMENT "DASKA" IN NW PELOPONNESE: DECODING THE ANIMAL BONES IN AN ISOLATED SITE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Argyropoulos, Vassilios (Ephorate of Antiquities of Achaia, Greece) - Papagiannopoulou, Artemis (Museum National d' Histoire Naturelle Paris)

Abstract format: Poster

The unveiling of the prehistoric settlement of Ntaska in the rugged terrain of mountainous Achaia, located on the foot of Mount Erymanthos in the northwestern Peloponnese, stands as a remarkable witness to the region's archaeological narrative. The remote location of this settlement, dating from the late Middle Helladic to the peak of the Late Helladic period, located far from established communication routes, in an isolated gorge, invites us to investigate the motives behind its selection.

The initial archaeological findings, which include pottery and fragments of animal bones, suggest a flourishing community primarily dedicated to animal husbandry.

In particular, comparative, taphonomic and morphometrical analysis techniques were applied on the recorded animal remains. This analysis reveals:

1. A diverse range of identified osteological remains encompassed both young and old animals, as well as different species (Caprinae being the dominant one) pointing towards a substantial production of various animal products.

2. The taphonomic markers and bone location during excavation, along with the fact specific bone parts that were pointed to household waste.

3. Differentiated size of bone fragments indicates either different animal breeds of the same species or wild ones.

4. Specific bone elements suggested that sorting occurred at the slaughter site, followed by the subsequent transport of bones to the settlement.

This approach aims not only to yield information about the dietary patterns of the Ntaska inhabitants, but also to decode the economic dynamics of the settlement, and to reveal its character and significance.

602 LOCAL AND ALLOCHTHONOUS CHERT SUPPLIES IN THREE EARLY NEOLITHIC SETTLEMENTS IN THE MATERA AREA (BASILICATA, SOUTHERN ITALY)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Muntoni, Italo (Soprintendenza ABAP BAT-FG, Ministry of Culture) - Conforti, Jacopo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro", Bari, Italy) - Allegrretta, Ignazio (Dipartimento di Scienze e Tecnologie Biologiche ed Ambientali, Università del Salento, Lecce, Italy) - Delluniversity, Emanuela (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro", Bari, Italy) - Terzano, Roberto (Dipartimento di Scienze del Suolo, della Pianta e degli Alimenti, Università degli Studi di Bari "Aldo Moro", Bari, Italy) - Angeli, Lucia (Dipartimento SAGAS, Università degli studi di Firenze, Firenze, Italy) - Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro", Bari, Italy)

Abstract format: Poster

In the Matera area several evidences of prehistoric human presence since Paleolithic. Numerous settlements, located on the eastern side of Matera, show a frequentation since the Early Neolithic.

In this contribution we focus on the knapped lithic industries from the sites of Giavarra, Murgia Timone and Trasanello as indicators of the chert supply during the Early and Middle Neolithic.

The Giavarra site is located near the SP51 Matera-Gioia del Colle. The excavation context is represented by five sub-circular pits. Based on the typological characteristics of the pottery and the radiometric dating, the site can be framed in an archaic phase of the Early Neolithic Impressed Ware, between the end of the 7th millennium and the beginning of the 6th millennium BCE.

All the 86 Early Neolithic knapped chert artefacts are analyzed.

The settlements of Trasanello and Murgia Timone (Matera, Basilicata) are two ditched villages typical of the Early and Middle Neolithic of the Southern Italy. The Early Neolithic phase of Trasanello (first half of VI millennium cal BC) provided 100 chert artefacts consisting mainly of unretouched and common tools with a low number of cores. As for Murgia Timone only 12 chert artefacts were attributed to the Early Neolithic phase of settlement occupation.

All the samples were investigated underwent nondestructive petrographic and chemical (pXRF) analyses to understand the provenance of raw materials according to NM-PCI protocol.

The chert lithotypes identified show different chert supply patterns in three investigated sites. If at Giavarra we have the prevalent use of cherts from Gargano promontory formations, at Murgia Timone et Trasanello the main component is produced using local secondary chert sources (radiolarite, silicified calcarenites and nodular chert) originated from the outer geological units of the Southern Apennine. These evidences fit well the archaeological hypothesis of occupation strategies of the neolithization of this area.

603 EXPLORING THE SPATIAL-TEMPORAL VARIABILITY OF BIFACIAL POINT TECHNOLOGY IN THE TERMINAL PLEISTOCENE OF NORTHERN JAPAN AND ITS IMPLICATIONS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Takakura, Jun (Archaeological Research Centre, Hokkaido University) - Hashizume, Jun (Niigata Prefectural Museum of History)

Abstract format: Poster

A widespread distribution of the bifacial points, including leaf-shaped and stemmed types, can be seen in the terminal Pleistocene of northern Japan. Many researchers have argued that bifacial point technology characterises the adaptation strategy of the terminal Pleistocene hunter-gatherers in northern Japan. However, no consensus has been established on the emergence and development of bifacial point technology, particularly with regard to the transition of subsistence and hunting weapon technologies. This paper explores the behavioural variability of bifacial point technology in the terminal Pleistocene of northern Japan by focusing on spatial-temporal changes in the manufacturing technology and use of bifacial points. To address this issue, we attempt to reveal the interrelationships between the lithic production technology involving reduction methods and techniques and morphometric features of the bifacial

points indicating projectile weaponry. The results of analysis suggest that significant changes in bifacial point technology occurred at the onset of the Late Glacial period. This may have important implications not only for the technological changes reflected in bifacial point technology but also for the relationships between human behavioural system and environmental change during the terminal Pleistocene.

608 **DOMUM SERVAVIT, LANAM FECIT - WOOLWORKING AND OTHER EVERY DAY OCCUPATIONS OF WOMEN IN ROMAN SALONA BASED ON EPIGRAPHIC EVIDENCE**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Banovac, Ivana (Independent researcher) - Jadrić-Kučan, Ivana (University of Zadar)

Abstract format: Poster

Women in Roman Salona (Dalmatia), just like in other parts of the Roman Empire, engaged in different everyday jobs and occupations in accordance with their social status, opportunities, and necessities. Their primary occupation was their family and household management, within which their duties were determined according to their status. Spinning wool was considered one of the more noble occupations, which was, above all, the task of every Roman matron and respectable woman. Women of the lower classes, in addition to household duties, opted for certain professions, which mainly included traditionally female occupations such as nursing (nutrices), midwifery (obstetrices), and hair-dressing (ornatrices). Besides the matrons, we learn the most about these women from epigraphic monuments, and in most cases they are freedwomen and slaves. Moreover, it was not uncommon for women to engage in occupations dominated by men, such as medicine, education, crafts, commerce, and management. In Salona, women were not only their husbands' co-workers in the workshops and on the estates, but they were also owners and managers. This contribution will focus on those Salonitan women of different social statuses who represent the majority of working women of ancient Roman society, and whose lives, especially those from low-ranking classes, were regularly neglected or even misinterpreted in ancient and contemporary sources. Thanks to the epigraphic evidence that gives us information about these women and their occupations, we can learn more about women's social identities and their important contributions within the city community.

609 **DIGITAL MAPPING TECHNIQUES AND GIS APPLICATIONS FOR SCATTERED MICROLITHIC FRAGMENTS RECORDING AND SPATIAL ANALYSIS: ARCHAEOLOGICAL SURVEY AT ONGASAKI, TSUSHIMA (JAPAN)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Avola, Giuseppe (International Research Institute for Archaeology and Ethnology (IRIAE)) - Ciulla, Irene (International Research Institute for Archaeology and Ethnology (IRIAE)) - Mezzapelle, Diego (International Research Institute for Archaeology and Ethnology (IRIAE))

Abstract format: Poster

Archaeological investigations at the Early Neolithic site of Ongasaki (Tsushima, Japan) are currently conducted as part of the project "Jomon Sea - Navigation in the Origins of Japan", a research initiative conceived and directed by the International Research Institute for Archaeology and Ethnology (IRIAE), funded by the Ministry of Foreign Affairs and International Cooperation of the Italian Republic, in collaboration with the Asian Research Institute for Underwater Archaeology (ARIUA) and the Tokyo University of Marine Science and Technology. Since 2023 the project is focusing on the study of seafaring, maritime networks and fishing economy in Japanese prehistory through advanced methodological and technological approaches. Investigations at Ongasaki aimed to survey with systematic sampling methodology concentrations of scattered obsidian and quartzite microlithic fragments, residuals from the activity of fishing tool production as evidenced from complete artefacts found (mainly harpoons). The panel will discuss the results of applied experimental digital mapping techniques which combined drone georeferenced topographic survey, detailed direct and GPS recording and the use of multiple, interactive GIS softwares (Google Earth, Global Mapper, ArcGIS) to acquire accurate microlithic fragments positioning. Integrating quantitative and material-class featured spatial analysis to recorded microarchaeological data allowed to interpret post-depositional dynamics and intensity of fragments scattering by environmental-based visibility, advancing further hypothesis on the topography of site use. Future investigation goals include the study of site formation processes, changes in lithic tool production and its intensity by diachronic trends.

611 **WALL-FARE. THE EARLIEST CITADELS. WALLED LANDSCAPES, CONFLICT AND SOCIAL CHANGE IN BRONZE AGE SOUTH-EASTERN ITALY**

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Gori, Maja (National Research Council of Italy) - Kaplanis, Panagiotis (National Research Council of Italy) - Magri, Alessandra (National Research Council of Italy) - Perrone, Nicoletta (University of Salento) - Scardozi, Giuseppe (National Research Council of Italy) - Vandelli, Alessandro (University of Salento) - Scarano, Teodoro (University of Salento)

Abstract format: Poster

Along the Adriatic and Ionian coasts of Apulia, numerous multi-phase settlements defended by dry-stone fortifications were established during the Middle Bronze Age (c. 1700 to 1500 BC), making it the most extensively militarised region of the Italian peninsula during that period. It was previously thought that such fortifications spread across Italy from the 17th century BC, with the Protoappennine enceinte at Coppa Nevigata being the oldest known example. However, new data from aerial and terrestrial surveys in Salento suggest an earlier appearance of this phenomenon. The recently launched WALL-Fare project (2024-2025), a joint research between the University of Salento and the CNR, aims to investigate the early appearance of walled enclosures and the formation of a militarised landscape as an earlier marker of settlement hierarchy and increased social conflict. The results of this 2-year project will provide crucial clues to the overall social history of the Mediterranean during the period between the late 3rd and early 2nd millennium BC.

The project takes a multidisciplinary approach. For the first time, legacy data will be integrated into a systematised, open-access GIS-based database. The combination of traditional and innovative remote/proximal sensing techniques, field surveys, non-invasive geo-archaeological prospection, small-scale excavations on 6 sites and a large-scale absolute dating campaign (50 samples) will allow the reconstruction of settlement patterns, hierarchies and catchment areas.

615 **BESIEGING AN ISLAND: AN INTEGRATED APPROACH TO WARFARE IN THE PHOENICIAN-PUNIC SITE OF MOTYA (ST. PANTALEO, TP ITALY)**

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Leprai, Francesco (University of Palermo)

Abstract format: Poster

In the context of battlefield archaeology, the comparison between historical sources and archaeological evidence often highlights aspects that require a systematic archaeo-historiographical process. The Phoenician outpost of Mozia (Italy), the scene of one of the best-known events in the history of ancient warfare, represents a particularly significant case study in this sense. The siege and subsequent destruction of the city by the Syracusan armies in 397 BC have in fact been attested in detail by historical literary sources (Diodorus Siculus, Book XIV), which in this circumstance attribute to the Greeks the use of innovative devices designed specifically for siege warfare. The research of the University of Palermo in the northern sector of the island seems to somehow substantiate this source: extensive destruction contexts associated with some of the main buildings have yielded a repertoire of weapons significant in terms of quantity and typological variety. Through a multidisciplinary approach that integrates GIS spatial analysis, volumetric reconstructions of the deposits and 3D modelling, the first results relating to the distribution of some of the weapons used during the siege and some hypotheses on their trajectories will be presented.

618 **FROM TURKEY REMAINS IN THE EARLY MODERN PERIOD TO THE CULTURAL HERITAGE IN THE CONTINENTAL CROATIA**

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Kolenc, Magdalena (PhD student, Faculty of Veterinary Medicine, University of Zagreb) - Korpes, Kim (PhD student, Faculty of Veterinary Medicine, University of Zagreb) - Trbojević Vukičević, Tajana (Faculty of Veterinary Medicine, University of Zagreb)

Abstract format: Poster

Turkey (Meleagris gallopavo) was first introduced to Europe during the early 16th century and became widely accepted as a protein source, first among nobility and then it spread to all social classes. Historical records document that the turkey was introduced to the Zagorje region around 1523, believed to be a gift from bishop Alessandro Geraldini and first turkey was on menu of Pauline monks in 1561 in Lepoglava, both within northern Croatia. Archaeozoological records from the Castle Čanjevo also support turkey presence in the 16th century in Croatia. In this research, we analysed avian remains from three archaeological sites in Continental Croatia: the nobility castle Stari Grad Milengrad, the Pauline monastery of All Saints in Streza, both built in the 14th century and the prestigious urban block Banski

dvori in Zagreb, established in the 13th century. Avian remains are dated to the 16th century. Turkey remains were isolated and skeletally determined. Age group was determined based on the fusion and porosity of the bones, while the presence of medullary bone determined sex. A total of eight turkey remains were found. Most of the turkey remains were found at castle Stari grad Milengrad, while only one remain was found at the Pauline monastery of All Saints and Banski dvori, respectively. All remains were from adult animals except one immature individual from the castle. Medullary bone was not determined. From the presented data we can conclude that turkey was accepted as a food source in Croatia quickly, especially in the Zagorje where castle Stari grad Milengrad is. It became more popular than already known and used poultry species. Over the centuries, turkey slowly became the regional pride of Zagorje, and the meal prepared with the bird Zagorski puran has been protected as a recognised cultural heritage food.

619 MILLET STABLE ISOTOPES REVEAL THE ADVANCE OF FARMLAND MANAGEMENT PRACTICE IN THE CAPITAL CITY OF THE HAN EMPIRE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Liao, Jingwen (Leiden University) - Allen, Edward (Fudan University) - Henry, Amanda (Leiden University) - Laffoon, Jason (Leiden University) - Li, Ming (Hanyang Mausoleum Museum) - Liu, Daiyun (Shaanxi Provincial Institute of Archaeology) - Sheng, Pengfei (Fudan University)

Abstract format: Poster

The Han Dynasty saw agricultural technology in ancient China advance dramatically. Archaeology has suggested significant intensification in agricultural practices in the prehistoric period, but not in this critical dynastic time frame, nor for Imperial China generally. Here, we analyzed carbon and nitrogen stable isotopes of 35 samples of common millet (*Panicum miliaceum*) and 19 samples of foxtail millet (*Setaria italica*) recovered from four Han Dynasty tombs (Longzaocun, 2002CSX, 2008XJG, and Sanyaocun) and one Late Neolithic settlement site (Ziweitianyuan) in the Guanzhong Basin, Central China. Our results, when compared with the available millet isotope data from the Late Neolithic through Han Dynasty periods, show the long-term trajectory in soil and water conditions in the Guanzhong Basin from about 3625 BC to AD 220. Compared to the previous, the $\delta^{13}C$ values of common and foxtail millets decreased by 2.7‰ and 3.0‰, respectively, while the $\delta^{15}N$ values increased by approximately 8.3‰ and 4.3‰, respectively, in the Han Dynasty capital and surrounding areas. We also find an offset of about 0.8‰ and 1.8‰, respectively, between husks and seeds in the $\delta^{13}C$ and $\delta^{15}N$ values of modern millet crops. In this paper, it is argued that the advance of fertilization and irrigation practices in the Han period are the key causes of the variations in nitrogen and carbon stable isotope values of archaeological millet crops. We suggest that the first major agricultural revolution in early China most likely occurred in the powerful Han Empire.

621 ARCHAEOLOGICAL MISSIONS AS A TOOL FOR THE VALORIZATION AND PROMOTION OF "FORGOTTEN HERITAGE": THE ARMENIAN-ITALIAN MISSION IN ARUCH

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Fausti, Elena (Sapienza Università di Roma) - Galanti, Francesca (Sapienza Università di Roma) - Ferdinandi, Sergio (ISMEO) - Babajanyan, Astghik (IAE NAS RA) - Petrosyan, Artur (IAE NAS RA) - Dan, Roberto (ISMEO) - Vitolo, Priscilla (ISMEO)

Abstract format: Poster

This poster presents the work carried out by the Archaeological Mission of "Aruch e l'incastellamento della Via della Seta" which represents a collaborative project between Armenian and Italian specialists aimed at uncovering and preserving the rich archaeological heritage of Armenia along the Silk Road. Central to this Mission is the excavation of areas with a very high historical and archaeological value that have been forgotten and abandoned, with the active involvement of the local population in the archaeological activities. The Mission also aims to raise awareness and cultural identity as well as to create a deeper sense of belonging among community members, but also to revitalise neglected areas and turn them into symbols of the past heritage and historical relevance of the village of Aruch, a small town in Armenia's Aragatsotn province.

The combined action of community involvement and excavation activities has created a collective effort to preserve the archaeological "treasures" and instilled a newfound appreciation for the region's rich heritage not only in the villagers, but also in the valorization of the archaeological remains for the future generations and the promotion of tourism and economic development of the area.

622 MODELLING THE ORIGIN AND DISPERSAL OF POTTERY IN EARLY HOLOCENE AFRICA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Rotunno, Rocco (McDonald Institute for Archaeological Research, University of Cambridge, United Kingdom; The Archaeological Mission in the Sahara, Dept. of Ancient World Studies, Sapienza University of Rome, Italy) - Crema, Enrico (Dept. of Archaeology, University of Cambridge, United Kingdom)

Abstract format: Poster

Ceramic technology appeared in sub-Saharan Africa and spread towards the central Sahara during the early Holocene, sometime around the end of the 10th and the beginning of the 9th-millennium cal BC, coinciding with a greening trend in the desert zone. The possible origin point(s) of this technology remains, however, open to debate, with different hypotheses claiming single or multiple and independent episodes of innovation.

Here we have compiled an extensive literature-based radiocarbon database of archaeological evidence for pottery across Early Holocene Africa, including the whole central and south Sahara and the Nile Valley, which we used to test three competing hypotheses on the geographical origins of pottery. In particular, we consider a southern Saharan/Sahelian origin, a Nile Valley origin, and a dual-origin theory. We formally compare the three hypotheses by developing a custom Bayesian statistical model based on spatiotemporal diffusion curves fitted on dated contexts with the presence/absence of ceramics.

623 DOCUMENTING TRADITIONAL ECOLOGICAL KNOWLEDGE FOR MITIGATING CLIMATE AND ENVIRONMENTAL CHANGE: PRESENTING AN EMERGING INITIATIVE

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Rose, Thomas (Deutsches Bergbau-Museum Bochum) - Lerski, Martha (Leonard Lief Library, Lehman College|CUNY, Bronx, NY, USA) - Mwale, Frank (KEYS Organization, Kapyanga Village, Malawi)

Abstract format: Poster

The climate and environment are constantly changing and constantly require mankind to adapt. The most sustainable mitigation strategies are often conserved in traditional knowledge which is deep-rooted in the cultural context of the local communities. The strategies do not require the use of modern technologies or materials, are often easy to implement by means of local resources, and were tested and refined over time. Nevertheless, nowadays, they often fail due to the unprecedented speed of man-made climate and environmental change. In addition, traditional knowledge that has not already been lost due to displacement or political and economic suppression is now at risk of getting lost because of disinterest among the younger generation or the adoption of western ways of life.

This initiative aims to preserve this traditional knowledge in a digital infrastructure. In addition to documenting this immaterial cultural heritage, it will be made available to other communities to help them find new strategies for mitigating climate and environmental changes. During all steps, the owners of the traditional knowledge will keep full control over their knowledge, to whom, and under which conditions it will be shared as per local safeguarding policies.

For our pilot study, we have partnered with the KEYS organization in Malawi, who has agreed to grant us access to their knowledge, valued cultural elements, and further provide in-country research cooperation. However, limited funding and time are hampering our progress. With this poster, we, therefore, reach out to colleagues and interested persons by presenting our approach and seeking support to further advance this initiative.

624 MOVING IN THE LOWER TRENT BASIN: ANALYSING THE DIFFERENT INTERACTIONS BETWEEN HUMANS AND LITHIC RAW MATERIALS DURING THE MESOLITHIC PERIOD

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Zhang, Ziliang (Department of Archaeology, University of York)

Abstract format: Poster

There are abundant Mesolithic remains and several renowned Mesolithic sites in the lower Trent basin, England. A few famous sites are often selected to establish the behaviour patterns and the interaction model between people and landscapes. However, scholars lack a systematic analysis of other Mesolithic locations in the area. Additionally, past Mesolithic studies in this region have not included landscape archaeological studies at the basin level. This study aims to analyse the interaction between people and lithic raw materials based on information from 579 Mesolithic locations. A database of Mesolithic locations is established. The data are sourced from the local archaeological databases of nine counties. The effectiveness of the database is evaluated based on the positions and the types of archaeological interventions recorded. Subsequently, the distribution patterns of these locations, including period, function types, number, and lithology of remains contained within these locations, are analysed. Finally, this study reconstructs the interaction between local people and raw materials during the Mesolithic period in the lower Trent basin, alongside the behavioural patterns of sourcing raw materials. The maximum sourcing range and the least-cost path, established

based on the least-cost method, generate new insights into the interaction between people and raw materials. A possible "relay station" model for long-distance sourcing is proposed and discussed.

625 AMINO ACID $\delta^{15}\text{N}$ PATTERN CAN ENHANCE THE PALEODIETARY RECONSTRUCTION OF A MARINE-BASED NEOLITHIC POPULATION IN KOREA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Yun, Hee Young (Hanyang University) - Choy, Kyungcheol (Hanyang University)

Abstract format: Poster

Recent studies show that there have been increasing evidences from $\delta^{15}\text{N}$ values of amino acids (AAs) in bone collagen to refine dietary patterns of past populations from archaeological sites, using amino acid $\delta^{15}\text{N}$ values of diverse food sources (cereals, terrestrial animals, and marine animals). This compound specific stable isotope analysis (CSIA) approach has assumed that there are (i) the consistent ^{15}N -enrichment patterns between human collagen and dietary sources, and (ii) the robust $\delta^{15}\text{N}$ difference of two AAs such as glutamic acid and phenylalanine ($\delta^{15}\text{NGlu-Phe}$). However, it is not tested how $\delta^{15}\text{N}$ values of AAs in bone collagen are consistent within different food sources (cereals, terrestrial animals, marine animals). In order to estimate the contribution of animal proteins in human diets more accurately, we selected human and faunal bones from the Neolithic sites in Korea. Our AA results from Neolithic sites in Korea show that most $\delta^{15}\text{NGlu-Phe}$ values were lower in terrestrial animals (i.e. livestock) than marine animals (i.e. fish and marine mammals). This is potentially due to the different nitrogen sources at the trophic base of terrestrial and marine environments. Moreover, $\delta^{15}\text{NGlu-Phe}$ values in terrestrial animals showed significant increase with trophic levels (based on ecological niche). However, the increase of $\delta^{15}\text{NGlu-Phe}$ pattern associated with the trophic levels was not detected in marine animals. Rather, $\delta^{15}\text{NGlu-Phe}$ patterns in marine mammals was lower than these in marine fish. This discrepancy in TP estimates between terrestrial and marine animals might be related to distinct nitrogen excretion modes in marine animals that can influence AA $\delta^{15}\text{N}$ values, such as Glu and Pro. These findings could provide more enhanced dietary reconstruction of prehistoric populations who has mainly marine-based diets.

626 PROSPECTING FOR EARTH RINGS ON WURUNDJERI WOIWURRUNG COUNTRY, SOUTHEASTERN AUSTRALIA, USING AIRBORNE LIDAR

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Kurpiel, Rebekah (La Trobe University) - Rachcoff, Jamie (La Trobe University) - Meredith-Williams, Matthew (La Trobe University) - Spry, Caroline (Wurundjeri Woi Wurrung Cultural Heritage Aboriginal Corporation; La Trobe University) - Jones, Ron (Wurundjeri Woi Wurrung Cultural Heritage Aboriginal Corporation) - Mullins, Bobby (Wurundjeri Woi Wurrung Cultural Heritage Aboriginal Corporation) - Wandin, Allan (Wurundjeri Woi Wurrung Cultural Heritage Aboriginal Corporation)

Abstract format: Poster

The investigation of sacred, ritual and ceremonial sites and landscapes is essential to our understanding of the human social past. Moreover, the need to identify and conserve these places and their broader cultural landscapes is critical in increasingly urbanised and developed environments. On Wurundjeri Woiwurrung Country, current knowledge about ceremonial earth ring features is centred on the archaeological evidence from five earth rings situated in Sunbury, southeastern Australia. This study investigates the potential for identifying similar earth rings elsewhere on Wurundjeri Country through an archaeological remote sensing approach. In a first for Australian archaeology, visual prospection of high-resolution airborne LiDAR processed with the Visualization for Archaeological Topography relief visualisation technique developed by Kokalj and Somrak (2019) identifies 28 potential earth ring features on Wurundjeri Country, including eight features considered highly likely to be of Aboriginal cultural origin. These potential earth rings share similar characteristics to previously recorded earth rings, including a characteristic cleared centre with raised edges. The identified features are present in four geographic regions: (1) Springfield, Lancefield and Goldie; (2) Sunbury, Gisborne South and Clarkefield; (3) Wallan, Whittlesea; and (4) Seville and Launching Place. The broad distribution of identified features across Wurundjeri Country highlights the imperative to consider earth rings, and any Aboriginal cultural heritage places, as components of a cultural landscape synonymous with the concept of Country. Clearly, heritage and planning laws must better respond to the pressures of urban development on Aboriginal cultural landscapes, and ensure they are recognised and protected into the future.

627 COMPREHENSIVE DATA COLLECTION METHODS OF THE PAINTED TEMPLE'S COMMINGLED HUMAN REMAINS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Murphy, Kara (Ministry of Culture: Peru)

Abstract format: Poster

Pachacamac was one of the primary and most respected oracles of the pre-Hispanic central coast. Located in the region of Lima, Peru, it has a history of more than a thousand years of continuous occupation. During 2017-2019, excavations were conducted on the north frontier of the Painted Temple (900 AD - 1533 AD) as part of the Research and Conservation Program of the Pachacamac Sanctuary 2015-2016. A large accumulation of commingled human remains was recovered, historically disturbed by looting and architectural destruction. Part of this debris covered an area of the Uhle cemetery, where teams were able to identify and record a series of disturbed bundles, 10 bone conglomerates, and bone fragments associated with Late Horizon (1470-1533 AD) cultural material.

We present here the data collection documenting and coding methods from a context of mixed and fragmented skeletal remains. We have been able to identify approximately more than 50 individuals through the use of accessible materials, standardized variables, and anatomy guides, which allowed us to assign a life history, as well as assess MNI, pathologies, and age at death. The goal of using these methods is to maintain context integrity, avoid bone damage, and digitize complete and accurate demographic data for future collection studies. The methods used in this commingled sample could serve as a model for other cases of studies that present considerable mixing and fragmentation of skeletal remains, taking into account the limitations of time and resources.

629 STRONTIUM ISOTOPE ANALYSIS OF THE 4TH CENTURY HORSE BONES RECOVERED AT A DAESEONG-DONG ROYAL TOMB OF GAYA CONFEDERATION IN KOREA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Hong, Jong Ha (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea) - Ko, Young Min (Daegu National Museum, Daegu, South Korea) - Yi, Yang Su (Cheongju National Museum, Cheongju, South Korea) - Go, Ala (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea) - Ko, Eun Byul (Department of Archaeology and Art History, Seoul National University, Seoul, South Korea) - Kang, In Uk (Institute of Korean Archaeology and Ancient History, Kyung Hee University, Seoul, Republic of Korea) - Shin, Dong Hoon (Department of Anatomy and Cell Biology, Seoul National University College of Medicine, Seoul, South Korea)

Abstract format: Poster

During the late 4th century CE, the situation on the Korean Peninsula was in a state of flux. Cavalry tactics in warfare, for example, were actively adopted, and the horse-riding tradition was transmitted to Japan, along with other aspects of culture and practice. The two horse tooth fragments found in Daeseong-dong tombs dating to the 4th century Gaya Confederacy, therefore, can be of great significance to animal archaeology. In gross-morphological and ancient DNA (aDNA) analyses, we confirmed that the teeth from Tomb #1 were of a horse. To determine the breeding pattern for horses in the 4th century Gaya Confederacy, we subjected the teeth to strontium isotope ($^{87}\text{Sr}/^{86}\text{Sr}$) analysis. The $^{87}\text{Sr}/^{86}\text{Sr}$ values were 0.710083 ± 0.000018 (KH-30) and 0.710263 ± 0.000018 (KH-34), respectively, and are mostly in close agreement with the herbaceous plant $^{87}\text{Sr}/^{86}\text{Sr}$ values representative of the southeastern part of the Korean Peninsula where the Gaya Confederacy and, later, the Silla Kingdom gained the ascendancy. We speculate that it was probably only after Korea was unified by the latter that horse breeding was deployed to the entire Peninsula by the central government. This work was supported by the Ministry of Education of the Republic of Korea and the National Research Foundation of Korea [NRF-2019S1A5C2A01083578]

630 THE SOUND OF THE RATTLE. FROM ARCHAEOLOGICAL FIND TO ARCHAEOLOGICAL EXPERIMENT AND BACK

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Vinazza, Manca (Department of Archaeology, University of Ljubljana) - Korat, Lidija (Slovenian National Building and Civil Engineering Institute) - Korošec, Paola (Sculptor) - Perovšek, Boštjan (Musician, composer)

Abstract format: Poster

In Slovenia, ceramic rattles were discovered by Karl Dežman during the excavation of one of the most renowned pile dwellings in Ig. These rattles represents some of the oldest musical instruments found in Slovenia.

The rattles were discovered intact, presenting a challenge for archaeological research due to the concealed interior. Consequently, a micro-CT scan was employed to visualize the inner structure and the ceramic beads responsible for producing the distinctive sound.

To comprehend the functionality of the rattle and replicate its sound, an archaeological experiment was conducted. This experiment involved recreating the rattle using the same manufacturing techniques employed in its original production, from clay collection to firing in a replica kiln. Subsequently, the final step involved reproducing the sound and comparing it with the original. Maintaining fidelity to ancient production techniques was crucial for accurately recreating the sound, which was recorded by bioacoustic musicians both in studio settings and within the reconstruction of the pile dwelling.

This study unveils both the technological and musicological aspects of the instrument from the Copper Age.

631 **ARCHAEOACOUSTICS AND NEW TECHNOLOGIES: THE CASE OF GROTTA PAGLICCI (APULIA - SOUTHERN ITALY)**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Crezzini, Jacopo (Department of Biology - Laboratory of Anthropology, Molecular Anthropology/Paleogenetics Unit - University of Florence, via del Proconsolo 12, 50122, Firenze, IT; Department of Physical Science, Earth and Environment - Research Unit of Prehistory and Anthropology - University of Siena, Italy, Strada Laterina 8, 53100 Siena, IT) - Picciolo, Francesco (Department of Physical Science, Earth and Environment - University of Siena, 53100 Siena, IT; Health Service of Tuscany, South-East Tuscany Health Unit, 53100 Siena, IT) - Salvini, Riccardo (Department of Physical Sciences, Earth and Environment and Centre of Geotechnologies, Via Vetri Vecchi 34, 52027 San Giovanni Valdarno (Arezzo), IT) - Ronchitelli, Annamaria (Department of Physical Science, Earth and Environment - Research Unit of Prehistory and Anthropology - University of Siena, Italy, Strada Laterina 8, 53100 Siena, IT) - Ricci, Stefano (Department of Physical Science, Earth and Environment - Research Unit of Prehistory and Anthropology - University of Siena, Italy, Strada Laterina 8, 53100 Siena, IT) - Boschini, Francesco (Department of Physical Science, Earth and Environment - Research Unit of Prehistory and Anthropology - University of Siena, Italy, Strada Laterina 8, 53100 Siena, IT) - Bogi, Andrea (Health Service of Tuscany, South-East Tuscany Health Unit, 53100 Siena, IT) - Mariotti, Emilio (Department of Physical Science, Earth and Environment - Section of Physics - University of Siena, 53100 Siena, IT) - Armelloni, Enrico (AIDA a University of Parma - Department of engineering and architecture, Parma, IT.) - Farina, Adriano (E-MUSE SRLS, via Vito Salmi 3, 43123, Parma, IT)

Abstract format: Poster

We present an analytical approach and a methodological protocol for the modeling of the acoustic parameters of cave sites with evidence of symbolic activities by prehistoric human. The investigated cave is Grotta Paglicci located on the western slope of the Gargano promontory (Apulia, southern Italy). In addition to a rich and thick stratigraphical sequence (it spans from Aurignacian to late Epigravettian) the site is remarkable for the found of some portable art objects and for the presence of wall paintings in an internal room of the cave. The paintings include two horses and a series of "positive" and "negative" depictions of hands. We realized an editable 3D model of the whole cave created using SLAM-based LiDAR technology that combines two methods: LiDAR (Light Detection and Ranging) and SLAM (Simultaneous Localization and Mapping). The 3D point cloud produced was then processed to build the textured model of the cave in mesh format that is the starting point for an acoustic reconstruction effort. Then we applied on the 3D model an acoustic CAD that permitted to capture cave's acoustic properties facilitating comprehensive analysis and interpretation. Furthermore auralization, the synthesis of sound inside the cave, enables to perceive and study the auditory ambiance of Grotta Paglicci. This acoustic dimension adds a new layer of understanding to the reconstructed environment on the acoustic dynamics and potential uses of the cave by the palaeolithic hunter-gatherers. At this regard, the editable 3D model permitted to reconstruct the layout of the investigated spaces during the period when human activities occurred, allowing the collecting of more reliable data. Moreover, the adoption of this method could be useful to reduce the accesses to these peculiar areas ensuring a better preservation of the archaeological records.

633 **A PRELIMINARY ARCHAEOBOTANICAL STUDY OF CHARRED REMAINS FROM THE ARCHAEOLOGICAL SITE OF TELL ES-SULTAN (JERICHO, PALESTINE)**

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Armenio, Cecilia (Department of Science of Antiquities, Sapienza University of Rome, Rome, Italy; Department of Environmental Biology, Sapienza University of Rome, Rome, Italy) - Nigro, Lorenzo (Department of Oriental Studies, Sapienza University of Rome, Rome, Italy) - Sadori, Laura (Department of Environmental Biology, Sapienza University of Rome, Rome, Italy) - Moricca, Claudia (Department of Environmental Biology, Sapienza University of Rome, Rome, Italy)

Abstract format: Poster

The present work concerns the study of charred botanical (seeds/fruits and wood) finds from the site of Tell es-Sultan, the ancient city of Jericho, considered as one of the most significant archaeological sites for the study of South Levantine cultures. The macro-remains were retrieved from layers datable between the Early Bronze Age (EBA) and the Middle Bronze Age (MBA) (3000-1650 BC), collected during the 2019-2023 excavation seasons carried out by Sapienza University of Rome and the Palestinian MoTA-DACH. The aim of this study is to investigate the use of plants by one of the first agricultural urban communities and how this allowed the development of Jericho as an urban center from the 3rd millennium BC. In fact, the favorable past environmental conditions of this area allowed a great economic revolution through agriculture, leading to technological and social developments. This research, therefore, aims to answer questions concerning the exploitation of the environmental resources in Jericho during the Bronze Age, focusing on the cultivation practices and agricultural products. Preliminary results show that *Hordeum vulgare* L. (barley) and taxa belonging to the genus *Triticum* are the most abundant, mostly collected from Middle and Early Bronze Age residential and palatial areas. The high concentration of cereals was expected: they were one of the main sources of food, even before their domestication, and among the first crops intensively and systematically cultivated to increase their production, which is the basis of agriculture. Remains of pulses and fruit plants were also found, allowing to hypothesize a richer diet and a more varied agriculture. Charcoals, instead, provide information about the past arboreal vegetation of the area and the exploitation of local resources, such as *Acacia* sp. (*acacia*) and *Populus* sp. (*poplar*).

635 **ADAPTATION AND RESILIENCE: SUSTAINABLE SUBSISTENCE STRATEGIES IN VOLCANIC CAPPADOCIA THROUGH ETHNOGRAPHIC PERSPECTIVE**

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Falay, Burak (Tekirdağ Namık Kemal University)

Abstract format: Poster

The communities of the Melendiz region (Nigde province), bordering Turkey's Volcanic Cappadocia, have developed a livelihood strategy combining animal husbandry and limited agricultural activities in a challenging mountainous geography. This strategy supports a sustainable food production system by utilizing seasonal grazing areas and following migration routes that match the feeding rhythm of the herds. These traditional practices are important for understanding how local communities adapt to environmental conditions and their contribution to sustainability. This study focuses on key concepts such as climate, resilience and sustainable livelihood strategies. Through the combination of historical records and interviews with local people, the research highlights the role of cultural practices and socio-economic systems of Melendiz region communities in their adaptation to environmental conditions. From this point of view, the study transcends the mere documentation of traditional lifestyles within a region; it proposes general principles and practices on how sustainable living can be encouraged on a global scale.

637 **EARLY CERAMIC TECHNOLOGIES AND TRADITIONS IN THE EDMOM LOWLANDS REGION OF SOUTHERN JORDAN FROM A DIACHRONIC PERSPECTIVE**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Carrion Anaya, Sara (UCL Institute of Archaeology, London UK) - Quinn, Patrick (UCL Institute of Archaeology, London UK) - Burton, Margie (UC San Diego Levantine and Cyber-Archaeology Laboratory, Department of Anthropology, California USA) - Levy, Thomas (UC San Diego Levantine and Cyber-Archaeology Laboratory, Department of Anthropology, California USA) - Najjar, Mohammad (UC San Diego Levantine and Cyber-Archaeology Laboratory, Department of Anthropology, California USA)

Abstract format: Poster

The Early Bronze Age and Early Iron Age in the Edom Lowlands Region in southern Jordan is characterised by socio-cultural, economic and political changes that were part of a shifting process that was deeply linked to the organisation of copper metallurgical production in the Faynan district over time.

The aim of the present project is to document and study the traditions of ceramic manufacture and usage at several previously surveyed and/or excavated settlement sites dating from the Early Bronze Age III-IV and the Early Iron Age located in the Faynan district. The research will focus on characterising the chemical and mineralogical composition and determining the provenance and examining the technological steps and skills involved in the manufacture of the ceramics. An 'integrated approach' will be taken to combine the data obtained by several different scientific techniques including the macroscopic study of the ceramics, thin section petrography analysis and other compositional analytical techniques (i.e. pXRF, LA-ICP-MS, SEM-EDS, XRD). The aim is to shed light onto the organisation of pottery production at a local (site) and regional (Edom Lowlands Region) levels at every given period, which will contribute to better understand the evolution of pottery-making traditions over time. The observations made are also expected to address the nature of any possible trade and exchange networks with other communities from an intra-regional and supra-regional perspective by comparing the published data from that of other southern Levantine sites. The role played by pottery production in the development of copper metallurgical production and in the configuration of the so-called 'complex' societies will also be discussed by incorporating the data obtained into the theoretical debate and interpretations of the sociopolitical structure and socioeconomic dynamics of southern Levantine communities in each period.

639 METALS AND METALLURGICAL REMAINS AT THE 3000-1500 BCE SITE OF CASTANHEIRO DO VENTO (NE PORTUGAL)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Muralha, João (Department of History, School of Social Sciences and Humanities, NOVA University of Lisbon (NOVA FCSH); Centre for the Humanities (CHAM), NOVA FCSH) - Garrido, Tiago (Department of History, School of Social Sciences and Humanities, NOVA University of Lisbon (NOVA FCSH)) - Serrano, Sofia (Department of Conservation and Restoration, School of Science and Technology, NOVA University of Lisbon) - Elin, Figueiredo (Department of Conservation and Restoration, School of Science and Technology, NOVA University of Lisbon; Centre of Materials Research (CENIMAT/i3N), School of Science and Technology, NOVA University of Lisbon (NOVA FCT))

Abstract format: Poster

Archaeological research of later pre-historic sites in north-western Iberia has focused mainly in megalithic tombs, settlements and rock-art sites. In northern Portugal archaeological systematic studies began in the 1970's. In 1990's the Copper and Bronze Age monumental site of Castanheiro do Vento (Vila Nova de Foz Côa, Portugal) was discovered, located in a prominent hill in the hinterland, 10 km south of the Douro River. Around 20 archaeological excavation campaigns have been performed since 1998 which revealed enclosure with an area of around 10.000 m², with a time span occupation that covers ca. 1,500 years, from 3,000 BCE to 1,500 BCE (radiocarbon dates).

During the archaeological campaigns a collection of metals and metallurgical remains were recovered from different archaeographic contexts and chronologies. Only a very small part of this collection was studied and published, in contrast to the studies on the site's structures and in relation to the monumentality and importance that the site may have had for the prehistoric communities.

In this work we will present the preliminary results of elemental analyses by X-ray fluorescence spectrometry (XRF) performed on all the metal artefacts and metallurgical remains recovered during the archaeological campaigns. We will relate the type of metal and metallurgical vestige with the archaeological context and discuss their significance in terms of the emergence of copper metallurgy, arsenical copper and bronze (alloy of copper and tin) in the region and in a wider, Iberian context. Provided that northern Portugal is rich in various metal sources, such as tin and gold, and that Castanheiro do Vento is the only monumental site with extensive archaeological work in the hinterland region, the present data is of major importance for the study of the adoption and continuity of the use of specific metals and alloys in the northern Portuguese territory.

642 WINDOW GLASS CONSUMPTION AT MONASTIC SITES IN MEDIEVAL ENGLAND

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Stone, Bronwen (University of Sheffield / Historic England) - Jackson, Caroline (University of Sheffield) - Paynter, Sarah (Historic England) - Gherardi, Francesca (Historic England) - Tyson, Rachel (c/o Historic England) - Merrony, Colin (University of Sheffield)

Abstract format: Poster

Around 1000 monasteries were built in England during the medieval period. From the C12 these were soaring, gothic structures with the structural strength to carry expansive glazing. It is known from documentary evidence that the glazing was imported from the continent, particularly from France. During the C13 a glassmaking industry developed in England, in The Weald and in Staffordshire, and window glass produced here may have also been used to glaze the windows of the monastic buildings.

The poster reviews PhD research into the consumption of window glass from seven monastic sites in England from two distinct orders, Benedictine and Cistercian. This work is being carried out at the University of Sheffield in collaboration with Historic England. Approximately 300 fragments of unpublished, excavated window glass are used in the study. The results of investigations into both stylistic imagery and chemical analysis of the glasses, indicating dates and provenance, are used to elucidate the complex nature of the use of glazing in a monastic setting in medieval England. Excavated window glass is generally under studied and published in part because of the difficulties in working with small and often corroded fragments. The project has devised novel ways of interpreting and recording indistinct applied decoration, and combining stylistic evidence with historical information in a framework that helps understand the chronological structure of each assemblage.

643 POWERFUL WOMEN AND CHILDREN IN PRE-ROMAN UMBRIA: UNDERSTANDING INCLUSIVE SOCIETIES WITH FOREIGN PEOPLES THROUGH MOLECULAR ANTHROPOLOGY AND ARCHAEOLOGY

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Weidig, Joachim (Albert-Ludwigs-Universität Freiburg, Institut für Archäologische Wissenschaften, Abteilung für Urgeschichtliche Archäologie) - Pauselli, Rebecca (Università degli Studi di Urbino Carlo Bo, Dipartimento di Studi Umanistici) - Pusceddu, Allegra (Università degli Studi di Roma Tor Vergata, Dipartimento di Biologia) - Ottoni, Claudio (Università degli Studi di Roma Tor Vergata, Dipartimento di Biologia) - Casciarri, Silvia (Ministero della Cultura, Museo Archeologico Nazionale e Teatro Romano di Spoleto) - Coen, Alessandra (Università degli Studi di Urbino Carlo Bo, Dipartimento di Studi Umanistici) - Micozzi, Marina (Università degli Studi della Tuscia Viterbo, Dipartimento di Scienze Umanistiche, della Comunicazione e del Turismo) - Martinez-Labarga, Cristina (Università degli Studi di Roma Tor Vergata, Dipartimento di Biologia)

Abstract format: Poster

Bioarchaeological studies of the last decade have demonstrated the value of digging into our past through multidisciplinary approaches, revealing biological and cultural trajectories in human evolution previously completely unexplored. The pre-Roman era, when the Italian territory was inhabited by the Italic population with its distinctive languages and traditions, represents a crucial period in the history of the Italian peninsula. Through multidisciplinary approach, archaeology and ancient biomolecules, this project aims at shedding light on the genetic ancestry, lifestyle, diet, and health of the inhabitants of pre-Roman Central Italy. The treasure trove of funerary evidence gathered through archaeological investigations at the Necropolis of Piazza d'Armi at Spoleto (PG) (2008- 2011), shed new light on the role of women and children in this society between the end of the 8th and the middle of the 6th century BCE.

Furthermore, evidence of allogenic nuclei within the community seems to prove the role of Spoleto as bridge with other Italic populations from Central Italy. The material culture originating from the necropolis of Spoleto revealed many non-local objects, giving rise to the assumption among archaeologists that they belonged to individuals who grew up far away. It is plausible that Spoleto embraced numerous influences that shaped its culture and possibly even its language. The unique features of the necropolis of Piazza d'Armi are testimony to the inclusive nature of this pre-Roman center, open to accept foreign people into the upper classes of the society and to confer symbolic power to children. For this reason, only a multidisciplinary approach can uncover the Umbrian people from Spoleto.

(This project is supported by PRIN 2022 PNRR Cod. P2022LATB9 allotted to A.C., M.M. and C.M.-L.)"

645 THE BEGINNING OF COPPER METALLURGY IN OMAN: THE CASE OF WADI SHAB GAS-1

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rivoltella, Rosa (University of Salento) - Giardino, Claudio (University of Salento)

Abstract format: Poster

The significance of the Wadi Shab GAS-1 site is reconsidered with the aim of improving our knowledge of the development of early metallurgy and the circulation of metals in Central Asia and the Near East. This prehistoric site, dated to the 4th millennium BC, is located on the north-eastern coast of the Sultanate of Oman and was excavated in the early 2000s as part of the Join Hadd Project by S. Cleuziou and M. Tosi. It is one of the oldest sites on the Arabian Peninsula where copper tools have been documented. Taking into account the data obtained thanks to the analyses already carried out on some of the copper artefacts from the site, and in the light of the recent discovery of the chronologically contemporary site of Al Khashbah, where copper smelting activity is attested, new analyses on unpublished materials will be presented for a better understanding of the role of this site in the emergence and diffusion of metallurgical technologies in the Omani territory.

650 IDENTIFYING ANCIENT SOURCES AND PROCESSING METHODS OF CINNABAR

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lewis, Jonathan (Free University of Berlin) - Alexandra, Rodler-Rørbo (Austrian Archaeological Institute of the Austrian Academy of Sciences)

Abstract format: Poster

Cinnabar (HgS), a pigment widely used in antiquity, was mined from geological sources and traded across the ancient world. Some sources of this material have been identified, but whether other geological sources were exploited in antiquity is unclear. Raw cinnabar was purified via roasting before it was used as a colorant, though no sites of cinnabar processing have so far been identified. This research aims to support ongoing efforts to connect cinnabar found in the archaeological record in Europe and the Mediterranean region to potential documented and as-yet undocumented sources via S and Pb isotope analysis. Additionally, this research will compare the Hg isotope composition of cinnabar found in archaeological contexts to geological sources in order to identify the extent of Hg fractionation caused by roasting. This, potentially combined with experimental roasting of unprocessed cinnabar samples, will provide constraints on the intensity of cinnabar roasting in terms of temperature and roasting time, and how these parameters may have varied across locations and time in history. This research will also attempt to locate cinnabar processing sites near locations of ancient cinnabar mining and utilization by investigating nearby soil for burned layers and elemental enrichment. Additionally, lacustrine sediments near potential sites of cinnabar mining and processing will be sampled and investigated for evidence of associated runoff and airborne pollution. Intervals of elevated Hg and other heavy metals in such sediments may allow ancient cinnabar exploitation to be identified even in the absence of direct archaeological evidence, and may allow this exploitation to be constrained in time.

