ISBN 978-80-88441-08-3 30th EAA Annual Meeting (Rome, 2024)

CONTENTS

Session & Paper Abstracts	16
13. Amphibious Archaeology, Waterscapes, and Fluidity	17
15. United Europe of Things? Materialities Creating Medieval Ritual Landscapes (c. AD 1000-1550)	22
18. Fish * Forms * Functions: The Importance and Societal Role of Aquatic Resources in Prehistoric Societies	29
33. Earthen Architecture and Its Environmental Dimension, from the Past to the Future.....	35
34. Archaeology, Landscape and Skyscape. How Material Archeology Change and Persist with Different Ontological and Epistemological Interpretations.....	41
37. Landscapes of Sustainability: Resource Exploitation in the Mediterranean	44
42. Europe-South Asia Relations in the Medieval and Modern Periods	49
57. What Do We Need to Know to Understand Stone Age Migration and Mobility?	52
58. Archaeologies of Global Outlands. Non-Agricultural Economies and Interconnected Societies	56
63. Shifting Focus: The Cultural Context of Figurines in the European Neolithic	58
72. Biological Anthropology Insights into Behavioral and Cultural Changes	63
74. Establishing a Socio-Political Bioarchaeology in Historical Times: Impacts of Status-Quo Transitions on Lifeways and Deathways in the Mediterranean Southern Europe.....	68
76. Exploring Sounds and Music in Archaeological Landscapes	72
83. What's Going on with Finder-Collectors where You Are?	77
85. Trade Hub? Safe Haven? Ritual Centre? The Role of Ditch Systems and Central Sites in the Neolithic	80
88. Colonizing the New World: The Impact of Roman Imperialism across the Atlantic	85
92. Stable Isotope Analysis of Central and Eastern European Skeletal Remains	88
93. Post-Earthquake Scenarios in the Classical and Medieval Periods. Archaeoseismology as a Tool for Investigation on an Urban and Architectural Scale	97
95. Second Millennium BCE Burial Practices in the Central and Eastern Mediterranean from an Interdisciplinary Perspective	101
104. Zoochanges: Animals as Proxies during Periods of Transition and Change	109
105. How Were Medieval Towns in Europe Formed? Urban Settlements Between the Early and the High Middle Ages.....	119
120. Divide and Conquer? Advancing Multiscale Theoretical Frameworks for Archaeological Ceramics in Northwestern Europe.....	122
122. Indicators of Nonprivileged Populations from Funerary Contexts: Multidisciplinary Approaches to Assessing Disparities in Past Populations.....	125
135. All in One Breath: (Bio)Archaeological Approaches to Respiratory Diseases	130
139. Understanding the Broader Picture: Multi-Site and Longue Dur?e Approaches to the Study of Recycling, Repair, and	

Secondary Use in Antiquity.....	135
143. ResourceCultures - Socio-Cultural Dynamics and the Use of Resources	138
151. The Beasts Among Us: A Closer Look at Synanthropic Human-Animal Relations in the Past	141
157. Multidisciplinary Approaches to Human Behavior and Environmental Dynamics of Late Early Pleistocene and Middle Pleistocene Europe.....	145
160. Mysterious Mud: A Transversal Approach to Interpreting Unsolved Earthen Remains.....	151
173. Early Careers on the Roman Frontiers ? Connecting People, exploring innovative methods, advancing interdisciplinarity.....	155
182. Invisible or Hard to See: Non-burial Treatment of the Dead in the Archaeological Record	158
184. Archaeology of Foodways: Towards a Cross-Cultural Comparative Perspective	165
188. Cult Practices in the Ancient Mediterranean: Mobility, Changes, and Persistence	173
192. Frontiers of Heritage: Cultural Landscapes, Community Interactions, and Methodological Approaches	177
207 .. Divided by ?Facts?: Re-thinking the Challenging Relationship between Ancient Written Sources and the Archaeological Record through Telling Case Studies.....	179
209. Not Another Session on Ethnicity! Replacing Ethnic with Other Types of Group Identities	183
210. Breaking Traditions: Sudden Change and Abandonment in Archaeological Landscapes.....	187
217. Materialising the Invisible. The Analysis of Rural Societies in the Transition to the Early Middle Ages in the Iberian Peninsula.....	190
223. Monumental Issues: Archaeological Approaches to the Public Materialities of Contested Pasts.....	194
226. Maritime Heterotopias: Novel Insights into the Archaeology of Maritime Cultural Landscapes in the Mediterranean and Beyond.....	197
240. Megaliths and the Community: Opportunities and Challenges of Community Engagement in the Management, Public Presentation, and Protection of Neolithic Landscapes.....	203
247. Essential or Essentialist: Sex and Gender Categories in Archaeological Interpretation.....	206
248. Lithics, Fauna: Let Them Refit!	206
301. What Is a Village? Collective Action, Settlement Patterns and Rural Communities	215
302. Luxury - Standard - Poverty: Archaeology of Quality of Life in Medieval and Early Modern Towns	221
306. Phoenician and Punic Archaeology in Europe (and Beyond): Receptions, Heritage, and Projects.....	226
327. Human Influence on Coastal Paleoenvironments: A Geoarchaeological Perspective of Human-Environmental Interactions from the Quaternary to the Anthropocene	232
330. Textile Records: Past, Present and Future of Textile-Related Artefacts Recording in the Mediterranean and beyond..	235
331. Across Deserts and Seas: Tempos and Modes of Neolithization in the Horn of Africa and the Arabian Peninsula	241
332. Change and Persistence in the Transition from Late Hellenistic to Early Roman Imperial Times in the Eastern Mediterranean	244

334. Ethnographic Analogy and the Pleistocene Archaeological Record: Re-assessing Potentials and Pitfalls	246	
336. Burial after the End of the World	250	
340. Aftermath of War: Precarity and Consequences of Armed Conflicts from Prehistory to Early Modern Period.....	256	
354. Scene City. Settlement Aggregation and Community Transformation in the Built Environment of the Eastern Mediterranean between IV-II Millennia BC.	264	
355. Ochre and Culture: The Odyssey from Exploitation to Societal Significance	267	
359. The 4th and 3rd Millennium BC Steppe Impact on Prehistoric Europe	273	
360. The 4th and 3rd Millennium BC Steppe Impact on Prehistoric Europe Part 2.....	280	
364. Modeling Pleistocene Survival Dynamics: Ecology, Energetics and Evolution	284	
369. Animals in Bronze Age Europe: New Perspectives.....	287	
374. From Lab to Field, from Vertical to Horizontal. New Approaches to the Use of Portable X-ray Fluorescence (pXRF) in Archaeology.....	292	
381. Capacity Building for FAIR Data Sharing and Digital Preservation	297	
387. Archaeology & the Global Middle Ages: Opportunities, Challenges, and Future Trajectories.....	304	
390. Modelling connections: new methodologies to understand human mobility, route networks and land use.....	308	
393. Continuity and Change in Ritual Landscapes Dynamics: Reuse and Transformation of Prehistoric Ritual Places	315	
395. Old Stories and New Data on Slavs. How to Interpret the Genetic, Linguistic and Subsistence Shifts in Early Medieval Europe?	322	
396. Exploring everyday domestic life: from the Neolithic to the early modern period	327	
398. What Do Animal Bones Have to Offer? Zooarchaeology and Taphonomy during the Middle to Upper Palaeolithic Transition in Southern Europe	333	
406. Doing Good with Archaeology?: Social Sustainability and Activistic Practices to Transform People's Lives and Support Flourishing Communities.....	338	
408. Crafting Iron Age Societies: Can Creativity, Technology, or Typology Highlight Human Past Transformations?	344	
409. Out across the Sea: Bell Beaker Maritime Connections and Networks in the Mediterranean	348	
411. What Are the Next Challenges for the Professional Ethics of Human Remains?	353	
417	Hispania and the Mediterranean: New Approaches to the Analysis of Sea-and-Inland Networks (3rd c. BC-7th c. AD).....	354
426. When Geophysics meets Archaeology: examples from Cultural Heritage to Rescue Archaeology	358	
430. Current Trends and Future Directions in Quarries and Rock-cut Sites Studies: Theory, Method and Dissemination ...	365	
432. Residential Building Techniques with Wood and Daub in Prehistory: What We Find and What We Reconstruct.....	367	
433. Enclosed Societies: prehistoric ditches of Southeast Europe and the adjacent areas	374	
438. In spe resurrectionis. The multidisciplinary approach to crypt burials in early Modern Europe.....	378	
439. Interdisciplinary and Multiscalar Approaches to Bioarchaeology in the Danube Provinces of the Roman Empire.....	382	

446. The Grand Tour between Tradition and Transformation: Narratives, Presentations, and Representations.....	385
452. Coastal Technology among Stone Age Hunter-Gatherers and Early Agropastoral Communities.....	390
460. Alternative paths to complexity: new perspectives on Late Bronze Age and Iron Age centralisation in the Mediterranean.....	393
463. Methods of Analysing Subsistence Resources, Landscape Management and Exploitation Practices between the Bronze Age and Iron Age.....	396
466. Facilitating Public Engagement and Participation in Development-led Archaeology.....	401
468. The relationship between rural settlements and the territory during the Roman period and Late Antiquity.....	403
470. Bridging the Walls: Comparative Perspectives on Fortified Settlements.....	407
472. Archaeologies of Climate Change?: Current issues and future directions.....	415
482. "Past Is Not Past". Environmental Effects of Past Land Use on Present Resources Ecology. Environmental Archaeology betw. en Research and Application.....	423
484. Archaeologies and Heritagizations of Historic and Contemporary Violence.....	426
492. Assessing Damage Caused to Archaeological Heritage: Expectations and Reality.....	431
493. Animals mediating the real and imaginary: In Search for New Understandings of Human-Animal Relationships.....	436
496. From Micro to Macro: Integrating Micromorphology and Microcontextual Analyses for Archaeological Insights.....	445
497. Food Storage and Security in Prehistoric Europe.....	452
498. Refuse in Context: Archaeology of Waste Management Practices in Ancient Mediterranean Urban Settings.....	457
499. Neutrons and Synchrotrons in Heritage Science: New Methods, Techniques, and Their Impact on Archaeology.....	459
502. Advances in Japanese Archaeology.....	462
505. Ethnographies of Makers and Making: Traditional Craft and Technology in Contemporary Societies.....	467
510. Rome's Place in an Eponymous Empire.....	473
514. Applying Archaeological Research Software Engineering as Little Minions: Statistical & Computational Approaches to Daily Archaeological Tasks.....	477
517. BC_Before Church. Cult Buildings in Ancient Mediterranean Europe. Session 2: Hut - Temple - Church (Xth BC - IIIrd-IVth AD).....	481
520. Persisting and Changing Work Identities from the Prehistoric to the Hellenistic Mediterranean.....	485
522. Society in the Medieval Mediterranean (5th to the 12th Centuries) through Archaeology of Death.....	488
525. Exploring Dental Pathologies and Diet Across Time and Space: An Interdisciplinary Approach.....	491
531. Making Connections: Towards Archaeological Narratives in Contemporary Society.....	496
533. Forensic Archaeology: The Important Role of Archaeology in Legal and Humanitarian Investigations.....	501
538. Contacts, Movements, Migrations in the Viking Age: Maritime Aspects of the Norse Expansion into the North Atlantic.....	505
542. Medieval Sensorium: Exploring the Archaeology of the Senses.....	505

544. New Directions for Metric and Nonmetric Biodistance Analysis in Europe and Beyond.....	508
548. "Land ahead!" Islands-Mainland Mobility across the Mediterranean in Prehistory.....	511
549. Interdisciplinary Approaches to the Middle Paleolithic Record of the Balkan Peninsula.....	515
553. Advancing Paleolithic Intra-Site Spatial Analysis: New Methods, Applications, and Interpretation.....	518
556. Exploring Ancient Solutions for Modern Challenges: Archaeological Insights into Food Systems and Adaptations to Changing Environments.....	525
557. New Frontiers in Stable Isotope Research of Bioarchaeological Remains: Progress and Pitfalls.....	531
559. The Mediterranean(s) in Transition: Global Permanence(s), Material Culture(s), and Resilience between 5th and 10th Century AD.....	539
566. Multiple Scales in the Manifestations of the Islamic.....	542
569. Unearthing the Echoes of Violence.....	546
571. Debating Best Practices and New Approaches for a Sustainable Study of Rock Art.....	549
575. Abandonment and Opportunities? Responses to the Late Medieval Desertion.....	555
577. Following the River: Flowscapes as Clusters of Communication in the Ancient Mediterranean World.....	557
579. Digital Approaches in Textile Archaeology from the Field to the Museum.....	561
588. Studies of Migration Period and Early Medieval Populations: Integrating Natural Sciences and Humanities.....	562
591. Beyond the Walls. Interrogating the Wider Landscapes of Iron Age Communities in Temperate Europe.....	569
592. Decision-making and Assessing and Articulating Archaeological Significance.....	572
593. Whither Evolutionary Archaeology?.....	575
594. "All Roads Lead to the South", Facing the European Palaeolithic from the South of the Iberian Peninsula.....	576
595. The Living Heritage: Archaeological Cultural Routes in the Context of Cultural Tourism Networks.....	581
597. Migration and the Making of the Ancient Greek World.....	587
598. The Archaeobotany of Cities and Urban Landscapes.....	589
600. Churches as Resources for Society? Co-Creating Knowledge and Capturing Social Value.....	596
613. Making the Most of What We've Got: Activating Museum Collections, Monuments and Built Heritage.....	598
615. Archaeology of Archaeology?.....	608
616. Whose Heritage? Migration and Heritage: Problem or Opportunity?.....	612
617. From Lots of Data to Big Data: Strategies for Quality, Reusability, and Accessibility of Databases.....	614
626. MERC Forum. Standing Ruined Buildings in Large Cities: A Burden or a Resource for Society?.....	619
627. More than Fire: Investigating Pyre Technology in Experimental and Archaeological Cremations for Understanding the Burning Conditions.....	620
629. Living Through Crisis: Urban Household Archaeologies in the Medieval World.....	626
631. "A Day without Pottery Is a Day Wasted" - Pottery Technology and Manufacture.....	629
632. Multiscalar Methods for Studying Ancient Landscape Developments and Settlement Dynamics in the Classical World.....	

between Archaeology and Heritage Management.....	634	731. Changes in Life, Changes in Death: An integrative Approach to the Neolithic Transformations in Southwest Asia.....	766
637. Unveiling Eurasia's Prehistoric Techniques through Use-Wear Analysis.....	639	732. Wetland Archaeology: Advances in Practice and Policy in the 21st Century	772
638. Symbolism and Society during the Late Prehistory of Western Europe: Megaliths and Hypogea as Case Studies.....	643	733. Interdisciplinary Approaches to the Archaeology of Roman Textiles - A Story Told Through Threads	776
643. The Experience of Stone II: Sculpting Comparative Phenomenologies.....	647	735. Post-medieval cemeteries on the focus - Anthropological and archaeological studies about the past 500 years.....	781
644. Mobility and Territoriality in Pre-Roman Italy: Routes, Objects, Ideas.....	650	736. Interdisciplinary Trajectories in Mortar Analysis of Historical Buildings.....	787
646. Exploring Traumatic Injuries Leading to Disability in the Pre-antibiotic Era: A Multidisciplinary Approach.....	655	737. Computational Landscapes: Debating Fundamental Issues of Archaeological Narratives.....	792
647. Trajectories of AI in Archaeological Heritage: Geographies, Innovations, Future-Making, and (In)Justices	659	738. Reclaiming Herstory: Women in Mediterranean Archaeology from the 18th Century to Today.....	795
648. Workers of the Past Unite! Labour studies today: a reflection on the potentialities and limits of the approach	661	739. Analysing the City. Archaeological Science Approaches to Urbanisation in the Mediterranean (1000-500 BCE).....	799
650. Disappeared and Forgotten: Nazi Concentration Sub-camps, Forced Labour Camps, and Other Types of Camps as Neglected Archaeological and Heritage Sites.....	664	743. Isotopic Baselines and Beyond: Expanding Archaeological Narratives and Reevaluating the Use of Baselines in Isotope Bioarchaeology.....	806
653. Infectious Disease and Hygiene in the Neolithic and Bronze Age.....	668	745. Remote Sensing of the Changing Mediterranean, Middle East and North Africa Region.....	811
654. Centering the object: between production and consumption in ceramic studies.....	672	771. Heritage Beyond Consumption: A Call for a Collective Discussion	817
657. Teaching and Learning Archaeology with Digital Tools.....	676	772. Embracing Transdisciplinarity: Multiple Ways of Seeing the Past through Different Ontologies.....	817
661. On Fire! Ancient Pyrotechnologies in Productive and Ritual Eastern Mediterranean and Near Eastern Contexts.....	681	775. Exploring Dates-as-Data Approaches: Theoretical Promises and Methodological Problems.....	821
664. Archaeological Heritage Management: Processes and Models for Comparison.....	685	776. Plaster a Multipurpose Material for Binding Knowledge	825
666. The Impact of Digital Methods in Bioarchaeology and Paleoanthropology: Innovative Applications and Technological Advances.....	691	784. Demand for Salt: from Prehistory to the Early Modern Period	828
669. Ottoman-Era/ Historical Archaeology: Materials and Methods in Context.....	696	787. Artists and Craftsmen. Multidisciplinary Approaches in the Analysis of the Production of Early Medieval Wall Paintings.....	831
676. Pots in Transition: Resilience, Change, and Revival in Central Asia and Its Neighbourhood from the Perspective of Ceramics Research	701	789. Sharing, Merging and Analysis of Noninvasive Archaeological Data: towards a MCSA Doctoral Network.....	837
679. Gender and Sexualities in Material Culture of the Ancient World.....	706	790. The (Copper) Age of Transformation: Research Developments on c. 4500-3500 BC from around the Carpathian Basin	837
695. Destruction, Burial or Just Fading away. Roman Case Studies on the De-sacralisation of Religious Sites and Material Culture in Antiquity.....	711	793. Lithic Raw Materials Lithotheques: Open Access and Interoperability Initiatives.....	841
696. Preventive Archaeology in Europe: Context of Exercise, Methods and Working Conditions	714	794. Old Excavations and Finds, New Data and Interpretations: The Use of Archives in Current Archaeological Research Projects	847
697. Human-Environment Interactions in European Calcareous Landscapes during the Pleistocene and Holocene	720	797. Best Practices on Archaeological 3D Data Management: Methods and Approaches to Capture, Generate, and Disseminate 3D Information in Archaeology.....	854
699. Tracing Ovicaprines Lives: Bioarchaeological Perspectives on Sheep and Goat Husbandry	723	799. Elevating the Elders: (Re)Centering Older Adults in Bioarchaeology.....	859
704. Bioarchaeology of Ancient Pathogens	730	802. From Prehistory to Post-medieval Times: Persistence and Change in Artisanal Production across the Mediterranean.....	863
708. Digital Dissemination: Using New Tools to Communicate with Stakeholders.....	736	803. Dynamics of Ownership and Transformation of Urban Spaces in the Roman Era.....	869
709. Ties That Bind: Community, Ecology and Challenges of Scale	739	804. Make Dolia Great Again - Comparative Perspectives on Ancient Clay-jar Winemaking.....	873
710. Around the Black Sea: Resilience and Mobility in Prehistory.....	742	811. Bridging the Wall between Prehistory and the Present: Communication and Inclusiveness in the Realms of Science, Heritage and Education	877
717. Interwoven. Textile Exchanges Across the Mediterranean from Prehistory to Us	745	814. Materialising Meaning. Centering the Role of Social Interactions in Archaeomaterials Studies	884
723. Egyptian Blue - From Literature to the Artifact to the Lab.....	749	818. Current Status and the Future of Digital Archaeology in the Eastern Mediterranean	891
727. The Roman Economic Mosaic: Exploring the Complexity of Economic Dynamics during the Roman Empire.....	755	819. Network of European Identities ? The Iron Age between Alps, Pannonia and Balkans.....	894
729. Recent Advances in Documenting the Archaeology of Caves and Their Environments.....	761		

833. Adriatic Bridge - Unravelling political, social, and cultural transformations in the Adriatic-Ionian, and Balkan region in the last millennium BC.....	900
834. Women through the Ages: Roles, Rituals, and Research through the Lenses of Archaeological Sciences	906
835. The Horse in Archaeology: An Interdisciplinary Approach for Uncovering Relations between Horse and Humans in the Past.....	914
838. Community Engagement in Archaeological Heritage: Best Practices, Objectives, Conflicts, and Plans for the Future.....	923
842. Continuity in Change: Environmental, Cultural, Social and Material Evolution in Ancient Arabia	924
843. The 'Data Rush' - Adapting to the Consequences of Increased Quantities of High-quality Data in Archaeological Research.....	930
845. Trans-Adriatic Dynamics: Late Bronze to Early Iron Age Matt-Painted Pottery in the Southwestern Balkans and Southern Italy	933
848. The archaeogenetics of ancient Italy: socio-cultural changes, interaction and mobility from Prehistory to the Middle Ages.....	938
849. Zooarchaeology in Transition(s): Subsistence Patterns, Cultural Changes and Continuity in European Prehistory through Old and New Tools.....	947
852. Manufacturing Memory. Past Mnemotopoi and Present Map-making in the Quest of Collective Memories	955
854. Building Bridges: An Open Forum for Archaeology and Metagenomics.....	961
856. So Falls the World: Archaeology and Heritage against Empire(s)	967
857. Persistent signs on surfaces: the innovative use of Visual Archaeology techniques in investigating voluntary and crafting marks	971
860. Going with the Flow: The Many Facets of Glass in Past Societies	975
861. Insects for Archaeology, Archaeology for Insects: Environmental Storytellings for the Past, Present, and Future	981
862. Archaeological Heritage ? Diversifying Approaches of Cooperation with Non-European Partners	986
863. The Lives and Afterlives of Megaliths: Dialogues of Persistence, Reinvention and Change.....	990
866. Current Research in the Americas. Interdisciplinary Research between Past and Present.....	994
870. Prestige and Luxury Goods: A Material Approach to Gift Giving as a Tool for De-Escalation.....	1003
871. Not Just Wear: The Synergy of Trace Analysis with Other Disciplines and Non-Invasive Techniques in Archaeology..	1006
880. PARIS or Paradigm Shift	1014
882. Synthesis, Facilitator or Hindrance: Should Synthesis Be Part of Commercial Archaeology or Left to the Academics?.....	1018
884. Transfer and Reception of Public and Private Architectural Types in the Coastal Settlements of the Mediterranean Basin	1020
886. The Archaeology of Mass Graves: New Approaches	1024
888. From Material Landscapes to Cognitive Landscapes	1028
893. Professional Archaeology in Europe: The State of the Issue	1028

895. Perceiving and Shaping Landscapes.....	1030
901. Understanding the Research Process as a Cha?ne Op?ratoire	1035
902. Archaeology of Wilderness: Humans, Animals and Landscapes throughout the Holocene.....	1037
903. 'What Does Pottery Tell Us??' Interpreting the Neolithic Lifestyle in the South of Europe: Traditions, Cultural Identity and Interactions.....	1045
904. Mobility, movement and interaction in the ancient world: New Avenues of Interpretation	1048
905. Modernity as a Colonial Process from within: The Material Impact of Industrialization on European Societies	1054
909. Integrating Data on Ancient Wine and Oil Presses: Challenges and Interpretative Potential.....	1057
915. 3D Heritage. Digital Humanities for Documentation, Analysis, and Dissemination of Material Culture.....	1061
916. Integrating Neandertal Legacy: From Past to Present. From Science to Society.....	1068
918. Public Benefit: Sharing, Critiquing, Brain-Storming and Blue-Skying Experience and Ideas to Help Archaeology Benefit Wider Society in the Future	1073
923. Metals and Metalworking I: Compositions and Origin.....	1077
924. Roads, Passes and Valleys ? Recent Discoveries and Perspectives in Caucasus Archaeology.....	1081
926. Bridging Past and Present: Exploring Collaborative Approaches in Community and Citizen Archaeology	1086
927. Reflecting History in Architecture and Vernacular Design ? Directing Sustainable Futures	1090
928. Why We Should Persist in Making Archaeology Accessible and Inclusive to All?.....	1093
929. What Is the Village? Regional Comparison of Early European and Near Eastern Prehistoric Villages	1093
930. Barbarians at the Gate or Behind the Gates? The Collision of the Material Cultures of the Invader and the Invaded..	1096
931. Tracing Human Stories through Stable Isotopes: Unravelling the Dynamics of Health and Identities.....	1099
932. Continuity and Change in the Wagons and Chariots of Later Prehistoric Europe and Eurasia	1105
934. Sacred Landscapes in Context: Creation, Development, and Conceptualisation	1108
936. Towards the living city through time: Interdisciplinary approaches to ancient civilisations of Central Italy	1113
938. The Archaeology of Ancient Borderscapes: Multiple Approaches, New Paradigms.....	1117
946. Ritualism and Funerary Practices in the Mediterranean Basin: Objects, Symbolism, Inputs, and Resilience.....	1125
950. Trade in Metals from the Bronze Age till Early Modern Times between the Carpathian Basin and the Northern Adriatic.....	1130
957. Destroyed, Submerged, and Unreachable: The Challenging Interpretation of Human Strategies across Lost Landscapes.....	1134
965. In-Situ Sensing of (Geo-)Archaeological Soil and Sediment Archives: Emerging Methodologies and Applications	1136
971. Health of Laboring Communities across Geographies of Work	1141
973. Pyroarchaeology: Fire-Related Engineering, Environment and Cultural Proxies.....	1144
974. Metals and Metalworking II: Production and Technology.....	1149

975.....Baskets and Their Belongings: Archaeobotany and Conservation of Vegetal Basketry Objects and Their Vegetal Content	1155
978. The Role of Public Archaeology in Heritage Management	1159
982. Tracing & Protecting: Facing the Shadows of Illicit Trafficking in Cultural Goods	1163
984.Archaeology and Anthropology, two approaches one goal: insight into life and death from the 3rd to 7th century CE.....	1167
987. The Introduction of Tin Bronze in Prehistoric Europe.....	1171
988. Through the Lens of Pottery: Technologies in Times of Change in Prehistoric Mediterranean Basin.....	1174
995. Sense and Sustainability in Foraging Communities.....	1182
997. Chaîne OpÉratoire and Life Cycle of Protohistoric and Ancient Building Materials.....	1184
1000. Advanced Methodologies for Life History Reconstruction in Bioarchaeology.....	1190
1004. Tracking the Life History through the Microarchitecture of the Human Bone	1202
1008. Food Processing and Cooking Practices in Europe, North Africa, and Western Asia (Neolithic to Iron Age).....	1206
1009. Beyond the lens: contemporary methods and interdisciplinary synergies in archaeobotany	1216
1011. Investigation of Neolithic Lithic Technology and Experimentation: An Approach to Technical Variability.....	1222
1013. Funerary Rites in European Prehistory: Knowledge Transfer in a World of Worlds	1225
1015. Eternal Rest in the West: Funerary Contexts in Western Mediterranean Protohistory	1231
1016. Intra-Murial Burials and Their Cultural Landscape in Europe and the Mediterranean from Prehistory to the Middle Ages.	
1234. 1018More than Just Data: The Role of Archaeological Theory in Refining Geoscience-driven Research Questions.	
1237	
1021. EAA Community for Climate Change and Heritage (CCH) Roundtable	1239
1022. Rethinking Ancient Mediterranean Incarceration and Exile.....	1240
1023. Connecting through vitreous materials: multidisciplinary approaches to Mediterranean networks in the 2nd-1st Millennium BCE	1242
1024. Understanding Behavioural Changes through Material Studies - Adaptation and Social Complexity of the Homo Sapiens	1246
1027. How to Hunt? How to Herd? New Approaches to Old Questions on Human-Nonhuman/Animal Entanglements ...	1251
1029. Changing Perceptions on Tile, Brick, and Architectural Terracotta ? New Results and Directions in Research.....	1254
1030. Surveying in Archaeology in the Digital Era: Rethinking Old Procedures and Imagining New Standards.....	1258
1033. Choosing the Right Cup for the Job: Functional and Non-Functional Consumption Habits.....	1264
1040. Tracking the Urban DNA. Unravelling the Rise and Fall of Towns and Cities	1267
1043Out of Neglect, into the Spotlight. Strategies and Good Practices for Rediscovering Sites with Troubled Histories.....	1269
1044What a Waste! ? The Epistemological Value of Refuse and Discarded Materials in the Current Archaeological	

Research	1277
1046. Evolutionary Approaches to Archaeological Questions: Human Behavioral Ecology and Cultural Transmission	
Theory	1282
1048.Antiques, Heirlooms, and Memorabilia: The Relationship between Portable Objects and Memory in the Ancient World.....	1287
1049. Til Death Do Us Part. Revisiting the Question of Double Burials.....	1290
1050. Redefining Abandonment: Geoarchaeological and Ethnographical Approaches to Unveiling Hidden Narratives	1297

13 AMPHIBIOUS ARCHAEOLOGY, WATERSCAPES, AND FLUIDITY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Nabais, Mariana (IPHES) - Crutcher, Megan (Texas A&M University) - Casimiro, Tânia (NOVA University of Lisbon) - Gabriel, Sónia (BIOPOLIS-CIBIO-InBIO)

Session format: Regular session

Water covers most of the planet's surface, and aquatic ecosystems have been important for humans throughout all times. Archaeologists working in aquatic environments tended to solidify the fluid boundaries of land, sea, and shore. But what if land, sea, shore, the object, and the human were actually inextricably bound up in one another, making such divisions far less relevant? By blurring these ideological fields, we can better understand how territories and environments are permanently changing. Humans are amphibious creatures and these ecosystems—whether beaches, dune belts, coastal lagoons, alluvial plains, river terraces, estuaries, lakes, underwater, or oceans—have been essential to our cultural development. Fish, shellfish, aquatic mammals and aquatic plants have been staple foods. Rivers, lakes and oceans served as natural highways facilitating transportation and exchange of goods, ideas and people. Human occupations near waterlines have also been the most affected by climate change and shifts in sea levels, providing great insights into adaptation to environmental conditions. The purpose of this session is to encourage discussions in fluidity, amphibiousness and hybridity in archaeology. We welcome papers on archaeological, ethnographic and experimental case-studies, waterscapes, maritime and nautical archaeology, innovations in theory, methodologies and the arts, from prehistory to the present.

ABSTRACTS

1 BIRDS EXPLOITATION IN EEMIAN WETLANDS OF NORTHERN FRANCE

Lebreton, Loic (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - López-García, Juan Manuel (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Antoine, Pierre (UMR 8591 CNRS-Univ. Paris I-UPEC, Laboratoire de Géographie Physique, Environnements Quaternaires et actuels) - Auguste, Patrick (CNRS, Univ. Lille UMR 8198 - Evo-Eco-Paléo) - Deschodt, Laurent (UMR 8591 CNRS-Univ. Paris I-UPEC, Laboratoire de Géographie Physique, Environnements Quaternaires et actuels; Inrap, Institut national de recherches archéologiques préventives) - Locht, Jean-Luc (UMR 8591 CNRS-Univ. Paris I-UPEC, Laboratoire de Géographie Physique, Environnements Quaternaires et actuels; Inrap, Institut national de recherches archéologiques préventives, Nord-Picardie) - Hérison, David (CNRS-UMR 7041 ArScAn, équipe AnTET, MSH Mondes)

Recent discoveries have brought back into perspective the importance of bird exploitation during the Middle Palaeolithic. These findings demonstrate the interest of human groups in birds whether for meat exploitation or for inedible parts such as talons or feathers. They also highlight the ability of human groups to maximise the use of the resources available in their environment. The exploitation of birds to obtain non-food products is mostly documented from the end of MIS5 'Rufà et Laroulandie, 2021.

Recent excavations at Waziers and Caours sites have revealed Neanderthal occupation in Northern France during the Eemian. Thanks to their exceptional state of preservation (peat for Waziers and calcareous tufa for Caours), these sites have yielded well-preserved faunal remains, enabling us to understand the exploitation strategies of these human groups in the context of these humid environments. Both sites have yielded bird remains, particularly waterfowl, showing signs of human exploitation. The exploitation of this resource highlights the ability of these Neanderthal groups to adapt to the diversity of resources present in different environments.

2 ABOVE AND BELOW THE WATER LINE: AMPHIBIOUS APPROACHES TO ARCHAEOLOGY IN THE NORTH AMERICAN GREAT LAKES

Lemke, Ashley (University of Wisconsin Milwaukee; Advisory Council on Underwater Archaeology)

One of the most significant planetary changes since the Pleistocene has been fluctuating water levels. Changes in sea level have been documented for the last two million years, but particularly since the last glacial maximum, vast landscapes were once exposed and are now submerged. Paleoenvironmental research and modeling of submerged landscapes has shown that they were productive habitats, and underwater archaeological investigations at these locations reveal complex mosaics of plant, animal, and human communities. While large-scale fluctuations in water level characterize the continental shelf, they were also present in large inland lakes. For example, the immediate post-glacial

history of the Great Lakes is characterized by a series of high and low water stands regulated by the interaction of early Holocene climate, the flows of glacial melt waters, the isostatic rebound of recently deglaciated land surfaces and the activation of new hydrological outlets. The most extreme low water stand in the Lake Huron basin (Lake Stanley) saw water levels drop as much as 130 meters. Lake Stanley presented a radically different environment than present and archaeological research below the lake has documented a unique record of hunting sites and lithic artifacts. This paper will explore lifeways of hunter-gatherers in the Great Lakes region across the Lake Stanley time frame (11,500–8,000 cal yr BP) in an amphibious fashion, moving between and connecting terrestrial and underwater archaeological evidence. Waterways have connected people to places for millennia and this regional case study offers new insights into forager niche construction and resilience in the context of immense environmental and climatic change.

3 REVIEW AND PROSPECTS ON THE NEOLITHIC PILE DWELLINGS RESEARCH IN SAVOIE ALPINE LAKES (FRANCE)

Brigand, Robin (Service Régional de l'Archéologie, Ministère de la Culture, Lyon; UMR 8215, Lab. Trajectoires, Paris) - GORIN, Camille (Service Régional de l'Archéologie, Ministère de la Culture, Lyon; UMR 7041, Lab. Arscan, Nanterre)

In 2011, several underwater archaeological sites located in French Alpine lakes, were added to the World Heritage List. This recent UNESCO classification represented a turning point in the research history of prehistoric and protohistoric lakeshore settlements. Indeed, starting from 2015, a 16 months monitoring were conducted by Y. Billaud (DRASSM) and spread over 4 years. It involved 45 sites in the French lakes, including 9 UNESCO-listed pile dwellings and 4 others classified as historical monuments, as well as 24 other located in their buffer zones. These archaeological surveys contributed to the elaboration of an overview synthesis (in 2017) compiling the available planimetric and chronological data on the Neolithic pile dwellings of French lakes (Brigand, Billaud 2021). Since 2017, extensive fieldworks were conducted on the Neolithic site of Beau Phare (Aiguebelette lake). Moreover, latest studies on the Annecy lake showed the archaeological implications of lake-level fluctuations (dir. Magny, Vérot). These recent works has pushed research into Neolithic pile dwellings in the French Alps even further and increasingly raises the question of their long-term preservation, in the context of climate change. The aim of this contribution is to build a synthesis of the available planimetric and chronological data regarding Neolithic pile dwellings in the French lakes. Using exploratory data analysis and GIS spatial analysis, the goal is next to model the vulnerability of lakeshore sites and to prioritize the action to be taken to ensure their conservation. Based on this documentation, it will eventually be possible to consider a long-term strategy for the study, the conservation and the cultural mediation of Neolithic pile dwellings. Finally, in a context of global warming, leading to inevitable erosion of the lake's cultural heritage, it is necessary to take action and to initiate new research projects to preserve pile dwellings sites on Alpine lakeshores.

4 SKIN BOATS IN THE BALTIC SEA? EVALUATING THE MARITIME MOBILITY OF THE PITTED WARE CULTURE

Fauvelle, Mikael (Lund University) - Horn, Christian (University of Gothenburg) - Alfv, Jacob (University of Gothenburg) - Artursson, Magnus (University of Gothenburg)

The Pitted Ware Culture (PWC) dominated the Baltic Sea and the Kattegatt Sea during the second half of the Early Neolithic and Middle Neolithic, c. 3500-2300 BC, gradually occupying the coasts of central and southern Sweden as well as major islands and archipelagos including Åland, Gotland, Öland and Bornholm, and parts of eastern Denmark and Jutland. Long known as proficient fishers and seal hunters, recent archaeological work has documented long-distance over-water connections between PWC communities, suggesting that the PWC people were proficient mariners. Very little is known, however, regarding the boats that were used by the PWC to fish, seal, and conduct maritime trade. In this paper we explore different possibilities for PWC watercraft technologies. We argue that several lines of both direct and indirect evidence point to skin boats as the most likely form of watercraft used by the PWC for every-day activities and long-distance voyages. We will discuss the implications of the use of skin boats by the PWC for our understanding of the political and economic landscape of neolithic Scandinavia.

5 CONNECTING FARMERS AND FISHERS: EXAMINING POTENTIAL INTERACTIONS BETWEEN COASTAL AND INLAND LAND USE IN MIDDLE BRONZE AGE SOUTH-EAST IRELAND

Spillane, Ben (University College Cork) - Howle Outlaw, Carolyn (Mizen Archaeology)

Thirty years of research and development-led archaeological investigation has revealed that prehistoric Ireland was the scene of a complex series of inland and coastal land use systems, food economies and habitation types, all of which could vary regionally and over time. And yet, for an island nation, where maritime activity would have been of significant importance, there is little existing research on potential interactions between inland and coastal land use in prehistory. Rather than viewing inland and coastal habitation as separate spheres of human activity, we argue that both could have been interrelated, with developments in one affecting the other.

We will examine these potential connections in the coastal counties of Waterford, Wexford and Wicklow in south-east Ireland during the Middle Bronze Age (c.1600–1150 BC). In this region, inland land use was comprised of small farmsteads along with Fulachtaí Fia, pyroclastic sites that became increasingly commonplace after 1300 BC. Coastal land use was heavily linked to shell midden deposition. Although the deposition of shell middens had declined nationally during the Late Neolithic (c. 3500–2500 BC), a sharp increase in shell deposits occurred in most regions during the Bronze Age (c. 2100–800 BC), whilst in some areas such as the south-east, they remained a rarity. Though taphonomic processes could explain the lack of shell middens along the south-east coast, we argue that human agency and contemporary developments in inland land use could have also influenced this pattern.

Through an integrated Bayesian analysis of the coastal and inland dating evidence, we will suggest that a growing reliance on transhumance and pastoralism during the 14th to 11th centuries BC, particularly exemplified by Fulachtaí Fia, affected the need for and use of shell middens. Essentially, we will argue that a regional preference for an inland form of land use took precedence over coastal variations.

6 LOST WAX? USING ANCIENT GREEK WARSHIP BRONZE RAMS TO INFER THE EXTENT OF THE BEESWAX INDUSTRY IN THE ANCIENT MEDITERRANEAN

Zak, Claire (Texas A&M University)

Bronze-cast rams affixed to Greek warships are not readily associated with beekeeping. Yet, most metal objects of the ancient Mediterranean world after c. 3500-3000 BC were created using the cire perdue or lost-wax casting method. Considering all of the metal objects from the archaeological record, this technique required an immense quantity of beeswax, necessitating an industry of wax production and by extension, the cultivation of honey bees (*Apis mellifera*). Through the examination of Greek warship's bronze rams, created using the cire perdue process, and archaeological beehives, archaeologists can make inferences about beeswax production and its relationship with ancient navies. The investigation of this topic requires a combination of archaeological material from both terrestrial and underwater sites, and integrated methods of investigation using textual analysis, 3D modeling, experimental archaeology, and statistics. The result of this inquiry demonstrates the necessity to fluidly blend traditionally distinct disciplines and strands of evidence to not only answer new questions but to refresh what questions are asked. This paper presents new research regarding the estimated quantities of beeswax necessary to cast the warship rams and the number of honey bees and beehives required to produce that honey using both rams and beehives found in the archaeological record.

7 WATER AS LEGAL MATTER? AN EXAMPLE FROM THE EARLY MEDIEVAL LAKEBUILDING CALLED THE BULWARK ON GOTLAND

dAgnan, Peter (Lund university)

In the 1130's a vast square wooden platform was erected in the middle of a shallow lake on the island of Gotland in the middle of the Baltic Sea. On top of the platform there was a range of houses built in different techniques. After 100 years of research we still don't know the purpose of this strange place. One hypothesis suggests the site was a juridical thing, where people gathered and came to agreements. The water thus served as a neutral point where peace was absolute.

If the hypothesis is right this artificial island could teach us more of early medieval thought and practice of waters and juridical organization in the landscape. The houses and the way they were built may hold more answers to this fascinating and classical Scandinavian problem. A new research project at Lund university, taking advantage of the latest aids in digital archaeology, aims to answer some of these answers.

8 THE KRAO COAST HERITAGE INITIATIVE: DOING COASTAL ARCHAEOLOGY IN SOUTHEASTERN LIBERIA

Crutcher, Megan (Texas A&M University) - Kondeh, Prince (Independent Scholar; Indiana Wesleyan University)

West Africa remains understudied within the discipline of maritime archaeology. One such area is the West African nation of Liberia, which was settled by African-descended people starting in 1822. Historians of Liberia have tended to focus on the arrival and actions of the African American settlers in Liberia during the 19th century. However, people were living on Liberia's coast for centuries prior to the arrival of the settlers. One of these groups is the Krao, known to most authors as Kru, who became famous in the 19th century for working aboard European and American ships. The Kru trace their origins to modern Liberia's Sinoe County, where the oldest town in Liberian history was marked on European maps as early as 1620—200 years before Liberia's founding as a nation.

Our project, the Krao Coast Heritage Initiative, works alongside communities in southeastern Sinoe County, Liberia on the first amphibious archaeological project in the nation of Liberia. This paper presents preliminary project results in three key domains: Krao origins and migration to the coast during the medieval period; heritage conservation and

maintenance of traditional livelihoods; and the history of Krao maritime labor. These three themes illustrate the longevity of Krao history and the importance of multitemporal approaches in coastal archaeology in West Africa. Emphasizing the broader regional and global significance of these stories, our research is a groundbreaking collaboration with Liberian Kru (Krao) communities for heritage preservation. In addressing the historical exclusion of Krao voices from archival sources, dominated by European perspectives, this initiative becomes an essential step toward a more inclusive understanding of Liberia's maritime heritage. Timely in the face of sea level rise and epistemicide, our project serves as a crucial effort to maintain the landscapes and memories of Krao maritime heritage.

9 OUT OF THE BLUE: REVALUATING PILGRIMAGE FROM A MARITIME PERSPECTIVE IN THE EARLY MEDIEVAL PERIOD ACROSS THE IRISH SEA

Machin, Joanne (University of the Highlands and Islands)

The sea during the Age of Saints in the medieval period, was perceived as a physical periphery and a Christian spiritual margin of dark foreboding despite acting as a conduit for merchants, travellers, missionaries, and pilgrims alike. Traversing the sea affirmed belief, accentuated religious ritual, facilitated social, cultural, and commercial contact by acting as a conduit linking disparate communities and stimulated ecclesiastical and secular infrastructure.

Using a case study area of Galloway in Southwest Scotland, within the Irish Sea Zone, a historical-archaeology multi-disciplinary approach has been devised. The research combines experiential study and phenomenological 'marinimity' to delineate seascape characteristics and sea-to-land perspectives. Amalgamated with research of placenames, written sources, cartography, and material remains these seascape elements provide a fresh perspective to traditional terrestrial-based pilgrimage discussions.

This paper revisualizes the periphery of the sea from the sea, giving a maritime pilgrimage viewpoint. Theorizing how the sea was synonymous with destruction from a theological perspective in the medieval period, embraced maritime pilgrimage and influenced terrestrial pilgrimage routes, respectively. Furthermore, the multidisciplinary methodology provides the detail for the narrative that the case study area contained a spiritual maritime highway where secular and religious sites are purposefully sited within coastal margins of encounter due to peripheral sea characteristics.

10 THINGS UNMOORED: AQUATIC ITINERARIES AND WATERY ENTANGLEMENTS IN SMALL-ISLAND SEASCAPES OF THE EARLY MODERN CARIBBEAN

Antczak, Konrad (Universitat Pompeu Fabra; Unidad de Estudios Arqueológicos, Universidad Simón Bolívar)

This paper follows things – archaeologically recovered artefacts and historically documented commodities – on their aquatic itineraries through the Venezuelan Caribbean during the early modern period to understand how these became entangled with humans through space and time. Such a “following” necessarily entails marshalling a robust theoretical framework that dovetails the concepts of itineraries of things and assemblages of practice, theories of material entanglement, and spatial notions of small-island seascapes to make the best use of the abundant archaeological and archival data available. Here, I reveal how, on the one hand, Venezuelan things such as sea salt, cacao, and coarse earthenwares, and, on the other hand, British things such as ceramics, tea, and rum punch were unmoored by the mobilities potential of the sea and itinerated far and wide, making waves on distant shores. On a deeper level, as they became increasingly unmoored by the sea and entangled with mariners, some new and fashionable things began exerting more magnetism than ever before, entrapping middling seafarers in novel entanglements and making them discerning Atlantic consumers and harbingers of early modern individualism.

11 HUMAN-OCEAN INTERACTIONS PAST, PRESENT AND FUTURE: A TRANSDISCIPLINARY APPROACH

Mooney, Dawn Elise (Museum of Archaeology, University of Stavanger)

Gathered marine resources such as driftwood, seaweed, shellfish, coastal plants, and eiderdown were key elements of past subsistence, but are often overlooked in studies of past human-ocean interactions. This paper presents the project 'Marine resource gathering and infrastructure in the Norse North Atlantic (MARGAIN)', recently funded by the Research Council of Norway's 'Oceans' program. MARGAIN uses historical and ethnographic sources, archaeological survey and excavation, and environmental archaeology to work towards a better understanding of how marine resource use influenced settlement patterns and ways of life in the North Atlantic, from the Viking Age until the early 20th century. Most studies of coastal sites in this region have focused on the development of commercial fisheries, but we aim to examine the coast as a lived space. We move away from conceptualising this region as 'marginal', and towards understanding its centrality to coastal communities, with humans as part of the marine ecosystem. Our focus on interactions between humans, plants and animals in the littoral zone acknowledges that the lived experience of the inhabitants of our sites extended beyond the water's edge, and that their lives cannot be understood without transgressing this (artificial) boundary.

The results of MARGAIN will be used to inform and promote sustainable human-ocean interactions in the present and future. For example, driftwood, which was used as fuel and timber in North Atlantic coastal communities, is now declining due to climate change and river management. Where past communities collected driftwood, we now find plastic pollution. Through films, workshops, and a touring exhibition, we will invite comparison between the marine resources exploited in the past and what washes up on the shore in the present. By foregrounding issues such as this, we propose that archaeology can be a powerful tool with which to combat 'shifting baseline syndrome'.