652 TOO MANY HANDS FADED AWAY WITH TIME. A COLLECTIVE (AND DISTURBED) TOMB FROM A LATE ANTIQUE ITALIAN CATACOMB

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Cecconi, Viola (Collaboratore esterno, Servizio di Bioarcheologia, Museo delle Civiltà, Rome, Italy) - Braconi, Matteo (Dipartimento di Studi Umanistici, Università degli Studi Roma Tre, Rome, Italy) - Guidi, Eveline (Scienze dell'Antichità, "La Sapienza" Università di Roma) - Di Tomassi, Alessandro (Dipartimento di Studi Umanistici, Università degli Studi Roma Tre, Rome, Italy) - Sperduti, Alessandra (Servizio di Bioarcheologia, Museo delle Civiltà, Rome, Italy; Università degli Studi "L'Orientale" di Napoli, Naples, Italy)

Abstract format: Poster

The Catacomb of Santa Mustiola (Chiusi, Italy) is a large Early Christian hypogeum currently investigated by the Pontifical Commission for Sacred Archaeology and Roma Tre University, with the collaboration of the Museum of Civilizations. So far, 61 tombs have been excavated; they can be distinct in three main typologies: arcosolium, loculus, and pavement tombs. Among the arcosolia, most of the sepulchres contained several individuals (4 up to 33); their stratigraphic excavation revealed an intense use of the space, with both contemporary and subsequent depositions within the same structure. We also recognized clear evidence of ancient operations of skeletal reduction and isolated elements rearrangement to make room for more bodies.

The recently excavated tomb A2b differed from the others in several specific features. In the first, it was missing the original closure and the clayey sediment that typically filled all the other structures. Moreover, unlike the other graves, all bone elements were rather well preserved but highly commingled with complete loss of any anatomical connection.

The osteological analysis documented the presence of at least 25 individuals: 18 nonadults and 7 adults. While this number is in line with other tombs, Bone Representation Indexes indicate a strong inconsistency. For instance, in the adult sample, the survival rate is 71.4% for humeri and 92.8% for femurs and tibiae, whereas, elements known to have relatively good survivability are extremely rare (patella BRI = 7.1% and metacarpals BRI = 21.4) or even missing, as in the case of carpal bones.

Overall, this concurrence of evidence led us to hypothesize that the assemblage represents a selective and casual relocation of remains coming either from the same structure or from other tombs within the Catacomb.

654 THE CIRCULATION OF CERAMIC MATERIAL: MEDIEVAL TRADE ITEMS OF THE ARUCH FORTRESS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Galanti, Francesca (Sapienza Università di Roma) - Fausti, Elena (Sapienza Università di Roma) - Ferdinand, Sergio (ISMEO) - Babajanyan, Astghik (IAE NAS RA) - Petrosyan, Artur (IAE NAS RA) - Dan, Roberto (ISMEO) - Vitolo, Priscilla (ISMEO)

Abstract format: Poster

This poster is about the analysis of the ceramic material that came from the excavation and research activity conducted by ISMEO – Associazione Internazionale di Studi sul Mediterraneo e l'Oriente, in collaboration with IAE NAS RA - Institute of Archaeology and Ethnography of the National Academy of Sciences of the Republic of Armenia as part of the "Archaeological Mission to Aruch and the Silk Road Fortress". The aim is to open through pottery an overview of the commercial dynamics that involved, during the late medieval times, the Fort of Aruch (Aragatson region), a strategic castrensian site located along the main communication route between East and West: the Silk Road. The ceramic here is studied on different levels: it is studied as "life product" that suggest the function of the fortress' rooms, and that illustrate the local cultural traditions, but also as a "trade item" which testifies to the fact that the site of Aruch was reached by Iranian, Iraqi, and Georgian imports. The study of this context has also offered an opportunity to reflect on methodology: opinions about future developments in the method of studying the archaeological record must always clash with the reality to which they refer. Lack of systematic studies of medieval ceramic materials in Armenia, which local scholars have only recently been filling, makes it clear that in this case a more traditional typological approach to the study of ceramic record was necessary, but at the same time demonstrates how the right, even if traditional, methodological choice adapted to the scientific context in which it is embedded can bring 'new' results.

657 SEQUENTIAL ISOTOPIC ANALYSIS OF ATLANTIC COD (GADUS MORHUA) VERTEBRAE: APPLYING A DEVELOPING METHOD FOR LIFE-HISTORY RECONSTRUCTION FROM "ACELLULAR" FISH REMAINS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Noble, Emma (University of York) - Orton, David (University of York) - Alexander, Michelle (University of York) - Craig, Oliver (University of York)

Abstract format: Poster

Sequential isotopic analysis of fish vertebrae (SIAV) is a novel method for obtaining stable isotopic data representing multiple periods across an individual animal's life history. Such a sampling approach has significant potential for reconstructing the ontogenetic development of ancient fish, but there remains some uncertainty regarding the period over which accurate isotopic data may be retained in fish vertebrae. Material turnover through remodelling would alter the isotopic composition of bone deposited during early life and thus preclude assessment beyond the last few years of life. It is known that bone remodelling does occur in fish bone containing osteocytes and prior SIAV studies have shown this "cellular" fish bone to only retain material deposited in the last few years before death. Whether an equivalent process occurs in "acellular" bone lacking osteocytes is less certain. We applied SIAV to the remains of Atlantic cod ranging from approximately one to ten years of age at death; in doing so, this study represents the first application of SIAV to investigate "acellular" fish bone from individuals old enough for remodelling to be a concern. As with "cellular" vertebrae, samples representing later life yielded isotopic data consistent with the expectations established from each individual's catch-location and size-at-death. Additionally, the "early-life" data obtained from individuals caught as adults were more consistent with the expectations for habitat and dietary variation of the studied population than that of remodelled bone. Still, interpretation was limited by the combined influences of ontogenetic diet and habitat shifts yielding equivocal results in the isotopic sequences. With the applicability of SIAV to various fish taxa now becoming understood, this study hopes to offer recommendations for how future SIAV studies of archaeological material may be planned to maximise research yield from this developing research method.

659 LATE ANTIQUE POTTERY TYPES, CHARACTERISTICS: CASE OF KOSOVO

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Shipoli, Elza (Pázmány Péter Catholic University; Institute of Albanology - Prishtina)

Abstract format: Poster

Late Antiquity was a very complex period due to the significant challenges that occurred during this time, as well as various changes in structural, political, administrative, economic, and social views.

Various artifacts compared with earlier periods, such as ceramics from late antiquity, show changes in particles in social life.

Apart from the diet, economic, and social aspects of a place, art, decoration, types, and the food used in a particular era, pottery has a wide range of distribution and a long duration compared to other materials, making it a valuable resource for the past of human life, has given pottery fundamental importance for reconstructing past periods of human life.

The purpose of this poster is to identify the main variations, types, characteristics, and forms of Kosovo pottery during late antiquity in comparison with other countries in the region, and to find out which pottery was most frequently used, reflecting the major changes in ceramic types.

661 OLD WOMEN WHO SLEEP, DEAF OLD MEN: BIOARCHAEOLOGICAL GLIMPSES OF THE ELDERLY FROM THE CENTRAL COAST OF PERU

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Murphy, Melissa (University of Wyoming)

Abstract format: Poster

Spanish chroniclers writing during the sixteenth and seventeenth centuries describe the Inca administrative system and the census. The Incas collected taxes as labor from their subjects and so the census categories reflected the capacity for labor by gender and age. The chroniclers had different classifications and categories of age classes and not all of them had chronological years associated with their categories, but the consensus among them was a prime of life category for men and women and then two categories for the elderly, "old" and "very old". Here I conducted a bioarchaeological and mortuary analysis of individuals fitting these categories from a sample of Late Horizon (AD 1570-1532) burials from the central coast of Peru. I hypothesize that the mortuary treatment of the elderly may be distinct from the mortuary treatment of individuals classified in the younger adult age categories. I then explore how they are different and why and assess if this is associated with state's labor expectations.

663 UNDERSTANDING THE SPATIOTEMPORAL PATTERNS OF THE EARLIEST OCCUPATIONS OF WESTERN EUROPE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.) - Hall, Harry (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.; Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK) - Reschke, Jan-Olaf (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.; ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany; Institute for Ecology, Evolution and Diversity, Goethe University, Frankfurt am Main, Germany) - Longborg, Kamilla (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France) - Grove, Matt (Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK) - Hertler, Christine (ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany) - Saqalli, Mehdi (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France) - Moncel, Marie-Hélène (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.)

Abstract format: Poster

Understanding the interplay between ecological dynamics and early hominin behaviour, and how it may have affected the colonization and occupation of new territories, is a challenging archaeological enterprise. The archaeological record suggests that during the first Out of Africa dispersal, Western Europe stayed at the limit of the human "Oikoumene" for almost 1 million years. The earliest evidence of hominin diffusion out of Africa is dated to 2.1 million years in Eurasia (Levant and China. Hominins reached the gateway of Europe (southern Caucasus) around 1.8 million years ago, but the first human occupations of Western Europe are dated to around 1.2-1-4 million years ago (Italy and Spain).

The Lateurope ERC project devotes a whole work package to reconstructing and studying environmental dynamics and how they affected hominin populations in Eurasia between 1.5 and 0.5 million years ago. In our project we have opted for an interdisciplinary approach, bringing together specialists in archaeology, ethnography, biology and climatology, to apply different computational modelling techniques (i.e., paleoclimatic and environmental reconstructions and agent-based modelling). It is our objective to shed light on the complex interplay of dynamics and variables that influenced the colonization of Western Europe during the Early and Middle Pleistocene and get a better understand-

ing of the current spatiotemporal pattern. In this poster, we present our hypotheses, data management protocols and modelling strategies.

664 SMALL SACRED OBJECTS IN THE LANDSCAPE - THE CONTEXT OF EVERYDAYNESS, MYSTERY, AND SPIRITUALITY

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Bešina, Daniel (Constantine the Philosopher University in Nitra) - Bönde Gogová, Stanislava (Constantine the Philosopher University in Nitra) - Borzová, Zuzana (Constantine the Philosopher University in Nitra) - Fottová, Eva (Institute of Archaeology SAS)

Abstract format: Poster

Landscape for archaeology means a space in which there are elements that have a system between them. It is a space to which man attaches meaning and a certain practical function. Small sacred objects (divine torments, crosses, chapels), insignificant in size, belong to the characteristic elements of the neo-medieval cultural landscape. They stand mostly in places where people moved, lived, and worked. In villages they were built near churches, in cemeteries, near water sources, on communal or private land. Outside the villages in open countryside, near roads, dirt, and forest tracks. Apart from being a kind of memento mori - so that man would not forget the transience of his own life, they had the role of a profane topographical object in defining the boundaries of land and a landmark at the crossroads. A certain specificity was the placement of the divine torments on the roads leading to the execution sites. In exceptional cases, they were also located directly on the execution site. At this place, the procession could stay with the condemned in the last prayer or perform the function of a memorial to the executed. They are also found on the banks of watercourses, bridges, and vineyards, where they served a protective function against natural disasters.

Their meaning and symbolism have changed over time, but their overall genius loci and their memory in the country persists to the present day. They include not only artistic, historical, and aesthetic values, but they are also important landscape elements, cultural objects that are reminders of various human destinies and events, as well as their religious and spiritual legacy. They form a kind of symbols in the landscape that help us to read its past.

665 TALALATI - NEW INSIGHTS INTO THE CASTRUM OF RAS EL AÏN AND THE ROMAN NORTH AFRICAN FRONTIER

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Millin, Thomas (Durham University) - Racine, Karl (Durham University)

Abstract format: Poster

This presentation analyses new data from the Roman Fort of Talalati at Ras El Ain, Tataouine, Tunisia. The new Data was collected during excursions by the Aliph funded project the "Partnership for Heritage", led by British and Irish universities (Durham, UWE Bristol, Dublin), and facilitated and run by the Institut national du patrimoine of Tunisia.

Utilizing UAV photography, survey data, and ceramic analyses, the presentation illuminates the economic, cultural, and political life of an important castrum upon the Limes Tripolitanus. Through high-resolution aerial imagery and ground surveys, we produced a new plan of the fort, allowing for more insight into the development of the Vicus and the scale of the settlement. Additionally, newly acquired ceramic data through macroscopic fabric analysis and scanning electron microscopy provides insight into the occupation timeline of the settlement, contextualising the site's evolution amidst political unrest and the provenance of the ceramics found on site.

Finally, our new study offers an exciting and new nuanced understanding of the fort's importance in the Roman frontier. It explores the "vicus-castra" dynamic as well as daily life along the frontier. The new study aims to rejuvenate and restore energy to the field of North African frontier research, through a multiscalar approach, focusing on the data collected at the site and placing it within its wider landscape context.

666 CREATURES OF HABIT: A COMPARATIVE MULTI-PROXY STUDY OF THE ZOOARCHAEOLOGICAL REMAINS FROM RELIGIOUS ESTABLISHMENTS IN LATE MEDIEVAL ULSTER

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Montgomery, Ryan (Queen's University Belfast) - Murphy, Eileen (Queen's University Belfast)

Abstract format: Poster

The reform of the Church in Medieval Ireland during the Late Medieval brought about the establishment of new religious orders and monastic complexes that would become crucial hubs of religious and economic activity. This project aims to apply a multi-proxy approach combining zooarchaeological analysis, multi-isotope techniques and aerial surveys to provide new insights into the human-animal-environment interactions that enabled key monastic foundations in Late Medieval Ulster to function and thrive.

A number of assemblages from Late Medieval Ulster ecclesiastic foundations, including the high-profile monastic sites of Cathedral Hill, Downpatrick and Devenish Island, Fermanagh will be the focus of investigation. Substantial zooarchaeological assemblages from these sites hold critical information about livestock exploitation patterns and husbandry practices. Using age/sex profiles, and palaeopathological indicators within these faunal assemblages along with the application of strontium, oxygen, sulphur, carbon, and nitrogen isotope analyses, this project will compare how the monastic communities engaged with and relied upon their local ecosystems.

Integrating these multi-proxy datasets will enable a more nuanced understanding of how human-animal-environment interactions underpinned the survival and sustainability of these important religious establishments, particularly in the face of major social, political, climate and religious instability in Late Medieval Ireland. Comparative analysis of the data will provide a better understanding of how the farming practices may have been influenced by the regulations or beliefs of the various religious orders.

Ultimately, this project will enrich archaeological narratives by foregrounding the crucial role of animals in the functioning of Late Medieval monastic communities. By doing so, it will also feed into current debates concerning the long-term environmental impacts of historical livestock husbandry practices and their relevance to understanding sustainable farming methods in the context of modern climate change.

667 GEOMETRIC MORPHOMETRICS TO THE STUDY OF CERAMIC FROM THE 15TH AND 16TH CENTURIES IN THE SOUTHEAST OF THE IBERIAN PENINSULA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Piñera, Francisco (UNED) - Busto-Zapico, Miguel (Universidad de Granada) - Maldonado Ruiz, Alexis (University of Santiago de Compostela; Universiteit Leiden)

Abstract format: Poster

Between the end of the Nasrid Emirate and the formation of the Kingdom of Granada, significant changes occurred marking the transition from an Andalusian and medieval society to a Castilian and modern one. These transformations are clearly reflected in ceramics, a material element that can be studied through geometric morphometrics. This technique is presented as an effective tool for analyzing differences in forms, which has been rarely used in contexts of this period, making this study pioneering.

The objective of this work is to analyze the transformations or continuities in the ceramic repertoire of the 15th and 16th centuries in the southeast of the Iberian Peninsula. The study focuses on two specific ceramic forms of the period: atafores and plates. These are chosen because they are pieces of social representation and changes are particularly evident in them. The analyzed sample consists of 100 pieces from archaeological contexts, with complete profiles, typology, chronology, and production center determined in previous studies.

The methodology used involves the identification of the defining landmarks of each of the forms. Subsequently, their statistical analysis includes morphological classification through cluster grouping, covariance matrix, principal component analysis, and canonical variation analysis. With this approach, we seek to obtain precise morphological classifications and, through them, understand the possible evolution of the forms. This will enable us to establish relationships between a specific form, its chronology, and its determined production center.

This study could help identify validated formal groupings associated with certain groups. At the same time, the exhaustion of some forms is observed through the loss of their function and meaning, as demonstrated in the transformations of the ataifor until its gradual disappearance. In this way, we identify specific territorial and cultural units.

670 THE BIOARCHAEOLOGICAL STUDY OF MIGRATION PERIOD ELITE GRAVES FROM DROUŽKOVICE (CZECH REPUBLIC) - PRELIMINARY REPORT

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Witan, Joanna (University of West Bohemia in Pilsen; Institute for Preservation of Archaeological Heritage of Northwest Bohemia) - Doležalová, Jana (Institute for Preservation of Archaeological Heritage of Northwest Bohemia) - Szostek, Krzysztof (Cardinal Stefan Wyszyński University in Warsaw) - Lisowska-Gaczorek, Aleksandra (Cardinal Stefan Wyszyński University in Warsaw) - Molak, Martyna (University of Warsaw) - Pospieszny, Łukasz (University of Gdańsk; University of Bristol) - Blažek, Jan (Institute for Preservation of Archaeological Heritage of Northwest Bohemia)

Abstract format: Poster

The occurrence of complex constructions of burial chambers during the Migration Period is usually associated with male elites. An individual buried in grave No. 52 with a wooden structure, along with two graves at the Doužkovice site, may offer a different perspective. As the graves had been robbed of artifacts, bioarchaeological methods were used to provide information about the possible origins of those buried and their social status.

Genetic and stable oxygen isotope analyses were used to establish the origin of the studied individuals and to determine their biological sex. Moreover, reconstruction of their diet based on carbon and nitrogen isotope analysis was attempted. For this purpose, enamel and bone samples were taken to trace potential migrations and changes in diet over the lifespan of the women buried at Doužkovice site.

Genetic analysis revealed that the women buried at the site were not related to each other and had X2c1, T1a1, H2a mitochondrial haplogroups. Oxygen isotope analysis of the enamel indicated that they were not local, but the last years of their lives were probably spent in the region close to the burial site. Dietary reconstruction showed that the studied females had a typical C3 diet with a relatively high proportion of animal protein. The percentage of dietary protein intake in childhood was between 10% and 20% higher than in adulthood. Moreover, they probably did not consume millet or products with a high carbon isotopic value, or the value was marginal. The potential geographical origin of the buried females and their migration path have not yet been determined.

The goal for future research is to extend the analysis to other sites in the region and to conduct a more comprehensive study of social and migration processes during the Migration Period in northwestern Bohemia.

673 CHANGING ROLES AND MORPHOLOGY OF DOGS IN LATER PREHISTORIC, ROMAN AND MEDIEVAL SOUTHEAST EUROPE

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Everett, Sarah (BioArCh, Department of Archaeology, University of York)

Abstract format: Poster

Dogs played a wide variety of roles in past societies — utilised for hunting, herding and guarding, for pest control, and kept as pets. While distinct dog breeds only emerged within the last few centuries, human-induced change in dog morphology as a result of selection for particular traits has a much longer history. Analysis of spatial and temporal variation in dog morphology provides important insights into changing human-dog interactions over time.

This poster presents the meta-analysis of published data from archaeological sites across southeast Europe, with a temporal scope spanning from later prehistory to the medieval period. The poster explores changes in dog morphology across key political transitions — such as the Roman conquest of southeast Europe in the last centuries BCE, and the transition from late Antiquity to the medieval period — examining changing human-dog interactions and relationships over time and space. Diachronic change in dog stature and robustness is considered, as is intraperiod spatial variation, and variation across different site types. A key focus of the study is the impact of the Roman occupation on dog morphology, and the emergence of particularly small dogs in the Roman period. Morphological data from Roman-period sites are presented from three regions subject to very different levels of direct Roman control — (a) the Balkan provinces, under long-term Roman occupation, (b) Dacia, a Roman province from 106-271/275 CE, and (c) regions to the north that remained beyond the borders of the Empire.

674 FIRE, COLOUR AND SOIL. A SOIL THERMOMETER AS A PRACTICAL TOOL FOR LANDSCAPE HISTORY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Schulz, Erhard (Institut für Geographie und Geologie Universität Würzburg) - Bencik, Attila (Department of mineralogy, geochemistry and petrology, University of Szeged, Hungary) - Cacovean, Horea (Office for pedologic and agrochemical studies, 4000483 Cluj-Napoca, Romania) - Herrmann, Ludger (Institut für Bodenkunde und Standortkunde, Universität Hohenheim, Germany)

Abstract format: Poster

Charred material, colour and transformation of soil material are indicators of burning.

However, an estimation of the fire temperature is difficult - even it is important information for archaeology and landscape history. The experimental burning in a slash and burn project in Forchtenberg/SW-Germany as well as observation of forest and open land fires at Leghia/Romania evidenced different types of colour and soil transformation. A systematic burning of soil material (loess and Keuper) from the Forchtenberg site and Bullenheimer Berg (NW-Bavaria) at regular temperature intervals up to 1000 °C and micromorphological observations evidenced a systematic change in colour and nature of the soil material. A first stage is at 400°C when the organic material got burned and the soil was black in colour. Afterwards the soils colours changed into brown and the material got more and more compacted up to 600°C as the next stage. Orange colours prevailed up to 900°C with a preponderance of Fe₃-oxides and a cementation of the soil material. At 1000°C the colour was reddish, the material was completely cemented and first stages of smelting could also be observed. In all, it gave a practical field guide to estimate fire temperatures by the Munsell colours. These results were compared with the burned material from the Forchtenberg experiment site and the Bullenheimer Berg excavations.

675 BRONZE AGE TEXTILE PRODUCTION IN IBERIA. ANALYSIS OF A WARP-WEIGHTED LOOM FROM THE SETTLEMENT OF CABEZO REDONDO (SE, SPAIN)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Basso Rial, Ricardo (University of Alicante) - García Atiénzar, Gabriel (University of Alicante) - Martín de la Sierra Pareja, Paula (University of Alicante) - Carrión Marco, Yolanda (University of Valencia) - Barciela González, Virginia (University of Alicante) - Hernández Pérez, Mauro (University of Alicante)

Abstract format: Poster

Evidence of textile activities in prehistoric societies is scarce. However, in certain contexts, the quantity and variety of evidence, both direct and indirect, allows us to propose the importance of weaving as part of craft activities. In this communication, we present the analysis of a warp-weighted loom documented at the site of Cabezo Redondo (Villena, Spain). This settlement, inhabited between 2100 and 1250 cal. BC, stands out for the exceptional preservation of its archaeological remains, including numerous tools related to textile activity. An outstanding find is a concentration of 49 loom weights associated with remains of charred wood, interpreted as the structure of a warp-weighted loom. This was documented in a semi-covered external platform, annexed to a circulation space and various residential units, which suffered a fire event dating to around 1450 cal. BC.

This work has two aspects: the systematic analysis of the loom weights to assess their use and the types of fabrics that could have been woven, and an anthracological study of the charred wood to identify the plant species used. The analysis of the loom weights suggests that most of them would have worked together on the loom. This has led to various hypotheses about their use, including their placement on a multi-shaft loom to produce twill weaves. Furthermore, the spatial analysis of the platform has allowed us to interpret it as a projection of several domestic spaces to the outside, creating a shared space where diverse groups could work together to carry out different activities, such as weaving.

In short, it is a context that constitutes a first-rate archaeological document for the study of textile production and its changes during the second half of the 2nd millennium BC. It also gives us the opportunity to study the domestic and social structures hidden behind the textiles.

676 ARCHAEOLOGICAL HUMAN HAIR DISCOVERED IN A NECROPOLIS OF 15TH-19TH CENTURIES FROM NICULITEL (TULCEA COUNTY, ROMANIA)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Donciu, Paul (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology, Iași, Romania) - Groza, Vasilica (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research, Iași, Romania) - Ciorpac-Petraru, Ozana (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research, Iași, Romania) - Stănică, Aurel (“Gavrilă Simion” Eco-Museum Research Institute, Tulcea, Romania) - Crețu, Eliza (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology, Iași, Romania) - Bejenaru, Luminița (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology, Iași, Romania; Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research, Iași, Romania)

Abstract format: Poster

The present research is focused on the remains of human hair discovered on the skeleton codified M32/S5, recovered during the archaeological excavations carried out in the necropolis of 15th-19th centuries near the “Sf. Athanasie” Church from Niculitel (Tulcea County, Romania). The church was built at the beginning of the 14th century by a local ruler, with the purpose of a familiar necropolis. The church was built in the middle of the 14th century, then in the 15th, 17th, and 18th centuries it underwent various renovations and served a small rural community. The preventive archaeological researches during 2022-2023 documented a number of 348 inhumation graves/funeral complexes covering a chronological interval between 15th and 19th century.

The skeleton under study (M32/S5) is incomplete and quite fragmented, belonging to a female aged 30-35 years old. The associated inventory items, including a metal comb and fragments of vestments, indicate a relative dating for the 19th century. At the level of the skull, in the occipital region, hair remains attached to the bone were identified. After sampling, the hair remains were evaluated macroscopically, then they were analyzed using optical microscopy and scanning electron microscopy (SEM). As resulted from the degradation score analysis, most hairs show intermediate and severe postmortem changes of the cuticle. The observations mainly reveal the presence of several ovoidal lesions produced by keratinolytic fungi, known as fungal tunnels. Also, mycelial hyphae were observed on hair surfaces. The taphonomic analysis was limited by the precarious conservation status of the material.

677 WOOL PROJECT: FARMING, TRANSHUMANCE AND TEXTILE PRODUCTION IN CENTRAL-NORTHERN APULIA DURING THE 1ST MILLENNIUM BC

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: de Sio, Matteo (Università degli Studi di Bari)

Abstract format: Poster

This research project, financed to University of Study of Bari in a PNRR project: CHANGES “Cultural Heritage Active Innovation for Sustainable Society”, aims to contribute for a reconstruction of the historical and archaeological landscapes linked to the world of sheep farming, transhumance and related textile activities in central-northern Apulia during the 1st millennium BC. The impetus for this thematic investigation stems from the resurgent interest in the study of ancient fabrics and is underpinned by a holistic approach to archaeological datum. The purpose, through a systematic investigation, is the reconstruction of the wool supply chain between the end of the Bronze Age and the Roman Republican period; in a geographical area that held significant prominence in sheep farming and in the production of valuable vellera.

The integrated analysis of tools for textile production and fragments of mineralized fabric, employing a multidisciplinary approach - archaeological and archaeometric - and subsequent comparison with literature on zooarchaeological data, has allowed the systematic investigation of the archaeological record from various inhabited, productive, and funerary contexts in central-northern Apulia, such as Monte Sannace, Jazzo Fornasiello, Gravina, Altamura, Ascoli Satriano, and Herdonia.

This poster presents the preliminary results of the research based on the study of over 6000 tools for textile production and approximately 50 fragments of mineralized fabrics. The integration of these data has provided new insights on weaving techniques, the nature and quality of the raw materials used, and the economic, social, and productive dynamics associated with wool production in central-northern Apulia during the 1st millennium BC.

679 NAMES, THINGS, PLACES. INTERACTIONS AND ENACTIVE LOGICS BETWEEN PEUKETIAN AND BRADANIC AREAS, AN INTERDISCIPLINARY APPROACH

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Fanizzi, Federica (Università degli Studi di Bari)

Abstract format: Poster

The study of roof tile stamps is a multifaceted topic that bridges archaeology, epigraphy, and linguistics, offering new avenues of research to illuminate the intricate socioeconomic and productive dynamics of the ancient world.

Research conducted in 2019 within the indigenous settlement of Monte Sannace, located approximately 5 km north-east of Gioia del Colle in central Apulia, has revealed several environments adjacent to the defensive wall circuit. Among these, a Laconian-type roof tile bearing an impressed stamp emerges as a crucial element in analyzing the actors involved in production, their mobility, the origins of production facilities, and the distribution of products. Indeed, another Laconian-type tile with a very similar stamp was discovered in the late 1990s within a space located adjacent to the defensive wall circuit of the indigenous center of Difesa San Biagio, situated near the Bradano River in eastern Basilicata.

This contribution, stemming from data comparison, enables the tracing of the “enactive logics” connecting the Peuketian hinterland with the Bradanic area, whose people possess a hybrid culture showing, between the 4th and 3rd centuries BCE, that while they continued to exhibit typical customs of the Apulian populations, they also manifested practices entirely assimilable to those of Lucania.

681 AROUND THE WATERING HOLE: AN IN-DEPTH ANALYSIS OF POMPEII'S FOUNTAINS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Trusler, Kate (Wright Paleohydrological Institute; University of Missouri) - Lorenz, Wayne (Wright Paleohydrological Institute)

Abstract format: Poster

Drinkable water and the strategies used to get it are at the heart of every sustainable society. Pompeii's remarkable water distribution system shaped the very character of the city from its network of water towers to its overflowing fountains. By the 1st century CE the Aqua Augusta, or Serino Aqueduct, dramatically altered the urban development of Pompeii and served to provide water to many poorer citizens who otherwise would have had little to no access to potable water.

In the summers of 2018 and 2019, the authors conducted fieldwork in order to investigate the fountain and water tower system found at Pompeii. Results include updated and more accurate measurements pertaining to the overall

volume and construction of the fountains, detailed accounts of the wear patterns found on the fountain surfaces and proposed explanations for their presence, and layouts of the stone “supports” that surround many of the basins. This poster aims to increase the knowledge on use and construction of public fountains in Pompeii.

684 RETURN OF THE GODS: UNDERSTANDING THE SOCIO-CULTURAL SIGNIFICANCE OF RESTITUTION TO THE COMMUNITIES IN THE KATHMANDU VALLEY

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Borkar, Taramati (University of Durham)

Abstract format: Poster

John Henry Merryman encouraged discussions surrounding cultural heritage ethics. The emotional engagement often attached to an object is critical in ensuring its return to the community. The complexity of this interdependence of emotion and reason plays a significant role in understanding restitution as a process for the traditional communities in Nepal.

The socio-cultural characteristics of illegal trade in antiquities distinguish it from other forms of trade. The tangibility of cultural heritage is the contribution of its intangible values, a thought central to Nepal's restitution cases. Although a processual challenge, it is imperative to investigate if restitution changes an object's significance in traditional communities.

The methods undertaken are qualitative. Conversational communication is critical, allowing investigation of the object's post-restitution condition and an understanding of the motivations. Case study research, in-depth interviews, and community surveys are primary for this purpose.

An investigation of objects returned to Nepal in the last two decades revealed that these are medieval stone sculptures stolen from their original locations. They are prime examples of Nepal's illustrious iconography, trafficked out of the country between the 1960s-1980s, called the period of “endemic thievery” by Lain Singh Bangdel. Only five objects are returned to the communities. Conducting on-site community surveys and interviewing stakeholders is critical. The expected result is to collect over a hundred surveys and twenty-five interviews.

The return of cultural objects is an emotionally charged discussion. Even with international dialogues with geographically innovative solutions, the debate surrounding changing custodianship struggles to re-establish and maintain identities. Nepal imbibes that an object's aesthetic must be admired within its original context, whether in temple or in-situ. Therefore, the interdisciplinarity of this research integrates with an entire experience of spirituality, aesthetics, history, and art. Thus, this research aspires to produce intangible benefits in the current dynamic and competitive archaeological landscape.

685 SURPRISE SARCOPHAGUS IN AQUINCUM

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Polgár-Nyerges, Anita (Budapest History Museum) - Mende, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities) - Gerber, Dániel (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities)

Abstract format: Poster

In 2015 a Roman era sarcophagus was found on the southern slope of Aranyhegy (Budapest, Hungary). The grave contained two female skeletons. The sarcophagus, which had no inscription, contained numerous grave goods, but the real curiosity were the remains of textiles of various qualities and other organic materials. Prominent amongst these are the remains of a linen bandage seeped in resin, the golden thread decorating the silk shroud, and the leather remains decorated with golden foil in a pattern, which once made up the funerary footwear. The bioarchaeological examination of the skeletons was also performed, for which petrous bone (Individual "A") and teeth (Individual "B") were sampled. There was no detectable blood relationship between these individuals. The results of the analysis showed that the genomic makeup of individual "A" blends better to Southwest European, individual "B" with Central-Eastern European genetic pool. The bandage, the textiles of luxurious quality, and the funerary footwear were observable at other mummification burials in Aquincum and other parts of Pannonia (Brigetio, Carnuntum, Intercisa) as well. Within Aquincum, such graves have been found in Táborhegy, Testvérhegy, and Aranyhegy, which, based on their location, must have belonged to the private burials of the hillside villa complexes. The shared characteristic of these burials is that the bodies were preserved and then wrapped up multiple times in textile seeped in resin, and then attempted to hermetically close the sarcophagus. The persons buried this way belonged to the exceptionally wealthy social classes of the early 4th century A.D. Aquincum.

686 A LATE BRONZE AGE FORTIFIED SETTLEMENT NEAR MEDGYESEGYHÁZA, SE HUNGARY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Szevényi, Vajk (Déri Múzeum) - Priskin, Anna (Déri Múzeum) - Wieszner, Balázs (Hungarian National Museum) - Czukor, Péter (Móra Ferenc Múzeum)

Abstract format: Poster

The aim of our poster is to present the preliminary results of our research at a recently discovered Late Bronze Age multivallate fortified settlement in southeastern Hungary carried out during the past few years. The site of Lagzi-dűlő lies south of the modern town of Medgyesegyháza and covers ca. 30 hectares. It is part of a larger network of fortified sites that emerge during the first half of the Late Bronze Age in the southern Great Pannonian Plain. Our multiyear, multiphase project is aimed at the study of the various levels of this network of settlements ranging from ‘mega-forts’ through larger or smaller fortified settlements to small unfortified hamlets. Here we describe the results of our non-invasive research including remote sensing, extensive and intensive, systematic field surveys, geophysical prospection, and geological coring, and the results of our small-scale, targeted excavations aimed at the investigation of multiple enclosures of a ‘mid-sized’ fortified settlement. (The research is financed by the “Settlement, economy and society in the Late Bronze Age of Eastern Hungary” NKFI “OTKA” FK-135805 project).

689 AND WHAT NOW? A RECORDING PROTOCOL FOR THE STUDY OF HUMAN REMAINS AND MORTUARY PRACTICES THROUGH EXCAVATION PHOTOGRAPHS AND DRAWINGS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Solomou, Anastasia (Independent Researcher)

Abstract format: Poster

This poster attempts to present a method that can be used in circumstances where the skeletal remains are not preserved, or access to the material is not possible, with a view to maximising the extractable data in poorly recorded or preserved contexts. The method devised uses excavation photos and drawings for the analysis of the human skeletal remains. The recording protocol focuses on an archaeoethnological approach, for which a flowchart is created, structuring the recording process, and ensuring comparability and repeatability. The protocol is showcased through the analysis of the available mortuary deposits from three Early Bronze Age cemeteries in the Greek mainland and six contemporaneous cemeteries in the Cyclades. The results show how the protocol implemented allows the identification of the primary deposits, the categorisation of the secondary interferences, and the sequencing of the deposits, shaping the skeletal assemblages, and elaborating on the processes of their formation. Furthermore, new data is added to the corpus of Early Bronze Age funerary contexts regarding the grave environment, which has been largely assumed by the excavators rather than evidenced. Indeed, despite the evident resolution deficit resulting from the limitations of the photographic materials, which is to be anticipated, by using the recording protocol devised, new data is obtained, giving way to further discussions.

690 ANALYSIS OF LATE BRONZE AGE GRINDING STONE DEPOSITIONS FROM SE HUNGARY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Priskin, Annamaria (Déri Múzeum) - Pető, Ákos (Hungarian University of Agricultural and Life Sciences, Department of Nature Conservation and Environmental Management) - Torma, Andrea (University of Szeged, Department of Geology and Paleontology)

Abstract format: Poster

Most of the macrolithic tools discovered at the Pre-Gáva/Cruceni-Belegiš II type settlements in eastern Hungary are grinding stones used for grinding and pulverizing. It is generally characteristic that besides the large number of fragmentary finds there are few intact grinding slabs and handstones, which may have been mainly due to the lack of nearby raw materials. However, during the excavation of an LBA settlement at Biharkeresztes (ca. 1350-1100 BC), a large amount of high-quality, well-preserved ceramic and macrolithic artefacts came to light, based on which it is possible to reconstruct almost the entire process of food storage, food preparation and consumption. The macrolithic implements were excavated, documented and collected carefully in large quantities. Most of them are fragmentary and have rather varied contexts. However, in a few pits, several grindstones were placed together, so the possibility of intentional deposition, as well as the existence of special grinding pits in the settlement. In our presentation, we examine these possibilities based on the results of archaeological, archaeobotanical and phytolith analyses. Since these tools usually represent the first stage of the food preparation process, by examining them from several aspects, we can get answers not only about the way of usage, the grinding technique, but also about the types of processed plants and the degree of processing. The analysis is carried out within the framework of NKFI “OTKA” FK-135805 project (“Settlement, economy and society in the Late Bronze Age of Eastern Hungary”).

692 THREE LATVIAN CASTLES IN THE LIGHT OF SPATIAL ANALYSIS**Abstract theme:** 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps**Abstract authors:** Garstka, Anna Maria (Doctoral School of Humanities, University of Łódź)**Abstract format:** Poster

Recently, the use of the GIS technology is becoming increasingly popular. This also includes the spatial analysis of past landscapes. An example of this can be the analysis of line-of sight (intervisibility), field of view (viewshed) and potential time of movement from one place to the another (mobility). During the researches, conducted as a part of the international project INHILLDAUGAR (related to the Latvian hillforts along Daugava river), it was noticed that in several cases hillforts were replaced with the castles, such as: Koknese, Aizkraukle and Sēlpils. The Koknese castle was erected in 1209 by Bishop Albert of Riga and was abandoned in 1701. Castles in Aizkraukle and in Sēlpils, both were built by the Livonian Order in the first half of the XIII century. Both were also destroyed during the battles – Aizkraukle castle in the end of the XVI century by Russian and Polish army and Sēlpils castle in 1704 by Swedes.

Thus, the chronology of these three castles overlaps and they were located close to each other, so they could communicate or be part of a fortification system. Therefore, using GIS program, the above-mentioned spatial analysis were performed for these three sites.

The purpose of poster will be to present (in form of the images) the results of the viewshed, intervisibility and mobility analysis conducted for castles: Koknese, Aizkraukle and Sēlpils. An attempt will also be made to interpret these results and to answer the research questions whether it was possible to see the tower of the neighbouring castle from a particular castle tower and what the visibility from individual castles might have looked like.

695 VIRTUAL ARCHAEOLOGY. LATTE BULDINGS IN THE MARIANA ISLANDS**Abstract theme:** 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps**Abstract authors:** Berrocal-Maya, Luis (Universitat Pompeu Fabra)**Abstract format:** Poster

This poster focuses on the virtual archaeology of the Mariana Islands, an archipelago located in the northwest of the Pacific Ocean, near the equator. It is about 1500 km from the Philippines and a slightly greater distance from southern Japan. Since the 1500 BC, it has been inhabited by the CHamoru. Apparently, they lived here without much alteration until their colonization by the Spanish Crown in the 17th century. However, since 900 AD, a megalithic architecture appeared, probably related to social changes.

This architecture is named latte and gives its name to a new phase, the Latte Period. The preserved remains show groupings of pillars between 1.2 m and 5 m high. However, the upper part of these buildings has been completely lost. This must have been due to a perishable characteristic of its materials. In this research, different reconstructive proposals have been evaluated. To make the reconstruction tangible, a latte structure has been modeled in 3D through Blender. This has allowed us to better understand the functioning and socio-cultural characteristics of these buildings, which must have had a communal character.

699 NOT ONE BEFORE ANOTHER: A MULTI-ISOTOPE APPROACH TO THE LIFE-HISTORIES OF LA BRAÑA-ARINTERO MESOLITHIC BROTHERS (NORTHERN IBERIA)**Abstract theme:** 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps**Abstract authors:** Fernandez-Crespo, Teresa (Universidad de Valladolid) - Czermak, Andrea (University of Oxford) - Le Roux, Petrus (University of Cape Town) - Ordoño, Javier (Arkikus) - Schulting, Rick (University of Oxford) - Vidal Encinas, Julio (Junta de Castilla y León) - Fano, Miguel Ángel (Universidad de La Rioja)**Abstract format:** Poster

La Braña-Arintero site in the León province of northern Spain provides a unique context to explore variability in Mesolithic dietary and mobility patterns in strictly coeval and close relative individuals. In 2006, two human skeletons were recovered from the surface of the cave. After radiocarbon, anthropological and genetic studies, they were defined as two Mesolithic adult male brothers. It is likely that, as full siblings, they grew up together and were raised similarly, but also that from boys to men –when becoming more independent– they chose different pathways. Within the framework of the HunTran project (PID2020-112915GB-100), sequential stable carbon and nitrogen isotope analysis of primary dentine and strontium isotope analysis of enamel have been conducted in one of their lower permanent third molars to reconstruct their life-histories during late childhood and adolescence. The resulting data, with sub-annual temporal resolution, suggest a broadly stable high-trophic-level diet and the exploitation of exclusively or predominantly terrestrial resources, from a relatively restricted landscape for both individuals. This is consistent with the stability within broad-spectrum diets and high degree of territoriality suggested for the last hunter-gatherers of interior Iberia, although this does not preclude contacts with or mobility to other regions (e.g., the Cantabrian

coast), as attested through the study of lithic raw material and shellfish procurement in nearby Mesolithic sites. At a finer scale, the brothers' stable carbon and nitrogen isotope sequences show non-coincident patterns of opposite covariance, which suggests that they suffered from different catabolic and anabolic processes throughout juvenility. Moreover, they both show a short, marked change in diet around age 14, followed by a sustained divergence in nitrogen isotope data until the end of their available isotope sequences that may be attributable to a distinct protein intake. This evidence may tentatively suggest a change related to social age and/or family independence.

701 THE BUILDING SITE OF THE TEMPLE OF DIONYSUS IN TEOS: SOME PRELIMINARY RESULTS FOR THE RECONSTRUCTION OF THE CHAÎNE OPÉRATOIRE**Abstract theme:** 1. The Material Record: Current Trends and Future Directions**Abstract authors:** Bozza, Sara (CNR-Istituto di Scienze del Patrimonio Culturale) - Kadioğlu, Musa (Teos Archaeological Project - Ankara University) - Casa, Giacomo (Sapienza Università di Roma) - Ismaelli, Tommaso (CNR-Istituto di Scienze del Patrimonio Culturale)**Abstract format:** Poster

The Temple of Dionysus in Teos in Asia Minor (Izmir, Turkey), whose construction began in the late 3rd century BC and ended in the imperial period under Hadrian's reign, is one of the most significant buildings for the study of ancient architecture, as it is mentioned in the famous work *De Architectura* by Vitruvius as an example of eustyle temple, designed by the architect Hermogenes during the Hellenistic time. An ongoing research project, thanks to the collaboration between the Teos Archaeological Project (Ankara University), Sapienza University of Rome, and CNR-ISPC, focuses on the Temple to reconstruct its biography, from the architectural project to the building site, its various phases, and its decoration.

A detailed analysis of the ancient construction practices adopted in the building site is conducted through the innovative application of the traceological method to the study of ancient architecture: thousands of blocks scattered in the temple area are investigated through the systematic cataloguing of traces of tools on the marble surfaces, and the morphological and dimensional features of clamp-, dowel- and pry hollows. This analysis allows the reconstruction of technical procedures (chaîne opératoire) (for moving, lifting, carving and connecting the blocks) and is intended to assess i) the relative and absolute chronology of the different sectors of the temple, ii) the organization of various working groups; iii) the technical know-how shared by the stonemasons; iv) the socio-economic implications of the project in terms of time, workforce and materials. The poster will present some preliminary results of the research on the organisation and temporal development of the building site of the Temple.

704 PAST IN PRESENT SOILS: LEVERAGING DEVELOPMENT-LED ARCHAEOLOGICAL DATA TO GENERATE INSIGHTS INTO URBAN SOIL DEVELOPMENT AND SOIL HEALTH**Abstract theme:** 7. Archaeology of Sustainability through World Crises, Climate Change and War**Abstract authors:** Bekesi, Anna (University of Glasgow; Museum of London Archaeology (MOLA))**Abstract format:** Poster

Urban soils play a fundamental role in the lives of cities. It is essential for the future to preserve it in a state where it can fulfil its ecological and economical functions as well as meet the needs of all its stakeholders. Human interactions leave significant impact on soils. Short-term or immediate effects have been a focal point in scientific research. Archaeology is in a unique position to compliment this rapidly expanding knowledge pool due to its unique ability to offer insights into long term human activity, environmental change and human-environment interactions.

This poster presents the preliminary stages of a collaborative research project, "Past in Present Soils". It uses development-led archaeology data and aims to enable interdisciplinary collaboration between archaeologists, soil scientists, development companies, urban farming communities and local authorities within Greater London. By cross-mapping the archaeological and soil science domains using semantic modelling methods, it allows for a more holistic understanding of soil. The proposed data model illustrates creating and disseminating data in a way that holds benefit within the discipline and beyond. The case study aims to illustrate how archaeological data can be implemented successfully and used beyond archaeology, on projects concerned with soil health, sustainability and climate change.

706 DISTRIBUTION PATTERN OF ELITE TOMBS OF THE XIONGNU EMPIRE AND ITS IMPLICATIONS AS SEEN THROUGH GIS SURVEY OF GOL MOD-2

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Han, Jinseong (Kyung Hee University)

Abstract format: Poster

The Gol Mod-2 site are characterized by the largest size, the largest number of tombs, and the excavation of various burial products among the ancient tombs of the Xiongnu Empire. The analysis of individual ancient tombs is actively underway, but studies on the formality of the distribution of tombs in the ancient tombs are somewhat insignificant. This poster presentation is based on GIS data collected through aerial (drone) surveys from the Gol Mod-2 cemetery site in 2022, and the purpose of this presentation is to poetically examine the distribution formality of aristocratic tombs of the Xiongnu Empire and their implications. As a result of the preliminary results, (1) the Gol Mod-2 cemetery is located at an altitude of 1800-1860m, and 500 tombs are concentrated in the range of 5 km². (2) The tombs are distributed in groups of at least two areas, of which the largest tombs are characterized by being located at the point of low elevation. (3) Most of these burials are square stone tombs with terrace, and the terrace are set in the southeast direction. In addition, the satellite graves tend to be located to the east of square stone tombs with terrace tombs. (4) Particularly noteworthy part of this survey is the confirmation of the traces of the tomb's mound and the existence of ditch around the tomb, and it seems necessary to reconsider the study of the previous tomb construction. I think this study will not only contribute to the understanding of the burial culture of the Xiongnu Empire, which was a huge axis of the Eastern Eurasian grasslands, but also help to examine the empires formed throughout Eurasia in the 8th and 3rd centuries BC.

707 HEALTH PROFILES OF ROYAL TOMB KEEPERS OF THE WESTERN HAN CHINA (202 BC TO 8 AD)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Zhan, Xiaoya (Nanyang Technological University) - Shao, Jing (Shaanxi Academy of Archaeology, China) - Zhu, Yingpei (Shaanxi Academy of Archaeology, China) - Yeh, Ivy Hui-Yuan (Nanyang Technological University)

Abstract format: Poster

The health profiles of royal tomb keepers in ancient Chinese contexts are seldom discussed due to limited skeletal remains. The recent excavation at Dabuzi Cemetery, Shaanxi, China, revealed a group of royal tomb keepers for Emperor Gaozu of Han (reigning from 202 to 195 BCE) and Empress Lü. The specimen, coded as North II M68, was believed to be one low-ranking official of the tomb keepers. Hundreds of burial goods were unearthed, including pottery, jade, bronze artifacts, and iron swords. With 90% of bones preserved, M68 was believed to be an adult man between 25-32 years old. Integrated research has been done to piece together the lives of M68. Compared with the other 85 human skeleton remains studied, M68 exhibited robust bones and muscular attachments on limb bones and torso. There is a well-healed fracture at the left fibula distal end. Bony outgrowth, porosity changes, osteochondritis dissecans, and osteoarthritic changes are exhibited on the lower limbs and feet. The joint changes are more exaggerated compared to the other individuals. It is possible that the fracture contributed to the joint changes. It is also possible that M68 was actively engaged in physical activities, potentially military, regarding the iron swords in his burial goods, which contributed to the joint changes. M68 also exhibited several dental conditions, including caries, abscesses, and LEH. Paleoparasitology analysis indicates a possible dog roundworm (*Toxocara* sp.) in the soil sample of M68's pelvic region, indicating close contact with domestic animals. Archaeobotany indicated that the grains in the pottery barns were rice and millet, providing information on the diet of M68. These pieces of information draw a more integrated picture of the Han tomb.

708 MAPPING ARCHAEOLOGICAL HERITAGE IN SOUTH ASIA

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Roberts, Rebecca (University of Cambridge) - GS, Abhayan (University of Kerala) - Hameed, Mohammad (University of the Punjab) - Mushtaq, M. Waqar (Islamia University Bahawalpur) - Prabhakar, VN (IIT Gandhinagar) - Samad, Abdul (Directorate of Archaeology and Museums, Khyber Paktunkhwa) - SV, Rajesh (University of Kerala) - Kumar Singh, Vikas (Banaras Hindu University) - Project, MAHSA (University of Cambridge) - Petrie, Cameron (University of Cambridge)

Abstract format: Poster

Archaeological heritage in India and Pakistan is rich, diverse and ubiquitous. Ancient settlements, monuments, buildings and other features of cultural importance are part of the living landscape, and often their existence does not fit comfortably with contemporary development needs. Rapid urban and agricultural development in both countries has led to the destruction of many archaeological sites, the existence of which may not be recorded in formal registers.

The Mapping Archaeological Heritage in South Asia (MAHSA) project is working alongside a range of stakeholders, including museums directorates, universities and government departments, in order to create a comprehensive open access online database of protected archaeological heritage in combination with a management tool for the documentation of vulnerable sites to be used by heritage professionals in Pakistan and India. Using the Arches database platform, MAHSA is helping to transform the way heritage is managed at both local and national levels. Sources of data about sites includes published site gazetteers, existing sites and monuments lists, historic maps, and results of archaeological groundtruthing. In addition to the creation of the database tool, MAHSA is also developing documentation tools and training sessions for digital heritage documentation using open source software such as QGIS and Open Data Kit to ensure that stakeholders have the tools required to produce, analyse and manage born-digital heritage data, while also critically evaluating our workflow in relation to the 'digital divide' and the hidden costs of digital data, such as infrastructure, technical know-how and inherent post-colonial knowledge imbalances.

709 BONE BROOCHES FROM PANNONIA (HUNGARY): MANUFACTURE AND USE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Sáró, Csilla (HUN-REN-ELTE Research Group for Interdisciplinary Archaeology, Budapest, Hungary; Institute of Archaeological Sciences, ELTE Eötvös Loránd University, Budapest, Hungary) - Tóth, Zsuzsanna (Hungarian National Museum, National Institute of Archaeology, Budapest, Hungary) - Borel, Antony (Histoire Naturelle de l'Homme Préhistorique (HNHP), Muséum national d'histoire naturelle (MNHN), CNRS, UPVD, Alliance Sorbonne Université, Département Homme et Environnement, Paris, France; Institute of Archaeological Sciences, ELTE Eötvös Loránd University, Budapest, Hungary)

Abstract format: Poster

Roman period brooches were typically made of copper-base alloy, while precious metals (gold, silver) and iron were less common. However, bone brooches were a rarity, and their manufacturing process was distinct from that of metal brooches, often requiring the collaboration of workshops. Such brooches are known from Pannonia (Hungary). We present here the analysis of two bone brooches with metal pin constructions from Aquincum (Budapest). First, our investigations showed that their form is not unique, similar artefacts have been found in the region, and their raw material, large mammalian long bone, was present locally in the area. The surface of the artefacts was then examined at different scales using a stereomicroscope and a Laser Scanning Confocal Microscope (LSCM) to document the traces related to different manufacturing and use phases. During the manufacturing process, the rectangular preform was sawn out of the bone. After that, fine sawing was used to create a basic outline and details, while the surface was scraped with a knife to shape it. The final surface was smoothed by abrasion. Also, high resolution measurements of the catchplates through LSCM allowed differentiating striations related to this manufacturing processes from others demonstrating the use of these brooches.

710 MEDIEVAL SKELETAL REMAINS CHALLENGE MEDICAL EXPERTS' EXPECTATIONS OF LIFE EXPECTANCY FOR THOSE WITH EXCESS PRESACRAL VERTEBRAE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rieber, Riley (University of Aberdeen)

Abstract format: Poster

The human skeleton is comprised of 24 presacral vertebrae, with an axial formula of 7 cervical, 12 thoracic, 5 lumbar. However, normal human variation can range from 23-25. In rare cases, segmentation defects of the spine occurring during fetal development can result in vertebral variations outside of this accepted range, although, these abnormal variations are deemed "incompatible with life" by embryologists.

Macroscopic analysis was conducted on a set of medieval skeletal remains, and a differential diagnosis was developed based on observable pathological conditions. The identification assigned to the remains is LC84 SK181 and were discovered during the 1980's excavation of the interior floor of the Linlithgow Carmelite Friary in Scotland. The remains date to the late 15th century.

The differential diagnosis concludes that LC84 SK181, an elderly female, suffered from segmentation defects of the spine resulting in an unusual number of presacral vertebrae, and unilateral hip dysplasia. Excess vertebrae were observed in the thoracic and lumbar regions, while a block vertebra was present in the cervical spine. The burial context was also of interest as her burial was located below the floor of the claustral area of the friary.

Despite the belief that excess vertebrae are "incompatible with life", this case study seeks to challenge this notion, as well as highlight four other known examples spanning 123 years. Though rare, this condition is not impossible among adults as the evidence suggests. There also appears to be a possible correlation between excess vertebrae and Klippel-Feil Syndrome, as 4 out of the 5 known cases of 26 presacral vertebrae also meet the diagnostic criteria for Klippel-Feil Syndrome.

THE PALEOGENOMICS OF WILD AND DOMESTIC CATS IN THE ANCIENT LEVANT AND NORTH AFRICA

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Rovelli, Valentina (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Italy) - De Martino, Marco (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Italy) - Serventi, Patrizia (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Italy) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Peters, Joris (ArchaeoBioCenter and Institute of Palaeoanatomy, Domestication Research, and the History of Veterinary Medicine, Ludwig Maximilian University Munich, Munich, Germany) - Mattucci, Federica (Unit for Conservation Genetics (BIO-CGE), Italian Institute for Environmental Protection and Research (ISPRA), Ozzano dell'Emilia, Italy) - Caniglia, Romolo (Unit for Conservation Genetics (BIO-CGE), Italian Institute for Environmental Protection and Research (ISPRA), Ozzano dell'Emilia, Italy) - Van Neer, Wim (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Ottoni, Claudio (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Italy)

Abstract format: Poster

Located at the crossroads of Africa, Asia, and Europe, the Levant is considered the cradle of cat (*Felis silvestris*) domestication, a process that most likely started around 11 thousand years ago with the onset of farming. Zooarchaeological and iconographic evidence suggests that ancient Egypt could be a possible second, later center of domestication. This narrative is corroborated by genetic analyses of modern wild and domestic cats, which demonstrated that domestic cats derived from *Felis silvestris lybica*, the North African and Near Eastern wildcat. Previous ancient DNA (aDNA) investigations showed that cats in ancient Egypt possessed two mitochondrial lineages commonly found in modern domestic cats. Haplotype-C, which spread all over the Old World since Classical Antiquity from Northern Africa, and haplotype-A, associated with an earlier cat dispersal from the Levant during the Neolithic. However, the exact contribution of Egypt is controversial due to the paucity of data, especially because the majority of Egyptian samples are represented by cat mummies, from which the retrieval of authentic aDNA is challenging.

Here, we show the results of paleogenomic analyses conducted on more than 100 cat remains from North Africa, Israel, Saudi Arabia, Oman, Syria, and Turkey, dated from the Neolithic to the 15th century AD. We generated whole mitochondrial genomes and low-coverage ancient nuclear genomes (0.1x-0.6x). In addition, to provide a broader view of modern wildcat genetic variation, we produced whole mitogenomes and low-coverage nuclear genomes (0.4x-1.2x) from eight museum samples from central Africa and five modern high-coverage genomes (12.3x-15.3x) of wildcats from Tunisia, Morocco, Mauritania, Western Sahara, and South Africa. Our paleogenomic dataset provides an outline of ancient DNA preservation in cat remains across time and space. Furthermore, it lays out a key background to unravel the individual contribution of Egypt and the Levant to cat domestication.

ACCURACY ASSESSMENT OF DENTAL MORPHOLOGICAL TRAITS IN SEX ESTIMATION, ON ARCHAEOLOGICAL HUMAN GROUPS OF 16TH-19TH CENTURIES FROM EASTERN ROMANIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Popovici, Mariana (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, "Olga Necrasov" Center of Anthropological Research (Romania)) - Ciorpac-Petru, Ozana-Maria (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, "Olga Necrasov" Center of Anthropological Research (Romania)) - Groza, Vasilica-Monica (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, "Olga Necrasov" Center of Anthropological Research (Romania)) - Bilavski, George (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, Institute of Archaeology (Romania)) - Bacumenco-Pîrnău, Ludmila (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, Institute of Archaeology (Romania)) - Bejenaru, Luminita (Alexandru Ioan Cuza University of Iasi, Faculty of Biology (Romania); Romanian Academy, Iasi Branch, "Olga Necrasov" Center of Anthropological Research (Romania))

Abstract format: Poster

Due to the great phenotypic variability, and the difficulty to establish some morphometric or morphological boundaries between the males and females, the sex estimation can be difficult steps in the reconstructing the biological profile of human skeletons from archaeological contexts. As human remains from archaeological excavations, the teeth have a distinct importance as they have a very good preservation, thus being frequently recovered.

The present paper focuses on the evaluation of sexual dimorphism by combining some dental morphology variables (i.e., dental shape and non-metric traits) in the discriminant functions.

The dental material is represented by mandibular second molars coming from several archaeological sites of 16th-19th centuries in Eastern Romania. The teeth were analysed by Geometric morphometrics and by quantifying nonmetric traits (i.e., anterior fovea, groove patterns, cusp numbers). The obtained data were used to the principal component analysis, canonical variate analysis, allometry, discriminant function analysis.

The results show that the covariation of shape and dental traits contributes to the sex estimation, and that the geometric morphometrics is a suitable technique to highlight even the most discrete aspects differentiating the sexes. Allometry has a minor impact, but statistically significant in the sexual dimorphism. Multivariate regression within the dental configuration reveals how the occlusal outline and the intercuspidal grooves influence each other. Discriminant functions, based on shape variables and dental traits, highlight the significant role of the talonid in the sex estimation on archaeological medieval human groups (i.e., cross-validation classification: 72.3% for males, and 63.2% for females).

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

EXPLOITATION OF ANIMAL RESOURCES IN COMMUNITIES OF EARLY IRON AGE (HALLSTATT, BABADAG CULTURE) AT THE LOWER DANUBE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Cretu, Eliza ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași, Romania) - Stanc, Simina ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași, Romania) - Ailincăi, Sorin ("Gavrilă Simion" Eco-Museum Research Institute, Tulcea, Romania) - Donciu, Paul ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași, Romania) - Bejenaru, Luminița ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași, Romania; Romanian Academy, Iasi Branch, "Olga Necrasov" Center of Anthropological Research, Iasi, Romania)

Abstract format: Poster

This study contributes to the knowledge of relationships between animals and human communities of Iron Age (Hallstatt, Babadag culture), according to the faunal remains discovered in archaeological sites from Southeastern Romania. This work is based on the archaeozoological data of five samples dated to 10th-9th centuries BCE, and coming from Jijila-Popa Isac, Garvăn-Mlăjituț Florilor, Rasova-Malul Roșu, Satu Nou-Valea lui Voicu, and Niculițel-Cornet.

Animal resources used in these communities, as well as related occupations, were evaluated by the main archaeozoological methods (e.g., anatomical and taxonomic identifications, estimations of age and sex, quantification, taphonomic evaluation). The identified faunal remains belong to mammals, birds, reptiles, fish, and molluscs.

The preponderance of domestic mammals is observed in all five samples, and the species list includes: cattle, sheep/goat, pig, horse, and dog. In four samples, cattle remains has the higher frequency, ranging from 40% in Garvăn to 71% in Jijila; in Satu Nou, cattle remains represent only 14.4%, while sheep/goats 47%, and pig 34%.

Among identified wild mammals, red deer and wild boar are the best represented, found in all samples; other wild mammals are roe deer, badger, hare, aurochs and fox.

A significant number of fish remains were found in the samples of Niculițel (30.7%), and Garvăn (26.3%); lowest proportions were recorded in Rasova and Satu Nou. Fish species identified are catfish, pile, sander, carp, and tench. Reptiles (i.e., pond turtle, and tortoises) were identified in all the samples, most remains in the Niculițel sample (0.67%). Birds are poorly represented or even missing in the samples of Jijila and Rasova.

From archaeozoological perspective it is to remark that animal husbandry, fishing, and even hunting were important components of the local economies in the Lower Danube area during Early Iron Age.

BRIDGING ARCHAEOLOGY AND AI: INTRODUCING THE AI-ON-DEMAND PLATFORM (AIOD)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lozic, Edisa (ZRC SAZU) - Štular, Benjamin (ZRC SAZU)

Abstract format: Poster

Archaeologists' interest in artificial intelligence (AI) is rapidly increasing. We recognize the need to move beyond isolated case studies and foster collaboration within our community. Our initiative, the AI-on-Demand platform (AloD) (<https://aiod.eu>), has been in development since 2019 and is now part of the AI4Europe project.

The objective of AloD is to support solutions and tools that enhance the ecosystem of excellence and trust. We continually add AI assets and tools to empower the wider community to upskill and share knowledge across various innovation sectors. Our platform offers new services and a marketplace for non-experts to explore and utilize AI solutions in their work. AloD is a community resource, and its success hinges on active engagement from end users. Cultural heritage, including archaeology, plays a crucial role in AloD's mission.

Our poster aims to present key information about the ALoD platform, highlighting its features and benefits. Additionally, we will showcase one of our tools titled "Data Conversations Made Easy: Build my RAG". Many archaeologists have contemplated using AI for data analysis but have been deterred by its complexity. Our free online tool addresses this challenge by simplifying the process of building a Retrieval Augmented Generation (RAG) AI system tailored to individual needs. To facilitate decision-making, we've streamlined the process into five key questions.

The poster will prioritize presenting essential information and include QR links for further details and access to the tool.

716 ARCHAEOLOGICAL HERITAGE AND EDUCATION ON DEPARTMENT OF ARCHAEOLOGY IN CONSTANTINE THE PHILOSOPHER UNIVERSITY IN NITRA

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Borzová, Zuzana (Constantine the Philosopher University) - Bešina, Daniel (Constantine the Philosopher University) - Gogová, Stanislava (Constantine the Philosopher University) - Fottová, Eva (Institute of Archaeology SAS)

Abstract format: Poster

The education at the Department of Archaeology in Constantine the Philosopher University in Nitra includes education of our students in popularization of archaeology, presentations of archaeological monuments, archaeological sites, historical monuments and cultural heritage. The theoretical level of this education at the department is executed mainly in the subjects of: Public Archaeology, Digitalization and virtualization of the cultural heritage and Monument presentation and cultural heritage education. Their main goal is adoption of the methodological and theoretical basics of public archaeology and their subsequent application in practice. The students of our department can test their theoretical knowledge of these subjects by means of numerous popularization activities carried out by the Department of Archaeology in the project of Public Archaeology at the Department of Archaeology. It consists of creative workshops for general public, interactive exhibitions, colloquia, educational (tourist) trails focused on archaeology, creation of leaflets, brochures, guide texts, websites, creation of material for documentaries, 3D visualisations, such as visual materials for websites or exhibitions, etc. We would like to present these by means of our poster. Our second goal is to mention education of children at primary schools (with the topic of history, archaeology and cultural heritage), which is supported by the Department of Archaeology in form of workshops, interactive lectures, exhibitions, day-long programmes or day summer camps. Their main ambition is to stimulate interest in our cultural heritage in children, extend their knowledge of history of their region and country, provide a review of artifacts and monuments and their importance for the society as well as teach them about the work of archaeologists and other experts dealing with protection of the cultural heritage.

718 BIODEGRADATIVE POSTMORTEM CHANGES IN A HUMAN HAIR SAMPLE OF 19TH CENTURY FROM IASI CITY (ROMANIA)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Ciropac-Petraru, Ozana-Maria ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania; Romanian Academy, Iași Branch, "Olga Necrasov" Center of Anthropological Research, Iași, Romania) - Bacumenco-Pîrnău, Ludmila ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania; Romanian Academy, Iași Branch, Institute of Archaeology, Iași, Romania) - Groza, Vasilica-Monica ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania; Romanian Academy, Iași Branch, "Olga Necrasov" Center of Anthropological Research, Iași, Romania) - Popovici, Mariana ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania; Romanian Academy, Iași Branch, "Olga Necrasov" Center of Anthropological Research, Iași, Romania) - Popovici, Ovidiu-Alin ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania) - Bejenaru, Luminița ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology, Iasi, Romania; Romanian Academy, Iași Branch, "Olga Necrasov" Center of Anthropological Research, Iași, Romania)

Abstract format: Poster

During the archaeological excavations at the "Vovidenia" Church from Iasi city (Romania), several human skeletons were discovered. Among them, a female human skeleton of 19th century, preserving textile fragments and several hairs strands, was found. In burial context, hairs are rare findings that can offer valuable information to both bioarchaeology and forensic science through different investigative approaches including taphonomy. Although the taphonomic process has been intensely studied on the skeletal human remains, there are few studies regarding postmortem degradation of human hair in archaeological context.

The aim of this study is to characterize the postmortem biodegradative changes of the human hair fibers discovered during the archaeological excavations from "Vovidenia" Church, Iasi city (Romania). The hairs were evaluated using optical microscopy, scanning electronic microscopy (SEM), and scoring technique for taphonomic assessment. Dur-

ing the stereomicroscopic inspection of hairs, adherent deposits and several puparia were observed. Based on the peculiarity of the puparium later stage (i.e., respiratory horns and well visible carapace), some of the insect remains were identified as belonging to scuttle fly (*Megaselia scalaris*, Diptera: Phoridae). On the hair shafts several concave lesions were identified, probably due to gnawing activity of insects. The evaluation of external degradation by SEM imaging and histological scores reveals that most analysed hair shafts are in a good preservation state with the minor and intermediated changes in the cuticle cells. Indicators of fungal lytic activity (i.e., fungal tunneling) were observed in almost all hairs. This work contributes with data regarding the preservation of human non-skeletal remains and biological taphonomic factors in funerary archaeological context. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS-UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

719 ANCIENT DNA EXTRACTION: ENHANCING ENDOGENOUS MATERIAL YIELD THROUGH TISSUE SOURCE OPTIMIZATION AND DISSOLUTION TECHNIQUES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lubacki, Kajetan (Institute of Human Biology and Evolution, Faculty of Biology, Adam Mickiewicz University) - Kulesza, Maria (Institute of Human Biology and Evolution, Faculty of Biology, Adam Mickiewicz University) - Breszka, Agnieszka (Institute of Human Biology and Evolution, Faculty of Biology, Adam Mickiewicz University) - Chyleński, Maciej (Institute of Human Biology and Evolution, Faculty of Biology, Adam Mickiewicz University) - Juras, Anna (Institute of Human Biology and Evolution, Faculty of Biology, Adam Mickiewicz University)

Abstract format: Poster

A predominant challenge in ancient DNA studies pertains to the amount of endogenous genetic material derived from skeletal remains. In archaeogenetic analyses, it is frequently observed that significantly less than 10% of the obtained DNA sequences originate from endogenous genetic material. Since the preservation of human DNA varies according to the specific bones selected, exploring optimal tissue sources can serve to augment both the ratio of endogenous DNA and the quality of the extracts.

In this study, we examined not only the commonly used teeth and inner ear fragments from the petrous portion of the temporal bone but also auditory ossicles which have recently been proposed as an alternative source of ancient DNA. In contrast to existing research methodologies, we standardized the extraction process across all tissue types by employing dissolution instead of the mechanical homogenization. Furthermore, we tested the extent to which the observed variability in the amount of obtained endogenous DNA could be attributed to the exclusion of heat and friction resulting from mechanical homogenization of the bone tissue.

The obtained results reveal variability in the amount of recovered endogenous DNA, which depends on the type of tissue used and the presence of mechanical homogenization in the protocol. We contend that these factors along with the varying degrees of destructiveness imposed on skeletal remains by each method, must be carefully considered when designing ancient DNA studies involving valuable human bone remains.

721 GEOMETRIC MORPHOMETRICS AND LITHIC STUDIES: A MATCH MADE IN HEAVEN? ADDRESSING SOME 2D AND 3D QUESTIONS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Romagnoli, Francesca (UAM - Universidad Autónoma de Madrid) - Pérez, Guillermo (UAM - Universidad Autónoma de Madrid) - Gravina, Brad (Musée national de Préhistoire, Les Eyzies de Tayac; Université Bordeaux) - Brenet, Michel (INRAP Grand Sud-Ouest; Université Bordeaux)

Abstract format: Poster

Recent research on lithic studies have focused on the application of Geometric Morphometrics (GM) for quantifying differences in the morphology of lithic artifacts. In combination with Principal Components (PCs) and Machine Learning models, GM provides a powerful methodology for the analysis of stone tools. However, questions regarding methodology (number of landmarks necessary to capture an object shape, different degree of resolution between 2D and 3D GM, effects of using limited number of PCs), and type of application to archaeological assemblages persist. A sample of 40 cores belonging to three different reduction sequences (Levallois, discoidal and Hierarchical Discoid) were used to evaluate how many landmarks are necessary to reliably characterize the shape of a stone tool core. Three categories of backed flakes were employed to test the degree of resolution between 3D and 2D GM and the effects of different number of PCs on Machine Learning algorithms. 3D GM were employed to differentiate knapping strategies among backed products obtained from discoidal and Levallois reduction sequences. Results concerning the number of landmarks shows that shapes can be reliably captured with a limited number of landmarks. Results from the comparison between 3D and 2D GM show that, when analyzing volumetric objects, 3D GM provide a higher resolution of analysis. Additionally, tree-based algorithms (Random Forest, GBM and E5 Decision tree) are less affected

by the use of limited number of PCs. Results of knapping strategy identification indicate an AUC near 0.8, indicating the potential of 3D GM, machine learning models and experimental reference collections for the identification of knapping strategies among archaeological collections.

722 THE DENTAL DECODER: MAXIMISING INSIGHTS IN PAST POPULATIONS' LIFEWAYS THROUGH TOOTH SAMPLING IN BIOARCHAEOLOGY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Robert, Prudence (Ghent University) - Bodé, Samuel (Ghent University) - Boeckx, Pascal (Ghent University) - Vanhaecke, Frank (Ghent University) - De Groot, Isabelle (Ghent University)

Abstract format: Poster

In archaeology, biological and chemical analysis provides a variety of information on past populations. The conclusions' validity is intricately linked to the quality and nature of the biological samples analysed. Dental samples, with their remarkable preservation and age representation, offer a veritable archive of individual life histories, making them especially valuable when skeletal remains are fragmented or commingled. This research delves into the strategic values of dental sampling within such challenging archaeological contexts. However, it can also be helpful whenever sampling multiple skeletal remains is undesirable.

Teeth not only survive extensive post-depositional processes but also encompass a wide array of biological and archaeological data. This includes genetic information through ancient DNA and dental non-metric traits analyses; stable isotope ratios for dietary and mobility information, direct markers of diet and disease; health and biological sex information through proteomics analysis and radionuclides for dating (e.g. 14 dating). This material is pivotal for reconstructing comprehensive narratives of past human lives and societies.

This study outlines optimised methodologies for tooth sampling and preparation for subsequent analyses, but also practical guidelines for both field archaeologists and biological anthropologists. The focus is on maximising the information that teeth yield, ensuring that even when the material is scarce, the potential for discovery remains vast.

724 PRESERVING THE ARCHAEOLOGICAL REMAINS OF EARTHEN CONSTRUCTION: PATHOLOGIES IN THIS FREQUENTLY OVERLOOKED PART OF ARCHITECTURAL HERITAGE

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Pastor Quiles, María (University of Alicante) - González Donado, María Laura (University of Alicante)

Abstract format: Poster

The handling of earthen archaeological remains poses significant challenges, in the field, in the laboratory but also later, on the storage phase.

This material is an invaluable source of historical and cultural information, but due to various factors associated with its nature, it is often neglected. The lack of attention and recognition it receives leads to poorer conservation, that is complicated enough in itself.

Not treating those earthen pieces properly and preventively addressing the pathologies they may develop, can lead to their significant deterioration, impacting their internal and external structure, and compromising vital information. In the case of construction remains, it means important losses in past architectural history, causing considerable damage, affecting research and the public perception of these elements as historical and architectural heritage.

Improving the practices involved in their treatment and management cannot be separated from fighting the common underestimation these materials suffer and the need to promote awareness of their importance in archaeology. It is essential to recognise their value and to take appropriate measures for their preservation to ensure their future availability for the advancement of scientific knowledge.

This poster presents a transversal approach to this problem, addressing the most common pathologies found in earthen heritage remains so it can bring light in ways to better prevent them.

726 APPLICATION OF ANCIENT DNA ANALYSIS IN THE STUDIES OF THE 8TH CENTURY COLLECTIVE GRAVE FROM THE LEJASBITĒNI CEMETERY IN LATVIA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kimsis, Janis (Latvian Biomedical Research and Study Centre) - Pokšāne, Alise (Latvian Biomedical Research and Study Centre) - Pētersone-Gordina, Elina (Institute of Latvian History, University of Latvia) - Vilcāne, Antonija (Institute of Latvian History, University of Latvia) - Molls, Kaspars (Institute of Latvian History, University of Latvia) - Gerhards, Guntis (Institute of Latvian History, University of Latvia) - Ranka, Renāte (Latvian Biomedical Research and Study Centre)

Abstract format: Poster

Identification of gender and sex is an important part of archaeological research. Gender is a social category, while sex is biological. Gender and sex can match, but it is not always the case. Gender is characterised by grave inventory and occasionally, by grave orientation. This study focuses on sex, gender and genetic characterization in a collective grave from the Lejasbitēni cemetery (Burials 111-115), which is from the beginning of the Viking Age, based on C14 dating. This grave contains five adult individuals, but the poor preservation of bone does not allow to assess the possible cause of death. Two female gender burials (No 111 and 112) contained an axe, which is not usually associated with female gender. Another female gender burial (No 113) contained artefacts typical for female gender, but the orientation of the grave was the same as the adjacent male gender burials (No 114 and 115), which contained weapons. Moreover, the skull of the Burial 113 suggests that their biological sex was male. To better understand the context of this collective grave, we performed ancient DNA analysis using next generation sequencing techniques to assess the chromosomal sex of the individuals and their genetic affiliation on a local and regional scale. The results indicated poor DNA preservation, however, in several cases the gender corresponded to the chromosomal sex, thus providing the necessary additional evidence. Overall, our findings help to explore burial traditions in the Lejasbitēni cemetery, and relationship between sex and gender during the Viking Age in the territory of contemporary Latvia.

This study was funded by the Latvian Council of Science grant No. lzp-2022/1-0059.

727 CHARACTERISATION OF ANCIENT DNA PRESERVATION IN HUMAN BONE AND TEETH SAMPLES FROM LATVIA WITH COPPER PATINATION

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Pokšāne, Alise (Latvian Biomedical Research and Study Centre) - Kimsis, Jānis (Latvian Biomedical Research and Study Centre) - Pētersone-Gordina, Elīna (Institute of Latvian History, University of Latvia) - Vilcāne, Antonija (Institute of Latvian History, University of Latvia) - Gerhards, Guntis (Institute of Latvian History, University of Latvia) - Ranka, Renāte (Latvian Biomedical Research and Study Centre)

Abstract format: Poster

Bronze and other copper containing alloys are known to possess antibacterial properties, which might partly explain the observation of better preservation of bone, teeth, and other organic materials in close proximity to bronze artifacts in archaeological contexts. The selection of bone and teeth samples for ancient DNA (aDNA) analysis often can be limited due to excavation techniques used in the past, whereby only selected bones were removed from the burial for curation, and poor preservation of osteological material in general. The aim of this study was to compare the metagenomic profiles and endogenous DNA preservation between osteological samples with and without copper patination obtained from different burials in Lejasbitēni cemetery (7th-10th centuries CE). Sequencing data obtained from patinated samples showed much lower human genome aligning read percentages than non-patinated samples. Most of the analysed samples did not have enough reads for aDNA authentication or did not display the characteristic aDNA damage patterns at the ends of sequences. Metagenomic analyses indicated that one of the samples (an intensively patinated and highly porous hand phalanx) also had an increased proportion of sequencing reads aligning to *Sphingomonas* – a genus of Gram-negative, chemoheterotrophic, strictly aerobic bacteria with biodegradative capabilities including organometallic compounds. Overall, despite the apparently good preservation of bones and teeth located in close proximity to metals and alloys with antibacterial properties, sequencing data suggests poor endogenous human DNA preservation and a possibility of changes in metagenomic profiles in favour of more metal-resistant bacteria. For determination of specific causes of lower endogenous DNA percentage in patinated samples, further research is required.

This study was funded by ANM academic career doctoral student grant ANM_K_DG_05.

REDISCOVERING MOUNTAIN IDENTITY: ARCHAEOLOGY OF HISTORIC BUILDING FOR THE REGENERATION OF BERGAMO'S MOUNTAINS

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Pupella, Chiara (Università Cattolica del Sacro Cuore di Milano)

Abstract format: Poster

As well evidenced by studies conducted since the 1930s, the depopulation phenomenon of the Lombard mountains - and generally Italian - in favor of the urban context reflected a clear signal of unease in mountain areas. The latter, physically separated from the city, represent both distinct geographical spaces and valuable contexts of our cultural and historical heritage. However, their physical distinction shouldn't result in a conceptual division, but rather in a harmonious continuum where past and present intertwine in a fruitful dialogue.

A direct consequence of depopulation are the so-called "landscapes of abandonment," in which the identity bond between the local community and its home territory is broken, especially by the decrease in agroforestry activities that define both the village economy and the connotative historical physiognomy of the mountain building.

This is where the archaeology of historic buildings comes in: through interdisciplinary methodologies, it offers tools to reinterpret and enhance the historical heritage with the aim to restore its own meaning to that spontaneous and vernacular architecture, seen as the result of centuries of adaptation to the environmental, social and cultural conditions of a given context. Its preservation and enhancement must go beyond mere static conservation to embrace a more dynamic idea of reappropriation and reuse, in which even ruins can become places of vitality, capable of accommodating new functions and meanings in the contemporary context.

Aiming at a participatory archaeology, the research conducted as part of the project "Archeologia dell'edilizia storica in provincia di Bergamo," promoted by Università Cattolica di Milano and Fondazione Lemine di Almenno San Bartolomeo (BG), in synergy with local administrations, is focused on the census and mapping of medieval buildings still preserved, both to reconstruct the urban evolution of settlements and deepen knowledge on those architectures considered minor by focusing on their preservation.

NEW INSIGHT ON OCHRE USE DURING THE BRONZE AGE OF MOLISE REGION: THE REMAINS OF PIANA DI LARINO (CAMPOBASSO, ITALY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Catelli, Eliana (Independent researcher) - Santone, Maria Chiara (SOPRINTENDENZA ARCHEOLOGIA, BELLE ARTI E PAESAGGIO PER IL MOLISE)

Abstract format: Poster

Although ochre is well-documented in several domestic and funerary contexts for functional purposes and/or in symbolic-ritual activities with a powerful cultural significance, ochre pieces were still missing from the Molise archaeological record. Some ochre traces are cited in literature from Isernia La Pineta site (Cremaschi & perfetto, 1988), one of the key sites in the Italian prehistoric panorama, but no anthropically modified ochre pieces have currently been documented in Molise. Here we present some ochre remains found at the site of Piana di Larino (CB) from Bronze Age layers in association with lithics, pottery, faunal remains and fragments of pisè with traces of impressed reeds proving the existence of hut structures unfortunately not found in situ. These anthropically modified ochre pieces represent the first clear evidence of ochre exploitation in the Prehistory of Molise. The use-wear traces on surfaces and the presence of crayon-like shaped pieces provide an intentional use of this mineral resource during of Bronze Age. This confirms the importance of this raw material for ancient communities and documents ochre exploitation over time. Furthermore, the presence of these findings highlights the importance of ancient pigment analysis focused on materials that are not always readily accessible in open-air settings and even more so in emergency archaeological excavations, as is the case here. For this reason, here we will report the results of an integrated study combining macro use-wear analysis and mineralogical and geochemical characterization in order to establish raw materials and how they were used.

ARCHAEO LAB: UNVEILING ARTEFACT HISTORIES IN DEVELOPMENT-LED ARCHAEOLOGY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Bye Jensen, Peter (Vejle Museer) - Ravn, Mads (Vejle Museer)

Abstract format: Poster

ArchaeoLab specialises in archaeological analysis within development-led projects, utilising the artefact biography concept to achieve a deep understanding of artefacts and their historical contexts. Our primary analytical techniques include use-wear analysis of stone artefacts and archaeometallurgy, which enrich our comprehension of prehistoric human activities and technological evolution.

Our research is highlighted through two key studies. The first examines use-wear and post-depositional surface modifications on flint tools from Early Neolithic causewayed enclosures in Southern Britain and Southern Scandinavia. This study provides insights into the lifecycle of these tools—from production to disposal—and their functional and societal roles within Neolithic communities, thereby revealing depositional practices and broader cultural implications.

The second study focuses on a late mediaeval-early modern smithy in Stouby, Denmark (AD 1486-1573). It investigates diverse smithing techniques, the coexistence of local and imported iron, and the early use of mineral coal, offering insights into the technological and economic dynamics of the period.

Our methodological framework, centred on the concept of artefact biography, extracts extensive data from each artefact, constructing a comprehensive narrative of its historical journey. This analysis enhances our understanding of the artefacts' utilitarian and cultural significances within their broader historical contexts. Through these detailed artefactual studies, ArchaeoLab contributes significantly to the field of development-led archaeology, demonstrating how artefact life narratives can illuminate the complexities of past human societies across various timelines and geographies.

GENETIC ANALYSIS OF PRE-COLUMBIAN INDIVIDUALS FROM SOUTHEASTERN SOUTH AMERICA: INSIGHTS FOR EVOLUTIONARY HISTORY AND CULTURAL HERITAGE PROTECTION

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Ciervo, Micaela (University of Florence) - Modi, Alessandra (University of Florence) - Lari, Martina (University of Florence) - Caramelli, David (University of Florence) - Marciani, Giulia (University of Bologna) - Higgins, Owen (University of Bologna) - Carbonera, Mirian (Universidade Comunitária da Região de Chapecó) - Loponte, Daniel (Região de Consejo Nacional de Investigaciones Científicas y Técnicas - Instituto Nacional de Antropología y Pensamiento Latinoamericano.) - Benazzi, Stefano (University of Bologna) - Milheira, Rafael (Departamento de Antropologia e Arqueologia e Programa de Pós-graduação em Antropologia da Universidade Federal de Pelotas. Laboratório de Ensino e Pesquisa em Antropologia e Arqueologia (LEPAARQ/UFPel), Pelotas, RS, Brasil)

Abstract format: Poster

The Southeastern region of South America is currently undergoing a significant anthropogenic changes due to the large agro-industrial growth in recent decades. However, this is an extremely important region for studying the evolutionary dynamics and settlement of pre-Columbian societies. As a consequence, several projects to preserve the cultural and archaeological Heritage of the area are carried on. In this contest, ASSA program (Archaeology of Southeastern South America) aims to reconstruct the history and evolution of pre-colonial societies and to introduce different strategies for the protection of the archaeological and cultural heritage. In this perspective, paleogenetic studies provide an important contribute for reconstructing the genetic history of the indigenous peoples, and play a significant role to promote their cultural heritage. Here we present a paleogenetic study carried out on 39 individuals excavated in 10 different archaeological site from Argentina and Brazil, dated from 1880 BP to 350 BP. After a preliminary genetic analysis of the remains, we were able to assess the preservation of genetic material in an unfavorable environment, such as the sub-tropical region. Based on these results, 25 individuals were enriched for human mitochondrial DNA. Despite a certain degree of modern human DNA contamination in some individuals, we were able to reconstruct the complete mitochondrial genome from the majority of the individuals. All sequences fall within the variability of the A, B, C, and D haplogroups that are mitochondrial lineages typical of Native American populations. Phylogenetic trees were constructed in order to confirm the phylogenetic position of the newly reported sequences in the frame of modern and ancient mitochondrial variability of South America.

ECOLOGIES OF VIOLENCE: HERITAGE AND CONFLICT IN MORE-THAN-HUMAN-WORLDS

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Breithoff, Esther (Birkbeck, University of London) - Leonard, Matthew (Birkbeck, University of London) - Renshaw, Layla (Kingston University)

Abstract format: Poster

This poster presents the international multidisciplinary research project Ecologies of Violence: Heritage and Conflict in More-Than-Human Worlds, which uses archaeological, historical and ethnographic research as well as vitalist/'more-than-human' frameworks to critically investigate how landscapes remember past violence against both culture and nature, and how these social, material and biological scars persist in the contemporary world in the form of toxic landscapes, alongside varied attempts to regenerate them. It does so by exploring three case studies: 1) the continuing impacts of the US bombing of Laos during the 'Secret War' (1964-73), and ongoing consequences of UXO clearing activities on natural and cultural heritage in Laos to understand how both nature and culture have been and continue to be shaped by both exploded and unexploded ordnance; 2) the enduring consequences of infrastructural violence undertaken during Paraguay's dictatorship (1954-89) on natural and cultural heritage in the country via the

widespread clearance for agriculture, and the associated destruction of forests, Indigenous territory, flora and fauna; 3) the ongoing challenges of the conservation and management of First World War military heritage in France's 'Zone Rouge' – an area deemed too geographically and ecologically annihilated and contaminated for human occupation – and the repercussions of this heritage for contemporary agricultural landscapes in the region. In collaboration with a range of local and international organisations and NGOs, Ecologies of Violence uses a holistic and comparative approach to explore the lasting impacts of twentieth century violence on both natural and cultural heritage across three different continents, and how this in turn affects local communities. In doing so, the project investigates how these past/local impacts relate to issues of present/planetary concern, including the climate emergency, environmental pollution, and ongoing issues of global social and economic inequality.

735 UNVEILING THE MYSTERIES OF AN EGYPTIAN FELINE MUMMY THROUGH CT EXAMINATION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Amendola, Michela (Institute of Applied Physics) - Ikram, Salima (Department of Sociology, Egyptology and Anthropology - The American University in Cairo, Egypt) - Lippi, Donatella (Department of Experimental and Clinical Medicine - University of Florence, Firenze, Italy) - Argenti, Fabrizio (Department of Information Engineering - University of Florence, Firenze, Italy) - Carpi, Roberto (Department of Radiology, Azienda USL Toscana Centro, Firenze, Italy) - Cucci, Costanza (Institute of Applied Physics) - Fattorini, Valter (Museo Etnologico Missionario Francese di Fiesole, Firenze, Italy) - Prates, Carlos (IMI / Affidea, Lisbon, Portugal) - Zini, Chiara (Department of Radiology, Azienda USL Toscana Centro, Firenze, Italy) - Barucci, Andrea (Institute of Applied Physics)

Abstract format: Poster

Much of the fascination surrounding Egyptian civilization is linked to the practice of mummification. Indeed, to ensure the preservation of the body, the ancient Egyptians mummified both human and animal subjects. Despite their integral role in Egyptian material culture and history, mummified animal remains have often been overshadowed by their human counterparts in academic investigation. However, recent advancements in non-invasive imaging techniques, notably computed tomography (CT), have revolutionized the study of these enigmatic artifacts. This study centers on the analysis of a cat mummy housed at the Museo Etnologico Missionario di San Francesco di Fiesole in Florence, Italy—an exemplar of the broader significance of Egyptian mummification practices. Through CT examination, the once-obscured contents of the mummified bundle are revealed, showcasing the complete skeletal structure of the feline subject. Notably, the CT scans unveil evidence of fractures, particularly in the cervical region, hinting at possible causes of death. Furthermore, the anthropological analysis has allowed to identify the age-at-death of the cat, providing further information about the story of the mummy. This research not only advances our understanding of mummification practices but also underscores the crucial role of CT imaging in elucidating the mysteries of ancient Egyptian mummies. By emphasizing the importance of CT scans in humanistic studies and museum contexts, this study contributes to the ongoing exploration of Egypt's rich cultural heritage.

738 CONCEPTUALISING TIME AND SPACE IN THE MORPHOLOGY OF HISTORIC URBAN CENTERS: THE CASE STUDY OF NW HISPANIA ROMAN WALLS

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Machado, Diego (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território; Laboratório Associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território; Fundação para a Ciência e Tecnologia) - Magalhães, Alexandre (Universidade do Minho) - Folgueira Ríos, Francisco (Universidade de Santiago de Compostela) - Fernandes, João (Universidade do Minho) - Back, João Vinícius (Universidade do Minho; ERGANE Arqueologia Digital/Universidade Federal do Rio Grande do Sul; Universidade de Évora) - Moura, Ruben (Universidade do Minho) - Dias, Bruno (Universidade do Minho)

Abstract format: Poster

Archaeological activity in urban centres, especially from the second half of the 20th century onwards with the expansion of construction activity in the cities affected during the Second World War, called for greater reflection on the part of various scientific areas, such as Archaeology, Urban Planning, History, Geography and Architecture, in order to develop a theoretical and conceptual approach that would provide useful tools for analysing the historical construction of urban centres. At that time, the concept of palimpsest was used as a metaphor to express the preservation and permanence of the past under the guise of the present, as well as the reading and explanation of the process of formation and historical development of the urban landscape inscribed in the subsoil of cities through successive layers that document the passage of time.

Although undeniably positive for the theoretical and instrumental framework of archaeological action in urban environments, the concept of palimpsest has its limits. While it can conceptually explain the phenomena of overlapping layers and structures, such as the fills that fill in an abandoned building, it cannot provide answers to the processes

in which the past and the present are arranged differently. An alternative to the palimpsest is brecciation, proposed by Nadia Bartolini, who uses the process of consolidation of breccia as a metaphor capable of explaining situations in which transformations in urban landscapes occur through the juxtaposition of their built elements.

In this poster we propose analysing the historical evolution of the Roman walls of the cities of Bracara Augusta and Lucus Augusti, in north-west Hispania, considering the concepts of palimpsest and brecciation. We believe that using this conceptual framework makes it possible to better analyse the transformations of these structures and provides more effective tools for their historical and urban planning framework.

739 DIGGING DEEPER: INVESTIGATING MICROBIAL COMMUNITIES AND ANTIBIOTIC RESISTANCE IN THE ENVIRONMENT OF AN 18TH-CENTURY SLAUGHTERHOUSE, TURKU, FINLAND

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Maunula, Minna (University of Helsinki) - Mäkinen, Taru-Marja (University of Helsinki) - Uotila, Kari (Muuritutkimus Oy.) - Hultman, Jenni (Natural Resources Institute Finland) - Bogdanov, Kirill (University of Otago) - Virta, Marko (University of Helsinki) - Bläuer, Auli (University of Turku) - Auvinen, Petri (University of Helsinki) - Muurinen, Johanna (University of Helsinki)

Abstract format: Poster

Microbes are considered the first living organisms on Earth, slowly evolving and adapting to different environments. However, a much more recent inhabitant of the planet, Homo sapiens, has influenced their evolution. This influence has caused and still causes many environmental changes, the most significant of which has been the introduction of agriculture. The role of anthropogenic activities in the evolution of microbial communities and antibiotic resistance is unclear. Antibiotic resistance is also known to be ancient, as microbes have always produced antibiotics. However, the role of antibiotic-producing bacteria in the development of resistance is unknown. Manure and garbage piles are habitats where both antibiotic producers and bacterial pathogens thrive, providing an excellent opportunity to study the role of producers in the emergence of antibiotic resistance.

This study aims to shed light on the evolution of antibiotic resistance through the history of agriculture. Here, we investigate microbial communities, antimicrobial resistance genes (ARGs), and potential antibiotic-producing bacteria (APB) from the environment of an 18th-century slaughterhouse in Turku, Finland.

A total of 12 samples were collected from archaeological excavations, from which total environmental DNA was isolated and shotgun sequenced to determine the microbial communities and antibiotic resistance profiles. In addition, APB, which can remain as dormant spores for centuries, were cultivated from the samples. A total of 29 APB were isolated for whole genome sequencing, which will allow us to analyze the genomes of these isolates and identify the ARGs the bacteria harbor. By examining the genetic environment of the ARGs in the isolates, we can determine whether these genes are mobile and thus linked to the evolution of antibiotic resistance. In this poster, we present our current and developing results, which will elaborate our understanding of the impact of agriculture on the emergence of antibiotic resistance.

740 DECIPHERING HISTORICAL LANDSCAPES: A MULTI METHODOLOGICAL ARCHAEOGEOGRAPHICAL INVESTIGATION IN CASTRONOVO DI SICILIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Carver, Martin (University of York) - Orecchioni, Paola (University of Rome Tor Vergata) - Ciccone, Gabriele (University of Rome Tor Vergata)

Abstract format: Poster

The ERC Sicily in Transition project undertook an archaeogeographical study of the area pertaining to the current municipality of Castronovo di Sicilia in central Sicily, aiming for a comprehensive landscape analysis in order to identify possible dynamics of transformation of the historical landscape attributable to different political regimes, 3rd-13th century CE. The investigation employed diverse methodologies, including statistical road network analysis (Least Cost Path Analysis), fortification site visibility studies (Viewshed Analysis), parcel system examinations through historical cartography and aerial imagery, and the innovative use of drones with advanced sensors for the identification of new archaeological elements through multispectral, thermal, and microtopographic analysis. These approaches not only deepened our understanding of Castronovo's pivotal role in Sicily's road network, highlighting distinct differences between Roman, Byzantine, Islamic and Norman periods but also provided a more detailed picture of the topography of the Byzantine fortification of Kassar, a key feature of the landscape of Castronovo di Sicilia. This comprehensive study significantly advances our study of the historical, political, and geographical factors that have defined this region, a core aspect of the ERC project.

741 PUBLIC ARCHAEOLOGY AT THE PILE-DWELLING SITE OF SAN GIORGIO AND SANTA MARIA (REVINE-LAGO, TARZO, TREVISO, ITALY)

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: MODOLO, MARTA (University of Ferrara) - FATTOREL, LORENZO (Freelance Architect) - ZAMBON, EMMA (University of Padua) - GHELLI, ALESSANDRO (University of Padua) - SPERI, RICCARDO (University of Padua) - TONELLI, LUDOVICO (University of Padua) - ORTONE, NICOLE (University of Padua) - CONTE, GIULIA (Freelance archaeologist)

Abstract format: Poster

The lakes of San Giorgio and Santa Maria are two basins located in a glacial valley at the Veneto Pre-Alps' foothills in the Revine-Lago and Tarzo municipalities (Treviso, Italy). Archaeological pre-existence dates to 1923, when a Sauberbrunn bronze sword was found while excavating an artificial canal, followed by other artefacts. In 1987, the first pile-dwelling remains were discovered, and during the 1990s, several excavation campaigns documented a peri-lacustrine settlement dating to the late Neolithic-Eneolithic. Since 2019, as part of the reLacus project, the University of Ferrara has undertaken a new phase of multidisciplinary research in collaboration with the University of Padova. A series of non-invasive geophysical surveys, underwater prospections, geoarchaeological cores, and archaeological excavations were carried out to identify new settlement areas and reconstruct formation processes and paleoenvironment.

Beyond scientific research, dissemination and understanding of archaeological heritage among non-professionals represents one of the objectives of our work. Consciousness toward scientific research, the protection of cultural heritage, and the opportunities offered by culture for territorial sustenance allow the creation of awareness and various collaboration possibilities. We regularly organise workshops and guided tours to the excavation area for the regional territory's schools and groups from the Parco Archeologico Didattico del Livelet. One of the latest activities, in partnership with a surroundings association, allowed even the most vulnerable people to learn about this important archaeological context through a specially dedicated guided tour. Constant contact with cultural media, whether regional, national, or international, further contributes to disseminating research status, progress, and the findings' singularity. Furthermore, these topics and the planned initiatives are regularly made known through the project's website and Facebook and Instagram pages.

744 LIVING CONDITIONS PRIOR TO ROMAN CONQUEST: BIOARCHAEOLOGICAL EVIDENCE FROM THE CASTEL DI DECIMA NECROPOLIS

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Guidi, Eveline (Department of Antiquities, Sapienza University of Rome, Italy) - Cecconi, Viola (Independent researcher, Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome, Italy) - Fiore, Ivana (Department of Environmental Biology, Sapienza University of Rome, Italy) - Rossetti, Daniele (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy) - Candilio, Francesca (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy)

Abstract format: Poster

The necropolis of Castel di Decima (Rome, Italy) was identified in 1953 along the route of the Via Pontina (SS 148) in a suburb that now falls within the municipality of Rome. The settlement enjoyed a strategic position along the route that connected Rome and Lavinium, a location that suggested its identification with the ancient city of Politorium. This hypothesis was further supported by studies of the grave goods of the necropolis, which denote a period of use between 750 and 600 BCE, the latter date that historically corresponds to the one attributed to the conquest of Politorium by Rome under Anco Marzio. The particular significance of the site lies in the articulation of the funerary ritual and the richness of its grave goods, which include imports as well as symbols of social status, such as war chariots. The distribution of the burials and the nature of the grave goods help identify the eminent individuals in the community and the possible familial organization of the funerary space.

To initiate the characterization of the population burying their deceased at the necropolis of Castel di Decima, the present study analyzes the osteological remains preserved at the Museo delle Civiltà in Rome. Despite the compromised conditions by which individuals are, in most cases, represented exclusively by dental crown fragments, data were collected for demographic parameters as well as dental morphology, oral health, early stress indicators, and non-masticatory use, through both macroscopic and microscopic analyses.