12 COASTAL SHORELINE CHANGE OF AN ANCIENT HUMAN SETTLEMENT ON THE GULF OF MEXICO: A CASE STUDY OF ISLA PIEDRA

Inurreta Diaz, Armando (Texas A&M University)

Situated along the Gulf of Mexico, on the northwest corner of the Yucatan Peninsula, lies the northern coastal plain of the State of Campeche. This region's shoreline is significantly influenced by coastal processes and ecological succession driven by low-energy waves that transport and deposit sediment. As a result, a distinctive muddy shoreline has formed, characterized by extensive wetlands, including estuaries, mangrove forests, late estuaries, and vegetated islands known as petenes (hardwood hammocks). This dynamic ecological frontier serves as a transition zone between marine and terrestrial environments. Within this coastal zone, ancient human settlements – ranging from simple shell middens to more complex architectural sites – have been exposed to these coastal dynamics. Surprisingly, limited research exists on how these natural processes have shaped the landscape of these settlements over time. This study aims to unravel the transformation of Isla Piedra's coastal landscape – an ancient settlement along this coast – during its occupation and in the present day. The investigation begins by establishing the intricate relationship between coastal geomorphology and the location of ancient human settlements. Subsequently, change detection methods are applied to a series of satellite images of the coastline, and analyzed through remote sensing techniques. By identifying these changes, the research proposes a reconstruction of Isla Piedra's shoreline during its primary ancient occupation phase. This understanding serves as a foundational basis for future studies, shedding light on site formation and the adaptive strategies developed by the island's inhabitants throughout history.

13 VULNERABILITY OF UNDERWATER ARCHAEOLOGICAL SITES COPING WITH CLIMATE CHANGE: THE WATERISKULT PROJECT

Germinario, Luigi (University of Padova) - Mazzoli, Claudio (University of Padova)

Climate change has a dramatic environmental impact on seas and oceans, not only on ecosystems but also on the tangible evidences of human past survived underwater. The submarine world is the guardian of millions of submerged ruins, settlements, wrecks, and artifacts, whose protection greatly depends on mitigation and adaptation policies. The European project WATERISKULT (<https://wateriskult.geoscienze.unipd.it>) aims at providing the first quantitative assessment of the vulnerability of underwater cultural heritage in a changing climate, with a focus on archaeological stone artifacts and structures. The research approach is interdisciplinary (involving petrography, marine biology, underwater archaeology, oceanography, hydraulic engineering, and analytical chemistry) and based on a mixed field and laboratory experimentation. The key-factors of climate change addressed are ocean acidification and extreme weather events: their impact is investigated by a series of laboratory simulations and underwater exposure tests and monitoring, aimed at exploring the stages and rates of archaeological stone decay. The risk assessment is integrated by studying the current stone decay in selected underwater sites in the western, central, and eastern Mediterranean Sea (in France, Italy, and Cyprus), describing the link between deterioration, material properties, and environmental setting. By such approach, WATERISKULT is expected to enhance the knowledge of ancient materials and their interaction with the underwater environment, stressing the connection with past and future human actions.

14 HIDDEN RIVERS: EXPLORING FLOWSCAPES THROUGH REMOTE SENSING TECHNOLOGY

Gustavsen, Lars (The Norwegian Institute for Cultural Heritage Research)

Rivers form an integral part of the temperate zones of Northern Europe and have historically played a crucial role in shaping their physical and cultural landscapes. Embodying elements of sustenance and life while being agents of destruction, this inherent duality is the basis for various cognitive phenomena, including religion, myth, and folklore. Despite their significance, however, these cognitive dimensions are often overlooked in archaeological studies. It can be argued that this is at least partly a consequence of significant alterations to the terrain caused by a combination of natural processes and human interaction, which have included the infilling and levelling of past features, thereby posing a considerable challenge in the reconstruction of former landscapes. Consequently, the present landscape provides only a partial insight into its historical counterpart.

To counter this, a novel approach is proposed in which large-scale geophysical surveys and remote sensing technologies, such as high-resolution LiDAR and satellite imagery, enable us to map not only archaeological features but also former natural elements such as palaeochannels. Through this approach, valuable insights into the archaeological

landscape can be gained, shedding light on the role of rivers in structuring the landscape and on the character of former human-nature interaction. Moreover, this endeavour contributes to a broader theoretical discourse, where the landscape forms an active agent that humans interact with rather than being relegated to a passive backdrop where human activity takes place.

15 UNDERWATER REALMS. PLACE-MAKING UNDER THE SEA IN THE BRONZE AND IRON AGE MEDITERRANEAN

Yamasaki, Mari (PCMA - University of Warsaw)

Humans create places by transforming the space around them and endow it with value. The traces of the many ways in which people in the past turned spaces into places are a frequent object of study in archaeology. However, this interest has mostly been limited to dry land, while underwater place-making practices have been largely ignored. Scholars tend to dismiss the expanse of water below the sea surface as an undifferentiated space and often extend this concept to past cultures.

Evidence for the material modification of underwater spaces in antiquity is indeed limited, but this does not mean that underwater place-making did not exist. In fact, the transformation of spaces into places does not necessarily require their physical modification, but may operate on the immaterial and conceptual level. For instance, the fencing of open space to demarcate property may be just as effective in limiting access to a private lawn as a religious taboo in forbidding the trespass into sacred land. Places can exist in the physical world and be at the same time imaginary. Likewise, underwater spaces can be transformed into places of human engagement and meaning through visual representations, narratives, beliefs and ritual practices, independently of the building of subaquatic structures.

In this paper, taking the archaeological evidence as the starting point, I will discuss instances of real and imagined underwater places from the Aegean and Eastern Mediterranean between the Late Bronze and the Iron Ages.

15 UNITED EUROPE OF THINGS? MATERIALITIES CREATING MEDIEVAL RITUAL LANDSCAPES (C. AD 1000-1550)

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Webley, Robert (University of Reading) - Sawicki, Jakub (Czech Academy of Sciences in Prague) - Vargha, Mária (University of Vienna) - Parvanov, Petar (Bulgarian Academy of Sciences) - Lewis, Michael (Portable Antiquities Scheme; British Museum)

Session format: Regular session

The proposed session aims to bring together researchers from across Europe examining persistence and change in medieval ritual landscapes through material culture, such as through lived religion, personal/household devotion, ritual deposition and the material practices of religious institutions. We will be continuing conversations under the 'United Europe of Things' banner from previous EAA meetings - fostered by the European Medieval Finds (EMF) network (<https://ypp.com.pl/emf/>) - but here our focus is on the theme of how material culture is deployed in ritual action in the landscape. Another important strand we seek to weave in from previous meetings pertains to digital approaches to big data, specifically as they can be applied to questions of persistence and change in medieval ritual practices.

The Middle Ages saw huge religious transformations, experienced differently in various regions of Europe, alongside apparent persistence of established Christian tradition. How did different trajectories of conversion and reform influence personal devotion and engagement at a landscape level, and how did this change through time? On the other hand, to what extent did earlier traditions persist and how may this be contextualised: were there 'persistent places' that saw continued deliberate deposition? The session hopes to elucidate the regional differences and similarities in social interaction with religious landscapes across the period c. AD 1000-1550.

This session welcomes contributions with the following emphases:

- Material culture and persistent places
- Lived religion and personal devotion
- Multi-scalar approaches contrasting urban, rural, fluvial and other devotional landscapes
- Theoretical approaches to religious/ritual material culture
- Evidence from public and metal-detected finds
- Big data approaches to religious material culture
- Interactions with material culture of different social communities within a shared landscape
- Papers from across Europe, but discussions focusing on the fringes of medieval Christian Europe are particularly welcome.

ABSTRACTS

1 LATER MEDIEVAL 'PLACED DEPOSITS': REFLECTIONS ON AGENCY, MATERIALITY AND COSMOLOGY

Gilchrist, Roberta (University of Reading, UK)

Archaeologists have become increasingly alert to material evidence for a wide range of ritual practices that were not recorded in historical documents, such as objects and materials that appear to have been deliberately placed within medieval buildings or settlements, and in landscape contexts including cultivated fields and water courses. How might we account for ritual deposition within the cultural context of medieval Christian Europe? Until recently, single examples of such practices were dismissed as oddities, or regarded as superstitious behaviour or persistent pagan survivals. However, many placed deposits occur in spatial contexts that were tightly controlled by the Christian clergy, including monastic landscapes, parish churches and cemeteries. The church did not record these practices and they may not have encouraged them, but they evidently tolerated them, even within the most proscribed spaces. This paper reviews theoretical approaches to the interpretation of medieval placed deposits, reflecting on their proposed materiality, agency and intended causality. It argues for a contextual approach to archaeological interpretation grounded in medieval cosmology and the practices of lived religion, rather than assuming long-term continuities and cross-cultural intentions behind ritual deposition.

2 "CHARACTERFUL" MATERIAL CULTURE: BIASES, CHALLENGES AND DATA MANAGEMENT SOLUTIONS IN LARGE-SCALE ARCHAEOLOGICAL CULTURAL HERITAGE DATA

Oksanen, Eljas (University of Reading)

Scientific databases, including those produced for archaeology and cultural heritage applications, are artefacts shaped by a variety of factors. These include institutional policies, the unique characteristics of the primary sources, the requirements of associated research projects, the expertise and priorities of the data service developers, and the technology at their disposal. This diverse set of influences affects the utility of the data for broader audiences, including (and arguably especially) in big data analysis and research.

This presentation will examine applications of spatial "big data" analysis to the study of medieval ritual landscapes, considering the potential and challenges inherent in large object databases from a data management and FAIR data (Findable, Accessible, Interoperable and Reusable) perspective. The specific case study will be on metal-detected finds data from the Portable Antiquities Scheme in England and Wales database, but the questions raised have wide-ranging relevance.

How do the numerous subjective and contingent biases that inform the character and quality of such databases impact on research methodologies and workflows? For example, how do specific, local factors affect the reporting and recording of public finds data, especially in the study of particular landscapes and 'persistent places'? Therefore, what kind of Open Science research data management practices and documentation standards should be developed to enhance the reusability of both the primary data and the research results? This presentation aims to share experiences from practical work in Data Sciences-led archaeological research and foster a dialogue that might lead to collaborative solutions.

3 THE MATERIAL CULTURE OF CHRISTIANISATION - CONTROVERSIES AND NEW APPROACHES

Vargha, Maria (University of Vienna)

The present paper introduces the approach of the ERC StG project RELIC (Modelling Religiopolitics. The Imperium Christianum via its Commoners) to studying changes in material culture related to large-scale social and religious processes, such as Christianisation.

The historiography of religious conversion and the pagan-Christian shift observed by archaeology is vast. However, it often appears as a binary opposition of paganism and Christianity, which simplification should be re-evaluated, and instead, a gradual, non-exclusive adaptation from non-Christian to Christian should be advocated.

The project proposes an approach to study Christianisation on multiple spatial scales; firstly, it aims to focus on predominantly unpublished and unutilised archaeological data archives about the most informative sites, which refer to the Christianisation of the commoners. On a general (macro) level, the site location of rural churches and field cemeteries can be contextualised in relation to each other and the networks of secular and ecclesiastical power centres, such as the seats of the king and his lords and ecclesiastical dignitaries. Secondly, the analysis of the spatial relations of these sites can be supplemented with the inter- and intra-site level analyses of material evidence from well-researched and published sites, including the study of burial customs, liturgical objects, and grave accessories. The results of the archaeological analysis will be compared and contrasted with historical evidence and existing historical narratives on conversion and Christianisation.

The present paper aims to review the traditional approaches and elements of material culture connected to the Christianisation of everyday people and propose new methodological frameworks for their investigations.

4 **BY SWORD AND WORD: EXPANSION AND CHRISTIANIZATION OF THE SOUTHERN RUS' BORDERS AT THE END OF THE 10TH-11TH CENTURIES**

Diachenko, Dmytro (Institute of Archaeology of the National Academy of Science of Ukraine)

The decline of Viking age transcontinental trade forced the rulers of the young Rus state to look for alternative sources of enrichment. The view of the Grand Princes of Kyiv was focused on the fertile southern lands. Unfortunately, these regions were unpopulated due to raids by warlike Turkic nomads.

During Prince Volodymyr's reign, the situation gradually began to change. He began constructing fortified lines, hill-forts, and even full-fledged towns on a large scale. These processes required significant economic and human resources. The chronicle explicitly states that as a result of his numerous military actions against various peoples of Eastern Europe, in addition to tribute, Prince Volodymyr "gathered together the best men" and populated new lands with them.

This policy was also continued by Prince Yaroslav, his son. He pursued an active foreign policy and regularly conducted military campaigns against neighbouring states. By resettling Slavic and Turkic, Polish, Baltic, and possibly Finno-Hungarian peoples, the prince solved the problem of population shortage. The burial monuments with the material culture of these peoples on the southern border of his state along the river Ros are evidence of this.

The process of Christianization was instrumental in the reduction of cultural and religious differences among a multicultural population. Disagreements in traditional law were normalized by introducing the first unified legal codes (Russkaya Pravda). The control over the observance of the norms by the local population was based on the bureaucratic apparatus, which at that time began to differentiate itself from the paramilitary units of the prince (Druzhdina). At the same time, adherence to these norms ensured a certain "cultural autonomy", which can be seen in the funeral rites and the material culture of the immigrants at the end of the 10th and the beginning of the 11th century.

5 **MY REFUGE AND MY FORTRESS: A GEOSPATIAL STUDY OF FORTIFIED CHURCHES**

Downs-Tepper, Liam (University of Vienna)

Anything designed for a single purpose brings with it a purity and clarity of function. A meat grinder does one thing and does it with aplomb. A mousetrap is the ideal tool to have on hand if the goal is the trapping of mice. The moment multiple purposes are introduced, however, the situation becomes more complex - and even more so if those purposes are at odds with each other. What purpose is a priority? Are design choices a question of compromise? Or do they in fact compromise each other?

Such is the conundrum offered by fortified churches. They are a contradiction in terms: both military and ecclesiastical, intended to be both inviting and threatening, peaceful and violent.

This paper examines the cultural and spatial aspects of Europe's fortified churches. The goal is to provide new insight into the geospatial rationale behind different types of fortified church. It aims to use an interdisciplinary comparative approach to determine, on a fundamental level, the commonalities across disparate areas that lead to the construction of a fortified church - as opposed to some other form of fortress, or church, or fortified town - and further the different varieties of fortified church that exist.

Among the aspects that this paper explores is the transfer of architectural and spatial knowledge through Europe, following the movements of various crusading orders. It also highlights the relatively common structure of minority ethnic groups being responsible for fortified churches, delving into the concept of peasant fortifications. This is paired with an assessment of various theories from years of scholarship, intended to explain the "why" and "where" of fortified churches.

6 **EARLY ADOPTERS IN ANCIENT LANDSCAPES: GOTLAND'S FIRST CHURCHYARD BURIALS**

Ljung, Cecilia (Uppsala University) - Klevnäs, Alison (Stockholm University; Uppsala University) - Noterman, Astrid (Stockholm University)

The Baltic island of Gotland offers a rare archaeological resource in the form of intact graves from the first generations who were laid to rest in churchyards. Burial at newly established church sites is seen here from around the mid-eleventh century. Many of the first graves beside churches still use some customs which mirror traditional practices, notably dressing the dead in late Viking Age costume.

Other aspects show more complete rupture with the past. In contrast to other areas of Scandinavia, on Gotland the placement of the first churches broke with landscape traditions, with locations chosen close to significant farms rather than in conjunction with ancient grave fields. This represented a striking disjuncture since it brought to an end

centuries - even millennia - of mortuary continuity at the existing sites, some of which had attracted burials since the Bronze Age.

Practices at the new sites suggest radical change in the conceptualization of persons and bodies and how they related to community. This is when we see complete representation of the population for the first time, whereas previously burial had been afforded only to a subsection, mainly adults and often men. On the other hand, the first churchyards introduce spatial division of the sexes, with women placed on the less valued north sides.

Current dating suggests there was a considerable period during which the dead were divided between markedly different landscape and social settings, with burial and commemoration continuing in both early churchyards and ancient burial grounds, and also some novel rural locations of other kinds. This paper presents preliminary results from a pair of projects investigating the bioarchaeology and ritual treatment of the early adopters of churchyard burial and asking how they related genetically and socially to the community members who maintained the old ways of death.

7 **RURAL CHAPELS AS SITES OF POPULAR DEVOTION IN MEDIEVAL ESTONIA**

Valk, Heiki (University of Tartu)

The Baltic crusades in the Eastern Baltic region ended with the Christianization of the formerly pagan areas and the making of Medieval Livonia which greatly corresponds to the territories of present-day Estonia and Latvia. The network of parishes was sparse and the parishes were mostly big. The number of parish churches was especially low on the eastern fringe of Western Christianity.

The lack of churches was compensated by the dense network of rural chapels of different size and shape. These small sanctuaries, made mostly of timber, became objects of popular devotion - an expression of the cult of saints. The local rural chapels fell in ruins or were destroyed in the period of early post-medieval wars (1558-1625), but their ruins or sites, reflected until recent times in oral lore and toponyms, were still used for offering also later. Offering and its dynamics is archaeologically represented by coin finds, gained both from excavations and by metal detecting. In Estonia, Christianized gradually in 1215-1227, the earliest coin finds from rural chapel sites date from the 2nd quarter of the 13th century. The first chapels were located at major trade roads, but since the mid-13th century there is evidence also from other localities. Bigger chapels seem to have been built on the halfway between towns or castles, but coins were offered also at the local level. The practise of coin offering, expression of popular Christianity and devotion, increased in the 15th century and gained its peak from the mid-16th to the late 17th century. As votive gifts, coins of the lowest value were used.

8 **DEVOTION ON THE DOWN-LOW. MATERIALITY OF UN-INSTITUTIONALIZED RITUAL PRACTICES IN MONASTERIES IN THE LATE MEDIEVAL NETHERLANDS (CA. 1100-1600)**

Mulder, Fardau (Groningen Institute of Archaeology, University of Groningen)

Religious rituals were at the core of monastic daily life in the Middle Ages. These included the liturgical rituals, but also un-institutionalized practices, often expressed in material culture e.g. magical amulets, clay figurines and ritual depositions. Such non-liturgical devotional practices are generally not well known from normative sources concerning monasteries, but their representation in the archaeological record and local archives demonstrate they were an integrated part of monastic life. Patterns in such customs can help understand which factors were important in shaping monastic identity, like gender, region, and/or chronology. It also allows us to better understand the room for agency and local variety within the strict monastic environment. This paper focuses on un-institutionalized devotional practices in Dutch Late Medieval monasteries (ca. 1100-1600), by discussing some specific Cistercian monastic sites. It will discuss which objects we find that are associated with devotional practices, and in what contexts they are found, to create a better understanding of the monastic ritual landscape in the Late Medieval Netherlands.

9 **THE MATERIALITY OF PILGRIM CULTURE IN A MEDIEVAL URBAN LANDSCAPE**

Sawicki, Jakub (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

In 15th century Aachen, during events associated with the display of relics, 142,000 pilgrims were counted at the gates on a single day. Pilgrims, who arrived dressed in distinctive attire (specific hat, staff, and bag) also sought to acquire souvenirs imbued with the sanctity of the famous local relics. Considering these data, it can be ventured that pilgrims are a constant element of the medieval urban landscape. Not only in cities that were centres of worship but essentially in every town (or village) to which pilgrims returned with proofs of their journey.

What is then urban space associated with pilgrimages? Holy churches and monasteries? Hospitals, inns, and other resting places for travellers? Workshop of paternosters, holy clay figurines, and other popular utensils displaying devotion? Archaeological evidence suggests that pilgrim badges are found in less self-evident places. From the well-studied Wrocław, approximately 75% of all badges come from one of the city marketplaces, while in the Netherlands, a significant portion of finds originates from canals.

In this presentation, I would like to discuss urban material culture associated with personal devotion, primarily with pilgrimages but not exclusively. Based on the archaeological state of research, it turns out to be surprisingly scarce, limited only to a few types of objects and often originating from unusual contexts.

10 PERSISTENCE AND CHANGE IN THE MEDIEVAL LANDSCAPE: CONTEXTUALISING RELIGIOUS BADGES FOUND IN NORTH-WEST NORFOLK (ENGLAND)

Lewis, Michael (British Museum)

An important collection of pilgrim badges is housed by (King's) Lynn Museum, Norfolk; most of these were found in the mid-late nineteenth century through mudlarking. Lynn (Lene) was to become an important port during the Middle Ages because of salt production, also benefiting from the changing course of the River [Great] Ouse to the Wash, and thereon the North Sea, and the Continent. In this context, of a changing landscape, the intriguing discovery of pilgrim badges on the old course of the river (south of Lynn) provides insights into medieval ritual practice and religious belief. This paper will therefore seek to contextualise the urban badge collection with more recent rural finds, suggesting why medieval people were deliberately (it might be assumed) - perhaps in an act of persistence - depositing religious badges in this changing landscape. Importantly, the religious badges will be examined against finds of a 'secular' nature. Finally, thoughts will be given on why these rural badges are varied in the cults (both insular and continental) they represent.

11 THE AFTERLIFE OF PILGRIM SIGNS IN EUROPE

Søvsø, Mette (Museum Vest)

The number of finds of pilgrim signs from large parts of Europe (in the shape of badges, ampullas and other artefacts sold at places of pilgrimage) has been steadily increasing the last decades. Mainly because of metal detecting in rural areas and excavations in medieval towns. The comprehensive public databases including data about thousands of European finds has given new opportunities for detailed artefact studies. Research on pilgrim signs have for many years focused on travel activity and destinations, pilgrimage industry, iconography and cultural exchange. We know from written sources, that pilgrim signs were manufactured in hundreds of thousands, and the finds distribution shows a large geographical spread into medieval societies and landscapes. To a lesser degree focus has been on the afterlife of the artefacts: What happened to them, after they were brought home by the pilgrim, and when they were no longer attached to his or her dress or equipment? The subject has divided researchers: Were they considered to be metal scrap that could be remelted or even just worthless trash? Or did they still have religious value and meaning as useful objects in everyday life?

Based on Danish finds as well as published finds from European databases, this paper will present some observations both when it comes to secondary traces of use and wear and secondary contexts. The study indicates that the objects were in a number of cases reused, reworked or transformed and it seems that they can have had an extended afterlife in which they were treated as functional objects in the true sense of that term, in a time and a context when religio-magical praxis was present deep within the tiniest details of human life.

12 MEDIEVAL PAPAL BULL SEALS: FROM WRIT TO RITUAL

Pestell, Tim (Norwich Castle Museum and Art Gallery)

Papal bullae, the lead seals attached to papal charters for their authentication, have become familiar finds to UK metal-detectorists, as well as being made on the excavation of many church and monastic sites. This paper will look at how these bullae were used in their primary role and what this might tell us about the issuing of these documents by the papal chancery between the twelfth and sixteenth centuries. I will then go on to demonstrate how the seals themselves took on a numinous aspect, exploring the ways in which bullae were physically modified, revealing their secondary roles as amuletic objects. It is apparent from both Portable Antiquities Scheme data and contextual evidence from excavations, that a more nuanced picture emerges of the ways in which bullae were valued and seen as having agency. Using a case study of finds from the medieval Diocese of Norwich, it will be shown that far from being random finds in the landscape bullae might reveal structured practices of deposition indicating ritualised behaviour. The implications of the English experience of bullae practice will then be set into its European context.

13 THE TANGLED MEANINGS AND RELATIONSHIPS OF LANDSCAPES AND MATERIAL THINGS IN THE LATER MEDIEVAL PERIOD

Standley, Eleanor (University of Oxford)

This paper will explore two related strands: 1) devotional material found in landscapes, and 2) depictions of landscapes found on material culture. The first is an unsurprising approach and will consider forms of devotional material culture that were purposefully embedded within landscapes or buildings. This will include purposefully hidden or hoarded de-

votional objects, particularly those deposited at the Reformation in England. The second intends to consider attitudes and meanings associated with landscapes (or waterscapes) and how and why they were incorporated into the design of devotional and ritual material.

The case studies will include chance or excavated finds recovered from landscapes in England, but also other material culture decorated with ritual landscapes, such as English domestic drinking vessels decorated with 'forest' scenes; northern European ivory carvings with religious or romantic scenes set in 'wild/semi-wild/garden' spaces; and alabaster altar panels made in England where 'places' form part of the religious scenes and support the visual-reading of them. These material things open the possibility of understanding the qualities associated with 'scapes' and how they were considered and interacted with within the home or a devotional space. This is of particular interest as 1) the terminology of 'landscape' or 'waterscape' did not exist in the period under consideration, and 2) the combined approach can reveal the tangled meanings of, and relationships between, landscapes and material things.

14 DEVOTION MADE MANIFEST: A REGIONAL CASE STUDY FROM MEDIEVAL ENGLAND

Webley, Robert (University of Reading)

Most studies of religious practice in medieval Europe focus on the structures, material culture and locations of the church and other formalised religion. In England, evidence from large-scale excavations of medieval material can now be combined with publicly recorded metal-detected material to afford unprecedented insight into devotional objects and religious practice beyond a church context. This paper offers initial assessment of such data as collected by the Medieval Ritual Landscape project, which began in 2023 at the University of Reading, UK.

Analysis will focus on medieval and post-Reformation devotional practices across North Yorkshire. This large county contained over fifty religious houses, the major city of York and sizeable urban centres, including Scarborough. Rural evidence, coming from the major long-term excavations at the deserted medieval village of Wharram Percy, as well as from recent, unpublished excavations, alongside metal-detected material, completes a significant dataset. Through this new material culture data, I will explore the competing influences on devotional practice in different contexts across the medieval period in an attempt to elucidate both similarity and difference. As part of the transition into the post-medieval period, I shall also consider persistence of practice in a county famed for the Pilgrimage of Grace (1536) and its Catholic recusancy in the later 16th century. By considering archaeological evidence of religious practice across various settings, this project will provide new insights into lived religion for a much wider group of people in the medieval period.

15 LANDSCAPES OF BELIEF IN MEDIEVAL & POST-MEDIEVAL PERTSHIRE, SCOTLAND: A EUROPEAN CASE-STUDY IN REFORMATION AND RESISTANCE

Hall, Mark (Perth Museum)

This contribution will seek to interrogate the long durée of changes in belief (from early medieval through to post-medieval), pivoting about the sixteenth-century and later Reformation (itself a long-term process rather than a short-term event), and as evidenced by material culture. Thus, a range of things – sculptures (including Pictish sculpture rearticulated in later centuries), bells, relics and other holy and magical matter with perceived amuletic/apotropaic efficacy – will be addressed in the context of the belief networks they helped to power-up, along with traditions of practice, doctrines and specific places (personal and communal). The entwining of magic and belief with the changing rhythm of material culture through the agency of human use and reuse, giving material culture a biographical trajectory. The examples will range across a remote parish church and its setting at Struan, near Blair Atholl; the urban environment of Perth and urban and rural monastic settings (including St Serf's Loch Leven).

16 WEARING THE MEDIEVAL RITUAL LANDSCAPE: RELIGIOUS BELIEF AND RITUAL ACTIVITY EXPRESSED BY SCOTTISH DRESS ACCESSORIES

Prosser, Lydia (Durham University and National Museums Scotland)

Objects that were worn as part of dress had an important role in the enactment and perpetuation of medieval ritual and belief. Such items reflected participation in broad traditions and well as denoting access to ritual behaviour that was sometimes restricted, for instance to those of episcopal rank, or members of a guild whose identity was firmly situated in Christian theology and iconography. Focusing on dress accessories allows us to consider how ritual landscapes were embodied at a personal level, displaying as they do the physical marks of touch and wear, and alluding to individual interpretations of general practice and deviation from expected behaviour.

Scotland is often left out of general discussions of late medieval material culture and Scottish objects are frequently interpreted with the presumption that the meanings they reflected merely mimicked trends across Western Europe, especially England. Yet, Scotland itself was not a homogenous entity. Geographical realities bred distinctions between the rural Highlands and Islands, which retained long-established connections with Ireland and Scandinavia, and the

Lowlands with its burghs and trade links with the Low Countries. Factors such as war with England and the lack of a university in Scotland until the fifteenth century impacted the movement of craftspeople and the transmission of ideas such as belief in the beneficial properties ascribed to gemstones.

This paper will put Scotland firmly in the centre, championing the largely-untapped evidence of Scottish metal-detected finds and using Scottish sources to explore how ritual belief was expressed through dress accessories from the twelfth century to the fifteenth. Chronological and regional trends will be explored and a number of examples presented where a uniquely Scottish character can be identified. This research supplements the EMF network's broad aim of assembling a more nuanced picture of similarity and difference in portable material culture across Europe.

17 PERSISTENCE, SUBSTITUTION, RUPTURE? CERAMIC MATERIAL CULTURE IN THE SOUTHEASTERN IBERIAN PENINSULA BETWEEN THE 15TH AND 16TH CENTURIES

Busto-Zapico, Miguel (University of Granada) - García-Porras, Alberto (University of Granada)

The end of the Middle Ages and the beginning of the Early Modern period in the southeastern Iberian Peninsula are periods of great interest for studying the material manifestation of various processes of change. Interactions with the material culture of different communities (Nasrid-Castilian) and religions (Muslims-Christians) within a shared and constantly changing landscape are observable.

The subject of study in this work is the ceramic material culture, primarily focusing on pieces used on the table with some type of covering. The geographical scope of the study is the southeastern Iberian Peninsula, the area occupied by the Nasrid Emirate and the later Kingdom of Granada, between the 15th and 16th centuries. Results of comparative archaeological analyses (functional, typological, and morphometric) are presented, conducted on ceramic materials from the sites of Teba (Málaga), Cuarto Real de Santo Domingo (Granada), Macael, and Vera (Almería). The developed study methodology combines the use of databases and statistical analyses for handling large datasets.

Changes in ceramic forms can be observed, involving the substitution of some, the emergence of new production methods, or the use of other types of glazed and enameled coverings. Many of these changes are observable throughout Western Europe, but in the southeastern Iberian Peninsula, they are more pronounced, reflecting a cultural rupture.

Through this study, we can analyze how different phenomena of conversion, assimilation, migration, repopulation, and expulsion of different groups developed. We can explore whether there was a persistence of previous traditions regarding ceramic production and consumption, whether there was substitution, and if it was gradual or radical, seeking to understand how it manifests. Perhaps we are dealing with a non-linear phenomenon with advances and setbacks that combine phases of persistence, substitution, and rupture.

18 SACRED SWORDS OF THE ALPS - EXPLORING A FORGOTTEN MEDIEVAL TRADITION IN TYROL

Messner, Florian (University Innsbruck)

Since ancient times, the Alps have not been an insurmountable obstacle, but their valleys and passes have permitted lively traffic between north and south. In the past, the numerous passes were probably even more important than they are today, as they often shortened journey times considerably. At the same time, these crossings always involved a certain amount of risk; the weather could change quickly and surprise unwary travellers. It is therefore not surprising that from the Bronze Age at the latest, deposits were made at mountain passes, whether in gratitude for surviving a storm, a successful crossing or for religious reasons that are no longer traceable today.

To date, there are no known finds of swords from the high mountains from the early Middle Ages. This situation changed in the Tyrolean region (nowadays split between Austria and Italy) and thus probably also supra-regionally from the High Middle Ages onwards, which was previously unknown in the academic community. Only intensive research in the framework of my doctoral thesis on medieval swords from the Tyrolean region allowed me to assign six swords to sites in the mountains or on passes, with the highest sword find coming from the Pass d'Uffiern (Switzerland), at an altitude of 2,628 metres.

In my paper, I would like to look at the particular characteristics of this ritual landscape, what the sites have in common and where they differ. Due to the lack of written sources from the Middle Ages for this ritual behaviour, conclusions are drawn primarily from the local topography and the swords themselves. I will also look at the quality and traces of use of the weapons in order to show that these swords can indeed be used to grasp a ritual concept in a harsh landscape previously unknown to the scientific community.

19 THE EARLY MEDIEVAL AGGLOMERATION OF BOJNÁ - A PLACE THAT SOURCES POWER

Robak, Zbigniew (Institute of Archaeology, Slovak Academy of Sciences)

The complex of archaeological sites located in the vicinity of the village of Bojná in western Slovakia has been known for a relatively short time, but it became an important part of the scientific landscape of early medieval archaeology.

The sites have yielded thousands of artefacts related to early medieval elite culture, mainly parts of attire and weaponry, as well as objects associated with Christianity. This contribution aims to present the history of the site and the most important finds. The scope of the presentation spans from the 7th century when the first fortified settlement was established in Bojná until the creation of Tematín Castle in the 13th century. During this time, the centre of power was moved to different locations within the agglomeration, but always remained within its borders. The agglomeration reached its greatest momentum at the turn of the 9th and 10th centuries when the Vály stronghold was one of the largest military centres of the entire Great Moravia. Even after the decay of the fortress in the 1st half of the 10th century, iron hoards were deposited on the hill. The only justification seems to be the "tradition of the place" and symbolic rituals. However, the nobleman's court and rotunda did not disappear, and their function even seems to have become more important with the development of early medieval feudalism. Finds such as gilded spurs confirm the extraordinary position of the inhabitants of the area even in the Late Middle Ages.

18 FISH * FORMS * FUNCTIONS: THE IMPORTANCE AND SOCIETAL ROLE OF AQUATIC RESOURCES IN PREHISTORIC SOCIETIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Groß, Daniel (Museum Lolland-Falster) - Kramberger, Bine (Institute for the protection of cultural heritage of Slovenia, Centre for Preventive Archaeology (ZVKDS, CPA)) - Mansrud, Anja (University of Stavanger, Museum of Archaeology, Department of Cultural Heritage) - Hellmuth Kramberger, Anja (Alma Mater Europaea - Fakulteta za humanistični študij, Institutum Studiorum Humanitatis (AMEU - ISH)) - Theodoropoulou, Tatiana (Université Côte d'Azur, Cultures et Environnements, Préhistoire, Antiquité, Moyen Âge (CEPAM))

Session format: Regular session

Along with hunting and agriculture, aquatic resources represented an important aspect of subsistence in past communities. The various fishing techniques are proven through the finds of artifacts such as fishing equipment, through pictorial representations, and bones.

In this session we want to discuss the role that aquatic resources played in prehistoric societies as well as methods and tools for assessing their societal impact. We aim to discuss the role of fish and marine mammals in the livelihoods of past communities, since for certain periods and cultures, the fish not only served as a food source, but also had a symbolic or mythological meaning. We aim at coming closer to answering the question of the internal and external perception of "fishers".

We would like to invite contributions dealing with the use of aquatic resources and fishing techniques, but also theoretical contexts to discuss, for instance:

>> The importance of marine resources as food source and methods and techniques for acquiring them

>> the symbolic-religious meaning of the fish during different prehistoric periods

>> the archaeological analysis and evaluation of the relevance of aquatic resources in mixed economies

>> the social functions of fishing in certain communities. Were marine resources famine food, feast, seasonal abundance exploitation, export and trade, competition, 'social refugia', etc.?

We want to welcome colleagues at all career levels and offer particularly young researchers a platform to present their research results.

We also encourage studies that go beyond data presentation and contextualize their findings in a social perspective. Hence, ideas and methodological discussions are as welcome as archaeozoological, iconographic or techno-typological studies, to name a few.

ABSTRACTS

1 THE AFFECT OF MATERIAL DYADS: FISHING AS INTRASPECIES COMMUNICATION

Mansrud, Anja (Museum of Archaeology, University of Stavanger) - Radchenko, Simon (Museum of Archaeology, University of Stavanger)

This contribution aims to refresh the theorization of fishing in prehistoric coastal communities by moving beyond optimizing models reliant upon conceptions of economic rationality to explore the intra-social role of fishing. It takes a closer look at a soapstone sinker, engraved with geometrical patterns and a figurative ornament interpreted as representing a flatfish, that was accidentally discovered on the coast of Rogaland in Southwest Norway thirty years ago. In this talk, we report on results from experimental study and image-based 3D modeling of the sinker, and further employ it as a point of departure to explore the role of material culture in interspecies communication. Finds of fishbones, fishhooks, sinkers, harpoons, leisters, flutters and net needles attest to the fundamental importance of

coastal fishing in South-Western Norway from ca. 8000 BCE onwards. Fishing during the Middle Holocene period is commonly considered a mundane activity, crucial for everyday sustenance, and an entirely human achievement. By drawing on fish ethology, ethnography, and multispecies perspectives, we argue that the realm of the social encompasses more than human action. The activity of fishing relies on social and performative aspects - it is a technical action entangling humans, fish, artefacts, and bodily techniques, gestures and skills, in manifold and complex ways. Fishing takes place at the brink of two different worlds and actors' habitats, each with the capability to affect, i.e., insert influence or have an impact on the other. We further suggest the concept of material dyads; meaning objects applied to mediate the human-non-human interface and facilitating contact, communication, or control, as a fruitful concept for widening our understanding of past fishing practices.

2 FISH PEOPLE: HUMAN-ANIMAL RELATIONSHIPS IN IDENTITY CREATION IN THE IRON GATES DURING THE MESOLITHIC-NEOLITHIC TRANSITION

Rasmussen, Jason (University at Buffalo)

The Danube river which runs through the Iron Gate gorge (modern borders of Romania and Serbia) was central to the life of the many communities which lived alongside it. Fishing for sturgeon would have required the cooperative hunting of multiple individuals in the water and onshore/rocks to bring down a single specimen with specially crafted stone clubs (Dinu 2010). Over 200 carved local stone statues featuring combined human-sturgeon features have been found in Lepenski Vir – opposite one large whirlpool ('vir' = 'whirlpool'). Burials often feature individuals wrapped in a cloak with shell beads sewn into them resembling the bony scales found on sturgeon during the mating-harvest season (Živaljević 2023). A recent review of skeletons of the region and period show that one-third of the burial populations have a non-metric trait in the inner ear caused by extensive periods of being submerged in extremely cold water suggesting that swimming in the Danube was practiced extensively by communities (Villotte et al 2014).

The Iron Gates was a large region with access to a wide range of animal resources across many different environments including forests, grasslands, and wetlands. The partial remains of red deer, aurochs, wild boar, domesticated dog, wolf, and many species of water birds are found in burials, settlement areas, and cooking contexts but none of these are integrated to the extent that fish is folded into the personal collective identity. This presentation seeks to examine the way the people of the Iron Gates incorporated fish into their self-identity along with the use of other species in trying to understand what attracted the various communities to integrate them so extensively. It will look at the embodied act of hunting/swimming, the pressures to create a group identity during the Mesolithic-Neolithic transition, and the implications of crafting a group identity in prehistory.

3 WHO WAS THE FISHER(MAN) WITHIN THE BRONZE- AND IRON AGE COMMUNITIES? REVIEW OF ICONOGRAPHIC AND ARCHAEOLOGICAL DATA

Hellmuth Kramberger, Anja (Alma Mater Europaea – Institutum Studiorum Humanitatis) - Kramberger, Bine (Institute for the Protection of Cultural Heritage of Slovenia (ZVKDS), Centre for Preventive Archaeology (CPA))

Archaeological research and archeozoological analyses have revealed that fishing and collecting aquatic resources was an important integral part within the lives of prehistoric coastal and mainland communities. However, less information is available about the gender and the social status of the fisher. In our research we therefore addressed the question of whether it can be defined which group of people were involved in fishing in the Bronze and Iron Ages in Europe and Western Asia. What evidence do we have for this period, the 2nd and 1st millennium BC, that can provide us with insight into the question? On the one hand, especially in the Eastern Mediterranean and Western Asia, we find depictions, which are presenting people who are fishing and gathering aquatic resources using various techniques, and on the other hand, we have a number of finds uncovered within the graves, which include fishing equipment such as fishing hooks. A comprehensive review of depictions, graves (grave goods as well as anthropological analysis) has shown that fishing was done mostly by men in various prehistoric societies. However, with the appearance of a hierarchical societies in the metal ages, especially in the Bronze and Iron Ages, fishing was probably not only an important economic activity, but, similar to hunting in later periods, it also played an important role in the daily life of the highest class of the population in Central Europe, as well as in Western Asia. Furthermore, the pictorial representations in particular make it possible to identify very specific fishing techniques such as the use of swim bladders in Assyria in the early 1st millennium BC, which would not be evident from material legacies.

4 "O BEAUTIFUL FLOUNDER! O QUEEN OF THE SEA!" ARCHAEOLOGY, DEPICTIONS, MYTHS AND TRADITIONS RELATED TO THE HALIBUT

Brun, Wenche (Museum of Archaeology, University of Stavanger)

The line from the 17th-century poem *Swimming Animals and Fish of the Northern Ocean* by Petter Dass, reflects the important position of the halibut in the north of Norway, but the supremacy and magic of this large fish wrapped in myths and folklore seems to have long traditions, earlier than the written word.

Along the coast of west-Norway, the seascape with its resources must have been of utmost necessity during pre-history. The island of Åmøy in the county of Rogaland offers a glimpse into the Scandinavian Bronze Age period through the numerous shore bounded rock art panels. At this site the coastline holds a mega locality emphasizing the immersive significance of the maritime surroundings and marine resources through the motives of boats, fishing activities and fishes. The four carved representations of halibuts at this site will be discussed together with other relevant archaeological representations.

Throughout the world, the halibut is a recurrent motive in rock art, both painted and carved. Still, the halibut motives at Åmøy are traditionally referred to as uncharacteristic elements rarely represented within the context of South Scandinavian rock art. Even so, or maybe because of this – an approach combining traditional belief, superstition, and folklore with material culture might add value to the frames of interpretation.

5 PREHISTORIC FISHING IN THE ŽEIMENA RIVER, NORTHEASTERN LITHUANIA

Piliciauskas, Gytis (Lithuanian Institute of History) - Prancėnaitė, Elena (Klaipėda University) - Matiukas, Aldas (-) - Osipowicz, Grzegorz (Nicolaus Copernicus University) - Peseckas, Kęstutis (Lithuanian Institute of History) - Piličiauskienė, Giedrė (Vilnius University)

Between 2015 and 2023 professional divers, who are also archaeology enthusiasts, have discovered ten ancient fishing sites while diving in the Žeimena River. Preliminary underwater archaeological investigations at some of them revealed that they date back to a wide range of periods, from the Mesolithic to the Middle Ages, and at some of them not only wooden weirs and other fishing gear are preserved, but also a rich archaeological layer with remains of hunting and food processing and even human bones. Such underwater archaeological sites are extremely rare in the world, as fish weirs built in rivers usually do not survive many years. This is why prehistoric fisheries were studied mainly at the sea, lagoons and lakes, while an actual importance of rivers is often underestimated. We will present data of the newest underwater investigations at Žeimena River and discuss a strategy and methods of an upcoming systematic underwater survey of the Žeimena riverbed and detailed excavations at most valued Stone Age fishing stations.

6 HUNDREDS OF MARINE FISH AS OFFERINGS AT SALANGO, COASTAL ECUADOR, DURING THE MIDDLE GUANGALA PHASE (AD 300-600)

Lacorne, Camille (Muséum national d'Histoire Naturelle) - Lunniss, Richard (Universidad Técnica de Manabí) - Bearez, Philippe (Muséum national d'Histoire Naturelle)

The Salango Sanctuary (600 BC/AD 600) is of fundamental interest for understanding the relationship between man and the sea in the tropical Pacific coast. In 2015, the discovery of a ritual deposit containing thousands of fish remains from the Middle Guangala Period (300/600 AD) provided unique evidence of these complex practices as well as on fishing activities in south-central Ecuador. Approximately 3,300 bones have been identified and may represent the remains of about 340 individuals belonging to 49 different species. The assemblage is largely dominated by pelagic species, particularly scombrids weighing 2 to 3 kilograms. The presence of the dolphinfish, a taxon that has not yet been reported in the archaeological record of Salango, also supports the hypothesis that fishing was mainly conducted offshore by boat. The preservation in situ of numerous anatomical connections and the large number of remains found virtually intact suggest that the fish was deposited whole, undoubtedly with the aim of representing the exploited environment and, more broadly, the marine world. In this respect, Salango seems to represent a unique manifestation of pre-Columbian symbolic practices on the Ecuadorian coast.

7 A FISHING CAMP ON THE DESERT SHORE: FISHHOOK TECHNOLOGY AND ICTHYOARCHAEOLOGICAL DATA FROM A MID-HOLOCENE SITE IN THE ATACAMA DESERT

Power, Ximena (Instituto de Investigaciones Arqueológicas y Museo R.P. Gustavo Le Paige (IIAM), Universidad Católica del Norte) - Macari, Josefina (Independent researcher) - Rigaud, Solange (CNRS, Université de Bordeaux, Ministère de la Culture, PACEA) - López, Patricio (Museo de Historia Natural y Cultural del Desierto de Atacama) - Durán, Valentina (Independent researcher) - Talep, Claudia (Independent researcher) - Requena, Nicolás (Independent researcher) - Silva, Claudia (Museo de Historia Natural de Concepción) - Cases, Bárbara (Independent researcher) - Alday, Camila (McDonald Institute for Archaeological Research)

After four millennia of the peopling of the Americas, hunter-gatherers of the Pacific coast of South America developed specialized coastal and maritime technology during the Middle Holocene, ca. 8000 – 4000 cal yr BP. In the Atacama Desert coast, the specialization process included artifacts such as fishhooks, harpoons, and navigation technology and the exploitation of a broad spectrum of aquatic resources recovered from large shell mounds widespread during this period. Here, we present the first study results of the Quebrada Blanca-2 site, located in the interfluvial region of the Atacama Desert coast (20°48'34" S), dating back to 6700 yr BP. The settlement features, local topography, stratigraphy, fish technology and ichthyoarchaeological data suggest that this site functioned as a short-term camp where shell fishhooks production and fishing of sandy and rocky shore fishes were the main activities carried out on-site. Other elements such as cactus-spine fishhooks, fishing weights, fishing lines, and meat drying areas suggest a fishing task-oriented site. This contribution aims to develop a detailed contextual analysis of the site to evaluate the role of the fishing artifacts and infrastructure, explore the fishing methods of the target prey, and the social practices related to the fishing activity. Due to the complex and intricate stratification of the shell-matrix sites in the Atacama Desert and worldwide, we also outline some theoretical and methodological expectations to differentiate fishing task-oriented camps from multi-task/residential camps in maritime fisher-hunter-gatherers contexts and archaeological assemblages.

8 AQUATIC RESOURCES AND THEIR ROLE IN HUMAN LIVED EXPERIENCES AT MESOLITHIC LAKE ONEGA/KARELIA

Eckelmann, Rebekka (University of Helsinki) - Batanina, Olga (University of Helsinki) - Mannermaa, Kristiina (University of Helsinki)

To this day aquatic resources are a key element of subsistence for the majority of hunter-gatherer-fisher communities in the boreal and subarctic zones of Eurasia. Archaeological research indicates this most likely also applied to the Early Holocene populations in North-Eastern Europe, including the area of Mesolithic Lake Onega. However, the most prominent site in the area – the Yuzhny Oleniy Ostrov burial ground (YOO) – provided near to no material evidence for fish or fishing. This stands in stark contrast to the near omnipresence of mammalian fauna at the site and led to a long debate on the relative importance of fishing vs. hunting for the Mesolithic community there.

Only subsequent research into settlement and camp sites in the area and recent biomolecular analyses clarified the true extent of the importance of aquatic resources to the YOO population – which was enormous. Accordingly, fishing (and seasonal fowling) must have been a substantial part of these people's lived experiences, yet there is barely any evidence of it within the mortuary sphere. Due to archaeology's reliance on material evidence and focus on the burial ground, it is the animals represented at that site, which so far have dominated much of the conversation regarding the human-animal interactions at Mesolithic Lake Onega, effectively marginalizing the impact the aquatic character of these sites had on its population.

In this paper, we attempt to trace how subsistence based on aquatic resources affected the lived experiences of the people of Mesolithic Lake Onega and contrast them with the perceived experiences of the dead. To this purpose we will employ direct and indirect proxies, including faunal remains, bioarchaeological analyses and ethnographic data, to explore what it meant to live in a lacustrine world at 7th millennium BC Lake Onega.

9 FISHING DYNAMICS AND AQUATIC RESOURCE UTILIZATION IN LOWER DANUBE COMMUNITIES DURING THE 5TH MILLENNIUM BC

Savu, Mihaela (Christian-Albrechts Universität)

The 5th millennium BC marked a period of dynamic change in the Lower Danube region, influencing settlement patterns and economic strategies. Fishing played a significant role in these communities, supplementing their diets rich in plant and terrestrial animal resources. The proximity of these settlements to large bodies of water facilitated the exploitation of aquatic fauna, contributing to both their sustenance and economic endeavors.

This presentation examines the multifaceted involvement of fishing in Lower Danube communities during the 5th millennium BC. It explores how fishing practices not only directly supplemented the diets of these communities but also indirectly influenced other aspects of life. While evidence of fishing tools and aquatic fauna remains provides

direct insight into fishing activities, the absence of fish depictions in ancient representations prompts questions about cultural attitudes towards aquatic resources. Additionally, the utilization of aquatic fauna in contexts beyond the practical ones pertaining to sustenance further highlights the significance of fishing within these societies. Through the analysis of archaeological data, this study aims to provide insights into the intricate relationship between prehistoric communities and their aquatic environment in the Lower Danube region during the 5th millennium BC.

10 ADAPTATION AND INTEGRATION: FISHING STRATEGIES IN STONE AGE SOUTHERN SCANDINAVIA EVIDENCED BY STATIONARY WOODEN FISHING STRUCTURES

Koivisto, Satu (Museum Lolland-Falster) - Robson, Harry (University of York) - Groß, Daniel (Museum Lolland-Falster) - Philippsen, Bente (Norwegian University of Science and Technology) - Schmölcke, Ulrich (Leibniz Zentrum für Archäologie; Museum Lolland-Falster) - Måge, Bjørnar (Museum Lolland-Falster)

A growing body of archaeological evidence for Stone Age stationary wooden fishing structures found in Danish wetlands and submerged areas demonstrates the importance of aquatic resources to local Mesolithic and Neolithic populations. Between 2012 and 2022, extensive wetland excavations in the prehistoric Syltholm Fjord in Lolland, south-east Denmark, provided further evidence for prehistoric fishing practices and their fine-tuned chronology, emphasising the significance of mass fishing with fixed wooden structures for the Neolithic and Early Bronze Age coastal populations. Recent bioarchaeological studies have revealed no significant changes in the aquatic-rich diets of the Danish Ertebølle hunter-fisher-gatherers during the earliest Neolithic, who appear to have coexisted with the incoming Funnel Beaker farmers for decades or even centuries before the apparent genetic population turnover from c. 3800 BCE onwards. Interestingly, the data suggest a gradual shift to a mixed economy by the incoming farmers, and the process of Neolithisation appears to have included elements of cultural diffusion, as evidenced by new forms and types of material culture in this region. How is this reflected in the fishing-related materials and the apparent continued use of earlier sites in prime fishing locations? Can we detect any changes in the strategies and equipment used to exploit aquatic resources from the Mesolithic and into the Neolithic, especially in the use of mass-fishing devices such as weirs and traps? Further research is required to refine how the newcomers adapted to their new coastal, lacustrine and estuarine ecotones with rich and diverse aquatic resources. The well-preserved organic evidence from water-logged fishery sites allows us to explore and complement research into the Neolithisation process and subsequent developments, and to examine the adaptation and integration of aquatic livelihoods into Neolithic lifeways – involving also potential learning and gradual taking over of productive fishing grounds from indigenous hunter-fisher-gatherers.

11 THE NORWEGIAN (PRE)HISTORIC TRADITION OF STONE-BUILT EEL-TRAPS IN RIVERS AND CREEKS

Kvæstad, Christopher Fredrik (Stavanger maritime museum)

In 2019, in connection with the building of the new E39 main road between Ålgård and Lyngdal in Southwest Norway, an archaeological survey revealed the forgotten remains of stone structures used for trapping eel (*Anguilla Anguilla*) in the watercourses of the river Figgjo. This initiated an investigation in the traditions of eel-fishing in the water systems in a larger area. These purpose-built eel-traps, often misinterpreted to originate from more recent times, were widely used until the mid-20th century.

Magnus Lagabøte's State Law, promulgated by King Magnus VI of Norway between 1274 and 1276, stands as one of the earliest written records in Norway. It is emphasizing the role ownership and punitive actions, stating that if someone disrupts an eel fishery for someone else shall be fined by both the king and the owner of the fishery. This suggests the existence of a longstanding legal framework, extending back into prehistoric times, which guaranteed legal rights to essential resources like dependable seasonal river fishing for inland farming communities. In Southern Norway these eel-traps demonstrate that subsistence fishing with specialised trapping installations expanded beyond the more known and researched salmon and trout fisheries. Eel traps, strategically positioned to account for riverbed topography and proximity to farmsteads, served as continuously maintained infrastructural fixtures for the utilization of seasonal fish migrations over many centuries.

The consumption of eel was perceived ambivalently within a cultural context. Despite being abundant and rich in fat, making them nutritious and valuable for trade, their serpent-like appearance and ability to traverse long distances over land contributed to their taboo status and negative associations in local mythology and folklore.

12 WHALING IN PREHISTORIC EUROPE? AN ETHNOARCHAEOLOGICAL APPROACH

Weski, Timm (private researcher)

European people hunted whales from late Medieval Times up to the 19th century in open rowing boats with hand thrown harpoons, lances and ropes of organic material. Perhaps this has a long tradition as artefact made of whale-bones or depictions of whales on megalithic monuments are indicating. Because archaeological evidence for this hunting technique is poor, it is necessary to look at ethnographic examples. These show that people, some of them

can be regarded as early farmers or even hunters and gatherers, were chasing large maritime mammals, using similar techniques as those known from early modern times. Apart from harpoons and lances with heads out of stone, bone or mussel, ropes out of skin or plant fibre, floats or drags are recorded. Further paddled skin-, bark- or logboats were employed. Handling of the gear required an experienced crew of several members and often several boats were hunting together the same whale. Still more people were needed to cut up the whale after it had been killed and towed to land. The distribution of meat, blubber or teeth/baleen followed a regional, but strict social order.

13 HUMANS AND FRESHWATER ECOSYSTEMS - MESOLITHIC POPULATIONS AND EXPLOITATION OF WETLANDS ALONG THE ADIGE VALLEY (TRENTINO, ITALY)

Dipino, Noemi (University of Ferrara; MUSE - Science Museum of Trento) - Fontana, Alex (MUSE - Science Museum of Trento) - Visentin, Davide (University of Ferrara) - Fasser, Nicolò (University of Ferrara) - Nannini, Nicola (MUSE - Science Museum of Trento) - Flor, Elisabetta (MUSE - Science Museum of Trento) - Thun Hohenstein, Ursula (University of Ferrara) - Duches, Rossella (MUSE - Science Museum of Trento)

The beginning of the Holocene in the Adige Valley (TN, Italy) was characterised by a rapid climatic improvement that brought about significant environmental changes, marking the end of the long deglaciation process begun several millennia earlier. The new ecological structure of the valley consisted of a system of still freshwater basins formed by the meandering course of the Adige River. This latter, offered new and rich resources to the human populations that attended the valley at the beginning of the Holocene.

Within this general framework, our research aims to reconstruct the interactions between humans and the complex ecological mosaic of the Adige Valley by studying of freshwater animal remains, especially: fish, beavers, otters and pond turtles. The faunal remains analysed (about 20,000) come from various multi-layered sites that permit the tracing of the behavioural evolution of Mesolithic groups and how they dealt with ecosystem changes.

For this specific presentation, we decided to focus exclusively on the fish fauna which was studied thanks to a comparative osteological collection at the MUSE Science Museum zooarchaeology laboratory in Trento, Italy. This study allowed assessing the aquatic biodiversity, the seasonality of fish deaths and the different fishing techniques. Regarding the latter point, a key part of the research is the experimental activities dedicated to the reconstruction of fishing techniques and the treatment of fish for food purposes in prehistoric times.

14 ARCHAEOLOGICAL, ETHNOGRAPHICAL, AND EXPERIMENTAL RECONSTRUCTIONS OF FISHING IN THE NEOLITHIC SETTLEMENT OF DAKTARIŠKĖ 5, WEST LITHUANIA

Iršenas, Marius (Vilnius Academy of Arts) - Butrimas, Adomas (Vilnius Academy of Arts) - Slah, Gvidas (Vilnius Academy of Arts) - Rimkus, Tomas (Vilnius Academy of Arts; Klaipėda University)

The largest Neolithic wetland settlement in West Lithuania, located between the former lakes Biržulis and Stervas. Excavated material included approximately 11.000 potholes, a substantial flint inventory, as well as bone and antler axes, daggers, and amber artefacts from the Narva, Corded Ware, and Globular Amphora cultures.

The preservation of organic material in deep neolithic cultural layers and exceptional fishing conditions in the narrow water flow between Biržulis and Stervas lakes resulted in a large collection of fishing equipment, including harpoons, paddles, three types of net weights (Sinkers), and floats made from pine and birch bark.

The most fish-rich lake in the region of western Lithuania was wiped out during the Stalin reign (1950-55), which meant a great loss for nature, the economy, the way of life of local fishermen and fishing traditions. When we started the excavation of Biržulis in 1978, we also tried to collect ethnographic data from old local fishermen, as the local fishing traditions were ruined. Former fishermen (most of whom were born at the beginning of the 20th century) live in small communities around the lake. In each season of our excavations, we had the opportunity to receive explanations from the old generation of local fishermen about the archaeological artefacts that date back to the Neolithic cultural layer, and explanations about the traditional methods of making such equipment in their families in the first half of the 20th century.

Using these samples, the photographic material, and the comments of old fishermen on the archaeological finds we find every day, we are trying to recreate the manufacture of net floats and weights during the experiments we are currently carrying out and compare them with the Stone Age finds.

15 FISH TRAPPING IN 3D. TECHNOLOGICAL APPROACH TO WOODEN MESOLITHIC FISH TRAPS IN THE SCANDINAVIAN ALPINE AREAS BY 3D MODELLING

Mjaerum, Axel (Museum of Cultural History, University of Oslo) - Friis, Ellen (Museum of Cultural History, University of Oslo) - Gómez, Jorge (CNRS - University of Rennes)

Many mountain environments lack a natural fish population, which has sparked a debate regarding the introduction of fish by humans in these areas. In 2023, archaeologists excavated a 7000-year-old fish trapping enclosure system in the low alpine lake Tesse (850 masl.) in southern Norway. This discovery is the oldest known of its kind in all parts of Scandinavia and is one of the few examples of preserved Mesolithic woodworking in the region. The find provides a unique opportunity to study past fishing traditions, early woodworking, and lithic tool technologies. However, it also creates challenges in handling, documenting and interpreting the fragile and partially decomposed wooden remains.

During the excavation campaign, more than 60 poles were discovered and documented in situ at site, using 2D and 3D imaging, digital measuring, and other techniques. Subsequently, eight of the best-preserved poles were documented with blue light high resolution 3D scanning technology. This work allowing a detailed examination of production and use-wear traces on the wood. By integrating various sources of data, such as analysing the use-wear on stone tools, dendrochronology studies, radiocarbon analysis, and cross-referencing with other archaeological and ethnographic evidence, this study seeks to enhance our understanding of the fish trap and related technologies. This knowledge is vital in uncovering the origins of mountain fishing.

33 EARTHEN ARCHITECTURE AND ITS ENVIRONMENTAL DIMENSION, FROM THE PAST TO THE FUTURE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Pastor Quiles, María (University of Alicante) - Antolín, Ferran (DAI; University of Basel)

Session format: Regular session

Earthen architecture is known in different forms and building techniques, from wattle and daub, to mudbricks, to shaped or rammed earth, and is documented across all time periods and continents (except for Antarctica). Earth is rarely used alone in architecture, but combined with other materials, such as plants. It is a fragile construction type that suffers from erosion and, partially due to its vegetal component, it has even been deliberately damaged by governmental policies (e.g., the sebakh in Egypt during the 19th and 20th centuries). Diverse research has focused on the study of past earthen architecture, although many questions remain open, such as the environmental impact of the extraction of tons of mud from the surroundings of a settlement or its integration into plant economy strategies providing either the support for the construction or as tempering material.

This session welcomes papers dealing with:

- The identification of earthen architecture in unexpected contexts, such as burials.
- New techniques for the study of earthen remains, that help us understand the technology used, the origin of the raw materials (including plants), the maintenance work of the constructions, as well as their original appearance (e.g., painted plaster, but also of the parts of the construction built with more perishable organic materials), including 3D modelling efforts, etc.
- The correspondence between certain earthen construction types and the local environmental conditions and agricultural practices, as well as the environmental impact of earthen constructions.
- The sustainability of archaeological heritage in earthen architecture and current and future challenges regarding its preservation.
- Reflections on the connections between past, present, and future of earthen architecture and the environmental lessons we can learn.

Papers presented to this session will be invited to be submitted to the forthcoming Special Issue on the same topic in World Archaeology.

1 DIACHRONIC APPROACH TO LATE PREHISTORY EARTH BUILDING RECIPES IN SOUTHEASTERN IBERIAN PENINSULA: A MILLENNARY TRADITION OF SUSTAINABLE ARCHITECTURAL PRACTICES

Pastor Quiles, María (University of Alicante; Catalan Institute for Classical Archaeology) - Mateu Sagués, Marta (Catalan Institute for Classical Archaeology) - Jover Maestre, Francisco Javier (University of Alicante) - García Atiénzar, Gabriel (University of Alicante) - López Padilla, Juan Antonio (Museo Arqueológico Provincial de Alicante) - Llorio Alvarado, Alberto J. (University of Alicante) - Barciela González, Virginia (University of Alicante) - Busquier Corbí, José David (Abydos Arqueológica S. L.) - Hernández Pérez, Mauro S. (University of Alicante)

Earth has been widely used by human communities to build all kinds of structures since the beginning of sedentarism. But, have prehistoric mud “mortars” changed over time and regarding their relation to the use of available natural and anthropic resources?

The present work deals with this question by looking at the case of the territories in the Southeastern Iberian Peninsula from the 3rd to the 1st millennia BC. It is based on a comparative macro and microscopic analysis, with major reliance on thin-section micromorphology, of samples from multiple sites from the Chalcolithic to early Iron Age chronologies.

The main aim is to characterise these earthen mixes produced as a building material over time. Also, to address their components and features resulting from their preparation as involved in procurement and reuse strategies (as part of the notion of circular economy) to get the most out of the materials at disposal. Elements included in mud as a building resource, either naturally, by accident or as part of stabilising processes, can be of different origin and nature, from vegetal residues of agricultural activity to pyrotechnological substances, among others. Identifying and studying these ingredients is key to better glimpse past construction practices that have much in common with today’s human needs in terms of architectural sustainability.

2 EARTHEN ARCHITECTURE, ENVIRONMENT AND TASKSCAPES IN NEOLITHIC NORTHWESTERN GREECE

Kloukinas, Dimitris (Numismatic Museum Athens)

Rescue excavations and systematic research during the last three decades have brought to light a wide number of Neolithic settlements and sites in northern Greece. These show variability in both habitation patterns and architecture, and are situated in various geographic and environmental settings. Rubble areas of burned daub belonging to conflagrated post-framed buildings and associated structures are major components of most excavated sites. The superstructural remains offer ample evidence on the soils and sediments used, as well as on the exploitation and processing of timber and other vegetal resources. The latter include, for instance, remains of reeds, leaves/leaflets and plant tempers (chaff, chopped straw and grass-like materials) that are preserved as impressions or in their silicified form. Nevertheless, the analytical potentials of daub remains have not been fully explored.

The current paper focuses on a number of extensively excavated Neolithic sites providing rich assemblages of well preserved superstructural material. They include the extended settlements of Avgi, Kleitos I and Kleitos II, the riverside site of Koromilia and the lakeside settlement of Dispilio in the Kastoria and Kozani Prefectures of northwestern Greece. The attempt will be to approach the interplay between chaines operatoires, taskscapes and environment through the study of daub fragments and relevant architectural evidence. How does the exploitation of certain resources relate to their availability and accessibility in the immediate or more distant surroundings? How do local environments influence the building techniques applied? Are there transformations through time associated with changes in environmental proxies? What were the taskscapes performed by the inhabitants of Neolithic northern Greek communities within different environmental settings?

3 EARTHEN LONG-BARROWS CEMETERY AT SŁONOWICE, SOUTHERN POLAND - MONUMENTAL TOMBS ON THE EASTERN FLANK OF THE TERRITORY OF MEGALITHIC IDEA

Tunia, Krzysztof (Polish Academy of Sciences, Institute of Archaeology and Ethnology)

On the territory of Poland, megalithic structures appeared in the 4th millennium BC within the Neolithic Funnel Beaker culture. Stone tombs of this type were noticed in northern Poland in the 19th century. The loess uplands of the upper Odra and Vistula River basins – in southern Poland – seemed to be an area devoid of this form of sepulchral objects. The breakthrough was the research started in Słonowice in 1979. They led to the discovery of a huge sepulchral complex of the Funnel Beaker culture. The tombs discovered in Słonowice, although referring to the idea of megalithic constructions have specific features. Instead of erratic boulders traditionally serving as the building materi-

al, inaccessible in the loess uplands, local materials – earth and wooden beams – were used to build these structures. The walls were built in the form of palisades and the interior of the tombs – between the walls – was filled with an earth embankment. The sepulchral complex in Słonowice consisted of 11 trapezoidal tombs and a square-shaped place surrounded by the earthen ramparts. It can be assumed to be related to funeral ceremonies.

The fertile loess highlands of the upper Vistula River basin are an area of intensive agriculture from the Neolithic up to now. This activity led to strong erosion processes that completely or almost completely destroyed these monuments of earthen architecture. Nowadays their underground parts can only be discovered by means of aerial photography, Airborne Laser Scanning techniques in forested areas or – by chance – during large-scale rescue excavations.

The immense complex of the earthen funeral architecture in the megalithic rite at Słonowice is the only one fully explored in this part of Europe.

Elaboration of the results of excavations was funded in whole by the National Science Center, Poland, grant no. 2021/43/B/HS3/03024.

4 TELL-TYPE SETTLEMENTS FROM MUNTENIA AND DOBROGEA (SOUTHEASTERN ROMANIA): RAW MATERIALS, FORMATION PROCESSES, AND THEIR LANDSCAPE

Haita, Constantin (Muzeul National de Istorie a Romaniei)

Tell-type sites in Muntenia and Dobrogea are multilayered settlements, attributed to Boian and Gumelnița cultures, dating from the period 4900-3900 cal BC. They are anthropic mounds with circular/oval area, with a maximum diameter of 200 m, marked by delimitation structures, a well-developed stratigraphy, up to 12 m of continuous accumulation, formed by successive construction, occupation and destruction phases, and an organization of the inhabited space. Archaeologically recovered structures are interpreted as fired or unfired structures, passage areas, waste zones, and various zones of activity. Pits and trenches are also identified within the complex stratigraphy of these sites.

Dwellings are made of wood and clay/daub materials and present a detailed micro-stratigraphy, corresponding to the construction and to the successive phases of repairing and fitting out.

The raw materials were available in the vicinity of the settlement. The daub-type material is made either from loess sediments or from fine alluvium, and is mixed with vegetal materials as straw and chaff. Plants, especially those growing in wetlands, were also used for roof and soil matting.

This study presents case studies developed on tell-type sites located in various geomorphologic backgrounds (terrace, alluvial bar, lake shore, island), discussing data on their general stratigraphy and forming processes and emphasizing their relationship with the landscape.

5 NEOLITHIC VINČA-BELO BRDO BUILDING ACTIVITIES

Penezic, Kristina (Biosense institute, University of Novi Sad)

The Neolithic tell-site of Vinča-Belo Brdo with its over 8 meters of Neolithic deposits is a consequence of almost 800 years of continuous living at one place, with numerous building and re-building phases. Damaged by the Danube erosion over the past millennia, and with a long excavation history that started in 1908, this site stands for an absolutely dated yardstick for the phasing of the Late Neolithic in the Central Balkan area. The thick archaeological layers represent deposits of numerous phases of construction of houses typical for the Vinča period. These houses were produced in the wattle and daub technique, consisting of up to three rooms, with ovens inside and elaborate architecture. Recent studies indicated that the sourcing of the building material was done in the vicinity of the site, collecting available underlying sediments for both the daub production and the numerous levelling layers within the settlement. The sheer size of the archaeological layers today indicates monumental environmental alterations with the collection of the raw material. The build environment created in such major construction works modified the appearance of the prehistoric settlement, and probably influenced the perception of both the landscape and the imminent environment of the site for its inhabitants during their lifetime at the Neolithic settlement. This paper will present results of recent studies of environmental proxies related to the site (entomological evidence and biomarker study on house remains) and will try to infer the social dimensions of numerous building phases over a long time span and the rise of the tell.

6 EARTHEN HERITAGE IN THE EASTERN MEDITERRANEAN BETWEEN ARCHAEOLOGY AND SUSTAINABILITY (EARTHHERITAGE PROJECT)

Bombardieri, Luca (Università di Siena) - Amadio, Marialucia (University of Ghent) - Ghislandi, Sabina (University of Genova) - Rellini, Ivano (University of Genova)

The proposed paper aims to present the preliminary results of the EARTHHERITAGE Project, a two-year research programme finalised at the analysis, documentation and preservation strategies of the Eastern Mediterranean earthen architectural heritage, focusing on the island of Cyprus.

Cyprus has been selected as a case study because of the long-established tradition of earthen buildings, which has endured on the island since early prehistory. Through an interdisciplinary and synergic dialogue between archaeological, geoarchaeological and architectural approaches, the purpose of the EartHeritage research programme is to conduct multiscale analyses on earthen architectural evidence in one of the prehistoric contexts of the island, Middle Bronze Age Erimi (ca. 2000-1600 BC), which it has been selected as an exceptional case of good preservation of the earthen structures. The main objectives of the project are: to integrate archaeological and geoarchaeological analyses on prehistoric mudbricks and earthen building materials with in-depth geomorphological and pedological examinations of the natural environment of the southern region of Cyprus; to use the data set resulting from archaeological and geoarchaeological analyses to conduct technical experimentation on implemented earthen products; to verify the applicability of implemented earthen products as sustainable materials in the conservation and preservation practices of archaeological structures in Cyprus; to propose activities for the valorisation of the archaeological context examined by this research programme, leveraging the identity of the earthen architecture on the island.

The data presented in the proposed paper includes the first geoarchaeological and geomorphological results of the EartHeritage project which derive from the analyses conducted in 2023-2024 on archaeological and geological materials collected from the Middle Bronze Age site of Erimi and its surrounding natural environment.

7 TOWARDS SUSTAINABLE CONSERVATION: 'PHYSICAL' CHALLENGES FOR VULNERABLE EARTHEN HERITAGE

Mamma, Rachele (Sapienza University of Rome) - Laneri, Nicola (University of Catania) - Gueli, Anna (University of Catania) - Carafa, Paolo (Sapienza University of Rome)

Earthen building materials renowned for their exceptional versatility and cost-effectiveness, face significant challenges linked to perishability, particularly under adverse climatic and environmental conditions. To address these issues, a proposed solution will involve in future the development of a computer ontology-based platform capable of systematically tracking various restoration methods and the conservation status of earthen architecture, relating them to climatic and anthropogenic factors.

The initial experimental phase of the research entails the fabrication of mudbricks samples and the construction of a mudbrick wall model. In a controlled laboratory environment, simulations are conducted to assess the impact of timing and environmental processes – such as sun and wind exposure, water absorption, vibrations, and chemical air pollution – on the integrity of the mud units. Concurrently, elemental and mineralogical analysis provide crucial insights into the origin of tempers and the compositional characteristics of raw materials.

Methods of conservation and consolidation of the earthen features will be preliminary tested on a local site in Sicily and then applied on the case study of Tel Muhammad, a Babylonian context of the II millennium BCE. This endeavour sets the stage for a more comprehensive understanding of the impact of environmental phenomena and climatic changes on mud architectures.

8 NEW SETTLERS IN NEW FASHION: MUDBRICK ARCHITECTURE AND ITS SOCIO-ENVIRONMENTAL CHALLENGES IN PHOENICIAN EIVISSA

Cutillas-Victoria, Benjamin (Institute of Nanoscience and Nanotechnology, NCSR Demokritos.; Universidad de Murcia) - Lorenzon, Marta (University of Helsinki) - Esquembre Bebia, Marco Aurelio (ARPA Patrimonio SL) - Sanz Kite, Bernia (ARPA Patrimonio SL) - Ramon Torres, Joan (Consell Insular d'Eivissa)

Phoenician colonization brought forth significant cultural and environmental challenges for displaced groups across the Mediterranean Sea. A paradigmatic case of community establishment in new territories occurred during the 7th century BC with the Phoenician colonisation of the island of Ibiza. The arrival of the Phoenicians led to the foundation of two colonies, Sa Caleta and Eivissa (Balearic Islands, Spain), and the appearance of a new building tradition associated with Levantine practices and mudbrick architecture. This contribution aims to present the results of the geoarchaeological study of a representative sample of earthen building materials from these two sites. The analysis utilizes sediments as a reflection of social dynamics. Our methodology combines traditional and multidisciplinary techniques (XRF, XRD, CHN, Granulometry, Petrography, Phytoliths) to extract comprehensive information regarding technological, socio-economic and environmental data. The results revealed distinct catchment areas and different recipes, possibly indicating the Phoenicians' adaptation to Ibiza's specific conditions. Thus, this study provides an opportunity to analyze the development of mudbrick architecture on an island where this building tradition was completely unknown until the arrival of the Phoenicians.

9 UNEARTHING WALLS AND EMPIRES: A GEOARCHAEOLOGICAL EXPLORATION OF ARTASHAT/ARTAXATA, ARMENIA

Holmqvist-Sipilä, Elisabeth (University of Helsinki) - Lorenzon, Marta (University of Helsinki) - Cutillas-Victoria, Benjamin (NCSR Demokritos, Athens, Greece) - Myrsini, Gkouma (M.H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens, Athens, Greece) - Vrydaghs, Luc (MARI - Vrije Universiteit Brussel, Department of Art Studies and Archaeology, Brussels, Belgium) - Lichenberger, Achim (University of Münster, Germany) - Schreiber, Torben (University of Münster, Germany) - Zardaryan, Mkrtich (National Academy of Sciences of Armenia, Yerevan, Armenia)

In this talk, we focus on the geoarchaeological exploration of earthen building materials to offer insights into construction techniques and social structures in the Caucasus. We view these phenomena particularly over an extended period, which is an understudied topic. Artashat/Artaxata, located in the Ararat region of Armenia, presents a long history of occupation and displayed a consistent use of earthen architecture across historical periods. This interdisciplinary investigation explores mudbrick architecture as a proxy for understanding environmental and social dynamics during the 1st millennium BC, employing geoarchaeology, archaeobotany, and building archaeology. The study delves into changes and continuities in architectural forms and practices, reconstructing technological and social processes to address issues such as raw material procurement, material re-use, and the consistency of construction practices. Geoarchaeological analysis of earthen building materials from various parts of the ancient city reveals evidence of material re-use over time specifically between the Urartian and Hellenistic period.

10 BOTANICAL BLUEPRINTS: A CHRONOLOGICAL EXAMINATION AND METHODOLOGICAL ASSESSMENT OF MUDBRICKS FROM ELEPHANTINE ISLAND, EGYPT

Izak, Jessica (DAI Berlin) - Antolin, Ferran (DAI Berlin)

Mudbricks are an essential architectural element of Old Egyptian settlements but there is still very limited information on production techniques and particularly on the types of plant remains used as temper. These may differ for different regions (due to ecological particularities), time periods (due to economic changes) or even according to the type of construction within one chronological phase. This work is a first step towards a comprehensive approach to mud brick production on the island of Elephantine in Egypt, covering the time from the Middle Kingdom to the Greco-Roman period. The study aims to discern variations in botanical components during mudbrick production.

Seven mud bricks and three mortar samples were analysed for composition, with the main focus on botanical remains. Additionally, the research addresses the practicality of mudbrick analysis through applied experiments. A comparative study between flotation in chemical solutions (chloride and sodium carbonate) and the standard wash-over method was conducted. The goal was to identify the quickest and easiest approach, saving the need for mechanical pre-treatment of the mudbricks. Another experiment aimed to determine the optimal subsample size for analysing the organic fraction. Three differently sized random sub-samples were taken, analysed, and compared to establish an efficient sub-sample size, ensuring representative results and reducing the time required for the analysis of large samples.

Preliminary results show notable differences in the botanical remains associated with various historical periods and architectural building structures. These differences add to our understanding of the relationships between mudbrick composition and context. As well as expanding our knowledge of ancient building practices, this research also offers wider insights. Analysing the mudbrick components can serve as a proxy for understanding regional economic dynamics and shed light on resource use and the impact of human activity on the local environment.

11 WALLS MADE FROM EARTH ...EXPERIENCES FROM A ROMAN PERIOD RAMMED EARTH RECONSTRUCTION PROJECT AT XANTEN, GERMANY

Kienzle, Peter (LVR-Archaeological Park Xanten (Germany))

Ancient authors, such as Pliny and Vitruvius, placed earthen constructions to a distant past and to foreign countries. Nonetheless, rammed earth, mud bricks and wattle-and-daub seems to have been a common building material in the Roman lower Rhine area, a region scarce of stone. Next to the scarcity of useable stone, the cost of transport, the availability of the material and the climatic conditions determined the choice of material for many civil houses.

From 2007 to 2014 three two-storey town houses were reconstructed at the LVR-Archaeological Park at Xanten based on evidence gained in a long and detailed archaeological excavation. The reconstruction work employed rammed earth technology, timber framing, and wattle-and-daub. The reconstructed houses show, that rammed earth houses are far from being low and crude cottage-style thatched huts with poor housing conditions. They are indistinguishable from other Roman houses erected in stone or brick.

By now, considerable experience was gained on the construction process, the quality of the living conditions in the buildings and the durability of the material. Our perception of Roman (civil) architecture is determined by the remains of masonry and brick buildings. However, recent and more sophisticated archaeological evidence proves, that large

numbers of buildings made of perishable materials were common in Roman times and in almost all other periods in history.

12 ANCIENT AND MODERN EARTHEN ARCHITECTURE COHABITING IN THE THEBAN NECROPOLIS (LUXOR, EGYPT): PLACING CUPBOARDS, BIRDHOUSES, AND SILOS IN PHARAONIC TOMBS

Oliveira, Ana (American University in Cairo)

For most of the 19th and 20th centuries, the Theban necropolis was filled with modern mud structures with diverse uses, from silos and cupboards (saffat, soma, dulab) for storing grain and other commodities, to sleeping platforms (menama). These traditional devices were usually made of mud mixed with straw tempered and dung. Unfortunately, they are virtually extinct now, and have tended to be overlooked within archaeological contexts. However, during the last decades, these features have gained the interest of several researchers such as C. Simpson, S. Ikram, or M. Correas-Amador, among others.

This paper presents preliminary and unpublished archaeological data of the modern mud structures documented in a series of reused Middle Kingdom (2030 - 1650 BC) and New Kingdom (1550-1070 BC) tombs at Dra Abu el-Naga North, in the concession of the Spanish archaeological mission within the Theban Necropolis. Earthen architecture altered the original plans of the pharaonic tombs, adapting them for inhabitation by the living. Cupboards, silos, dressers, shelves, and pigeon-houses were built in unfired mud by the Qurnawis, the contemporary inhabitants of the necropolis.

Modern and ancient/pharaonic earthen architecture structures and devices coexist in the same site, as attested by a Middle Kingdom funerary garden made of mudbrick (2000 BC), small mud shrines (1550 BC), and plastered mud-brick funerary shafts dating to the Second Intermediate Period (1550 BC). The modern use of earthen architecture is a continuation of an ancient tradition that was once part of the life (and afterlife) of the pharaonic era inhabitants of the necropolis. The understanding and protection of both the ancient and more recent features may offer invaluable insights into the daily life of the modern inhabitants of Egypt (and Sudan), but also of their ancient counterparts.

13 A COMPARATIVE APPROACH TO CONSERVATION AND RESTORATION ANALYSIS OF ARCHAEOLOGICAL EARTHEN ARCHITECTURE IN WESTERN ASIA USING ENVIRONMENTAL AND CLIMATIC DATA

Volpi, Luca (Universidad Autónoma de Madrid) - Lanzaro, Nicola (Sapienza Università di Roma)

As pointed out in one of the meeting reports of the UNESCO World Heritage Programme on Earthen Architecture (WHEAP), there is a lack of comparative studies on the conservation of earthen architectural heritage at a regional level. The present paper aims to discuss a comparative methodology for the analysis of conservation and restoration of archaeological earthen architecture in Western Asia using environmental and climatic satellite data.

Earthen architectures have a tendency to decay in a short time once exposed to weathering. Other factors may participate in the decay of earthen architecture, such as moisture, clay salinisation, the wet-dry cycle, as well as roots, animals, fungi, and human activities. Each archaeological site has unique environmental and climatic characteristics that must be considered when developing effective conservation strategies. However, some sites in Western Asia are subject to similar climatic stresses.

In order to develop a comparative methodology, environmental and climatic data provided by various international organizations (e.g., MODIS, AVHRR, and VIIRS satellite sensors, the Global Wind Atlas, the World Climate Organization, and the World Meteorological Organization) will be used. This data will then be processed in a GIS environment to generate comparative maps. The research will help highlight whether there are substantial differences in conservation and restoration interventions between regions and the challenges faced in different geographical areas. The aim is to propose an approach to compare different conservation strategies and their effectiveness based on various climatic and environmental factors. Furthermore, the analysis of comparative maps will allow us to determine which type of climatic erosion has the greatest impact on the structures of a specific site. The research is part of the EnEAp project, a CIVIS3i-MSCA postdoctoral project funded by the European Union's Horizon 2020 research and innovation programme under grant agreement N°101034324.

34 ARCHAEOLOGY, LANDSCAPE AND SKYSCAPE. HOW MATERIAL ARCHEOLOGY CHANGE AND PERSIST WITH DIFFERENT ONTOLOGICAL AND EPISTEMOLOGICAL INTERPRETATIONS

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Balbi, Jose (Colchester Archaeological Group (UK)) - Gonzalez García, Antonio (Instituto de Ciencias del Patrimonio (INCIPI) CSIC) - Mejuto, Javier (Cultural astronomy Space Sciences. Universidad Nacional Autónoma de Honduras) - Martz de la Vega, Hans (Escuela Nacional de Antropología e Historia de Mexico) - Iwaniszewski, Stanislaw (State Museum of Archaeology, Warsaw,)

Session format: Regular session

This session is dedicated to the SEAC-EAA community and continues the success of the last five years of presentations at the EAA. The studies presented in this session explore the relationship between Material Archaeology, Landscape, and Skyscape, focusing on their ontological and epistemological aspects in Europe and other major cultural regions worldwide. These interdisciplinary studies have played a crucial role in understanding the relationships between different cultures, their interpretation of the heavens and landscape, and the elements established by ancient architecture. Our goal is to investigate people's way of life, practices, and worldviews through the use of new techniques to study the elements established by ancient architecture at archaeological sites and their connection to the landscape or sky. In particular in this session we encourage presentations dealing with how Archaeoastronomy and in particular the study of the orientations, alignments and/or the location of monuments in the landscape and their possible relation with the sky can provide clues into understanding cases of change/resilience in different societies. This modality allows us the contribution of different sciences and is the objective of the session. These are the questions that we aim to answer in the scope of the academic study of the work carried out in the field.

ABSTRACTS

1 CRYPTA BALBI. A ROMAN LANDSCAPE STUDY FROM AUGUSTUS TIME TO THE DNA PROJECT TODAY

Balbi, Jose (Colchester Archaeological Group (UK)) - Balbi, Carolina (Universidad de Buenos Aires - FADU) - Balbi, Lucia (Universidad de Buenos Aires - Facultad de Medicina)

In 1889 the Museo Nazionale Romano was founded as a consequence of the reunification of Italy and with the aim of becoming one of the "centers of historical and artistic culture of United Italy". The Crypta Balbi is one of the four buildings that make up this museum complex and is made up of a complete block in the heart of Rome.

We have carried out measurements and studies of the original architectures in the heart of Ancient Rome and neighboring Campus Martius, which will be described although their astronomical orientations do not present surprises since they correspond to the Roman construction logic of the 1st century Bce.

Our study is part of an evaluation of the architecture and landscape in Roman constructions from the beginning of our era. In a first step we have evaluated the city of Ravenna (Italy) and Arles (France), about which we published our conclusions at the EAA Urban community session at the Kiel Annual Meeting in 2021, with material collected before the Pandemic, and which we return to with the present study.

The Roman Crypta Balbi was conceived as a public space, it had a theater, temples, workshops, habitable places and other amenities. Its history can be followed during the Middle Ages and our work culminates with the "DNA project" carried out among the currently locatable family members, to determine the current locations of the descendants, certain statistics achieved with the DNA matches that make up a long study in progress, which we hope will provide a renewed vision of the Roman cultural legacy from the perspective of Architecture, the contributions of DNA technology and the study of landscape and celestial alignments.

2 THE LEGACY OF THE FOLIATED CROSS: SURVIVAL OF CRUCIFORM SYMBOLS IN THE CHORTI MAYAN CULTURE IN HONDURAS

Mejuto, Javier (Universidad Nacional Autónoma de Honduras) - Rodas-Quito, Eduardo (Universidad Nacional Autónoma de Honduras)

The symbol of the cross has been used by the Mayan culture in different contexts, from cosmological meanings explaining the apparent annual solar movement, to the abstraction of the corn plant, referring to the creation of the world by the god of corn, its time and as a symbol of the earthly world, as it is cultivation is typical of the agricultural cycle and its associated calendar. A classic example of what has been called a foliated cross is clearly represented in the classic archaeological site of Palenque.

The last vestiges of this symbology are reported in the period of the caste war in Quintana Roo, in the northeastern area of the Yucatan Peninsula. The idea of a cycle of agricultural renaissance persists in some communities such as Santiago Atitlán in Guatemala. However, this symbology has not been reported further south in the Mayan cultural area.

This work presents the way in which the foliated cross has seemed to remain within the body of Chortí Mayan beliefs in a syncretic manner with Christian symbolism, in a certain way similar to what was reported in the Mexican state of Quintana Roo. Likewise, possible relationships with the agricultural cycle carried out in a community in the western part of Honduras are sought.

3 THE TEMPLE PUNCHAOCANCHA OF INCA TUPA YUPANQUI ARCHITECTURAL COMPOSITION AND EXCEPTIONAL CELESTIAL ALIGNMENTS

Pinasco Carella, Alfio (Universidad Ricardo Palma)

In the splendor of Tahuantinsuyo, the Inca Empire (ca. 1470), the emperor Tupa Yupanqui arrived to the famous oracular sanctuary of the god Ychsma, the “Maker of the World”, located in a small valley of the arid coastal plains, facing the immense Pacific Ocean and at the foot of the central Andes mountain range. Uplifting the local oracular cult of the sanctuary, he renamed it as Pachacamac, the Inca god organizer-energizer of time-space. The Incas remodeled and enhanced the urban and architectural layout of the sanctuary aligning its structures primarily towards solstices, major lunar extremes, and the rise of Alpha and Beta Centauri (Pinasco 2017, 2022). The urban complex proves to be a great astronomical sanctuary.

As the ultimate imperial paradigm Tupa Yupanqui built, on the fringe of the sanctuary and on the highest hill, the imposing temple Punctaocancha, painted in red, and with the broadest view of the sanctuary, the sea, the river, the valley and the Andes.

The special architectural layout of the Temple and its exceptional astronomical orientation would have had foremost ideological importance for the Inca empire of Tupa Yupanqui, which motivates this present study.

4 ARCHAEOASTRONOMIC DESCRIPTION, LANDSCAPE AND SKYSCAPE OF INKAHUASI DE LUNAHUANÁ

d’Ans Alleman, Barthélemy (Instituto Peruano de Astronomia; Planetarium Maria Reiche)

This work reviews the concept of “New Cusco” to the Inca settlement of Inkahuasi de Lunahuaná proposed by Hyslop (1985) to which Cieza de León also refers in his “General Chronicle” of 1553. Hyslop found similarities and parallels in the functions of the architectural structures between Inkahuasi and Cusco that seem to replicate the mythical-spatial division system of the capital of the Inka Empire during the government of Túpac Yupanqui. The archaeoastronomic orientations have been reviewed and complemented with the landscape and celestial analysis of the complex, also taking into account the new excavations (CHU: 2016) in sectors of sacred spaces and places of worship where small ushnus were found. These new findings are particularly interesting for our analysis, since the ushnu is a main element of the Inca ceremonial apparatus associated with the imperial cult of Tahuantinsuyo associated, among others, with the solar cult. This structure is generally associated with the main sites of imperial settlements where they were astronomically oriented.

5 CHRONOLOGY AND ECLIPSES IN MESOAMERICA. ESTABLISHMENT, RESISTANCE AND ABANDONMENT OF EPOCHS AND GOVERNMENTS IN THE HEGEMONIC CENTERS

Martí de la Vega, Hans (National School of Anthropology and History, Mexico.) - Pérez Negrete, Miguel (Instituto Nacional de Antropología e Historia, Mexico.)

Mesoamerica was a supra cultural area that occupied part of the countries of Central America and Mexico in pre-Hispanic times, and in which peoples such as the Mayans, the Teotihuacans and the Mexicas developed. They recorded in codices, stone monuments, ceramics, and others, the cycles of the celestial bodies such as the Sun, Moon, and Venus, as well as eclipses. They also oriented the architectural structures and layouts of the settlements with respect to the landscape and calendrical-astronomical and mantic principles. Fundamental astronomical phenomena of the Sun have been detected, such as the solstices and zenithal steps, of the Moon as the standstills, and of Venus, as the extremes, as well as some families of days of fundamental intervals and cycles of its calendar and worldview.

All of these aspects were assigned a type of agency (ontology), as the case may be. For example, the agency of the days governed daily activities and tasks, those of the night the dreams and unfoldings, the Venusian questions of war. We study eclipses and detect that they are associated with changes in temporal depth, such as the beginning and end of eras and governments, reflected in the establishment and abandonment of settlements, hegemonic centers. We have it recorded in written history that has lasted since time immemorial and in structures and their orientations, both

reflected in the chronology defined, mainly, by archaeology. Through a narrative, we will show exceptional cases based on the chronology of archaeological sites that functioned as hegemonic centers for vast regions of land.

6 ANCIENT SKIES: PROGRESS AND ISSUES WITH DIGITAL TOOLS APPLIED TO ARCHAEOASTRONOMY

González-García, Antonio César (Instituto de Ciencias del Patrimonio, Incipit)

Nowadays, it is customary to use several digital tools for the archaeological research. All of them are also applied and with increasing interest in the field of Cultural Astronomy and particularly in Archaeoastronomy. Besides, this field is producing some tools of its own that can also be of use to mimic phenomenological approaches within the field of landscape archaeology, for example.

In spite of these, many of them are some times used to substitute field work, particularly troublesome is the indiscriminate use of Google Earth satellite images to derive measurements of orientations. Although this is a useful tool in several cases, it must be used with care and caution (see, e.g., Rodríguez-Antón et al. 2017).

In the present talk I’d like to review the digital methods presently used to derive data for archaeoastronomy, see how they are used, indicate a number of possible problems, and also a few ways forward to move in the future years in the aim of delving these tools as a complement for our data gathering and analysis, to enhance the and complement the interpretation of their skies by ancient peoples.

7 ANOTHER LOOK AT SKYSCAPE

Iwaniszewski, Stanislaw (Posgrado en Arqueología Escuela Nacional de Antropología e Historia - Instituto)

In all disciplines, scholars seek to examine the subject matter and produce a body of knowledge about their specific fields of inquiry. To describe the results of their explanations and interpretations, they often use concepts that help identify the topics we study. These concepts, like scientific knowledge, are subject to change. As soon as a concept is introduced to a field, it has the potential to serve multiple purposes, and its meanings can evolve over time. Consequently, the meanings of the concepts are often reviewed and revised.

The concept of skyscape was first defined in the mid-2010s when Fabio Silva and Nick Campion co-edited a book entitled *Skyscapes: The Role and Importance of the Sky in Archaeology* (Oxford: Oxbow Books 2015), and coincided with the launch of the *Journal of Skyscape Archaeology*. The term is synonymous with that of archaeoastronomy but is believed to be more neutral and value-free than the former one.

Fabio Silva, Daniel Brown, and others started to employ a triadic scheme of “scape” terms such as skyscape, landscape, and seascape, which may be understandable in the British context but hardly adaptable to other regions. Recently, in 2022, Fabio Silva presented a paper in which he justified the use of this concept in archaeoastronomy.

Despite multiple attempts, scholars have yet to conduct a more comprehensive study of human-celestial relationships in the past. In this paper, I aim to explore the concept of “skyscape” from various angles. I suggest that skyscapes are a temporal phenomenon that is entangled with the forms of dwelling and being of its inhabitants. To better understand how skyscapes are created, I plan to focus on various factors such as affordances, activities and tasks, signs, and systems of cognitive representations.

8 SKYSCAPE, RELATIONAL LANDSCAPE, AND THINGNESS AT TZINTZUNTZAN ARCHAEOLOGICAL SITE

García Reyna, Ricardo Arturo (Escuela Nacional de Antropología e Historia.)

The archaeological site of Tzintzuntzan, located in the current state of Michoacán, Mexico, was one of the main capitals of the Purépecha dominion. Previous studies in Archaeoastronomy rule out that the orientation of its architecture responds to celestial phenomena. However, data collected in our 2022 fieldwork season demonstrates the opposite.

First, we present the new findings in the orientation of the architecture (Yácatas), the surrounding landscape, and the apparent movement of the solar disk over the horizon. We discuss this evidence through the concepts of “skyscape” by Fabio Silva and “relational landscape” by Stanislaw Iwaniszewski.

Subsequently, relying on Heidegger’s ideas about the thing, we question the thingness and being-in-itself of the pre-Hispanic architecture of Tzintzuntzan. We discuss that pre-Hispanic architecture’s form, location, and orientation are aspects of its thingness, as well as the relationships with the landscape, celestial forms, time intervals, and human activities. The thingness of architecture lies in its ability to trigger relationships between the different elements and actors that surround it.