745 MARINE MAMMALS AND BODY ORNAMENTS IN THE UPPER PALAEOLITHIC: RARE EXAMPLE OF A SEAL TOOTH PENDANT FROM KENT'S CAVERN, U.K

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Crété, Lucile (Natural History Museum London) - Bello, Silvia (Natural History Museum, London) - Parfitt, Simon (Natural History Museum, London; Institute of Archaeology, University College London)

Abstract format: Poster

While personal ornaments, such as beads and pendants, played a crucial role in Upper Palaeolithic societies to represent social status, cultural identity, and individual expression, Palaeolithic marine mammal tooth pendants are exceptionally rare objects. This study describes an extensively worked, polished, and perforated grey seal tooth (*Halichoerus grypus*) discovered in 1867 at Kent's Cavern (Devon, UK). This is a unique find within the British Upper Palaeolithic archaeological record, although it bears similarities with a few other artefacts found in Magdalenian contexts in France. Our analysis of the Kent's Cavern seal tooth pendant integrates zooarchaeological methods with 3D surface imaging and micro-CT scanning techniques to shed light on the manufacturing process, use, and post-depositional history of this artefact. It shows the specimen displays extensive bilateral thinning of the root and a perforation made with a hand-held flint boring-tool, and bears wear patterns suggesting that the tooth was worn as a pendant suspended from a cord and used as a necklace for an extended period before its deposition at the cave's entrance. While today Kent's Cavern overlooks the English Channel, seal colonies may have been located up to 400 km to the southwest during the glacially-lowered sea-levels of the Last Cold Stage. The presence of 'exotic' marine mammal artefacts such as the Kent's Cavern seal pendant and similar occurrences of marine fauna at Magdalenian inland sites raises questions about their acquisition and their significance for prehistoric populations. While these could have been exchanged between groups through networks, they could have also been acquired from coastal regions and transported to occupation sites through long-distance seasonal migrations.

749 THE CITY OF OSOR IN THE MATRIX OF THE ADRIATIC SEA ROUTES

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Fera, Martin (VIAS - Vienna Institute for Archaeological Science, University of Vienna) - Doneus, Nives (VIAS - Vienna Institute for Archaeological Science, University of Vienna) - Blečić Kavur, Martina (University of Primorska, Faculty of Humanities) - Kavur, Boris (University of Primorska, Faculty of Humanities)

Abstract format: Poster

The project "Osor beyond the myth" focuses on the Iron and Roman Age town of Osor at the meeting-point of northern Adriatic islands Cres and Lošinj, Croatia. The role as a maritime node since the Iron Age emerges from spectacular finds, as these include a whole range of goods originating from the Pannonian Plain to Greece. 100 years of tradition also produced numerous interpretations, although hardly any details are known about the coastal setting and the navigability around the city. Therefore, the project addresses the question of whether the maritime role of the city, as indicated by trade goods, can be supported by its landscape context.

The project will develop a combined approach that can do justice to the cultural, landscape and marine aspects of the site across the border between the land and the sea. Provenance studies are the starting point for analyses of the material evidence of the trade and related "visibility" of Osor on maritime routes. The backbone of the landscape-based approach is the use of airborne laser scanning, airborne laser bathymetry, terrestrial and underwater geophysical prospection and geoarchaeological research for data acquisition behind vegetation, sediments and seawater. New results will provide detailed evidence of the coastal and marine conditions that would have affected the navigation and allow for a fact-based discussion of the extent to which human intervention in the landscape was needed to support Osor's role in the region.

Finally, provenance analyses of traded goods will place the city of Osor in the matrix of regional and transregional maritime networks.

751 GRAVES? RITUAL USE OF BONES AND BONES AS MATERIAL CULTURE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Andreasson, Kajsa (Arkeologerna, statens historiska museer) - Claesson, Pia (Arkeologerna, Statens historiska museer) - Lennblad, Astrid (Lödöse museum) - Paring, Maria (Arkeologerna, Statens historiska museer)

Abstract format: Poster

Graves and their content have been the focal point of research throughout the history of archaeology. In recent years, the fragmented manner of the archaeological burial material has formed part of grave archaeology, often under the name *pars pro toto*, as in "the part (may apply) to the whole".

Based on recently excavated bronze and iron age burial monuments in western Sweden, it is indisputable that the bones found seldom represent a human skeleton in its entirety. What we see is a mess of cremation material and finds that seem to be strewn haphazardly, the material apparently incomplete. Everything seems to be in pieces: the bones of individuals (sometimes crushed), fragments of ceramics, and other artefacts, broken and destroyed. This seemingly messy and fragmented manner of the material raises the question: when cremated human bones are used in different archaeological contexts, how do we define graves? Is it perhaps time to further explore our ingrained concept of a grave, a concept largely shaped by our modern perceptions and traditions around death. If what we are excavating are not graves, then where are they?

This poster will present a comparative case study of excavations in western Sweden where the presence of cremated bones was interpreted as a part of the material culture. The intent is to shed light on this phenomenon, and therefore bones as material culture and the definition of the term "grave".

753 **ARCHAOMETRIC ANALYSIS OF ROMAN MOSAIC AND FRESCO FRAGMENTS FROM AQUILEIA: INSIGHTS INTO SUBURBAN SETTLEMENTS**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Traviglia, Arianna (Istituto Italiano di Tecnologia) - Stucchi, Neva (Istituto Italiano di Tecnologia) - Lamuraglia, Raffaella (Istituto Italiano di Tecnologia) - Franceschin, Giulia (Istituto Italiano di Tecnologia)

Abstract format: Poster

This poster presents the results of an archaeometric study conducted on mosaics and fresco fragments unearthed during archaeological fieldwalking surveys in the suburban region of Aquileia, a prominent Roman city situated in northeastern Italy. While mindful of the challenges associated with dating materials collected from surface prospection, characterization and careful examination of these fragments offer valuable insights into the typology of the site where they were discovered, along with providing broad chronological information.

Archaeometric investigation has yielded valuable insights into the composition of both mosaics and frescoes, shedding light on the raw materials utilized and their probable origins. The selection of specific marble types for mosaic composition or the use of particular pigments for fresco production [e.g., Cinnabar] can, in turn, offer valuable clues regarding the wealth of the commissioner and the level of craftsmanship they could afford. Furthermore, analyzing the layering of materials can contribute to determining the potential dating of the material, as exemplified by the characterization of the stratification of frescoes.

Information generated from the archaeometric analysis of mosaic and fresco fragments is then combined also with data and dating from other diagnostic materials such as glass, coins, and specific types of ceramics recovered at the same location to attempt to extract correlations from the co-occurrence of these materials within a single context as part of an archaeological assemblage. The outcome is a nuanced mapping of the settlement within the suburban areas of the Roman city.

754 **BUTCHERY PRACTICES IN THE ROMAN WORLD: THE CASE OF CURED BEEF SHOULDER**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Platts, Tracy (University of Sheffield)

Abstract format: Poster

Specific butchery marks on cattle scapulae have long been documented in Roman period faunal assemblages from the north-western provinces (e.g. Schmid, 1972; Lauwerier, 1988; Dobney, et al., 1996). Marks include perforated or 'hook-marked' scapula blades, chopped and trimmed glenoid cavities and spina, and shave marks on the scapula borders, and are widely described as evidence of cured beef shoulder. Interpretations differ in some regions, but the evidence is uniform in appearance and technique and suggestive of a systematic practice. The evidence is widespread in the north-western Empire but is largely unreported in other areas of the central and southern provinces, including Italy itself.

Prior to this research, the geographical and temporal origins and dissemination of this practice had not been fully investigated. This has been addressed through targeted recording of faunal assemblages from different site types, areas, and time periods from central and north-western Europe. Raw data provided by other zooarchaeological researchers and evidence from literature were also included in analyses to supplement the dataset.

Evidence suggests that cured beef shoulder did not originate in the Roman period but was already a local culinary tradition in areas of the north-western Empire, including present-day Netherlands and the Alpine region, where it is present in pre-Roman faunal material and in a variety of Roman period site types including one north of the Danubian limes. Evidence suggests the practice was adopted and disseminated by the Roman military, possibly via auxiliary and legionary soldiers from these areas. Although previously believed to be absent, some evidence of the practice is present in Roman sites from Iberia and central Italy.

The research has clarified the geography of this practice beyond previous knowledge and lay the foundations for further study of the cultural relationship between the expanding Roman Empire and indigenous traditions.

755 **FAR FROM ANY ROAD: INTERPRETING THE TRANSRIVERINE PERIPHERY OF STRADONICE OPPIDUM IN THE CONTEXT OF LA TÈNE PERIOD SETTLEMENT**

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Dycka, Michal (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Venclova, Natalie (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Dreslerova, Dagmar (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

Abstract format: Poster

The Archaeological Information System of the Czech Republic (AIS CR) is a tool designed to integrate digital resources on Czech archaeology. With more than 70,000 individual records of archaeological fieldwork, its content is an excellent example of big data. This poster aims to demonstrate, through a case study, how to evaluate such a dataset spatially. The focus is on the site of Nižbor, situated across from the Stradonice oppidum on the left bank of the Berounka River in the Křivoklátsko Protected Landscape Area, Central Bohemian Region, Czech Republic. A brief archaeological investigation documented a sunken hut along with the skeletal remains of an older man within its fill – an obvious example of excarnation. Both radiocarbon dating and relative dating of the pottery assemblage support a 2nd-century BC dating of the site, contemporaneous with the nearby oppidum. The central question stands: why was there a peripheral settlement situated in this marginal spot? Is it a testimony of an unknown fording place? A solitary house or part of an unknown larger settlement? The case study focuses on evaluating the spatial distribution of La Tène period settlements within a 50 km radius around Nižbor via the Cumulative Focal Mobility Network (CFMN), using the Digital Terrain Model of the Czech Republic of the 5th generation (DMR 5G) and the Model of Potential Floodplains in the Czech Republic, together with data from the Archaeological Information System of the Czech Republic (AIS CR). As a result, we present a regional settlement map contextualized within natural mobility corridors, thereby enhancing our understanding of La Tène period settlement distribution and its broader implications for landscape archaeology.

756 **MARBLE HERM FROM THE COLLECTION OF CARDINAL DA CARPI - THE SEARCH FOR THE HEAD OF THE GODDESS HECATE**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kucova, Stanislava (National Heritage Institute, Czech Republic; Masaryk University, Czech Republic) - Radostová, Šárka (National Heritage Institute, Czech Republic)

Abstract format: Poster

The marble herm of the goddess Hecate is an exceptional work of art from the beginning of the 2nd century AD. However, the statue is currently headless, and its head has been missing since the end of the 18th century. This paper provides the iconographic analysis and a description of the statue's antiquarian history and emphasizes the issues related to archival work and the effort in finding the missing part. The marble herm originally belonged to the collection of Cardinal Pio da Carpi and was formerly considered to be Venus with the Graces or the goddess Themis. Aldrovandi in 1550 described the herm as un termine with a female head and dancing figures. The identification of the work with the present torso was made possible by a drawing in the writings of the theologian Pighio (1568). From the estate of Cardinal da Carpi, the statue came into the possession of Cardinal Perrenot de Granvelle in Besancon, and then, at the request of Emperor Rudolf II, into his collection in Prague, this time with the head. After its stay in the Rudolphine collection, the statue was in the possession of the Czernin family and today is located in the Czech Republic at the state castle Jindřichův Hradec. Authors in the 20th century already classified the statue as a hecataion. An attempt was made to supplement the hecataion with a head matching the style of the Moravian Museum, formerly from the collections of the castle Lysice, but it was not successful. The poster addresses the question of when the head was damaged and lost and whether it would be possible to trace it and exemplifies the possibilities of a virtual assemblage of this ancient sculpture.

757 **MURANO COMMUNITY IN THE LIGHT OF EXCAVATION OF THE 17TH CENTURY CEMETERY NEAR BASILICA DEI SANTI MARIA E DONATO**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Zukowski, Robert (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Abstract format: Poster

Basilica dei Santi Maria e Donato is a jewel of Venetian Romanesque architecture of the Ravenna type. Most likely, as a church, it was erected in the 7th century, but written sources date it only at the very end of the 10th century.

The oldest record confirming the existence of the church is a document signed in February of the year 999. The name „ecclesia baptismalis” appearing in the written sources indicates that already in the 11th century the church was accompanied by a baptistery that has not been preserved.

An indirect and additional confirmation of the hypothesis about the baptistery on the west side of the church is the current shape of the square in front of the façade of the Basilica in Campo San Donato.

It is very surprising that the presence of a building of this type in front of the basilica at the end of the 15th century is not confirmed by a detailed plan of Venice from around 1500 by Jacopo De'Barbari, but the last information about former baptistery relates to its final demolition in 1719.

The archaeological prospection revealed however that in the 17th century the square in front of basilica, where the remains of baptistery were still visible, was mainly used as a church cemetery. During the excavation 46 skeletal burials have been discovered, several of them in a secondary deposit.

Finds such as glass beads, personal adornment items in form of crosses and a medallion with inscription GIESU E MARIA VI DONO IL CUORE E LANIMA MIA give us an insight into the life of the community inhabiting Murano Island in the beginning of Modern Era in Italy.

759 **TRANSDISCIPLINARY STUDIES ON HUMAN PAST: THE EXAMPLE OF A NEW PROJECT ESTONIAN ROOTS**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Tambets, Kristiina (University of Tartu, Faculty of Science and Technology, Institute of Genomics) - Kushniarevich, Alena (University of Tartu, Faculty of Science and Technology, Institute of Genomics) - Klumpp, Gerson (University of Tartu, Faculty of Arts and Humanities, Institute of Estonian and General Linguistics) - Norvik, Miina (University of Tartu, Faculty of Arts and Humanities, Institute of Estonian and General Linguistics) - Saarma, Urmas (University of Tartu, Faculty of Science and Technology, Institute of Ecology and Earth Sciences) - Sarv, Mari (Estonian Literary Museum) - Tõrv, Mari (University of Tartu, Faculty of Arts and Humanities, Institute of History and Archaeology; University of Tartu, Faculty of Science and Technology, Institute of Chemistry) - Valk, Heiki (University of Tartu, Faculty of Arts and Humanities, Institute of History and Archaeology) - Veski, Siim (Tallinn University of Technology, School of Science, Department of Geology)

Abstract format: Poster

Starting in 2024, the Centre of Excellence (CoE) “Estonian Roots: Centre of Excellence for Transdisciplinary Studies on Ethnogenesis and Cultural Diversity” (Acronym “Estonian Roots”) has been established in Estonia. The synergy of Humanities and Natural Sciences allows the new CoE (2024–2030) to shed light on the formation of cultural and genetic diversity in Estonia and neighbouring areas in a vast transdisciplinary framework of genetics, archaeology, archaeozoology, archaeochemistry, linguistics, folkloristics and palaeoecology, unprecedented in its scope and capacity in the Eastern Baltics. CoE focuses on the evolution of peoples and cultures and their interactions with the environment on the eastern coast of the Baltic Sea since the first arrival of people after the Last Glacial Maximum. The 11,000 years of the settlement history will be analyzed in a novel areal and ecological context, allowing us to map the impact of abiotic (climate) and biotic (flora, fauna) factors on human cultures and populations, and making use of the existing and newly generated local dense datasets from different scientific sources. CoE facilitates synergistic approaches in archaeogenetics, archaeology, palaeoecology, and culture and language studies, enabling the synthesis of data on the region's populations and environment in the European context. In the poster, we will introduce our transdisciplinary framework of studying the human past to illuminate the prehistory of people in the current territory of Estonia and illustrate it with examples from some of the case studies. Further, we will discuss the challenges of bringing together the researchers, their data, methodologies, and perspectives on different scientific fields.

761 **BACK TO THE FUTURE. NEW DATA ON WESTERN-LUCANIA PREHISTORY FROM THE ARCHIVES OF R. ROSS HOLLOWAY'S AT THE BROWN UNIVERSITY**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Truffi, Michele (Dipartimento di Studi Umanistici - Università degli Studi Roma Tre; Associazione ORTA) - Nomi, Federico (Scuola Superiore Meridionale; Associazione ORTA)

Abstract format: Poster

The rethinking of old excavations and finds considering new analytical possibilities offered by the growing interdisciplinarity and technological advancements in archaeological research is a crucial theme of the third millennium.

Recently, within the framework of our research in Western Lucania, we succeeded in a rescue operation for the archaeological finds from the 1960s excavations conducted by Brown University in the Buccino territory (Salerno province, Italy). This research had highlighted significant sites for understanding the prehistory of the area. The Brown team, led by Prof. R. Ross Holloway, employed a multidisciplinary approach that was entirely innovative for its time. In addition to physical anthropology, archaeozoology, archaeometallurgy, and trace analysis on lithics, statistical-mathematical methods based on the digitization of findings were employed.

Here we present a topographic reconstruction of the archaeological evidence based on archival data within the main archaeological sites investigated by Brown: Sant'Antonio (Eneolithic) and Tufariello di Buccino (Middle Bronze Age).

The study aims at integrating the data of the artifacts recovered from the warehouses of the Soprintendenza and the archives of Holloway's excavation documents, now preserved at the Joukowsky Institute for Archaeology and the Ancient World.

The research will use archival data to reassign the artifacts and features to their exact location and to create a GIS of the archaeological sites under investigation. We will also re-examine the chronotypology of the artifacts to be inserted into the geodatabase, considering the discoveries made in the last 50 years.

This analysis serves as a basis for future research developments focused on the integration and revision of multidisciplinary data using updated methodologies, as well as the resumption of field investigations.

763 **ARE 70 YEARS TOO LATE? A FAIR ARTICULATION OF LEGACY DATA, ONLINE VISUALISATION TOOLS, AND REPOSITORIES: THE HARISTOY-OXOCELHAYA 1956 EXCAVATION**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Plutniak, Sébastien (Laboratoire CITERES-LAT; CNRS)

Abstract format: Poster

In 1955, Spanish archaeologist José Miguel de Barandiarán, exiled in France, and French archaeologists Pierre Boucher and Georges Laplace excavated the Haristoy-Oxocelhaya cave. One year before, G. Laplace discovered rock art in this part of the famous Isturitz cave complex located in the Basque Country.

This excavation featured one of the early applications of systematic 3D coordinating of archaeological remains, a method which was first published in 1954 by Georges Laplace and Louis Méroc. The Haristoy case study raises interesting issues both from a history of science and a digital archaeology perspective.

1) Although this dataset features outstanding accuracy, it has never been analysed at that time and in subsequent decades due to the lack of computing technologies to process it.

2) Furthermore, this dataset has never been published and has been kept in archived field notebooks so far.

However, the recent availability of new digital technologies and data infrastructures made a significant change in this situation. This example demonstrates a decentralised approach to data publication and editorialisation in archaeology, emphasising the use of open-source, FAIR, and non-profit resources, namely: open data repositories for data storage, semantic web technologies for data exposition, academic documentation systems for dissemination, and the “archoViz” application – an open-source software for the visualisation, exploration, and web communication of archaeological spatial data. This approach – applied to the Haristoy case – illustrates the widening of possible venues and perspectives articulating the reuse of legacy data and modern computing technologies.

764 **ARCHAEOLOGICAL SUBSOIL FEATURE DETECTION WITH HYPERSPECTRAL SATELLITE IMAGES: THE PERSEO PROJECT**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Poggi, Giulio (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Venezia, Italy) - Sech, Gregory (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Venezia, Italy) - Ljubenovic, Marina (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Venezia, Italy) - Fiorucci, Marco (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Venezia, Italy) - Traviglia, Arianna (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Venezia, Italy)

Abstract format: Poster

Hyperspectral images have been successfully used in archaeological prospection to enhance the visibility of surface traces and anomalies related to subsoil archaeological deposits. While most archaeological applications have predominantly utilised data from airborne sensors, satellite hyperspectral data represent a relatively novel frontier due to their lower spatial resolution, which compromises the detection of small-scale features prevalent in the archaeological and geomorphological domains. In this framework, the PERSEO project, conducted in partnership with the Agenzia Spaziale Italiana (Italian Space Agency), aims to develop and apply pansharpening techniques to enhance the spatial resolution of hyperspectral products. Particularly, the project focuses on the use of the PRISMA satellite, which provides 240 bands in the VNIR-SWIR range at a 30m Ground Sampling Distance (GSD), coupled with a panchromatic acquisition at 5m GSD. This contribution offers the first comparative evaluation of pansharpening techniques applied to PRISMA hyperspectral data in the context of geo-archaeological prospection, using multiple case studies from the Mediterranean region as benchmark tests.

Moving from top-performing baseline techniques and the development of novel approaches based on the HySure method, results were evaluated to assess the actual improvement in the detection rate of subsoil features introduced using a wide spectrum of information and a higher spatial resolution. The application to several case studies and different archaeological object classes offered the possibility to explore the implications of the use of these data in archaeological practice, evaluating their contribution compared to the use of alternative sensors, such as multispectral images. The results underscore the effectiveness of pansharpening, establishing satellite hyperspectral data as a promising tool for advancing geo-archaeological prospection.

765 **THE MEDIEVAL COMMUNITY OF SANTA SEVERA (ROME, 7TH-15TH CENTURY CE): PRELIMINARY PALAEOGENOMIC ANALYSIS**

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Orefice, Giulia (PhD Program in Evolutionary Biology and Ecology, Department of Biology University of Rome Tor Vergata, Rome, Italy; Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Rome, Italy) - Enei, Flavio (Museo Civico di Santa Marinella "Museo del Mare e della Navigazione Antica", Castello di Santa Severa, Rome, Italy) - Ottoni, Claudio (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Rome, Italy) - Martinez-Labarga, Cristina (Centre of Molecular Anthropology for Ancient DNA Studies, Department of Biology, University of Rome Tor Vergata, Rome, Italy)

Abstract format: Poster

This study aims to reconstruct the ancestry and kinship of Santa Severa's Medieval community.

The Castle of Santa Severa was built during the Medieval period overlying the Etruscan settlement of Pyrgi, which served as a pivotal hub that facilitated Mediterranean-wide trade for the Etruscan city of Caere. A Roman maritime colony was later established in the same location and was continuously occupied until the Middle Ages. Covering the ruins of Roman buildings, a large cemetery was discovered that was in use from the 7th to the 15th centuries CE. Excavation of the site revealed two cemetery areas: "Casa del Nostromo" and "Piazza della Rocca" dating to the Early and Late Medieval period, respectively. From a skeletal collection of 455 individuals, approximately 100 were selected based on archaeological and anthropological information. The archaeological survey also highlighted several sarcophagi containing multiple burials, suggesting potential kinship relationships among the individuals.

The primary objective of this project is to perform molecular analyses on skeletal remains to evaluate the genetic composition of the Medieval population from Santa Severa, and to assess the relationships between the two cemetery areas. Additionally, the study aims to evaluate potential family ties among individuals from multiple burials.

Preliminary sequencing at shallow depths have been conducted to investigate the degree of DNA preservation in the skeletal remains. The raw sequencing data have been processed using bioinformatic pipelines specifically developed for ancient DNA analysis. In this context, we present the preliminary palaeogenomic analysis of Santa Severa's Medieval community. Future steps will involve deep shotgun sequencing or targeted enrichment to reconstruct genome-wide variation in the individuals under investigation.

766 **BOYS AND GIRLS IN THE BRONZE AGE EUROPE: BURIAL PRACTICES AT THE MOKRIN NECROPOLIS (2100-1800 BC)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kreckovic Gavrilovic, Marija (University of Belgrade) - Amzirkov, Mina (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade) - Porčić, Marko (Faculty of Philosophy, University of Belgrade) - Rebay-Salisbury, Katharina (Austrian Archaeological Institute) - Kanz, Fabian (Unit of Forensic Anthropology, Medical University of Vienna, Austria) - Wolf, Michael (Department of Analytical Chemistry, University of Vienna) - Milašinović, Lidija (Narodni muzej Kikinda) - Stefanović, Sofija (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)

Abstract format: Poster

The position of children in prehistoric societies has been under-researched so far, and the influence of the biological sex on their growth, development and social status is almost completely unknown. They remain an important missing variable in the investigation of the interplay between biological sex and social status in past societies. This could help us gain new understanding of kinship relationships, boundaries between childhood and adulthood and means of inheriting and/or achieving status.

The complex problem of the materiality of sex and gender of children was further exacerbated by the lack of reliable and affordable methods for determination of sex in children. In INFANO project, to bridge this gap, we are utilizing a proteomic analysis of peptides AMELY and AMELX to determine biological sex in 58 children from an Early Bronze Age necropolis Mokrin in Northern Serbia. This Maros site is known for a strict norm in the funerary ritual which hinges on sex, shown in almost strict binary gender normativity of body treatment and grave inventory for adult men and women. Our hypothesis is that binary gender will be evident in the graves of children as well. Here we present the grave inventory of boys and girls buried at Mokrin, and discuss if there are sets of grave items that are gender specific and if those sets are the same for boys and men and girls and women.

767 **A PRELIMINARY STUDY ON THE EFFECTS OF CHILDHOOD ADVERSITIES IN THE MEDIEVAL POPULATION OF LEOPOLI-CENCELLE (RM, 9TH-16TH C.E.)**

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Galfano, Federica (PhD Program in Evolutionary Biology and Ecology, Department of Biology, University of Rome "Tor Vergata", Rome, Italy; Center of Molecular Anthropology for ancient DNA studies, Laboratory of Skeletal Biology and Forensic Anthropology, Department of Biology, University of Rome "Tor Vergata", Rome, Italy) - De Angelis, Flavio (Department of Biology, California State University Northridge, Northridge, USA; Department of Mental, Physical Health, and Preventive Medicine, University of Campania "Luigi Vanvitelli", Naples, Italy) - Marchi, Damiano (Department of Biology, University of Pisa, Pisa, Italy) - Maccioni, Francesca (Department of Radiological, Oncological and Anatomical-pathological Sciences, Sapienza University of Rome, Rome, Italy) - Casagrande, Giulia (Department of Classics, Sapienza University of Rome, Rome, Italy) - Annoscia, Giorgia (Department of Classics, Sapienza University of Rome, Rome, Italy) - Gazzaniga, Valentina (Department of Sciences and Medico-Surgical Biotechnologies, Sapienza University of Rome, Rome, Italy) - Martínez-Labarga, Cristina (Center of Molecular Anthropology for ancient DNA studies, Laboratory of Skeletal Biology and Forensic Anthropology, Department of Biology, University of Rome "Tor Vergata", Rome, Italy)

Abstract format: Poster

The study on childhood in Middle Ages has also recently expanded in relation to high infant mortality. Children were not excluded from harsh living conditions like high population density, poor hygiene, contact with pathogens and poor parental care.

The skeletal sample from Leopoli-Cencelle (9th-16th centuries CE) is a model for understanding the Italian medieval period for different reasons, such as the large sample size, the good preservation of the material, and the well-preserved archaeological evidence. In the cemetery area near St. Peter's Church, besides adult individuals, several infant burials, including fetuses, were discovered.

Children's bodies are fragile, so the study is very difficult. In this sense, bioarchaeology and paleopathology have refined approaches toward biological materials characterized by a high level of fragility. The children's exposure to repeated stressors can affect body development. Moreover, the genetic predisposition to develop certain anthropometric characteristics could be influenced by environmental factors, limiting genetically regulated phenotypic expression.

Advanced imaging methods will be used to examine children's bone structure and mineral density to explore the long-term implications of stress-induced phenotype changes. In this research, the same samples will be subjected to ancient DNA analysis to explore the genetic composition of populations and determine molecular sex. The DNA will be extracted using silica-based extraction methods and Illumina double-stranded libraries will be shotgun sequenced.

For the preliminary analysis, a sample of 30 well-preserved children aged from different age classes (foetus, perinatal, 1-6 years, 7-12 years, 13-19 years) will be selected.

The outcome of this project is therefore to explore how children cope with adequate growth in stressful conditions in a diachronic perspective, that can be read as a degree of human adaptation to the environment.

The research was financed by MUR "PRIN 2022 - Prot. 202255L4YW", "Early-life adversities: writing a biological history of childhood through a transdisciplinary approach".

771 ARCHAEOLOGICAL INVESTIGATIONS AT CASTRONOVO DI SICILIA: A MULTIDISCIPLINARY APPROACH

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Molinari, Alessandra (University of Rome Tor Vergata) - Orecchioni, Paola (University of Rome Tor Vergata) - Giovannini, Fabio (Instituto de Historia del Centro de Ciencias Humanas y Sociales di Madrid,) - Hummler, Madeleine (University of York) - Antoniono, Meo (University of Rome Tor Vergata) - Primavera, Milena (Università del Salento) - Colangeli, Francesca (University of Rome Tor Vergata) - Lundy, Jasmine (University of Rome Tor Vergata) - Aniceti, Veronica (University of Sheffield) - Ughi, Alice (University of York)

Abstract format: Poster

The intensive investigation of Castronovo di Sicilia and its environs has been the axial point of the ERC research project: Sicily in Transition: The Archeology of Regime Change, conducted by the Universities of York, Rome Tor Vergata and Salento and focused on the Byzantine, Islamic and Norman-Swabian Sicily. The principal central places and the main investigation points were the Byzantine fortress of Monte Kassar, the Norman castle of Colle San Vitale, and the multi-period area of Casale San Pietro. The main aim of the research was to supply the Castronovo area with a full biography from the 6th to the 13th century and so provide an epitome of the social and economic experience in an inland part of central Sicily. To achieve this goal, interventions of varying intensity were applied including intensive survey using drone flights, geophysics, geoarchaeological and archaeobotanical analysis of the sediments, test pits, or extensive excavations for large areas.

The study of artifacts (ceramic, glass, and metal objects) has been implemented by provenance analysis and the organic content of the ceramics; while carbon dating stable isotope and DNA analysis have been applied to ecofacts (plants, human and animal remains).

774 NEW APPROACHES IN THE COMMUNICATION OF PREHISTORY AT THE MUSEUM OF ANTHROPOLOGY OF THE UNIVERSITY OF NAPLES FEDERICO II

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Borrelli, Lucia (Museum of Anthropology, Naples) - Salomone, Flavia (Istituto Italiano Antropologia)

Abstract format: Poster

The Museum of Anthropology of the University of Naples Federico II, established in 1881, holds a rich heritage of osteological, archaeological and ethnographic collections that document the scientific researches of scholars who worked at the University and testify to the important Neapolitan cultural tradition.

Recently, the Museum has undertaken a work of reconsideration and enhancement of the ancient heritage in order to construct a museum narrative on anthropological themes according to current scientific knowledge, also to dispel prejudices about the perception of humanity deriving from past theories. It has created new exhibits, supported by multimedia products, and didactic-educational itineraries to give the public new tools for in-depth study of Prehistory and ancient civilisations and to encourage the correct interpretation of contemporary reality, the development of critical thinking and communication skills.

Inclusivity and accessibility have been at the centre of the Museum's educational and communicative work to increase the socio-cultural dialogue with the territory, to break down barriers and reach increasingly broad and heterogeneous segments of the public. The challenge was to find new and diversified languages that could tell the story of the present starting from the objects of the past: temporary exhibitions, workshops, meetings, debates, and book presentations were flanked by continuous communicative research work in line with the University's Third Mission. Varied programmes were created involving cultural associations of "social interest", governmental organisations such as UNAR for the "I AM A MAN" project, schools with PCTO routes and the traditional "Grazie Darwin" event. Immersive archaeological excavation experiences with the aid of multimedia technology have been realised for children.

The Museum's commitment resulted in the attraction and involvement of the entire citizenry on human origin and evolution themes, updated to promote reflections on multiculturalism, social inclusion, against all forms of intolerance and racism, and environmental protection.

775 ARCHEOLOGY AND ART

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Streichardt, Silvana (Streichardt and Wedekind GbR (SWA)) - Wesemann, Anna (Streichardt and Wedekind GbR (SWA))

Abstract format: Poster

What happens when archeology and art meet? A new perspective on archaeological finds and excavations is created. Together with the German-Italian artist Flavio Apel, Streichardt and Wedekind GbR (SWA) has started an exhibition project. The artist was born in Rome and came into contact with archaeological objects in his early childhood. For the exhibition planned for December in an art gallery in Göttingen (Germany), we will pick out motifs, either archaeological finds or excavation situations, which Flavio will artistically implement as pencil drawings. His search for perfection and realistic accuracy leads to his own interpretations and a different presentation of the objects through his images. At the planned exhibition the objects and excavations will be shown together with Flavio's pictures. With the poster we would like to provide an insight into the exhibition concept and some of the selected motifs. SWA is a private archaeological services company founded in 2011 that has already carried out numerous excavations. The aim of the exhibition is to bring the excavations with their finds and context closer to a wider audience.

776 SOCIAL STATUS OF GLASS IN THE 14TH-17TH CENTURIES. ARCHAEOLOGICAL FINDS FROM THE NEW TOWN OF PRAGUE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Ždárská, Anna (National Heritage Institute, Regional Office in Prague) - Podliska, Jaroslav (National Heritage Institute, Regional Office in Prague)

Abstract format: Poster

Understanding the standard of living and the unequal distribution of wealth within medieval and modern towns and their societies constitutes a complex and challenging task, and its research relies on the assessment of multiple sources (historical, archaeological and environmental). This poster presents a selection of glass findings obtained during two large-scale archaeological excavations carried out between 2009 and 2013 in the north-western section of the city district of Nové Město (New Town).

The historical layers comprised predominantly the medieval and early modern remains of the houses of the New Town burghers, including diverse cesspits and wells, which were used secondarily for waste disposal. The excavation of their fillings has yielded a rich collection of material culture covering a wide span from the founding of the New Town in 1348 to the brink of the industrial era at the end of the 18th century.

Glass vessels represented the second most frequent group of tableware. The abundance of glassware proves its popularity among the town's general population since the beginning of the New Town community, as well as the ability of the producers and sellers to satisfy the gradually growing demand for such products.

The analysis of the archaeological glass findings allowed the authors to gain insight into the unequal distribution of wealth among the town's population and to gather information on how the owners perceived the function, significance and value of these artifacts in different historical periods.

777 COMBINING OSTEOLOGY, MUSEUMIZATION AND ENHANCEMENT: THE CASE OF THE CAI CUTU TOMB (PERUGIA, ITALY)

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Candilio, Francesca (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy) - Bianchi, Vittoria (Dipartimento di Beni Culturali, Alma Mater Studiorum, University of Bologna, Ravenna, Italy) - Cecconi, Viola (Independent researcher, Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy) - Esposito, Carmen (Dipartimento di Beni Culturali, Alma Mater Studiorum, University of Bologna, Ravenna, Italy) - Sperduti, Alessandra (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy) - Turchetti, Maria Angela (Musei Nazionali di Perugia - Direzione Regionale Musei nazionali Umbria)

Abstract format: Poster

The tomb of the Cai Cutu was discovered near Perugia (Italy) in 1983. Recognizing the site's uniqueness and fragile state of preservation, it was deemed necessary to facilitate access through a museumization project that ultimately culminated in its complete reconstruction at the National Archaeological Museum of Umbria (MANU).

The hypogeum, dating between the 3rd and the 1st centuries BCE, features a cruciform layout and contains a sandstone sarcophagus as well as 50 inscribed and, at times, richly decorated travertine cinerary urns. The presence of onomastic inscriptions, both in Etruscan and Latin, has enabled the tentative reconstruction of the genealogy of the Cai Cutu family and prompted hypotheses regarding their probable servile origin. Furthermore, the fact that all the

names inscribed are interpreted as masculine strongly suggests that this funerary space was reserved for male members of the family.

The bioarchaeological analyses aimed at discerning the demographic profile of the sample and reconstructing the funerary ritual lend support to the existing hypotheses, indicating at the very least a pronounced predominance of males and a pattern of single-use burials.

This study is integrated within a broader enhancement framework, aimed at fostering greater awareness and understanding of this significant context by both the scientific community and the general public. It combines the results achieved here through macroscopic analyses with those collected through a meticulous review of archaeological finds, as well as through the use of biomolecular and microscopic methodologies.

778 RETOLD: DIGITALLY PRESERVING ARCHAEOLOGICAL OPEN-AIR MUSEUMS CULTURAL HERITAGE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Masriera-Esquerria, Clara (Universitat Autònoma de Barcelona) - Siebrecht, Matilda (EXARC)

Abstract format: Poster

The European project called RETOLD, led by the international association EXARC, aims to digitally preserve the heritage generated by archaeological open-air museums. These museums play a crucial role in understanding ancient crafts and construction techniques. The project focuses on creating a standardized digital system for collecting, digitizing and disseminating knowledge (data) related to the processes of building reconstruction and handcrafted objects.

As preservation RETOLD aimed to preserve memories (data) associated with experimental archaeology. For standardization, it establishes a standardized system for collecting and digitizing these memories (data) that are open access to technical staff, researchers and general public.

The project has run from January 2021 until December 2024. On September 2024, the Retold webapp will be launched and open to other Archaeological Open-Air Museums.

This project is led by EXARC in partnership with the tech company NUWA (<https://www.nuwa.ie/>), the Universitat Autònoma de Barcelona (UAB) - Prehistory department, and three open-air museums: Düppel (Stadtmuseum Berlin) (DE); Stone Age Park Albersdorf (DE) and ASTRA (RO).

780 DOCUMENTING PREHISTORIC ROCK ART IN JEBEL SHAQADUD IN THE EASTERN SAHEL

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Varadzinová, Lenka (Charles University, Faculty of Arts) - Unger, Jiří (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Zavřel, Jan (Independent researcher) - Varadzin, Ladislav (Institute of Archaeology of the Czech Academy of Sciences, Prague)

Abstract format: Poster

Renewed exploration at Jebel Shaqadud in the savanna region of north-western Butana in central Sudan has recorded five rock-art locations which concentrate in the area of the Shaqadud site complex, the most significant prehistoric settlement site in the Eastern Sahel. All feature only petroglyphs, with three locations containing figurative rock art with predominance of giraffes engaged in a limited number of compositions, one location only geometric rock art, and four sites (also) non-figurative marks. Most of the petroglyphs are entirely repatinated and some severely weathered, with many of them difficult to record using the standard means of field rock-art research. In 2021–2023, diverse documentation methods were employed to record the evidence at these sites, including 3D photogrammetry (SfM) and documentation by a hand-held optical scanner. In this poster, we present and compare the results obtained by the two approaches. The findings may be useful for future field research in Nubian sandstone environments.

781 MAKING EGYPTIAN MUMMIES VISIBLE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Ejsmond, Wojciech (Warsaw Mummy Project) - Szilke, Stanisław (Warsaw Mummy Project) - Ożarek-Szilke, Marzena (Warsaw Mummy Project) - Jaworski, Marcin (Warsaw Mummy Project)

Abstract format: Poster

As human remains ancient Egyptian mummies are not an easy subject for display for the wider public and research. On the one hand, they require the preservation of the dignity of human remains, on the other their study is methodologically challenging due to the uniqueness of each embalmed body. Furthermore, computed tomography (CT) and related software are quickly evolving, thus the methodology of the research is subject to changes.

The Warsaw Mummy Project was launched in December 2015 to conduct a comprehensive and multidisciplinary investigation of mummies at the National Museum in Warsaw. The project includes non-invasive examinations, i.e. CT and X-raying. Radiological imaging helped to answer questions about the sex, biological age, possible causes of death etc. of the individuals. The project goes beyond archaeological, anthropological, Egyptological, and medical analyses. Standard clinical software is not designed by default to examine mummified remains and artefacts. It is hard to establish standards or the workflow for postprocessing of the radiological documentation since every embalmed body is unique in its peculiarities, e.g. various radiological densities of embalming substances, materials, and foreign objects (e.g. amulets). Thus, in each case, we need to individualise our approach.

One of the crucial aspects of our project is to produce comprehensive images showing what is under the wrappings in which we can observe bandages, embalming substances, visceral packages, amulets, tissues, bones, etc. As an innovation, a hologram of a mummy presents a new way of displaying radiological images that can serve as both documentation and as an interactive object of display at museums since showing human remains is becoming a controversial practice. The poster aims to show our methodology for processing and visualising radiological data.

782 ARCHAEOLOGY IN TIMES OF ENERGY TRANSITION

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Strohmeier, Emanuel (Streichardt and Wedekind GbR (SWA)) - Ossenberg, Gero (Streichardt and Wedekind GbR (SWA))

Abstract format: Poster

More and more countries transition their energy infrastructure from fossil energy to renewable energy. Therefore lots of construction projects take place all around Europe.

This is especially important for archaeological supported projects such as solar farms, wind farms, electricity networks, etc. Especially in Europe where many different cultures settled across the whole continent for thousands of years it is not uncommon to find archaeological remains while constructing big energy projects. In Germany, large-scale energy route projects were initiated in a rapid process. In terms of climate protection, these are in the public interest. Over hundreds of kilometres, there is now the opportunity to gain far-reaching insights into past cultural and settlement landscapes. While other infrastructure projects have so far only been archaeologically monitored in areas of previously known sites, the responsible authorities have now supervised the entire routes of the newly developed energy lines. This approach led to the discovery of a wealth of previously unknown sites along fertile old settlement landscapes. Naturally, the data base of finds also increased significantly. Everyday archaeological life is now clearly dominated by energy projects, while other large infrastructure projects are declining noticeably. While, for example, larger motorway projects only consisted of partial expansions, we are confronted with a completely different situation here: the energy routes run through areas that have not yet been archaeologically developed. Not only do we benefit from those changes, but we also face different challenges such as conflicts of interest between archaeology and a fast transition for renewable energies. What can society gain from our work and what can we provide? We aim to answer questions that yet need to be answered. Archaeology has a special responsibility in this respect – also in the sense of the public interest.

783 PREHISTORIC SEMI-PORTABLE GRINDING TABLES FROM THE OPEN AIR SITE OF GARN EL TAMADA AT THE SIXTH NILE CATARACT, SUDAN

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Varadzin, Ladislav (Institute of Archaeology of the CAS, Prague, Ladislav Varadzin) - Varadzinová, Lenka (Czech Institute of Egyptology, Faculty of Arts, Charles University, Prague, Czech Republic)

Abstract format: Poster

This poster presents the discovery of a series of massive but movable granite blocks with grinding surfaces found during surface survey of the open air Holocene prehistoric site of Garn El Tamada located in the northwestern foothills of the Sabaloka Mountains in central Sudan. The flat and sub-horizontal surfaces of these blocks bear differently shaped and sized grinding surfaces in some repetitive arrangement, pointing to a differentiated, multi-purpose use of these facilities, some of which are likely to be a relic of a single household. The spatial distribution of these finds within the site's topography allows us to see in an unexpected detail the internal layout and estimate the number of homesteads on a single settlement site, which is usually impossible on prehistoric sites in Sudan without archaeological excavations. The findings presented in this poster highlight the potential of semi-mobile grinding devices made of durable materials for the research of intra-site patterning and organization of labour.

787 HIERARCHICAL ORGANISATION OF LARGE NEOLITHIC SETTLEMENTS, IDENTIFIED THROUGH POWER-LAW DISTRIBUTED HOUSE SIZES

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Bruvoll, Hallvard (University of Oslo, Department of Archaeology, Conservation and History)

Abstract format: Poster

While the dynamics of social inequality have been the subject of much debate in archaeology in recent years, much less attention has been given to hierarchical social organisation. In cases where hierarchy has been included as study object, it has mostly been conflated with inequality, leading to much confusion in the literature. Hierarchical organisation of societies is generally understood simplistically as synonymous with despotic top-down rule, while sociological and anthropological research strongly suggests that it is rather a universal phenomenon that emerges spontaneously in social groups that grow beyond certain thresholds.

Presented here is the first evidence of intra-site hierarchical organisation of settlements from the European Neolithic, as identified through the power-law distribution of building sizes. In the two sampled study areas and periods – Linear Pottery settlements in south-west Slovakia (c. 5300-4950 BCE) and Trypillia B2/C1 settlements in central Ukraine (c. 4100-3600 BCE) – only the largest settlements exhibit this special characteristic. This suggests that hierarchy tends to emerge in large human settlements irrespectively of political system, a hypothesis in line with much sociological research, but that will need to be further explored in other prehistoric settings.

788 BUSINESS ARCHAEOLOGY: MAIN DEFINITIONS AND SCIENTIFIC DISCIPLINE OVERVIEW

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Taratukhin, Victor (University of Muenster) - Pulyavina, Natalia (The Stanford Center at the Incheon Global Campus (SCIGC))

Abstract format: Poster

Business Archaeology is a new interdisciplinary discipline proposed by Michael Shanks, Victor Taratukhin, and Natalia Pulyavina as part of the Stanford Janus Network (Shanks, Taratukhin, and Pulyavina, 2023). It focuses on human experience in the past and present through artifacts and translates such knowledge to the future and strategies in business and management.

Cultural Diagnostics is central to the Business Archaeology framework (Taratukhin, Shanks and Pulyavina, 2023). It enables a comprehensive journey from historical insights to contemporary company conditions. The process includes three phases: Exploring the Past, Exploring the Present, and Orchestrating Futures. Of course, Business Archaeology as a discipline is certainly broader than the built-in method of cultural diagnostics. Business Archaeology employs a multidisciplinary approach, incorporating history, anthropology, sociology, psychology, and multiple management disciplines. It is also a set of tools and techniques, both archaeological and related to methods of creating innovations, such as the Stanford Design Method (Design Thinking), Business games, etc. It uses a variety of sources, from company artifacts to interviews of long-standing employees.

Business archaeology is presented in three components: research, education, and practice. Joint academic programs and courses in Business Archaeology at both undergraduate and graduate levels, merging archaeology and management, and developing research topics for doctoral studies are crucial to success in the discipline. Business Archaeology Labs will enhance the practical aspects of the discipline, offering students an opportunity to conduct industry-related projects and work with corporate artifacts. The educational elements of Business Archaeology should extend to direct engagement with the industry, defining models of collaboration between academic institutions and businesses.

789 NEOLITHIC SLASH-AND-BURN EXPERIMENT FORCHTENBERG (GERMANY): A COMPARISON BETWEEN DENDROECOLOGICAL INVESTIGATIONS AND ANTHRACOLOGICAL ANALYSIS FROM AN EXPERIMENTAL COPPICE WOODLAND

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Knapp, Hannes (Curt-Engelhorn-Zentrum Archäometrie) - Blume, Sanja (Curt-Engelhorn-Zentrum Archäometrie) - Nelle, Oliver (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart)

Abstract format: Poster

In the context of the Neolithic slash-and-burn experiment at Forchtenberg (SW Germany; see poster #564, Nelle et al.), we provide data on a combined approach of dendroecological and anthracological analysis to elucidate the growth dynamics of trees and the relationship between utilized wood and charcoal produced after slash-and-burn, to be used as a modern analogue for the interpretation of archaeological wood and charcoal finds.

The site Forchtenberg, with 2,5 ha, is situated on a moderate south-western slope at 325 m a.s.l. (mean annual precipitation 900 mm, average annual temperature 8.5°C). At the beginning of the 20th century the deciduous forest was transformed from a coppice with standards to a high canopy forest. During the last 25 years plots up to 900 m² were cleared in different years by the Forchtenberg team and partly burned resulting in different forest succession stages directly neighboring each other.

During spring 2023 an area of 900 m² was cleared and, the felled trees were sampled. The area was characterized primarily by shoots from coppiced wood and natural rejuvenation, with the occasional old trees which were not felled during the last clearing in 2006. Main tree species were Acer, Salix, Betula, Carpinus, Fraxinus, with minor proportions of Fagus, Populus and Quercus. For a better evaluation of the growth response to disturbances increment cores from older trees were taken from the vicinity. This allows a better comparison of the tree's response to disturbances within different exploitation systems

After dendroecological sampling the felled trees were used for slash-and-burn during autumn. Charcoal samples were taken afterwards from the surface, to elucidate potential indications of coppice in the anthracological record together with age and diameter analysis and average radial growth rate. Dendroecology and anthracology provide both complementary as well as supplementary information to depict the used wood for slash-and-burn.

790 THE ICONOGRAPHY OF FEMALE GENITALIA IN HUMAN FIGURE METAL PENDANTS WITHIN THE CONTEXT OF THE LATE BRONZE AGE SOUTHERN LEVANT

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Symes, Elsa (Independent researcher)

Abstract format: Poster

A popular and well-documented style of metal pendant from the interconnected region of the Southern Levant in the Late Bronze Age is the human figure or nude goddess pendant. The sixteen extant metal pendants from the sites of Megiddo, Lachish, Minet el-Beida, Ugarit and Tell el-Ajjul provide the basis for this analysis. This style has been explored since its first excavation over a century ago and has provided a lively ongoing discourse, particularly with the incorporation of mother-goddess worship debates. General assumptions have so far suggested the specific face, breast and vulva combination is a fertility or erotic representation. Even without a definitive understanding of the religious intention of the pendants, they provide evidence of the external spiritual and artistic influences.

This poster will focus on the genitalia within the remarkably varied corpus providing some insight into the intended depiction, as well as the intended audience. The variations within the female genitalia representations can be viewed as infantilisation with overly schematic renderings or leaning more towards fertility-related imagery with visible labia and pubic hair. Other incorporations into the pubic region include tree branches, perhaps reinforcing specific goddess iconography like the Egyptian Hathor, while there are other arguments for the presence of a pelvic girdle atop the pubic region potentially bringing different symbolism into some pendants. The analysis of this corpus is also extended further to consider external influences from Mesopotamia and Egypt, and the depictions in other mediums including clay plaques and figurines.