9 THE CULTOON STONE CIRCLE

Mom, Vincent (Digital Preservation Projects Foundation) - Higginbottom, Gail (Instituto de Ciencias del Patrimonio (Incipit))

In a moorish area on the peninsula of Rhinnes on the island Islay, about 5.5 miles North East of Portnahaven (Portnah-abhainne) lies the stone circle of Cultoon. The Cultoon circle is the largest of three on the island of Islay. Of 14 stones, currently two are more or less standing upright, the others have fallen, or have never been standing on their envisaged positions. Excavated in 1974 and 1975 by the Islay Historical Works Group (Euan MacKie), their conclusion was that it was abandoned in the middle of construction. Richards, in his book 'Building the Great Stone Circles of the North' (2013), puts the emphasis of such circles on the actual building process, instead of the finished result. However, as the actual building process was not completed we theorise a different possibility. Rather, that this incomplete monument is a possible reference to, and provide clues of, change, and thus in this way, it could perhaps be a "monument of the moment" of change, where moment has an unknown length of time, and is not restricted to a single cause. Also, the littered and cluttered site has become a memory-scape of a dramatic event, perhaps encapsulating the failure of the construction as well as the changes that occurred externally. We combine information about cultural changes occurring in Britain at the time of Cultoon's creation, along with data about the uniqueness of Islay's standing stone orientations overall, with the newest landscape and astronomical information we have created for the site of Cultoon, to discover something of the mystery of this monument and its place in the changing world of the Late Bronze Age. Our digital landscape and astronomical tools are Horizon and Stellarium, along with the 10m elevation data available from the Ordnance Survey in Britain.

10 GEOMORPHOLOGICAL AND ARCHAEOASTRONOMICAL ANALYSIS OF AN EARLY TO MIDDLE NEOLITHIC LANDSCAPE, CRANBORNE CHASE, SOUTHERN BRITAIN

Burley, Paul (University of Minnesota)

Cranborne Chase in southwest England is a well-known area of Neolithic archaeology where a nexus of population growth, cultural evolution and resource extraction during the 4th millennium led to development of one of the highest densities of earthen monuments, including numerous long barrows, the largest and longest cursus in Britain, and many other structures. Natural physiographic characteristics of the study area in tandem with anthropomorphic modification of local vegetation patterns on the downs since the Mesolithic provided a distinctive setting where the Early- to Middle-Neolithic cultural landscape developed. However, reasons for siting monuments at certain locations within the complex chalkland landscape, the purpose of specific and unique architectural forms and features of the earthen structures, and spatial relationships between the pattern of monuments and elements of the surrounding environment as a whole remain largely enigmatic. This paper presents methods and results of an astrometric analysis of topographic position, monument orientation, and viewscape from earthen monuments at Cranborne Chase. Results of this study demonstrate that spatial and temporal relationships between the earthen structures and elements of the surrounding landscape, seascape, and skyscape are key to recognizing and understanding the symbolism and signification expressed by the monumental architecture. The cultural landscape – including the pattern of both natural features and earthen monuments at Cranborne Chase, the South Hampshire Lowlands, and surrounding region – expresses spatial and temporal unification by alignment between Earth and sky, and the living and the dead. In that way, the cultural landscape is related to a Neolithic cosmology emphasizing features of the landscape and skyscape.

37 LANDSCAPES OF SUSTAINABILITY: RESOURCE EXPLOITATION IN THE MEDITERRANEAN

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Nixon, Lucia (Wolfson College, Oxford) - Kopal, Elif (Mimar Sinan Güzel Sanatlar Üniversitesi)

Session format: Regular session

In the Anthropocene, the interaction of humans with their environment is mostly defined by resource exploitation. Recently archaeologists have realised that many of these interactions are based on a desire for sustainability; in some cases there is clear evidence for human intention to make resource exploitation sustainable. In this Regular Session we want to look at archaeological evidence for sustainability in the Mediterranean past, and how sustainability can dovetail with resource exploitation.

Landscape archaeology gives us a very useful perspective to investigate both the dynamics of resource exploitation and ways of managing specific landscape features (arable land, pasturage, coastlines, wetlands, highlands). It seems likely that sustainability was often built into resource management, including production above subsistence. Sustainable strategies would enable people to manage predictable risks to their resource base, such as crop failure or temporary scarcity of grazing land.

In societies practising agriculture and animal husbandry, there are usually four main resources – arable land; pasturage or grazing-land; water or the means of procuring it; and connectivities of various kinds. In order to maximise resources, people may invest in agricultural terraces; they may find ways of separating agriculture from grazing-land; they will need to manage water; and they will also need to determine the patterns of connectivity which will enable them to select resources efficiently. Other resources may be relevant too (potting clay, trees, quarry areas, ore sources). Archaeological evidence can help us to detect and date resource strategies, in order to see how different kinds of exploitation fit together in a specific landscape.

We look forward to abstract submissions using archaeological evidence to suggest patterns of sustainable resource exploitation in specific Mediterranean landscapes, and to having energetic discussions on approaches to ecological sustainability in various Mediterranean economies.

ABSTRACTS

1 ENVIRONMENTAL IMPACT ON PLEISTOCENE CRETE: FAUNAL TURNOVER AND RESOURCES IN AN ISLAND ECOSYSTEM

Strasser, Thomas (Providence College)

It is long known that in island environments the endemic fauna is susceptible to extinction by humans. There are many examples of *Homo sapiens sapiens* doing precisely that in relatively recent times. Crete has been an island for all of hominin evolution. In Late Middle Pleistocene Crete (ca. 300,000 BP), there was a major turnover in the faunal suite from the Kritimys (dwarf elephants, hippopotami and large mice) to the *Mus* biozone (large elephants, smaller mice, deer both dwarf and normal size). *Homo heidelbergensis* was on the mainland by this time, and it is suggested here that this hominin was on Crete and may have factored into this faunal turnover.

In the Aegean this hypothesis has not been addressed much due to the lack of evidence for pre-Holocene hominins on the islands. This lacuna, however, has been filled by recent archaeological discoveries on the islands of Crete, Gavidos and Naxos. There is also evidence from Flores that demonstrate pre-*H. sapiens sapiens*' seafaring abilities and suggest their potential causality of the extinctions there. Since the endemic fauna were naive due to lack of predation, they were unafraid and easy to hunt. If hominins contributed to the faunal turnover on Crete, the prey would have sustained the hunter-gatherer group for a time, but in the long run, hominins would have needed to reconsider their resource base. Late Pleistocene and Holocene extinctions are reviewed to examine the scenarios for such an event on Crete, and their impact on resource management and sustainability.

2 AUTUMN LAMBING IN THE MEDITERRANEAN: THE ANCIENT HISTORY OF A SUSTAINABLE PRACTICE

Balasse, Marie (AASPE CNRS MNHN Paris France) - Gutierrez, Eléa (AASPE CNRS MNHN Paris France) - Sierra, Alejandro (Departament de Prehistoria, Universitat Autònoma de Barcelona, Spain) - Pignaut, Pierre (AASPE CNRS MNHN Paris FRANCE) - Gourichon, Lionel (CEPAM CNRS, Université Côte d'Azur, Nice France) - Bréhard, Stéphanie (AASPE CNRS MNHN Paris FRANCE) - Alhaique, Francesca (Servizio di Bioarcheologia, Museo Delle Civiltà, Roma, Italy) - Fidanoska, Aneta (Archaeological Museum of Republic of North Macedonia, Skopje, North Macedonia) - Balasescu, Adrian (Romanian Academy · Institute of Archaeology, Bucharest, Romania)

Agropastoral systems in the Mediterranean take a great variety of forms in response to a wide range of climatic, orographic and socioeconomic contexts. The predominance of caprines (sheep and goat) is a frequent common feature, and a particularity is the existence of autumn lambing. Annual rhythms of pastoral systems are strongly determined by animal births season, which defines the annual availability of animal products (milk in particular) and the organization of agropastoral tasks. In temperate latitudes, ewes alternate on an annual scale between a period of fertility and a sexual rest. This reproductive cycle, inherited from their wild ancestor, is mainly driven by the photoperiod. In contrast to the dominant pattern of spring lambing in today's temperate Europe, in the Mediterranean area lambing can also be scheduled in autumn, bringing benefits in terms of use of natural resources. Autumnal lambing in the Mediterranean is enabled by the conjunction of three factors: (i) the physiological capability of some Mediterranean breeds for an "out-of-season" fertility period; (ii) intentional scheduling by the herder, by separating females and males and reuniting them in the spring; (iii) abundant forage resources to support autumn lactation: in present-day Mediterranean climate, autumnal rains create favorable conditions. In this regard, autumnal lambing constitutes a form of sustainable pastoralism in the Mediterranean area. Recent studies involving stable isotope analysis in sheep teeth showed autumn lambing in the early and middle Neolithic (6th and 4th mill. BCE) in the northwestern Mediterranean, suggesting that all three conditions were met at least in different occasions in the past. We will present new findings on sheep birth season and the occurrence of autumn lambing in Neolithic contexts across the northern margin of the Mediterranean over a broad longitudinal range from North Macedonia and Greece to southern France.

3 UNVEILING SUSTAINABLE FARMING STRATEGIES IN THE LATE BRONZE AGE ARGIVE PLAIN, GREECE: A CRITIQUE AND APPLICATION OF CARRYING CAPACITY ANALYSIS

Timonen, Riia (Leiden University)

This presentation critically examines the use of carrying capacity analysis as a tool for studying sustainable farming strategies in the Bronze Age Mediterranean. It identifies key factors influencing regional carrying capacity and assesses whether these factors reflect intentions toward sustainability in past agricultural decision-making.

Sustainability in food production was crucially important for the Late Bronze Age (LBA, c. 1600 – 1200 BCE) communities inhabiting the Argive Plain, located in the northeastern Peloponnese, Greece. Given the region's dense settlement pattern within a notably confined subsistence area, it serves as a unique context for investigating sustainable farming strategies.

Three key factors – agricultural space, crop yields, and labor organization – have previously been identified as having a notable impact on the carrying capacity of the LBA Argive Plain. While archaeological evidence suggests that spatial limitations might have been alleviated by terracing, low-scale irrigation and manuring, labor costs related to these strategies may have made them unsustainable in the long term. In addition, the organization of Argive Plain communities – whether in large central settlements or small agricultural hamlets – affected the arrangement of different farming tasks and, consequently, their long-term sustainability.

This paper suggests that notable changes in regional carrying capacity, the maximum population size that can be comfortably sustained in a specific environment, reflect levels of regional sustainability. Measuring the scale of changes to the carrying capacity caused by a set of known Late Bronze Age farming strategies can shed light on the ways local farmers made decisions and whether they aimed for long-term sustainability or more immediate rewards in terms of food security.

4 UNRAVELING MULTIFACETED RESOURCE MANAGEMENT: INVESTIGATING DRY STONE WALL SYSTEMS IN MEDITERRANEAN CROATIA

Fera, Martin (VIAS - Vienna Institute for Archaeological Science, University of Vienna) - Doneus, Michael (Department of Prehistoric and Historical Archaeology, University of Vienna) - Doneus, Nives (VIAS - Vienna Institute for Archaeological Science, University of Vienna)

Dry stone walls, as a ubiquitous feature worldwide, play a significant role in shaping landscapes and reflecting the cultural heritage of regions. While they have garnered increased attention in Croatia, particularly in landscape architecture and historical geography, archaeological research on these structures remains limited, largely due to challenges posed by dense vegetation cover such as evergreen maquis.

This presentation will focus on a case study from the Mediterranean region of Punta Križa, on the island of Cres in Croatia, where dry stone walls are prevalent. Our research utilizes Airborne Laser Scanning (ALS) technology to create high-resolution digital feature models, offering a viable method for large-scale documentation in areas obscured by dense vegetation. Through the integration of ALS data with Geographic Information Systems (GIS) and a Harris Matrix framework, our spatio-temporal interpretation reveals a wealth of information on the complex sequence of human activity associated with dry stone wall systems.

By examining the intricate network of dry stone walls within the Punta Križa landscape, we aim to demonstrate the multifaceted nature of these systems and their role in shaping regional dynamics over time. Additionally, we will explore how the study of dry stone walls contributes to our understanding of vernacular agro-pastoral practices, cultural adaptations, and landscape evolution in the Mediterranean context.

Through the presentation of our methodology, findings, and interpretations, we seek to highlight the importance of archaeological research in elucidating the significance of dry stone wall systems and their broader implications for understanding human-environment interactions in Mediterranean landscapes.

5 LIVING OFF/WITH THE LANDSCAPE IN THE HINTERLANDS OF ATHENS: INSIGHTS FROM THE KOTRONI ARCHAEOLOGICAL SURVEY PROJECT (KASP) AT ANCIENT APHIDNA

Kinnaid, Tim (University of St Andrews) - Dakouri-Hild, Anastasia (University of Virginia) - Davis, Stephen (University College Dublin) - Andrikou, Eleni (Ephorate of Antiquities of East Attica)

The Kotroni Archaeological Research Project (2019-2023) centers on understanding the relationship between the natural and human landscape from prehistory through the present day in the diachronic landscape of Aphidna and its immediate catchment area. Aphidna, being a rather remote rural site near the border of ancient Athens is an excellent case study for the ambivalent and frequently pivotal role of so-called 'marginal' sites relative to 'core' ones. Aphidna was on one hand steeped in the foundational history of the Athenian polis, which saw in it a primordial, ancestral place tied to its own myths and legends. On the other hand, it was regarded by Athens as a rustic, charming frontier that

in some ways existed in its own world. In this paper, given the interesting dynamic of this particular landscape (both 'belonging', and 'other/distant/frontier'), we seek to tease out evidence about long-term, diachronic sustainability practices in the Aphidnian landscape. We examine approaches to arable land and erosion management in the form of terracing, the utilization of local resources in the immediate vicinity of the site (such as pottery and brick clay, marble, and iron ore), and the management and usage of water in the form of mills and other waterworks. We also take a detailed look at the archaeological record compiled through intensive survey, to determine how self-sufficient the local community was and to what extent it reached out to Athens and other areas beyond to access goods that made a demand of the environment. The picture emerging from ancient sustainability practices is then juxtaposed with less sustainable major infrastructure works in the area, namely the modern Marathon dam, which radically altered the landscape in the early 20th c. to provide water for modern Athens.

6 SUSTAINABLE AGRICULTURAL PRACTICES IN THE IONIAN CHORA: RURAL SETTLEMENT PATTERNS AND TERRACE FARMING

Koparal, Elif (Mimar Sinan Fine Arts University)

KLASP is a survey project conducted in Urla – Çeşme peninsula at the western tip of Anatolia. Field surveys combined with remote sensing and spatial analysis investigated the rural landscapes around the polis centres and diachronically recorded sites. It is a common phenomenon that the surface visibility of the rural sites is relatively much lower. Also dating is a problem due to the use of much simpler coarse wares instead of well-identified fine wares. In order to tackle this obstacle, the terraces and the olive groves mapped by making use of aerial and satellite images as well as pedestrian surveys. A model was created by using the distance to terraces, rock-cut presses and basins, olive groves as a parameter for a sampling strategy for areas to be covered by intensive surveys. This led to the discovery of quite a few number of rural sites and documentation of terraces. Historic Landscape Characterization (HLC) is also used as a tool for measuring the changes in land use practices.

Terraced landscapes have been crucial to rural development and demonstrated a model for sustainable and multifunctional land-use systems. This paper covers the morphology analyses for defining the history of terrace agriculture in the peninsula, and land use dynamics during the Iron age in the chora of Ionian poleis. It is known that terrace farming has been applied since ancient times in many arid and semi-arid regions of the world as one of the basic elements of land use and food production system in order to develop a sustainable land-use by expanding the potential of arable land. It is also crucial to understand the interactions between the city and the country during the antiquity. From this perspective this paper investigates the agro-pastoral economy of the polis states in Urla-Çeşme peninsula.

7 LANDSCAPE ARCHAEOLOGY AND SUSTAINABILITY IN GRAECO-ROMAN SPHAKIA, SOUTHWEST CRETE

Nixon, Lucia (Wolfson College, Oxford)

Sphakia is a former eparchy, now deme, with a large area (466 km²) of highly dissected terrain and a wide altitudinal range: in only 16 km, the landscape changes from palm trees on the coast to elevations of approximately 2400 m. Sphakia is dissected by some 15 gorges running south to the Libyan Sea.

The Sphakia Survey covers three main epochs: Prehistoric (PH), 4500–900 BC; Graeco-Roman (GR), 900 BC–AD 961; Byzantine-Venetian-Turkish (BVT), AD 961–1898. Information was also collected for the 20th and 21st centuries.

This paper's methodology is based on two assumptions. The first is that we are largely dealing with agropastoral economies usually made up of free land-owners. The second is that free agropastoralists would instinctively want to be sustainable, using resources without using them up, especially if they wanted to produce above subsistence.

Indications of agropastoral sustainability in dissected terrain include the following. First, planted arable needs to be as separate from pasturage as possible. Second, in hilly areas like Sphakia, it is likely that people will use terracing to maximise slopes with enough soil for planting, and to prevent soil erosion. Third, bees do not require arable; it is better to put larger numbers of beehives in stonier places on which enough plants will grow to provide bee fodder. People who separate arable and pasturage, terrace slopes to create 'extra' arable, and place larger numbers of beehives away from arable spreads may be deliberately employing strategies for sustainability. Fourth, it is likely that people will attempt to make use of all available altitudes, possibly on a seasonal basis.

In this paper, I focus on agriculture, pastoralism, bee-keeping, and where possible, the use and management of cypress timber. The Graeco-Roman evidence suggests that people were using sustainable strategies for most of these activities.

8 HOW TO HYDRATE (IN) AN ANCIENT METROPOLIS: RESOURCE EXPLOITATION FOR SUSTAINABLE WATER SUPPLY IN PERGAMON

Korkut, Y. Berslan (Department of Archaeology and History of Art, Koç University, Istanbul, Türkiye) - Becker, Fabian (Department of Earth Sciences, Institute of Geographical Sciences, Freie Universität Berlin, Germany)

Since the beginning of research in Pergamon in the late 19th century, scholars recognized the significance of studying the surrounding landscape to understand the city itself. Early researchers such as Alexander Conze (1831-1914) likened Pergamon and its environs to a cohesive entity, conceptualizing Pergamon as the head and its surroundings as the body. Thus, understanding the body became imperative to comprehend what nourished the head.

In line with this understanding, the current paper specifically focuses on the material resources used in the construction of water supply systems that sustained the growing population of Pergamon with fresh water from distant sources within the micro-region 2nd century BCE onwards. The examination includes pivotal structures such as the earliest pressure pipeline, the Attalos Pipeline (2nd century BCE), and the extensive 42 km Madradağ Pipeline (2nd century BCE), as well as the notable Kaikos-Line (2nd century CE), which was built to meet the growing demand of the Roman Pergamon, boasting over 45 aqueducts, among these, the monumental Karkassos Aqueduct standing at approximately 42 meters in height and 530 meters in length. The paper aims to quantify the material resources exploited for these infrastructure-building programs, such as the volumes of clay for water pipes; stones, rubble, and mortar for aqueducts, and firewood for production.

For this purpose, the ongoing research program, “The Transformation of the Pergamon Micro-Region Between Hellenism and Roman Imperial Period” (TransPergMicro), provides a sturdy foundation with a conceptual socio-ecological model for interdisciplinary collaboration among Archaeology, Physical Geography, and Historical Building Research (Bauforschung).

By adopting a diachronic approach, this study aims to illustrate the considerable effort and resources invested in establishing a sustainable water supply for Pergamon, thereby shedding light on the historical evolution and challenges encountered in ensuring the city’s water resilience.

9 ENGINEERING SUSTAINABILITY: ROMAN DAMS AND WATER MANAGEMENT IN THE MEDITERRANEAN AGRICULTURAL ECONOMY

Sökmen Adali, Emine (Social Sciences University of Ankara)

Resource exploitation in different contexts points to various forms of practices, landscapes, and management strategies throughout the Anthropocene. This paper focuses on the Romans’ water management systems, with a particular focus on dams, to illuminate how they endeavored to achieve sustainability within the Mediterranean’s agricultural economy. By examining archaeological evidence and historical records, this study highlights Roman dams not merely as feats of engineering but as pivotal components of a broader strategy aimed at harmonizing resource exploitation with environmental stewardship.

In the context of the Mediterranean’s climate, topography, and agricultural demands, Roman water management strategies exhibit a profound understanding of sustainable practices. The Romans integrated traditional knowledge with innovative engineering to develop dams that ensured a reliable water supply, mitigated the risks of water scarcity, and supported extensive irrigation. These endeavors were crucial for sustaining agricultural productivity, supporting the empire’s economy, and maintaining the social fabric in a region prone to environmental fluctuations.

By exploring the multifaceted role of Roman dams—from enhancing arable land and managing pasturage to securing water resources and facilitating connectivity—this paper argues that Roman’s approach to water management exemplifies a model of sustainable resource exploitation. The archaeological evidence of Roman dams in the Mediterranean landscape serves as a testament to Roman’s legacy in integrating sustainability into the fabric of its resource management strategies.

10 FADING CITIES. HYDRAULIC INSTALLATIONS IN LATE ANTIQUE AND EARLY BYZANTINE POMPEIOPOLIS

Tatbul, Mustafa (Bartın University) - Brizzi, Massimo (Durham University) - Ricci, Giovanni (Cooperativa Archeologia, Italia)

The excavations carried out since 2009 by the Turkish-Italian expedition in Zimbilli Tepe (District of Kastamonu, Central Anatolia) commonly identified as the site of the Roman colony of Pompeiopolis in Paphlagonia, have exposed evidence of the transformation of a rich Late Antique urban residence into a rural site through successive phases.

The activities that can be recorded during this transformation have as their common thread the creation, replacement, adaptation and reuse of infrastructures in terms of the use of water related facilities: its transport, conservation and disposal. In this paper we will try to interpret different “water economies and water related management strategies

both fresh water and waste” that have occurred in the private space of this block in relation to the construction and abandonment of public city infrastructures, such as aqueducts and sewers, and also the transformation of the surrounding landscape using other proxy palaeo-environmental data coming from the deposits investigated in the water facilities themselves and various other archaeological contexts. We hope to demonstrate different strategies in terms of water sustainability among the different phases of the Domus.

42 EUROPE-SOUTH ASIA RELATIONS IN THE MEDIEVAL AND MODERN PERIODS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Hueglin, Sophie (University of Tuebingen; Newcastle University) - Arfeen-Wegner, Percy (Ruhr University Bochum) - Hauser, Mark (Northwestern University) - Tripathi, Sila (National Institute of Oceanography (retired))

Session format: Regular session

In this session, we would like to give voice to the usually silent witness – the material evidence – of the trade and maritime connections between South Asia and Europe. The focus will be on the medieval and modern periods where it is mostly possible to combine historical sources, material evidence and sometimes even oral tradition. We think of topics like:

- the gemstone trade with Europe
- the spice trade evidence at ports like Muziris or Rome
- underwater remains like shipwrecks with cargo (e.g. teak timber or Basel Mission tiles) as witnesses of trade and exchange between the two regions
- the influences on the built environment through colonization and mission activities
- the activities of different colonizing nations or missions of different persuasions
- the evidence for change or resistance to new lifestyles and mindsets in both regions
- the absorption of South Asian products, religions, and cultures in Europe.

While presenting our research, we would like to discuss at the same time how research and teaching on this topic might need to be decolonized in the future.

ABSTRACTS

1 TRADE BETWEEN THE ROMAN EMPIRE AND ANCIENT INDIA, A REVIEW OF ARCHAEOLOGICAL & LITERARY SOURCES

Kumar, Pardeep (Assistant Professor, Deptt of History, Kanya Mahavidyalaya Kharkhoda, Sonapat, Haryana, India) - NAVNEET, NAVNEET (JMI UNIVERSITY NEW DELHI INDIA)

The trade interactions between Ancient India and the Mediterranean world constitute a pivotal aspect of ancient commercial history, elucidated primarily through the combined lenses of archaeological evidence and literary sources. Delving into the nuances of this historical exchange necessitates a meticulous examination of material remains and textual records, each offering unique insights into the multifaceted dynamics of ancient commerce. Research on the trade between the Roman Empire and Ancient India was started in 1946 by Sir Mortimer Wheeler and French archaeologist J.M. Casal at Arikamedu near Pondichery in. Archaeological finds, especially in Arikamedu and Pattanam the ancient Muziris provide excellent corroborative evidence for its trade relationship. Only from few sites –such as Arikamedu, Pattanam, Kaveripattanam and Kanchipuram archaeological reports have been published. Roman Empire

artifacts like pottery, glass objects and coins were found at these sites during recent excavations. The south Indian sites of Muziris and Arikamedu, occupy central positions within this intricate web of commerce, as evidenced by its mention in ancient texts. In this paper, we endeavor to synthesize archaeological and textual evidence, focusing on pottery, glassware, stone objects, and coins, to unravel the intricacies of Roman-Indo trade relations, thereby contributing to a nuanced understanding of ancient commercial network.

2 TIDES OF SPICES - COMMODITIES, LUXURY, AND VALUE IN THE PRE-MODERN INDIAN OCEAN

Autiero, Serena (Ruhr Universität Bochum)

This paper delves into the historical, cultural, and economic aspects that contributed to the transition of Asian spices from being coveted luxuries to essential staples in the Mediterranean with a diachronic perspective.

Initially, spices such as black pepper, cinnamon, and cloves were perceived as symbols of luxury, reserved for the affluent elite due to their rarity, exotic origins, and arduous procurement. Spices not only enhanced taste but also served practical purposes (e.g. as preservatives). Moreover, the use of spices extended beyond their culinary applications, encompassing their use in perfumes, medicines, and religious rituals.

The transition of some spices, such as black pepper, from luxury to staples in the Mediterranean world in ancient times can be attributed to a confluence of factors, including expanding trade networks, improved transportation systems, and changing socio-economic dynamics. These factors can be analysed through the lenses of globalization studies and connected theories. In particular, the gradual reduction in the cost of transportation, coupled with increased accessibility, facilitated the integration of spices into everyday life.

While archaeological findings, historical records, and written sources can provide insights into the distribution, consumption, and perception of goods in ancient societies, they can only offer a limited understanding of their value and distribution, therefore of their status. In short, we face the dilemma of assessing value without using quantitative methods. Therefore, understanding the social and economic dynamics of the time is crucial.

This abstract, drawing from historical texts and archaeological evidence, provides insights into the changing perceptions of spices, tracking a narrative of transformation from luxury to staple. This shift highlights the dynamic interplay between commodities and culture.

In conclusion, the assimilation of Asian spices into everyday life in the Mediterranean world offers room for wider discussions about ancient global trade and its transformation over time.

3 LOOKING FROM THE EAST: TRADE ROUTES AND MARKET CENTERS IN MEDIEVAL EURASIA

Papa, Luca (SAGAS, Università degli studi di Firenze, Italy) - La Salvia, Vasco (DISPUTER, Università G. D'annunzio Chieti, Italy) - Moderato, Marco (CASES, Universitat Pompeu Fabra, Spain) - Merola, Antonio (DIRIUM, Università di Bari, Italy) - Ganimede, Sara (DISPUTER, Università G. D'annunzio Chieti, Italy) - Vadakkiniyil, Dinesan (Kerala Council for Historical Research, India) - Petřík, Jan (Masarykova University, Czech Republic) - Hill, David (APAC Carlsbad, New Mexico)

This paper examines the material evidence of trade and maritime connections between South Asia and Europe, focusing on the Malabar harbour of Madayi during the Middle Ages. Situated on a laterite plateau overlooking the Kuppam river delta and the Indian Ocean, Madayi served as a crucial hub for maritime activities. Nonsystematic archaeological surveys reveal human activity from the early medieval to the Colonial period in key areas such as the Jewish Pond, the Fort, and the Mosque. A significant aspect of the study revolves around the examination of imported ceramics, particularly Chinese celadon pottery or so-called 'green ware', as a crucial marker of trade connections. The research underscores the prevalence of these ceramics in major ports along the Indian Ocean, both in the western and eastern spheres. However, the scarcity of such evidence in the Mediterranean challenges prevailing Eurocentric viewpoints, prompting a reevaluation of the medieval world system.

By spotlighting the peripherality of Europe in the medieval world system and emphasising the interconnectedness of regions extending from the Arabian Peninsula to the southern Chinese seas, the study prompts a critical rethinking of traditional narratives. The findings highlight the need for a more inclusive and nuanced understanding of historical trade routes, thereby enriching the discourse on the material evidence of South Asian and European connections in the Middle Ages.

4 EUROPEAN PERIOD SHIPWRECKS IN INDIAN WATERS

Tripati, Sila (CSIR-National Institute of Oceanography (retired))

The history of European shipwrecks began in Indian waters after the arrival of Vasco da Gama at Kapukad in Kerala, west coast of India on 17 May 1498. The marine and other related documents state that between the 15th century and 18th century CE several ships were wrecked off Goa, Cochin, Lakshadweep, Odisha and other waters off India during their journey from the European countries to India and back. A majority of the ships have wrecked due to storms,

hidden rocky reefs, woodborers, unskilled navigation, etc. The CSIR-National Institute of Oceanography (NIO), Goa, has undertaken the exploration of shipwrecks off Goa, Mincoy, Poompuhar, and Konark. In this paper, the Portuguese shipwreck in Sunchi Reef off Goa, which led to the recovery of storage jars, barrel of handgun, Chinese ceramic, elephant tusks, hippopotamus teeth, guns, iron anchor, gunshot, bases of glass bottles, lead pipes and sheets, copper strap, stone and clay bricks and many dressed granite blocks has been discussed. Among the shipwrecks explored in Indian waters, the wreck at Sunchi Reef is the oldest and is evidence of Indo-Portuguese trade and commerce during the early 17th century CE.

5 BEYOND EAST VERSUS WEST: EXPLORING THE DYNAMICS OF ARCHITECTURAL PRACTICES IN MALABAR, C. 15TH-17TH CENTURIES

Arfeen-Wegner, Percy (Centre for Religious Studies, Ruhr University Bochum)

Conventional narratives have traditionally depicted a significant rupture in architectural traditions across Malabar, South India, with the advent of Portuguese influence in the 16th century. While acknowledging the era's marked socio-economic transformations, particularly within the Indian Ocean trade dynamics, it is essential to question if cultural shifts were uniformly sudden or drastic, as is often assumed.

This paper aims to investigate shifts in building traditions and practices through a meticulous examination of the evolution of the iconic overhanging timber roof frame, spanning c. 15th-17th centuries. The study will scrutinise aspects of building technologies, techniques of execution, and motifs of constructions, with a focus on two pivotal inquiries: a) the heuristic value of framing architectural evolution through the dichotomy of "east" versus "west", where the west is often portrayed as an 'imposing' force and the east as a 'passive recipient', and b) whether changes in building traditions can solely be attributed to external political influences, notably the arrival of the Portuguese.

This paper contends that the reception of building traditions was complex and multifaceted. It demonstrates that the evolution of building practices involved extensive experimentation with techniques, as well as considerations of adaptation, internalisation and even rejection within regional contexts. This nuanced understanding challenges simplistic narratives of cultural imposition and underscores the agency and adaptability inherent in architectural evolution over time.

6 A RICE GRAIN'S JOURNEY IN THE BIG WORLD'S BARN - GLOBAL NUMISMATICS

Schwinghammer, Philipp (Thuringian Society of Coins and Medals/German Numismatic Society)

The presentation includes a global statistical analysis of coin finds worldwide with a current sample of more than 2 billion coins, which is intended to outline the global monetary circulation from 1000-1900 AD. On the basis of published finds and archaeological online databases, coins will be examined in the sense of travelling objects. The following questions will be relevant here: When did the first Asian or European coins migrate to other continents? What forms of imitations, counterstamps and cultural appropriation in the sense of an officially monetary or private use can we recognize in allochthonous or autochthonous monetary transactions? What is the general view of global distribution of coin finds? The aim of this presentation is to show these global connections. In addition, a system of imitation levels has been developed, by which different types of imitations can be named and a certain relative and developmental chronology of imitations of coinage can be traced. We can also recognize a certain chronological sequence between the application of graffiti, counterstamping and the start of imitative coinage, which traces the transition between an appropriated and an independent coinage.

7 MINTING MADNESS ON THE COROMANDEL COAST: SPATIAL PATTERNS AND ORGANIZATION OF EUROPEAN MINTS BETWEEN THE 17TH AND 18TH CENTURY

Hauser, Mark (Northwestern University) - Varma, Supriya (Azim Premji University)

Beginning in the sixteenth century with the Portuguese but reaching its apex in the 17th century, mints were a critical element of the built landscape in early colonial enclaves of Southern South Asia. Typical explanations for this distribution include a host of economic factors driving the need for a stable currency system, including the facilitation of trade, revenue generation, and the consolidation of colonial power. Rather than focusing solely on numismatics, this paper aims to map the distribution of mints as an element of the built landscape on the Coromandel Coast, offering an alternative explanation. It suggests that a multi-scalar analysis is required to understand this phenomenon comprehensively, encompassing cultural attitudes towards currency from disparate shores, to the immediate and concrete measures used to evaluate the quality and value of metal, and outward to economic reforms that were exogenous to both Europe and South Asia. Specifically, there was a manipulation of cultural exchanges and conflicts that ensued as European minting practices intersected with South Asian monetary systems. Furthermore, this study highlights the complexities of early colonial interactions and the power dynamics between South Asian polities and European colonies. It explores how the establishment of mints served as a tool for projecting the authorities of South Indian polities

and inserting European economic influence, while also revealing fractures in early colonial economies and conflicts with European colonial enclaves.

57 WHAT DO WE NEED TO KNOW TO UNDERSTAND STONE AGE MIGRATION AND MOBILITY?

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Högberg, Anders (Linnaeus University, Sweden; Palaeo-Research Institute, University of Johannesburg) - Hofmann, Daniela (University of Bergen) - Furholt, Martin (Kiel University)

Session format: Regular session

Human migration is the multi-directional movement of people and their thoughts, relationships and materiality – in large groups, smaller units or as individuals over long distances or internally within a region. Archaeological evidence documents extensive spatio-temporal continuity as well as change, revealing a variety of Holocene transformation processes. And, aDNA-studies have contributed with important knowledge about gene flow between populations, with multiple evidence of prehistoric human interaction.

Yet, we still have a relatively poor understanding of how Stone Age migration and mobility impacted on and affected humans and their material lives at various spatio-temporal scales, and we don't know how it played out in terms of changing relationships and social interaction. For this session, we invite papers that explore these topics.

We call for contributions that discuss integrated approaches in research that deal with various aspects of mobility and migration and combine data with theoretical and interpretative approaches. Papers should exemplify how we can explore theory and data in new ways to present informed analyses and results regarding innovation, knowledge-transfer processes and/or spatio-temporal variation in social processes. In all, we hope this session will bring us closer to grasping what we need to know to understand Stone Age migration and mobility.

ABSTRACTS

1 EMPIRICAL, OPEN AND MULTISCALAR: RESEARCH STRATEGY IN THE ARCHAEOLOGY OF MIGRATION

Johannsen, Niels (Department of Archaeology and Heritage Studies, Aarhus University)

The rapid ascent of genomic and genome-wide human aDNA research during the last 10 years has changed the role of migration in large parts of archaeology dramatically. While much energy has been devoted to critiquing and further developing this type of research, so far there has been limited strategic debate over what a coherent research strategy for studying migration archaeologically might look like. On the one hand, meaningful research strategies are likely to vary significantly according to the periods, geographical areas and individual cases studied – on the other, I will argue that it is nonetheless useful to discuss some general traits that may benefit most archaeological studies of concrete migration processes. In this talk, I propose that such studies in general should benefit from being empirical, open and multiscalar. Using examples from the study of migration processes in Neolithic Europe, I lay out what each of these three traits entails and argue why we can expect them to be beneficial traits.

2 SURFACE WATER DISTRIBUTION AS A CONSTRAINT ON HOMININ MOBILITY IN THE CENTRAL AZRAQ BASIN DURING THE MIDDLE PLEISTOCENE

Beller, Jeremy (Centre for Early Sapiens Behaviour (SapienCE), University of Bergen) - Collard, Mark (Department of Archaeology, Simon Fraser University)

The Levant was a cross-roads for hominins during the various Out of Africa dispersals. Understanding how Pleistocene hominins utilised the region is, therefore, an important task for archaeologists. Here, we report a study that investigated this issue in the Azraq Basin, a large endorheic catchment close to the eastern edge of the Levant. In the late 1980s, Lorraine Copeland and Francis Hours argued that the Acheulean of the central Azraq Basin has two different facies, the Desert Wadi Acheulean (DWA) and the Late Acheulean of Azraq (LAA). They posited that the DWA is earlier and more primitive than the LAA. They also observed differences in the facies' distributions, with the DWA being found along upstream portions of major wadis and the LAA occurring within and on the periphery of the spring-fed wetlands at the centre of the basin. According to Copeland and Hours, the different distributions were linked to the changing distribution of surface water. They proposed that the DWA was made when a palaeolake covered much of the center of the basin, while the LAA was produced during subsequent localised warming conditions when the palaeolake had receded into a series of marshy ponds. In our study we collated published data to assess how well Copeland and Hour's hypothesis is supported by the results of the large amount of fieldwork undertaken in the

region over the last 40 years. We found that Copeland and Hours' hypothesis holds up well: it still appears that over time Late Acheulean groups contracted towards the wetlands as surface water decreased. This has implications for the recently proposed idea that Pleistocene hominins migrated into the Levant from the Arabian Peninsula via 'palaeohydrological corridors'. Specifically, it suggests that if such movements occurred, they most likely took place during warm and wet periods.

3 THE GENETIC MAKEUP OF THE LAST HUNTER-GATHERERS OF SOUTHERN BELGIUM

Rivollat, Maité (University of Ghent, Belgium; Durham University, UK) - Toussaint, Michel (University of Ghent, Belgium) - Blevins, Kelly (Durham University, UK) - Robert, Prudence (University of Ghent, Belgium) - Crombé, Philippe (University of Ghent, Belgium) - Fernández-Domínguez, Eva (Durham University, UK) - De Groote, Isabelle (University of Ghent, Belgium)

During the Late Upper Palaeolithic and the Mesolithic, the climate warmup allowed human groups to re-populate north-western Europe after the Late Glacial Maximum. It is known that substantial human migrations came from southern refugia. Recent genetic analyses show a complex makeup of ancestries, with a mix of a component found in individuals associated to the Aurignacian culture and other eastern components in local Mesolithic individuals in neighbouring France and Germany.

Southern Belgium, and more specifically the middle-Meuse valley, is well-known for its very rich archaeo-anthropological record. Human remains have been found dating to the Middle Palaeolithic to the Bronze Age and a number of caves provide a unique fossil assemblage for the Mesolithic period – something which is lacking in the surrounding areas. In the frame of the project ROAM: Migration, diet, and health of the first permanent settlers of Belgium: inter- and multi-disciplinary perspectives, we aim to apply a multidisciplinary study to these remains to better understand the permanent re-colonization of northern Europe after the last ice age.

Here, we present the very first results from the ancient DNA investigation of the Mesolithic remains from several caves from the Meuse Valley. First, we will explore the genetic origins of the first permanent settlers in the region, discussing their affinities with neighbouring known individuals. Second, we will investigate the group structure of the individuals buried in these collective sepulchral caves, which will give insights into their funerary practices.

4 STRUCTURAL CHARACTERISTICS OF THE FORMATION OF THE LBK DIASPORA AND CONSEQUENCES FOR DAILY LIFE

Pechtl, Joachim (Institute of Archaeology University of Innsbruck)

LBK is most likely Europe's best researched Neolithic culture providing a vast body of find materials accompanied by extensive scientific analyses. This allows for clear identification of processes of long lasting and repeated mobility. Reaching from regional personal mobility to largescale colonization of Central Europe mobility seems to be a basic condition of LBK society. Especially formation of the LBK diaspora might have deeply affected the cultural system including both material culture as well as economic and symbolical behavior. For testing this thesis comparison is made to effects known from modern examples of migration and colonization, among these bottleneck effects in cultural diversity, hybridization and formation of creole culture versus strict segregation, conservative behavior and durable focus on the place of origin. Material culture as well as settlement structures, burial customs and economic strategies of the LBK are considered. Such analyses give way to discussing the spreading mode of the LBK and its direct consequences for everyday life of early farming people.

5 PATTERN IN DIVERSITY; UNDERSTANDING COMMONALITY AND THE SPREAD OF FLINT MINING ACROSS EUROPE

Baczowski, Jon (University of Southampton) - Werra, Dagmara (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Obtaining flint with the method of deep-mining is a widespread practice across the Neolithic of Northwest and Central Europe. The pursuit of mined flint, often to produce axeheads, resulted in amongst the largest, long-lived, and most complex Neolithic monuments in the form of deep-mines and their associated extraction horizons. Mine products travelled long distances from source, often after being refined at settlements in the mining regions. Flint mine material also formed the basis of economies at notable settlements, such the Funnelbeaker Culture settlement at Ćmielów, Poland, which contains vast quantities of material from two mines, Krzemionki and Świeciechów. This talk will discuss commonality that underlies cultural practices and the mining methodology. We will question if and how we can track and interpret the spread of mining and the movement of material and methodology across Northern Europe. Are the similarities of mining methods across a wide geographic region coincidental? Is the establishment of deep-mines associated with the spread of pioneer Neolithic communities, or the result of a fusion between indigenous and immigrant farming communities? Overall, the importance of mining reached far beyond the extraction face and was an important cultural activity that connected communities.

6 SPATIOTEMPORAL MODELLING OF THE MESOLITHIC-NEOLITHIC TRANSITION AND THE ARRIVAL OF NEOLITHIC FARMERS WITH ANATOLIAN-DERIVED ANCESTRY IN SOUTHERN SCANDINAVIA

Rose, Helene (Department of Historical Studies, University of Gothenburg) - Paulsson, Bettina (Department of Historical Studies, University of Gothenburg)

The Neolithic transition in Southern Scandinavia was delayed by more than a millennium compared to Central Europe, but recent genetic ancestry studies have demonstrated a swift arrival of Neolithic farmers with Anatolian-derived ancestry starting around 4000 BC. Resulting in a close to complete population turnover with limited genetic contributions from the previous local hunter-gatherer-fisher populations. This paper will contextualise recent results and present the on-going works of a spatiotemporal investigation of the transition in the region of present-day Denmark. We will provide a comprehensive overview of existing dating evidence based on an extensive literature review and present our novel integrative modelling approach, that combines radiocarbon data with prior information from archaeology, osteology, dietary stable isotopes and aDNA within a Bayesian framework. The adoption of agriculture is one of the most fundamental changes in human prehistory and our results provide detailed insights into spatiotemporal aspects of the transformation processes across Southern Scandinavia and contribute to the ongoing debate about Stone age migration and mobility.

7 INNOVATION PROCESSES AND KNOWLEDGE-TRANSFER SYSTEMS WITHIN SOUTH SCANDINAVIAN STONE AGE MOBILITY. A TRANSDISCIPLINARY APPROACH

Högberg, Anders (Linnaeus University; University of Johannesburg) - Brink, Kristian (Sydsvensk Arkeologi AB) - Brorsson, Torbjörn (Ceramic Studies) - Malmström, Helena (Uppsala University)

From archaeological and genetic data, we have evidence of mobility and migration events in south Scandinavia during the centuries around 4000 BCE (i.e. the beginning of the Early Neolithic in this part of the world). They occurred in specific situations that varied at multiple spatio-temporal scales with different rhythms in various contexts. But even though we know that these events happened, we actually have little knowledge about how they impact on and affected humans and their material lives.

In an ongoing project we explore innovation processes and knowledge-transfer systems within south Scandinavian Stone Age mobility. Drawing on competences from Archaeology, Genomics, Science and Technology Studies and Migration Studies, we: integrate analyses of large-scale archaeological excavation records with archaeogenetic data; explore spatio-temporal variation in mobility, population change and change in human's material lives; correlate these with each other, and; re-theorize Stone Age migration to test various models on mobility against our results. Our ambition is to interpret transformation processes to explain qualities of the roles played by innovation processes and knowledge-transfer systems within Stone Age mobility.

In this paper we present preliminary results from our work and discuss aspects of applying an integrated multidisciplinary approach to Stone Age migration studies and how migration impacted on and affected humans and their material lives in south Scandinavia during the centuries around 4000 BCE.

8 GENES, VESSELS, AND MIGRATIONS: HARNESSING CERAMIC TECHNOLOGY, PROBABILITY THEORY, AND NETWORK ANALYSIS TO UNDERSTAND THE EMERGENCE OF CORDED WARE

Kroon, Erik (Leiden University, Faculty of Archaeology)

5,000 years ago, a migration had a fundamental impact on Europe. Migrating communities spread across Europe within two centuries, leaving lasting changes in connectivity, language, and genetics. Yet these migrating communities did not enter an empty continent. Across Europe, they encountered indigenous communities with millennia-old roots. What interactions between these migrating and indigenous communities resulted in the changes seen in the archaeological record?

Modern migration studies show processes of learning and knowledge exchange are pivotal to the integration (or lack thereof) of migrants in host societies. Therefore, this paper develops an innovative approach to ceramics to shed light on learning processes 5,000 years ago.

Ceramics are ideal to study learning because each vessel bears traces of the production techniques which potters learned and applied to fashion them. The approach developed here uses a combination of the chaîne opératoire approach, network analysis, and probability theory to quantitatively compare these learned production processes and infer the amount of shared technical knowledge from them.

This approach is applied to ceramic assemblages from migrating Corded Ware and indigenous Funnel Beaker West communities in the Netherlands. The results demonstrate migrating communities repeatedly learned from the indigenous communities they encountered across Europe and applied this knowledge to produce Corded Ware vessels.

This finding is a crucial complement to archaeogenetic studies of this period and underlines the importance of looking at learning for understanding migrations during the Stone Age, and beyond.

9 STICKING TO YOUR ROOTS: CULTURAL DESCENT WITH MODIFICATION EXPLAINS THE CONTINUITY IN HUNTER-FISHER-GATHERER LITHIC PRODUCTION AT THE EARLY NEOLITHIC TRANSITION

Lundström, Victor (University museum of Bergen, University of Bergen)

In light of recent developments on ancient DNA and migration studies, it appears as if traces in the material culture record has taken the back seat, or at best, a complimentary role. In such complimentary cases, focus is directed on the presence or absence of lead artefacts and their formal morphological variation, often with implicit assumptions that similarity equals cultural relatedness. However, lurking in the blind spot lies the possibility that such formal variation arose independently. This is a crucial problem in migration studies void of ancient DNA, as the material cultural record, coupled with outdated culture historical frameworks, often leads to a 'whodunnit' situation. As a proposed solution to this problem, advancements within cultural phylogenetics and cultural evolution allows for the quantitative assessment on whether material traces are the result of unbroken cultural descent, independent invention or complete population replacement. In this paper, I present the results on such an analysis from 51 lithic assemblages along the west coast of Norway that date to the Late Mesolithic (8500-6000 cal BP), as well as parts of the Early and Middle Neolithic (ca. 5950-4500 cal BP). In contrast to its south-Scandinavian periphery, which indicates more or less a complete genetic and cultural population replacement at the Early Neolithic transition (ca. 6000 cal BP), Western Norway testifies to robust indications of continued hunter-fisher-gatherer cultural ancestry. This continuity did not evolve without change, however, as it featured both the loss of old cultural traits, as well as the invention and perhaps borrowing of novel ones. The underlying mechanisms of these changes will be discussed in relation to climate induced population dynamics, which prompted new forms of social learning in lithic production techniques.

10 NEOLITHIC TRANSFORMATIONS IN SOUTHERN NORWAY: MIGRATION, CULTURAL DYNAMICS, AND ECONOMIC CHANGE

Lechterbeck, Jutta (Arkeologisk Museum, Universitetet i Stavanger) - Bergsvik, Knut Andreas (University museum of Bergen) - Schülke, Almut (Kulturhistorisk museum Oslo) - Kirleis, Wiebke (CAU Kile)

The paper delves into the intricate social, economic, and migratory processes leading up to the adoption of agriculture in Southern Norway during the Neolithic period. Situated at the northern margins of the Neolithic world, the development in this region challenges the conventional model of neolithization characterized by rapid shifts from hunter-gatherer to agricultural economies. This prompts a reevaluation of migration and cultural transmission theories, and the aim of the paper is to develop an interpretative framework which considers the unique features of the archaeological material in Southern Norway and applies relevant perspectives on social and economic dynamics.

During the Mesolithic period Southern Norway was inhabited by coast-oriented forager groups. The subsequent Neolithic period (c. 4000/3900-1700 cal BC) witnessed diverse regional dynamics, marked by varying degrees of contact with agricultural populations in Southern Scandinavia, but no full-scale agrarian practices until c. 2300 cal BC. Instead, there were diverse lifestyles, cultural expressions, and economic practices across the area, which indicate dynamic social contact networks and mobility.

Our approach employs multiscale archaeological and archaeobotanical case studies spanning the 4th and 3rd millennia cal BC in four different regions of Southern Norway. Our archaeological case studies focus on depositional patterns and spatial distribution patterns of stone and flint tools, drawing comparisons between Hordaland (W-Norway) and the Inner Oslo Fjord area (SE-Norway). Archaeobotanical cases examine changing woodland use, management, manipulation, and land cover opening over time, incorporating relevant data from Rogaland (W-Norway) and a detailed pollen record of a laminated core from Lake Skogstjern, Bamble, Telemark county (SE-Norway).

The paper aims to provide a more nuanced basis for discussion for the assessment of the social and economic processes that led to the adoption of agriculture in Southern Norway during the Neolithic period.

11 MOBILITY OF COMMUNITIES IN THE FINAL ENEOLITHIC AND EARLY BRONZE AGE IN POLAND AND SLOVAKIA: INSIGHTS FROM STRONTIUM ISOTOPIC ANALYSES

Jarosz, Pawel (Institute of Archaeology and Ethnology PAS) - Szczepanek, Anita (Institute of Archaeology and Ethnology PAS; Department of Anatomy Collegium Medicum Jagiellonian University) - Horváthová, Eva (Archeologický ústav SAV)

Strontium isotopic analyses ($^{87}\text{Sr}/^{86}\text{Sr}$) were conducted to ascertain the geographic origins of individuals interred in graves dating to the Final Eneolithic and Early Bronze Age at various cemeteries in Southeastern Poland and Eastern Slovakia. Samples for isotopic studies were derived from the enamel of both human and animal teeth. The study region

encompasses diverse geological substrates, facilitating the distinction between local and non-local individuals, along with the determination of $87\text{Sr}/86\text{Sr}$ value ranges characteristic of the indigenous populations. The analytical results revealed that a majority of the examined individuals exhibited local isotopic signatures. However, an exception was noted in the Subcarpathia region, where a noteworthy proportion of “non-local” individuals was identified. Intriguingly, grave goods associated with these individuals also included artifacts of non-local origin. The grave furnishings of isotopically distinct individuals were found to be highly diverse, with a single complex containing both locally and non-locally sourced items. Furthermore, the observed elements of funeral customs suggested a lack of explicit emphasis on reflecting the geographic origin of the interred individuals in the grave inventory. This nuanced approach to grave goods composition underscores the complexity of socio-cultural dynamics during the Final Eneolithic and Early Bronze Age in the study area. This research was funded by the National Science Centre Poland, grant numbers NCN 2020/39/B/HS3/00454 and NCN 2020 UMO-2020/37/B/HS3/03816.

58 ARCHAEOLOGIES OF GLOBAL OUTLANDS. NON-AGRICULTURAL ECONOMIES AND INTERCONNECTED SOCIETIES

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Escribano-Ruiz, Sergio (University of the Basque Country (UPV/EHU)) - Hennius, Andreas (Upplandsmuseet)

Session format: Regular session

The old saying goes that “All roads lead to Rome”, if so, it would imply that all roads start somewhere else. It is becoming increasingly clear that the beginnings of these roads are to be found far out into the peripheral outlands beyond the agrarian regions and central places – such as boreal forests of northern Scandinavia, far-distance oceans and islands or tropical mountain-regions of the Far East. This session addresses social and economic patterns opposed to the hegemonic view of agriculture as the main human activity in the pre-industrial world and seek to explore common denominators for how life was shaped for people involved in a non-agrarian resource extraction.

Thus, this session aims to follow the multiscalar interactions underlying the large-scale exploitation and extraction of non-agricultural resources in a given place and time. Specifically, the aim is to bring together researchers interested in questions related to the exploitation of non-agricultural lands and non-cultivated products, and how these were integrated into long-distance networks of production and exchange. Considered peripheral areas and/or practices, there is enough evidence to believe and demonstrate that they were fundamental driving forces in societal developments in the past. It is precisely in this direction that this session search to provide empirical evidence.

While any related topic is welcome for the session, we encourage papers that address issues associated to, and derived from, large-scale economic activities concerning for example forest exploitation, fishing, livestock and handicrafts. Papers should consider long-distance commercialisation, but also the consequences of these practices on local societies and in relation to the actors involved.

ABSTRACTS

1 ARCHAEOLOGIES OF GLOBAL OUTLANDS NON-AGRICULTURAL ECONOMIES AND INTERCONNECTED SOCIETIES – AN INTRODUCTION

Escribano-Ruiz, Sergio (University of the Basque Country (UPV/EHU)) - Hennius, Andreas (Upplands Museum)

When the European colonisation of North America began after the first voyage of Christopher Columbus, the acquisition of furs from the large, forested parts of the continent was a key activity of the settlers. For a long time colonisers traded furs and pelts with the indigenous north-Americans and this was an important driving force for transatlantic travel and also catalyst for the European economy. If we turn to the Scandinavian Iron Age a thousand years earlier, a similar process can be observed. During this period, furs, iron, and antler from the boreal forests, were traded for other equally exotic items on the Eurasian continent. The result was that objects from most of the old world ended up in the soils in the agrarian regions in southern Scandinavia and in the Baltic islands. Similar processes, where non-agrarian products create surplus and wealth, can also be identified in eastern, central, and southern Asia, even if thousands of years earlier. Intense trade relations along the silk roads linked Asia and Europe for a long time. The trade around the Indian Ocean connected eastern Africa with south-east Asia. Likewise, the Atlantic tied together Europe and Africa with North and South America from the 16th century CE onwards. It is becoming increasingly clear, that a large-scale, non-agrarian production in Outland regions, such as boreal forests, mountainous regions or the open oceans have been fundamental for the economy, in different parts of the world for a long time.

The central marketplaces are relatively well understood, in comparison to the state of knowledge on the relationship between production areas and the trade networks in the central areas which is still limited. In this introduction we will

discuss the need for an Outland perspective on production and trade for a better understanding of societal developments.

2 MARGINAL LANDSCAPE - MARGINAL DATA?

Engevik, Asbjørn (University of Bergen)

The physical characteristics of the high mountains of Norway, with its steep and rugged terrain and harsh climate, has caused this area to be seen as marginal. However, more than 4500 pitfall traps and an almost infinite amount of hunting blinds and stone cairns, together with trails, gathering places, rock-shelters, ruins, and stone huts, clearly show that these areas have been exploited right from the Stone Age, until today.

However, our perception of marginality in prehistoric times seems to be defined in contrast to well-known modern standards, such as easy access to food, transport, and shelter. Areas that seem inaccessible and remote to us today, are thus easily perceived as marginal. It is therefore a need to challenge our present-day notion of marginality. If we wish to understand how prehistoric landscapes, such as the high mountains have functioned, we must bear in mind that our view on prehistoric marginality may be just a mere reflection of our modern way of life.

In this paper I am going to review the Iron Age material from the mountainous landscape of Norway, to show that the high mountains were not marginal. Instead, I suggest that it is the sources and data sets, that are deficient and inadequately interpreted. Empirical evidence shows that these so-called marginal areas contained a great variety of important resources. I also suggest that these high mountains were deliberately chosen for specific societal activities, which reflect the always underlying connectivity between agricultural settlements in the lowlands and the people who exploited the mountainous areas.

3 RESOURCE EXTRACTION AND NON-AGRARIAN PRODUCTION IN THE FORESTED NORTH - COMMODITIES FOR TRADE ON SUPRA-REGIONAL NETWORKS

Hennius, Andreas (Stiftelsen Upplandsmuseet)

Swedish Iron Age archaeology has for long had a focus in settlements and burials in the southern, agrarian parts of the country. Exploitation of the forested areas of the north have been interpreted in relation to the spread of agriculture northwards during the Viking Age and medieval period (from about 800 and onwards). The non agrarian resource extraction has been regarded as a passive adaptation to a low-yield agrarian production, and products like furs and iron could be traded as commodities at the Viking Age emporia.

New research, however, show a very different picture. A large-scale exploitation of the non-agrarian resources from the outlands was initiated much earlier. Already during the 4th – 5th centuries an intensified hunt for both terrestrial and marine mammals can be identified, as well as a largescale iron production, and somewhat later a largescale production of tar. In addition, there is an intensified trade with for example furs, antler and lithic materials.

The outlands increasingly appear as an integrated part of society as well as an important driving factor in societal development much earlier than previously reckoned. The development also shows the emergence of far-reaching trade networks well before the Viking age, where the non-agrarian resources from the forests most probably were of fundamental importance. These networks connected the forested north with the European continent and further beyond.

4 CRISES IN THE OUTLAND USE. THE ROLE OF REPLACEMENT INDUSTRIES IN LOCAL STRATEGIES

Pettersson, Susanne (Independent) - Svensson, Eva (Risk and Environmental Studies, Karlstad University) - Johansson, Annie (County Administrative Board, Varmland)

The outlying lands in boreal Scandinavia were full of diverse resources. These resources were extracted for different purposes. Some were used for self-subsistence by the peasants, others were made into commodities for trade. In this presentation the peasants conducted large scale commodity production and acted in trade networks. The forests are full of bloomery iron production sites and pitfalls for elk hunting. The heyday occurred during the 9th to the 12th century AD. There was a remarkable decline in bloomery iron production c. 1200 AD followed by a similar decline in the use of pitfalls c. 1250 AD. Simultaneously, pig iron in blast furnaces in the Mining District increased rapidly, and comb makers in the towns switched from antler to bones from butchered cattle. One example of the decline is the rural settlement Skinnerud. The economy was based on iron and hides from the outland and when this production was out of demand the settlement was abandoned and the land became an infield. At the same time there was an increased use of shielings for livestock breeding and agriculture, and a change of technology in the bloomery iron production. Another novelty was an increased quarrying for soapstone traded in local and regional networks. We interpret this as peasant strategies to meet the crisis caused by the failing market in bloomery iron and elk related products.

5 THE INTEGRATION OF INDIAN FOREST-DWELLERS INTO SHORT- AND LONG-DISTANCE EXCHANGE NETWORKS IN THE MEDIEVAL PERIOD

De Simone, Daniela (Ghent University)

In the latter half of the second millennium BCE, networks of trade and exchange developed throughout South Asia. Urban polities thrived on the extraction of timber and non-timber forest products (NTFPs), feeding them into networks across the region, the Indian Ocean and the Bay of Bengal. South Asian forest-dwellers remained first-tier suppliers of the 'spice trade' until the early nineteenth century, when the British started to 'legally' appropriate forested land from indigenous owners. Colonial ethnography misrepresented South Asian forest communities as primitive, remote and isolated therefore research on their past is rare and limited in scope. However, evidence from the Nilgiri mountains in southern India, a region of montane subtropical forests, suggests that the forest-dwellers inhabiting the area were connected to short- and long-distance trade and exchange networks. Assemblages excavated from sites in the Nilgiri mountains, dating between the 12th and 16th century, include artefacts imported from the surrounding lowlands, where temples were built in the forests at the feet of the Nilgiri mountains, between the 11th and 14th century, and had inscriptions recording the donations of NTFPs from merchants for the upkeep of religious establishments. This paper discusses the integration of the Nilgiri forests into the trade of NTFPs on the Malabar coast.

6 MODERN CARTOGRAPHIC TOOLS REVEAL THE ORIGIN OF ROME, PISA, ARLES, AND OTHER CITIES BORN ALONG A PROTOHISTORIC CIRCUM-MEDITERRANEAN PEDESTRIAN PATH

Perrone, Antonio (WEDAP)

Several onsite surveys and the analysis of the orography, performed with a geospatial software, have suggested the hypothesis of the spontaneous birth - in prehistoric times - of a pedestrian path that turned around the Mediterranean Sea.

This path, not only the naval routes, seems to have supported - in that age - the commercial and cultural movements spread all around the Mediterranean Sea.

The path often presented obstacles such as rivers, swamps, gulfs, deep valleys, rocky walls and impenetrable woods. These obstacles, obliging a stop or a slowing-down, constituted the privileged place where guides, porters, boatmen, innkeepers and stores were ready to offer their services to the travellers and merchants. Thus, little by little, in the prehistoric era, in those places, the first urban settlements arose.

The orography of the Mediterranean Sea has been analysed, from LiDAR data, with various cartographic software among which QGIS. The geospatial databases utilized for the research have been, among others, those produced by various public Italian, European and American bodies.

The performed analysis offered a lot of elements that allows say that - thanks to the mentioned path - very numerous cities and settlements were born near the coasts of the Mediterranean Sea. Among these cities - along the northern part of the Mediterranean Sea - there are Edessa, Valona, Brindisi, Benevento, Capua, Terracina, Rome, Pisa, Aix-en-Provence, Arles, Montpellier and Narbonne.

Among other things, the work discusses the case - outside the Mediterranean but towards this sea - of the possible ancient roads that connected the sites of Gobekli Tepe and Karahan Tepe, along what would later become the Silk Road. Such ancient connections between East and West could make us rethink the epochal transition of prehistoric men from hunter-gatherers to not only breeders-farmers but also to breeders-farmers-merchants-travellers.

63 SHIFTING FOCUS: THE CULTURAL CONTEXT OF FIGURINES IN THE EUROPEAN NEOLITHIC

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Becker, Valeska (University of Copenhagen) - Hofmann, Daniela (University of Bergen) - Iversen, Rune (University of Copenhagen)

Session format: Regular session

Figurines and other figurative representations, both anthropomorphic and zoomorphic, are an essential part of many cultural phenomena of the European Neolithic. They have been widely discussed in research with respect to their making and meaning, but their interpretation is still elusive even today. Nevertheless, they continue to fascinate, as they offer a glimpse into the mind of Neolithic people and can be used to reconstruct their makers' view on the world and on themselves.

This session aims to contribute to discussions surrounding the social significance of figurines. Rather than discussing typologies or single individual pieces, we want to focus on figurines embedded in their cultural context. What characterizes societies that use figurines in contrast to those who do not? Which role do figurines have alongside other

manifestations of belief, such as enclosures, burials in settlements and cemeteries, depositions or even other figural objects?

In this respect, changes and discontinuities are especially interesting: changes in quantity, quality, shape/appearance, sensory qualities, use and depositional modalities, but also changes in distribution over time, within the same cultural phenomenon or throughout larger areas.

Presentations can address figurines in their associated cultural context roughly between the seventh and the fourth millennium calBC.

ABSTRACTS

1 THE ANTHROPOMORPHIC-VASE IN THE "STRUCTURED DEPOSITION" AMONG THE CULTURES OF CENTRAL-NORTHERN ITALIAN PENINSULA, AT THE END OF 6TH MILLENNIUM BCE

Bersani Pancheri, Monica (University of Trento, Department of Humanities) - Ciela, Marika (University of Trento, Department of Humanities) - Pedrotti, Annalisa (University of Trento, Department of Humanities)

The report presents the results of PhD research completed in 2019, which primarily focuses on two categories of anthropomorphic vessel, the face-pot and the vessel adorned with one or more human figure motifs. One of the main objectives of the study was the analysis of the archaeological context of discovery. These artefacts, dating back to the period between the 7th and 5th millennia BCE, originate from 229 sites across the Levant, Anatolia, the Balkans, Central Europe, and Italy, with a specific emphasis on those from the Italian Peninsula and Sicily. Out of the 927 identified pieces, only 197 provide reliable information on the archaeological context in which they were found. Most of these artefacts have been found in fragmentary form, in contexts that suggest a potential cultic and ritual nature, such as funerary contexts, caves, and "house of worship". An assemblage of artefacts retrieved from pits, often interpreted as waste deposits, is possibly linked to ritual practices, as anthropomorphic vessel remains are accompanied by fragments of symbolic items like grindstones, deer antlers, miniature vessels, clay figurines, rhytons, animal parts, and polished stone axes. This consistent archaeological pattern suggests a "structured deposition", where the above-mentioned specific objects are intentionally deposited in fragmentary form, a practice already observed in various geographical and chronological contexts by other scholars.

The discussion primarily focuses mainly on the analysis of the practice of "structured deposition", a performance crucial for reconstructing the social practices related to the deposition of artefacts with a symbolic value, in the central-northern part of the Italian peninsula. It uses data from 27 artefacts, found in 17 different archaeological contexts, from 9 localities.

2 A PARTY TO REMEMBER? A UNIQUE FACE POT ASSEMBLAGE FROM THE MIDDLE NEOLITHIC OF THE CARPATHIAN BASIN

Sebok, Katalin (Institute of Archaeological Sciences, Eötvös Loránd University)

Anthropomorphic figurines and face pots seem to have 'coexisted peacefully' in the Alföld Linear Pottery Culture and the cultural units deriving from it—amongst others, the Szakálhát and Bükk cultures and the Esztár and Sátorajújhely pottery styles—representing the Middle Neolithic of the Carpathian Basin, roughly between 5600 and 5000 cal BC. The main factors considerably hindering the interpretation of these finds have always been the lack of context and a relatively high degree of fragmentation: most figurines and almost all previously discovered face pots are surface finds or have come from the fill of waste disposal pits; besides, in general, the bigger the original artefact was, the smaller part of it has persisted. These circumstances add greatly to the significance of the assemblage, discovered in a settlement of the Szakálhát Culture at Rákóczifalva-Bagi-földek in 2006, that contained the best part of six relatively large face pots with a complex incised and/or mono- or polychrome painted decoration—a find that had never been published before. The presentation gives a brief survey of the main characteristics of the unearthed archaeological feature, including its structure, position within the settlement and the landscape, local analogies, and the vessels and their fragmentation pattern, in an attempt to decide whether it was created by intent, and if yes, what can be revealed about the actions and reasons behind. Besides, by skimming the main results of the analysis of the vessel forms and decorations, the author provides a short overview of her current understanding of the cognitive background and social implications of the findings in focus, as well as their position within the stylistic, cognitive, and social development represented by face vessels and anthropomorphic figurines bearing a similar decoration of the easternmost Linear Pottery tradition.

3 NO FACE FIGURINES – MULTIPLE FACES OF INTERPRETATION

Kogalniceanu, Raluca (“1 Decembrie University” of Alba Iulia, Romania)

The Hamangia communities from south-eastern Romania and north-eastern Bulgaria are best known through the discovery and research of the Durankulak cemetery (Bulgaria). The other large cemetery excavated at Cernavoda (Romania) at the middle of the 20th century is less known due to the lack of publication shortly after its investigation. Our reassessing of those investigation in the last decade brought to light interesting data, especially interesting differences between the two cemeteries. In terms of Hamangia settlements, there are few excavations in Romania, mostly from the last century, but the ones from Bulgaria come to complete the image.

In terms of Hamangia figurines, the most famous ones are “the Thinker” and “his wife”. But most of the Hamangia figurines are different from these two. The diversity of postures (standing, sitting), states (pregnant or not) and representations (mostly faceless) of the Hamangia figurines are the illustration of a variety of concepts that might have been in circulation at that time in that particular cultural context. A reevaluation of the Hamangia figurines (beyond the Thinker and his wife), and of their individual contexts of discovery is needed. We will consider both cemeteries and settlements and try to outline an overview of the anthropomorphic figurines. We would also discuss the lack of zoomorphic and male representations (with one notable exception mentioned above), fragmentation issues and the possible significance of the Hamangia anthropomorphic figurines according to context of discovery.

4 ON THE SOCIAL CONTEXT OF FIGURINE FRAGMENTATION AND DEPOSITION: INSIGHTS FROM THE CUCUTENI-TRYPILLIA SITE OF STOLNICENI

Terna, Andreea (Christian-Albrechts-Universität zu Kiel, Institut für Ur- und Frühgeschichte)

This paper explores the social significance of anthropomorphic figurines within the Cucuteni-Trypillia society during the first half of the 4th millennium BCE, by looking into the fragmentation and depositional practices at the site of Stolniceni in the Republic of Moldova. This period witnessed the development of so-called mega-sites, considered to have functioned on an egalitarian ideology and decentralized decision-making processes. The anthropomorphic figurines from this period exhibit a notable degree of morphological standardization and a prevalence of fragmented pieces over intact ones, sparking debate over the intentionality and symbolic meaning behind their breakage. However, little attention has been paid to the depositional context of the fragmented parts. By analysing the intra-site distribution of fragmentation patterns and preservation rates and then comparing the results with other type of finds, like zoomorphic figurines and ceramic vessels, we were able to identify specific practices in the deposition of anthropomorphic figurines. Particularly striking are the differences observed between residential households and the so-called mega-structures, the later considered to be integrative buildings linked to decision-making processes. Our findings suggest that these structures may have also served as site for figurine fragmentation, raising further questions about the political and social implications of this practice.

5 ANTHROPOMORPHIC FIGURINES IN NEOLITHIC AND COPPER AGE CONTEXTS: INSIGHTS FROM THE PIETRELE SITE, ROMANIA

Müller, Michael (free researcher)

This study presents findings from over two decades of excavation at the Neolithic and Copper Age site of Pietrele in the Lower Danube region of Romania, spanning from the late 6th to late 5th millennium BC. A total of 638 complete and fragmented anthropomorphic representations were unearthed, showcasing a diverse range of materials including burnt clay, bone, hard animal material, and marble, fashioned into various forms such as freestanding figurines, anthropomorphic vessels, applications, rattles, and ornaments.

Notably, figurines crafted from hard animal materials like bone, antler, and shell emerged in Southeastern Europe exclusively during the Copper Age, primarily associated with the KGK VI cultural groups in the Eastern Balkan peninsula. In contrast, burnt clay was also employed to fashion zoomorphic figurines within the same geographical and temporal framework, whereas hard animal materials were reserved exclusively for anthropomorphic representations.

While the figurines at Pietrele exhibited a widespread distribution within general activity zones of the settlement, differences in their states before deposition and their distribution suggest distinct object biographies for figurines made of different materials.

Of particular interest, alongside Copper Age artifacts on the settlement mound, Neolithic pottery sherds and figurines were also retrieved from certain layers in between the Copper Age settlement phases, prompting speculation regarding their origins. Subsequent discoveries of Neolithic settlement layers surrounding the Copper Age settlement mound, from which earth material for mound construction was sourced, support the inadvertent incorporation of Neolithic artifacts, including figurines, into the mound. It remains speculative whether the chance discovery of Neolithic figurines by Copper Age inhabitants influenced the depiction of their anthropomorphic representations.

This paper aims to explore not only the distribution and contexts of Neolithic and Copper Age anthropomorphic figurines at Pietrele but also to elucidate their potential relationship across the two epochs.

6 UNUSUAL OR DIFFERENT NEOLITHIC IMAGES: ALLUSIONS TO MATERIAL OR SOCIAL FACTS AND PHENOMENA?

Marangou, Christina (Independent researcher, Athens, Greece)

The parallel reality of Neolithic material objects imitating “real things”, which either exist in nature, or result from the anthropogenic production, includes several subjects on various scales, complete or partial, isolated, in compositions, or interconnected. Common themes, their originals presumably existing in the natural world or used in every-day life, include humans, animals, objects and structures, such as buildings, domestic appliances or equipment and watercraft. However, more rarely, uncommon, different, if not deviant, three-dimensional representations of beings, structures or/and objects may occasionally suggest particular or divergent morphologies, postures, actions, events or disorders. Attempts at their “readings”, considering potentially represented or related creatures, facts, or performances within their presumably associated contexts, inevitably depend on existing evidence of material traces. Moreover, if such evidence is scarce, as in the case of surface finds, available information deriving from their own or comparable chronological periods, cultures and social contexts may also be considered.

The present paper endeavours to discuss, under an anthropological perspective, possible research directions towards hypotheses for potential interpretations and meanings regarding rare Neolithic examples of such represented divergent entities. Considering that they could possibly embody real or fictional presences, occurrences, behaviours or practices, their interconnections with the associated natural, material and sociocultural environment are examined. Examples originate mainly from Greece and neighbouring regions.

7 MORE THAN MEETS THE EYE: SOMATOPERCEPTION THROUGH NEOLITHIC FIGURINES

Mina, Maria (University of the Aegean)

In the proposed paper anthropomorphic and zoomorphic figurines are approached through an interdisciplinary approach, which combines archaeology with visual psychology to explore perceptions surrounding humanness, animality, and social identity in the Greek Neolithic. Rather than accessing the ancient mind through the study of artefacts, it is suggested in reverse order that understanding initially the involvement of visual perception in the production and handling of figurines can elucidate prehistoric cognition. Visual perception is defined as a cognition process in which humans see an object (in this case human or animal bodies), incorporate it, and then organise it within their brain to process it mentally. It is argued, therefore, that Neolithic figurines as representations of human and animal bodies could generate perception of the self and other entities.

Within the framework of visual psychology, which is employed for the purposes of the study, Neolithic figurines are approached as bodily schemata (i.e., shorthand representations of what the human or animal form should appear like) which can elucidate the concepts associated with the producers’ own bodies (somatoperception), and the materialisation of the body schema in the form of clay models (somatopresentation). Far from assuming universal human or animal archetypes underpinned by neurological processes, it is emphasised that visual schemata are culturally and historically contingent and it is within their relevant context that we need to understand them. The exploration of select Greek Neolithic figurines through the principles of visual psychology may offer new insights into the way the collective identity and humanness were mentally constructed and materially expressed diachronically.

8 SHAPED, FIRED, DISCARDED, DEPOSITED IN THE RONDEL DITCHES. THE LARGEST EUROPEAN FIGURINE COLLECTION IN 3D, CT, PETROGRAPHY, USE-WEAR AND GIS

Kanáková, Ludmila (MUNI - Ústav archeologie a muzeologie) - Nosek, Vojtěch (MUNI - Ústav archeologie a muzeologie) - Tóth, Peter (MUNI - Ústav archeologie a muzeologie) - Kreiter, Attila (MUNI - Ústav archeologie a muzeologie)

A total of 370 fragments of female ceramic figurines were found on post-Linear Neolithic settlement site Těšetice–Kyjovice Sutny. During a narrow span of 4750–4500 BC figurines were manufactured, fired, used, and discarded. All figurines were found fragmented, and all fragments in one location were preserved in only two cases. The majority of fragments do not correspond to whatever else. Although some part of fractures might be caused by post-depositional destruction by waste accumulation processes on the settlement, many of them were intentional. The fragments were deposited mainly into the ditches of the rondel enclosure. Without speculations with regard to religion or symbolism, we analyse the level of variability in all steps of the figurine operational chain to clarify, if these steps were realised on individual, communal or up-communal level of activities and how then was the role of figurines in the settlement not only in the moment of acting with them, but in all steps of their life cycle. The Těšetice rondel enclosure is the unique rondel site associated with larger collection of figurines. Certain intersection of socially cohesive behaviour or activities then took place here, performed in rondel constructing and figurine operating.

9 LIVING FAUNA MADE OF CLAY? A COMPARISON OF ANIMAL BONE FINDINGS AND INTERPRETATIONS OF ZOOMORPHIC FIGURINES

Luckner, Julia (Institut fuer Ur- und Fruehgeschichte Kiel)

Zoomorphic figurines were a central component of Neolithic and Eneolithic Europe and probably also of everyday life. However, it is questionable to what extent they reflect reality and what significance they or what they represented had. Should they really be regarded as naturalistic depictions or are they purely imaginary? In order to clarify such questions, 285 zoomorphic figurines from the Starčevo-Körös-Criș, Vinča and Kodžadermen-Gumelnița-Karanovo VI cultural areas were examined in detail. In 72 cases from 18 different sites, the animal bone findings were compared with the animal species depicted as figurines. Among other things, it was investigated whether there is a correlation between the animal species depicted and the animal species found in the sites. Based on these results, an attempt was made to draw conclusions about the different meanings of the animal species. Furthermore, it was analyzed whether cultural or site-related trends can be identified and whether different or similar world views can be inferred from this.

10 CHALCOLITHIC FIGURINES: THE NATURAL FORM OF UNGULATE PHALANGES AS AN ANTHROPOMORPHIC SCULPTURE FROM THE BOTAI CULTURE, KAZAKHSTAN

Merts, Victor (S.Toraighyrov Pavlodar State University) - Usmanova, Emma (Saryarka Archaeological Institute, Buketov Karaganda University, Kazakhstan; Margulan Archaeological Institute, Almaty, Kazakhstan) - Zakharov, Sergey (Margulan Archaeological Institute, Kazakhstan) - Pleshakov, Anatoly (Kozybaev North Kazakhstan University) - Olsen, Sandra L. (Division of Archaeology, Biodiversity Institute, University of Kansas)

The Chalcolithic Botai culture of north Kazakhstan, (fourth millennium BCE), is known for its subsistence focus on horses. Among the most intriguing Botai artifacts are 63 decorated ungulate phalanges. Most were derived from horses, but two were from kulan and five probably

from saiga. An additional 16 have been retrieved from another Botai settlement, Krasnyi Yar. This study aims to interpret the significance of these ornate objects. Similar ones have a broad temporal and spatial distribution across Eurasia, but whether there are cultural connections is difficult to prove. Most likely, the naturally anthropomorphic form of the phalanges encouraged ancient artists far and wide to engrave designs on them that probably reflect clothing and female body features. During manufacture, a phalanx was first smoothed, then engraved with designs on the dorsal and volar surfaces that probably represent the neckline, belt and designs on a dress. The sides were incised with short horizontal notches that suggest the garment's side seams. Pattern compositions consist of four main elements: straight lines, diamonds, triangles and V-shapes. In the settlements, the phalanges were found in pits, between and inside houses. The

number of left phalanges was double those of right at Botai, which may have some mythological meaning associated with women. Versions of the symbolism of the decorated phalanges in the Botai community and communication network are proposed:

- ancestral idols that participated in various rituals, ranging from those of household to funeral and memorial or
- fertility symbols.

Whether there is a symbolic link between females and the animals chosen for these figurines is uncertain. Possibly the natural form of ungulate phalanges, regardless of species, made them candidates for these beautiful artifacts. Perhaps these idols were symbolic "texts" of a magical incantation related to a fertility cult in the form of the female image.

11 PREHISTORIC LADIES FROM NORTH MACEDONIA

Spirova, Marina (Archaeological Museum of Republic of North Macedonia) - Kolishtrkoska Nasteva, Irena (Archaeological Museum of Republic of North Macedonia (retired))

One of the characteristics of the Neolithic and subsequently Chalcolithic period in North Macedonia is the abundance of discovered terracotta figurines. They can be observed at all of the sites belonging to both of the periods. Most of them were excavated in buildings - houses, but they are also found in sanctuaries, where their presence as manifestations of belief is accompanied by other objects of the cult.

Their dimensions range from miniature to relatively large ones, 5-50 cm. The size is closely related to the place of their discovery within the home, the larger ones deserving the place closer to the fireplace. Furthermore, significant number of the representative female figurines are simultaneously depicting a house. In this way, we draw information about the architecture, as well as the tradition of honoring the woman-mother. On the other hand, through the figurines, we perceive the desire for dressing up. Thus, they offer a glimpse into the fashion trends of the said periods, as seen in the clothes, jewelry and hairstyles.

The time frame in which we discover them ranges from the 5th to the 3rd millennium BC (Neolithic/Chalcolithic).

12 TURNING WEST: ON THE DISAPPEARANCE OF FIGURATIVE REPRESENTATIONS IN NEOLITHIC WEST-CENTRAL EUROPE

Bristow, Rebecca (University of Copenhagen)

At the start of the fifth millennium BCE, as the central-european Linearbandkeramik culture (LBK) was broken down in smaller cultural groups, the traditional making of figurative representations was either transformed or radically abandoned. For thousands of years, these clay figurines and vessels representing humans and animals had been a hallmark of early Neolithic lifestyle. They were found in hundreds in Southeastern Europe during the sixth millennium and continued to be produced as the Neolithic reached Central Europe, although in smaller numbers. By the start of the fifth millennium BCE, however, figurative representations seem to have disappeared from west-Central Europe, or turned into highly abstract symbols. This dissolution of a thousand year old figurative tradition may have played a fundamental part in the broader cultural changes of fifth millennium Central Europe.

This paper discusses the end of the figurative tradition in west-Central Europe in the context of cultural continuity and change.

13 THE CHANGE FROM ANTHROPOCENTRIC TO ZOOCENTRIC FIGURAL REPRESENTATIONS IN NEOLITHIC CULTURAL CONTEXTS OF THE SOUTHWESTERN CARPATHIAN BASIN

Botic, Katarina (Institute of Archaeology, Zagreb, Croatia)

Among the finds of the first farming communities, which inhabited the southwestern periphery of the Carpathian Basin at the beginning of the 6th millennium BC, a modest number of anthropomorphic and zoomorphic figurines have been discovered. These figurines belong to the regional Starčevo cultural phenomenon, but are rarely published with the full context of the finds. They also belong to a supra-regional context, including possible fragmentary stands of monumental figurines as described by E. Bánffy in the context of the clay-dominated south-eastern/Balkan world. By the mid-6th millennium, the Starčevo cultural context declined and new ones appear, Vinča and Ražište. While in the Vinča context, anthropomorphic figurines and the so-called altars are fairly numerous, in the Ražište context they are missing, as well as zoomorphic ones. In this later context, figural representations appear on the vessel rims or on the body, but in a highly stylised form. Although called zoomorphic applications, these stylised heads also appear on figurines and so-called altars in the Vinča and Ražište contexts. The question arises why there was such an obvious change in the understanding and importance of the human body, or why the focus and form of presentation of the body changed during the 6th-5th millennia BC. This study provides an insight into the diversity of cultural contexts in which figurines and other objects appear, and analyses the possible transformative processes of the identity of these communities. Study is supported by Transformation of identities through the past (TIPS) Project funded by the European Union - NextGenerationEU.

72 BIOLOGICAL ANTHROPOLOGY INSIGHTS INTO BEHAVIORAL AND CULTURAL CHANGES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Crevecoeur, Isabelle (CNRS; Université de Bordeaux) - Brukner Havelková, Petra (Natural History Museum; Charles University) - Velemínský, Petr (Natural History Museum) - Varadzinová, Lenka (Charles University) - Varadzin, Ladislav (Czech Academy of Sciences)

Session format: Regular session

What triggers cultural and behavioral changes and to what extent can anthropological evidence be mobilized to understand the factors and the mechanisms underlying these transformations? Are the abrupt cultural changes in time and space that archaeologists capture in their records, including those in subsistence (foraging vs food-production) and settlement (mobility vs sedentism) strategies as well as those in raw material procurement and use (introduction of new components or technology, shifts in production and consumption), related to cultural diffusion, local adaptation, or population changes? These questions are central to archaeology regardless of the chronology or the geographic area.

This session aims at bringing together biological anthropology approaches and perspectives that tackle the questions of population continuity/discontinuity during cultural and behavioral change. Welcoming biochemical and morphometrical analyses with representative examples from worldwide contexts, we hope to stimulate exchanges about the various approaches that allow addressing the question of population change or stability, notably in contexts where ancient DNA data are not available or where biological anthropology approaches can be compared with a-DNA findings.

1 ASSESSING AFRICAN HUMID PERIOD POPULATION DYNAMICS USING MULTIPLE SKELETAL INDICATORS

Stojanowski, Christopher (Arizona State University)

The Holocene African Humid Period was a time of significant population movements that helped shape patterns of diversity we see throughout the Sahara and much of North Africa today. Emerging from thousands of years of relative isolation in Pleistocene refugia, hunter-gatherers likely re-entered the greening Sahara from multiple directions, creating complex patterns of interaction. Here, I present data from the central southern Sahara from the Gobero region of Niger. Excavations recovered over one hundred burials that date to between 9.6 and 4.5 thousand years ago with an occupational hiatus associated with the 8.2kya event. A robust dating program and taphonomic signatures that mark temporal horizons allows allocation of most burials to either the early or middle Holocene. In addition, the size of the Gobero assemblages allows a more population-based approach to assessing population history.

Data were collected on craniometrics, dentition, and postcranial metrics and compared to Late Pleistocene and early Holocene samples from possible refugia (primarily the Nile Valley and Maghreb). Results from different data types are not wholly consistent, but this may reflect gaps in the comparative sampling record. The early Holocene Gobero burials were craniometrically most similar to Maghrebi samples, were intermediate between North and sub-Saharan samples in terms of dental variation, and preserved more typical sub-Saharan African body proportions. Despite clear craniometric differences when comparing the early and middle Holocene burials from Gobero, dentition and long bone proportions are relatively similar between occupation phases. These results speak to the difficulties of identifying population continuity vs. replacement and the varying evolutionary or adaptive signatures that different skeletal modules may preserve.

2 INSTABILITY IN AN EARLY SEDENTARY CONTEXT: THE CONTRIBUTION OF BIOANTHROPOLOGY TO THE EXPLICATION OF NATUFIAN SOCIETY (NEAR EAST, 13000-9800 BCE)

Bocquentin, Fanny (CNRS UMR 8068 TEMPS) - Crevecoeur, Isabelle (CNRS UMR 5199 PACEA) - de Becdelièvre, Camille (AMU, CNRS, Minist Culture, UMR 7269 LAMPEA)

The Near East is characterized by early sedentism among hunter-gatherers who built the first durable hamlets ca. 15000 years ago. These Natufian communities evolved during approximately three millennia and gave birth to Neolithic socio-economic systems at the dawn of the Holocene. This general trend should not, however, conceal diverse cultural trajectories and possible transitory returns to mobile lifestyles. Among the three phases of development recognized so far (Early, Late, Final), the Late Natufian raises questions as to the linearity of the settlement process. During this phase, approximately linked to the Younger Dryas climatic downturn, territorial occupation clearly changed. Some sites were abandoned while others were used principally as cemeteries. Others again became smaller than before, and the sizes of dwelling structures were drastically reduced. Technical and symbolic productions continue the strong legacy of the previous culture, but funerary practices exhibit a sharp break, with collective management of the dead (gathered in the same funerary area or even in the same grave) superseding the kind of individual or family management strategies documented for the previous period. Although Natufian populations remained generally homogeneous through time, bioanthropological analyses of Late Natufian communities reveal that significant changes were also taking place. Using multivariate analyses on a large corpus of biological markers, and metric and morphological data, we will attempt in this presentation to interpret the differences observed and define whether they may relate to such apparent behavioural changes.

3 TRANSITIONS OF PHYSICAL BEHAVIOUR FROM THE LATER STONE AGE TO THE NEOLITHIC IN NORTHWEST AFRICA

Wylin, Glauke (Department of Archaeology, ArcheOs: Research Laboratory for Biological Anthropology, Ghent University) - De Groote, Isabelle (Department of Archaeology, ArcheOs: Research Laboratory for Biological Anthropology, Ghent University; Research Centre in Evolutionary Anthropology and Palaeoecology, Liverpool John Moores University) - Humphrey, Louise (Centre for Human Evolution Research (CHER), Natural History Museum London)

The shift from hunter-gatherers to food producing populations is regarded as one of the most profound and impactful human lifestyle transitions. This paper focusses on the Neolithic transition in Northwest Africa where it is characterized by three consecutive cultural groups: the Iberomaurusian, the Capsian and the Neolithic. Previous archaeological and genetic research has highlighted the multifaceted nature of the Neolithization process in this region as an interrelation of migrating population groups bringing with them herding practices and other innovations related to food production, together with long-term population continuity in which local groups adopted the Neolithic practi-

es. Nevertheless, due to the scarcity of bioarchaeological studies covering this time span, it remains enigmatic how this subsistence change affected human physical behaviour. To address this knowledge gap, this paper investigates changing patterns of habitual activity and mobility by using bone cross-sections to measure strength adaptations and reconstruct behavioural patterns. The results point to increased and more equal humeral strength in the Neolithic, indicating a shift from unimanual hunting activities to bimanual arm use for food processing or craft activities. The pattern of anteroposterior strengthening of the lower limbs in the hunter-gatherers, points to high mobility related to long-distance travelling. In the Neolithic population, there is an anomaly between the continuously strong femora arguing for a maintained mobility during herding practices and declining tibial strength suggesting a more sedentary lifestyle. This sudden morphological change may be the combined outcome of changed activity patterns alongside declining health and an altered gene-pool associated with the Neolithization process. These observations of both behavioural continuity and adaptations to new activities add a significant new perspective to our understanding of the impact of subsistence change on physical behaviour and confirm the dynamic nature of the Neolithization of Northwest Africa.

4 TOOTH DECAY AND WILD PLANT EXPLOITATION IN PLEISTOCENE HUNTER GATHERERS FROM MOROCCO

Humphrey, Louise (Centre for Human Evolution Research, Natural History Museum, London) - De Groote, Isabelle (Department of Archaeology, ArcheOs: Research Laboratory for Biological Anthropology, Ghent University) - Morales, Jacob (Departamento de Ciencias Historicas, Universidad de Las Palmas de Gran Canaria) - Barton, Nick (Institute of Archaeology, University of Oxford) - Bouzouggar, Abdeljalil (Institut National des Sciences de l'Archéologie et du Patrimoine, Rabat)

Grotte des Pigeons at Taforalt in Northeastern Morocco preserves a deep and well stratified sequence of Iberomaurusian (Later Stone Age) archaeological deposits dated from 23,000 to 12,600 cal B.P. The uppermost layers document a striking sedimentary transition at around 15,000 cal B.P, with the onset of a rapid accumulation of ashy midden layers signalling an intensification of human activity. Occupational deposits from the front of the cave preserve for systematic harvesting and processing of edible wild plants, including acorns and pine nuts, alongside exploitation of edible land molluscs and a continuation of hunting activities. This transition in occupational and subsistence behaviour coincided with the first use of the site for elaborate human burials in a spatially demarcated area towards the rear of the cave. Burials involve all age groups with a high proportion of infants. Skeletons preserve evidence of healed trauma and skeletal modification. The upper jaws are characterised by deliberate pattern of dental modification involving removal or one or both incisors. Analysis of oral pathology revealed a high prevalence of caries consistent with the archaeological evidence for increased reliance on plants food rich in fermentable carbohydrates and changes in food processing. Archaeological and skeletal evidence point towards a more sedentary lifestyle involving more prolonged occupation periods and/or a larger population. These changes may have been facilitated by progressive increase in temperature and humidity. There is no evidence for population discontinuity at Grotte des Pigeons but direct comparison of populations from the early and late Iberomaurusian is not possible due to the absence of human skeletal evidence from the earlier period.

5 EXPLORING ANCIENT ORAL MICROBIOMES DURING THE MESOLITHIC-NEOLITHIC TRANSITION IN FRANCE

Blunt, Sierra (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199) - Bennett, E. Andrew (Chinese Academy of Sciences, Institute of Vertebrate Paleontology and Paleoanthropology) - de Belvalet, Harmony (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199) - Mendisco, Fanny (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199) - Pruvost, Mélanie (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199)

In the last decade, the development of ancient metagenomics has considerably impacted our knowledge of past lives. Specifically, the study of dental calculus has become significant in this discipline, as it is rich in well-preserved microbial biomolecules and is common in the archaeological record. Variations in ancient oral microbiomes between chronologically and geographically distinct groups can be linked to diet, ecology, systemic and oral health, and population dynamics. Therefore, major cultural and demographic transitions can leave lasting traces in these microbial communities. For example, the transition from the hunter-gatherer economy of the Mesolithic to the agro-pastoral economy of the Neolithic are reflected in the oral microbiome through an increased abundance of both oral commensals and pathogens, the introduction of bacterial strains, and functional differences associated with starch and dairy consumption. While interdisciplinary evidence supports a generally gradual Mesolithic-Neolithic transition in the European region, studying the evolution of the human oral microbiome can contribute to our growing understanding of the Neolithisation process. However, current data regarding these shifts in present-day France is sparse, despite it being the convergence site of both the Danubian and Mediterranean migration routes. Here, we present our findings from the study of 72 ancient oral metagenomes from France dated from the Upper Paleolithic through

the late Neolithic. To determine how the transition to agriculture affected the oral microbiome, we examine changes in taxonomic composition and metabolic functions related to host diet and health. Additionally, the phylogenetic analysis of highly abundant taxa provides insight on the dispersal of microbial strains due to interactions between host groups. With these results, we discuss how ancient microbial metagenomics, when combined with archaeological and anthropological data, offers a unique perspective on cultural and behavioral changes in the past.

6 **CHANGING LAKE, COMPLEX STORY: SYNTHESIZING MULTI-PROXY EVIDENCE FOR HOLOCENE BIOCULTURAL CHANGE AROUND LAKE TURKANA, KENYA**

Sawchuk, Elizabeth (Cleveland Museum of Natural History, USA; Turkana Basin Institute, Kenya)

The Holocene archaeological record from the Lake Turkana Basin in northern Kenya evokes big anthropological questions about what triggers change and the diverse ways in which people respond. During the African Humid Period (AHP, ~15,000-5500 years ago), pottery-using fisher-foragers hunted with bone harpoons and buried their dead in beaches. As the AHP waned and Lake Turkana receded ~5000 years ago, domesticated animals and herding lifeways spread alongside new lithic and ceramic traditions. These changes coincided with the construction of megalithic “pillar site” cemeteries that are unique to the Turkana Basin and are the earliest-known examples of monumentality in eastern Africa. While it has long been assumed that cattle, sheep, and goats—and at least some cultural practices—were introduced through population movement(s) from northern Africa, many questions remain about identities and relationships among fisher-foragers and herders, and how interactions shaped (or didn't) contemporaneous behavioural shifts.

Over the past decade, bioarchaeological, palaeoenvironmental, and genetic research have massively contributed to this discussion, yet the story seems, if anything, more complicated than ever. We now know that lake levels fluctuated throughout the Holocene, and that mortuary patterns among both fisher-foragers and early herders were more complex than previously thought. Although efforts to extract ancient DNA from Turkana Basin sites have yet to be successful, recently published whole-genome data from other ancient foragers and pastoralists across eastern Africa hint at substantial admixture around this time. Rather than resolve debates about population continuity/discontinuity, new data raise further questions about human interactions and cultural syncretism underlying the mid-Holocene shift to food production. In this paper, I synthesize the current state of knowledge about Holocene biocultural change around Lake Turkana, discuss directions for future research, and reflect on archaeology's increasingly fine-scale view of major transformations in the past.