This style of pendant is an exemplar of the interrelationship between the Southern Levant and Egypt at the end of the Bronze Age. The interchangeability present provided local artisans with a general blueprint of a goddess pendant that could be successfully translated into different sects of religion further promoting the internationalisation of this time and region.

COMPOSITIONAL CHARACTERISATION OF EARLY IRON AGE POTTERY FROM ETRURIA: CHALLENGES AND NEW PERSPECTIVES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Andreadakis, Efraim (Archaeometry Research Group, Eberhard Karls University of Tübingen) - Diakatou, Maria (Archaeometry Research Group, Eberhard Karls University of Tübingen) - Deimichei, Giulia (Archaeometry Research Group, Eberhard Karls University of Tübingen) - Morandi, Lionello (Archaeometry Research Group, Eberhard Karls University of Tübingen; Department of Civilisations and Forms of Knowledge, University of Pisa) - Amicone, Silvia (Archaeometry Research Group, Eberhard Karls University of Tübingen; Institute of Archaeology, University College London)

Abstract format: Poster

During the early Iron Age (late 10th—late 8th century BCE), the Etruria region (central Italy) underwent significant sociocultural changes and fundamental innovations, resulting in various social, political, and economic developments. Throughout these transformative shifts, numerous sites in the region displayed the presence of the so-called Villanovan material culture.

Villanovan pottery has been thoroughly investigated from a stylistic point of view. However, paramount research questions about the production, circulation, and exchange of early Iron Age pottery from Etruria remain to be addressed by means of a comprehensive scientific study.

This work aims to characterise with an interdisciplinary approach pottery from different early Iron Age production centres in Etruria, to reveal pottery making recipes and set the base for an investigation on patterns of circulation and exchange among proto-Etruscan communities, as well as between Etruria and other Mediterranean cultures.

To do so, we carried out archaeometric analyses, including ceramic petrography and X-ray fluorescence on pottery found in different key sites from both northern and southern Etruria. To link pottery to its centre of production, we carried out systematic sampling and analysis of all geological formations and clay sources around the main settlements, from inland valleys to river mouths on the coast. This has allowed us to define a mineralogical and chemical fingerprint of vessels produced in Etruria at each site examined.

In this poster we present the preliminary results of this work which provides for the first time a robust reference study for investigating pottery technology and circulation in Etruria and in the Mediterranean basin during the early 1st Millennium BCE.

Given the systematic geological study undertaken for this research, the results are also relevant for the study of production and circulation of central Italian pottery from different cultural and chronological contexts.

FIRST INSIGHTS INTO THE ANCIENT ORAL MICROBIOME OF EGYPTIAN CAT MUMMIES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Baldoni, Marica (Department of Biology, University of Rome Tor Vergata, Rome Italy) - De Martino, Marco (Department of Biology, University of Rome Tor Vergata, Rome Italy) - Di Corcia, Tullia (Department of Biology, University of Rome Tor Vergata, Rome Italy) - Rovelli, Valentina (Department of Biology, University of Rome Tor Vergata, Rome Italy) - Serventi, Patrizia (Department of Biology, University of Rome Tor Vergata, Rome Italy) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, Brussels Belgium) - Van Neer, Wim (Royal Belgian Institute of Natural Sciences, Brussels Belgium) - Ottoni, Claudio (Department of Biology, University of Rome Tor Vergata, Rome Italy)

Abstract format: Poster

Cats, our intriguing “domestic” companions, share a long-standing relationship with humans. As renowned pest-control agents and hosts of several zoonotic pathogens, they also played a key role in the animal-human pathogen transmission. In this perspective, it is known that cat bites represent a significant threat for human health, even though the transmission of microorganisms due to prolonged contact was also documented [1-2].

The cat oral microbiome may offer key insights into the understanding of zoonotic transmission to humans [1], and at the same time shed light on the influence of diet, disease, and other environmental variables in the cat oral microbiota within the anthropogenic niche [1,3-4].

Metagenomic analysis of dental calculus demonstrated to be a valuable tool for investigating modern and ancient human and animal oral microbiomes [e.g. 5-7]. This research focuses on the analysis of dental calculus from twelve ancient Egyptian cat mummies aiming at reconstructing their oral microbial composition. By shotgun sequencing double-stranded genomic libraries obtained from calculus samples, we provide here the first ancient oral microbiome data from Egyptian cat mummies. This offers unprecedented insights into the oral microbiome of cats from the past, the anthropogenic factors that may have influenced it, and the evolution of commensal and pathogenic oral microbial species.

FELINE VOYAGERS: TRACING HUMAN HISTORY THROUGH PALEOGENOMICS OF CATS IN VIKING HARBOUR SETTLEMENTS

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Serventi, Patrizia (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Mouraud, Betty (University of Lille, Department of Biology, Lille, France) - Rovelli, Valentina (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - De Martino, Marco (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - Baldoni, Marica (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - Di Corcia, Tullia (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - Schmölcke, Ulrich (Leibniz-Zentrum für Archäologie - Center for Baltic and Scandinavian Archaeology (LEIZA-ZBSA), Schleswig, Germany) - Van Neer, Wim (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Ottoni, Claudio (University of Rome Tor Vergata, Department of Biology, Rome, Italy)

Abstract format: Poster

The analysis of the genetic makeup of ancient wild and domestic animals proved to be a key tool to unravel human migrations and routes of trade and connectivity in the past. Undoubtedly, cats (*Felis silvestris*) have a long history of association with humans, valued for their dual role of companions and pest controllers, particularly in maritime activities and settlements. For this reason, they represent valuable bio-proxies to reconstruct human-mediated translocations.

We applied cutting-edge genomic techniques to analyse cat remains recovered from two harbour settlements dated to the Viking Age, Haithabu (AD 800-1050) and Schleswig (AD 1050-1250), in northern Germany. Their strategic positions, leveraging natural features and navigational benefits, contributed significantly to their prominence in local and long-distance trade networks across Europe (and beyond) during the Middle Ages. Here, we show the preliminary results of ancient DNA (aDNA) analyses conducted on over 50 cat specimens, one of the most extensive cat genetic dataset from a single site assembled to date. We generated via shotgun sequencing complete mitochondrial genomes and low-coverage genome-wide data that allowed us to diachronically investigate the intertwined histories of humans and their feline companions in the two Viking harbours. Our genomic dataset represents a key tool to outline the spatial and temporal dispersal of cats in Europe via human connectivity, and elucidate ancient admixture between domestic and European wildcat populations.

HOME: PALAEO-LITHIC SHELTERS IN EAST-CENTRAL EUROPE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Chu, Wei (Leiden University)

Abstract format: Poster

From penthouses to igloos, homes are a cornerstone of human society, deeply entrenched in our evolutionary past. Their staggering array of architecture simultaneously shape and reflect our sociocultural traditions, structure our local economies, and have enabled us to inhabit all four corners of the earth. Yet surprisingly little is known about their earliest forms—Palaeolithic shelters. This is because no systematic attempts have been made to target their early archaeological signatures. Here, I present the new project HOME that will search for a diversity of Palaeolithic shelters during the Late Pleistocene through informed systematic surveys and excavations of archaeological sites in East-Central Europe, a place where early mammoth bone structures suggest precocious shelters, but where the record remains inconclusive. This project's goal is to uncover and assess a variety of Palaeolithic shelters with the aim to understand the diverse ways that humans lived and survived in some of the coldest, harshest climates. The objectives are to: (1) Recognize the factors that influence the location and design of forager shelters through a goal-directed study of ethnographic documentation. (2) Develop new geophysical methods to identify open-air shelter residues in large-scale archaeological surveys. (3) Determine how one of the earliest unambiguous built structures, a mammoth bone structure, was used with the latest techniques in archaeological science. (4) Compare and contrast how these open-air shelters relate to a regional cave occupation through targeted excavations. The results will elucidate how our

ancestors adapted to past climate change and expanded into new biomes, ultimately leading to our ubiquitous population of the earth. In addition to its significance to archaeology and anthropology, the outcomes have implications for theories of culture, evolution and human resilience by helping us understand the physical building blocks of early societies.

797 **ARCHAEOLOGICAL ANIMAL AND PLANT REMAINS OF 15TH-19TH CENTURIES FROM IASI CITY (NE ROMANIA)**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Stanc, Simina Margareta (Alexandru Ioan Cuza University of Iași, Romania) - Danu, Mihaela (Alexandru Ioan Cuza University of Iași, Romania) - Bilavski, George (Alexandru Ioan Cuza University of Iași, Romania) - Pirnau-Bacumenco, Ludmila (Alexandru Ioan Cuza University of Iași, Romania) - Bejenaru, Luminita (Alexandru Ioan Cuza University of Iași, Romania)

Abstract format: Poster

The investigated area from Iasi City (NE Romania), researched in 2021-2022, has a particular historical and archaeological potential due to its location in the core of the medieval city, near the Princely Court. The archaeological discoveries are dated to Middle Age (15th-17th centuries) and to the Modern period (18th-19th centuries). The ruins of the former "St. Petersburg Hotel", which overlapped the houses of the Ghica boyar family, were excavated during the research. Archaeological complexes, older or contemporary with these buildings were investigated, from which numerous artifacts of heritage importance were recovered (e.g., local and imported kitchenware, a monetary of 14th-15th centuries, numerous other coins, decorative objects, pipes, tiles, iron tools, glass vessels of 17th-19th centuries etc.). Numerous housing complexes, lime and clay extraction pits for constructions, water supply systems or stone sewers were also discovered and researched.

The analyze of animal and plant remains aims to contribute at the economic and environmental evaluation of the settlement. Phytoliths are the main vegetal remains studied in this work. Animal remains are described in terms of their frequencies based on the number of identified specimens and the minimum number of individuals. Archaeozoological results highlight the dominance of domestic mammals (i.e., cattle, sheep/goat, pig, horse, dog), cattle being the preferred species for consumption. Few remains were identified as belonging to wild mammals (i.e., red deer, wild boar, roe deer, hare, wolf), and also to birds, fish, and molluscs.

This work was supported by a grant of Ministry of Education from Romania, CNCS-UEFISCDI, project number PN-III-P4-PCE2021-1180, within PNCDI III.

800 **LINEAR POTTERY IN SOUTHERN LOWER SAXONY (GERMANY): HOW ANALYSIS OF ORNAMENTS CAN TELL THE STORY OF STYLES, TRANSFER AND CHRONOLOGY**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Stoffner, Sabine (Streichardt and Wedekind GbR (SWA)) - Streichardt, Silvana (Streichardt and Wedekind GbR (SWA))

Abstract format: Poster

The Linear Pottery in southern Lower Saxony (Germany) was divided into 7 phases about 25 years ago. The basis for this were mainly surface finds and from the settlement area of Diemarden. The various ornaments of fine ceramics were evaluated and a relative chronology based on the development of ceramics was presented. It seems nowadays that some elements of the decoration are dated too early or too late (e.g. plastic strips with accompanying scratch lines). In addition, consistent elements (e.g. undecorated rims) and adherence to old traditions in the decoration make it difficult to assign a phase. Correlation with neighboring regions is therefore difficult.

Decoration styles and elements from the west, central Germany and the northern Harz region are taken up, especially in the younger and youngest Linear Pottery. The influences are reflected differently within the pottery of different sites in southern Lower Saxony and can show communication and transfer routes. A regional style has not yet been determined.

There are many sites of Linear pottery, especially in the Leine Valley, which number will now raise through several power-line-projects. In order to be able to carry out a precise chronology, phase division and style development, the ceramics from future sites should be recorded using a uniform system. The basis for this is the catalog of ornaments from "bandkeramik_online". The evaluation of closed complexes of finds should then make it possible to highlight the influences and peculiarities of the style in ceramics, as well as to revise the regional phase division and link it to neighboring areas.

804 **LATE NEOLITHIC SITE OF KOTLINA IN EASTERN CROATIA: EXCAVATIONS 2018-2023**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rajkovic, Dragana (Archaeological museum Osijek) - Vitezović, Selena (Institute of Archaeology, Belgrade)

Abstract format: Poster

The site of Kotlina – Suzai Hegy is situated in eastern Croatia, in Baranja region, near the town of Beli Manastir. The prehistoric site is situated on south-eastern slopes of Bansko brdo, elongated loess elevation, on the edge of a large ravine, approximately 10 km to the east from the Danube River. The site was noted during field surveys carried out in the second half of the 20th century, and in 2018 Archaeological Museum in Osijek initiated systematic researches within the project „Kotlina – the prehistoric site“.

In 2018-2019 non-destructive magnetic prospection was carried out. The magnetometric data showed the numerous pits of different size, as well as 60-m diameter ring ditch system. In 2018 excavations were initiated, and in the period 2018-2023 approximately four trenches were excavated, located to the south of the ditch (that is, outside of it), covering the total surface of 130m². Excavations revealed numerous structures and features: rubbish pits, post holes, dwellings, as well as several burials, containing inhumated remains of several individuals and rich grave offerings: ceramic vessels, polished stone tools, ornaments from mollusc shells. Other findings include ceramic vessels, in particular pots with painted motifs, characteristic for the Lengyel culture, numerous lithic tools, including a substantial amount of obsidian, bone tools and personal ornaments. This poster will present the most important results from these researches.

806 **INVESTIGATING THE BIOLOGICAL BACKGROUND OF THE CASALECCHIO DI RENO CELTIC COMMUNITY (BOLOGNA, ITALY; 4TH-3RD CENTURY BC) THROUGH NON-METRIC DENTAL TRAITS**

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Mameli, Davide (Alma Mater Studiorum Università di Bologna) - Sorrentino, Rita (Alma Mater Studiorum Università di Bologna) - Luzzati, Giselle (Alma Mater Studiorum Università di Bologna) - Nicolosi, Teresa (Alma Mater Studiorum Università di Bologna) - Piccirilli, Erica (Alma Mater Studiorum Università di Bologna) - Mariotti, Valentina (Alma Mater Studiorum Università di Bologna) - Novotny, Friederike (University of Vienna – NHM Vienna) - Spannagl-Steiner, Michaela (University of Vienna – NHM Vienna) - Ramsel, Peter (University of Vienna) - Belcastro, Maria (Alma Mater Studiorum Università di Bologna)

Abstract format: Poster

Archaeological data attest the earliest presence of the Boii Celtic tribe in the Po Valley (Northern Italy) in Casalecchio di Reno necropolis (Bologna) during the 4th century BC. Ancient sources (Dion. Hal., I, 18, 5; Pol., II, 17; Serv., Ad Aen., X, 168) describe several types of interaction (i.e., replacement, integration) between Celts and local populations (mostly Etruscans) in the Po Valley.

In Casalecchio, archaeological data suggest a continuity of occupation from the Neolithic to medieval time. The presence of Etruscans is well attested (village and funerary area).

This contribution aims at investigating the non-metric dental traits (ASUDAS method) of the Celtic community of Casalecchio. Our data were compared with other Bronze/Iron Age groups from Italian and European territories already studied by Coppa et al. (1998), Anttil (2016), Sorrentino et al. (2018) and Piccirilli et al. (2023), using the same methods.

Preliminary results suggest that Casalecchio shows biological affinity both with Celtic and Italic (especially Etruscans) groups, letting to hypothesize the relationship between local and foreign individuals.

Therefore, a future direction of this research would be to assess the local/non-local origin of the individuals of Casalecchio through the strontium and oxygen isotope analysis. Furthermore, the sample will be integrated with data from "Celts" from cemeteries in Austria.

This research was funded by the Austrian Science Fund FWF (Project P36086-G).

808 CONTINUITY VS. DISCONTINUITY IN CASALECCHIO DI RENO (BOLOGNA) FROM THE IRON AGE TO LATE ANTIQUITY: A NON-METRIC DENTAL TRAITS ANALYSIS

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Luzzati, Giselle (Alma Mater Studiorum University of Bologna) - Sorrentino, Rita (Alma Mater Studiorum University of Bologna) - Mameli, Davide (Alma Mater Studiorum University of Bologna) - Mariotti, Valentina (Alma Mater Studiorum University of Bologna) - Nicolosi, Teresa (Alma Mater Studiorum University of Bologna) - Poli, Vanessa (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara) - Novotny, Friederike (University of Vienna – NHM Vienna) - Spannagl-Steiner, Michaela (University of Vienna – NHM Vienna) - Rams, Peter (University of Vienna) - Belcastro, Maria Giovanna (Alma Mater Studiorum University of Bologna)

Abstract format: Poster

The Zone 'A' of Casalecchio di Reno (Bologna, Italy) represents an intriguing archaeological context, with documented habitation continuity from the Neolithic period to the Early Middle Ages. In this study, we aim to explore the biological composition of the population inhabiting this area from the late Iron Age to late Roman Antiquity. For this purpose, we assessed and analyzed non-metric dental traits using the ASUDAS system, then proceeded to calculate the Mean Measure of Divergence (MMD).

The dental samples we analyzed belong to the Roman Necropolis A (2nd-5th century CE) and B (2nd-3rd century CE), as well as to the late antique Necropolis, for a total of 80 individuals examined. These three burial grounds likely represent the funerary area of a nearby village of farmers and traders, particularly thriving during late Antiquity. Additionally, we included in the analysis data from the Celtic Boii Necropolis of Casalecchio di Reno (4th-3rd century BC, 92 individuals).

Preliminary results suggest a biological affinity between the A and B Roman groups, as well as with the late antiquity Romans, indicating a potentially biological continuity through the centuries in this rural settlement in Casalecchio. On the other hand the MMD values also display a significant biological distance between the Boii Celts and all the Roman groups, suggesting a potential scenario where these two populations might not have extensively mixed. As a result, our data highlights the lack of a significant biological contribution from the Casalecchio Celts to the Romans subsequently settled in the area.

The research was partly funded by the Austrian Science Fund FWF (Project P36086-G).

810 THE WEIBULL MODEL TO RECONSTRUCT NEANDERTHAL POPULATION STRUCTURE FROM THE UPPER VALLEY OF THE LOZOYA RIVER (SPAIN)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Reyes Rojas, Andrea (Departamento de Geodinámica, Estratigrafía y Paleontología, Universidad Complutense de Madrid) - Rodríguez-Gómez, Guillermo (Departamento de Geodinámica, Estratigrafía y Paleontología, Universidad Complutense de Madrid; Centro UCM-ISCIIE de Evolución y Comportamiento Humanos) - Martín-González, Jesús (Departamento de Matemáticas y Computación, Universidad de Burgos) - Luis Arsuaga, Juan (Departamento de Geodinámica, Estratigrafía y Paleontología, Universidad Complutense de Madrid; Centro UCM-ISCIIE de Evolución y Comportamiento Humanos)

Abstract format: Poster

Paleodemographic reconstruction is useful to understand the development of extinct species, and in the case of humans, it is of great interest and scientific debate. However, the fossil record is partial and are usually not complete enough to provide this information. Therefore, it is necessary to approach these studies using alternative methods. One of these is the estimation of survival and mortality profiles, which allow us to reconstruct the structure of the populations, estimate the carrying capacity and the availability of meat resources in paleoecosystems. This can be done in extinct populations through mathematical models. The main objective of this study is to validate one of these models, the Weibull model, as a tool to obtain profiles of survival, mortality, and age structure of mammal species. For this purpose, we analyzed 13 current mammal populations that meet or are close to meeting conditions of stability and stationarity, which are the conditions imposed on the Weibull model to obtain long-term profiles and structures. As input to the Weibull model, the values of the reproduction rate by age classes are used and the population structures are obtained as outputs. Statistical analyzes of chi-squared test were carried out to compare the observed population structures with the estimated ones and the results obtained allowed the model to be validated. Thanks to this validation, we reconstruct the population structure of the Neanderthal groups (*Homo neanderthalensis*) that inhabited the upper valley of the Lozoya river (Madrid, Spain) during the Late Pleistocene, based on reproduction rate values of current hunter-gatherer populations.

813 A MEDIEVAL GATEWAY TO THE CONTINENT, NEW ARCHEOLOGY IN KALMAR OLD TOWN

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Stibéus, Magnus (202100-4953) - Hellgren, Felicia (202100-4953) - Palm, Filip (202100-4953) - Lindgren, Ola (202100-4953)

Abstract format: Poster

Kalmar was one of the most important towns of medieval Sweden, comparable with the North German market towns of the Hanseatic league. Situated on the southeastern coast of Sweden, close to the Danish border, it served as a gateway between Sweden and the rest of Europe. The town played an important role during the late medieval union of the Nordic countries, known as the Kalmar union.

During the Middle Ages a few thousand people of various cultural backgrounds, lived and worked within the town walls. The town was moved to a nearby island during the 1700th century, leaving much of the old town untouched below the surface until modern times.

The aim of this poster is to show the importance of collecting so called 'mass materials', how to work with it, present it and what it can give. The study will provide insight into several areas of the town, including the center and the harbor quarters, which can tell us about merchants and craftsmen. It is also possible to discuss the private and public; the local and global; as well as how the town handled crises.

Recent years large excavations were conducted due to the renewal of the Kalmar water system. This has led to a total distance of 1,3 km or 6000 m² being excavated, making a cross-section through the entire town. This corresponds to 50 plots, over 200 buildings, amongst them 30 stone houses with cellars, and parts of the medieval streets and alleys. The excavation generated tens of thousands artefacts which present a rare opportunity but also many challenges. The largest find categories are animal bones (2000 kg) and ceramics (25 000 shards). The material also includes metal objects, glass, worked bone and macrofossils, engaging specialists from many disciplines.

814 EXPANSION TO THE TOP OF THE NEOLITHIC WORLD. THE GALLERY GRAVE AT SELJE, NORWAY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Smiarowski, Konrad (University of Bergen) - Ramstad, Morten (University of Bergen) - Roberts, Howell (University of Bergen) - Dahl, Yvonne (University of Bergen)

Abstract format: Poster

In 2023, The University Museum of Bergen excavated a Late Neolithic gallery grave at Selje, - the first such monument discovered in Western Norway. The collapsed stone built chamber and semi-articulated human remains were recorded using hybrid recording techniques including photogrammetry for detailed 3d modelling. The grave contained the remains of several individuals buried around 2000 cal BC. A large quantity of faunal remains was also recovered, together with remains of multiple structures such as houses, middens and burials from several periods.

Apart from new knowledge about the neolithization processes in Norway the context has the potential to contribute a deeper understanding of population dynamics and the social organization of the Late Neolithic expansion in Scandinavia and beyond. In the poster we will present the project, highlighting interdisciplinary studies combining archaeology, human osteology, stable isotope analyses, mtDNA analyses, palaeopathology and archaeobotany.

We will use novel techniques for integrating the complex multi-period dataset and disseminating results. The aim of the poster presentation is to spark interest in the project and encourage broader collaborations.

815 COLOURS FOR THE AFTERLIFE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Cholakova, Anastasia (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Pashova, Maria (Regional Museum of History, Blagoevgrad, Bulgaria) - Gratuze, Bernard (Institut de Recherche sur les Archéomatériaux, Orléans, France)

Abstract format: Poster

The aim of this poster presentation is to shed light on the role of coloured glass in the jewellery found in the grave assemblages of a medieval necropolis (ca 10th – 12th c.) at the present-day village of Tuhovishte, SW Bulgaria, in the Mesta River valley. The site is identified as a burial ground of a small rural community that has inhabited a remote mountainous area, with clear evidence of conservative traditions of the burial rite, likely rooted in the pre-Christian intangible heritage of the population. A particular emphasis of the presentation is put on a rich grave assemblage that contains, beside all other grave goods, a remarkable set of glass bangles and thousands of glass beads, with an impressive variety of colours, production and decoration techniques. The laboratory analyses of the chemical glass compositions demonstrate that the jewellery placed in the grave have originated from different regions and even

from different time periods, hence posing a certain interpretive challenge to the comprehension of such a specifically focused and still amazingly complex material record.

816 EXPLORING PUBLIC PERCEPTION: AN ONGOING PROJECT ON THE IMPACT OF ANCIENT HUMAN REMAINS VIA COMPUTERIZED CRANIOFACIAL DEPICTION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Manzollino, Roberta (Interdepartmental Center of Research DigiLab, Sapienza University of Rome, Rome, Italy; Institute for Mummy Studies, Eurac Research, Bolzano, Italy; Suor Orsola Benincasa University of Naples, Naples, Italy) - Liu, Jessica (Face Lab, Liverpool John Moores University, Liverpool, UK) - Malatesta, Saverio Giulio (Interdepartmental Center of Research DigiLab, Sapienza University of Rome, Rome, Italy) - Leopardi, Laura (Interdepartmental Center of Research DigiLab, Sapienza University of Rome, Rome, Italy) - Genovese, Gianluca (Suor Orsola Benincasa University of Naples, Naples, Italy) - Montanari, Roberto (Suor Orsola Benincasa University of Naples, Naples, Italy) - Palombini, Augusto (Institute of Heritage Science - National Research Council of Italy) - Wilkinson, Caroline (Face Lab, Liverpool John Moores University, Liverpool, UK) - Paladin, Alice (Institute for Mummy Studies, Eurac Research, Bolzano, Italy)

Abstract format: Poster

The ancient human remains are of great interest to both the public and scientific community due to their symbolic, emotional and cultural values. Thus, they are considered "culturally sensitive artifacts". However, there remains a lack of comprehensive definition for the status of "human remains", beyond some international regulations (e.g., ICOM) for their display in museum collections. Consequently, there is a growing debate within the scientific community about the ethical issues surrounding this topic. Increased awareness is also reflected in the public's interest when encountering human remains in a museum.

In this regard, computerized craniofacial depiction can play a central role in disobjectifying ancient human remains. By restoring their physical appearance, visitors can virtually meet an individual of the past, no longer seen as an abstraction but as a human being. Consequently, using this technique, our objective is to enhance comprehension of these issues through a multi-level approach to investigate the interest that these remains can generate among museum audiences and to determine whether the display of craniofacial depiction can provoke a response from visitors. Therefore, the skeletal human remains currently housed at the Museum of the Colle del Duomo di Viterbo (Rome) will be bioanthropologically analysed for the first time. Moreover, the measurement of visitor interest will be achieved by detecting indexes of interest and behavioural dynamics using sensor systems and subsequent data processing employing AI techniques, developed within ARTEMISIA project (CNR-ISPC). Data from motion sensors (i.e., stops, transit, direction of attention) and biometric data (i.e., gender, stature) will be used in a completely anonymous way and then analysed with AI algorithms. This will allow us to obtain both an overall analysis of the museum experience and to identify possible methods of individual profiling before and after the visualization of the craniofacial depiction.

817 ADVANCES IN SEX DETERMINATION IN PLEISTOCENE CAVE BEARS: INTEGRATING PALEOPROTEOMICS AND MORPHOMETRICS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Gutiérrez- Carbajal, Amanda (CENIEH (National Research Center on Human Evolution), Burgos, Spain; Institut de Biologia Evolutiva (CSIC-Universitat Pompeu Fabra), Barcelona, Spain) - Villalba de Alvarado, Mónica (Centro Mixto UCM-ISCI de Evolución y Comportamiento Humanos, Madrid, Spain Dept. de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain; Dept. de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain; Musée de l'Homme, Paris, France) - Santos- Ureta, Elena (Centro Mixto UCM-ISCI de Evolución y Comportamiento Humanos, Madrid, Spain; CENIEH (National Research Center on Human Evolution), Burgos, Spain; Cátedra de Otoacústica Evolutiva y Paleoantropología (HM Hospitales-Universidad de Alcalá), Departamento de Ciencias de la Vida, Universidad de Alcalá, Alcalá de Henares, Madrid, Spain) - Kelley, Joanna (Ecology and Evolutionary Biology, University of California Santa Cruz, Santa Cruz, California, CA, USA) - Lizano, Esther (Institut de Biologia Evolutiva (CSIC-Universitat Pompeu Fabra), Barcelona, Spain; Institut Catala de Paleontologia Miquel Crusafont, Universitat Autònoma de Barcelona, Cerdanyola del Vallès, Spain) - Marquès- Bonet, Tomàs (Institut de Biologia Evolutiva (CSIC-Universitat Pompeu Fabra), Barcelona, Spain; Institut Catala de Paleontologia Miquel Crusafont, Universitat Autònoma de Barcelona, Cerdanyola del Vallès, Spain) - Arsuaga, Juan Luis (Centro Mixto UCM-ISCI de Evolución y Comportamiento Humanos, Madrid, Spain Dept. de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain; Departamento de Geodinámica, Estratigrafía y Paleontología, Facultad de Ciencias Geológicas, Universidad Complutense de Madrid, Madrid, Spain) - Martínón- Torres, María (CENIEH (National Research Center on Human Evolution), Burgos, Spain; Department of Anthropology, University College London, London, UK)

Abstract format: Poster

Sexual dimorphism in the Ursidae family is commonly observed, with males typically exhibiting a significantly larger size than females, which varies between 10% and 50% depending on the species. Particularly, cave bears are known for showing pronounced sexual dimorphism, highlighted in several morphological dimensions such as the diameter of canines, skull size, and limb bones.

Paleoproteomics emerges as a viable strategy for sex determination in ancient specimens, especially in cases where conventional methods face limitations due to fragmented or incomplete remains. Here, a rapid and sensitive mass spectrometry (MS)-based method is presented for determining biological sex in bears using dental enamel, incorporating proteomic extraction via acid etching to minimize material destruction.

The method has been tested on a set of canines from the Middle Pleistocene cave bear species *Ursus deningeri* from the Sima de los Huesos site, within the archaeological and paleontological complex of the Sierra de Atapuerca, Burgos, Spain. The sexual determination of these specimens was previously assigned through morphometric methods, as described by Koby (1949) and Kurtén (1955).

By reconstructing isoforms of the Amelogenin protein from isolated X and Y chromosomes of current *Ursus arctos*, significant differences between AMELX and AMELY sequences were observed, enabling reliable sex determination through this enamel protein.

Amelogenin exhibits high conservation in mammals, being completely identical between cave bears and current brown bears. This similarity allows the use of these sequences as a reference for reconstructing both sequences in ancient specimens.

This study presents a novel application of palaeoproteomics integrating with morphometrics in Pleistocene bears, offering a valuable alternative in situations of fossil material scarcity, where dental enamel may be the only preserved tissue source. This approach will facilitate more comprehensive investigations into cave bear populations, as well as understanding their demographics, behavior, and social structure.

820 SUBSISTENCE ECONOMY IN COMMUNITIES OF 14-18TH CENTURIES FROM THE EAST OF ROMANIAN CARPATHIANS: ARCHAEOLOGICAL RECORDS OF VEGETAL AND ANIMAL REMAINS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Danu, Mihaela (Alexandru Ioan Cuza University of Iasi, Faculty of Biology) - Stanc, Simina (Alexandru Ioan Cuza University of Iasi, Faculty of Biology) - Bejenaru, Luminița (Alexandru Ioan Cuza University of Iasi, Faculty of Biology)

Abstract format: Poster

The present study focuses on several archaeological sites of 14-18th centuries located in the Romanian extra-Carpathian area, more precisely between Subcarpathians and Prut river. Bioarchaeological research was conducted to understand of the subsistence economy and to gain insights into how environmental conditions, geographical features, and at times, the political-military landscape influenced daily life and habits.

The applied methodology involved a detailed analysis of vegetal micro-remains, particularly phytoliths, and an archaeozoological approach to understand the dynamics of the economy and environment during the transition from the Middle Ages to the modern period, in this area. The economic features were not uniform but varied in response to the local topography, climate, and whether the sites were urban or rural. The results of this work shed light also on what is common for the local economies to the east of Carpathians, revealing a significant dependence on livestock husbandry (e.g., cattle, sheep/goat, pig) and cereal cultivation (e.g., wheat, barley, oats, rye) as central pillars of their agricultural framework. The cereals were foundational to the settlements' food economy, serving as primary sources of carbohydrates and forming the basis of the diet not only for inhabitants but also for domestic animals. Beyond the local consumption, cereals likely played a role in the wider economy at regional level, including the trade.

By analysing the both vegetal and animal remains recovered from archaeological sites, it is possible to gain a multi-faceted understanding of the medieval and premodern landscape, revealing the complexity of people-environment interactions in communities to the east of Carpathians.

This work was supported by a grant of Ministry of Education from Romania, CNCS-UEFISCDI, project number PN-III-P4-PCE2021-1180, within PNCDI III.

821 USING COLLAGEN FINGERPRINTING TO EXPLORE THE FAUNAL SPECTRUM AT AMARA WEST, A LATE-SECOND MILLENNIUM BCE COLONIAL CENTRE IN UPPER NUBIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Williams, Ellie (Archaeology, Canterbury Christ Church University) - Ruebens, Karen (Department of Archaeology, University of Reading) - Smith, Geoff (School of Anthropology and Conservation, University of Kent) - Spencer, Neal (Fitzwilliam Museum, University of Cambridge) - Weinstock, Jaco (Archaeology, University of Southampton)

Abstract format: Poster

Since 2008 British Museum-led investigations at Amara West (c. 1280-1070 BC) in Upper Nubia (present day northern Sudan), have revealed significant insights into the lived experience of a town designed as a centre for the pharaonic administration of Upper Nubia. Ongoing zooarchaeological analysis has produced a dataset of c. 40,000 recorded faunal specimens, contributing important evidence for subsistence practices, diet, animal management, mobility, and localised environmental change. A particularly interesting finding is the high proportion of caprine versus ovine remains, as initial morphological assessment suggested (following Zeder and Lapham 2010).

To gain additional data on the bovids at Amara West we applied Zooarchaeology by Mass Spectrometry (ZooMS) to 138 specimens. In a first step, 90 faunal specimens that were assigned to either goat (n=55), sheep/goat (n=30) or sheep (n=1) were chosen for analysis. These specimens included astragalus, calcaneus, humerus, metatarsal, phalanx 1, radius/ulna and tibia, and derive from a range of site phases, and from houses, storerooms, and open spaces. Some of the samples come from earlier (c. 1500-1400BCE) desert encampments that predate the town, from the first decades of pharaonic control of the area. In a second step, 48 additional bone fragments, most of which were thought to be wild bovids, were sampled. Collagen was extracted using an acid demineralisation (HCl) protocol and while collagen preservation was variable, over 60% of the sampled bone fragments could be identified taxonomically.

ZooMS confirmed the dominance of capra as no sheep were identified; this contrasts with other sites in the region (e.g. Sai and Kerma) and potentially reveals distinctive approaches to livestock management in different parts of colonised Nubia. This poster outlines our approaches – particularly the applicability/value of ZooMS – discusses some of the complexities of the data set and analysis, and presents some preliminary interpretations on the findings"

822 "PIECING TOGETHER PAST STORIES": COMMINGLED HUMAN REMAINS FROM THE CEMETERY OF THE THIRD ORDER OF OUR LADY OF CARMO (PORTO)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Rodrigues, Zélia (LABOH – Laboratory of Biological Anthropology and Human Osteology, CRIA – Centro em Rede de Investigação em Antropologia, Faculdade de Ciências Sociais e Humanas, Universidade NOVA de Lisboa, Portugal; Arqueologia e Património Lda.) - Malcherek, Anne (LABOH – Laboratory of Biological Anthropology and Human Osteology, CRIA – Centro em Rede de Investigação em Antropologia, Faculdade de Ciências Sociais e Humanas, Universidade NOVA de Lisboa, Portugal) - Fonseca, Vitor (Arqueologia e Património Lda.) - Fonseca, Jorge (Arqueologia e Património Lda.) - Pereira, Maria Graça (Arqueologia e Património Lda.) - Alves Cardoso, Francisca (LABOH – Laboratory of Biological Anthropology and Human Osteology, CRIA – Centro em Rede de Investigação em Antropologia, Faculdade de Ciências Sociais e Humanas, Universidade NOVA de Lisboa, Portugal; In2PAST - Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory (Portugal))

Abstract format: Poster

This research explores secondary depositions (SD) identified and excavated during the archaeological intervention (2022-2024) at the cemetery of the Hospital of the Third Order of Our Lady of Carmo (CARMO) – Porto (Portugal). The cemetery operated between 1801 and 1869, a historical period marked by the Napoleonic wars in Europe, the Siege of Porto during the Civil Revolution and cholera pan/epidemics. The term SD is used loosely here to identify disarticulated and/or re-organised clusters of human remains resulting from post-depositional disturbances, intentional or not, after the primary burial of the body. This preliminary study categorised SD into different typologies based on their position, spatial and stratigraphic distribution, and bone element representation. Drawings, photographs, orthophotography, and on-site recording were used to build the profile of the depositions. To date, 140 SD clusters were identified, amongst which distinct types can be distinguished based on variations in the following features: minimum number of individuals (MNI), bones present, organisation of bone elements, presence/absence of burial container such as coffins, and spatial relation of SD to other architectural and burial features. The MNI per SD ranged from 1 to 250 and the total number of individuals recovered from SD is approximately 800. Some clusters show a distinct composition of bone elements present, for example being composed entirely of long bones and skulls. In terms of variation in spatial organisation SD were found both within and beyond the boundaries of the main cemetery. The stratigraphic data suggested that some SDs were produced after the cemetery's abandonment, and others occurred as part of the management of the burial space; all indicate distinct events and show the informative potential of SD in accessing historical events and cultural practices of past populations.

823 EXPLORING THE ORIGINS OF GROG WITH SEM-EDS: THE BRONZE AGE CERAMICS FROM CROATIA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Neral, Natali (Institute of Archaeology, Zagreb, Croatia) - Kudelić, Andreja (Institute of Archaeology, Zagreb, Croatia) - Quinn, Patrick (Institute of Archaeology, University College London)

Abstract format: Poster

Studying the composition of ancient pottery and its origin is very challenging mainly because ceramics is usually composed of several components; the raw clay and tempering materials that are usually added. To investigate the origin of certain pottery raw materials it is necessary to apply analytical methods that ensure the precise geochemical composition of the clay matrix and added tempers, and enables determination of certain technological features. Therefore, using scanning electron microscopy equipped with energy dispersive X-ray spectroscopy (SEM-EDS) and ceramic petrography, this research presents an analysis of the grog-tempered, Bronze Age ceramics from two archaeological sites situated in different geographical regions; Biranj site from Central Dalmatia and Molve-Topolova site situated in Continental Croatia. The intensive grog tempering was particularly common in continental Croatia during the Middle and Late Bronze Age, while along the eastern Adriatic coast, the addition of a small amount of grog is characteristic exclusively for Early and Middle Bronze Age communities. By comparing the geochemical compositions of ceramic matrix and grog, the aim of this study is to consider whether the grog is foreign or originates from the same source as the clay and to examine the variations in grog practice among communities exposed to different cultural influences. The preliminary results suggest that grog has a different geochemical composition compared to clay matrix. These may strongly indicate imports, transported from another manufacturing region or migrations of potters and/or pottery due to various cultural or socio-economic reasons. In addition, differences in pottery practice between regions also reflect cultural influences from the Mediterranean and Central Europe.

824 SKELETAL DANCE: ADVANCING UNDERSTANDING OF PAST EXCAVATIONS THROUGH ARCHEOTHANATOLOGY AND DIGITAL METHODS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Durczak, Kinga (Antea Group)

Abstract format: Poster

The core mission of archeoethanatology is to deepen our understanding of post-mortem interactions with human remains across diverse historical periods and geographical contexts. By exploring the intricate web of cultural, social, and environmental influences on the treatment of the deceased, this interdisciplinary field aims to reconstruct past societies' attitudes towards death and illuminate the complexities of funerary customs. Through meticulous analysis of burial practices, mortuary rituals, and taphonomic processes, archeoethanatology contributes to a nuanced comprehension of human behavior and belief systems throughout history.

Presently, a wealth of documentation methods exists, ranging from traditional techniques like drawings and photographs to cutting-edge digital technologies such as Geographic Information Systems (GIS) and 3D image-based modeling. However, the application of these methods to older excavations raises questions about feasibility, data availability, and cost-effectiveness.

Despite these challenges, leveraging advanced documentation techniques in old excavations remains a viable possibility. With careful planning and innovative approaches, researchers can harness these methods to extract valuable insights from existing data sets and enhance our understanding of human behavior.

Indeed, such endeavors offer a significant opportunity to advance our knowledge of past societies and inform future research directions. By learning from these projects, we can refine our methodologies, deepen our understanding of human behavior, and apply this knowledge to address contemporary challenges in archaeology and beyond.

825 EXPLORING WINE PRODUCTION STRUCTURES: CHARACTERIZATION OF BUILDING MATERIALS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Girimonte, Genea (ERAAUB, IAUB, Universitat de Barcelona) - Pecci, Alessandra (ERAAUB, IAUB, Universitat de Barcelona; INSA-UB, Universitat de Barcelona) - Reynolds, Paul (ICREA) - Forn, Clara (Museu de Badalona) - Miriello, Domenico (Università della Calabria)

Abstract format: Poster

In Roman times, production installations of wine, as well oil or fish by products, usually involved the presence of plastered vats where substances were collected and /or decanted/fermented.

In this work we propose to explore mortars and plasters characterization of the coatings of the vats to verify if the materials used in the construction of these may be correlated with the type of product processed within them. In other words, if the mortars and plasters used in the construction of production structures may show characteristics that reflect the past use of the structure itself.

Within the framework of this research, we will present the results of analyses conducted on various samples obtained from Baetulo, renowned for its distinctive wine production. We will detail the proposed methodology, including sampling procedures and mortar analysis protocols, as well as discuss the potential challenges and opportunities arising from the application of this investigative approach.

This work is part of the activities of the FI-SDUR 2022 (5635122) contract of Genea Girimonte in the PhD program "Sociedad y Cultura: Historia, Antropología, Arte y Patrimonio" at the University of Barcelona financed by AGAUR - Gencat, the project RACAMed II (PID2020-113409GB-I00), financed by MCIN/AEI/10.13039/501100011033 (A. Pecci, P. Reynolds), the ERAAUB (2021 SGR 00696), the Institut de Arqueologia de la Universitat de Barcelona (IAUB) y del INSA-UB, María de Maeztu Unit of Excellence 2021, MCIN/AEI/CEX2021-001234-M and the Università della Calabria.

826 THE MODELLING LINK BETWEEN HOMININS AND THE ENVIRONMENT

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lomborg, Kamilla (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse II Jean Jaurès) - Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine) - Hall, Harry (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine; Department of Archaeology, Classics and Egyptology, University of Liverpool) - Reschke, Jan-Olaf (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine; Institute for Ecology, Evolution and Diversity, Goethe University; ROCEEH Research Center, Senckenberg Research Institute) - Grove, Matt (Department of Archaeology, Classics and Egyptology, University of Liverpool) - Hertler, Christine (ROCEEH Research Center, Senckenberg Research Institute) - Gaudou, Benoit (Institut de Recherche en Informatique de Toulouse, Université Toulouse I Capitole) - Saqalli, Mehdi (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse II Jean Jaurès) - Riede, Felix (Department of Archaeology and Heritage Studies, Aarhus University) - Moncel, Marie-Hélène (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine)

Abstract format: Poster

The poster intends to demonstrate the opportunities of computational methods in the investigation of the interactions between hominins and their environment, more specifically on environmental reconstructions and agent-based modelling analysis. With two examples within this subject, the methodology is demonstrated by two different research questions: 1) The impact of environmental parameters on hominin dispersal in the Early Pleistocene, and 2) Lithic raw material procurement strategies of Neanderthals in the Middle Palaeolithic. The poster is designed around the common ground for the two studies:

- A landscape model, which can include both climate, vegetation and lithic resources.
- Agent settings, which determine the abilities of the simulated hominin populations.

For the question of hominin dispersal, the use of climatic and vegetational data is emphasised, since this aspect demonstrates how a landscape model can be used to test hypotheses with simulations of population dispersals in a representative environment. This can help connect the strings given by the archaeological record, with testing possible scenarios in an observable environment. The second study demonstrates how simple agent-based models can contribute with a quantitatively testing of hypotheses made from archaeological and ethnographical investigations. This is a great attribution to reject or confirm hypotheses on procurement strategies and even identify important parameters. By approaching two different research questions with the same methodological framework, it is demonstrated how environmental reconstruction and agent-based modelling are valuable tools for further exploration of hominin-environment interactions of the past.

827 ENVIRONMENTAL PROTECTION VS. HERITAGE PROTECTION: WHAT CHANCES FOR A COMMON ACTION?

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Ventura, Paola (Ministero della Cultura)

Abstract format: Poster

The amendment, in 2021, of the art. 9 of the Italian Constitution has combined the protection of "the landscape and the historical and artistic heritage of the Nation" with the protection of "the environment, biodiversity and ecosystems, also in the interest of future generations". Albeit the shared satisfaction for the recognition of the urgency of an incisive action to face the climate and environmental crisis, a minority of legal experts had soon raised some doubts about a possible conflict between the safeguard of cultural heritage and the needs of a rapid green conversion of the production system.

The legislative frame is analyzed, from the first derogatory rules for the authorizations concerning green energy production plants, through emergency decrees as a consequence of embargo on gas imports from Russia, to a series of laws for the implementation of the National Recovery and Resilience Plan (Italian: PNRR), subject to ongoing changes (a government bill, including the unsuitability of agricultural fields for photovoltaic systems is being examined just now – May 2024). Subsequently, we focus on the impact on the landscape and the archaeological assets – the visible, and even more the "invisible" ones.

Some case-studies (Friuli Venezia Giulia Region, NE Italy) are showcased: we try to provide figures about the authorization requests for new plant projects - with special regard to location choices - and the related archaeological impact assessment procedures (as far as possible, with data under constant evolution).

Indeed, the main purpose of this poster is a reflection about the chances to overcome the more and more frequent opposition between natural environment and cultural heritage, aiming to safeguard them both in a balanced manner.

828 **NEW DATA ON THE GRAVETTIAN AND SOLUTREAN OCCUPATIONS AT COVA DE LES CENDRES (ALICANTE, SPAIN)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Bel, Miguel Ángel (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; UNIARQ-Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras de Lisboa, Universidade de Lisboa) - Badal, Ernestina (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Martínez-Alfaro, Álvaro (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Martínez-Varea, Carmen M. (GIR PREHUSAL. Departamento de Prehistoria, Hª Antigua y Arqueología, Universidad de Salamanca) - Real, Cristina (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Roman, Dídac (Pre-EINA, Departament d'Història, Geografia i Art, Facultat de Ciències Humanes i Socials, Universitat Jaume I) - Villaverde, Valentín (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

Abstract format: Poster

Cova de les Cendres (Alicante, Spain) is a crucial site for reconstructing the different Upper Palaeolithic chrono-cultural periods in the Mediterranean basin of the Iberian Peninsula, from the Evolved Aurignacian to the Upper Magdalenian. Focusing on the Gravettian and Solutrean, human occupations of both periods were well documented in one part of the excavated area of the site (Sector B), and the results have already been published.

This poster presents new information recovered in Sector A during the last field campaign. Beneath the Magdalenian sequence preserved in this sector, we documented deposits with diagnostic Gravettian and Solutrean lithic industry. The retouched materials include some backed pieces attributable to the Gravettian and remarkable examples of Solutrean pieces with flat retouch. Furthermore, we provide radiocarbon dates that align with the lithic industry. The documentation of lithic pieces and dates from the older phases of the Solutrean is particularly noteworthy, especially considering that recent phases are better represented in Sector B. This new data enhances our understanding of the Gravettian and Solutrean and underscores the importance of human occupations in the cave during these periods, particularly in relation to specific Solutrean phases.

829 **LAYERS OF LANDSCAPES: DIACHRONIC AND MULTIMODAL APPROACHES TO UNRAVELLING THE ROMAN TERRITORIES AT AQUILEIA**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Giovanelli, Riccardo (Istituto Italiano di Tecnologia) - Traviglia, Arianna (Istituto Italiano di Tecnologia) - Poggi, Giulio (Istituto Italiano di Tecnologia)

Abstract format: Poster

For nearly two decades, our team has been exploring the cultural landscape surrounding Aquileia, Italy, unraveling its dynamic transformations over time. A cornerstone of our research involves the development of advanced fieldwork methodologies that integrate remote sensing technologies. These include satellite multispectral imaging, airborne hyperspectral analysis, historical flight imagery, and LiDAR models. These methods have revealed paleo-landscape features like ancient coastlines and river networks, as well as archaeological structures, settlements, and centuriation axes. Artificial Intelligence techniques have further improved our ability to rapidly assess large areas and identify promising sites for detailed field investigation.

Our fieldwork, augmented by handheld tablets for semi-automated, geolocated annotations in conjunction with traditional GPS methods, has unearthed numerous archaeological sites and corroborated findings from remote sensing analyses. These efforts have yielded a wealth of artifacts, including pottery shards, which have been catalogued and subjected to advanced archaeometric analysis. For instance, the identification of a field abundant in mosaic glass fragments and colored tesserae suggests the presence of a Roman-era furnace specializing in coloring and creating elaborately decorated glassware.

By integrating these varied methodologies, our research aims to advance the elaboration of technological and methodological standards to boost the understanding of how natural and human actions shaped the ancient landscape of Aquileia. This multidisciplinary approach aids in reconstructing the historical and cultural context while emphasizing the importance of preserving our cultural heritage amidst modern-day challenges.