7 **WHO WERE THE FIRST FOOD-PRODUCERS OF THE NILE VALLEY? DOCUMENTING THE PAST POPULATION HISTORY THROUGH TEETH**

Martin, Nicolas (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, France) - Velemínský, Petr (Department of Anthropology, Natural History Museum, National Museum, Czech Republic) - Crevecoeur, Isabelle (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, France)

In the Nile Valley, transitioning from foraging to food-production occurred between the early 6th millennium BCE and the advent of the 5th millennium BCE, in a context of gradual climate change. From a biological point of view, this change in subsistence strategies was also accompanied by significant morphological variations, especially in the craniofacial region. Assumptions on whether this variation resulted from in-situ adaptation or population discontinuity have been debated for the past several decades. In this work, we analyzed dental remains from a large sample of individuals (n= 361) from Late Paleolithic to Neolithic sites in the Nile Valley. We measured mesiodistal and buccolingual crown dimensions of the whole dentition in these individuals. Using microcomputed tomography, we also analyzed dental tissue proportions and enamel thickness patterns of the U11, UM1 and UM2. Furthermore, the enamel dentine-junction (EDJ) of the first and second upper molars were submitted to a geometric morphometric analysis through a surface deformation-based and landmark-free method. The results highlighted significant differences in tooth size apportionment, dental tissue proportions, enamel distribution patterns and EDJ shape between the last hunter-gatherers and first food-producers. We suggest that such substantial shift in crown dimensions, at both the outer and inner levels and in EDJ morphology, cannot be related to an in-situ adaptation or morpho-functional adaptation scenario. On the contrary, we suggest that this is consistent with some level of biological discontinuity. Our results also highlight regional biological variability among the Neolithic food-producing populations, differentiating Central Sudanese from Nubian groups. All of these data contribute to a better understanding of the emergence of food-production in the Nile Valley and suggest complex scenarios of migrations rather than cultural diffusion.

8 **EXPLORING THE INDIVIDUAL AND COLLECTIVE EXPERIENCES OF THE MESOLITHIC AND NEOLITHIC TRANSFORMATIONS, DIRECT BIOANTHROPOLOGICAL INSIGHTS FROM THE CENTRAL BALKANS**

de Becdelievre, Camille (AMU, CNRS, Minist Culture, UMR 7269 LAMPEA)

With a continuous Early to Middle Holocene sequence of occupation (ca 9500 – 5500 BC) and a broad number of contextualised bioanthropological remains (>500 individuals; > 300 radiocarbon dates), the region of the Danube Gorges (Central Balkans) is a key archaeological complex to further our understanding of Mesolithic foragers' mobility patterns, to document a pre-agricultural trajectory toward sedentism, to tackle the issues of Mesolithic - Neolithic interactions and of farming dissemination, or to explore the dynamics of the Neolithic Demographic Transition. During the last 25 years, a substantial number of research has harnessed bioanthropological data with a wide range of methodologies to refine the chrono-cultural frame of human behavioural transformations (e.g. radiocarbon dates), to reconstruct subsistence and dietary adaptations (e.g. stable isotopes), biological affinities and population interactions (e.g. epigenetic and non-metric variations, body proportions, aDNA), mobility and migrations (e.g. strontium radiogenic evidence), experienced physiological and biomechanical stress (e.g. skeletal markers of health status, bone functional adaptations and alterations), violence and injuries. The combined interpretations of these datasets with spatial and contextual information about mortuary practices (e.g. corpses treatment) or joint cultural evidence (e.g. adornments) may shed some lights on the behavioural mechanisms beyond the subsistence transition, processes of social social transformations or cultural transmission patterns. In this paper, we synthesize these different lines of evidence – external or virtual morphological and metrics, biomolecular and mortuary – at different scales from the grave to the region, from the individual to the population, from the time of experienced events to the duration of social memory in order to reconstruct the biographic and collective narratives behind the Mesolithic and Neolithic transformations and to decipher the effects and the consequences of behavioural innovations, ecological transformations, biological adaptations and population changes.

9 **ECHOES FROM AFAR: CULTURAL TRANSFORMATIONS DURING THE TRANSITION TO AGRO-PASTORALIST SOCIETIES IN THE HORN OF AFRICA (3RD MILLENNIUM BCE)**

Maréchal, Laura (Laboratory of African Archaeology and Anthropology, University of Geneva, Geneva, Switzerland; Université Toulouse Jean Jaurès, CNRS, TRACES - UMR5608, Toulouse, France; Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA - UMR 5199, Pessac, France) - Hérouin, Stéphane (Direction de l'archéologie - Chartres métropole, Direction générale adjointe Aménagement et Développement, Chartres, France) - Desideri, Jocelyne (Laboratory of African Archaeology and Anthropology, University of Geneva, Geneva, Switzerland) - Mologni, Carlo (Université Côte d'Azur, IRD, CNRS, Laboratoire Geoazur - UMR7329, Valbonne, France) - Cauliez, Jessie (Université Toulouse Jean Jaurès, CNRS, TRACES - UMR5608, Toulouse, France)

During the Neolithic transition in the Horn of Africa (5th–3rd millennia BCE), several evidences point towards an increasing social complexity, from the diversification of trade networks to an economy of deferred return implying rules for controlling and sharing resources, through the cultural variability reflected in the plurality of ceramic technical traditions. Among these evidences is also the development of funerary monumentalism, reflecting willingness to commemorate the deceased while demonstrating political and/or economic power. However, beyond this meaningful insight provided by the material culture, our knowledge on the identity of the first agro-pastoralists in the Horn of Africa, both in terms of biological diversity and symbolic thought, remains scarce.

To refine our understanding of the terms and mechanisms of the transition from a hunter-gatherer to an agro-pastoralist lifestyle in this geographical context, we conduct a bioanthropological study on the site of Antakari 3 (Gobaad basin, Republic of Djibouti) (2848-2475 cal. BCE), combining the study of both the funerary practices and the morphological variability of the human groups buried in this funerary site. We here present the first results of the osteological study of the skeletal remains of 155 individuals. Through the burial space management, the biological affinities, the cultural practices and the successive phases of use of the necropolis, we propose a first insight into the identity of these populations. To further address the integration of these groups into the evolutionary history of the region - and in absence of ancient DNA data - we then present an ongoing morphometrical analysis on dental remains. We conclude by presenting future prospects to better characterize, through morphological diversity quantification, the identity, settlement processes and local adaptation of these populations during the Neolithic transition.

BIOARCHAEOLOGICAL RESEARCH OF THE IRON AGE POPULATIONS OF THE CARPATHIAN BASIN - PAST, PRESENT, AND FUTURE

Gyenesei, Katalin (Eötvös Loránd University, Doctoral School of Biology; Hungarian National Museum, National Institute of Archaeology) - Szeniczey, Tamás (Eötvös Loránd University, Department of Anthropology) - Czifra, Szabolcs (Hungarian National Museum, National Institute of Archaeology) - Hrabák, Zita (Hungarian National Museum, National Institute of Archaeology; University of Szeged, Doctoral School of History) - Gémes, Anett (Eötvös Loránd University, Doctoral School of Biology) - Hajdu, Tamás (Eötvös Loránd University, Department of Anthropology)

The Iron Age (IA) of the Carpathian Basin (CB) is characterised by significant changes which began in the 10th century BC and lasted until the 1st century AD.

Transdanubia was inhabited by the bearers of the Hallstatt culture in the Early and Middle Iron Ages (EIA and MIA); meanwhile, at the foothills of the Northern Hungarian Mountain Range and at the Great Hungarian Plain (GHP), the Mezőcsát and later the Vekerzug populations lived. The appearance of Celtic groups in the Late Iron Age (LIA) transformed the whole CB. Interestingly, IA burial rites show remarkable heterogeneity. The Hallstatt, as well as some of the Vekerzug and Celtic groups, cremated their dead, whilst the Mezőcsát population, several of the Vekerzug and Celtic people, inhumated the deceased.

The IA of the CB is notable for several population movements, mainly described using historical sources and archaeological observations; but there are limited anthropological studies. Thus, the aim of our ongoing research is to revise previous studies and expand our understanding of the IA populations of the CB by introducing new osteological materials.

Due to their burial practice, the Hallstatt groups are considered almost anthropologically unknown. As for the Mezőcsát and Vekerzug cultures, the question arises whether they descended from the local Late Bronze Age inhabitants adapting lifestyle and some characteristic artefacts from the steppe region or did an eastward influx of populations during the EIA and MIA partially or fully assimilated the autochthons. The Celtic migration is also recognizable in the heterogeneous LIA osteological materials, however, according to previous and recent results, the local component remained more dominant.

This project is supported by the Bolyai Scholarship, the New National Excellence Program (ÚNKP-23-5, ÚNKP-23-3-SZTE-61), project no. 405906 of the HNM NIA, the grant of the Hungarian NRD Office (FK128013), and project no. C2284509 KDP-2023.

ESTABLISHING A SOCIO-POLITICAL BIOARCHAEOLOGY IN HISTORICAL TIMES: IMPACTS OF STATUS-QUO TRANSITIONS ON LIFEWAYS AND DEATHWAYS IN THE MEDITERRANEAN SOUTHERN EUROPE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Michael, Dimitra (Laboratory for Interdisciplinary Research in Archaeology, (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece) - Karligkoti, Anna (Science and Technology in Archaeology and Culture Research Centre, The Cyprus Institute, Nicosia 2121, Cyprus) - Nikita, Efthymia (Science and Technology in Archaeology and Culture Research Centre, The Cyprus Institute, Nicosia 2121, Cyprus) - Triantaphyllou, Sevi (Laboratory for Interdisciplinary Research in Archaeology, (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece)

Session format: Regular session

Human history is characterized by repetitive cycles of socio-political transitions. The establishment and collapse of major political and economic entities, such as the Roman Empire, the processes of colonization and decolonization throughout the globe and in the Mediterranean southern Europe in particular, societies transitioning between political systems, such as oligarchy or monarchy or democracy, are just a small glimpse of the complex transformations that human populations have faced throughout history. Such status-quo changes often have significant implications for human health, dietary patterns, mobility/migration, physical activity, social organization, gender relations and mortality practices. Many of the changes observed in the above dimensions are frequently associated with structural violence and intersectionality.

Bioarchaeologists are uniquely equipped to examine such impacts by placing the human body and the burial environment at the center of enquiry. Aiming to better comprehend the varied responses to status-quo transitions we invite bioarchaeologists of diverse expertise (e.g. human, animal and plant remains) to share methodological and theoretical advancements for the sub-discipline of socio-political bioarchaeology. We are particularly interested in case-studies that incorporate literary sources, material evidence and bioarchaeological approaches; combine macroscopic with bi-

omolecular analyses; focus on health inequalities under the prism of possible social, gender, age or ethnic inequities; employ experimental bioarchaeological approaches to study human cremations or patterns of conflict; implement multi-proxy methods to address complex issues such as heterogeneous frailty and the osteological paradox. We are interested in both regional case-studies focusing on a single transition or on multiple socio-political changes, as well as wider comparative investigations.

We hope that this session will generate a productive dialogue between scholars of different research foci, offering insights that could inform us about similar transitions that people face in the world today.

ABSTRACTS

1 THE SICTRANSIT PROJECT 2016-2024. TRANSITIONS IN ECONOMY AND SOCIETY IN EARLY MEDIEVAL SICILY, FIFTH TO THIRTEENTH CENTURY; A BIOARCHAEOLOGICAL STUDY

Carver, Martin (University of York) - Molinari, Alessandra (University of Rome Tor Vergata) - Fiorentino, Girolamo (University of Salento at Lecce)

The aim of the Sictransit project was to study the material lives of Sicilian farmers, merchants and their families over seven hundred years of the Middle Ages (550-1250). During this period the country was governed successively by Byzantine, Islamic, Norman and Swabian rulers, but our interest lay primarily with the people that history seldom mentions, those who farmed the land, grew, made, sold and delivered its produce, lived, worked, married and died in its villages and towns. Who were these people, how mobile were they and how did they fare in good times and bad? Some were Christians, some were Muslims, others Jews – how far did the people of different faiths intermingle? What made Medieval Sicily a peaceful and affluent or a turbulent and belligerent society?

These questions are important today as we face the widespread movement of refugees, issues of religious tolerance and political and economic insecurity. Medieval Sicily provides a proving ground for their investigation: a large fertile island located between continental Europe, North Africa and West Asia, it was open to influences and predation from each quarter.

Our objectives were to combine history, archaeology, bioarchaeology and biomolecular archaeology to investigate life in town and country, agriculture, diet, trade, mobility and spirituality in the four successive regimes. The development of a joined up synthesis, interweaving the results from different disciplines and understanding the significance of when they converged or diverged, was not simple. It has engaged our team and presents an important challenge for the future.

This presentation draws on the research of the SICTRANSIT team, OI Craig, Michelle Alexander, Nathan Wales, Léa Drieu, Jasmine Lundy, Alice Ughi, Aurore Monnereau, Madeleine Hummler, Veronica Aniceti, Derek Hamilton, Paola Orrechioni, Antonino Meo, Francesca Colangeli, Fabio Giovannini, Gabriele Ciccone, Milena Primavera, AnnaMaria Grasso. For list of publications see <http://sicily-in-transition.org>.

2 SEX, SURVIVAL, AND THE FALL OF THE ROMAN EMPIRE: GENDERED DIFFERENCES IN STRESS AND MORTALITY IN LATE ANTIQUE GAUL

Quade, Leslie (Austrian Archaeological Institute)

Late Antiquity (c. 300-700 CE) has often been conceptualized as a period of socio-political rupture marked by the collapse of the Western Roman Empire and the transition to the Medieval period. The impact of this transition on health and well-being has not yet been thoroughly explored, including considerations of potentially gendered health consequences. This research examines how transitions occurring during Late Antiquity affected stress, health and mortality in Roman and Late Antique males and females from Gaul. The skeletal remains of 410 adult individuals are assessed for mortality and survivorship through age-at-death distributions and Kaplan-Meier survival analysis, as well as macroscopic and biochemical skeletal stress markers, including dental enamel hypoplasia and concentrations of the 'stress' hormone cortisol in teeth.

Results demonstrate an overall similarity between time periods and the sexes in the frequency of dental hypoplastic defects and cortisol concentrations. Because these indicators reflect stress and health during childhood, this suggests that transitions in Late Antiquity were not differentially affecting males and females in early life stages. However, significant differences were identified in mortality (age-at-death) and survivorship over time between Roman and Late Antique burial populations, with female mortality notably affected. Adult females were more likely to die in early adulthood (18-35 years) than males in Late Antiquity, and both males and females in the Gallo-Roman period. Environmental shifts, trade localisation, and sociocultural changes in Late Antiquity could have placed new pressures on existing systems of structural inequalities, resulting in increased female mortality in early adulthood.

3 HELLENISTIC BIOARCHAEOLOGY: WHAT DO WE KNOW, WHAT QUESTIONS ARE STILL PENDING AND HOW DO WE ANSWER THEM?

Nikita, Efthymia (The Cyprus Institute)

This presentation focuses on the state-of-the-art in Hellenistic period (4th -1st c BCE) bioarchaeology. This period has been characterized by flourishing cultural exchanges, scientific and artistic innovations, as Greek cultural influence expanded across the Mediterranean and beyond. At the same time, the Hellenistic period witnessed serious political turmoil as the dominance of the Greek civilization reached its end while a new power, Rome, started emerging. As will be demonstrated, despite the cultural and political interest that this period exhibits, the bioarchaeological information available regarding its citizens and how they experienced being part of the Hellenistic world is scant. This presentation will offer an overview of this limited information, shedding some light on the dietary patterns, mobility and health (physiological and mechanical stress) of these individuals. Importantly, it will highlight the existing gaps in our knowledge, especially compared to earlier and later historical periods, and it will propose theoretical and analytical ways forward. The research on which this presentation is based has been conducted in the context of the MetaMobility Project.

4 INVESTIGATING THE IMPACT OF MULTIPLE AND CONSECUTIVE STATUS-QUO TRANSITIONS ON HUMAN LIFEWAYS IN ANCIENT AMPHIPOLIS

Michael, Dimitra (Laboratory for Interdisciplinary Research in Archaeology (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece) - Snoeck, Christophe (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB, Pleinlaan 2, 1050 Brussels, Belgium) - Tselekas, Panagiotis (Laboratory for Interdisciplinary Research in Archaeology (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece) - Sverkos, Ilias (Laboratory for Interdisciplinary Research in Archaeology (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece) - Malamidou, Dimitra (Ephorate of Antiquities of Serres, Ethnikis Antistasis 48, 62122 Serres, Greece) - Triantaphyllou, Sevi (Laboratory for Interdisciplinary Research in Archaeology (L.I.R.A.), School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki, Thessaloniki 54124, Greece)

Experiencing different socio-political regimes is considered to shape the human body, in biological as well as in cultural terms. Historical knowledge of various types of political systems and aspects of social hierarchies can offer the capacity to actually measure how different regimes may impact on human health and lifestyle from the less privileged individuals to the most favored “elite” groups in a society. The BIOSOCIOPOLIS project, funded under a Marie Skłodowska-Curie frame, aims to develop a new interpretive model to reveal the extent to which multiple and consecutive socio-political transitions, affect human lifeways and deathways, in a diachronic perspective. Amphipolis in northern Greece, experienced many different political models, including colonization, political autonomy, consolidation and imperialization (5th c. BC-2nd c. AD) and was thus chosen as an ideal case study. A well-contextualized sample from the inhumation burials of the diachronic cemeteries of Amphipolis has been selected on the basis of representation for the time period as well as for the diverse mortuary evidence linked to “elaborate” and “modest” burial features. As Amphipolis moved from an autonomous entity to participatory in a political network and eventually to a provincial subject of an empire, it passed from a state of managing its resources for its own benefit to serving the needs of others. This could theoretically affect various parameters of social organization and reflect consequently to the general well-being and physical strenuousness. To test this hypothesis, physiological stress and oral health indicators, traumatic lesions and activity patterns are being recorded, and will be presented in relation to age, sex, time period and contextual data (burial types and artifactual evidence). This approach, which is completely novel for historical populations of the broader region of northern Greece, is expected to induce significant progress, both on a methodological level, as well as for humanities in general.

5 SEX-RELATED DIFFERENCES AND SOCIAL STRATIFICATION IN HELLENISTIC/EARLY ROMAN MENAINON, SICILY

Caruso, Antonio (The Cyprus Institute) - Nikita, Efthymia (The Cyprus Institute)

Historical sources are polarized when describing the place that men and women occupied in the Greco-Roman society, with the latter apparently suffering important inequalities in terms of food access, occupation and health in general. However, such sources are characterized by a male elitism bias and tell us the story of a wealthy minority living in large urban settlements. Instead, the vast majority of the people lived in rural settings or smaller communities, and have been largely neglected by both ancient historians and, until recently, modern bioarchaeologists. This work aims at shedding light into male-female inequalities in the rural community of Menainon during the Hellenistic/early Roman period. The Hellenistic period in eastern Sicily marks an important transition of the political power; whereas the island started as a focus point of the great Greek colonization, it evolved into the first Roman province. Within this

framework, osteoarchaeological methods have been used in combination with historical and archaeological sources to explore differences and inequalities of lifestyle between males and females. Specifically, the analysis of diet (dental diseases, stable isotopes), occupation (activity-related skeletal changes) and health (non-specific stress markers) has been used to test to what extent the historical record represents the “marginalized” communities living in rural areas.

6 INVESTIGATING THE IMPACT OF SOCIOCULTURAL TRANSFORMATIONS ON HEALTH QUALITY IN A BIG CITY. THE POPULATION OF THEBES DURING CLASSICAL ANTIQUITY

Karligkioti, Anna (The Cyprus Institute; American School of Classical Studies at Athens) - Aravantinos, Vasilios (Ephorate of Antiquities of Boeotia, Hellenic Ministry of Culture and Sports) - Charami, Alexandra (Ephorate of Antiquities of Boeotia, Hellenic Ministry of Culture and Sports) - Nikita, Efthymia (The Cyprus Institute)

During Classical Antiquity, central mainland Greece was characterized by important historical events that shaped the Greco-Roman world. In particular, the turbulent history of the region was marked by a series of major wars, the formation of alliances, as well as economic and cultural prosperity and decline. Boeotia played an active role in the aforementioned events, while its capital, Thebes, was one of the main powers in the region until its destruction by Alexander the Great in 335 BC. Since then the area remained under the influence of the Macedonians until its occupation by the Romans in the 2nd century C.E.

The above social, political and economic changes had a great impact on the inhabitants of the area. As such, they offer an ideal context for examining health levels and lifestyles in Boeotia over time. Although Classical Antiquity in Greece has been thoroughly studied in relation to both its history and archaeology, bioarchaeological studies of historical period assemblages are extremely few, with only three focusing on Boeotia. Specifically, two concern the population of Akraifeia (Nikita et al. 2019, Tritsaroli 2017) and one concerns the population of Agia Triada (Michael et al. 2017).

The current work examines how socio-political changes affect demography, health, diet and activity and aims to identify variations in relation to biological sex and social stratification during classical antiquity, through the study of human skeletal remains found in the northeastern cemetery of Thebes.

7 EMBODIED DIFFERENCES IN ADULTHOOD STRESS AND MORTALITY BY SEX AND HISTORIC PERIOD (ROMAN IMPERIAL AND BYZANTINE PERIODS) AT OYMAĞAÇ-NERIK, TURKIYE

Marklein, Kathryn (Department of Anthropology, University of Louisville; Center for Archaeology and Cultural Heritage, University of Louisville) - Deurell, Sara (Department of Anthropology, University of Louisville; HMB Professional Engineers (Archaeology Division))

The historical narratives of empires, their “rises” and “falls,” are generally reconstructed from the archaeological or literary remnants of geopolitical “cores” and peoples within. While important for understanding sociopolitical transitions, these narratives are not reflective of all local and regional experiences and responses to geopolitical change. Examining human skeletal remains, in tandem with archaeological, zooarchaeological, and paleobotanical data, provides a comprehensive reconstruction of sociopolitical transitions, especially in rural areas, which are oftentimes underrepresented in historical records. In this study, we interrogate the consequences of a political transition, from the early Roman Empire (c. 0-400 CE) to the Byzantine Empire (c. 500-900 CE), on a rural community in northern Anatolia (Oymağaç-Nerik, Samsun province). First, we examine overall changes in mortality (age-at-death distributions) and adulthood morbidity (antemortem fracture, osteoarthritis, and tibial periosteal new bone formation) occurring in this agricultural community, then situate these diachronic findings regionally within other late Roman/Byzantine populations in Anatolia and broadly within contexts of famine, plague, and war. We subsequently compare rates of fracture, osteoarthritis, and tibial periosteal new bone formation in estimated adult females and males between periods to identify differentially-embodied experiences correlated with phenotypic sex. Overall, this case study provides an opportunity to assess how rural communities may have been impacted by the transformation of the Eastern Roman Empire and contributes to ongoing archaeological and bioarchaeological studies examining the causes and consequences of imperial “falls.”

8 THE TRANSITION FROM MUSLIM WORLD TO PORTUGUESE KINGDOM IN SOUTHERN PORTUGAL (11TH-13TH CENT.)

Maurer, Anne-France (Hercules Laboratory and IN2PAST, Universidade de Évora, Portugal) - MacRoberts, Rebecca (Hercules Laboratory and IN2PAST, Universidade de Évora, Portugal) - Lopez-Aceves, Judith (School of Archaeology and Ancient History, University of Leicester, UK) - Ortega-Gonzalez, Alvaro (School of Archaeology and Ancient History, University of Leicester, UK) - Valente, Maria Joao (Universidade do Algarve / CEAACP, Portugal) - Fernandes, Teresa (Research Centre for Anthropology and Health (CIAS), University of Coimbra, Portugal; Departamento de Biologia. Escola de Ciências e Tecnologia. Universidade de Évora) - Teixeira, Joao (Australian Centre for Ancient DNA, School of Biological Sciences, University of Adelaide, Adelaide, SA, Australia; Centre for Interdisciplinary Studies (CEIS20), University of Coimbra, Coimbra, Portugal; Evolution of Cultural Diversity Initiative, The Australian National University, Canberra, ACT, Australia) - Schöne, Bernd R. (Institute of Geosciences, University of Mainz, Germany) - Oliveira, Luis Filipe (Universidade do Algarve / I.E.M-FCSH-Nova, Portugal) - Tete Garcia, Cristina (Comissão de Coordenação e Desenvolvimento Regional do Algarve, CEAACP / Universidade do Algarve, Portugal)

The TRANSCULTURAL project, developed between 2018 and 2022, conducted multi-disciplinary research to study the remains of different medieval Portuguese communities. The aim was to enhance comprehension of the transition from the Muslim to the Christian period during the emergence of the Portuguese Kingdom. The objective was to complement existing historical and archaeological sources for this period of economic and political transition, which continues to be inadequately understood. Specifically, the project aimed to explain the repercussions of this transition on different social groups, their coexistence, and their intercultural dynamics.

This presentation will showcase the mobility patterns observed among the last Muslims buried in Loulé prior to its conquest by the Christians, and the first Christians buried in Cacela-a-Velha after the conquest of this fortified village by the Order of Santiago (both sites located in Algarve, southern Portugal). These patterns are deciphered through the analyses of the biogeochemical composition of skeletal remains (bone $\delta^{34}\text{S}$, tooth enamel $\delta^{18}\text{O}$ and $87\text{Sr}/86\text{Sr}$), as well as of some botanical samples. Utilizing a machine learning methodology in tandem with probability assignments, and integrating genomic, archaeological, anthropological and historical datasets, our objective was to elucidate the complexities of this transitional period and the dynamics of conquest in the southwestern region of Iberia.

76 EXPLORING SOUNDS AND MUSIC IN ARCHAEOLOGICAL LANDSCAPES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Díaz-Andreu, Margarita (ICREA; Departament de Història i Arqueologia, Universitat de Barcelona (UB); Institut d'Arqueologia (IAUB)) - Dordevic, Zorana (Departament de Història i Arqueologia, Universitat de Barcelona (UB); Institut d'Arqueologia (IAUB)) - Kopij, Kamil (Instytut Archeologii, Jagiellonian University) - Kumbani, Joshua (Departament de Història i Arqueologia, Universitat de Barcelona (UB); Institut d'Arqueologia (IAUB))

Session format: Regular session

Although past soundscapes have increasingly captivated the attention of researchers in recent decades, their exploration still significantly lags behind the study of the indoor acoustics of ancient monuments and sites. Therefore, this session aims to serve as a platform to stimulate discussion regarding the role of sound and music in past landscapes. It encompasses a diverse range of themes including music archaeology and archaeoacoustics, the social significance of sound, and heritage preservation.

As objectives the session proposes, first, to induce conversation concerning the acoustic characteristics of archaeological sites and past soundscapes, and of the musical instruments and other sound devices such as animal call tools played in the open air. In this context, we warmly welcome papers focusing on emerging technologies that facilitate the analysis of sound behaviour in outdoor environments. To foster a dialogue on the social significance of sound beyond enclosed spaces is the session's second objective. A related topic to discuss is how communities may have employed specific acoustic features of particular areas to evoke a sense of identity. Also, the artistic representation of sound and musical instruments within past landscapes may be considered as a debate topic. Thirdly, this session endeavours to facilitate the exchange of ideas regarding the preservation of endangered past soundscapes. Finally, this session seeks to provide some insights on the difficulties encountered by the interdisciplinary nature of the field of archaeoacoustics in which, in addition to archaeologists, scholars also include acoustic engineers, musicologists, soundscape specialists, anthropologists, art historians and heritage experts.

This session is organized by the Artsoundscapes, Cult-Aural and Acoustics and proxemics of 'contiones' projects and it is open to everyone.

ABSTRACTS

1 THE SONG OF LOA. REFLECTIONS ON SOUNDSCAPE INFLUENCE IN ROCK ART OF LOA MEDIO

Candela, Jose (University of Chile)

Chile is a particular South American country. Its extended, narrow territory contains climatic environments ranging from tundra to desert climates. In the middle of the Atacama Desert, we find the Loa River, the longest river in Chile, with an extension of 440 km. Despite its hydrographic basin of 33,570 km², the Loa has a relatively low flow rate due to the desert characteristics of the area. However, this did not impede it from becoming the axis of the development of the Atacama society for several centuries. This paper attempts to seek influences from the soundscape of this river in the rock art survey of the Loa Medio from an enactive and embodied perspective. To do this, we will review the sound characteristics of the Loa in the location of Santa Barbara (3,000 meters above sea level) - a rural area located at the foot of rock art of the Loa Medio - analyzing how this specific soundscape may have informed the in site artistic practices and their results. I propose that this review will allow us to better know and understand, from a sensitive perspective, how this type of ancient art was generated.

2 BEYOND THE MOVE: A SYSTEMATIC ANALYSIS OF DANCE SCENES IN THE ROCK ART OF ZIMBABWE AND SOUTH AFRICA

Kumbani, Joshua (Institut d'Arqueologia UB (IAUB), Universitat de Barcelona; Departament de Història i Arqueologia, Universitat de Barcelona) - Díaz-Andreu, Margarita (Institució Catalana de Recerca i Estudis Avançats (ICREA); Institut d'Arqueologia UB (IAUB), Universitat de Barcelona; Departament de Història i Arqueologia, Universitat de Barcelona)

Dance is an activity intimately connected to music and sound, typically performed outdoors. It holds a social significance that extends well beyond mere entertainment, but it does not exclude it. In this paper, we aim to focus on dance within the archaeological record of southern Africa, specifically exploring dance scenes depicted in rock art sites. For the last three decades the depictions of dances in South African rock art have been associated with the medicine or trance ceremony, but a thorough study is needed to confirm this association. Moreover, in our paper we would like to conduct a comparative analysis of the recorded dance scenes from South Africa with others from Zimbabwe, to explore whether there are regional differences in the way dances are portrayed and their potential function. Attention will be focused on the gender of the figures, the dance postures, costumes, and all associated paraphernalia.

This work comprises a comprehensive review of dance scenes found in both published and unpublished literature, as well as a search of the SARADA database, with a specific focus on dance in the rock art of Zimbabwe and South Africa. Through the examination of these dance scenes, the study aims to reveal the socio-cultural dynamics of past hunter-gatherer groups who created the art. The anticipated identification of both similarities and differences in dance depictions can provide insights into the ceremonial and recreational practices of these ancient communities.

This article is part of the ERC Artsoundscapes project (Grant Agreement No. 787842) that has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme. PI: Margarita Díaz-Andreu.

3 ETHNOARCHAEOLOGY AND ARCHAEOACOUSTICS: SEVEN CUP-MARKED SOUNDING ROCK SITES IN THE HIGHLANDS NORTH TO THE GREDOS MOUNTAIN RANGE, SPAIN

Jiménez Pasalodos, Raquel (Universidad de Valladolid)

Within the framework of an ethnoarchaeological survey focused on identifying seven acoustically significant rocks and rock outcrops in the landscape of various areas on the north face of the Gredos mountain range, in the provinces of Ávila and Salamanca (Spain), a compelling long-term cultural phenomenon has emerged. This phenomenon involves the utilization of natural rocks for sound production, resulting in distinct cup-marks on the rock surfaces.

This paper aims to provide an initial exploration of seven archaeoacoustical sites exhibiting these features. It will introduce the methodologies employed during the identification of these sites, propose a classification, and endeavor to explain the acoustic phenomena involved. Notably, these phenomena cannot be solely attributed to the lithophonic properties of the rocks. The paper will also delve into the potential association of these acoustic features with ancient practices. This archaeoacoustical approach is founded on the methodologies developed under the ArtSoundscapes research project, supported by the European Union's Horizon 2020 research and innovation programme ERC, under grant agreement No 787842.

4 **CLAY - SHAPE - SOUND, WHAT'S SO RATTLING? NEW RESEARCH PERSPECTIVES ON CERAMIC RATTLES FROM PRESENT-DAY POLAND**

Taton, Katarzyna (Doctoral School of the University of Rzeszów)

Ceramic rattles are quite simple sound tools. They have been known since the Neolithic – when clay became a popular raw material for making objects of everyday use. Although they are not present in today's Polish folk musical instruments, there were periods of their great popularity here. Currently, there are more than 1200 preserved ceramic rattles or their fragments. Many of them are still capable of producing the sound.

As archaeological objects, rattles are subject to contextual and material examination using the latest research techniques, such as petrography and computed tomography. However, rattles are also sound tools and modern methods also include archaeometric sound research, i.e. in-depth analysis of the structure of their spectrum, but also numerical modeling with reverse engineering methods. This allows for the detection of momentary features, often impossible to capture in an auditory assessment. The hitherto unknown phenomena, like presence of ultrasounds or the existence of groups-types of sounds, are therefore revealed. The observations will shed some light on the acoustic landscape in which the constructors of rattles, their users and recipients functioned. They will allow for the identification of previously unknown socio-cultural phenomena.

5 **THE MANY SOUNDSCAPES OF EFLATUNPINAR HITTITE OPEN AIR SANCTUARY**

Erbil, Yigit (Hacettepe University) - Ünlü, Elif (Boğaziçi University) - Bolat, Senem (İzmir Yüksek teknoloji Enstitüsü) - Yiğit H. Erbil, Elif Ünlü, Senem Bolat

Water was seen as an effective purifying element in Hittite ritual practices. Its cleansing power can be seen in the form of lustrations or even full baths. Through the cult given to the river and the spring-goddesses, Hittite texts attest to the sacred character of water. As deities, rivers were usually associated with mountain gods. The rock reliefs and monuments located near the rivers are the root of this association.

Eflatunpinar monument is a stage within the natural landscape that dominates the landscape both visually and aurally. The sound of water surrounds the whole monument by design. The natural spring located to the northeast of the pool gurgles loudly as its waters are directed into channels to run neatly outside the east and north of the walls of the pool from where they would be allowed to pour into the pool at different locations where each outlet or a combination of outlets create different levels of sound. The increasing proximity to the monument augments this aural experience. The audience of the rituals taking place within this setting would have been engulfed in a meticulously engineered soundscape with water being the primary source, which would also have been combined with human and animal sounds of ritual participants.

This talk aims to investigate the possible combinations of aural experience at different parts of the monument using aural modelling. To achieve that water sounds were recorded at the monument at five different points. Sounds were also recorded at three listener positions. Present and virtually reconstructed versions of the monument were simulated using Odeon software. Auralizations were created based on the recordings, subjectively calibrated for listener positions and finally convolved with an original ritual music composed for this study.

6 **EXAUDISSIMI LOCI: FROM WHICH ROSTRA IN ROME COULD THE SPEAKER BE BEST HEARD?**

Kopij, Kamil (Institute of Archaeology Jagiellonian University) - Pilch, Adam (AGH University of Krakow) - Drab, Monika (Wrocław University of Science and Technology) - Popławski, Szymon (Wrocław University of Science and Technology)

This study delves into the audibility of speech across various speaking platforms in ancient Rome during the late Republican and Early Imperial period, specifically focusing on the rostra vetera, rostra aedis Castoris, rostra Augusti, rostra aedis divi Iulii, the Capitoline Temple, and the Temple of Bellona. Employing a rigorous approach, we employ acoustic simulations using the virtual reconstructions of these historical venues considering not only the geometry of the space but also the acoustic properties of the construction materials.

Our investigation incorporates three distinct levels of background noise (36, 49, and 55 dBA) to mirror the diverse auditory environments of ancient Rome. Additionally, crowd size estimation relies on insights gained from contemporary crowd studies in analogous scenarios. By combining these elements, we aim to answer a fundamental question: which rostra, during a specific historical period, maximized the intelligibility of the speaker's message to the largest audience?

Preliminary results suggest intriguing variations in acoustic properties across the different speaking platforms. The observed variability extends not only between different rostra but also among different background noise scenarios, implying a significant fluctuation in crowd sizes. This prompts consideration of whether speakers could have chosen a specific speaking platform based on the anticipated volume of the crowd.

This interdisciplinary study not only sheds light on the practicalities of communication in ancient Rome but also contributes to a deeper understanding of the intersection between architecture, acoustics, and public discourse. Ultimately, our findings aim to identify the rostra that, during a given period, optimized the audibility of speeches, providing valuable insights into the communication dynamics of this pivotal era.

7 **DEEP LISTENING TO THE RUINS**

Nissin, Laura (Tampere University) - Tiekso, Tanja (University of Helsinki)

Recent archaeological research has witnessed a shift known as the sensory turn, which moves away from solely visual studies towards a more comprehensive understanding of the past through multiple senses. This shift entails exploring the sounds and soundscapes of ancient built environments, which have traditionally been examined primarily through the lens of sight and vision alone. In our paper, we introduce listening as a possible method for exploring these environments.

Our methodology combines archaeological fieldwork with experiential artistic research practice, more specifically, deep listening. Employing experimental methods in archaeological research has a long past. In recent sensory archaeology, methods that use the bodily experiences of researchers as a means of conveying information of past sensations, have become even more sought-after. Such embodied, experiential techniques are believed to lead to a more inclusive and comprehensive understanding of the ancient sensorium and thus the ancient societies (see, e.g. Hunter-Crawley 2019, Tringham and Danis 2019, Tilley 2019; Rowan 2024, Garland 2023; cf. Hamilakis 2013).

In our research presented in this paper, we introduce the method of deep listening for exploring ancient architectural soundscapes. Deep listening is a method for listening intended for musical composers and musicians including also those who do not have classical musical training. The method is invented by American Composer Pauline Oliveros in artistic collectives since the 1960s (e.g. Oliveros 2005). In her recent artistic research concerning posthuman and urban soundscapes, Tanja Tiekso has developed the method of deep listening further (e.g. Tiekso & Lummaa 2022). In our paper, we will introduce our methodology of listening, in which we use sound recording, sound mapping and listening diary as our research tools. The presentation is based on our current fieldwork at three archeological sites: Pompeii, Forum Romanum and Ostia Antica.

8 **REPORT OF ARCHAEOACOUSTIC AND ANTHROPOLOGICAL STUDY OF THE ROTUNDA IN BÉNY (2016-2021)**

Lovász, Irén (Karoli Gaspar University of the Reformed Church in Hungary University)

Multidisciplinary studies were made during fieldworks of our international research group in the medieval Rotunda of Bény (Bína), in Central Europe where unusual sound phenomena can be experienced. The unique feature of the Rotunda are the 12 mysterious vaulted niches within.

First oral history as an anthropological method of study was used and local people were interviewed to understand local legends relating to the rotunda.

Then fieldwork was undertaken to test the rotunda's archaeoacoustic and resonant properties with the contribution of Professor Paolo Debortolis (I), University of Trieste. Equipment, methods, results with our conclusion were presented and published in the III. Archaeoacoustic conference in Tomar, Portugal in 2017.

In the next turn of study we expanded our research team and changed the concept and technical facilities of the recordings. After taking into consideration the possible use of human voices in the niches and in the whole rotunda we also changed the position of microphones. First we used male voice and the testing method of our invited guest Professor legor Reznikoff (F), the respected scholar of archaeoacoustic research.

A simultaneous study was carried on with complete acoustical machinery and sophisticated technology by Paul Oomen (NL), sound artist, researcher, founder of 4Dsound Studio in Budapest, in order to document and understand the most prominent acoustical properties in the Rotunda. Our research describes the acoustical reasons for observed phenomena and draws conclusions on the likeliness of an intentional sound design in the architecture of the Rotunda. Based on the acoustic findings, it may be concluded that the village myth is partly true as far that each niche has significantly different resonances, these are clearly audible and measurable in the niches when excited by the human voice.

9 **EXPLORING THE MONASTIC SOUNDSCAPES IN MEDIEVAL CATALONIA: PRELIMINARY RESULTS**

Dordevic, Zorana (University of Barcelona) - Costa Badia, Xavier (University of Barcelona) - Alvarez Morales, Lidia (University of Barcelona)

This paper explores the essential role of bells in shaping the monastic soundscapes of medieval Catalonia. The primary focus of this case study is directed towards three monasteries - Santa Maria de Gerri, Sant Pere de les Maleses, and

Sant Pere del Burgal - and a church of Santa Maria de Aneu, all established between the 9th and 10th centuries within the north-west region of Alt Pirineu in Catalonia. This research has two main objectives: firstly, to determine the aural community created by each of these religious establishments, and secondly, to explore the potential communication interlinking these religious establishments and how it changed over the seasons. The methodological approach involves on-site acoustic measurements and audio recordings of bell sounds to obtain the sound intensity across frequencies. Subsequently, we explore the propagation of sound through the Geographical Information System (GIS), utilizing the ArcGIS software and freely available Sound Mapping Tools fed with the data obtained during on-site acoustic measurements. The resultant sound propagation map further facilitates an analysis of the environmental and seasonal influence on the propagation of bell sounds, thereby delineating the aural footprint within which messages could potentially be communicated. Preliminary conclusions highlight the aural coverage of bell sounds in configuring the monastic soundscapes in medieval Catalonia.

10 INVESTIGATING NEW SOUNDS FROM A RECREATED MEDIEVAL ORGAN WITH PAIRS OF CONICAL PIPES

Chinaglia, Walter (Centre International de Musiques Médiévales- CIMM (Montpellier, France); Centre for Cultural Heritage Studies, University of Insubria, Como (Italy))

The Harding Bible (Dijon, Bibliothèque Municipale) was written and illuminated at the Cistercian monastery of Cîteaux during the leadership of the third abbot Stephen Harding. It includes an illustration (MS14, vol.3, folio 13v), dated to about the second decade of the twelfth century and showing Psalmist King David with his four musicians, one of which playing an eight-keyed organ with eight pairs of conical flue pipes.

Although this image of an organ is often regarded as unreliable – to be reconsidered in the light of squashed perspective and multiple viewpoints - I believe that it provides sufficient elements for a realistic reconstruction and hence further investigation on the role of the pairs of equal-length pipes.

For historical accuracy, the construction of typical organs of the period had to be taken into account, thus for windchest and conical pipes reference was made to the coeval treatise *De diversis artibus* by Theophilus.

As a natural result of the building process, the lengths of the pipes of the reconstructed instrument, as well as their arrangement on the windchest and the lineup of their mouths, correspond to the illustration in the manuscript.

Yet, regarding the sound some questions arise, which this research aims to examine:

How were the pairs of pipes used - at their perfect unison or slightly mistuned, resulting in an undulating sound? Would this oscillation be a plausible sonic model for medieval organs? Could it be considered as a precursor of the Italian Renaissance organ stop 'Voce Umana'?

11 PRECOLONIAL URBAN SOUNDSCAPES IN ISLAMIC EAST AFRICA

Baumanova, Monika (University of West Bohemia, Pilsen, Czech Republic)

Islamic cities of the global Middle Ages are well known for their spatial organisation, where residential houses were distributed in clustered blocks, with public spaces represented by mosques, winding streets, as well as other features like open spaces and markets. The role of mosques in the urban layout, for example, have been studied for their part in power negotiations, in representing individual quarters, building identity of the community or for attesting shared values.

This paper presents how understanding the socio-spatial organisation of Islamic towns may be significantly aided by studying the characteristics of urban sensory landscapes. Presenting a case study from the Islamic world, it focuses on the Swahili coast that extends from the Horn of Africa to the south of the continent, as the largest Islamic region in eastern Africa, and also one of the first where Islam became a dominant religion. Utilising selected analyses from the field of acoustics, the paper considers the layout of several precolonial sites dated to approximately 12th-15th century, in order to assess the distribution of mosques and the role of call to prayer in the urban soundscape of the towns. Apart from the placement of built features, the role of natural sounds is also considered. The derived observations may be used for comparison of urban soundscapes within the Islamic world, as well as in cross-cultural analyses, e.g. with contemporary towns of Christian Europe.

12 RE-CREATING THE SOUNDSCAPE IN A WORLD WAR 2 CONCRETE BUNKER

Mølgaard, Martin (Museum Skanderborg)

This paper will focus on development of soundscapes in historic buildings. Museum Skanderborg, together with the Struer Museum, Midtjyllands Museum and Aarhus University, has worked to map historical soundscapes to give guests an even better experience of the historic buildings they visit.

Each museum selected a historic building for the project, and at Museum Skanderborg the choice fell on a former German command bunker. The bunker was part of the Luftwaffe's headquarters at Skanderborg and is used today as a museum building.

The buildings themselves are seen as historic objects. Still standing as they did when they were abandoned. Already at the sight of the building, guests feel a historical encounter, which is typically only reinforced when meeting the building's interior. Guests experience the feeling of authenticity, but in silence. By adding a soundscape to the building, the building is brought back to life and gives visitors an experience of the life that once took place.

Together we have developed the use and understanding of sound within museum communication in authentic buildings, where sound is perceived as intangible cultural heritage and functions in such a way that it becomes an integral part of the authentic experience that the buildings provide opportunities for.

In this paper will share challenges and experiences regarding the mapping and selection of the sounds in the bunker, the implementation, and the guests' experience of the soundscape. By recreating parts of the acoustic characteristics of the former soundscape in the bunker, the functions of the individual rooms come to life again through the sounds and give the guests an experience of the bunker as it was intended when it was built and used by the German soldiers.

13 THE PAST HAS EARS: REFLECTIONS ON OVER 10 YEARS OF INTERDISCIPLINARY RESEARCH IN ARCHAEOACOUSTICS

Katz, Brian (Sorbonne Université / CNRS / Institute d'Alembert)

Hearing is one of our most pervasive senses, lacking the equivalent of closing our eyes or averting our gaze. The acoustics of heritage sites represent an intangible consequence of their tangible construction and furnishings. Acoustic qualities imbue spaces with an immersive, spatial character that is inherently egocentric due to the nature of auditory perception, contrasting with the external observation possible in visual perception. Therefore, methods for communicating acoustic heritage must capture acoustics' spatially immersive and listener-centric essence.

While physical and digital reconstruction methods have been employed in acoustics for decades, recent advancements in computational technologies have significantly enhanced the quality and resolution of acoustic modelling, particularly in large-scale spaces where acoustics play a crucial role amidst increasing complexity.

This paper traces our journey from studies in the History of Science, examining historical endeavours to comprehend and enhance room acoustics, to our current use of digital simulations to deepen our understanding. Building upon this foundation, studies in Theatre Studies have explored the intertwined evolution of acoustics and vocal practices through immersive virtual reconstructions of performance spaces. More recent investigations in Musicology and Ancient and Medieval Christianity have delved into dynamic and interactive reconstructions, enabling analyses of live performance variations resulting from evolutions in acoustic conditions over time.

This presentation offers an overview of these interdisciplinary projects and examines the technical and methodological challenges arising from the collaborative efforts between acousticians, computer scientists, and humanities scholars in the developing field of archaeoacoustics.

83 WHAT'S GOING ON WITH FINDER-COLLECTORS WHERE YOU ARE?

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Thomas, Suzie (Universiteit Antwerpen) - Oksanen, Eljas (University of Helsinki; University of Reading) - Deckers, Pieterjan (Katholieke Universiteit Leuven) - Wessman, Anna (University of Bergen)

Session format: Regular session

In this lightning session we invite researchers, archaeological heritage managers, and others to provide short and succinct updates concerning current initiatives, policies, viewpoints, and debates around finder-collectors in their countries and regions. Finder-collectors include archaeological citizen scientists, metal-detectorists, fieldwalkers, mudlarks and other hobbyists who may find, collect, research or engage with archaeological heritage in different ways. Participants may focus on different aspects of this phenomenon but may wish to reflect on one or more of the following questions:

- Has policy recently changed or are changes being discussed in relation to finder-collectors in your country?
- Are digital finds recording schemes or other relevant cultural heritage infrastructure running or being developed in your country?
- Do you have finder-collectors contributing to your archaeological research?
- Are you carrying out ethnographic research on finder-collectors?
- What ethical controversies emerge in relation to finder-collector practices in your country or region?
- What practical challenges emerge in relation to finder-collector practices in your country or region?