830 **SILIROCK: A NEW CHERT REFERENCE COLLECTION FOR CENTRAL ITALY**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Carletti, Elena (Sapienza University of Rome) - Eramo, Giacomo (University of Bari) - Conati Barbaro, Cecilia (Sapienza University of Rome)

Abstract format: Poster

Chert provenance analyses are rapidly increasing among the scientific community due to their potential in unravelling hidden aspects about prehistoric groups and societies. Hence, access to lithotheques (i.e., comparative collections of siliceous rocks) is essential to link archaeological raw materials to geological sources.

In this contribution, we present the first project of construction of a lithotheque for the Sabina region (central Italy) as a valuable tool for provenance analysis. The collection is composed of knappable raw materials collected during field surveys in Sabina and neighbouring areas (Umbria and Abruzzi regions) by researchers from the Department of Antiquities, Sapienza University of Rome.

The aim of the SiliROck project is to create a digital platform open to archaeologist and other scholars interested in siliceous rocks provenance to better understand raw material acquisition, circulation, and mobility throughout Prehistory.

The SiliROck lithotheque will be available online as an open-access space to provide information about the availability, distribution, and localization of chert sources across central Italy. To date, the collection is stored at the Origini Museum (Sapienza University of Rome) and is accessible to scholars previa request.

The virtual platform, beyond providing fresh comparative data, will encourage scientific inter-operability, cooperation, and data sharing, according to the FAIR principles.

831 **MORE THAN JUST FOOD: USE AND IDENTIFICATION OF BIVALVE SHELLS AS TEMPERING MATERIAL IN NEOLITHIC POTTERY FROM LATVIA**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Haferberga, Vanda (University of Latvia) - Bērziņš, Valdis (University of Latvia Institute of Latvian History)

Abstract format: Poster

Bivalve shell is one of the most common tempering materials in Neolithic pottery of the eastern Baltic. It can be assumed that bivalves constituted a food source during the Neolithic, where the waste, namely the shell, was secondarily used by adding it as tempering material to the clay paste. Shell as tempering material in various clay paste recipes has been quite well studied (e.g. Sobkowiak-Tabaka et al. 2023).

However, much less research has been devoted to the identification of shell temper in the pottery fabric. Quite often, due to soil conditions, the shell has been dissolved from the pottery fabric, leaving only voids. The study focuses on the identification of this tempering material, trying to answer the question of whether it is possible to not only to identify shell but also to make taxonomic distinctions.

Experimental clay briquettes were prepared and compared to Neolithic pottery using a stereomicroscope as well as ceramic petrography.

The paper was prepared within the Latvian Council of Science funded project "Skills in Synergy, Crafts in Context: An Integrated Study of eastern Baltic Stone Age Technologies" (project no. lzp-2021/1-0119).

832 **THE ARCHAEOBOTANICAL RECORD OF MĂGURA GORGANA AT PIETRELE IN SOUTH ROMANIA (4550 - 4250 BC)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Aquaro, Antonella (DAI - Deutsches Archäologisches Institut)

Abstract format: Poster

This poster presents the main results of the archaeobotanical investigation of the Copper Age settlement of Măgura Gorgana at Pietrele, South Romania. Here, extensive excavation efforts and systematic soil sampling have yielded a rich collection of charred plant macroremains, offering insights into at least 300 years of plant utilization (4550 - 4250 BC).

The recovered plants include cereals, pulses and stone fruits and provide a glimpse into the subsistence strategies and dietary habits of this prehistoric community. Utilizing an integrated approach, the analysis of different types of samples (e.g., stored, waste, or residues from grain processing) is combined with the interpretation of the context of origin within the settlement. The resulting comprehensive dataset of economically relevant plants shows that a big part of the diet was based on barley, emmer and einkorn wheat, lentils, peas and bitter vetch, flax, alongside a variety

of wild-collected fruits, including grapes, blackberries, raspberries and various types of plums such as dwarf cherry, cherry plum, bird cherry, blackthorn, hawthorn and cornelian cherry.

In the selection of preferred crops, a clear continuity is evident. Towards the end of the settlement, the predominance of barley likely indicates the necessity for a more resilient grain variety. Similarly, we can observe remarkable stability in the preference for lentils.

This poster outlines the results of the plant identifications and their relative abundance within samples, in combination with contextual information. This integrated approach sheds light on storage practices, processing techniques, and the organization of the settlement. By combining these aspects, we gain a comprehensive understanding of how the inhabitants interacted with their plant resources throughout the history of the settlement and discern patterns of adaptation and cultural preferences that shaped their community livelihoods over time.

834 FAMILY FESTIVAL OF ARCHAEOLOGY AND POTTERY: UTILISING ARCHAEOLOGICAL RESEARCH TO ENGAGE WITH AND IMPACT LOCAL COMMUNITIES

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Trinder, Ermelinda (Staffordshire University)

Abstract format: Poster

The Family Festival of Archaeology and Pottery was undertaken in Stoke-on-Trent, England, in one of the most famous areas for its pottery heritage. This project aimed to utilise the archaeological practice of pottery fragmentation, identified in Iron Age burial mounds in Albania, to bring together members from deprived areas, asylum seekers and refugees in a fun, safe and family-based environment. This paper will present how archaeological research has the potential to bring together diverse individuals and how it could provide people with a sense of community identity, cultural heritage, and civic pride.

This paper will argue that archaeological research can meaningfully impact and become a catalyst for positive change and can break down language, social, educational and financial barriers and inequalities. The success of the Family Festival of Archaeology and Pottery was based primarily on collaborating with three charitable organisations that are currently engaged in helping and supporting different communities within the area. This project created the foundation for meaningfully impacting social inequalities in local communities and promoting a sense of civic pride. However, this paper advocates for a structured framework organised by universities and government institutions that supports archaeologists and heritage professionals in engaging in long-term ways and meaningfully empowering their local communities.

836 CROSS-REFERENCING BIOARCHAEOLOGICAL EVIDENCE WITH HISTORICAL DATA, THE RESULTS FROM THE EARLY MODERN SARDINIAN CHURCH OF SANT'AVENDRACE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Gallisai, Alice (University of Cagliari, Italy) - Pietra, Giovanna (Soprintendenza Archeologia Belle Arti e Paesaggio per la Città Metropolitana di Cagliari e le Province di Oristano e Sud Sardegna, Italian Ministry of Culture, Rome, Italy) - Ippolito, Vincenzo (Independent researcher, Soprintendenza Archeologia Belle Arti e Paesaggio per la Città Metropolitana di Cagliari e le Province di Oristano e Sud Sardegna, Italian Ministry of Culture, Rome, Italy) - Caria, Laura (Museo Archeologico Nazionale di Cagliari, Italian Ministry of Culture, Rome, Italy) - Uccheddu, Giulia (Universidad de Granada, España) - Candilio, Francesca (Museo delle Civiltà, Italian Ministry of Culture, Rome, Italy)

Abstract format: Poster

Excavations conducted during public works for the refurbishment of the Church of Sant'Avendrace in Cagliari (Sardinia, Italy) led to the identification, meticulous excavation, and recovery of over 200 primary burials and associated commingled remains dating from the 16th to the early phases of the Early Modern Age.

This funerary context was ultimately closed following the extension of the Napoleonic edict of Saint Cloud (1804) to the Kingdom of Italy and then to Sardinia, which mandated the relocation of burial grounds away from inhabited areas and cultivated lands.

During this time period, spanning over little more than 200 years, the community of fishermen and breadmakers living along the coastline in the peripheral area of Cagliari was affected by numerous historically documented events of interest to the region, including two famines (1645, 1680), the Black Death (1652), attacks by Anglo-Dutch ships under Charles III (1708), and Spanish incursions (1717-1718).

This study leverages the abundance and variety of information granted by the defined and limited period of use (characterized by numerous events that would have affected health and living conditions); the availability, at the diocesan archive of Cagliari, of the *Quinque libri* (church registers where births and deaths were recorded); and the quality of

conservation of the osteological remains. It uses a multidisciplinary approach to analyze the historical data and the bioarchaeological evidence to assess how these corroborate one another. Preliminary findings suggest a strong agreement between the data collected in the archives and the examination of historical sources, with peaks in mortality consistent with church records during the years of the aforementioned historical events. Similarly, corroboration is attested in the results from the preliminary bio-archaeological analysis of approximately 50 individuals, which indicates a community marked by evidence of hardship and, in different occasions, signs of severe malnutrition.

837 A NEW BRANCH OF RESEARCH FOR ANALYSING ARCHAEOLOGICAL CONTEXT: APPLICATION OF DRONE-BASED MAGNETOMETER

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mandorlo, Alessia (University of Salento)

Abstract format: Poster

In the last decades, various drone-based systems equipped with sensors, such as multispectral, thermal, and LiDAR have been tested in many archaeological sectors and in the rescue archaeology. In the most recent years, there has been a growing interest in the use of geophysical sensors like magnetometry and ground-penetrating radar in archaeology, leading to a new area of research. This poster will present the current state-of-the-art and potential applications of drone-based magnetometers in archaeology, in which magnetometry has proven to be an effective method for detecting and mapping archaeological features buried underground; at the same time, the Unmanned Aerial Vehicles (UAVs) have been widely recognized for their ability to map and survey archaeological sites from above. The combination of Unmanned Aerial Vehicles (UAVs) and magnetometers offers a promising approach for surveying and mapping archaeological sites that are difficult to access. By leveraging the advantages of drone-based magnetometry, it can enhance archaeological prospection in challenging terrain, on local and large scale and in relatively short time.

838 REFITTING CERAMICS FROM MIDDLE NEOLITHIC SETTLEMENTS: PRELIMINARY MORPHOLOGICAL AND SPATIAL ANALYSES FROM CAL SITJO SITE (4100-3700 BCE, NE IBERIAN PENINSULA)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Cámara Manzaneda, Javier (Departamento de Geografía e Historia, Universidad de La Laguna) - Gómez de Soler, Bruno (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili) - Chacón, M. Gema (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili; UMR 7194 - Histoire Naturelle de l'Homme Préhistorique) - Farkouch, Mourad (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili) - Suesta, Alfredo (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili) - Allué, Ethel (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili) - Mas, Bàrbara (Seminaris d'Estudis i Recerques Prehistòriques (SERP), Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona (IAUB); Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA)) - Díez-Canseco, Celia (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili) - Vallverdú, Josep (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA); Àrea de Prehistòria, Universitat Rovira i Virgili)

Abstract format: Poster

The Cal Sitjo site consist of a new archaeological sequence located in the chert-rich region of the town of Sant Martí de Tous (Barcelona, Spain), in the northeastern part of the Iberian Peninsula. This region highlights for the frequent number of archaeological sites, quarries, and workshops (e.g., Vilars de Tous, La Guinardera) which were potentially dedicated to the chert exploitation throughout prehistoric and modern times (Cámara 2017; Clop et al., 2005; Gómez de Soler et al., 2020; 2021).

Since the discovery of Cal Sitjo in 2019, the successive archaeological excavations carried out in one of the sectors have revealed around an 8 m sedimentary sequence with diachronic occupations dated from the Mesolithic to the Middle Neolithic (Gómez de Soler et al. 2023). One of the significant traits of the Neolithic layers is the frequent number of structures huddled in the excavated sector (e.g. post-holes, combustion, and stone-floor structures), which points towards the hypothetical articulation and repeated reorganization of the occupational space. Radiocarbon dates and diagnostic traits of the ceramic remains place these occupations during the Middle Neolithic and, particularly, at the end of the Postcardial regional Neolithic horizon (4070-3700 cal. BCE).

This paper aims to present the new obtained results from the latest archaeological fieldworks, which were mainly concentrated on the excavation of the Middle Neolithic layers, as well as to analyse the spatial distribution of potsherds within the succession of the Neolithic occupations and structures. Moreover, preliminary data on the typological and

technological characterization of the ceramic assemblage show not only the attribution of the assemblage to the Molinot regional style, but also the prevalence of the same Early Neolithic forming traditions during the Middle Neolithic in the NE Iberian Peninsula.

839 ORGANIC CONTENTS OF BRONZE AGE FUNERARY VESSELS FROM NORTH-WEST PORTUGAL

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Back, João Vinícius (Department of History, University of Minho, Portugal; ERGANE – Digital Archaeology, Federal University of Rio Grande do Sul, Brazil; University of Évora, Portugal) - Oliveira, César (HERCULES Laboratory, University of Évora, Portugal; IN2PAST – Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory, Portugal) - Bettencourt, Ana (Department of History, University of Minho, Portugal; IN2PAST – Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory, Portugal) - Sampaio, Hugo (Department of History, University of Minho, Portugal; IN2PAST – Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory, Portugal; LAB2PT – Landscapes, Heritage and Territory Laboratory, Portugal) - Vilas Boas, Luciano (Department of History, University of Minho, Portugal; IN2PAST – Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory, Portugal; LAB2PT – Landscapes, Heritage and Territory Laboratory, Portugal) - Gonçalves, Luís (Earth Sciences Center (CCT/UM), Earth Sciences Department, University of Minho, Portugal) - Bernardes, Paulo (LAB2PT – Landscapes, Heritage and Territory Laboratory, Portugal; Unity of Archaeology (Unidade de Arqueologia), University of Minho, Portugal)

Abstract format: Poster

The analysis of organic residues present in archaeological ceramic vessels plays a crucial role in determining the functions of these containers, providing valuable information about agro-pastoral and gathering practices, as well as the processing methods used and the selection of specific raw materials. However, its application to prehistoric vessels from the Iberian Northwest is still scarce. The proposal of this poster is to present a new project that aims to systematically use chromatographic techniques to study organic residues preserved in vessels from Bronze Age funerary contexts in north-western Portugal. Furthermore, samples were taken following the rigorous archaeological practices to avoid contamination and preserve the integrity of the residues. Some of the results obtained for horizontal rim vessels dating from the first half of the 2nd millennium BCE are presented. These results were compared with recently published studies of a vessel of this typology. The study of the organic chemical composition preserved in vessels of this type also contributes to answering the various hypotheses established about the use of horizontal rim vessels in funerary practices.

841 POTS BURIALS AS MORTUARY PRACTICE IN NEOLITHIC CENTRAL ANATOLIA (TÜRKİYE): THE CASE OF TEPECİK ÇİFTLİK

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Büyükkarakaya, Ali (Hacettepe University, Department of Anthropology; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Godon, Martin (IFEA / Institut Français d'Études Anatoliennes)

Abstract format: Poster

In this paper, a phenomenon that has not been seen before as the mortuary practice in early Pottery Neolithic settlements in Southwest Asia is presented. Based on the stratigraphy of the settlement and the available calibrated radiocarbon dates, it can be said that members of the Tepecik-Çiftlik community in Central Anatolia (Türkiye) began to bury some of their babies who died at very early ages in pots, starting from the first half of the 7th millennium BCE. It was determined that the ages of these babies ranged from newborn to one year old. Potteries used for these burials are produced locally on site, and are mostly straight wall pots with flat bases. One can easily understand such typological selection when considering the deposition process of human remains and eventually offerings inside a container. Additionally, in the studies carried out, it was also observed that small bowls were used as grave goods in some of the graves of babies. In this contribution, we evaluate the traces of this particular form of mortuary behaviour, which continued throughout the 7th millennium at the settlement, in the context of the subject-object relationship in terms of the community's conceptualization of death by including bioarchaeological data.

842 THE THERMAL BATHS OF LA ONTAVIA AND THE MANSIO MARIANA, A ROMAN CONTEXT NEAR OF THE ROUTE OF VICARELLO CUPS

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Esquinas, Ana (EIDUNED. Universidad Nacional de Educación a Distancia)

Abstract format: Poster

This study aims to highlight the distribution and the interconnections between Roman-era sites located in the surroundings of the thermal baths of La Ontavia (Terrinches, Ciudad Real, Spain) and the mansio Mariana (Puebla del Príncipe, Ciudad Real, Spain). Mariana is an ancient Roman mansio which is mentioned in the Antonine Itinerary in section XXIX Item per Lusitaniam ab Emerita Caesarea Augusta and the Vicarello Cups. The territory referred to is located north of the Saltus Castulonensis.

La Ontavia is located just five kilometres away from Mariana, also in the vicinity of Vicarello Cups Roman road. It is a thermal complex of remarkable dimensions built in the High Imperial period, abandoned from the third century C.E. and in the Late Antique and High Medieval period was reused for funerary purposes.

Other settlements from the Roman period have been documented in the vicinity of both sites. We present a diachronic and comparative analysis of the rural population in this area based on extensive and intensive systematic surveys as well as some archaeological excavations.

The aim of this research is to analyse at various scales how the different settlement models are situated in this territory. It is also intended to study the connections between these settlements with the mansio Mariana, the thermal baths of La Ontavia and the Roman roads.

843 PETROGRAPHIC CHARACTERISATION OF ARABIAN QUARTZ-ARENITES: UNVEILING PETROGENESIS AND WEATHERING PROCESSES OF ABIOTIC PREHISTORIC RESOURCES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Prieto, Alejandro (University of the Basque Country) - Cristóbal, Paula (Department of History, Geography and Communication. University of Burgos) - Crassard, Rémy (CNRS, UMR 5133 Archéorient) - Schiettecatte, Jérémie (CNRS, UMR 8167 'Orient & Méditerranée') - Hibert, Yamandú (Institute for Archaeological Sciences, Department of Paleoanthropology, University Tübingen)

Abstract format: Poster

The characterisation of abiotic resources has constituted a major topic in Prehistoric Archaeology since the 50s of the previous Century. Inferring human mobility, especially if the distance is high, still constitutes the main output of lithic raw material research. Furthermore, in the last decades, the characterisation of abiotic resources is diversifying the directions looking forward because the features of the rocks, different depending on the formative and weathering processes that have created and affected them, modify the way humans transformed, used and managed them. This interdependence between the rock features and their human use was obvious and thanks to interdisciplinary approaches that include petrography, technological analysis or use-wear analysis, among others, we are depicting new human behaviours and unveiling historic narratives of past human populations.

Nowadays, the Arabian Peninsula constitutes a relevant scenario for Palaeolithic research as the new archaeological discoveries are challenging the dispersion of the human populations out of Africa. In this area, little is known about the characteristics of the abiotic resources used by humans. In this presentation, we will give insights into the few quartz-arenites obtained from the Arabian Peninsula. The main objective of this presentation consists of the characterisation of lithic resources potentially exploited by past populations as this constitutes the cornerstone for later interdisciplinary research. With this aim we have characterised quartzite thin sections using high-resolution petrography and non-destructive stereomicroscopy. This allowed us to infer the genesis of the material, characterise how it has been weathered and determine particular features that can determine its human use.

844 A DIVIDED SEA?: COMPARING POTTERY USE IN JAPAN AND KOREA AT THE DAWN OF AGRICULTURE THROUGH ORGANIC RESIDUE ANALYSIS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Lundy, Jasmine (University of York) - Craig, Oliver (University of York) - Bondetti, Manon (University of York) - Murakami, Natsuki (Nara National Research Institute for Cultural Properties) - Brainerd, Leah (University of Cambridge) - Nicholson-Laylie, Sessa (University of York) - Sasaki, Miho (Nara National Research Institute for Cultural Properties) - Son, Joon-Ho (Korea University) - Crema, Enrico (University of Cambridge) - Shoda, Shinya (Nara National Research Institute for Cultural Properties)

Abstract format: Poster

In the first Millennium BC rice and millet agriculture was introduced to the Japanese archipelago from the Korean peninsula, first arriving in Northern Kyushu. A recent synthesis of radiocarbon dates from carbonised rice grains has helped elucidate the timing of this process and its subsequent dispersal through the Japanese archipelago. Yet relatively little is known regarding the extent to which rice and millet agriculture transformed diets and foodways in Japan. To investigate this, here we compare the results of stable isotope analysis of human bone and organic residue analysis (ORA) of cooking pots from contemporary sites in Korea and Northern Kyushu, Japan. Carbon and Nitrogen stable isotopes enable us to understand the major dietary sources (i.e., C3/C4 plants and terrestrial vs aquatic animals) and ORA gives direct chemical evidence of resources processed in the cooking vessels analysed.

During the first Millennium BC in Korea, stable isotope analysis of human remains has shown that millet, a C4 crop, was a major dietary source. The addition of ORA of Korean 'Mumun' pottery has enabled us to investigate culinary practices from a much wider range of sites. Our results, reinforce the human stable isotope data, as milliacin, a lipid biomarker for Broomcorn millet (*Panicum miliaceum*), was readily identified in Korean pottery.

In contrast, at contemporary sites in Kyushu, Japan, millet has not been identified in any Final Jomon/Initial Yayoi pottery and stable isotopes of Final Jomon/Initial Yayoi human remains from Kyushu point to diets dominated by terrestrial and aquatic foods rather than a C3 or C4 signal. Thus, it can be argued that, whilst some aspects of an agricultural package did enter Northern Kyushu, it did not have a major influence on the pre-existing culinary habits of the populations residing there at least in the introductory phase.

845 MISFITS OR NEIGHBOURS? DIET ($\delta^{13}C$, $\delta^{15}N$) AND MOBILITY ($\delta^{18}O$) IN THE NEOLITHIC SITES OF BĂLĂŢEANCA AND CERNICA (ROMANIA)

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: García-Vázquez, Ana (ArchaeoSciences Division, Research Institute of the University of Bucharest) - Vasile, Gabriel ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest, Romania) - Ştefan, Cristian ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest, Romania) - Bălăşescu, Adrian ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest, Romania)

Abstract format: Poster

The archaeological site of Bălăţeanca, located in the commune of Cernica (Ilfov Conty, Romania), was researched in the winter of 2020. The rescue excavations of the A0 Motorway surrounding Bucharest revealed a complex settlement with features from many time periods, from the Neolithic to the Middle Ages. The oldest habitation belong to Neolithic, Boian culture – phase Bolintineanu (ca. 5200-5000 BC).

Three graves from Boian culture containing human remains were excavated, alongside with a dozen of pits containing animal remains, possibly domestic. The graves correspond to two adults (M6 and M7) and a child aged 10-11 (M8). Isotopic analysis was conducted on the three humans and four animals (cattle and ovicaprines). The %N in the bone indicated that only two of these graves contained sufficient collagen (M6 and M8). The preservation of the animal remains was poor and didn't have enough collagen, with some of the bones completely burnt to a white colour. $\delta^{13}C$ and $\delta^{15}N$ results were compared with the nearby (3.7 km) and contemporary site of Cernica. The result for M6 showed a significantly lower $\delta^{15}N$ value compared to the entire population of Cernica, suggesting a diet with much less animal protein, whereas the child also exhibited a lower $\delta^{15}N$ than the neighbouring population, although their results could be more consistent with Cernica's diet. Regarding $\delta^{18}O$, all individuals seem to be of local origin, although M6 appears to have spent the last years of his/her life in a colder area.

846 THE STEĆCI TOMBSTONES AS MULTIETHNIC ARCHAEOLOGICAL HERITAGE AND SOCIAL PHENOMENON

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: anzur, lana nastja (University of Ljubljana) - Caval, Sasa (Stanford University; Research Centre of the Slovenian Academy of Sciences and Arts)

Abstract format: Poster

Stećci are medieval tombstones found in Bosnia and Herzegovina, Montenegro, Serbia, and Croatia. There are over 70,000 documented stećci, but the actual number could be even higher due to poor preservation and lack of archaeological research. Despite being in a politically divided area, stećci are not contested heritage. In fact, they can be used to overcome the division between different ethnic groups. This was demonstrated when they were added to the UNESCO World Heritage List as a multinational nomination in 2016.

Stećci are not limited to a single ethnic or religious group. They are a phenomenon defined by geographical and temporal boundaries. They come in various forms, with only about 8% being decorated. Around 400 have inscriptions in Bosnian Cyrillic and Glagolitic scripts, which are now extinct. However, the endurance of stećci is also evident in the use of forms in Early Modern Jewish tombstones in Central Bosnia. The iconography of the decorations on stećci is diverse, with many motifs linked to prehistory. Additionally, the symbols used in traditional Bosnian tattooing of Catholic women also clearly connect to those found on stećci. Building on the paradigms of participatory heritage discourse, we will present the impacts of the stećci as both cultural and social phenomenon, looking at how local people perceive them through the lens of community building and reconciliation.

847 CAVE CHURCH AT ZAHAITANSKA ROCK (CRIMEA): FOUND&LOST?

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Chuyeva, Kateryna (independent scholar) - Bobrovskyy, Tymur (The National Conservation Area "St. Sophia of Kyiv")

Abstract format: Poster

In 2004 a cave church with wall paintings was found at Zahaitanska Rock near Sevastopol (Crimea, Ukraine) by Dr. Tymur Bobrovskyy and Kateryna Chuyeva. The church is a part of the rock-cut cave complex and was cut down in a grotto at an altitude of about 25 meters from the foot of the cliff. During 2005-2006 excavation of the floor of the church and visual examination of the wall paintings were conducted by the authors of the discovery. According to the materials received, the church and its unique wall paintings were dated to the late 13th - early 14th century. Wall paintings covered about 15 m² total in apse and partly in a nave. The iconography program was described as fully as possible despite the heavy losses of paint layer, fungal deterioration etc.

The conservation measures were extremely needed for further preservation of the wall paintings. We started to elaborate on the program. Wall paintings were fragile, partly wet and kept crumbling. Unfortunately, it was not possible to start immediately due to the lack of financial support and the difficulty of access to the church.

In 2014 Crimea was annexed by the Russian Federation. We lost any access to the site. In 2017 a group of Russian amateur speleologists visited the church and chipped off a fragment of the wall-paintings to photograph the carved inscription which fragment became visible through the crumbling of murals. It was published by Dr. Vinogradov (Moscow) and contains the date "1303".

After 2014 the site was unattended and unrestored.

Since 2022 the risks of damage and loss of the wall paintings have increased due to the military operations in/near Sevastopol which is one of the most militarized zones despite the World Heritage Site located in the area.

848 ODESA ARCHAEOLOGICAL MUSEUM AT THE TIME OF FULL-SCALE WAR

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Lobanova, Mariia (Odesa Archaeological Museum of the National Academy of Science of Ukraine) - Kalashnikova, Nataliia (Odesa Archaeological Museum of the National Academy of Science of Ukraine)

Abstract format: Poster

The Odesa Archaeological Museum of the NAS of Ukraine is the oldest archaeological institution in Ukraine. The museum was founded in 1825 as Odesa Museum of Antiquities. In 2025, the institution will celebrate its 200th anniversary. This collection was granted the status of the "National Heritage of Ukraine" in 2008. It covers different historical stages. It includes large collections from prehistoric and ancient sites, numismatic collections, and Egyptian and Cypriot antiquities. The museum was constantly attacked during the war because of its location in the city center, close to the seaport.

In February 2022, the museum team removed the exhibited collection to a safe place and barricaded large objects. The building was heavily damaged (fallen ceilings, walls, broken windows) after the massive attacks by Russian Federation on Odesa in July 2023. Due to systematic shelling, the condition of the museum building is getting worse.

Military operations occurred on the Zmiinyi island, where the museum's branch institution has been since 2008. In Ancient times, the island was sacred to the hero Achilles and had a temple of the hero with a statue inside. According to the last pictures of the island, museum definitely damaged or destroyed.

The Museum received help from various international organizations (UNESCO, ALIPH, Museum for Change, organizations from Germany, Poland and Czech Republic). The museum team is implementing projects to digitize its collections and protect its building.

A full-scale war affects all aspects of the archaeological heritage in Ukraine and the Odesa region. Most projects are frozen, and settlements in strategic military places are being destroyed. Odesa Archaeological Museum is using all its efforts to preserve cultural heritage.

849 'ORGANIC TEMPER' AND THE EARLY NEOLITHIC POTTERY PRODUCTION: THE CHALLENGE OF INTERPRETATION

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Dzhafzova, Tanya (St Cyril and St Methodius University of Veliko Tarnovo, Bulgaria)

Abstract format: Poster

The seemingly uniform vegetal inclusions (usually interpreted as 'chaff'), standardly found in the clay paste used for pottery production at many Neolithic Eastern Balkan settlements, actually reveal much greater diversity in terms of used types of plants and vegetal parts.

The specific nature of the organic remains, the study of essential aspects of their role as potential functional temper, as well as the research on the various actual sources of vegetal inclusions used in the technological cycle of pottery production, refer to several major questions. Why was organic temper added? What were the plant materials that took place in the process of making ceramic vessels? How the diversity, established within this category of 'organic temper', can be explained?

These questions are tackled by the application of various macro- and microscopic analytical approaches. Potentially, a more comprehensive understanding of the studied materials thus sheds light on the essence of the interaction between two major cycles of the Neolithic way of life – the subsistence practices and the ceramic technology.

851 DENTAL CALCULUS OF LATE-IRON AGE ESTONIANS: DIRTY TEETH AND VALUABLE INFO

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Unt, Agnes (University of Tartu)

Abstract format: Poster

While the studies of ancient foodways are well-established within the Estonian archaeological discourse, the analysis of microremains from human dental calculus is an underutilised method. Applying this method, the first study of this size was conducted in Estonia on human dental calculus from the Kukruse Late Iron Age cemetery. A dedicated clean laboratory was established at the University of Tartu, Estonia, and the methodology was refined to suit the nature of the material. Work with a purpose-built reference collection was done in tandem with the analyses. All debris was recorded, yielding 1164 microdebris from the ten analysed individuals. Altogether 333 microremains belonged to kingdom Plantae of which Triticeae and Fabaceae starch granules were found. Interestingly, there was a lack of phytoliths in the samples, a phenomenon that needs to be investigated further. The presence of wood debris may be indicative of crafts or practises. A preliminary data comparison was done with the EA-IRMS and ORA analyses from the same site, suggesting that the microremains from dental calculus contained more material of plant and less of animal origin than may seem from the previous results. This dental calculus analysis is the first of its kind on this scale in Estonia, opening a small window into the dietary practises of ancient populations of Estonia.

852 EXPLORING ANCIENT NETWORKS: A SURVEY ON ETRUSCAN EVIDENCE ALONG THE THE SECCHIA RIVER FROM THE APENNINES TO MODENA

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Battaglia, Sara (Università degli Studi Roma Tre) - Tulipano, Jacopo Francesco (Università degli Studi di Roma La Sapienza)

Abstract format: Poster

This poster aims to present an investigation into Etruscan mobility within the territories surrounding the Secchia River (situated in the province of Modena). The research is based on a comprehensive review of published archaeological data focusing on the Secchia Valley intersected with topographical and ancient landscape data.

Utilizing sources such as the Atlas of Archaeological Heritage of the Province of Modena and subsequent publications, the study aims, in its initial phase, to analyze and systematize data pertaining to the Iron Age. This endeavour is crucial for delineating areas of Etruscan influence and identifying Etruscan settlements and other sites across the Province of Modena, ranging from the Apennines to the course of the Po River.

The significance of this research lies in its focus on an area historically marginalized due to its proximity to Bologna (the Etruscan Felsina) and overshadowed by more substantial discoveries in neighbouring territories.

In addition to archaeological findings, the second phase of this research investigates evidence from topography, toponymy and popular traditions, particularly highlighting indicators of potential Etruscan occupation or influence along the Apennine ridge.

Historically, rivers and mountain ranges have often served as territorial boundaries. However, recent works are aiding a re-evaluation of these landscapes as crucial elements facilitating communication and interaction between adjacent territories and cultures. This shift in perspective underscores the importance of investigating the Secchia Valley and its surroundings within the broader context of ancient mobility patterns.

This poster will detail the methodologies employed in this investigation, utilizing GIS to register archaeological and topographical data, and subsequently intersecting those data to draw preliminary conclusions. These tools are instrumental in identifying potential communication routes linking the Po Valley with the northern Tyrrhenian slope, shedding light on the intricate networks of Etruscan mobility in the region.

854 POTTER'S STAMPS ON ITALIC TERRA SIGILLATA IN THE ROMAN CITY OF POLLENTIA (ALCÚDIA, MALLORCA, BALEARIC ISLANDS)

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Plaza Conesa, Paula (ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona (IAUB); Universitat de Barcelona (UB), Spain) - Guimarães, Raquel (ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona (IAUB); Universitat de Barcelona (UB), Spain; Fundação para a Ciência e a Tecnologia (FCT)) - Siclari, Patrizia (ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona (IAUB)) - Talavera Montes, Antonio Jesús () - Cau-Ontiveros, Miguel Ángel (ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona (IAUB); Universitat de Barcelona (UB), Spain; ICREA, Passeig Lluís Companys 23, 08010 Barcelona, Spain, Chercheur Associé, Aix Marseille Univ, CNRS, CCJ, Aix-en-Provence, France) - Mas Florit, Catalina (ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona (IAUB); Universitat de Barcelona (UB), Spain) - Chávez-Álvarez, M^a Esther (Grupo de investigación ARQHISPA, Departamento de Geografía e Historia, Universidad de La Laguna, Spain)

Abstract format: Poster

This study offers a first insight into the commercialization of terra sigillata (or Samian Ware) from Italic officinae from around the turn of the era until the 2nd century AD in Pollentia. The Roman city of Pollentia, is located in Alcúdia, on the island of Mallorca (Balearic Islands, Spain). According to classical authors, it was founded in 123 BC by the consul Quintus Caecilius Metellus, after the conquest of the island. Both unpublished and previously published data have been utilized for the analysis of the sigillata stamps. These materials have been classified and grouped by periods and associated with officinae for the purpose of analyzing the commercial distribution of the product within the city and throughout the trade networks of Hispania. In this regard, the initial data suggests that Pollentia demonstrates a significant predominance of imported Italic sigillatas, even during periods when sigillatas of South Gallic or Hispanic origin held hegemony.

MULTIPROXY APPROACHES FOR THE RECONSTRUCTION OF SITE FORMATION PROCESSES ASSOCIATED WITH THE COLLUVIAL DEPOSIT OF AMOREIRA ARCHAEOLOGICAL SITE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Adewumi, Opeyemi (Geosciences Centre (CGEO), University of Coimbra, Portugal.; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Centre, Coimbra, Portugal.; Earth and Memory Institute, Mação, Portugal.; IPHES, Institut Català de Paleocologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.) - Lattao, Virginia (Geosciences Centre (CGEO), University of Coimbra, Portugal.; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Centre, Coimbra, Portugal.; Earth and Memory Institute, Mação, Portugal.) - Vallverdú, Josep (IPHES, Institut Català de Paleocologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain.; Área de Prehistoria, Universitat Rovira i Virgili (URV), Avenida de Catalunya 35, 43002 Tarragona, Spain.) - Rosina, Pierluigi (Geosciences Centre (CGEO), University of Coimbra, Portugal.; Earth and Memory Institute, Mação, Portugal.; Polytechnic Institute of Tomar, Portugal.) - Oosterbeek, Luiz (Geosciences Centre (CGEO), University of Coimbra, Portugal.; Earth and Memory Institute, Mação, Portugal.; Polytechnic Institute of Tomar, Portugal.) - Gomes, Hugo (Geosciences Centre (CGEO), University of Coimbra, Portugal.; Earth and Memory Institute, Mação, Portugal.; Polytechnic Institute of Tomar, Portugal.) - Marrocchino, Elena (Department of Environmental and Prevention Sciences, University of Ferrara, Italy.)

Abstract format: Poster

Colluvial deposits are accumulations of sediment, rock fragments, and soil that result from the downslope movement of material largely due to gravitational forces. These deposits often play a significant role in archaeological site formation processes, impacting the preservation and stratigraphy of artefacts and features. Understanding the formation of colluvial deposits is crucial for interpreting the archaeological record accurately. This paper presents a multiproxy study conducted at the Amoreira Archaeological site, located on the right bank of the Tagus River, in the municipality of Abrantes, Portugal.

Micromorphological technique was combined with other microscale analyses such as stable isotope analysis (in particular $\delta^{13}C$), XRF and LOI analyses to study the sediment from the site for the reconstruction of its site formation processes. Micromorphology, in particular, has provided insights into the nature of the formation of colluvial deposits at the site of Amoreira. The analysis identified spodosols as the major type of soil for this site, usually formed in cool and humid climates evidencing, coarse-textured initial materials, the presence of vegetation that supplies mobile and sesquioxide, leading to the subsequent movement, and deposition of organic compounds. These processes are considered a contributing factor to the disruption of occupational sequences at the Amoreira site. In addition, other complementary analyses also gave useful insights in reconstructing the environmental changes that occurred at the studied site during human occupation. Therefore, this paper will contribute to the knowledge of the site formation processes associated with the Colluvial deposit of Amoreira Archaeological Site, in the middle Tagus region of Portugal.

THE ARCHAEOLORE GROUP: ARCHAEOLOGY, ORAL TRADITION AND PLACE NAMES - DELVING INTO NEW PERSPECTIVES

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Vieira, Alexandra (Independent researcher)

Abstract format: Poster

In the span of just a few generations, our connection with the environment and the landscapes has undergone a profound transformation. We find ourselves in an increasingly interconnected and globalized world, a world that has gradually distanced us from old traditions and our natural surroundings. Our grandparents possessed precious empirical knowledge, gleaned from a lifetime intertwined with the world around them. However, this invaluable intangible heritage is now evaporating at an alarming rate.

The catalyst for this disheartening loss can be traced back to a generational rupture, driven by a complex number of circumstances. As a result, we stand at a precipice where the very essence of our connection to the land, our history, and our heritage is at risk of slipping through our fingers. It is now, more than ever, of utmost urgency and importance to delve into the recent past and rediscover how communities once intricately wove themselves into the fabric of their landscapes. In this quest, we must turn to the profound reservoir of social memory to unravel the intricate tapestry of our relationship with the land, before it fades into obscurity.

Therefore, the ArchaeoLore Group aims to bring together researchers from diverse backgrounds to investigate the rich cultural heritage (tangible and intangible) and oral narratives embedded in our landscapes. By combining archaeological evidence, myths, oral traditions, folklore, and the study of place names, we strive to gain a deeper understanding of the intricate connections between past/present societies and their environments.

Therefore we must explore the relationship between archaeological landscapes and oral traditions, study the role of folklore in shaping place names and sacred places, or investigate the intersection of intangible and tangible cultural heritage associated with specific regions.

ISLAND ARCHAEOLOGY IN SAINT KITTS AND NEVIS (LESSER ANTILLES): NEW DATA ON PRE-CONTACT POPULATION FROM FIELD SURVEYS AND ARCHAEOGENETICS

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: COPPA, ALFREDO (Sapienza University of Rome; Department of Evolutionary Anthropology, University of Vienna, Austria) - Truffi, Michele (Università degli Studi Roma Tre; Associazione ORTA) - Lucci, Michaela (Department of Environmental Biology, Sapienza University of Rome, Italy) - Guidi, Alessandro (Università degli Studi Roma Tre) - Nomi, Federico (Scuola Superiore Meridionale; Associazione ORTA)

Abstract format: Poster

The pre-contact history of the Caribbean prior to European arrival is a narrative rich in migrations and interactions among relatively small communities. After decades of archaeological research in the Greater and Lesser Antilles, archaeogenetics has begun to shed new light on these dynamics, helping to clarify several obscure points.

Despite these strides, the study of pre-contact archaeology in the Lesser Antilles has faced challenges in maintaining consistent research efforts over time. The case of Saint Kitts and Nevis, a small federation consisting of two islands in the north of the Lesser Antilles, is emblematic. The main archaeological projects on the main island of Saint Kitts are the field surveys and test excavations conducted in the 1970s by C. Goodwin and D. V. Armstrong and the excavation in the early 1990s of the Bloody Point site by S. E. Farr. As for the smaller island, Nevis, the only systematic project is the survey by S. M. Wilson, carried out in the 1980s.

Here we show the preliminary results of a research project initiated in 2021 which goal was twofold: to assess the preservation status of key prehistoric archaeological sites on St Kitts and Nevis, and to conduct new archaeogenetic analyses on skeletal remains from pre-contact indigenous populations on St Kitts.

The survey showed that traces of prehistoric sites found in past research can still be found on the ground, but also highlighted how rapid changes in the landscape due to both natural and anthropogenic phenomena are threatening their preservation.

The aDNA analyses on the skeletal remains of the Bloody Point and Sugar Factory Pier sites have made it possible to extrapolate genomic sequences of 7 out of 9 samples, whose analysis will add a fundamental piece to our knowledge of the mobility of the indigenous peoples of the Lesser Antilles"

OBSIDIAN TRADE IN THE LATE BRONZE AGE AT NURAGHE SANTA BARBARA DI BAULADU (SARDINIA, ITALY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Tykot, Robert (University of South Florida, Tampa)

Abstract format: Poster

Among the finds recovered during the excavations of the Late Bronze-Early Iron Age site of Nuraghe Santa Barbara di Bauladu in Sardinia are >1000 obsidian artifacts. Analyses were conducted identifying the specific geological sources that were used on >600 of the artifacts, allowing the reconstruction of prehistoric trade and exchange patterns. This study provides statistically significant data that may be compared with results from both contemporary LBA/EIA sites as well as examination of changes over time starting in the Early Neolithic.

Santa Barbara di Bauladu is a complex Nuragic site with multiple external towers, constructed about 1500 BCE. The later village on the west side of the Nuraghe (1200-800 BCE) revealed evidence for bronze, copper, and lead metal casting used for tools and the well-known bronzetti figurines. During the LBA, there were also contacts with the eastern Mediterranean, as indicated by finds of oxhide ingots and Mycenaean ceramics at sites in Sardinia. Obsidian stone tools continued to be used throughout the Bronze Age, however, with the material obtained from different subresources at Monte Arci.

Non-destructive analyses using a Bruker Tracer 5e X-ray fluorescence spectrometer were conducted, on many geological samples from each of the sources and the obsidian artifacts from Nuraghe Santa Barbara. Results for trace elements were used to assign each artifact to a specific Monte Arci subresource (SA - 90, SB1 - 9, SB2 - 99, SC - 419). The proportion of each is compared for different parts of the site, and with five other Nuragic sites with at least 25 artifacts tested: Ortu Comidu, Duos Nuraghes, Serbine, Urpes, and Mitza Pidighi. The patterns for these Nuragic sites are compared with Neolithic and Copper Age sites, with changes over time in socioeconomic complexity integrated in our interpretations.

861 **AUGUSTAE, NOBILISSIMAE, DOMINAE: CONSIDERATIONS ON THE ROLE OF MATERIAL DATA ON THE TITULATURE OF THE 4TH CENTURY AD IMPERIAL WOMEN**

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Garibotti, Martina (University of Verona) - Romano, Antonio (Le Mans Université)

Abstract format: Poster

The poster aims to provide insights into the role of material evidence - such as inscriptions and coins - in examining the titulature of imperial women from 284 AD to 395 AD. From 284 AD onwards, a significant shift in the titulature assigned to imperial women is observed: for instance, the title "Mater Castrorum" disappears, and that of "Augusta" experiences a drastic decline in attributions. Material evidence indicates that this change does not signify the cessation of conferring honorary titles upon women but rather the adoption of new titles like "Nobilissima Femina" and "Domina Nostra".

Ambiguity surrounds the roles played by women of the domus Augusta at court, making the titles bestowed upon them particularly significant nodes. Consequently, titulature emerges as one of the primary avenues for investigating the functions of women within the imperial family. This circumstance poses a challenge for the 4th century AD, as the scarcity of material evidence about women, such as coins and inscriptions, complicates the systematic study of titles, compounded by the unreliability of historiographical sources.

The importance of these sources in titulature studies is underscored by the fact that for the Valentinian dynasty - a period for which no epigraphic or numismatic evidence can be attributed to imperial women - it is impossible to ascertain which titles were associated with these women. This issue sometimes extends to their onomastics as well. Therefore, contrary to what their scarcity would suggest, the poster aims to highlight the significance of material sources in studying imperial women of the 4th century AD in general, particularly their titulature. It aims to highlight the need for an interdisciplinary approach that integrates historiographic and archaeological sources. Additionally, the poster would propose some reflections on the possible reasons for this scarcity of material evidence.

864 **AN ARCHAOMETRIC STUDY TO SOLVE THE MYSTERY OF THE ORIGINAL LAYOUT OF THE AUGUSTAN TROPHY OF SAINT-BERTRAND-DE COMMINGES?**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: PIANET, isabelle (Université Bordeaux-Montaigne) - Iuliano, Adriana (Université Bordeaux-Montaigne) - Galluzzi, Francesca (Université Bordeaux-Montaigne) - Savin, Marie-Claire (Institut Català d'Arqueologia Clàssica)

Abstract format: Poster

The Augustan trophy of Saint-Bertrand-de-Comminges (Occitanie, France) is a remarkable composition of mannequins and captives sculpted in the round (16-13 B.C.). It is composed of three distinct trophies - Gallic, Hispanic, and Naval - each of them comprising different elements, more or less sculpted, and a Victory. All of them are made of white marble, whose crystalline appearance suggests it comes from local quarries. The statues also display numerous traces of red and black polychromy.

Its reconstruction is still the subject of debate: Is it a single monument representing a commemoration of the victories of Augustus? Or can we consider that the Victory is not part of it, as proposed by some authors on archaeological, stylistic, and historical grounds?

Answering this question requires a global archaeometric approach to elucidate the provenance of marbles and the chemical nature of pigments. This is the goal of this work, for which:

A detailed study of samples taken from scattered areas of the monument was performed using petrography, CL, isotopes, NMR, and ICPOES. The results obtained were compared with marbles extracted from nearby quarries using statistical tools such as ACP to determine the provenance of marbles.

An in situ analysis of the areas exhibiting traces of pigments was done using portable digital microscopy, FORS, and pXRF.

In conclusion, some elements are made of marbles of different qualities coming from different quarries in the region with red ochre being the primary pigment used for decorating the different elements.

865 **AUTOMATIC DETECTION OF TELL SITES IN CENTRAL IRAQ USING MACHINE LEARNING ON OPEN ACCESS SATELLITE SYNTHETIC APERTURE RADAR IMAGERY**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Chiricallo, Elena (Università Ca' Foscari di Venezia; Istituto Italiano di Tecnologia) - Poggi, Giulio (Istituto Italiano di Tecnologia) - Jatrapitpornchai, Raveerat (Istituto Italiano di Tecnologia) - Fiorucci, Marco (Istituto Italiano di Tecnologia) - Vascon, Sebastiano (Università Ca' Foscari di Venezia) - Traviglia, Arianna (Istituto Italiano di Tecnologia)

Abstract format: Poster

Tells are archaeological settlement mounds peculiar to the Near and Middle Eastern landscapes and dating back from the Neolithic period to the Bronze Age. Their systematic mapping offers valuable insights into the emergence, development and organization of the early complex human societies and serves as a crucial measure for their preservation against threats such as looting and large-scale alteration of the landscape resulting from destructive anthropogenic activities such as agriculture, industry, and transport.

Due to the pronounced topographic elevation of tells sites, manual visual inspection of satellite Synthetic Aperture Radar (SAR) imagery has been successfully used to map tells in remote and hazardous regions. However, these approaches proved to be time-consuming when systematically mapping tells, considering the large number scattered across the landscape. Machine Learning-based approaches can help speed up the screening process and improve the detection accuracy across large geographical areas.

In this study, a new Machine Learning pipeline for the automatic detection and segmentation of tell sites in Central Iraq on satellite SAR data has been developed and tested. The pipeline employs open-access, medium-resolution SAR products from Copernicus Sentinel and Third-Party Missions (i.e., Copernicus Global 30-meter Digital Elevation Model and multi-temporal Sentinel-1 amplitude images) and supervised object-based classification methods. The proposed workflow, tailored and validated based on the physical attributes of tells, can also be employed to identify topographic features exhibiting similar characteristics, such as ancient settlement mounds and burial mounds. This capability proves especially valuable in remote and hazardous regions where conducting systematic on-site inspections is impractical due to political instability or in regions where the use of LiDAR scanning from drone and airborne sensors is restricted.

869 **PERSISTING IN THE FACE OF CHALLENGE: THE CHOICE OF RAW MATERIALS IN PREHISTORIC CERAMIC PRODUCTION ALONG THE EASTERN ADRIATIC COAST**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Kudelic, Andreja (Institute of Archaeology Zagreb) - Neral, Natali (Institute of Archaeology Zagreb)

Abstract format: Poster

It is well known that the study of the operational sequence of an ancient craft practice provides data for technological considerations but also for a socially oriented interpretation. Following this premise, the aim of the research is to investigate the Bronze Age pottery practices in the relatively unexplored area of the eastern Adriatic coast and hinterland. The assumption that variability in the choice of raw materials and production techniques can be a good indicator of socio-economic changes encouraged us to consider prehistoric communities in a wider social context. The focus of the research is ceramics from fourteen archaeological sites distributed along the eastern Adriatic coast and the hinterland of central Dalmatia.

By applying a multi-analytical approach (optical microscopy, p-XRF, SEM-EDS, and ICP-MS, ICP-ES) the goal is to determine the characteristics of paste recipes, the type and proportion of non-plastic tempers intentionally added to the clay, and to provide information on the production techniques and firing conditions. Through a comparative analysis, the aim is to consider the variability in pottery practice from the Early to the end of the Late Bronze Age in order to better understand the wide range of behaviours that are directly related to ancient pottery produced in a certain social environment.