We are asking for short 6 slide 6 minute talks. As discussion of finder-collectors can sometimes be a sensitive topic, we ask that participants, including the audience, engage in debate and discussion in a respectful manner.

ABSTRACTS

1 PORTAL OF AMATEUR COLLABORATORS AND REGISTER OF INDIVIDUAL FINDS OF THE CZECH REPUBLIC

Marik, Jan (Institute of Archaeology of the CAS, Prague) - Antal, Robert (Institute of Archaeology of the CAS, Brno)

The searching of archaeological finds is reserved exclusively for professional archaeologists under the conditions of Czech legislation. In practice, however, many archaeological institutions have been cooperating at various levels with the finder-collectors for several decades. Different approaches to collaborators and the finds themselves, their documentation and storage in collections have been subject to many discussions concerning the ethics and legality as well as the very meaning of such collaboration.

In 2021, the Portal of Amateur Collaborators and Register of Individual Finds was launched. The aim was to identify amateurs who could and were prepared to collaborate with archaeologists within the legal limits and to set up the fundamental ethical and methodological procedures. The portal was created as a platform to support collaboration between professionals and amateurs.

The use of the portal is not obligatory; therefore, its start was relatively slow. The launch of the portal was marked in the first months by a heated debate on legal and ethical aspects. At present, it is only used to a greater extent in only some regions. The main obstacles to its wider use are administrative constraints resulting from outdated legislation and a lack of manpower on the side of professional archaeologists.

Although the portal currently covers only a small part of the finder-collectors community in the Czech Republic, its considerable contribution is to open a discussion on the unification of cooperation procedures and searchers and the possibilities of using their capacities for the protection and research of archaeological heritage.

2 A MAJOR TRAIN WRECK: THE 'NEW' FINDS REPORTING APP OF THE AUSTRIAN FEDERAL MONUMENTS AGENCY

Karl, Raimund (Universität Wien)

Modern technology often seems to offer quick fixes for age old-problems. Yet, "we've now got an app for that", in and of itself, doesn't necessarily solve the problem; and especially doesn't relieve those who want to fix it of their duty to consider the foreseeable outcomes of their actions: *quidquid agis, prudenter agas, et respice finem* (Gesta Romanorum; Oesterley 1872, 431). The ongoing train wreck caused by the Austrian Federal Monuments Agency's (BDA) most recent attempt to solve the 'problem' of (the lack of) 'archaeological' finds reporting by members of the public (despite a legal duty to do so) by purchasing "an app for that" serves as an abject lesson for this. Instead of fixing the problem, the thoughtless acquisition of an entirely unsuitable 'quick fix' has created a possibility to commit perfect crimes, both of defamation and of 'laundering' illicitly trafficked portable antiquities; while doing nothing to actually improve 'public' finds reporting. This paper will examine what led to this utter train wreck for heritage management.

Oesterley, H. 1872 (ed.). Gesta Romanorum. Berlin: Weidmann.

3 THE FINDS WE NEVER SEE. ARCHAEOLOGICAL ARTEFACTS KEPT AS TROPHIES BY LICENSED METAL DETECTORISTS

Falkenberg, Josefine (Archaeological Heritage Office Saxony)

In the German federal state of Saxony, every artefact found in the ground without clear ownership legally belongs to the federal state, not the landowner or finder. While a reward for a finder is mentioned in the legal text, the nature of this reward is not defined. Ever since 2018 metal detecting has become increasingly popular, with many different people wanting to explore their surroundings and their history. Two and a half years ago the Archaeological Heritage Office reacted to growing numbers of people wanting a license for metal detecting in Saxony. A position was created to better deal with administrative work, finds and necessary lectures as part of the licensing process. Practical challenges of this position include the also growing number of illegal detectorists. Aside from openly illegal treasure hunters who post about themselves, their activities and their finds on social media archaeology is faced with people going through the lengthy process of becoming registered only to never hand in their discoveries. If controlled by the police, these collectors have valid licenses to show. When asked for finds by archaeologists, research has supposedly never taken place or nothing was ever discovered. The assumption is, that finds are collected, shelved or sold under the cover of legality. While this generally concerns finds from all ages, a clear favour with the collectors seems to lie

4 MANAGEMENT OF ARCHAEOLOGICAL HERITAGE, SEARCH AND COLLECTION IN UKRAINE: THE TIME MACHINE WORKS

Videiko, Mykhailo (Kyiv Metropolitan Borys Grinchenko University) - Motorzhyna, Mariia (Kyiv Metropolitan Borys Grinchenko University)

The 19th century in the lands of Ukraine, which was a part of two empires, became a time of intensive searching and collecting. At the same time, part of the land was private, part was state-owned, and ownership of archaeological artifacts was distributed accordingly. At the beginning of the 20th century, many collections became the public domain through a network of museums, and collectors moved to fund archaeological research. The communist regime after 1917 monopolized land, archaeological artifacts and archaeological research.

The 1991 division of land into public and private lands, while preserving the remaining monopolies with weak public institutions and the absence of state control, resulted in the mass destruction of cultural heritage due to unauthorized prospecting. Large number of searchers-collectors were involved in illegal treasure searches. They and their collections are outlawed.

In the conditions of war, the scale of illegal search has decreased. Two trends became active: the transfer of collections to museums and the confiscation of archaeological objects from smugglers and collaborating collectors for the benefit of the state. Some of such gatherings were looted by the Russian occupiers or destroyed along with their owners due to military actions and lost forever.

Attempts to catalog and digitally record the finds obtained during the search are limited by the ethical problems of dealing with the things obtained in this way. Problem is the existence of a state monopoly in the absence of effective control over the processes.

The uncontrolled situation clearly poses a threat to cultural heritage. Attempts to discuss changes in the legislation have failed, although there is an understanding of their need. Looking for a way out, it is worth turning to the experience of the beginning of the 20th century, when cultural heritage was saved by the common efforts of state, public and collectors.

5 RESEARCH TO THE RESCUE? A HELPING HAND FOR HERITAGE MANAGERS IN ESTONIA

Kuriso, Tuuli (Tallinn University)

As in many countries that allow metal detecting, there is a considerable administrative burden in Estonia in managing data related to metal detecting. This has led to delays of several years in the processing of public finds, which has weakened local hobbyists' trust in the state (represented by the National Heritage Board). In addition, heritage management resources are often stretched, and major changes to the system or significant digital developments require political will and a longer timeframe for implementation. Alternatively, research and targeted outreach activities have the potential to influence the system from the outside. In this paper I will briefly present three aspects of an ongoing research project that will hopefully lead to positive changes in the current system. These are basic research (a case study of Estonian plough zones), a machine learning experiment (medieval and early modern coins), and a public engagement plan derived from the needs and interests of local hobbyists.

6 INTERNAL ENEMY. WHO IS DESTROYING THE UKRAINIAN ARCHAEOLOGICAL HERITAGE?

Ivanova, Oleksandra (National University of Kyiv-Mohyla Academy) - Zotsenko, Ivan (Institute of Archeology, National Academy of Sciences, Kyiv, Ukraine)

First of all, it is worth noting some details of Ukrainian legislation in the field of heritage protection. The Law of Ukraine "On the Protection of Archaeological Heritage" defines this heritage as: "a set of archaeological heritage objects that are under the protection of the state, and the territories connected with them, as well as movable cultural values (archaeological artefacts) originating from the objects of archaeological heritage". Such a definition artificially narrows the terminology at the expense of tying archaeological objects to objects and territories and requires proving the connection between a specific object and an object or territory. In the case of archaeological objects of unknown or illegal origin, this is usually unprovable. Exactly this provision of the law, in our opinion, creates a large number of problems with the extraction and circulation of archaeological artefacts inside of the country.

Also, the number of finder collectors has increased tenfold over the past 20 years due to restrictions on the purchase of metal detectors and their price.

Particular attention should also be paid to Internet platforms and antique shops that sell archaeological artefacts and the legislative acts regulating this process in Ukraine.

The problem of private collections, which include objects of archaeology obtained illegally, also exists and is increasingly becoming political in nature (both at the local and state level).

The last issue we would like to raise is the acceptance by official museums and the introduction of illegally obtained objects into scientific circulation by scientists. Today, gifts of certain unique artefacts to museum institutions, or purchases of such items by patrons at illegal auctions, have become a fairly popular practice among private collectors. This is a complex issue, around which there is a lively discussion in the Ukrainian scientific community and there is no consensus.

7 NEW CHALLENGES IN RELATION TO METAL DETECTING IN HUNGARY

Rác, Tibor (Ferenczy Museum Centre; Community Archaeology Association)

In autumn 2021, the 1st National Community Archaeology Conference was held in Hungary, a forum for summarising the results of cooperation with the non professional sector, especially metal detectorists, and for methodological systematisation of applied archaeological procedures. Analysing the presentations of the second national conference, held two years later in 2023, we find that in just two years the number of cooperative programmes supported by museums has doubled, many new actors have emerged in the field of community archaeology and cultural heritage institutions have started to adapt their policies to the new trends. At the same time, while acknowledging the obvious scientific results, the unfolding debates and roundtable discussions have revealed striking differences of opinion, revolving around metal detecting, field recording protocols, the framework for self-guided work and the institutional background. This short presentation will reflect on the new challenges in relation to metal detecting brought about by this rapid development and the changing institutional background.

85 TRADE HUB? SAFE HAVEN? RITUAL CENTRE? THE ROLE OF DITCH SYSTEMS AND CENTRAL SITES IN THE NEOLITHIC

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Maurer, Jakob (University for Continuing Education Krems) - Hukelova, Zuzana (Institute of Archaeology of the Slovak Academy of Sciences) - Wunderlich, Maria (Kiel University) - Bistáková, Alena (Institute of Archaeology of the Slovak Academy of Sciences)

Session format: Regular session

The Neolithic is traditionally considered a period of little social differentiation and a rather flat hierarchical structure. In possible contrast, e.g., the Linear Pottery (LBK) dwelling landscape displays a distinct variety of settlement types, some of which sport earthen enclosures. Due to their size, their long-time use, exceptional finds and imports, they are frequently assessed as sites of central significance. Although enclosures generally seem to be a rather late feature on many LBK-sites, they are thought to be key to identifying “central settlements” and surrounding dwelling clusters. The first appearance of an enclosure within an existing settlement network might reflect a change in social behaviour and/or group interaction.

They are also relevant for ongoing discussions about a possible “crisis situation” at the end of the LBK, not least in the context of numerous human remains found in ditch systems, e.g., in Schletz (Austria) and Vrábľa (Slovakia). The purpose of such ditches as well as the interpretation of human remains recovered from these structures may vary from one site to another and seems to be manifold.

In our session, we want to take a closer look at potential Neolithic central sites and their hinterland with a focus on enclosures, which have been described as fortifications, as “a manifest sign of social identity”, as trading places, burial grounds or ritual sites. We welcome contributions discussing various aspects that might shed light on the purpose and role of enclosed Neolithic sites (e.g., their architecture, development and function; the persons, communities and practices involved in the history of such sites; the geographic or diachronic situation contextualising – perhaps explaining – sites with enclosures). Although our focus is set to the Early Neolithic, we also encourage contributions from other Neolithic periods or ethnoarchaeological contexts, presenting comparative evidences and interpretations.

ABSTRACTS

1 TRANSFORMATIONS OF A SOCIO-SPATIAL SYSTEM DURING THE NEOLITHIC IN SW SLOVAKIA: VRÁBLE AND THE ŽITAVA VALLEY

Furholt, Martin (Kiel University) - Cheben, Ivan (Slovak Academy of Sciences) - Bistáková, Alena (Slovak Academy of Sciences) - Wunderlich, Maria (Kiel University) - Furholt, Kata (Kiel University) - Köhl, Till (Kiel University)

In this paper, we will present the results of our 12 year fieldwork on settlement and social organization in the Žitava valley during the Neolithic, i.e. the LBK, Želiezovce and Lengyel periods. During the Early Neolithic, this region is characterized by the presence of one outstandingly large settlement with a double enclosure ditch, as it is found in Vrábľa Veľké Lehemby and Farské. We were able to reconstruct a regional settlement history from 5300 to 5000 BCE, which shows a gradual settlement concentration of farmsteads in Vrábľa at the costs of the other sites in the valley. This concentration process culminates around 5100 BCE, after which an enclosure ditch is dug around one neighborhood of Vrábľa, which in additions saw complex ritual activities, involving, among others, the deposition of more than 90 human bodies in and along the enclosure ditches. After 5000 BCE, settlement in Vrábľa rapidly dissolves and the whole settlement structure is transformed into a more dispersed, and decentralized pattern, which is however compensated with a number of rondels, or circular enclosures, which represent, we argue, non-domestic central places. In this paper, we want to discuss the social significance of those different enclosed sites in the Žitava valley in their changing socio-spatial contexts.

2 UNIQUE SETTLEMENTS COMPLEXES OF LBK AND ŽELIEZOVCE GROUP IN SW SLOVAKIA: ARCHAEOLOGICAL RESEARCH IN VRÁBLE SITE

Bistáková, Alena (Institute of Archaeology (Slovak Academy of Sciences)) - Cheben, Ivan (Institute of Archaeology (Slovak Academy of Sciences)) - Furholt, Martin (Kiel University) - Wunderlich, Maria (Kiel University) - Furholt, Kata (Kiel University) - Hukelová, Zuzana (Institute of Archaeology (Slovak Academy of Sciences)) - Fuchs, Katharina (Kiel University) - Köhl, Till (Kiel University)

The large settlements of Vrábľa “Veľké Lehemby” and “Farské” can currently be ranked as some of the most important Neolithic sites in Central Europe. The reason for this is not only the size of the three neighbouring settlement complexes of the LBK and the Želiezovce group, but also the uniqueness of the discovered finds. The three separate settlements extend over an area of almost 50 ha. The geophysical survey identified more than 300 longhouses, which were evenly distributed and arranged in the same pattern in each settlement area (Areas I-III). Settlement Area I was fully enclosed by a ditch and was interrupted by six entrances.

In this paper we present the course of archaeological research (2012 - 2023), which was carried out at the settlement complex in Vrábľa (5250-4950 BC) with varying intensity. The systematic research in the first years/stages focused on the examination/exposure of selected longhouses. They were identified according to the geophysical plan, based on the occurrence of pairs of long pits situated along the outer walls of the houses. Since 2017, the research has also focused on investigating the area of the five entrances of Areal I. In addition to the findings of regular (?) skeletal graves situated in the areas of the entrances, human skeletons were also found directly at the bottom of each ditch. In the research seasons 2022-2023, a unique discovery of a mass deposit of human skeletons, for which the absence of a skull is a common feature, was found in the western end of the trench at entrance 2. We can currently speak of at least one hundred individuals buried in Vrábľa. It is possible that the number may increase with further research.

3 HEADLESS SKELETONS IN THE DITCH: UNRAVELLING THE COLD CASE AT THE SETTLEMENT OF VRÁBLE-VEĽKÉ LEHEMBY (SLOVAKIA, 5250-4950 BCE)

Hukelova, Zuzana (Institute of Archaeology (Slovak Academy of Sciences)) - Bistáková, Alena (Institute of Archaeology (Slovak Academy of Sciences)) - Cheben, Ivan (Institute of Archaeology (Slovak Academy of Sciences)) - Furholt, Kata (Christian-Albrechts-Universität zu Kiel) - Furholt, Martin (Christian-Albrechts-Universität zu Kiel) - Köhl, Till (Christian-Albrechts-Universität zu Kiel) - Wunderlich, Maria (Christian-Albrechts-Universität zu Kiel) - Fuchs, Katharina (Christian-Albrechts-Universität zu Kiel)

Comprising of three Linear Pottery villages, counting 313 houses, Vrábľa – Veľké Lehemby is one of the largest Neolithic conglomerates in Central Europe existing between 5250 and 4950 BC. Around 5000 cal BCE, a double-ditched enclosure was constructed around the southwestern settlement. Here, the remains of at least 61 headless individuals were discovered, 53 of which were concentrated at the area of one of the gates. Body depositions in ditches are known from the Neolithic, but Vrábľa–Veľké Lehemby is the only site where the skulls are missing.

How did these people die? Why were they seemingly carelessly thrown in the ditch and not regularly buried as some other individuals from the site? Were everybody or only selective groups treated this way? How, when and why were

the skulls removed? Did the individuals die at the same time or were they buried in the ditch over a longer period? Many of the questions related to this puzzled case remain open and the story is continuously being unravelled.

In this paper, newly acquired osteological results are presented. The focus is put on the biological profile of the buried population and skeletal evidence of how and when the skulls could have been detached from the bodies. Preliminary observations point more to a careful rather than a violent removal of heads. Thus, this finding may not necessarily represent evidence of bloodshed and bitter rivalry, but point to a complexity of Neolithic society in terms of ritual behaviour – in which the ditch seems to have played an important role.

4 SURROUNDING A LBK-“CENTRAL SITE”. FIRST RESULTS ON THE DIACHRONIC AND SPATIAL DEVELOPMENT OF THE “SCHLETZ SETTLEMENT CLUSTER”/LOWER AUSTRIA

Längauer, Julia (University for Continuing Education Krems, Center for Museum Collections) - Hascher, Cornelia (University for Continuing Education Krems, Center for Museum Collections) - Pieler, Franz (State Collections of Lower Austria) - Teschler-Nicola, Maria (Natural History Museum Vienna) - Irrgeher, Johanna (Montanuniversität Leoben, Department General, Analytical and Physical Chemistry) - Schober, Michael (Montanuniversität Leoben, Department General, Analytical and Physical Chemistry) - Prohaska, Thomas (Montanuniversität Leoben, Department General, Analytical and Physical Chemistry) - Duboc, Olivier (University of Natural Resources and Life Sciences Vienna (BOKU), Institute of Soil Research) - Maurer, Jakob (University for Continuing Education Krems, Center for Museum Collections)

Asparn/Schletz in the Lower Austrian Weinviertel is one of the most prominent Linear Pottery Culture sites in Europe, due to evidence suggesting a massive violent attack on the settlement around 5000 BC. The fortification of the site, its size, long-time use and exceptional finds have all contributed to its classification as a “Central Site”. Nevertheless, not much thought was given to what it might actually have been the centre of.

The research project “United by Crisis?”, funded by the GFF Lower Austria, aims to explore the diachronic and spatial development of LBK sites in the hinterland of Asparn/Schletz. Since the end of 2022, multiple Line Walking surveys have been conducted as well as a thorough examination of finds existing in collections and research in archival sources. This work has gradually unveiled a more detailed picture of possible founding strategies of LBK sites in the region, of interactions and potential functional roles of sites and of the overall development of the “Schletz settlement cluster”. Additionally, within the project, the creation of a local isoscape of the study region, Sr Isotope ratio analysis of human remains, further anthropological work and C14-dating will shed light on the potential origin of the slain individuals and deliver additional information on what happened at the site of Schletz itself. In this talk, we aim to discuss initial findings from our ongoing research, which we consider to be crucial for a better understanding of the social developments that led up to the special role of Asparn/Schletz and the events that happened there.

5 DEFINING STRUCTURE OF A “CENTRAL SITE”? STRATIGRAPHY, ARCHITECTURE AND FUNCTION(S) OF THE DITCHES SURROUNDING ASPARN/SCHLETZ

Pieler, Franz (State Collections of Lower Austria) - Längauer, Julia (University for Continuing Education Krems) - Hascher, Cornelia (University for Continuing Education Krems) - Maurer, Jakob (University for Continuing Education Krems)

The fortified Bandkeramik site of Asparn/Schletz is amongst the most prominent Neolithic sites in middle Europe, due to the gruesome evidences of a massacre, in which, around 5000 BC, many inhabitants seem to have met their ends.

Interdisciplinary research carried out in recent years and the ongoing project “United by Crisis?” shed new light on the connections of the potential regional central hub with the wider Bandkeramik world as well as with the regional dwelling cluster. In parallel to these regional studies, the structures of Asparn/Schletz have been assessed in closer detail, revealing that, in contrast to preliminary reports, all ditches in Asparn/Schletz date to the late Bandkeramik, long after the settlement – and its adjacent secondary sites – had been established. Evidences further imply a surprisingly dynamic history of the enclosure, with stages of construction, decay, secondary use and reconstruction. During episodes of disrepair, the ditches were used for pit ovens, and – after they were partly filled in, either actively or due to erosion – as burial ground. This seemingly contradicts the conventional picture of a fortification as a representative feature on a place of some central significance, but rather suggests a purpose-built defensive structure, which was only maintained as long as need dictated. We therefore assume that the construction of the ditches was not so much an act of an enhanced show of authority, but more likely a reaction to changes in the greater Bandkeramik world and/or to scenarios of menace, possibly to the entire regional network.

6 INDICATIONS OF A CRISIS? UPDATED EVIDENCE DRAWN FROM THE HUMAN REMAINS DISCOVERED AT ASPARN/SCHLETZ

Teschler-Nicola, Maria (Natural History Museum Vienna) - Novotny, Friederike (Natural History Museum Vienna) - Längauer, Julia (University for Continuing Education Krems, Center for Museum Collections Management) - Hascher, Cornelia (University for Continuing Education Krems, Center for Museum Collections Management) - Maurer, Jakob (University for Continuing Education Krems, Center for Museum Collections Management) - Pieler, Franz (State Collections of Lower Austria)

The Late Linear Pottery site of Asparn/Schletz in Lower Austria is considered an exceptional phenomenon in the Central European distribution area of this culture due to the structure of the site and the diversity of the human skeletal remains uncovered in different contexts. In contrast to the initial bioanthropological analyses, today the remains of around 130 individuals form the basis for further considerations and systematic analyses. The majority of these skeletal remains were recovered from a ditch and show massive, often multiple injuries; those who died in this way had remained unburied and were therefore exposed to different taphonomic processes. Further clusters are formed by “normative” inhumations within the settlement, which corresponded to the rites of the time, as well as by skeletal remains recovered from within the settlement, i.e. from a well and settlement pits (often mixed with animal bones).

These finds and their diversity in relation to the area of discovery within the settlement as well as their taphonomic changes not only imply a diverse and complex way of dealing with dead bodies. Injuries – healed as well as fatal – in conjunction with (unspecific) stress markers and other alterations, e.g., due to overload, also strengthen the perception of a “crisis situation”. Within and alongside the current, transdisciplinary GFF-project “United by crisis?” this hypothesis is checked with an extended methodological approach (e.g. imaging and histological techniques as well as isotope and aDNA analysis to resolve questions of origin).

The present contribution i) deals with the taphonomic transformations and possible ritual practices in how human bodies are treated and ii) presents for discussion up-to-date results of a systematic analysis of pathomorphological features that might have characterised life in a “transitional phase” and the socio-cultural changes associated with it.

7 DITCH, PIT, GRAVE: ON THE BURIAL PRACTICES IN THE SETTLEMENT OF ASPARN-SCHLETZ AND FURTHER LBK SITES IN LOWER AUSTRIA

Hascher, Cornelia (University for Continuing Education Krems) - Längauer, Julia (University for Continuing Education Krems) - Novotny, Friederike (Natural History Museum of Vienna) - Teschler-Nicola, Maria (Natural History Museum of Vienna) - Pieler, Franz (State Collection of Lower Austria)

The analyses of burials at Asparn-Schletz in Lower Austria contributes a rich narrative to broader discussions on Early Neolithic burial practices. In the context of the Linear Pottery Culture (LBK), various “regular” burial complexes were excavated within the settlement of Asparn-Schletz. These include multiple burials (such as V 614) and notably adorned burials (e.g. V 692). The presentation will contextualize these burials from Asparn-Schletz with LBK settlement burials recovered at a wider geographical range in Lower Austria.

In Asparn-Schletz the burials were found in the western and northern sectors, some in close vicinity to the houses, others within the ditch system, and provide detailed insights into burial positions, orientations, and potential ritual aspects. Some regularity can be seen in the composition of age and gender. Additionally, some of the pathological changes observed at the human skeletal remains and their possible relation to the diversity of the burial place and how the corpses of the dead were dealt with are debated. As part of the GFF project “United by Crisis” all settlement burials are radiocarbon-dated in order to determine their chronology, which will also be discussed.

By examining burials from Asparn-Schletz in contrast with those from other sites, the presentation aims to shed light on the multifaceted roles of ditch systems and central sites and to get a nuanced understanding of Neolithic societal structures, emphasizing mortuary practices and potential symbolic elements.

8 THE CENTRAL POINT OF THE REGION FROM THE NEOLITHIC TO THE BRONZE AGE? SETTLEMENT AGGLOMERATION IN PLOTIŠTĚ NAD LABEM (BOHEMIA)

Langova, Michaela (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Schimerová, Eva (The University of Hradec Králové) - Burgert, Pavel (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Adameková, Katarina (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Thér, Richard (The University of Hradec Králové) - Vokolek, Vít (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

The presence of a fortified compound, the creation of which requires considerable collective effort, is indicative of the capabilities and motivation of a given community. Moreover, the construction of a fortification, its duration, and the manner of its demise and destruction can point not only to the life of a local community, but often also to events of supra-regional significance. Where the attributes of centrality can be traced at a single site over a longer period,

across different archaeological cultures, the choice of site is unlikely to be related solely to the preferences of the community in question, but rather reflects favourable natural conditions.

One of these places is located north of Hradec Králové (Eastern Bohemia) near the Elbe River in Plotiště nad Labem. Systematic excavations, especially from the 1960s - 1970s, have revealed a large number of prehistoric finds there. It is clear that from the Neolithic to the Early Bronze Age the site showed a high degree of centrality of at least a regional character. From this site and their immediate surroundings, it is possible to mention several rondels, palisade enclosure, cremation as well as inhumation graves and a concentration of imported items for the Neolithic period, in addition to a high concentration of settlements. At the same time, Eneolithic finds are also abundantly documented from this site from practically all archaeological cultures described so far in Eastern Bohemia. In addition to an enormous concentration of settlement and burial finds from the Early Bronze Age, a fortified settlement is also known from the site. This fortification, which is the only known from the whole Eastern Bohemia, and its connection to the specific natural conditions that made Plotiště nad Labem the centre of the entire region since the Neolithic period will be the main topic of the paper.

9 LARGE SETTLEMENTS AS CEREMONIAL CENTERS IN THE BRZEŚĆ KUJAWSKI CULTURE (POLISH LOWLANDS: 4350-4000 BCE)

Wieczaszek, Kalina (University of Gdańsk) - Pyzel, Joanna (Maria Curie-Skłodowska University in Lublin) - Czerniak, Lech (University of Gdańsk)

The phenomenon of the Brześć Kujawski culture (BKC) in the eastern part of the Central European Lowland (4350-4000 BCE) was formed in the process of intense demographic growth and settlement agglomeration. A complex settlement system emerged, including large settlements built with longhouses that operated as ceremonial centers that brought together a network of surrounding farmsteads and hamlets. At the same time, in other regions of the "Danubian Neolithic World", the opposite process was taking place: the dispersion of village communities for which undeveloped enclosures and cemeteries became the central places.

In the paper we analyze the evolution of central places from Schletz-type settlements in LBK, through rondels in SBK, to central settlements in BKC. We focus mainly on the formation of central BKC settlements in Kuyavia and the accompanying phenomenon of extraordinary intensification of commemoration practices addressed to distant ancestors. A detailed comparative analysis of two closely adjacent microregional groups gathered around central settlements (Osłonki surrounded by a ditch and palisade and Brześć Kujawski) revealed new phenomena that allow us to better understand the process of formation of central settlements and their functioning in a network of various social connections. Among others it turned out that beneath the surface of the demonstrated unification (longhouses, ceramics) there were deep differences that could express both the groups' separate origins and the conscious creation of differences in order to strengthen their own identity.

10 SETTLEMENT AGGREGATION, EARTHWORKS, AND SOCIAL COMPLEXITY: PONDERING AN ARCHAEOLOGY OF RISK

Salisbury, Roderick (Comenius University in Bratislava; Austrian Archaeological Institute, Austrian Academy of Sciences)

Neolithic ditched enclosures are common features in Central Europe. New findings, including around small and lesser known tell-like mounds, indicate that they are more common than previously thought. Ditches have been variously interpreted as defensive, for animal management or flood control, or as tools for inclusion, exclusion, and social memory. Direct relationships between ditches and enclosed spaces are not always investigated. In at least some cases, we find evidence for changes in the use of enclosed space at Neolithic tells. Construction of ditches around house clusters began at least as early as the LBK period, as indicated by recent discoveries. Ditch construction continued after population dispersal and the abandonment of large, nucleated tell-focused sites in the later Neolithic, at least in the eastern Carpathian Basin. The geographical range and persistence over time suggest several complementary functions, centered on the mitigation of risk.

Risk, as the perceived potential for some event to occur in a specified period of time, is culturally defined and contingent. Which risks are perceived, and how they are valued, communicated and managed, are shaped by socially embedded knowledge and shared experiences. In this paper, ditches are presented as resources committed to community projects to address threats that might have been partly or wholly subjective, but highly valued. In particular, we address their potential for mitigating the challenges of increasing social complexity and demographic change. Other advantages of ditches would have justified their continued construction and maintenance, even in the absence or acceptance of the original perceived risk.

88 COLONIZING THE NEW WORLD: THE IMPACT OF ROMAN IMPERIALISM ACROSS THE ATLANTIC

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Hanscam, Emily (Linnaeus University) - Hingley, Richard (Durham University)

Session format: Regular session

Over the past few decades, a considerable dialogue between archaeologists, classicists and ancient historians has taken place on the impact of Roman imperialism in the ancient and contemporary worlds. This dialogue has, however, primarily concentrated on the territories of the former Empire itself, leaving much to consider regarding other contexts. Although the continent of North America is geographically distant from the Roman Empire, ideologically it became closely entangled from the moment the 'New World' was invented in the minds of Europeans and classical parallels play a significant role in the processes and practices of colonization. This entanglement continues to the present day, with frequent (and conflicting) comparisons made between the United States and the Roman Empire, particularly during the Trump presidency. We therefore consider it long past due for a better understanding of the use of Roman frontier concepts in the colonization of the New World, focusing in this instance on the 16th century onwards. We invite papers on themes such as the impact of ideas of 'the frontier' in developing North American perceptions of space and territory, of the use of Classical place names in North American territory, of the creation of plantations, colonies and forts as a means of colonization and control, and any other relevant themes linking Roman imperialism to the colonization of North America.

ABSTRACTS

1 EARLY ENCOUNTERS IN VIRGINIA: ANCIENT BRITAIN AND NATIVE AMERICANS

Hingley, Richard (Dept. of Archaeology, University of Durham)

This paper explores the early colonization of part of North America by the English during the late sixteenth and early seventeenth centuries, addressing how Roman-period classical parallels were called upon to conceptualize encounters. The Roman-period texts that addressed the conquest of Britain during the early first century CE were directly mined to create a claim of justification for conquering territory and establishing colonies. In this process, artists and authors were able to draw upon the records of the appearance and customs of native Americans to inform their accounts of pre-Roman ancient Britons. This paper will explore the ways that classical texts were used to make such colonial claims. It will focus on the concept of the colony (or plantation), which was partially adopted from Roman texts. Can the archaeological critique of the use of classical Rome as an aspect of Victorian imperial discourse (e.g. Hingley 2000), provide an insight into this earlier use of classical parallels? What insights might archaeological fieldwork provide for this research?

2 COLONY OR PLANTATION?: THE CLASSICAL SPATIAL LEXICON OF THE EARLY ENGLISH EMPIRE

Musselwhite, Paul (Dartmouth College)

The planners, colonists, and officials of the early English empire in the Americas were not sure about what the fundamental building blocks of their empire were. Reams of documents vacillated between discussions of England's empire consisting of "plantations" or "colonies," or sometimes both. Generations of scholars have taken this seeming interchangeability as a sign that contemporaries saw the two terms as synonyms, but few have grappled with when or how the terms were applied and to what kinds of spaces, and still less have recognized that one of these terms – colony – had much clearer classical antecedents than the other.

This paper proposes to bring together written, cartographic, and material evidence to explore the application of "colony" and "plantation" as spatial constructs in early-seventeenth-century English America. It will revisit the archaeological evidence of early English settlement, particularly in the Chesapeake region, and reinterpret it in light of more recent historical research on the influence of classical humanism on early English colonial discourse. Were English settlements laid out in ways that suggested analogies to Roman *colonia*, and did this correlate with the application of the terms "colony" and "plantation"? The paper will argue that "plantation" and "colony" were deliberately deployed to reflect different understandings of the structures of society and economy within new settlements and across the nascent "imperium" of England. As part of the debate between these different interpretations, it will suggest that classical frameworks and analogies continued to be relevant beyond the initial classical humanist strain of Virginia colonization in the 1610s, and "colony" became an increasingly important part of the Stuart monarchy's vision for empire throughout the century.

3 COLONISATION OF THE NORTH AMERICAN FRONTIER IN THE MIDDLE OF THE 19TH CENTURY AND AGRARIAN REFORM IN REPUBLICAN ROME

Compatangelo-Soussignan, Rita (University of Le Mans; Centre de Recherche en Archéologie, Archéosciences, Histoire, UMR 6566)

By the late 1840s, after the annexation of Texas and the end of the war with Mexico, vast tracts of land had opened up in North America for settlement and colonisation west of the Rocky Mountains. In this context, John L. O'Sullivan in 1845 coined the term "manifest destiny," meaning that America was destined to be "the great nation of futurity"; the westward movement of civilization had no limits and was divinely ordained. According to this view, United States were no more concerned with the cyclical view of history as the rise and fall of nations and empires that prevailed since the time of the Founding Fathers. Until then, the fall of Roman Republic and/or Roman Empire had greatly inspired political debates.

However, this vision was not abandoned by other political activists in the 1840s, and resurfaced in the campaign of the National Reform Association to provide free public lands to homesteaders, notably in the new western territories opened up to colonization. From this time until the vote of the Homestead Act in 1862, the supporters of the "Vote yourself a farm" platform defended the idea of a modern yeoman republic for the United States. This was the solution proposed to guarantee the same rights and freedom to all citizens and realize the unachieved goal of the Revolution of 1776. Otherwise, decline and fall could be the destiny of the United States, just as failure of the agrarian reform promoted by the Gracchi brothers caused the end of Roman Republic and the rise of the tyrannical Empire.

We propose to examine the analogies and differences between the Roman agrarian reform and the contents of the Homestead Act. We also analyse the arguments developed by supporters of the NRA based on the model of ancient history of the Roman Republic.

4 THE ROMAN STOICISM OF IMPERIAL NEW ENGLAND, 1830-1860

Drake, Spencer (University of Cambridge)

This paper examines the co-opting of Roman virtue by Transcendentalist and Unitarian authors in antebellum New England, investigating how the expansion of a 'greater New England' across the American West and South was legitimised by its Roman colonial parallels. Styling themselves as new age republican philosophers, writers like Ralph Waldo Emerson, Henry David Thoreau, and Theodore Parker upheld the virtues of New England society as a civilising counterforce to the barbarity of the slave-holding South. Each sought to reconceptualise American expansionism along the lines of free religion, respect for indigenous peoples, and environmentalism, using Roman stoicism as a unifying foundation.

By charting the interpretation of classical thought in antebellum New Englander essays and sermons, this paper emphasises how Roman imperialism informed competing conceptions of an American empire, and how these interpretations of Roman memory came to clash in the American Civil War. Drawing from my MPhil research, it frames antebellum America as a space of internal cultural frontiers, where Northern and Southern intellectuals considered themselves locked into a death struggle for the future of the North American continent. Integral to this was their ideological legitimacy as heirs to the Greco-Roman intellectual tradition, and the qualification of Westward expansion through perceived Roman colonial precedents.

For these intellectuals, interpreting Roman expansion carried a weight in determining America's contemporary ideals and its future *raison d'être* across the North American continent. This paper concludes on how this tradition continues to the present day, and why Americans reinterpret classical memory to understand their own national values. This paper draws from Michael O'Brien's 'Conjectures of Order' and the writings of Gilbert Osofsky. It utilises extracts from Emerson and Thoreau's essays, and the sermons and personal writings of Theodore Parker.

5 EMPRESS TERESA CRISTINA AND CLASSICAL ARCHAEOLOGY IN BRAZIL: MODERN AND ANCIENT EMPIRE IN SOUTH AMERICA

Garraffoni, Renata (Federal University of Parana)

The aim of this paper is to discuss how Pompeian material culture shaped new ideas of Modernity among Rio de Janeiro elites in the 19th century. To do so, I will focus on the empress Teresa Cristina's political activities. Born in Naples, Teresa Cristina became Brazilian empress when she married D. Pedro II and created the bases for the development of studies on art, ancient culture and Classical Archaeology. Although there are many studies on D. Pedro II's connections to French Egyptology, Tereza Cristina's support to the beginning Classical Studies in the country is underestimated as her political influence among artists and elites' members in building different types of networks with Naples. I shall argue these networks enabled the elites a way to approach Brazil to Roman Empire, framing a new modern identity to the country, which became independent from Portugal a few decades early. In short, the analysis of this phenomenon thus becomes a way not only to perceive how certain segments of Brazilian society understood the

Romans but also to discuss the beginning of Classical Archaeology in the country through a gender approach. - This research has been developed with the support Spanish government through ANTIMO project, an international research group lead by Mirella Romero Recio and Jesus Sallas (Proyecto de I+D+i "La Antigüedad modernizada: Grecia y Roma al servicio de la idea de civilización, orden y progreso en España y Latinoamérica", PID2021- 123745NB-I00, MCIN/AEI/10.13039/501100011033 y FEDER)

6 FROM ARBEIA TO THE ALAMO AND BACK: COLONIAL FRONTIERS IN ROMAN EUROPE AND SPANISH AMERICA

Gardner, Andrew (UCL Institute of Archaeology)

The differences between the colonial expansion of Europeans in the Americas, and the Roman occupation of northern Europe, are many. The scale and pace of contact and conquest, the ideologies and motivations involved, the religious and cultural dimensions, and the ecological, epidemiological and technological elements all present plenty of contrasts. And yet, there are at least two reasons why we might profitably compare these episodes of colonial border-making. In keeping with much recent scholarship in 'Border Studies', comparison of different situations of frontier life can always provide insights into the dynamics of policy and practice in border situations, which can illuminate new aspects of familiar case-studies. And of course, ideas about Roman practice, even if inaccurate by modern standards, frequently played a significant role in later European empire-building, influencing the thinking of officials and military commanders. It is worthwhile, therefore, to think through the differences – and the similarities – between life in the borderlands of northern Europe over the long-term of Roman occupation, particularly in Britain, and the similarly long-lasting Spanish frontier in what became the southern US, with its infrastructure of presidios and missions. This paper will aim to outline some of the key dimensions, and analytical insights, of this comparison.

7 TALL TALES AND TELEOLOGY: ROMAN ANALOGY AND THE WINNING OF THE WEST

Kitching, Paul (Durham University)

Analogy is an essential tool for the archaeologist and polemicist alike, used differently in the processes of discovery and justification on the one hand, and communication on the other. The former concern conceptualising and warranting interpretations and are both reciprocal and reflexive; the latter concerns conveying an idea in a familiar form and is unidirectional.

This paper discusses how classical analogies were used by some nineteenth-century 'patrician' historians writing about the American frontier, for whom a primary motivation was fostering respect and pride for a nationalist cause in the present. Theodore Roosevelt's *The Winning of the West*, for instance, which considers the 'tall tales' typical of frontier lore alongside archival research, situates both within an argument extolling westward expansion and draws both directly and implicitly on unexamined analogies with Roman martial spirit, 'romanisation', imperial destiny, and a civilisation-barbarism hierarchy. It does not consider the underlying assumptions of these conceptions, nor what the experience of the American frontier might reveal about the frontiers of imperial Rome. Its definitive, teleological view of history paints a narrative of inevitable progress with analogies used not interpretatively but as shorthand.

There is no perfectly objective understanding of the past; archaeology especially, given the ontological status of material remains, is a study of the past in the present. However, the use of analogy in either interpreting evidence from the past or contextualising phenomena in the present is reciprocal and the conclusions drawn provisional. Polemic, on the other hand, is invariably unidirectional, selectively co-opting the past to communicate a pre-determined, definitive conclusion. Recognising the different uses of analogy in the historiography of the American frontier can help understand how they are employed elsewhere.

8 HOW DO I CROSS THIS HIGHWAY? OR, ASSEMBLAGE THEORY AND ROMAN URBAN DESIGN IN SMALL-TOWN TEXAS

Van Dyke, Ruth (Binghamton University - SUNY)

Assemblage theory can help us conceptualize how materials and ideas persist, gathering into diverse assemblages over time and space, sometimes with surprising and unintended consequences. In the historic Alsatian community of Castroville, Texas, Roman urban planning is a frequent topic of conversation. This surprising fact derives from the un-gainly juxtaposition of a Roman orthogonal grid system with two constraining and enabling material features: a river, and a major east-west highway. When Alsatian immigrants laid out the town in 1844, they adopted an orthogonal grid plan derived from the Laws of the Indies, a series of regulations created by the Spanish Crown for new world colonies. The Spanish adopted this idea from Roman urban design. However, Castroville town planners angled the grid so that streets would parallel a horseshoe bend in the Medina River. In the 1940s, as part of the war effort, a major east-west highway was constructed that bisected the gridded town. Today, the combination of the angled Roman grid with the highway creates acute and obtuse angles. The situation frustrates pedestrians, contributes to traffic accidents, impacts the economy, and dictates the shape of future town developments.

9 'BUILD THE WALL': ROMAN FRONTIERS AS IDEOLOGICAL NARRATIVES IN THE CONTEMPORARY UNITED STATES

Hanscam, Emily (Linnaeus University)

We know that the legacy of the Roman Empire influences national movements in the modern world; particularly in Europe, geographically linked to the former Empire, and in North America where there is a presumed intellectual link. This legacy can be acutely visible, recently seen with the leveraging of the British Iron Age and Roman past during the Brexit debates, and during the January 6th Capitol Riots in the United States which paralleled the sack of Rome. In Europe, national borders can also be a visible link to the Roman past, with some of Rome's frontiers still serving as national borders today. But, we do not fully understand the symbolic power of the Roman frontier as an ideological narrative deployed in the United States. How are ideas about the ancient Romans civilizing the barbarians and the Americans civilizing 'the West' connected? Does the narrative of the Roman frontier facilitate the contemporary notion that the US needs walls to help keep 'the barbarians' out? This paper concentrates on evolving discourse about the US/Mexico border during recent US presidential election cycles, exploring links with ideas about the Roman past.

92 STABLE ISOTOPE ANALYSIS OF CENTRAL AND EASTERN EUROPEAN SKELETAL REMAINS

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Gugora, Ariana (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN, Budapest, Hungary) - Somogyvári-Lajtár, Enikő (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest, Hungary; Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN, Budapest, Hungary) - Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb, Croatia)

Session format: Regular session

Stable isotope analyses of skeletal material (bones and teeth) have been an integral component of Western European and North American bioarchaeology for decades, but Central and Eastern Europe are somewhat underrepresented in this sense. It is only within the last ten or so years that isotope analyses have been used to understand the diets, lifestyles, and mobility of past populations in these parts of Europe.

As such, our aims for this session are threefold. Our primary goal is to highlight the stable isotope research performed on prehistoric and historic skeletal material from Central and Eastern Europe, potentially including samples from Austria, Croatia, Czech Republic, Germany, Hungary, Latvia, Lithuania, Poland, Romania, Serbia, Slovakia, and Slovenia, etc. We invite all types of isotope studies (e.g., C, N, O, Sr, etc.), ranging from diet and nursing/weaning to paleopathology and mobility. All time periods are welcome, as we are looking for temporally broad discussions to better understand the changes in diet, lifestyle, and mobility across Central and Eastern Europe over time. Second, we are interested in the potential research questions that are unique to these two regions. Insights may be gained about the role of culture in the dietary practices of neighboring Central/Eastern European countries; the impact of a population's shared history on the diet or lifestyle of its members; the applicability of cross-country comparisons in diet and/or mobility studies; and more. From an archaeological, anthropological, or cultural perspective, are there any differences in the stable isotope results within and between these two regions? A final aim for this session is to establish a community of researchers working in Central and Eastern Europe, with the potential for future collaboration.

ABSTRACTS

1 NEOLITHIC LAKE SHORE SETTLEMENT ARCHAEOLOGY MEETS ISOTOPIC ARCHAEOMETRY

Turck, Rouven (University of Zurich)

A complete skeletal record of humans in Neolithic features from so-called lakeside settlements in Switzerland is rare. In some cases, dislocated individual human bones are recovered from the contexts.

Initial strontium isotope studies on a small number of individuals from the greater Zurich and Zug area in Switzerland show the value of multiple sampling of single individuals: the archives of enamel, dentine and bone can reveal the complex mobility behavior of individual Neolithic individuals. Due to enamel, bone and collagen preservation seven individuals (three Horgen, four Corded Ware) are considered in the analysis strategy: the "Horgen" individuals include seven samples of enamel, dentin and bone for strontium. The "Corded Ware" individuals contain around ten analyses of dentin and enamel for strontium and three each for oxygen and carbon/nitrogen/sulphur. In particular, the elaborate referencing of bioavailable strontium in the Swiss Plateau provides an essential basis (around 20 analyses) for identifying mobile individuals.

The paper represents a kick-off to a large mobility project in Central Europe for the 4th and 3rd millennium BC. The interior of Switzerland is representing a first "core area" representing the project. In a second step, animals as well as other isotope systems such as oxygen and sulphur will be considered.

R. Turck/N. Bleicher, Leben und Sterben auf dem Abfallhaufen? Eine Strontium-Isotopen-Untersuchung zu den menschlichen Skelettresten der jungsteinzeitlichen Seeufersiedlung von Zürich-Parkhaus Opéra. In: N. Balkowski/I. Hohle/K. P. Hofmann/A. Schülke (Hrsg.), Mensch - Körper - Tod. Der Umgang mit menschlichen Überresten im Neolithikum Mitteleuropas (Leiden 2023) 243-265.

2 SOME WEANING PATTERNS IN LATE NEOLITHIC POPULATION OF LATVIAN TERRITORY

Batraga, Anna (Institute of Latvian History, University of Latvia) - Czermak, Andrea (School of Archaeology, University of Oxford) - Schulting, Rick (School of Archaeology, University of Oxford) - Zariņa, Gunita (Institute of Latvian History, University of Latvia)

The transition from foraging to farming, the characteristics of the process and the regional variations are still not completely understood. In the Eastern Baltic region, the first signs of early farming are assumed to fall in the Neolithic period of the 4th–3rd millennium cal BC. The same is presumed for the area of modern-day Latvia. However, several academics argue that farming was established later, during the Bronze Age (1800 – 500 cal BC). With the introduction of farmed crops, early childhood diet and especially weaning food changed significantly. Examining if there was a shift in weaning patterns during the Neolithic can provide insights into the process.

To identify whether there is evidence of early farming in the Late Neolithic (2900 – 1800 cal BC), stable carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) isotope analyses were performed on sequential dentine samples from the first permanent molars of nine individuals from the two late Neolithic settlements of Abora and Kreiči (3484 – 1925 cal BC and 3368 – 1765 cal BC), Latvia. Teeth provide a chronological record of the dietary intake during their growth, with first molar giving insights into an individual's life history from birth to age nine. Analyses were carried out at the School of Archaeology, University of Oxford.