The research showed that the Bronze Age potters used locally available clay and non-plastic temper materials: calcite, sedimentary rocks and grog. The results indicate a correlation between tempering material selection with spatial and chronological frameworks. It has also been observed that the choice of calcite shows a long-lasting and very persistent tradition while the use of grog could be related to the periodic influences of various social factors.

SPECIAL BURIAL GROUNDS FOR INFANTS AND BABIES IN THE MEDIEVAL AND EARLY MODERN PERIODS - SINGLE OCCURRENCES OR TRANSREGIONAL PHENOMENON?

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mateovics-László, Orsolya (ARDIG Archäologischer GesmbH) - Nyárádi, Zolt (Muesul Haáz Rezső, Odorheiu Secuiesc, Romania) - Portschy, Jennifer (Asinoe GmbH, Krems a.d. Donau, Austria) - Rác, Miklós (Free-lancer) - Hausmair, Barbara (Department of Archaeologies, Universität Innsbruck, Austria)

Abstract format: Poster

In recent decades, bioarchaeology has increasingly focused on studying past childhood and the social bonds of children and parents within society. Apart from biological information obtained from their skeletal remains, comprehensive examinations of burial contexts provided further understanding of the funerary behaviour of various societies, revealing a wide variety of practices. Among these, age-specific rites led to the formation of peculiar clusters of fetal and neonatal burials, as the early stages of life had a special spiritual significance in different periods and cultural entities. Children who died in the womb or during/soon after birth often evoked controversial attitudes, as many societies consider them as liminal beings who require special treatment to secure their transition into the afterlife or prevent them from harming the living.

The proposed poster intends to draw attention to medieval and early modern burial sites in central and eastern Europe that were exclusively used to bury prematurely deceased children. To date, only a few such places have been published as isolated case studies, raising the question if they constitute single occurrences or are representative of a transregional phenomenon of special burial practices that has not been properly recognized yet. By presenting case studies from Austria, Hungary and Transylvania, this poster is supposed to ignite exchange on such special burial grounds and advance the study of the archaeology of early infant death and burial and parental grief responses.

DOWN BY THE RIVERS: RECONSTRUCTING THE MAGDALENIAN OCCUPATION AT ÉTIOLLES-LE COUDRAY (FRANCE) USING GEOPHYSICAL METHODS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Corradini, Erica (Institute of Geosciences, Christian-Albrechts-University Kiel, 24118 Kiel, Germany) - Wilken, Dennis (Institute of Geosciences, Christian-Albrechts-University Kiel, 24118 Kiel, Germany) - Le Jeune, Yann (Service Archéologie de Loire-Atlantique, UMR 6566, 35700 Rennes, France) - Weber, Mara (Museum für Archäologie Schloss Gottorf, UMR 8068, 24837 Schleswig, Germany) - Wunderlich, Tina (Institute of Geosciences, Christian-Albrechts-University Kiel, 24118 Kiel, Germany) - Caron-Lavolette, Elisa (Technologie et Ethnologie des Mondes Préhistoriques, UMR 8068, F-92023 Nanterre, France) - Mevel, Ludovic (Technologie et Ethnologie des Mondes Préhistoriques, UMR 8068, F-92023 Nanterre, France) - Valentin, Boris (Ecole d'histoire del l'art et d'archéologie de la Sorbonne, Université Paris 1, UMR 8068, F-75006 Paris, France) - Villa, Valentina (CNRS, CEPAM Cultures et Environnements, Préhistoire, Antiquité, Moyen Âge, Université Côte d'Azur, UMR 7264, 06300 Nice, France) - Rabbel, Wolfgang (Institute of Geosciences, Christian-Albrechts-University Kiel, 24118 Kiel, Germany)

Abstract format: Poster

An investigation of the Magdalenian occupation at Étioilles-Les Coudray (France) was conducted using geophysical methods and corings. Based on ground-penetrating radar (GPR), electrical resistivity tomography (ERT), electromagnetic induction (EMI), and stratigraphic information, we present a reconstruction of the main sediment interfaces carrying the Magdalenian occupation. Étioilles-Les Coudray is one of the most important open-air campsites in the Paris Basin, where consecutive settlements distributed along the Hauldres stream were preserved by silts. The geoarchaeological goals were, in particular, the reconstruction of the ancient environment in which hunter-gatherers settled, providing spatialized known stratigraphy able to find an echo in the Seine Valley. We observed that the major reflections in the GPR records were generated from interfaces that have grain size variation: (1) the bottom of the Holocene colluvium and (2) the bottom of the upper Late Glacial silt. EMI and ERT show a very clear horizon associated with the upper Late Glacial silt, in some places even more clearly defined than with GPR. We confirmed the presence of a channel along the slope, placed under Locus 1, and a second channel of the same type globally following the paleotopography of Locus 2. We created a thickness map of the "beige sandy silt" and hypothesized a high probability of good preservation conditions of Magdalenian evidence. Finally, the detection of several localized diffraction hyperbolas in the GPR record offers the possibility to obtain the ground truth of the geophysical results in the near future and verify the nature (archaeological or geological) of these features.

LA MARMOTTA (LAKE OF BRACCIANO, ITALY): UNRAVELLING THE FATE OF AN EARLY NEOLITHIC COMMUNITY THROUGH GEOARCHAEOLOGICAL APPROACH

Abstract theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Abstract authors: Nomi, Federico (Scuola Superiore Meridionale) - Mineo, Mario (Museo delle Civiltà, Rome, Italy; Associazione ORTA, Italy) - Moreno Caballud, Ana (Pyrenean Institute of Ecology (IPE-CSIC), Spain) - Bartolomé, Miguel (Departamento de Geología, Museo Nacional de Ciencias Naturales (CSIC), Spain; Swiss Institute for Speleology and Karst Studies (SISKA), Switzerland; Department of Earth Sciences, Geological Institute, ETH, Zurich, Switzerland) - Galofré, Marcel (Pyrenean Institute of Ecology (IPE-CSIC), Spain) - Dulias, Katharina (Technische Universität Braunschweig, Institut für Geosysteme und Bioindikation, Braunschweig, Germany) - Victoria Nogales, Luis (Technische Universität Braunschweig, Institut für Geosysteme und Bioindikation, Braunschweig, Germany) - Gibaja, Juan (Institució Milà y Fontanals (CSIC), Spain) - Iriarte Avilés, Eneko (University of Burgos, Department of History, Geography and Communication, Laboratory of Human Evolution-IsoTOPIK Lab, Spain) - Truffi, Michele (Dipartimento di Studi Umanistici, Università degli Studi Roma Tre, Italy)

Abstract format: Poster

The emergence of the Neolithic economy ushered in a distinct capability for reshaping landscapes by human communities. The relocations necessitated to discover suitable land for agriculture and animal husbandry resulted in these communities occupying varied ecological niches, often interconnected by access to water sources. Among these, perilacustrine environments exemplify such adaptations.

The settlement of 'La Marmotta' (Anguillara Sabazia, Italy), now submerged beneath the waters of Lake Bracciano, served as a shoreline settlement inhabited for a prolonged period during the Early Neolithic (ca. 5690 - 5260 cal BC). The exceptional nature of the site is due to the excellent preservation of some classes of materials that are usually subject to rapid deterioration, including five dugout pirogues, numerous wooden artifacts and plant remains. The abundance of findings coupled with multidisciplinary analysis has facilitated a meticulous reconstruction of numerous aspects of the inhabitants' way of life at La Marmotta.

However, several inquiries persist regarding broader aspects such as the true extent of the site or the reasons behind its abrupt abandonment, which remain unresolved. Moreover, the discovery of additional traces of a Neolithic settlement phase, coinciding with the abandonment of La Marmotta and located less than 400 metres from the current shoreline, shortly before the site's identification in the late 1980s, has prompted speculation that the community migrated inland following a natural event that precipitated the site's abandonment.

To address these inquiries, we employ an interdisciplinary geoarchaeological approach, involving the extraction of geological cores both within the lake and inland.

Here, we present the preliminary findings of our analysis on the samples extracted from the cores (archaeological, palaeobotanical, geochemistry, sedimentary aDNA), accompanied by their geoarchaeological description. Our aim is to provide a paleoenvironmental reconstruction of the geomorphological conditions preceding, concurrent with, and after the occupation of the La Marmotta site.

PRIN 2020 THE TIME OF CASTLES: AN ANALYSIS PROCEDURE FOR DATING MORTARS FROM DONORATICO CASTLE (LIVORNO, ITALY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Calandra, Sara (Department of Earth Sciences, University of Florence, Florence, Italy) - Pecchioli, Elena (Department of Earth Sciences, University of Florence, Florence, Italy) - Salvatici, Teresa (Department of Earth Sciences, University of Florence, Florence, Italy) - Garzonio, Carlo Alberto (Department of Earth Sciences, University of Florence, Florence, Italy) - Lubritto, Carmine (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, MARE Centre, Caserta, Italy) - Mantile, Noemi (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, MARE Centre, Caserta, Italy) - Giacometti, Valentina (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, MARE Centre, Caserta, Italy) - Di Cicco, Maria Rosa (Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, MARE Centre, Caserta, Italy) - Buonincontri, Mauro Paolo (Department of History and Cultural Heritage, University of Siena) - Bianchi, Giovanna (Department of History and Cultural Heritage, University of Siena, Siena, Italy)

Abstract format: Poster

The PRIN 2020 CASTLES Project focuses on studying mediaeval castles in Italy, particularly their chronology and transformations using archaeometric analysis of mortars and charcoal. The project aims at conducting multidisciplinary research to establish a new chronology for the construction sites of incastellamento (11th-12th centuries), focusing on the timings of castle development. In this contribution we examine the case study of Donoratico Castle (Livorno, Italy), a site in Tuscany, where the existing archaeological evidence dates from the 12th century.

Several bedding mortars from the housing unit, church, towers, and surrounding wall inside Donoratico Castle were sampled. We propose a specific characterization procedure to choose the samples suitable for dating. A detailed minero-petrographic, chemical, and physical characterization was carried out to extract the binder and lump samples suitable for radiocarbon dating. The minero-petrographic data highlighted mortars constituted by a weakly hydraulic lime binder, obtained burning a marly limestone. The aggregate is constituted by quartz, feldspars, and rock fragments (rhyolites, fossiliferous and micritic limestones), with a heterogeneous distribution, a different grain size and binder/aggregate ratio. From mortar samples of church and housing units, lumps were selected and analysed through chemical analysis and observations using cathodoluminescence. These analyses reveal the presence of both geogenic and anthropogenic calcite.

Starting from the characterization results, the samples were selected for radiocarbon concentration measurement, using accelerator mass spectrometry (AMS). The data obtained reveals a date range from the first half of the 13th century in one case, and from the second half of the 13th century in another. This is further confirmed by radiocarbon dating of charcoal fragments found within the same mortars. This initial study shows that while Donoratico Castle has an archaeological date from the 12th century, this is not entirely consistent with the archaeometric dating from the first and second halves of the 13th century.

874 BETWEEN TRADITION AND INNOVATION: A MULTIDISCIPLINARY APPROACH TO THE STUDY OF THE ANCIENT VIA TRAIANA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Stricchiola, Sofia (Università del Salento)

Abstract format: Poster

In line with the increasing technological development applied to archaeology, it is becoming more and more important to contribute to the innovation of the traditional topographical approach to the study of the ancient landscape. The following poster proposes the presentation of the methodological aspects of a project involving the case study of Via Traiana.

Specifically, the procedures implemented in Remote Sensing (the science of identifying, observing, interpreting and measuring objects without coming into direct contact with them) are used.

The methodology identified is based on the comparison of several non-invasive investigations, such as traditional direct and systematic ground surveys, aerotopographic surveys and, finally, geophysical prospecting (Ground Penetrating Radar and magnetometry). This integration allows, on one hand, the implementation of data concerning the ancient route of the Via Traiana and its road stations and, on the other, the testing of the effectiveness of the different methodologies, understanding their limits and potentialities. By doing so, a multidisciplinary approach is identified, which can be reproduced to multiple case studies, and which provides a large datasets of knowledge with a reduced use of instruments, time and money compared to a stratigraphic survey.

Finally, this poster presents the preliminary results of the photointerpretation carried out for the area between the two ancient cities of Herdonia and Canusium. The research begins here with the aim of proposing an hypothesis on the location of the statio Furfane, which is named only in the Tabula Peutingeriana.

875 DIGESTING THE DATA: VALIDATION IN ANCIENT METAGENOMIC STUDIES IS ESSENTIAL

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Pach, Aleksandra Laura (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Øster Farimagsgade 5A, 1253 Copenhagen, Denmark) - Lanigan, Liam (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Øster Farimagsgade 5A, 1253 Copenhagen, Denmark; School of Archaeology, University of Copenhagen, Karen Blixens Plads 8, 2300 Copenhagen Denmark) - Niemann, Jonas (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Øster Farimagsgade 5A, 1253 Copenhagen, Denmark) - Winther Pedersen, Mikkel (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Øster Farimagsgade 5A, 1253 Copenhagen, Denmark) - Schroeder, Hannes (Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen, Øster Farimagsgade 5A, 1253 Copenhagen, Denmark; School of Archaeology, University of Copenhagen, Karen Blixens Plads 8, 2300 Copenhagen Denmark)

Abstract format: Poster

Shotgun DNA sequencing of archaeological samples, such as dental calculus, coprolites, or mastics, provides a powerful tool for reconstructing ancient microbial communities and gaining valuable insights into the diet and subsistence strategies of past communities. However, reliably identifying eukaryotic taxa poses a challenge. One of the main obstacles is the risk of false positives, which can arise due to different reasons, including sample contamination, the presence of contamination in published reference genomes, and sequence homology between closely related taxa. In this

study, we re-analyse five previously published datasets (Jensen et al. 2019, Maixner et al. 2016, Maixner et al. 2021, Rampelli et al. 2021, Reynoso-García et al. 2023) using two different ancient metagenomic workflows that have been previously employed to detect eukaryotic taxa in complex ancient metagenomic datasets. Our study highlights the risk of obtaining false positive results in ancient metagenomic studies and underlines the need for rigorous validation.

876 A BIOARCHAEOLOGICAL EXPLORATION OF THE INDIVIDUALS FROM THE VÁROSFALVA BURIAL MOUND IN TRANSYLVANIA, ROMANIA (15TH - 19TH CENTURY)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Reeves, Vanessa (University of South Florida) - Nyárádi, Zsolt (Haáz Rezzo Múzeum) - Bethard, Jonathan (University of South Florida)

Abstract format: Poster

Very few bioarchaeological studies have been conducted on the Szekler people of Transylvania, a region now located in Romania. These ethnically Hungarian peoples have occupied the Carpathian Basin since at least 1000 CE, and for most of history served as cavalymen and defenders on the Hungarian Kingdom frontier. This bioarchaeological project seeks to explore the lived experiences of the Szekler people interred in the Városfalva village burial mound (in Orășeni, Romania). In the 1960s, a raised earthen mound was discovered north of the village of Városfalva, in the valley of the Homorodul Mare River, and had begun to be utilized for materials for a local road repaving project. During this process human remains were discovered, and the repaving project was halted. Test pits and small-scale excavations were undertaken by several previous archaeologists from the Haáz Rezzo Múzeum, however no excavation journals or artifacts were retained from these explorations. In 2016, large-scale organized archaeological excavations began at the site, which unearthed 58 cemetery graves. Associated burial artifacts, such as coins, helped provide a general date range for the initial use of the archaeological site (14th -16th century), with burials continuing in to the early 19th century. This poster will present the biological profile information, including age at death, sex, pathologies, and traumas for the individuals interred at the Városfalva village burial mound. Preliminary stable isotope data (C and N) will also be presented with a discussion of the individuals' dietary profiles and compared to isotopic data generated from other nearby Szekler communities.

877 APPLICATION OF ZOOMS TO FAUNAL ASSEMBLAGES FROM PREHISTORIC CROATIA TO PROVIDE INSIGHTS ON IDENTIFICATION AND PRESERVATION

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Caraballo-Santiago, Angelica (University of California Santa Barbara) - Zavodny, Emily (University of Central Florida) - Krigbaum, John (University of Florida)

Abstract format: Poster

The transition from the Copper Age to the Bronze and Iron Ages is shown through changing sociopolitical and economic organization reflected in faunal material. With ZooMS (Zooarchaeology by Mass Spectrometry), fragments deemed unidentifiable through morphological analysis can be identified through chemical analysis. This poster tests the application of ZooMS to 34 samples from faunal assemblages collected from 2 different sites in Croatia. Otočac-Stari Grad (n=27), a Copper Age site with poor preservation, and Piplica (n=7), a Bronze-Iron Age site with good preservation. By using samples from these sites, the aim is to compare the level of identification possible through ZooMS given differing levels of preservation.

ZooMS, also known as Collagen Peptide Mass Fingerprinting, is an interdisciplinary analytical technique that has been gaining traction in the field of archaeological sciences in the last decade. The identification of certain collagen peptides can be used to identify a bone sample down to taxonomic genus.

From the 34 samples tested, 31 produced identifiable ZooMS spectra (91.2%) From ZooMS analysis, the level of identification improved in 25 samples (73.5%), but 3 samples were unidentifiable (8.8%). Of the 31 identifiable samples, 9 samples (29.0%) had a lower level of identification. Samples from Otočac-Stari Grad had a higher rate of failure and lower level of ZooMS identification compared to Piplica. Due to preservation of the material, the C (COL1α2 502-519), E (COL1α2 454-483), G, and G' (COL1α2 757-789) peptides consistently were missing from most spectra. While identification can be made without these peptides, particularly the C and G peptides are important for differentiation between goat (Capra), sheep (Ovis), and deer (Cervidae). The B (COL1α2 484-498), P2 (COL1α2 292-309), and D (COL1α2 793-816) peptides were the most abundant and resistant to weathering. Future research will integrate ZooMS into larger faunal studies to supplement morphological analysis of animal husbandry.

878 HOLOCENE CLIMATIC VARIATIONS ASSOCIATED TO CADAVAL CAVE DEPOSIT

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Lattao, Virginia (Geosciences Centre, University of Coimbra, Portugal; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Centre, Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal) - Adewumi, Opeyemi L. (Geosciences Centre, University of Coimbra, Portugal; University of Coimbra (Polo II), Faculty of Sciences and Technology, Department of Earth Sciences and Geosciences Centre, Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal; IPHES, Institut Català de Paleoecologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain) - Ferreira, Cristina (Geosciences Centre, University of Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal) - Rosina, Pierluigi (Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal) - Vallverdú, Josep (IPHES, Institut Català de Paleoecologia Humana i Evolució Social, C/Escorxador s/n, 43003 Tarragona, Spain; Àrea de Prehistòria, Universitat Rovira i Virgili (URV), Avenida de Catalunya 35, 43002 Tarragona, Spain) - Garcês, Sara (Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal) - Gomes, Hugo (Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal) - Marrocchino, Elena (Department of Environmental and Prevention Sciences, University of Ferrara, Italy) - Pereira, Telmo (University Autónoma de Lisboa, Lisbon, Portugal; Geosciences Centre, University of Coimbra, Portugal) - Oosterbeek, Luiz (Polytechnic Institute of Tomar, Portugal; Geosciences Centre, University of Coimbra, Portugal; Earth and Memory Institute, Mação, Portugal)

Abstract format: Poster

The analysis of stable isotopes has been used to reconstruct environmental variations in continental contexts. Our goal is to verify the possibility of applying this analytical methodology to cave deposits that contain archaeological traces of human occupation. To do so, different and relevant methodologies were applied in the same stratigraphic section of the Cadaval cave deposits, such as stable isotope analysis (in particular $\delta^{13}C$), pollinic, non-pollinic palynomorph and microcarbon studies, microstratigraphy, XRF and LOI analyses to discriminate the organic component present and to identify the composition of the sediments.

Part of this work is integrated into the Pluriannual PIPA "Strategies of Occupation of the Territory in the Holocene in the Middle Tagus" and the MTAS project "Tasks in movement through forms: the agro-pastoral dispersion to and from Alto Ribatejo". The results help to elucidate changes in vegetation patterns and changes in climatic conditions. The study aims to obtain data on the composition of the landscape during the various phases of occupation of the cavity and its relationship with human behaviour.

879 SEXUAL DIMORPHISM: AN ODONTOMETRIC APPROACH

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Price, Bethan (Cardiff University)

Abstract format: Poster

Sex estimation has long been used to help examine and interpret past populations. It gives us a staggering insight into social networks and hierarchies, dietary differences, and disease frequencies, amongst other things, that all feed into our current understanding of how past populations were structured and how they functioned.

Previous studies indicate a level of sexual dimorphism in the dentition reflected in dental metrics, enamel surface area and dentine deposition (Fernée, Zakrzewski and Brown, 2020). However, in previous studies, these approaches are frequently limited to adult skeletal remains. Sex estimation of juveniles is a difficult goal given that skeletal maturity is incomplete, but it would be incredibly useful when interpreting past populations.

This research builds upon this and a previous MSc project as part of a present PhD thesis. It includes applying an odontometric approach to adult and juvenile individuals from various medieval populations in Britain in the hopes of determining a methodology for sex estimation in juvenile populations, supported by amelogenin testing. It will also examine the differences in diet and disease between sexes.

881 OUR NOBLE STEEDS - THEIR DIRTY OLD MULES. DEPICTIONS OF ROMAN AND NON-ROMAN EQUINES ON ROMAN IMPERIAL MONUMENTS

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Nagy, Goldie (Johannes Gutenberg-Universität Mainz)

Abstract format: Poster

The utilization of horses as "war machines" fundamentally changed ancient warfare. Especially in the time of the Roman Empire the cavalry advanced from a formerly niche arm of service only accessible for a small wealthy elite to an essential part of the Roman Military (Kemkes 2007, 109; Klinkhammer 2022, 114).

This poster attempts to investigate the depiction of equines on official Roman monuments, such as the triumphal columns of Trajan and Marcus Aurelius, to determine function and conceptualization of these animals in their iconographic context.

The study does not focus on horses but regards all equines, including mules as beasts of burden carrying weaponry and goods for the soldiers. They were often overlooked in past studies of involvement of animals of war, even though they were an important pillar of Roman military logistics.

Furthermore, this work compares how equines are conceptualized depending on the groups they are associated with (Romans; friendly/romanized locals and allies; enemy groups). What differences can be seen in depictions of their quantity, handling, behavior and equipment depending on the figures they are paired up with? What can be said about the depicted groups by looking at the equines they employ for war?

To conclude, this poster attempts to examine how depictions of different equines are utilized to conceptualize and enforce certain pictorial narratives of wars as recounted by the Roman victors.

883 LAB TRASH. THE ARCHAEOLOGY OF ARCHAEOSCIENCE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: del Río, Judit (University of Burgos)

Abstract format: Poster

The archaeomagnetic laboratory at Burgos University (Spain) hosts a variety of geophysical research applied to the understanding of archaeological phenomena, particularly those related to ancient fire technologies. Together with results, this research yields waste, usually in the form of surplus rocks, blocks, and sediments collected together in a sturdy plastic box until it is time for its disposal. What follows is a small-scale case study consisting in the archaeological excavation of the refuse resulting from archaeo- and paleomagnetic studies. This project inevitably follows the path set by The Garbage Project (Rathje, 1974), both in its study of daily waste – although of a different kind – and in the main role that the archaeological method plays in it. I am set to explore how 'doing things archaeologically' allows for a different treatment of my own samples and, I argue, for a different mindset than the one I adopt when conducting experiments. In line with what Shanks & McGuire proposed already in 1996, the craft of archaeology in/ of the laboratory produces a knowledge that helps me situate my own academic work as somebody who is perennially stranded at the crossroads between archaeological theory and scientific practice.

Rathje, W. L. (1974). The Garbage Project: a new way of looking at the problems of archaeology. *Archaeology*, 27(4), 236-241.

Shanks, M., & McGuire, R. H. (1996). The craft of archaeology. *American antiquity*, 61(1), 75-88.

885 ALTINUM AND IULIA CONCORDIA: SPACES AND FUNCTIONING OF ROMAN RIVER-LAGOON PORTS AT THE GATEWAY TO THE NORTHERN ADRIATIC

Abstract theme: 6. The Mediterranean from Within

Abstract authors: Rosatti, Elisabetta (Sapienza Università di Roma, Dipartimento di Scienze dell'Antichità)

Abstract format: Poster

The Roman cities of Altinum and Iulia Concordia, situated near the ancient lagoons of Venice and Caorle in the Northern Adriatic region of Italy, were ports with distinctive features as hubs between river, lagoon and sea trade. These settlements, positioned on slightly high grounds, were surrounded and crossed by a network of natural and artificial waterways along which quays and storehouses were established.

This contribution presents the structure and the first steps of an ongoing research project aimed to clarify how these two ports worked by studying spaces, “users” – goods and boats – and the mutual interaction between them.

Research conducted so far within various institutions’ archives has made it possible to collect excavation data from edited contexts and some unpublished documentation. Additionally, historical maps and aerial photographs have also been assembled to better comprehend the landscape and reconstruct the urban water network. A coring campaign recently begun in Altinum is also providing crucial data on paleocanals, including width and depth, which are essential for navigation analysis.

All collected data are being studied and integrated into a GIS project that will make it possible to reconstruct an initial overview of the port spaces of the two sites under investigation.

888 MORPHOLOGY OF NEOLITHIC CATTLE FROM THE BALKANS, TURKEY, AND POLAND

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Gembicki, Maciej (The Faculty of Archaeology University of Adam Mickiewicz) - Bălăşescu, Adrian (“Vasile Pârvan” Institute of Archaeology, Romanian Academy, Bucharest, Romania) - Radu, Valentin (ArchaeoSciences Platform, Research Institute of the University of Bucharest (ICUB); University of Bucharest, Bucharest, Romania; National Museum of Romanian History, Bucharest, Romania) - Dimitrijević, Ivana (Institute of Archaeology, Belgrade Serbia)

Abstract format: Poster

Different morphotypes of cattle in the Early and Middle Neolithic are often explained as animals of different degrees of domestication or populations of different origins. The distinction between the morphotypes is mainly based on the study of the size of their bones, but more information is needed to link this biometric data to genetic variation between the populations of this region. This poster presents the preliminary results of the project - Changes in the morphology of cattle after the domestication period and its environmental conditions—in the case of Central Anatolia, Western Balkans, and Central Europe. Our investigation seeks to identify distinct morphotypes of cattle based on bone size and shape. We utilize traditional biometric methods, including the Logarithm Size Index, alongside three-dimensional geometric morphometrics applied to astragali. The results are based on data from Turkish, Romanian, Serbian, and Polish sites, as well as a reference collection of contemporary cattle from Poland.

889 POTENTIAL OF AIRBORNE LASER SCANNING AT VERY HIGH RESOLUTION FOR THE PROTECTION OF CULTURAL HERITAGE IN SLOVAKIA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mino, Martin (Monument Board of Slovak Republic) - Lieskovsky, Tibor (Slovak University of Technology, Faculty of Civil Engineering) - Bisták, Peter (Monument Board of Slovak Republic) - Neumann, Martin (Monument Board of Slovak Republic) - Kmetová, Petra (Monument Board of Slovak Republic) - Pristáš, Martin (Monument Board of Slovak Republic) - Šperka, Jakub (Slovak University of Technology, Faculty of Civil Engineering) - Ďuračiová, Renáta (Slovak University of Technology, Faculty of Civil Engineering)

Abstract format: Poster

Since 2023, a new project (APVV-22-0151) aimed at exploitation of airborne laser scanning (ALS) data with high resolution has started under the aegis of Slovak University of Technology (collaborating parties are Monuments Board of Slovak Republic and Archaeological Institute of SAS).

Today, in Slovakia the ALS data are available in the form of digital elevation model (DEM) at a resolution of 1 m/px, which enables collecting detailed information about the enormous number of archaeological relics in the landscape. However, raw data can be processed at a four-time higher resolution. DEM at such high resolution makes it possible for archaeologists to use new spatial data more efficiently and thus to identify, explore, and better protect even parts of archaeological heritage that cannot be identified by using other data sources. Very high-resolution DEM will make it possible to identify the magnitude of features of anthropogenic origin that would not be identified otherwise. The main goals are also to create a methodology for their validation, verifying selected groups of relics directly in the field, design and creation of archaeological spatial database, and publishing a catalogue of representative types of relics of a fossil cultural landscape that will also be usable also within international cooperations. The work also aims at comparing two or more available ALS data sources, their quality, and possibility for change detection. The possibilities of identifying relics and verifying them in the field are tested in 3 regions of Slovakia (Tribeč Mountains, Štiavnické vrchy Mountains, Medzibodrožie). The result can help to manage and protect cultural and historical heritage in Slovakia.

891 CHRONICLE OF A DEATH FORETOLD? THE STATUS OF ARCHAEOLOGY IN DEVELOPER-FUNDED PROJECTS

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Díaz de Liaño, Guillermo (MOLA (Museum of London Archaeology))

Abstract format: Poster

This poster addresses, using ethnographic evidence obtained during the study of the relationship between archaeology and construction, one of the key issues in developer-funded archaeological projects in the UK: the perception of archaeology as a risk for construction and development.

The poster explores the main reasons why developers and construction perceive archaeology as a risk to their projects, to then review the key measures that key stakeholders in both archaeology and construction are proposing, within the current framework, to address and fix the issue.

However, the poster will also analyse the methodological and ethical consequences of these measures, insofar they are not neutral and have an impact on how commercial archaeology is practiced. This poster argues that while some of the practices used to adapt developer-led archaeology to construction environments can have a positive impact for archaeology, the contractual submission of archaeology to construction might not only diminish the agency of archaeologists, but also affect the very epistemological and axiological foundations of the discipline.

892 EXPERIMENTAL PREPARATION AND CARBONIZATION OF TAMALES TO DETERMINE PRESERVATION POTENTIAL IN THE ARCHAEOLOGICAL RECORD

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Cagnato, Clarissa (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice) - Longo, Laura (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice) - Bonetto, Alessandro (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice) - Badetti, Elena (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice) - Marcomini, Antonio (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice)

Abstract format: Poster

Tamales, prepared traditionally from masa (maize dough) filled with meat, vegetables, and/or fruits before being wrapped in leaves and steamed, are believed to have been consumed by the ancient Maya. Epigraphically, tamales were represented by the glyph wa or wah, and also depicted in Classic Maya iconography, from murals to polychrome ceramic vessels. Besides the Dresden Codex (Maya book), which mentions the use of some meat products in the preparation of Maya tamales, the types of plants used in their elaboration remains much more elusive, as is any direct archaeological evidence of such foods. To understand under what conditions archaeologists might be able to recover evidence of these foods and to develop a reference collection, we carried out a set of replicative experiments whereby tamales were prepared using a range of ingredients available to the ancient Maya, and subsequently exposed to varying thermal conditions for different periods of time. In this poster we present the results obtained from this study, providing a range of qualitative and quantitative information of use to archaeobotanists working in Mesoamerica, but also potentially beyond.

893 LOSS DRIVEN HERITAGE: SYCAMORE GAP AND THE HERITAGE VALUES OF HADRIAN'S WALL

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Hiscock, Alex (University of Edinburgh) - Johnston, Emily (University of Edinburgh)

Abstract format: Poster

Sycamore Gap has become an emblem of Hadrian's Wall, a frequent feature for photographers and a stopping point for travellers, which has contributed to the development of intangible values associated with Hadrian's Wall at the confluence of landscape, 'natural' and ancient archaeological aesthetics. Prior to its felling, the sycamore tree had become embedded with meaning in both local and global communities, which have all exhibited different attachments and memories associated with the site. The felling of the sycamore in September 2023, and the public media explosion that followed represents a key moment of heritage interaction online and offline, as these communities emerged on social media to comment on news articles, post photos and share memories associated with the landmark.

This poster explores the status of the Sycamore Gap in entangled local and global communities, through exploration of these 'loss driven' interactions and outlines the values associated with the Hadrian's Wall World Heritage Site that have emerged in their wake. Timeseries data collected from X (formally Twitter) as well as testimonies collected from local stakeholders are compared to outline transformations that have occurred across global and local scales.

894 COPING LEADS TO CREATIVITY. BURIAL STRATEGIES AND IDENTITY EXPRESSION IN THE FUNERARY RECORD OF THE LATER IRON AGE

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: de Roest, Karla (University of Groningen (Groningen Institute of Archaeology))

Abstract format: Poster

In the later Iron Age (c. 500 BCE–100 CE) of the North-eastern part of the Netherlands funerary options are less visible, but also seemingly less regulated than in previous periods. The obscurity is partly due to less monumentally constructed graves in the landscape, and further hindered by the dissolvment of bone material in the prevalent sandy soil conditions. Whereas cremation practices benefit the preservation of bone material, the absence of urns or mounds is less favourable; there is the likelihood of missed graves during excavation. Although the North-eastern part of the Netherlands is taken as a case study here, the dispersed image seems to be wider phenomenon, as shown by other studies.

Presumably, the existence of multiple burial customs within a local society, reflects a new way of expression of norms. Clear correlations between social status, age, provenance and so forth, and disposal choices elude us although recent scientific methods bring some clarity.

That the monumentality of graves decreased and the reasons behind funerary choices are currently not fully understood, does not mean that coping with the inevitable change in societal relations after life-changing events became less important. The expression of identity will undoubtedly have been manipulated and communicated during the funerary process.

The model suggested in the current research, demonstrates that it is possible to understand expressions of identity and coping strategies in a changing world during the Iron Age, despite the unclarity and lack of uniformity of the archaeological data. This is achieved by applying sociological models, behavioural and neurological studies, and to combine these with archaeological methods studying finds morphologically and through ever-improving laboratory methods. From this, likely scenario's or narratives of the steps in decision-making are deduced that will further advance our understanding of the various ways Iron Age people dealt with their deceased.

896 MEDIATING AND ENTERTAINING: AN EDUCATIONAL FACT SHEET ON HORREA PIPERATARIA FOR THE PARCO'S EDUCATION, DIDACTICS AND TRAINING SERVICE

Abstract theme: 3. The Life of Archaeological Heritage in Society

Abstract authors: Dipino, Luana (Independent Researcher)

Abstract format: Poster

Public archaeology plays an essential role in the practice of modern archaeologists: not limiting itself to mere research but extending to the dissemination of contents, archaeology can act as a bridge between the past and the public

This poster outlines a public archaeology activity undertaken during an internship at the Colosseum Archaeological Park, supervised by Dr. Andrea Schiappelli. It focused on creating an educational fact sheet about the Horrea Piperataria, ancient warehouses constructed under Emperor Domitian, above Neronian-era structures, for preserving, storing, and selling spices. This initiative is part of a larger outreach and entertainment project of the PARCo's Education, Didactics, and Training Service. Personal involvement in excavations carried out at the site by Sapienza University (Prof. Domenico Palombi) inspired this project [1].

The fact sheet, tailored for school audiences, will be soon part of the "Strolling around with Tarpea" series on the PARCo website. It illustrates the role of spices in medical art and daily life, showing the buildings where spices were sold and the urban changes that occurred over time. Highlighted is a neighborhood historically associated with medicine, transitioning from ancient spice tabernae to a medieval church honoring saints Cosmas and Damian still protectors of doctors and pharmacists today [2].

In addition, the current project involves the development of an interactive serious game soon to be available on PARCo's website: imagining being a character from the past walking around in today's Rome, it will allow students to learn how ancient warehouses were located, with a focus on spices used in the Roman world.

898 BRACTEATES AND BELOKS- THE COMPOSITION OF IRON AGE GOLD

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Jouttijarvi, Arne (Heimdal-archaeometry)

Abstract format: Poster

It is often assumed that the Iron Age gold objects in Scandinavia were made from Roman coins, and thus were of relatively high purity. In general, Roman gold coins maintained their gold content, unlike silver coins, which were at times severely debased by addition of copper. Results from two separate projects aimed at elucidating the technology of two specific types of objects seem to add some nuance to this picture. In both cases, the analyzes were made with p-XRF, which was calibrated against standard gold alloys.

Analyses of around 150 bracteates from Danish and Norwegian finds show, that the composition changes systematically according to the typology, so that A bracteates has the highest gold content, and the contents of silver and copper increase in B, C and to D bracteates. The composition seems to be strongly controlled, as is also known from some types of coins, and follows exactly the same course as seen, for example, in Merovingian and Visigothic coins from the period between. 450 and 650 AD. The changes in composition seem to have caused certain technical problems for the artisans who made the bracteates.

On the basis of analyses of around 100 Gold Berlocks from the 1st to 2nd centuries, also from Danish and Norwegian finds, it could be concluded that two different alloys were generally used. One with a relatively high purity (about 70-80 % gold) and the other made of about equal parts gold and silver. It thus appears to be the relatively rare type of alloy "electrum". These berlocks often have a very pale-yellow color, and in some cases can be mistaken for silver. The choice of this particular composition must, however, be assumed to have been deliberate. Here, the different compositions of the base metal have meant that varying solders have been used.

900 HEAT TREATMENT OF CHERT IN THE EARLY MESOLITHIC AT ROTTENBURG-SIEBENLINDEN (SOUTHWEST GERMANY)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Huber, Hannah (Eberhard Karls Universität Tübingen) - Tafelmaier, Yvonne (State Office for Cultural Heritage Baden-Württemberg) - Kind, Claus-Joachim (retired, previously State Office for Cultural Heritage Baden-Württemberg) - Schmidt, Patrick (Eberhard Karls Universität Tübingen)

Abstract format: Poster

Evidence for heat treatment is documented at several sites of the Early Mesolithic of Southwestern Germany. However, unambiguous evidence so far is restricted to a single type of raw material and to cave sites of a restricted region, the Swabian Jura. The open-air site of Rottenburg-Siebenlinden provides the possibility to investigate heat treatment outside of this region and on an additional raw material. For the lithic assemblages of the site's Early Mesolithic horizons, thermal alterations were recorded, and heat treatment was proposed. In our study, we experimentally heated Middle Triassic Chert, the predominant raw material at the site, and reanalyzed the lithic assemblage of archaeological horizon III at Rottenburg-Siebenlinden, focusing on gloss contrast, the best available criterion for establishing intent. The artefacts classified as gloss contrast artefacts were analyzed for surface roughness using laser-scanning microscopy, to strengthen the macroscopic observations. Gloss contrast artefacts were then used as visual references to assess the relative proportion of heat treated material in the assemblage. Our results show that heat treatment was applied to a wider range of raw materials than previously thought. They also suggest that heat treatment was regularly used in Early Mesolithic reduction sequences regardless of raw material. These findings have implications for our understanding of Early Mesolithic technology, by highlighting that the last Central European hunter-gatherers were more flexible in terms of their material choices and that heat treatment was a more widespread phenomenon than previously thought.

901 DATING ROCK ART IN EASTERN SOUTH AMERICA: A HIGH-PRECISION U-SERIES DATING

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Chim, Eliane (Museu de Arqueologia e Etnologia, Universidade de São Paulo) - Strikis, Nicolás (Instituto de Geociências, Universidade de São Paulo) - da Cruz Junior, Francisco (Instituto de Geociências, Universidade de São Paulo) - Strauss, Andre (Museu de Arqueologia e Etnologia, Universidade de São Paulo)

Abstract format: Poster

America was the last continent to be populated by modern humans. However, the date of their arrival is still a controversial issue. The consensus among archaeologists is that the entire continent had already been occupied at the end of Pleistocene, 11,700 years before present (BP). It is from this period that sufficient evidence emerges to formulate theories about past ways of life, based on adaptation to different environments, as well as the variability of subsistence

practices and technology. Although it is recognized that many sites with rock paintings were already occupied during this period, there is no precise indication of when people started producing rock art, whether it was during this time or throughout the Holocene. The lack of direct absolute dating makes it difficult to determine the rock art chronology and associate figures with material culture found in stratigraphic contexts. Therefore, absolute chronological data are crucial for reducing speculation in defining styles and avoiding oversimplified interpretations of rock art. In the last two decades, however, improvements in uranium-thorium dating (U/Th) have allowed the method to be used to date rock paintings. Here, we systematically applied the U/Th method to date 44 samples of 23 carbonate coatings directly associated with cave paintings at four archaeological sites in eastern South America. Our results reveal that rock art began to be produced in the end of Pleistocene and continued throughout the Holocene. This first approach is part of a large project to establish the chronology of rock art production in eastern South America.

902 DECODING THE HEAVEN OVER OURANOPOLIS

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Denk, Olivia (University of Basel)

Abstract format: Poster

Probably in 316 BC, Alexarchos, the brother of the Macedonian king Cassander, founded Ouranopolis (“Heavenly City”) on the Chalcidice peninsula in northern Greece. The location of the city is linked today with the area of ancient Sane near modern Nea Roda, where a Hellenistic cult building has been excavated. The archaeological material suggests that Apollo or Apollo-Helios was worshipped in a trinity with Artemis and Leto or with Selene and Eos. The coinage of Ouranopolis represents a particularly interesting case in terms of the illustration of astronomic-related components. The silver and bronze coins show on the obverse a solar disc or an eight-rayed star or rather a star with a crescent moon, while on the reverse sits a figure usually interpreted as Aphrodite Ourania on a celestial sphere with a special headdress and holding a scepter. The legend reads ΟΥΡΑΝΙΔΩΝ (the Ouranids) or ΟΥΡΑΝΙΔΩΩΝ ΠΟΛΕΩΣ (of the city of the Ouranids), providing an insight into a unique community. This poster aims to visualize the celestial elements (sun, crescent moon, star) and other features with the focus of a new interpretation, which proposes that the coin depict the god Helios or the personification of the sky (Ouranos) instead of the heavenly Aphrodite. This case study explores a Hellenistic worldview through a new interdisciplinary approach to Ouranopolitian coinage.

903 COMPARATIVE ANALYSIS OF 3D DENTINE WEAR RATES IN MESOLITHIC AND NEOLITHIC POPULATIONS FROM THE NEAR EAST AND THE IBERIAN PENINSULA

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Carrascal Olmo, Susana (Archaeology Institute of the University of Barcelona; University of Barcelona; Autonomous University of Barcelona) - Estebananz-Sánchez, Ferran (Archaeology Institute of the University of Barcelona) - Martínez, Laura (University of Barcelona; Archaeology Institute of the University of Barcelona) - Umbelino, Claudia (Coimbra University) - Chamel, Bérénice (Maison de l’Orient et de la Méditerranée) - Khawam, Rima (National Museum of Damascus) - Molist, Miquel (Autonomous University of Barcelona) - Subirà, Eulàlia (Autonomous University of Barcelona) - Pérez-Pérez, Alejandro (University of Barcelona; Archaeology Institute of the University of Barcelona)

Abstract format: Poster

We present a comparative analysis of 3D dentin exposure rates in human populations from the Mesolithic and Neolithic periods in the Near East and the Iberian Peninsula whose archaeological analyses indicated distinct patterns of food production and ecological conditions. These samples provide a relevant model for testing dietary hypotheses in relation to regression models of dentin exposure in relation to age at death. The archaeological samples studied provide clear insights into dietary habits, lifestyle changes over time and oral health during the transition from a predominantly hunter-gatherer Mesolithic lifestyle to a sedentary, agricultural Neolithic society. Significant shifts in dentin exposure rates are expected, both between cultural traditions and geographical areas, as new dietary challenges and food consumption adaptations accompany this transition. The main goal of the present research is to investigate the prevalence, potential causes and implications of dentine exposure rates during the transition from hunter-gatherer to Neolithic agriculturalist human populations, as well as the implications of regional dispersal in the Mediterranean during the agricultural transition.

904 RYE IN POLAND: INSIGHTS FROM ARCHAEOLOGICAL DATABASES ACROSS THE NEOLITHIC TO IRON AGE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Jesionowski, Michal (University of Warsaw)

Abstract format: Poster

Presentation explores the diverse archaeological perspectives surrounding the cultivation of rye in Poland, spanning from the Neolithic to the Iron Age. Utilizing comprehensive datasets and innovative methodologies, I aim to shed light on the agricultural practices and cultural dynamics that shaped ancient Polish societies.

In the context of bridging gaps between archaeological sciences, humanities, and the digital era, my study emphasizes the transformative potential of archaeological databases. Through the integration of advanced scientific approaches, I analyze extensive datasets to reconstruct the distribution and significance of rye across various archaeological sites in Poland. Additionally, I conduct comparative analyses with contemporaneous sites across Europe, aiming to discern regional variations and broader cultural interactions during this pivotal historical period.

This research not only contributes to our understanding of rye cultivation but also offers insights into the complexities of ancient societies and their relationships with their environment. By synthesizing data from multiple sources, I strive to provide a nuanced interpretation of the archaeological record, enriching our understanding of the past.

905 STUDY OF THE CONSTRUCTION TECHNOLOGY OF BYZANTINE POTTERY FROM ANCIENT SIKYON. THE COMPARISON WITH OTHER NEARBY MAJOR POTTERY PRODUCTION CENTRES

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Panagopoulou, Adamantia (Institute of Nanoscience and Nanotechnology “Demokritos” National Center for Scientific Research, Athens.)

Abstract format: Poster

In the present case study, the manufacturing technology of glazed pottery from Ancient Sikyon in Greece was investigated. The samples belong to the collection of Byzantine - Christian Museum of Athens and came from the excavation in the area of Ancient Sikyon conducted by the archaeologist Anastasios Orlandos. An assemblage of eleven ceramic fragments was examined for their advancement of production technology (decoration, surface treatment), and they dated in Byzantine Period. The chemical peculiarities of the glaze and fabric composition applied to the glazed pottery were investigated. Furthermore, structural analysis was carried out, which included the determination of the crystalline and non-crystalline phases of the structure and coating and the uniform distribution of the components during firing, focusing on construction technology. This was accomplished by following an analytical process that took into account the compositional analyses of pigments, slip coatings, and glazes. The physicochemical analysis was carried out using Optical Microscopy (OM), X-Ray Fluorescence Spectroscopy (pXRF), Scanning Electron Microscopy (SEM-EDS), X-Ray Diffraction Spectroscopy (XRD), Fourier transform infrared spectroscopy (FTIR), and Raman Spectroscopy. At the end, the construction technology of the examined samples was compared with that of other nearby major manufactured centres during the Byzantine Period, such as the Athenian Agora and Chalcis in Euboea.

906 AN INVISIBLE WORLD OF COLORS - COPPER-ALLOYS IN THE BRONZE AGE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Jensen, Simone (Heimdal Archaeometry)

Abstract format: Poster

The poster will present a study of the use of colors in bronze jewelry and decorative ornaments from Denmark's late Bronze Age (around 1100-500 BC). These analyses result in a more detailed knowledge of the bronzesmiths' production of bronze artifacts. Based on previous research, on possible colors of tin-bronzes, the colors are divided into five groups: red, orange, golden, silver, and tinned. XRF analyses are used to determine the chemical composition of the chosen artifacts, thus making it possible to estimate the original colors of the bronzes used. The analyses show the use of all five colors in the different types of jewelry and decoration artifacts. Based on this, it is possible to recognize certain tendencies in specific types of artifacts, such as the tutuli, which have mostly been produced in a golden color, and within a different range of 3% in tin content. Furthermore, by applying the theories about the bronzesmith and this person's skills and knowledge, two possible chaîne opératoires to produce the artifacts in a chosen color are presented. This study shows the perspective of future research on the colors in bronze artifacts from the bronze age.

907 TWO TREES OR NOT TWO TREES? EXPLORING REGIONAL VEGETATION DIVERSITY ON NEOLITHIC SHETLAND

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Mosley, Hazel (Queen's University Belfast)

Abstract format: Poster

Shetland, an island group off the north coast of Scotland, was occupied by Neolithic farmers from the early fourth millennium BC. Within a couple of hundred years, people were using a distinctive rock called felsite to make highly polished tools, which were distributed widely across the archipelago. Only a small number of Early Neolithic sites have been identified in Shetland with even fewer independently dated, but the extraction, use, deposition and distribution of felsite artefacts across the archipelago provides both a useful proxy for human activity and an insight into how communities lived within their wider island landscape.

The landscape of Shetland today is an almost treeless patchwork of farmland, heath and blanket bog, but palynological studies show that, during the Neolithic, vegetation was much more diverse. Several records show high values of tree and shrub pollen, but, due to the problem of wind transport, researchers are circumspect about whether these really represent local woodlands. Previous studies have focussed on south and south-west Mainland, meaning the palaeoenvironmental context of felsite quarries and key felsite-associated sites in the north-west has not been fully examined.

Through analysis of pollen, non-pollen palynomorphs and microcharcoal from new peat cores, we uncover divergent patterns of land use and human impact at sites associated with the quarrying, production, use and deposition of felsite artefacts. This new data is integrated with existing palaeoecological studies to explore regional variations in vegetation. Pollen modelling approaches are used to explore taphonomic issues with pollen transport and deposition, along with GIS to visualise and manage palaeoecological and archaeological data, examine variations in land-cover, and explore spatial and temporal relationships.

908 ARCHAOMETRIC INSIGHTS INTO BRONZE AGE CERAMICS THE FORTIFIED SETTLEMENT IN EAST SLOVAKIA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Gašpar, Adam (Institute of Archaeology of the Slovak Academy of Sciences) - Petřík, Jan (Department of Geological Sciences, Masaryk University) - Olšav, Štefan (Institute of Archaeology of the Slovak Academy of Sciences)

Abstract format: Poster

Over 40 years of systematic archaeological research at the Bronze Age site in Nižná Myšľa, near Košice, has uncovered the key site of Otomani-Füzesabony Cultural Complex (OFCC), characterized by a distinctive ceramic style. Our petrographic study focuses on the later phase of occupation, scrutinizing ceramics from a significant fortified settlement spanning approximately 75,000 m².

Strategically positioned on a terrace near the confluence of three Carpathian rivers, and with its location along the Amber Road, the site facilitated extensive trade networks. Through macroscopic observations, we identified diverse ceramic recipes and technologies within the fortified central site.

Analyzing over 100 samples of varied vessel types revealed distinct fabric characteristics. Chemical composition analysis identified main production groups and outliers. Petrographic analysis, utilizing optical microscopy on select samples, categorized fabric groups based on provenance and technology. Provenance classification indicates significant ceramic exchange within the presumed hinterland, with sporadic evidence of imports.

These insights deepen our understanding of Bronze Age ceramic production and exchange networks within the broader region. We aim to contextualize these findings with other fortified settlements and outline avenues for future ceramic research.

910 CONNECTING CULINARY TRADITIONS: COMPARING EVERYDAY COOKING VESSELS ACROSS SUB-SAHARAN NORTH AFRICA (C.1000 BCE-1000 CE)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Matthews, Steven (Deutsches Archäologisches Institut) - Nowotnick, Ulrike (Deutsches Archäologisches Institut)

Abstract format: Poster

The Connecting Foodways project (DAI, Berlin) investigates the culinary traditions of Early Iron Age sub-Saharan North Africa for evidence of interregional interaction, based on domestic, everyday foodways. The focus is upon the

study of food technologies, specifically cooking pots and their technical dimensions, and food stuffs, such as food traces and botanical remains. These are used in combination to investigate cultural transmission via household-level interaction over the long-term.

Comparing key technical characteristics of globular cooking pots, including fabric, wall thickness, size of mouth opening, etc., we investigate similarities in function across sub-Saharan North Africa, as well as regional changes in these over time. These are analysed in conjunction with a comparison of plant and animal lipids recovered from the same cooking pots using gas chromatography-mass spectrometry (GC-MS) and gas chromatography-combustion-isotope ratio mass spectrometry (GC-C-IRMS), in collaboration with Dr. Julie Dunne (University of Bristol). Here we present a first overview of results, focusing on the analysis of these food technologies and food stuffs from across sub-Saharan North Africa in interregional, comparative perspective.

911 MICROSCOPIC PERSPECTIVES ON EARLY NEOLITHIC POTTERY IN BISKUPICE, POLAND

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Glód, Anna (Institute of Archeology and Ethnology Polish Academy of Sciences) - Kurzawska, Aldona (Faculty of Archaeology Adam Mickiewicz University) - Sobkowiak-Tabaka, Iwona (Faculty of Archaeology Adam Mickiewicz University) - Moskal-del Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences) - Mrozek-Wysocka, Małgorzata (Institute of Geology, Adam Mickiewicz University)

Abstract format: Poster

Pottery fragments are commonly encountered at prehistoric settlement sites. Those associated with the early Neolithic period, specifically with the Linear Band Pottery Culture (LBK), provide valuable insights into the culture and technology of the first farming communities in Poland. Residues found on pottery surfaces, such as pigments, food crusts, and other organic remains can provide information about past environments and dietary customs, enriching our comprehension of past subsistence strategies and culinary practices.

A significant assemblage of pottery remains discovered at Biskupice (Southern Poland), dating from 5200 to 5000 BC is associated with only one occupation phase at the settlement, enabling an in-depth study. In our research, alongside petrographic studies, we carried out a thorough analytical and microscopic analysis specifically focusing on pottery surfaces, aiming to detect residues such as pigments, food crusts, or wood tar. We selected samples for further examination using both optical and digital microscopes. Scanning Electron Microscope (SEM-EDS) facilitated the identification of charred plant remains and remains of red pigments. Chemical analysis was conducted specifically on the red residues to determine the proportions of major elements and their compositions. Results from the multiple analyses were combined with the taphonomy of the excavated features and archaeobotanical studies.

912 VIRTUAL REUNION AND MATERIALLY-INFORMED ANALYSIS: STUDYING AN ETRUSCAN VOTIVE DEPOSIT DIVIDED ACROSS CONTINENTS

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Faas-Bush, Susanna (University of California, Berkeley, USA)

Abstract format: Poster

A substantial collection of Etruscan votives – predominantly female heads and figurines – discovered at Caere in December 1885, the Vignaccia deposit was later split up between many museums worldwide, with about 800 entering the collections of the Phoebe A. Hearst Museum of Anthropology in Berkeley. While the majority were cataloged and published in 1988 by Helen Nagy, in the 1920s a subset of 30 votives had been sent to New Zealand in an exchange with the Tūhura Otago Museum in Dunedin, where they remain unpublished and decontextualized, severed from the larger collection.

This poster presents the results of my ongoing efforts across multiple continents to virtually reunite the disparate parts of this votive deposit – photographs of new types from the deposit found in Dunedin and evidence of polychromy on multiple female votive heads.

This research project is also focused on examining evidence from autopsy of the artifacts about how these votives functioned in individual worship. Drawing on new materialist, sensory archaeology, and usewear methodologies, this entails close examination of the artifacts to identify wear based on specific, particular use or engagement with the objects, as well as consideration of both the life history and the physical and sensory affordances of the artifacts. I present several examples that sketch out a more intimate, personal history of votive and dedicant.

913 LIFE IN THE CASTLE KRYSTYNA OF KOZIEGŁOWY

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Ginter, Artur (University of Lodz) - Kittel, Piotr (University of Lodz) - Kłusek, Marzena (Silesian University of Technology) - Michczyńska, Danuta (Silesian University of Technology) - Piotrowska, Natalia (Silesian University of Technology) - Pawełczyk, Fatima (Silesian University of Technology) - Poręba, Grzegorz (Silesian University of Technology) - Tudyka, Konrad (Silesian University of Technology) - Woźniak, Zuzanna (University of Lodz) - Ustrzycka, Alicja (Silesian University of Technology)

Abstract format: Poster

Krystyn of Koziegłowy was born in 1350. Already in the 1380s he was a well-known personage in Lesser Poland, but the peak of his career was connected with the person of the King of Poland and Lithuania - Władysław Jagiełło. In undetermined circumstances, he became the king's right-hand man, participating at his side in all the most important events for Poland - including the battle against the Teutonic Order at Grunwald. In Koziegłowy, on a former early medieval stronghold, he built a magnificent castle that dominated the area long after his death. The castle was abandoned in the 16th century, after which the walls were dismantled in the 19th century. Thanks to the fact that no major construction work was carried out on the castle in the modern period, the medieval layers and the artefacts they contained had been waiting to be discovered since the 16th century. This poster aims to present the history of the site, from the first settlers who appeared in the 3rd-4th centuries AD, through the early medieval fortress defending an important trade route and an area where silver, lead and iron mines were located, to the medieval knight's castle visited by King Władysław Jagiełło himself.

914 THE GOLD.PT PROJECT AND THE STUDY OF A SET OF GOLD EARRINGS DECORATED WITH GRANULATED SPHERES

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Figueiredo, Elin (Department of Conservation and Restoration, School of Science and Technology, NOVA University of Lisbon (NOVA FCT), Caparica, Portugal; Centre of Materials Research (CENIMAT/i3N), NOVA School of Science and Technology (FCT-NOVA), Lisbon, Portugal) - Serrano, Sofia (Department of Conservation and Restoration, School of Science and Technology, NOVA University of Lisbon (NOVA FCT), Caparica, Portugal; Centre of Materials Research (CENIMAT/i3N), NOVA School of Science and Technology (FCT-NOVA), Lisbon, Portugal) - Figueiredo-Persson, Sofia (Centre for the Humanities (CHAM), School of Social Sciences and Humanities, NOVA University of Lisbon (NOVA FCSH), Lisbon, Portugal) CHAM, Centre of Humanities, Lisbon, Portugal)

Abstract format: Poster

In Portugal, the Gold.PT project is studying more than one hundred protohistoric gold and silver artefacts. The artefacts form part of the goldsmith's collection at the National Archaeological Museum in Lisbon and include both historical acquisitions and recent archaeological finds.

During the Late Bronze Age and the Iron Age, the gold and silver metallurgy of the Iberian Peninsula brought together a set of characteristics, both in typology and technology, which reflect Atlantic and Mediterranean influences, as well as endogenous attributes linked to the Iberian communities.

This paper presents a study of six gold earrings from the Iron Age, consisting of an open hoop with a triangular drop of granular beads soldered to the hoop. These forms originate from the ancient Mediterranean, with elaborated parallels found in the interior of Iberia. It is interesting to note that all six gold earrings are made of solid gold, reflecting older forms connected to Late Bronze Age, instead of later ones, which include hollow pieces.

Elemental XRF analysis of the hoop and the granules shows that the region of the granules contain more copper than the hoop itself. This suggests the use of a solder to weld the beads together and into the hoop, with a lower melting temperature than the gold alloy used to make the hoop. The gold alloy of the hoop and granules contains silver and copper in amounts that are within the composition of other Iron Age western Iberian gold artefacts.

915 BRAZILIAN CENTRAL PLATEAU IN THE PLEISTOCENE/HOLOCENE TRANSITION AND THE EARLY HOLOCENE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Straioto, Haruan (Museu de Arqueologia e Etnologia, Universidade de São Paulo) - Chim, Eliane (Museu de Arqueologia e Etnologia, Universidade de São Paulo) - Oliveira, Rodrigo (Museu de Arqueologia e Etnologia, Universidade de São Paulo) - Strauss, André (Museu de Arqueologia e Etnologia, Universidade de São Paulo)

Abstract format: Poster

South America was the last continent to be populated by humans and the chronology of earliest occupation are hotly debated. In the Brazilian Central Plateau there is evidence of human occupation since 14.0 ky cal BP. Models of dispersal suggest an intensification of occupied areas around 11.0 ky cal BP, followed by a process of regionalization after two millennia. The study of lithic technology, as the major evidence available, is crucial to understand these long-term processes. Distinct technological organization of lithic production are identified since the early period in the region. In some areas, there is the production of formal tools, characterized by thick flakes with unifacial retouch. Conversely, numerous contemporary sites lack formal lithic artifact production, with flake tools (mostly unretouched) being the predominant type of manufactured instrument. In this work, we compare the technological variability of assemblages from three rock shelters in different areas of the Brazilian Central Plateau during the period between 14.0 and 9.0 ky cal BP. At the Lapa do Santo site the lithic industry primarily involves the production of quartz flake tools (rock crystal), without the manufacturing of formal artifacts. At the Lapa do Boquete site, the lithic industry is distinguished by the production of formal artifacts exhibiting unifacial flaking, a characteristic of the Early Holocene in the Brazilian Central Plateau. Meanwhile, at the Toca da Braúna I site, during the period's occupations, the lithic industry is characterized by both the production of formal unifacial artifacts and the manufacturing of flake tools, primarily made of quartz. One of the factors under analysis is the relationship between raw material availability and technological schemes. From a diachronic perspective, we examine how regionalization processes have influenced the adoption of distinct operative schemes across various areas.

918 FROM THE CITY TO ITS TERRITORY: RECONSTRUCTING THE ROMAN LANDSCAPE OF VEII

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Pavanello, Elena (Sapienza Università di Roma)

Abstract format: Poster

Veii was the first city of Etruria conquered by Rome in 396 BC. Ancient sources describe how the event took place on the plateau and the hinterland, even so, they don't always match with the archaeological evidences. Furthermore, most of the Etruscan and Roman remains of the urban and rural settlement are not longer visible, while the natural environment has grown up and the evidences have become part of a hidden palimpsest to explore.

Over the years the urban and territorial area has been investigated by antiquarians, topographers and archaeologists using different techniques such as surface survey, geophysical prospection, excavations and aerial photography that led to the production of a large amount of 'legacy' data. Integrating the datasets of these researches into a dedicated Informatic System is becoming essential to manage and, most of all, to understand the ancient multilayered landscape.

Scholars agreed to talk about continuity instead of discontinuity after the Roman expansion. However, it is still difficult to trace the boundaries of the *ager veientanus* with the surrounding territories before the event and most of all how the interaction with Rome could have shaped the Etruscan area.

Analysing the data, the poster will present a reconstruction of the entire archaeological settlement of Veii, with a multiscalar approach, from a monumental to a urban and territorial scale. The aim is to understand the Roman impact on the *ager* by defining the area of concern, from its conquest to its abandonment, during the 4th century AD.

919 TRACKING ANCIENT PLANT PATHOGENS AND THEIR POTENTIAL TO EXPLORE PALAEOECOLOGICAL CHANGES AND PLANT/HUMAN INTERACTIONS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: MORANDI, LIONELLO (Department of Civilisations and Forms of Knowledge, University of Pisa; Archaeometry Research Group, Eberhard Karls University of Tübingen) - MAZZUCCO, NICCOLÒ (Department of Civilisations and Forms of Knowledge, University of Pisa) - SARROCCO, SABRINA (Department of Agriculture, Food and Environment, University of Pisa)

Abstract format: Poster

There is nowadays a large body of evidence testifying to the spread and evolution of pathogens throughout human history. Within this line of research, so far the majority of efforts have been devoted almost exclusively to human- and animal-related pathogens, shedding light on issues such as ancient disease outbreaks (e.g. plague and tuberculo-

sis) resulting from large-scale population movements and renovated subsistence practices, chiefly the introduction of Neolithic lifestyles involving a close proximity with domesticates. However, within the last decade, only scant attention has been given to the investigation of the history of plant pathogens and their evolutionary pathways subsequent to the shaping of new ecological niches, especially following the onset of agriculture and related landscape modifications. Building on previous palaeoecological literature and recent data from archaeological artefacts, we aim to select a range of finds and biological proxies which will enable us to address the issue of past plant pathology. Well-preserved organic materials and sedimentary samples are particularly promising in this regard, and by applying a suite of analytical methods ranging from genetics to micropalaeontology and GC/MS, a protocol can be set up to track long-term changes and human-induced modifications in the plant pathogen record.

921 NUBIANS IN FIRST INTERMEDIATE PERIOD AND EARLY MIDDLE KINGDOM EGYPT (CA. 2200-1900): AN INTERSECTIONAL APPROACH

Abstract theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Abstract authors: Matic, Uros (University of Graz) - Ejsmond, Wojciech (Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences)

Abstract format: Poster

Thinking of ancient Egypt as an ethnically homogenous state still prevails and seems to be an inheritance of the 19th and early 20th centuries' views. Of course, the situation was more complex and several ethnic groups were living under the pharaoh's scepter. Furthermore, Egyptology has generally been reluctant to reflect on its own theories and methods and their historical contingency, as well as to apply, test, or reflect on the body of theory outside its narrow sphere. An intersectional approach to identity is well-known in some archaeologies, whereas in others, such as Egyptology, it is rarely, if ever, considered. Thus, a fresh rethinking and re-examination of identities is needed. For this, we need to go beyond defining people from only one perspective.

In short, an intersectional approach to identity considers that various facets of identity, such as age, gender, ethnicity, status, etc., can intersect in a myriad of ways. In this poster, we will apply an intersectional approach to the identity of Nubians in First Intermediate and early Middle Kingdom Egypt (ca. 2200-1900 BCE). We analyze both self-representations of Nubian men and women in ancient Egyptian art of this period, and representations of Nubian men and women done by others. We argue that age, gender, status, and ethnicity intersect in these representations, differentiating between: Nubian men in Egyptian service, Nubian women, Nubian women in Egyptian service, women of Nubian origin married to Egyptian kings, boys from mixed Nubian-Egyptian marriages depicted as Nubians, and girls from such marriages depicted as Nubians. We discuss the possible reasons behind the children from these marriages being depicted as Nubian rather than Egyptian.

923 INTERPRETING MIGRATION PATTERNS: INSIGHTS FROM STRONTIUM ISOTOPE ANALYSIS OF THE EARLY MEDIEVAL CEMETERY OF ALTHEIM-ESSENBACH, BAVARIA (GERMANY)

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Velte, Maren (State Collection of Anthropology Munich) - Seyr, Elsa (State Collection of Anthropology Munich) - Brather, Sebastian (Albert Ludwigs University Freiburg) - Patzold, Steffen (Eberhard Karls University Tübingen) - Meier, Mischa (Eberhard Karls University Tübingen) - Schmidt-Hofner, Sebastian (Eberhard Karls University Tübingen) - Burger, Joachim (Johannes Gutenberg University Mainz) - Harbeck, Michaela (State Collection of Anthropology Munich)

Abstract format: Poster

There has been much discussion about the role that migration played in the transition from Late Roman to Early Medieval times, particularly in the formation of the Baiuvarian tribe and the founding of their tribal dukedom, which took place from the 5th to the 6th century in what is now Southern Bavaria (Germany). The cemetery of Altheim-Essenbach is one of the largest Early Medieval row cemeteries ("Reihengräberfelder") in this region. As part of an ongoing interdisciplinary research project, genetic, osteological and isotope-chemical data were collected from 100 burials dating between the 5th and the 7th century. This contribution focuses on the performed strontium isotope analysis, a pivotal tool in migration research enabling the detection of migrants originating from geologically diverse areas. While preceding studies suggest a high migration rate (of around 24%) in Southern Bavaria in the 5th century, $87\text{Sr}/86\text{Sr}$ data from Altheim-Essenbach indicate a notably low proportion of migrants (approximately 6%). We here discuss the possible interpretations of this result, considering the additional data collected from the burials. In doing so, we also demonstrate the limitations of strontium isotope analysis, even with large data sets.

926 ANALYSING QUARTZITE VARIABILITY OF THE EL SOTILLO ACHEULEAN ASSEMBLAGE (CIUDAD REAL, SPAIN)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Abrunhosa, Ana (IPHES-CERCA - Institut Català de Paleoeologia Humana i Evolució Social, Spain.; Universitat Rovira i Virgili (URV), Departament d'Història i Història de l'Art, Tarragona, Spain; ICArEHB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, FCHE - Universidade do Algarve, Portugal) - Heras-Bastida, Sergio (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain) - Pérez-González, Alfredo (I.D.E.A. - Instituto de Evolución en África, Madrid, Spain) - Rubio-Jara, Susana (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain; I.D.E.A. - Instituto de Evolución en África, Madrid, Spain) - Méndez-Quintas, Eduardo (Grupo de Estudios de Arqueología, Antigüidade e Território (GEAAT), University of Vigo, Ourense, Spain; I.D.E.A. - Instituto de Evolución en África, Madrid, Spain) - Panera, Joaquín (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid, Madrid, Spain; I.D.E.A. - Instituto de Evolución en África, Madrid, Spain) - Santonja, Manuel (I.D.E.A. - Instituto de Evolución en África, Madrid, Spain)

Abstract format: Poster

The complexity of early humans' behaviour is linked to the degree of technological specialization and variability of raw materials exploited. However, the timing of when early humans transitioned from merely expediently exploring locally available materials to exhibiting more sophisticated behaviours remains a topic of ongoing debate and limited research, particularly in older chronological contexts.

The Acheulean techno-complex, originating in Africa c. 2 million years ago, marked a significant milestone in human technological advancement. This phase, which lasted until c. 300,000 years according to most records, is characterized by symmetrical objects and standardized shapes crafted from large flakes such as bifaces and scrapers.

In contrast, the Iberian Large Flake Acheulean (LFA) persisted until the final stages of the Middle Pleistocene, with sites such as Porto Maior, Ambrona, and Torralba dating between 400,000 and 150,000 years ago, coexisting with the Middle Palaeolithic. Technological similarities between African Acheulean and those in the Iberian Peninsula, the Aquitaine region in France, and the Near East are apparent.

A significant concentration of Acheulean sites in the Iberian Peninsula, particularly along river terraces such as those along the central sector of the Guadiana River basin, highlights the region's importance. El Sotillo stands out as one of the largest Acheulean assemblages in Europe with a complex stratigraphic sequence with Mousterian and Acheulean levels.

This paper focuses on the raw material analysis of the Acheulean assemblage from El Sotillo's level 5, composed mainly of quartzite and dated to 245–345 ka by OSL. Quartzite sub-groups are identified by examining macroscopic and microscopic features through thin sections. This characterization, encompassing grain size, porosity, intergranular contacts, and cementation, facilitates understanding the rock's mechanical behaviour. By correlating this data with techno-typological studies, patterns in raw material procurement and exploitation at El Sotillo during this period can be assessed.

927 FROM ROME TO AQUITANIA: CHARACTERISING THE PAINTING TECHNIQUE OF THE GALLO-ROMAN WALL PAINTINGS OF LIMONUM

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Iuliano, Adriana (Archéosciences Bordeaux, CNRS/University Bordeaux Montaigne/University of Bordeaux) - Galluzzi, Francesca (Archéosciences Bordeaux, CNRS/University Bordeaux Montaigne/University of Bordeaux) - Pianet, Isabelle (Archéosciences Bordeaux, CNRS/University Bordeaux Montaigne/University of Bordeaux) - Carrive, Mathilde (Hellénisation et romanisation dans le monde antique (HeRMA), University of Poitiers)

Abstract format: Poster

Roman influence expanded in Gaul from the 3rd century BC and culminated with the conquest and administration of the region under Augustus, bringing with it new construction and decoration techniques, including wall painting. Gallo-Roman decorative traditions, initially strongly influenced by Italian models, are known for gradually acquiring a certain autonomy and originality in the second half of the 1st century AD. This raises questions on possible changes in the choice of pigments and painting technique made by craftsmen of the time.

Painting production in Gaul is well studied and documented from an archaeological and artistic point of view. In the last ten years, archaeometric studies have also been carried out, although limited to a single building or a group of close and/or contemporary buildings, therefore not allowing a comprehensive study of the practices employed in ancient painting. For this reason, this research focuses on the investigation of a larger corpus of wall paintings in the

Aquitania province: that of Limonum (modern-day Poitiers, France). Several lots of painted plasters were selected and analysed to characterise the colour palette and understand the evolution of the painting technique used.

A multi-analytical approach was followed. In a first step, non-invasive techniques such as portable microscopy, hyperspectral imaging, XRF spectroscopy and XRD analysis were used. This allowed for the characterisation of red and yellow ochres, green earth, Egyptian blue, cinnabar, carbon black, and for the selection of sampling areas. Micro-invasive analyses were carried out in a second step, including optical microscopy, SEM-EDS, and micro-Raman and FTIR spectroscopy. Point and molecular analyses confirmed previously obtained results, while stratigraphic observations gave insights on the painting technique, revealing the presence of mezzo frescoes and lime paintings.

928 WHEN THE OLD ONES ARE GONE: BIOARCHAEOLOGICAL ANALYSIS OF AN INDIGENOUS MUMMY FROM BRAZIL AT THE TIME OF EUROPEAN CONTACTS

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Borges, Caroline (Department of History, Federal Rural University of Pernambuco, Dom Manuel de Medeiros street, s/n, 52171-900, Recife, PE, Brazil) - Cunha, Claudia (Coordenação da Graduação em Arqueologia/Programa de Pós-graduação em Arqueologia – Universidade Federal do Piauí, Brasil. Centro de Investigação em Antropologia e Saúde – Universidade de Coimbra, Portugal) - Tomé, Tiago (Departamento de Antropologia e Arqueologia - Faculdade de Filosofia e Ciências Humanas - Universidade Federal de Minas Gerais) - Magalhães, Sônia (Coordenação da Graduação em Arqueologia/Programa de Pós-graduação em Arqueologia – Universidade Federal do Piauí, Brasil) - Spehner, Olivier (Akia Consulting) - Saless, Kevin (Department of Anthropology, Masaryk University, Faculty of Science, Kotlářská 2, 611 37 Brno, Czechia)

Abstract format: Poster

This study presents a multidisciplinary investigation into an Indigenous naturally mummified individual who was deposited on the surface of a room inside a cave in Colônia de Gurgéia, Piauí, northeast of Brazil. The burial cave is located in the semiarid region where Caatinga vegetation – deciduous shrub forest autochthonous to Brazil – predominates. Our aim is to reconstruct the life history of this individual by biogeochemical and bioarchaeological analysis. Bioanthropological information recovered suggests that this individual is an elderly female individual who presented several health issues at death. Some are related to advanced age such as osteoarthritis in different joints and deformities of the vertebral bodies. In addition, she presents evidence of an on-going periapical infection at the time of death, periodontal disease, and ante mortem loss of different teeth. Moreover, she displays evidence of a healed fracture to one of her ribs. The elderly woman underwent a funerary ritual involving body decoration and body wrapping in a sleeping hammock before being placed in the surface of the cave. This practice remains prevalent among indigenous communities in Brazil nowadays. The exceptional preservation of the body enables stable carbon and nitrogen isotope analysis of bone, skin, hair, nail, and oral mucous membrane samples offering nuanced insights into her dietary patterns during her adulthood and her late life. Finally, we provide the two first ¹⁴C radiocarbon dates for this individual showing that she lived in the edge of the beginning of the European colonization of Americas. By synthesizing these diverse analytical approaches, this research contributes to a deeper understanding of this individual's life. Also, this study enriches our comprehension of Indigenous history and cultural practices in Brazil, elucidating the complexities of the first contacts, honoring the enduring legacies of Indigenous peoples in the Americas.

929 HORSES AND HUMANS. AN OVERVIEW OF LATE IRON AGE DATA FROM LOWER DANUBE AREA

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Magureanu, Despina (Institute of Archaeology „Vasile Parvan”) - Matei, Sebastian (Buzau County Museum)

Abstract format: Poster

Archaeological research carried out at Late La Tène period settlements of pre-Roman Dacia uncovered contexts with equid bones. As generally acknowledged, osteological remains discovered on archaeological sites constitute a coherent documentary source. The archaeozoological analyzes carried out mainly in the Lower Danube area yielded data on certain types of human-horse relationships. Owning such animals emphasizes the attention paid to their breeding and care. Most horse remains originate from contexts with profane functionality, public spaces, but mainly waste pits. Horse remains are few when compared to other species. For sure, horse was occasionally eaten, in certain circumstances. It was sub-adult specimens or old animals that were intended for food consumption. The bone assemblage studied indicates the presence of two horse breeds. One, more robust, with semi-massive limbs, was used more for domestic activities. The horses of the other breed, of smaller size, were riding horses, sometimes also used for military purposes.

Completing the image of the equestrian equipment, the distribution of certain artefacts is suggestive of horses material culture. For the studied time frame, harness elements like bits, or rider elements like spurs, were discovered in the Lower Danube area settlements.

The importance of riding horses turns them into emblems as indicators of social status. The iconographic analysis of certain figurines of unique character, such as those from Cârloșnești, Buzău County representing a rider and his horse (image of a riding hero), emphasizes the strong connection between man and horse, as well as an equestrian tradition.

Representations of horsemen with symbolic valences can be found on artifacts belonging to the Toreutes and the Statuaria attributed to the Geto-Dacians.

We here present our study within the wider frame, paralleling them to finds of horse bones and horse material culture, or horse representation from other sites in the Lower and Middle Danube area.

930 THE ALGHERO PLAGUE EPIDEMIC (SARDINIA, A.D. 1582-1583): THE INTERSECTION BETWEEN HISTORY OF MEDICINE AND PALEOPATHOLOGY

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Varotto, Elena (College of Humanities, Arts and Social Sciences, Flinders University) - Milanese, Marco (History, human sciences and education, University of Sassari, Italy) - Galassi, Francesco Maria (Department of Anthropology, Faculty of Biology and Environmental Protection, University of Lodz, Poland)

Abstract format: Poster

This communication explores, through a multidisciplinary approach, the intersection between the study of plague by means of historical sources and data originating from the bioarchaeological and paleopathological study of human remains retrieved from the cemetery of the ex-Jesuit college of San Michele in Alghero (Sardinia, Italy) excavated under the scientific directorship of one of the authors (M.M.) in 2009.

The mass plague burial comprises sixteen long and narrow graves called “trenches”, each holding the remains of 2 to 30 individuals, and additional multiple graves for a total of ca. 200 plague victims, who orderly lay next to one another, potentially including entire families laid down together. It thus represents a unicum in Mediterranean funerary archaeology. The fact that the plague occurred in a short time range and this is no ordinary mass grave allows scientists to obtain a more precise snapshot of pathological conditions, especially congenital ones.

In this communication, we will thus recapitulate the preventive measures adopted by the Protomedicus Quinto Tiberio Angelerio to fight the advancing plague and compare them with similar contemporary measures adopted in Italy during the recent COVID-19 pandemic. Not only will they be listed, but their supposed efficacy will be highlighted in light of the medical knowledge of the day. Furthermore, the presentation will thus focus on one specific rare congenital anomaly found in Alghero, namely Klippel Feil Syndrome found in four individuals. To this date, this is the sole cemetery in Italy to have yielded such a high number of cases of this disorder, while in most instances only single cases are found by paleopathologists. This is in direct connection with the specific cemetery situation described above. Finally, the importance of combining sources in paleopathological research will be stressed as a potential asset devised to improve the overall quality and sensitivity of retrospective diagnostics.

933 SACRED SPACE, INSCRIBED WALLS, AND PAINTED NARRATIVES - ANALYZING A NEWLY DISCOVERED CHAMBER IN DONGOLA

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Skarzynska, Magdalena (Polish Centre of Mediterranean Archaeology UW) - Deptuła, Agata (Polish Centre of Mediterranean Archaeology UW)

Abstract format: Poster

In early 2023, researchers working under the ERC grant “Umma” in Old Dongola made a remarkable discovery beneath the floor of a 16th-century house: a small chamber adorned with paintings and inscriptions dating back to the 13th century. This find was hailed as one of the top 10 archaeological discoveries of the previous year and garnered mention in over 100 scholarly and popular publications worldwide. The paintings depict figures such as the Virgin Mary, Christ, and a scene featuring a Nubian king alongside Christ and the Archangel Michael. However, the portrayal of the Nubian ruler differs from typical depictions of royal patronage by saints and archangels; here, the king bows to Christ seated on clouds, kissing his hand. In addition to the paintings, inscriptions in both Old Nubian and Greek were found on the walls. While the Old Nubian texts reference historical events unrelated to the chamber itself, the Greek inscriptions unequivocally reveal the chamber's liturgical function. These texts contain prayers from the liturgy of Pre-sanctified Gifts, allowing for communion on non-liturgical days of the year. Similar prayers are known from the prothesis of several Nubian churches, although this chamber's inscriptions feature a more extensive collection. Our poster will focus on the epigraphic and iconographic analysis of this space, seeking to elucidate the relationship between its representations and the liturgical character of the texts.

934 MICRO CT DETAILS OF A POSSIBLE KIDNEY STONE FROM THE 13-16TH CENTURIES, KNIGHTS' TEMPLARS CHURCH RAŠAŠKA - RAČEŠA (CROATIA)

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Sarkic, Natasa (Aita Bioarchaeology) - Cighetti, Roberto (Aita Bioarchaeology, Barcelona, Spain; Osteoarc, Via Giacomo Matteotti, 7, Gornate Olona VA, Italy) - Erjevac, Igor (University of Zagreb, School of Medicine, Center for Reproductive and Regenerative Medicine, Laboratory for Mineralized Tissue;4) - González-Garrido, Laura (Universidad de León, Área de Antropología Física, Departamento de Biodiversidad y Gestión Ambiental, Campus de Vegazana, León, Spain; University of Coimbra, Research Centre for Anthropology and Health, Department of Life Sciences, Calçada Martim de Freitas, Coimbra, Portugal) - Mihaljevic, Marija (Nova Gradiska Town Museum)

Abstract format: Poster

During the excavation of the Rašaška site in Croatia, dating from the 13th to 16th centuries, a male skeleton, aged over 30 years old, was discovered with a light brown irregularly shaped calcified mass in the abdominal region. Upon macroscopic examination, the recovered mass indicates the potential diagnosis of a urolith extending from the renal pelvis into at least four calyces, each displaying dilated and rounded apices. Micro-CT scanning further elucidated the radiopaque nature of the stone and notably lacking distinct lamina. Following a thorough differential diagnosis, the mass was identified as consistent with staghorn uroliths, often associated with chronic urinary tract infections, likely exerting adverse effects on the overall health of the individual. While calcified formations are extensively documented in clinical research, their occurrence is less frequently reported within the realm of Paleopathology. Therefore, the rigorous archaeological excavation techniques and refined identification methodologies for such calcified formations is imperative for advancing recognition, enhancing diagnostic accuracy, and deepening interpretative understanding of past populations. Subsequent investigations will focus on determining the chemical composition of this kidney stone, offering further insights into the health status"

935 THE WOODEN TECHNOMORPHOLOGICAL VARIETY OF ARCHITECTURAL ELEMENTS AT THE LUCONE D SITE

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Maltese, Giuseppe (Department of Cultures and Civilizations, University of Verona - Italy) - Baioni, Marco (Museo Archeologico della Valle Sabbia - Italy)

Abstract format: Poster

The Lucone D pile-dwelling site, situated in an inframorraine basin near Lake Garda and dendrochronologically dated between 2034 and 1967 ± 10 B.C., has provided a wide range of horizontal wooden elements, probably part of the buildings. A total of 1060 wooden elements, 550 of which are horizontal, were identified in Sector 1, preserved through exceptional events such as fire or abandonment in water. To define the different types of horizontal elements found on the excavation, and to achieve a clearer and more complete classification of the woody assemblages, given the absence of an appropriate classification in the archaeological literature, wood technology sources were consulted. Thus, a classification of the elements based on the measurements of their horizontal section was proposed, distinguishing between beam, small beam, joist, lath, plank, board and small board. Joists and boards were found to be the most representative, accounting for 42.73% and 28.79%, respectively.

Furthermore, the combination of xylological analyses and the classification of wooden assemblages allows for a more complete and detailed understanding of the construction techniques found at the site. The predominance of oak, especially of the ROBUR variety (*Quercus* sp. sez. ROBUR), for large-scale elements is evident and finds comparison at other sites in the Benaco region.

The techno-morphological investigation of the horizontal elements discovered at Lucone D has enabled a detailed analysis of wood-working techniques during the Bronze Age, highlighting a remarkable level of technical and architectural complexity, as well as carpentry skills.

938 THE MARKETPLACE AT GERASA/JERASH, 6TH-9TH CENTURY CE

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Simpson, Ian (Leiden University)

Abstract format: Poster

This poster presents results of excavations and archival research that have unearthed and reconstructed the continued commercial and social life of Roman Gerasa in Jordan in Late Antiquity and the Early Islamic Period. It presents evidence and materials from the marketplace in Jarash in studies by the Islamic Jarash Project and Market Section, including architecture, accounts ledgers, commercial products, coins and seals. Together these provide insight into

the evolving market infrastructure of the town in the 6th-9th centuries CE, and demonstrates marketplace organization, the context of social interaction, and social and economic changes that took place during the initial formation and expansion of Islam. The marketplace under study is located outside an early mosque in central Jarash and formed a site of cultural and not only commercial exchange. It shows that a planned commercial and industrial program was initiated in the Late Byzantine period to facilitate trade and exchange, which continued into the Abbasid period.

941 RITHMS PROJECT: HOW DIGITAL TECHNOLOGY CAN HELP US PROTECT CULTURAL HERITAGE

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: De Bernardin, Michela (Istituto Italiano di Tecnologia (Center for Cultural Heritage Technology)) - Giovannelli, Riccardo (Istituto Italiano di Tecnologia (Center for Cultural Heritage Technology)) - Leeson, Madison (Istituto Italiano di Tecnologia (Center for Cultural Heritage Technology)) - Traviglia, Arianna (Istituto Italiano di Tecnologia (Center for Cultural Heritage Technology))

Abstract format: Poster

In recent decades, the devastation of archaeological sites, particularly in conflict-affected areas of the Middle East, has reached unprecedented levels, sparking public concern and raising awareness about the perils of looting and illicit trafficking in cultural heritage.

Dedicated units within Law Enforcement Agencies (LEAs) have developed databases of stolen artefacts and engaged in provenance research activities. Concurrently, an increasing number of museums have made their archaeological collections more accessible to the public through repositories and inventories.

Within the European project RITHMS (Research, Intelligence, Technology for Heritage, and Market Security), this wealth of information is expanded by Open Source Intelligence (OSINT) data sourced from public websites and social media. Leveraging the innovative application of social network analysis methodology, RITHMS aims to illuminate the intricate web of connections among actors involved in the trade and trafficking of stolen archaeological items.

This technological advancement equips LEAs with more precise and timely intelligence, empowering their investigative efforts. The interoperable digital platform developed by the RITHMS project promises invaluable insights, enabling the identification of active organized criminal networks. Consequently, LEAs can address the criminal phenomenon more efficiently and preempt the further proliferation of illicit activities.

943 UNFINISHED, BROKEN AND DISCARDED: AN ANALYSIS OF THE NEOLITHIC AMBER PROCESSING TECHNIQUES IN THE EASTERN BALTIC (LATVIA)

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Cakare, Agnese (Institute of Latvian History, University of Latvia)

Abstract format: Poster

In the archaeological record from the Eastern Baltic region amber occurs most prominently throughout the Middle and Late Neolithic (4th-3rd mill. BC). It was collected along the Baltic coast and worked into jewellery and figurines, traveling far inland, but processed where amber raw material were abundant. Three major Neolithic amber processing centers are known in present-day Latvia: Sārnate, Siliņupe and Lubāns Lake basin. So far, the collections have been studied mainly from a typological point of view, and less from a technological one, related to the methods used to transform the material. This study focuses on combining experimental and microscopic analysis to investigate the techniques and materials used to treat amber by examining amber rough-outs, broken artifacts and final products from the above-mentioned amber processing sites. Depending on the characteristics of the amber, the type of jewellery intended, the complexity of manufacture, the availability of resources and the skill of the maker, the techniques used varied. Amber was worked using tools made from both locally available material (antler, sandstone, Silurian flint) and imported Cretaceous flint, while the processing techniques identified suggest an interplay of the materials: some of the techniques were used to work flint before the appearance of amber.

945 BONE GROWTH CHANGES IN NON-ADULTS IN THE CONTEXT OF URBANIZATION AND CLIMATE CHANGE IN 13TH-18TH CENTURY BERLIN

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Brennan, Emily (University of South Carolina)

Abstract format: Poster

The study of non-adult skeletal individuals offers an opportunity to study not only the biological and physical changes of growth and development but also the effects of social, cultural, and environmental exposures during early periods of the life course. Since children are regarded as the most vulnerable members of the population, evaluation of non-adult health trends have been used to examine the health consequences of large scale changes in society, like urbanization

and climate change. Using non-adult individuals, those under 18 years of age, (n = 69) excavated from the St. Peter's Square in Berlin dated between c. 1200 -1717, this study seeks to determine whether environmental factors, namely a volatile climate and urban growth in the early modern period (1500-1800), are associated with inhibited bone growth, as measured by endochondral, appositional, and cortical growth, measured via radiological scans. Results suggest that bone growth measures were largely the same for non-adults between the late medieval (c. 1200 – 1500) and early modern periods. For both time periods, individuals under 5 years of age were compared to individuals older than five since differences of immunocompetency exist between these age groups. In the early modern period individuals under 5 display greater values for bone growth measures compared to those over 5. This may be interpreted as a display of greater resilience in that individuals who survived early childhood did so even with evidence of earlier life stress. These results may reflect differential investment in parenting in post-Reformation Berlin. The new Church emphasized the importance of not only marriage, but motherhood for women, with an emphasis on both pre- and post-natal care for mothers and infants. This study demonstrates the utility of using radiological imaging to measure bone growth and the importance of contextualizing such measures with cultural and temporal experiences of childhood.

946 **SINERGICALLY ASSEMBLING THE PUZZLE OF PREHISTORIC PORTABLE ART FROM GIOVANNA CAVE (SIRACUSA, SICILY) THROUGH A DIGITAL HUMANITIES APPROACH**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Zampetti, Daniela (Fondazione Sapienza Università di Roma)

Abstract format: Poster

Understanding cognitive complexity of prehistoric human beings is currently improving thanks also to the developments of scientific technologies and new holistic approach based on the interaction between several disciplines.

Overall, the production of engraved figurative and abstract signs on portable limestone stones reflects the cognitive complexity of prehistoric human beings. Their ability to conceptualize, plan, and execute such intricate designs speaks to us also about their capacity for innovation in choosing a visual way to express ideas.

This research is following a multi-dimensional and interdisciplinary methodological approach to bridge the gap between the seen and unseen aspects of the twenty-two engraved fragments found at Giovanna Cave.

Through a holistic investigation encompassing geology, bioarchaeology, naked eyes visual analysis, lens/lower magnification microscopic analysis/ macro-photography, 3D surface and volume reconstruction (Structure from Motion) the study aims to dig deeper into the cognitive and symbolic significance of limestone and pebble artworks.

In this research program we are committed to use low-cost resources in order to disseminate not only data but also good affordable practices, comparing and experimenting with scanners, photogrammetry, AutoCAD and VR. We plan also to explore different interfaces to visualise and analyze, building different layers of information available on digital twins. The goal is not just to create the models of the engraved limestone fragments but to experiment with, exploring them also within a VR experience with Eye and Hand Tracking to better understand ancestors' ergonomics and manual ability in the engraving production processes.

947 **COOKING OVER FIRE: INTENDED AND ACTUAL FUNCTION OF THIRD-MILLENNIUM COOKING POTS, EASTERN CROATIA**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Miloglav, Ina (University of Zagreb) - Vuković, Jasna (University of Belgrade) - Vuković, Miroslav (University of Zagreb) - Balen, Jacqueline (Archaeological Museum in Zagreb)

Abstract format: Poster

Intended (suitability of vessel's attributes for different functions as a result of potter's technical choices) and actual (use-alterations) function are two aspects related to modes of use of ceramic vessels. Both aspects will be examined in the case of S-profiled pots with a polished upper part and textured lower part, and usually with two tunnel handles from the site of Prisunjača, typical forms belonging to the Late Copper Age Vučedol culture of Eastern Croatia (2880-2450 BC). Technological traits: intentional blackening of their upper parts and textured surfaces of the lower body suggest that preferable performance characteristics could be related to thermal food processing. Use-alteration traces: abrasion on the handles as the consequence of suspending the vessel over the fire, and carbon deposits on vessels' interiors were identified by macroscopic examination and observation under a stereoscopic microscope. They also suggest the function of cooking with the presence of water. Analysis of the spatial distribution of the pots revealed that the majority of the specimens were found inside the house. Together with already conducted organic residue analyses from other neighboring contemporary sites, it can be stated that their function of cooking meals on a daily basis is not questionable.

949 **NEW DATA ABOUT SUBSISTENCE STRATEGIES DURING THE MESOLITHIC IN THE INTERIOR OF THE CANTABRIAN REGION: INSIGHTS FROM ARANGAS CAVE (SPAIN)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Ruiz Cristóbal, Patricia (University of Cantabria) - Portero Hernández, Rodrigo (University of Salamanca) - Arias Cabal, Pablo (University of Cantabria; International Institute for Prehistoric Research of Cantabria (IIIPC))

Abstract format: Poster

In this poster we present the archaeozoological and taphonomic analysis of macromammal remains from level 3 of Arangas cave. The location of this site, in the mountainous interior of eastern Asturias, contrasts to the numerous known coastal sites from the Mesolithic of Cantabrian Spain. Level 3, dated to the VIII millennium cal BP, has revealed a high number of well-preserved macromammal remains, unlike most of the contexts studied in the same geographical area.

These aspects position the site as a key location for understanding the subsistence strategies of late hunter-gatherers groups. For this purpose, we conducted an analysis of macromammal samples from squares F8, G12, and G13 to provide new data into the management of animal resources within the context of Mesolithic human group subsistence strategies.

Through anatomical and taxonomic identification, we analyze the animal species exploited and assess their representation at the site using quantification measures. Additionally, we estimate the caloric contribution of each species to the human diet to understand their respective roles. We also inferred the paleoeconomic behavior according to the seasonality of hunting activity and the processing and consumption of the prey from the study of taphonomic marks, which provided the anthropic contribution of the faunal deposit.

950 **PREDICTING ANCIENT HUMAN POPULATION MOVEMENTS USING PHYLOGENOMICS OF ANCIENT COMMENSAL MICROBES**

Abstract theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Abstract authors: Willingham Grijalba, Arve Lee (Université Paris Cité) - Ponce-Soto, Gabriel Yaxal (Université Paris Cité) - Rascovan, Nicolás (Université Paris Cité)

Abstract format: Poster

Dental calculus is the calcified biofilm that accumulates on teeth's surfaces during an individual's life. This exceptionally preserves a genetic record of an individual's oral microbiome, one of the most stable and conserved human microbial communities across populations, which is composed of hundreds of species. However, most of what we know about oral microbiomes is based on modern samples, and little is known regarding these human-microbe associations over large spatiotemporal scales, and how informative they can be about an individual's history. We hypothesize that the ancient oral microbiome is likely maintained within human populations over long periods and therefore it can reflect human population movements throughout time. To test this hypothesis, I am analyzing multiple individuals from the Southern Cone of the Americas, a region rich in archaeological record but yet underexplored using paleogenomic approaches. Phylogenomic methods were used to reconstruct the relationship between strains of oral microbial species recovered from individuals across multiple spatiotemporal contexts. When combined with archaeological data, we reveal strong biogeographic associations for several species, bringing novel insight into the long-term association between humans and their commensal microbes. We propose that this type of data and the implemented analytical approaches can be used to contribute a novel and complementary approach to investigate ancient human demography.

951 **CARRYING CAPACITY AND MEAT AVAILABILITY FOR THE NEANDERTHAL GROUPS IN THE UPPER VALLEY OF THE LOZOYA RIVER (MADRID, SPAIN)**

Abstract theme: 1. The Material Record: Current Trends and Future Directions

Abstract authors: Rodríguez-Gómez, Guillermo (Universidad Complutense de Madrid) - Molino, Lucía (Universidad Complutense de Madrid) - Arsuaga, Juan Luis (Centro UCM-ISCIIL de Evolución y Comportamiento Humanos; Universidad Complutense de Madrid)

Abstract format: Poster

The site of Cueva del Camino (CdC) is one of the richest paleontological sites in the Calvero de la Higuera complex (Pinilla del Valle, Madrid, Spain) of the Upper Valley of the Lozoya River. Its faunal assemblage, with mammals of different sizes, corresponds to a late interglacial period (MIS 5c), with dates around 90,000 years ago. This rich fauna, together with the remains of lithic industry and two Neanderthal molars, has made it possible to study the behavior, interaction with the environment and subsistence strategies of human groups in the past. The results of studies carried out over the last three decades have allowed the site to be interpreted as a hyena den with sporadic human presence.

The objective of this work is to determine the ecological conditions and meat resources available to humans in the large mammal paleocommunity of CdC, through the estimation of prey biomass (PB) or carrying capacity and meat availability (TAB), and to infer whether the resources of this paleoecosystem were sufficient to sustain human groups in a stable manner. To evaluate and contextualize the paleoecological conditions of CdC, the results were compared with other paleoecosystems of the Iberian Peninsula and with present-day ecosystems in Africa. The results reflect similar conditions with respect to some sites in the Sierra de Atapuerca and also with the current ecosystem of the Kruger National Park (South Africa). From the PB values, estimates of the density (ind/km²) and population size of the CdC human groups were made, and a great similarity with the values of present-day hunter-gatherer populations was observed. These approximations allow us to conclude that the CdC ecosystem could have had sufficient animal resources to stably support a Neanderthal group of approximately 28 individuals in the Upper Valley of the Lozoya River.

952 GLOBAL FISHING IN THE NORTH ATLANTIC. BASQUE FISHERIES IN CANADA AND IRELAND AND THE OUTLANDS

Abstract theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Abstract authors: Escribano-Ruiz, Sergio (University of the Basque Country (UPV/EHU))

Abstract format: Poster

Since the Middle Ages, Basque society have been involved in deep-sea fishing in the North Atlantic. The first known experiences along the British coasts soon spread to North America and then moved to Greenland. The new lines of research developed from archeology are calling for a history of fisheries that surpasses the traditional economic and Eurocentric vision that emanates from traditional historiography. In this poster we will try to represent how the mobility paradigm may be applied to the Basque fisheries of the North Atlantic and how it depicts its development within a clear capitalist scheme, aspects that are not thematically far from traditional historiography but that will be considered according to recent theoretical frameworks. Thus, we will claim that these economic models not based on agricultural production, the Outlands, represent the prelude to capitalism. But we will also consider the way in which such a large-scale economic activity affected both local societies and the actors involved.

INDEX OF SESSION & PAPER AUTHORS

The following list contains the names of all session organisers and all first authors of oral papers.

Name	Session ID	Name	Session ID	Name	Session ID