The results show that there are no major differences in the timing of exclusive breastfeeding, weaning and the age of cessation of breastfeeding in the Late Neolithic compared to published data from the Mesolithic/Early Neolithic at Zvejnieki. The similar $\delta^{15}N$ and $\delta^{13}C$ results indicate that there were little to no detectable changes in supplementary foods used during the weaning process. Our results show that, if the transition to farming indeed started in the Late Neolithic, it did not cause any changes in breastfeeding and weaning patterns, at least not in its initial stages.

3 THE DIETARY PRACTICES OF HUMAN COMMUNITIES AT SITE 3 IN MIECHÓW (SOUTHERN POLAND) FROM THE NEOLITHIC TO THE IRON AGE

Nowak, Marek (Institute of Archaeology, Jagiellonian University in Kraków, Poland) - Mnich, Barbara (Institute of Zoology and Biomedical Research, Jagiellonian University in Kraków, Poland) - Szostek, Krzysztof (Institute of Biological Sciences, Cardinal Stefan Wyszyński University in Warsaw, Poland) - Nowak, Oskar (Institute of Human Biology and Evolution, Adam Mickiewicz University in Poznań, Poland) - Rodzińska-Nowak, Judyta (Institute of Archaeology, Jagiellonian University in Kraków, Poland) - Przybyła, Marcin (Independent researcher)

Within the comprehensive elaboration of results of excavations conducted at site 3 in Miechów (ca. 30 km north of Kraków) isotope analyses of $\delta^{13}C$ and $\delta^{15}N$ were performed for human groups that inhabited the site since the Neolithic to the Iron Age. In total, 41 skeletons were investigated. The analyses aimed to reconstruct the nutrition strategies of communities from consecutive periods and to confront the obtained knowledge with their biological condition and current views on food management of prehistoric communities from central Europe. The results indicate a general predominance of the terrestrial diet, in which plant-based food prevailed, although it did not predominate conspicuously. However, there are indications of slightly varying nutritional strategies among successive human groups. These differences are related to the contribution of animal protein and the relationship between C3 and C4 plants. For instance, in the middle Neolithic (4th millennium BC) a greater consumption of meat can be postulated, when compared with the early Neolithic stage (late 6th and 5th millennium BC). It is also possible that a portion of the diet included food obtained from freshwater organisms. On the other hand, the proportion of meat in the diet of the early Bronze Age inhabitants (2nd millennium BC) was the lowest in the entire history of site occupation. It returned to near-Neolithic levels in the developed Bronze Age and Iron Age (1st millennium BC). Regarding plant food, the results indicate a greater variability in the plants consumed in the Bronze and Iron Ages. Levels of $\delta^{13}C$ imply some contribution of C4 plants, i.e. millet, in these periods. This complies with the recently formulated theses on younger i.e. post-Neolithic beginnings of millet cultivation and consumption in central Europe. The research was carried out under the project of the National Science Centre Poland no. 2016/23//HS3/00387.

4 EXPLORING SOCIAL INEQUALITY, DIET AND LIVESTOCK MANAGEMENT STRATEGIES AT THE EARLY BRONZE AGE COMMUNITY OF JELŠOVCE (SLOVAKIA)

Skorna, Henry (Excellence Cluster ROOTS - University of Kiel) - Wilkes, Fynn (Excellence Cluster ROOTS - University of Kiel) - Batora, Jozef (Slovak Academy of Sciences)

This study employs Carbon ($\delta^{13}C$) and Nitrogen ($\delta^{15}N$) stable isotope analysis to investigate human diet and different animal management strategies and combines it with analyses of wealth distribution in the buried of the Early Bronze Age Society of Jelšovce (okr. Nitra, Slovakia). The Early Bronze Age in South-Western Slovakia is a period of change and transition marked by shifts in social and settlement structure technological advancements, and cultural practices. This is reflected in the available rich archaeological resources. Stringed along the river Nitra, Váh, Hron and Žitava are substantial burial sites each with up to several hundred graves. Together with the pivotal settlement centre at Vrblé (okr. Nitra) they reflect on the dynamic developments in Early Bronze Age in this region. The site of Jelšovce (okr. Nitra) is an ideal case study to look at the correlation between wealth distribution and diet as it already was investigated with a wide range of interdisciplinary data. In addition to the detailed catalogue and a typological analysis, radiocarbon dates, Sr-isotope- and anthropological studies are available (including Batora 2000 and Reiter/ Frei 2015). The burial ground was used for the duration of the Early Bronze Age (2300/2200-1600 BCE) and probably provides an accurate archive of the socio-economic developments in this period. Drawing from a larger sample set of 82 human and 24 animals the dual-isotope analysis offers a unique insight into the changing diet habits, wealth relations as well as different animal management strategies in the course of the Early Bronze Age.

5 RECONSTRUCTING DIETARY PATTERNS OF INDIVIDUALS INTERRED AT THE EARLY BRONZE AGE CEMETERY IN KRZYŻANOWICE DOLNE, SOUTHEASTERN POLAND

Szczepanek, Anita (Institute of Archaeology and Ethnology Polish Academy of Sciences; Medical College Jagiellonian University) - Jarosz, Paweł (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Study focuses on the stable carbon and nitrogen isotopic analysis conducted on the individuals buried at the Early Bronze Age Cemetery in Krzyżanowice Dolne, in Southeastern Poland. The research encompasses 50 individuals, with most being interred in single graves, while one mass grave containing 9 individuals was also identified. Collagen extracted from bone samples, including both human and animal remains, underwent comprehensive analysis. The findings were contextualized against a broader backdrop, incorporating Neolithic and Bronze Age samples from south-eastern Poland, along with local environmental data derived from plant macroremains dated to the Neolithic era. The isotopic values obtained from the individuals at Krzyżanowice Dolne enabled the reconstruction of the community's diet. The general dietary pattern suggested an inland orientation, primarily reliant on C3 plants, complemented by diverse quantities of animal products. Comparative analysis with data from the mobile Corded Ware culture population, as well as the Globular Amphora and Mierzanowice culture communities, revealed a notable prevalence of animal-derived food sources. Additionally, the study highlighted variations attributable to the age at death, particularly evident in a distinct group of the youngest children. However, the distinctions between adult females and males were not readily discernible. This research was funded by the National Science Centre Poland, grant number NCN 2020/39/B/HS3/00454.

6 EXPLORING DEVIANT BURIALS THROUGH STABLE ISOTOPE ANALYSES: A CASE STUDY OF THE EARLY FIRST MILLENNIUM BC JURILOVCA-ORGAME SITE (ROMANIA)

Petrache, Noria (Doctoral School of History, Faculty of History, University of Bucharest, Romania; ArchaeoSciences Platform, Research Institute of the University of Bucharest (ICUB), Romania) - Ailincăi, Sorin (Doctoral School of History, Faculty of History, University of Bucharest, Romania; Institute of Eco-Museum Research (ICEM), Tulcea, Romania) - Constantinescu, Mihai (Faculty of History, University of Bucharest, Romania) - García-Vázquez, Ana (ArchaeoSciences Platform, Research Institute of the University of Bucharest (ICUB), Romania)

The funerary customs of emerging settlers at the onset of the Late Bronze Age in Dobroudja (Southeastern Romania), assigned to the Babadag culture (c. 1000-800 BC), mirror the broader cultural shifts and social restructuring that occurred during the early first millennium BC. Given the absence of designated cemeteries and the exclusive adoption of settlement burials, often labelled as “deviant” or “macabre”, this study highlights the significance of stable isotope analysis in elucidating human behaviour and adaptation in response to socio-environmental changes.

This paper presents the isotopic data derived from 12 individuals (6 males, 4 females and 2 indeter, of different ages), discovered in a singular pit in the precolonial level at Orgame (Jurilovca), marking the first attempt to conduct stable isotope analyses within these communities. Burial practices can be seen as windows into the societal framework and cultural dynamics, potentially signifying social stratification. By employing the analysis of stable isotopic ratios ($\delta^{13}C$, $\delta^{15}N$) of bone collagen, we test the common archaeological hypothesis that deviant burials may represent socially marginalized or distinct individuals. Furthermore, we assess the interplay between dietary habits and the wide-rang-

ing spectrum of this era's climatic, cultural and environmental transformations. Through the application of isotope analysis, the study addresses questions regarding sex- and age-related variations in dietary patterns and delineates subsistence strategies that can be correlated with the societal standing of the individuals interred at this site.

The study highlights the value of isotopic analysis in archaeology by having the potential to unravel the complex web of human consumption patterns associated with burial practices, environmental adaptation, and societal evolution during the Late Bronze Age in the Lower Danube region. Moreover, this research perspective enables us to address a significant knowledge gap between two European regions that regrettably lack a comprehensive molecular mapping of their respective environments.

7 POPULATION DYNAMICS IN CROATIA: STRONTIUM ISOTOPE ANALYSIS OF CREMATED REMAINS FROM SLATINA (LATE BRONZE AGE) AND ZVONIMIROVO-VELIKO-POLJE (LATE IRON AGE)

Legrand, Emma (Archaeology, Environmental Changes and Geo-Chemistry research group, Vrije Universiteit Brussel, Belgium) - Ložnjak Dizdar, Daria (Institute of Archaeology, Zagreb, Croatia) - Dizdar, Marko (Institute of Archaeology, Zagreb, Croatia) - Rajić Šikanjić, Petra (Institute for Anthropological Research, Zagreb, Croatia) - Novak, Mario (Institute for Anthropological Research, Zagreb, Croatia) - Šlaus, Mario (Anthropological Centre of Croatian Academy of Sciences and Arts, Zagreb, Croatia) - Griffith, Jacob (Archaeology, Environmental Changes and Geo-Chemistry research group, Vrije Universiteit Brussel, Belgium) - James, Hannah (Archaeology, Environmental Changes and Geo-Chemistry research group, Vrije Universiteit Brussel, Belgium) - Snoeck, Christophe (Archaeology, Environmental Changes and Geo-Chemistry research group, Vrije Universiteit Brussel, Belgium)

Strontium isotope analysis ($^{87}Sr/^{86}Sr$) is a commonly employed method for the investigation of mobility in archaeological populations. However, as the strontium (Sr) assimilated in skeletal tissues relies on food intake, $^{87}Sr/^{86}Sr$ also allows for the investigation of diet and land-use patterns, and provides multiple lines of understanding of past populations.

Slatina and Zvonimirovo-Veliko Polje (ZVP), are two multi-phases sites located in the Drava valley, in Northern continental Croatia. In Slatina, an Urnfield culture cemetery dated to the 11th century BC was recovered, alongside a few graves from the Early Iron Age. In ZVP, a rich middle La Tène cemetery dated from the end 3rd c./first half of the 2nd BC was excavated, and is to this date the only systematically investigated cemetery from that period in Northern Croatia. Despite being separated by less by 20km, preliminary $^{87}Sr/^{86}Sr$ results on cremated samples from 5 individuals from Slatina, and 3 individuals from ZVP showed already striking differences between populations of these two sites (around 0.7130 and 0.7115 respectively). To better understand the reasons behind this variation, additional cremated samples from both sites were analyzed for Sr isotopes and concentrations. Similar analysis was also conducted on plants collected within a radius of 30km from both sites, to provide a local baseline and as part of the construction of a bioavailable Sr isoscape for continental Croatia. The aim of this study is to look into factors such as mobility patterns, dietary habits or landscape use on a diachronic perspective, to provide first insights into the variability observed.

8 UNVEILING LATE BRONZE AGE CEMETERIES IN NORTH-EASTERN SLOVENIA: A COMPREHENSIVE ANALYSIS OF $^{87}SR/^{86}SR$, $\delta^{88}SR$, AND [SR]

Gerritzen, Carina (Archaeology, Environmental Changes and Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - Goderis, Steven (Archaeology, Environmental Changes and Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - Črešnar, Matija (Centre for Interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Leskovar, Tamara (Centre for Interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - James, Hannah (Archaeology, Environmental Changes and Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - Gruškovnjak, Luka (Centre for Interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Potočnik, Doris (Department of Environmental Sciences, Jožef Stefan Institute, Slovenia) - Ogrinc, Nives (Department of Environmental Sciences, Jožef Stefan Institute, Slovenia) - Snoeck, Christophe (Archaeology, Environmental Changes and Geo-Chemistry Research Unit, Vrije Universiteit Brussel)

The fascination with archaeological sites in north-eastern Slovenia, particularly those from the late Bronze Age, has persisted for more than a century. Geographically, this region is bordered by the Alps in the west and extends towards the expansive Pannonian plain in the east. In recent decades, several flat cremation cemeteries dating back to the Late Bronze Age (approx. 1050-800 BC) have been unearthed in north-eastern Slovenia, also due to extensive construction activities in the area. Some of these sites house a significant number of cremations, with thorough osteological analyses conducted to date. The analysis of grave goods has been employed in previous attempts to discern social structures among various sites. Presently, ongoing modern scientific analyses are shedding new light on cremation burials and social structures in north-eastern Slovenia during the Late Bronze Age (1050-800 BC) by integrating novel methodological approaches with existing excavation reports

This research presents findings from a combined analysis of $^{87}\text{Sr}/^{86}\text{Sr}$, $\delta^{88}\text{Sr}$, and $[\text{Sr}]$ on cremated human remains from five cemeteries comprising a total of 181 individuals in north-eastern Slovenia. The concentrations and isotopic compositions of Sr in bones provide direct insights into the human diet. The investigation involving the comprehensive analysis of $^{87}\text{Sr}/^{86}\text{Sr}$, $\delta^{88}\text{Sr}$, and $[\text{Sr}]$, along with the comparison of results across different sites, offers a distinctive perspective on the social structures within north-eastern Slovenia. Offering insights into palaeomobility ($^{87}\text{Sr}/^{86}\text{Sr}$), and diet ($\delta^{88}\text{Sr}$, and $[\text{Sr}]$), of the population.

9 PRELIMINARY RESULTS OF THE MULTI-ISOTOPE ANALYSIS IN THE HALLSTATT PERIOD BI-RITUAL CEMETERY AT MODŘICE (8TH-5TH CENTURY BCE, CZECH REPUBLIC)

Vytlačil, Zdenek (National Museum, Czech Republic; Department of Anthropology and Human Genetics, Faculty of Science, Czech Republic) - Drtikolová Kaupová, Sylva (National Museum, Czech Republic) - Tvrđý, Zdeněk (Anthropos Institute, Historical museum, Moravian Museum, Czech Republic) - Kos, Petr (Institute for Archaeological Heritage, Czech Republic)

Analysis of strontium, carbon, nitrogen and sulphur isotopes has been performed on Hallstatt period (8th-5th century BCE) individuals buried in a bi-ritual cemetery at Modřice in South Moravia (Czech Republic) in order to explore their diet and mobility. The preliminary results are presented. The strontium analysis of 24 skeleton and 24 cremation burials suggest high mobility among elites and individuals with a presumed religious role, as well as craftsman, with possible links to the areas of today's Germany and Austria, as suggested by the character of the accompanying grave goods. Dietary analysis of bone collagen of 26 inhumations (accompanied by 19 samples of comparative faunal samples) suggest diet of terrestrial origin with the notable proportion of millet and surprisingly low input of animal products.

The study was funded by the Czech Ministry of Culture (DKRVO 2024-2028/7.l.a, 00023272) and the Ministry of Education, Youth and Sports (OP JAK: Ready for the future: understanding long-term resilience of the human culture; RES-HUM; CZ.02.01.01/00/22_008/0004593).

10 STABLE ISOTOPE INVESTIGATION AIMING THE DIETARY HABITS OF THE LATE ROMAN AGE COMMUNITY IN MAROSSZENTANNA, TRANSYLVANIA

Major, Istvan (HUN-REN ATOMKI) - Futó, István (HUN-REN ATOMKI) - Körösfői, Zsolt (Jósa András Museum)

Once, the Dacia province had been surrendered by the Romans in 271, the route to Transylvania was opened for barbarian ethnic groups. By the 4th century, this area formed the western edge of the extensive Marosszentanna-Chernyahov culture, which can be identified as a mixed ethnic confederation of Germans, Sarmatians and Thracians led by the Visigoths. In our study, we wanted to gain a more precise insight into the dietary habits of this group, using stable carbon and nitrogen isotope analysis of bone remains deriving from the Marosszentanna cemetery. Based on our results, it can be seen that the $\delta^{13}\text{C}$ values of the studied population are relatively less negative ($-15.4 \pm 1.2\%$), while the $\delta^{15}\text{N}$ values are in the middle of the range typical for humans ($10.1 \pm 1.0\%$). Compared to other contemporaneous groups in Europe, these new stable isotope ratio results differ significantly from the values associated to Northern European populations and are more similar to the ones found in the Mediterranean region being closer to the Transylvanian Basin. The greatest similarity was found related to the values of the mixed ethnic groups in the post-imperial age Pannonian basin, suggesting similar lifestyle. This can be seen in the medium or minimal consumption of animal protein (mainly terrestrial species) and in the greater contribution of cereal crops, partly millet.

11 NO MAN AN ISLAND: INSULAR DIET FROM THE LATE ANTIQUE SITES OF MARTINŠĆICA AND MIRINE, EASTERN ADRIATIC

Caric, Mario (Institute for Anthropological Research, Centre for Applied Bioanthropology) - Causevic-Bully, Morana (Université de Franche-Comté, UMR Chrono-environnement) - Delliste, Anaïs (UMR ArTeHiS, Université de Bourgogne) - Bully, Sébastien (CNRS-UMR ARTEHIS, Université de Bourgogne) - Novak, Mario (Institute for Anthropological Research, Centre for Applied Bioanthropology)

The results of the carbon (^{13}C) and nitrogen (^{15}N) stable isotope analysis of 24 human samples from the Late Antique-Early Medieval site of Mirine located on the island of Krk, and the same-period site of Martinšćica located on the island of Cres (both dated around 5th century CE), provides an excellent ground for comparing potentially different dietary habits from geochronologically similar site. Such studies may indicate minute but visible differences which further expands not only diet, but also the overall reconstruction of lifestyle of past populations. Stable isotope analysis of bone collagen was conducted as part of the broader archeological excavation on the aforementioned sites, and so far, provides one of the few such results from the Late Antique period of Croatia. In addition, it also gives us an opportunity to compare the obtained data with those from earlier periods, which ultimately may point to potential shifts in diet on a territory oftentimes marked with turbulent migrations phases.

12 DIETARY TRANSITIONS DURING THE MIGRATION PERIOD IN CENTRAL AND SOUTHEASTERN EUROPE: NEW DATA AND PRELIMINARY INTERPRETATIONS

Djukic, Ksenija (Center of Bone Biology, Faculty of Medicine, Belgrade (Serbia)) - Toyne, JM (University of Central Florida, Orlando, Florida, USA) - Carić, Mario (Institute for Anthropological Research, Zagreb, Croatia) - Dugonjić, Anita (Archaeological Museum Zagreb, Zagreb, Croatia) - Rapan Papeša, Anita (Vinkovci Municipal Museum, Vinkovci, Croatia) - Novak, Mario (Institute for Anthropological Research, Zagreb, Croatia)

The main aim of this study is to elucidate regional patterns in the diets of early medieval Central and Southeastern Europe. In addition, we will explore possible changes in dietary variation between and within three cemeteries from the territory of modern Croatia (Vinkovci) and Serbia (Kormadin near Jakovo and Gradina-Jelica). Based on the archaeological contexts, all the investigated cemeteries are dated into the 6th century CE. From Vinkovci, 13 individuals (2 non-sexed adults, 4 adult males, and 7 adult females); from Kormadin, 6 individuals (3 non-adults and 3 adult males); while from Gradina-Jelica, 20 individuals (3 non-adults, 4 non-sexed adults, 10 adult males and 3 adult females) were included in this study. To explore stable isotope data, we selected 58 samples (bone and tooth) from burials across the sites.

The carbon and nitrogen stable compositions for bone samples suggest a broadly similar dietary range across each site and limited variation within sites. There appears a strong focus on C3 based plant resources (such as wheat, oats, barley) with limited C4 plants (millet), although juveniles may have been supplemented with millet during the weaning stage. There also appears to be consistent terrestrial animal protein in the diet of all members of each community. Only a few higher $\delta^{15}\text{N}$ values among females may suggest possible pathophysiological stresses impacting isotopic compositions. Tooth samples in Vinkovci seem to suggest that several individuals may have started life in quite a distinct dietary regime compared to paired later life bone carbon isotope compositions, thus reflecting that some individuals experienced relocation. While representing broadly different geographic locations and regions impacted variably by ongoing Migration Period processes, at first review, there appear to be common dietary patterns characterizing these sites.

13 „WHAT HAVE THE ROMANS EVER DONE FOR US? MULTI ISOTOPE DATASET FROM LATE ANTIQUE AND EARLY MEDIEVAL SLOVENIA

Faragó, Norbert (Eötvös Loránd University) - Milavec, Tina (University of Ljubljana) - Koncz, István (Eötvös Loránd University) - Vyas, Deven (Stony Brook University) - Leskovar, Tamara (University of Ljubljana) - Vida, Tivadar (Eötvös Loránd University) - Geary, Patrick (Institute for Advanced Study, Princeton) - Veeramah, Krishna (Stony Brook University)

In recent decades, isotope research in bioarchaeology has described a very distinctive arc. A promising and revolutionary discipline in the early 2000s, it has gradually shown its potential over the past decades. However, as the technology became more mature by the 2020s, its limitations became increasingly apparent. In this process, in which isotope studies have sought links with archaeology and other bioarchaeological methods, the Central and Eastern European region has unfortunately only taken a limited part. In the present study, we aim to add to the hitherto modest knowledge base with more than 200 Sr and more than 300 C/N data from three Slovenian regions, namely the areas including Ljubljana and Celje and the Vipava River Valley, and to open new perspectives for joint paleogenomic, archaeological and cultural-historical interpretation.

Our results, although limited in themselves, combined with the results of genomic analysis, support a narrative that reconstructs the continued existence of the local population in the nearby highland settlements as the late Roman centres in present-day Slovenia were depopulated following the decline of Roman rule. On one side, evidence for this is provided by the homogeneity of human Sr data, the narrower local Sr baselines, which rather indicate a great difference in land use and nutrition habits than the arrival of new incomers. On the other side, the relatively large size of pedigrees with few unrelated individuals and the decline in genetic diversity support this reconstruction. Later, during the 9th and 10th centuries, the Sr isotopic distribution became more heterogeneous with some individuals yielding more various Sr signals and increased mobility, while a new northeast European genetic component appeared in the sites, supporting the appearance of new populations in the territory.

14 LIVING AT THE LAKE - RECONSTRUCTING THE DIET OF MEDIEVAL INHABITANTS AROUND THE LAKE OF ZURICH, SWITZERLAND

Goujon, Antoinette (Institute of Archaeology, University of Zurich)

Swiss lakesides have been popular settlement areas since Prehistory due to their natural abundance of resources. Many settlements have been documented for the Lake Zurich, ranging from the Neolithic until today. As the human remains from prehistoric periods are scarce and fragmented, historical skeletal material provides a welcome first insight into questions relating to diet and health around the Lake Zurich area. The studied sites date from the Early

Middle Ages to the Early Modern Times (c. 550–1500 calAD) and provide a vast amount of information to examine life histories: Not only are there ample archaeological and anthropological sources, but, furthermore, historical sources from the studied region and periods concerning daily life, prices, and food, adding to this discussion. The chosen human remains (n=100) have not yet been investigated through archaeometrical analyses. Apart from having great potential for approaching socio-economic and socio-cultural questions and providing abundant information on diet through interdisciplinary studies, archaeometrical analyses of human remains also shed light on possible location-related dating biases (e.g. radiocarbon reservoir effects), which have yet to be investigated in Switzerland.

This study combines historical sources, anthropological and palaeopathological examinations with stable isotope and ancient protein analyses to investigate the diet of medieval rural and urban communities around the Lake Zurich. Even though the study focuses on a specific region and time frame, the outcomes provide a foundation for further diachronic studies throughout Europe.

15 THE PALEODIET EVOLUTION DURING THE 8TH-12TH CENTURY IN THE VENETIAN LAGOON (ITALY)

Lonocce, Norma (Department of Cultural Heritage, University of Salento, Lecce, 73100, Italy) - Viva, Serena (Department of Cultural Heritage, University of Salento, Lecce, 73100, Italy; Department of History and Cultural Heritage, University of Siena, Siena, 53100, Italy) - Turetta, Clara (Institute of Polar Sciences – National Research Council CNR-ISP) - Cadamuro, Silvia (Department of Humanities, Ca' Foscari University, Venice, Italy) - Bonato, Emanuele (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice, Via Torino, 155, 30172 Venezia Mestre, Italy) - Giummolè, Federica (Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice, Via Torino, 155, 30172 Venezia Mestre, Italy) - Barbante, Carlo (Institute of Polar Sciences – National Research Council CNR-ISP; Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice, Via Torino, 155, 30172 Venezia Mestre, Italy) - Gelichi, Sauro (Department of Humanities, Ca' Foscari University, Venice, Italy) - Battistel, Dario (Institute of Polar Sciences – National Research Council CNR-ISP; Department of Environmental Sciences, Informatics and Statistics, Ca' Foscari University of Venice, Via Torino, 155, 30172 Venezia Mestre, Italy)

The archaeological project at the site of Jesolo (ancient Equilo; Venice, Italy), under the direction of Ca' Foscari University, in recent years has focused on the locality of St. Mauro, where research has given centrality to the medieval cemetery that developed inside and outside the ecclesiastical buildings. The aim was to analyze in detail a significant population sample related to a community that developed in the Venetian lagoon from the 8th to the 12th century. Bio-anthropological analyses have recently been complemented by the paleodiet research, reconstructed by the stable isotopes analysis of $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ found in collagen of teeth and bones from St. Mauro sample. A total of 52 individuals of various ages, sex, chronologies, and pathological condition were included in this study. Our findings revealed the presence of two distinct dietary patterns influenced only by chronology. We observed that a more fish-based diet (30–60% of the overall diet) prevailed between the 8th and 10th centuries. However, between the 10th and 12th centuries, fish consumption decreased (10–30% of the overall diet), and there was a shift towards a diet rich in terrestrial protein sources. We link this change in dietary habits to economic development also evidenced by the transformations of the site and increased trade with the hinterland. Furthermore, it was observed significantly higher $\delta^{15}\text{N}$ values in individuals from 8th–10th compared to those from 10th–12th centuries. We proposed two potential explanations: a shift in child-rearing practices, such as delayed weaning during early middle age compared to late middle age, or a change in diet of breast feeders.

16 ISOTOPIC ANALYSIS IN BIOARCHAEOLOGY: A CASE STUDY FROM TRANSYLVANIA

Fennell, Dorothea (University of South Florida) - Zejdlik, Katie (Western Carolina University) - Nyáradi, Zsolt (Haáz Rezső Múzeum) - Bethard, Jonathan (University of South Florida)

For the last several decades, bioarchaeologists have made great strides in interpreting the subsistence strategies and dietary patterns of past communities around the world. In particular, bioarchaeologists have made particular use of isotopic analyses of carbon (^{13}C) and nitrogen (^{15}N) in dietary reconstructions. This study aims to use bulk stable and compound-specific isotopic analysis to reconstruct the diet of Transylvanians uncovered from the Văleni-Papdomb archaeological site in Harghita County, Romania. The church and associated cemetery sit in a secondary valley of the Târnava Mare River, with traces of 661 burials ranging from the tenth to seventeenth centuries. Collagen was extracted from over 150 individuals, including one equine sample, by demineralization and solubilization of the bone. Samples then underwent bulk stable isotope analysis via Continuous Flow Elemental Analyzer Isotope Ratio Mass Spectrometry (CF-EA-IRMS) at the Marine Environmental Chemistry Lab at the University of South Florida. Five samples were selected to undergo compound specific isotope analysis of amino acids, to allow for a more detailed interpretation of protein sources. Samples were derivatized to N-acetyl methyl esters, then analyzed via Gas Chromatography Combustion Isotope Ratio Mass Spectrometry (GC-C-IRMS) at the Stable Isotope Facility of the

University of California, Davis. Initial results from the bulk stable analysis indicate diet was primarily focused on C3 terrestrial protein sources, though analysis of the compound-specific data is required.

17 MOBILITY AT THE PROBABLE MEDIEVAL MUSLIM CEMETERY IN OROSHÁZA, HUNGARY USING STABLE STRONTIUM AND OXYGEN ISOTOPE ANALYSES

Gugora, Ariana (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Demény, Attila (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Farkas, Csaba (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Somogyvári-Lajtár, Enikő (Institute of Archaeological Sciences, Eötvös Loránd University; Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Rózsa, Zoltán (Archaeological Institute, Hungarian National Museum) - Fóthi, Erzsébet (Institute of Archaeogenomics, Research Centre for the Humanities, HUN-REN)

Orosháza, in southeastern Hungary, has a unique history. Archaeological and zooarchaeological evidence suggests that, in the Middle Ages (11th–13th centuries CE), it was home to some of the Muslims that were likely involved in trade and/or regional tax collection on behalf of the Hungarian kings. The complete absence of pig (*Sus scrofa*/*Sus* sp.) bones at the site indicates that the individuals did not consume pork, which is considered unusual in medieval Hungary. Further supporting the conclusion that these individuals were Muslim are their burial positions (skulls turned towards where they thought Mecca was), a general lack of grave goods, and their niche burials.

Here we present the first stable isotopic study examining the mobility of the purported Muslim population at medieval Orosháza. Stable strontium isotope analysis was performed on dental enamel, whereas stable oxygen isotope analyses were conducted on both enamel and bone, from skeletal phosphate, because it is impervious to post-depositional diagenetic alteration, unlike skeletal carbonate. Combining these two isotopes enabled us to distinguish between locals and non-locals, as well as to tentatively identify the most likely areas of origin for the non-locals. The results show that several of the studied individuals were not local. Instead, they were born elsewhere and traveled to Orosháza a few years prior to their deaths. The $\delta^{18}\text{O}$ values indicate that these people came from a cooler, mountainous place, potentially somewhere in the Balkans or the Volga-Ural region. This pioneering study is not only important archaeologically and historically, but also biochemically and geochemically, as it uses the more reliable skeletal phosphate for the first time in Hungary.

This project was financed by a grant from the National Research, Development, and Innovation Fund (Grant KP2020-NKA-20).

18 LIFE AT MEDIEVAL OROSHÁZA ACCORDING TO THE STABLE ISOTOPE ARCHAEOLOGICAL EXAMINATION

Somogyvári-Lajtár, Eniko (Institute of Archaeological Sciences, Eötvös Loránd University; Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Gugora, Ariana (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, HUN-REN) - Rózsa, Zoltán (National Archaeological Institute, Hungarian National Museum) - Fóthi, Erzsébet (Institute of Archaeogenomics, Research Centre for the Humanities, HUN-REN)

Learning about the dietary habits of past communities can provide a glimpse into their daily lives. Food consumption is both a biological necessity and a sociocultural phenomenon. In the case of the population of medieval Orosháza (11th–13th centuries CE), this is a particularly important fact. This site is located in the Great Hungarian Plain in southeastern Hungary and is unique in Hungarian medieval archaeological research. The archaeological and archaeozoological findings from the settlement indicate that a Muslim community may have resided there. Furthermore, their funerary practices also support this hypothesis.

In this study, we examined the diet and lifestyle of 67 individuals from the cemetery of Orosháza. The research questions were: Is it possible to identify Muslim traditions in the population's dietary habits? Were there any differences in the diet between the biological sexes? How could we characterize childhood and adulthood dietary habits? Could we observe changes in the individual's life course based on their nutrition? Could we detect connections between paleopathological conditions and dietary habits? We measured stable carbon and nitrogen isotope ratios on bone and tooth dentine collagen samples, as well as stable carbon and oxygen ratios on enamel apatite carbonate samples to determine dietary habits on both the individual and population levels.

The project was funded by a grant from the National Research, Development, and Innovation Fund (Grant KP2020-NKA-20).

19 RECONSTRUCTING DIET OF MEDIEVAL POPULATIONS IN NORTHERN CROATIA: THE IVANEC-STARI GRAD SITE AND STABLE CARBON AND NITROGEN ISOTOPE ANALYSES

Kokotovic, Tea (Institute of Archaeology, Zagreb, Croatia) - Bedić, Željka (Institute for Anthropological Research, Zagreb, Croatia) - Krznar, Siniša (Institute of Archaeology, Zagreb, Croatia) - Sirovica, Filomena (Archaeological Museum in Zagreb, Croatia) - Belaj, Juraj (Institute of Archaeology, Zagreb, Croatia)

When reconstructing the diet of medieval populations in northern Croatia, one can follow multiple lines of inquiry. So far, most of the information on this subject came from written sources, zooarchaeological and paleobotanical analysis, and paleodentological studies. Stable isotope analyses are still rare and mostly focused on earlier periods. This lack of data prompted the study of the High and Late Medieval population based on samples collected during archaeological excavations at the Ivanec-Stari grad site in northwestern Croatia. This is a multiperiod site dating from antiquity to the modern period. Archaeological excavations unearthed the remains of a Renaissance castle, three churches, and a total of 324 burials. The cemetery, used until the beginning of the 17th century, was established at the end of the 11th century around the Romanesque church. At the beginning of the 14th century, it slightly shifted around the new Gothic church-fortress built by Knights Hospitallers. Following stratigraphic data, obtained radiocarbon dates, and changes in funerary practices, burials were separated into five successive phases.

To reconstruct the dietary habits of the local population in the period between the 11th and 14th centuries, stable carbon and nitrogen isotope analyses were conducted. The series includes 30 adult human bone samples from the first three burial phases in Ivanec and 16 animal bone samples from the same geographic region. The majority of the individuals had $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ values consistent with a diet based on terrestrial food sources, primary C3 plants with relatively low animal protein intake, and, depending on the burial phase, varying quantities of C4 plants, like millet. Compared with the available stable carbon and nitrogen isotope data from the region, but also in conjunction with historical sources, archaeological context, and bioarchaeological data, these results provide new insights into the dietary trends of medieval populations in continental Croatia.

20 THE USE OF SULPHUR ISOTOPE ANALYSIS FOR DIETARY RECONSTRUCTION IN BIOARCHAEOLOGY: A CASE STUDY FROM THE SZEKLER REGION OF TRANSYLVANIA

Christelow, Hollie (University of Bradford) - Koon, Hannah (University of Bradford) - Zsolt, Nyáradi (Haáz Rezső Múzeum) - Zejdlík, Katie (Western Carolina University) - Bethard, Jonathan (University of South Florida)

For the last several decades, bioarchaeologists have reconstructed subsistence practices of past communities through stable isotope analyses. It is well known that food and drink contain isotopic signatures which track aspects of past peoples' energy and protein consumption. Carbon and nitrogen isotopic data are utilised routinely; however, additional isotopic systems are gaining importance in bioarchaeological studies. Among these, analyses of sulphur isotopes are becoming more common and have added additional information to what is known about past communities. In this presentation, a review of sulphur isotopic analysis in bioarchaeology will be presented, along with a case study from an archaeological context in Transylvania.

Szeklers are a community of Hungarian speakers who have inhabited the Transylvanian region eastern Europe for a millennium. This research focuses on a site called Papdomb which represents a local village church and churchyard used for approximately eight hundred years throughout the medieval and early modern periods, broadly dated to the 11th -19th centuries. Carbon, nitrogen, and sulphur isotopic data derived from bone collagen of adult individuals (n=95) representing the span of the site's use will be presented in this presentation. Preliminary analyses suggest that social status is a possible reason for variation observed in the isotopic data from this site. Overall, this presentation will focus on how sulphur isotopic analysis complements traditional datasets utilised in bioarchaeological contexts.

21 LATE MEDIEVAL CEMETERY ON BOKŠTO STR. IN VILNIUS: DIETARY PRACTICES OF THE ORTHODOX COMMUNITY

Kaplunaite, Irma (The Lithuanian institute of History) - Jonaitis, Rytis (The Lithuanian institute of History)

In 2006 – 2014 archaeological research was carried out in Vilnius, at Bokšto Street. An exceptional object was discovered here – the late medieval cemetery dating back to the last third of the 13th – early 15th centuries. This is the earliest currently known burial ground in the city. At that time, Vilnius, as the capital of the Grand Duchy of Lithuania, was still growing. Three different communities lived here – local pagans and newcomers Christians – Catholics and Orthodox. During the late medieval period, the majority of the population in Lithuania was still pagan and practiced cremation. Meanwhile, the Orthodox Christians who settled in pagan Vilnius were buried at Bokšto Str. cemetery in inhumation graves.

Out of 533 skeletal remains from this burial ground, 50 individuals were chosen for carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope analyses of bone collagen. The results of $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ allow us to determine and evaluate the dietary habits of the late medieval Orthodox community, which left the burial ground, and reveal significant differences

in nutrition determined by biological sex, age, and social status. Additionally, in this presentation, the obtained results are further compared with later burial grounds in Vilnius and its surroundings, which facilitates distinction of the peculiarities in dietary practices of one confessional group – the Orthodox – and their changes over time.

22 HUMAN DIET IN VILNIUS IN THE 13TH - 18TH CENTURIES

Jonaitis, Rytis (The Lithuanian institute of history; Vilnius University) - Kaplūnaitė, Irma (The Lithuanian institute of history; Vilnius University) - Motuzaitė Matuzevičiūtė, Giedrė (The Lithuanian institute of history; Vilnius University) - Brindzaitė, Rūta (Vilnius University) - Jankauskas, Rimantas (Vilnius University)

Since the end of the 13th century Vilnius started to develop into the multicultural urban entity. Yet, very little is known how those processes unfolded and the different social and confessional groups subsisted and lived along each other.

We present the thorough study on the dietary habits of the chronologically and socially diverse Vilnius population. The study is based on the material from 14 different burial grounds located within the city and dated between the 13th – 18th centuries. Out of ca 2000 recovered skeletal remains, 250 adult individuals were chosen for stable isotope ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) analyses of bone collagen. The interpretation of dietary results from stable isotope measurements were done in the light of grave goods, contextual information, past zooarchaeological and botanical analyses, along with historical sources from Vilnius City. This research enables the assessment of the: a) changes in Vilnius population subsistence over time; b) diets of different confessional communities in Vilnius; c) differences between social classes and biological sex.

Our research has shown that the dietary basis of the population in Vilnius mainly consisted of C3 plants of terrestrial origin, which was supplemented with meat and dairy products. Statistically significant dietary differences were particularly evident when comparing population from the 13th – 15th centuries with the population from the 16th – 18th centuries. In addition, dietary differences were observed between adult men and women of Catholic, Orthodox and Protestant communities and between representatives of different social groups.

Project is funded by the Research Council of Lithuania (contract No. S-MIP-23-59).

93 POST-EARTHQUAKE SCENARIOS IN THE CLASSICAL AND MEDIEVAL PERIODS. ARCHAEOSEISMOLOGY AS A TOOL FOR INVESTIGATION ON AN URBAN AND ARCHITECTURAL SCALE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Arrighetti, Andrea (École normale supérieure - Université PSL of Paris; Università degli Studi di Siena) - Pecchioli, Laura (Humboldt Universität of Berlin; Technische Universität Wien; Università degli Studi ROMA TRE) - Thomalsky, Judith (German Archaeological Institute, Berlin) - Sousa, Ana Catarina (Centro de Arqueologia da Universidade de Lisboa)

Session format: Regular session

Ancient times and the Middle Ages records contain many references to natural disasters. Tectonic activity, with its associated geological processes, such as volcanism and earthquakes, has been regarded as drivers of early human evolution (as path makers) and as reasons for both the collapse of the Roman Empire (Vesuvius/Pompeii) and major changes in the modern age (Lisbon, 1755). Also, long-term tectonic processes have significantly transformed our prehistoric landscapes and former humankind's well-known worlds that can be related to changing dispersal routes, economy, site patterns and human evolution from the Holocene until the Medieval Ages.

Surviving documents and geological and archaeological evidence are essential in understanding and interpreting the data relating to traces on site, which are often the result of co-calamities. In this context, archaeoseismology provides an interdisciplinary investigation tool to gain field experience and train an interpretative approach based on scientific and humanistic methods, enriching historical seismology. In the current research framework, topics such as resilience and adaptability to seismic events, if analyzed on an urban scale, highlight peculiar aspects and choices (social, economic, architectural, infrastructural, and political) connected to the life of that community. If we focus on a post-earthquake disaster, continuity, and change, characterize the resilience of many ancient and current societies, express themselves in the advancement of building construction techniques, in the choice of migration or permanence in the affected areas, in the policy of aid in a post-disaster and the reuse of construction materials. In this way, it is possible to investigate the risk perception, such as post-disaster reconstruction or abandonment choices.

The session proposal considers projects developed in urban and territorial scale contexts in seismic areas. Investigation methodologies, techniques, and research perspectives are introduced, and focalizing the research results will better define the role of archaeoseismological data.

1 PROTECT: AN ARCHAEOSEISMOLOGY PROJECT FOR THE STUDY OF THE HISTORIC CITY CENTRE OF SIENA

Arrighetti, Andrea (École normale supérieure - Université PSL; Università degli Studi di Siena)

The archaeoseismological study of historic centres located in seismic areas allows to acquire an in-depth knowledge of the effects certain earthquakes had on material components, while at the same time providing evidence of the social, economic and political dynamics that arose in the wake of these events. These processes remain imprinted in the architecture, which often becomes the sole witness of a seismic past, the comprehension and understanding of which is in constant development. The project PROTECT – Knowledge for PReventiON – Techniques for repairing seismic damage from the medieval period to the modern era, financed by the European Union's Horizon 2020 research and innovation program together with a Marie Skłodowska-Curie Individual Fellowship, is part of this line of research. The aim is to apply, on an entirely experimental basis, the methods of archaeoseismological analysis to the historic city centre of Siena (Tuscany), thus acquiring a more in-depth knowledge of the context of study from the point of view of seismic prevention. Methodologically, the project is based on the experimental application of archaeological reading to the effects of earthquakes on the city's historic buildings, following a study of the architecture at different scales of detail. The PROTECT project intends to fill this gap by employing data from different humanistic and scientific disciplines, interweaving this information for future application in other contexts of study. The final objective will be to create an operational protocol for the archaeoseismological reading of the historic centre of Siena, or at least a part of it, and to export this model to other Italian or European realities, with a view to understanding, safeguarding and preserving the historic heritage from seismic risk.

2 THE BATHS OF VILLA DEI QUINTILI: ARCHAEOSEISMOLOGY AND WALL STRATIGRAPHY

De Pari, Marta (Università di Bari Aldo Moro; Università di Roma La Sapienza)

The site of the Villa dei Quintili on the Appian Way is part of the so-called XXL projects, which define a category of Roman brick structures distinguished by monumental scale. The villa's baths especially stand out for their elevated preservation and stratigraphic and structural complexity. They provide an ideal context for methodological investigations based on archaeology, archaeoseismology, and structural consolidation, all contributing to the conservation theme.

This paper examines the seismic history of the Villa dei Quintili, focusing on ancient structural reinforcements in the bath complex. The villa has experienced numerous earthquakes over the centuries, resulting in extensive destruction of much of the building, while other portions, characterized by ancient structural restorations, still endure. Among these are targeted interventions for structural consolidation, such as the closure of numerous openings and the reinforcement of extensive portions of earlier walls. The definitive abandonment of the bath complex likely occurred following an earthquake that sealed off some areas, preserving the opus sectile floor decoration and parts of the decorative cycle.

The paper investigates the building's seismic history and causes of instability, relying on interdisciplinary methods, including bibliographic and archival sources, stratigraphic and building techniques analysis, and crack pattern interpretation. Furthermore, it contextualizes the complex within Rome's seismic history by tracing the different construction periods; this chronological analysis provides crucial termini ante/post quem, which will serve as reference points for understanding the evolution of crack patterns. Finally, the paper aims to contribute to the debate on seismic precautions in the Roman period and will provide valuable insights into the architectural resilience of antiquity.

3 SOME REFLECTIONS REGARDING BUILDING ARCHAEOSEISMOLOGY IN CHALLENGING CONTEXTS. THE VENETIAN EXPERIENCE

Ganz, Margherita (DASStU-Politecnico of Milan)

Archaeoseismology applied to architecture has been shown to achieve very interesting results in culturally and geographically well-defined contexts. Can the archaeoseismological approach be extended to more dispersed environments? Eastern Veneto presents a very unique seismic landscape. It is prone to generating powerful earthquakes with lengthy interseismic periods, but at the same time, it experiences the propagation of seismic effects generated in neighboring seismogenic zones such as northeastern Friuli Venezia Giulia. Under these conditions it may be difficult to attribute all the damage solely to seismic activity, as moving away from the epicenter implies that other external and unpredictable factors may influence the seismic response of structures. On the other hand, the long periods between epicentral seismic events in the examined area have hindered the development of building practices commonly known as local seismic cultures: it is well known that these practices, involving post-seismic repairs and anti-seismic measures, allow us to better characterise and pinpoint the timing of construction phases of artefacts in seismic areas.

Through the presentation of some Venetian artefacts partially affected by the 1348 Carinthian earthquake, we will demonstrate that not only is archaeoseismological analysis feasible in such dispersed contexts but that it is also essential to preserve the wealth of seismic history that they contain.

4 URBAN FORM AS A SEISMIC RESPONSE

Pecchioli, Laura (Humboldt University/TUVienna/Roma Tre University)

Many construction techniques, preventive solutions, and post-disaster management advancements emerged during ancient times. Specific building systems or devices were incorporated into structures, providing seismic resistance and reducing vulnerability.

In cases of comparable construction techniques, ancient buildings offer similar damage patterns to current contexts, such as the AD 62 earthquake in Pompeii, the seismic effects identified in Ostia Antica with those in the recent earthquakes in Umbria and Marche (1997) and L'Aquila (2009). Therefore, the typical chessboard pattern of the Roman settlement, like in Ostia Antica, and the nature of the soil had a decisive task in traditional knowledge systems choices and the damage effects. In Ostia, we find a common and diffuse damage pattern in masonry structures that appears to be the effects of the horizontal seismic impacts.

Urban form, intended as the size, shape, and configuration of an urban area, the nature of the terrain, and the insertion of punctual pushing structural elements into the settlement of the city play a relevant role in traditional knowledge systems choices, the damage effects, and the seismic actions' analysis for a vulnerability assessment. The research on the masonry building aggregates after the L'Aquila and the Emilia-Romagna earthquakes showed that adjacent structures positively influenced the buildings' dynamic behavior despite their composition of low-quality material. In this context, the historical chronology must also be considered in a structural urban analysis framework to interpret collapse dynamics.

The EAE classification requires an architectural and urban reading to identify the typology of seismic effects and one probable orientation. An urban-structural- and 'formal' analysis of the agglomeration would represent a second phase of investigation or be developed in parallel. Archaeoseismology can provide information concerning the seismic vulnerability assessment, which is relevant information about ancient local reinforcement work, as a valuable prevention and disaster management tool.

5 THE 1292 EARTHQUAKE AND ITS LONG-TERM CONSEQUENCES IN URBAN LANDSCAPES OF SOUTH-WESTERN CRIMEA

Dmytro, Moisieiev (CO «Crimean institute of strategic studies»)

The earthquake of 1292 is known from the record in the Sudak Synaxarium (in Sudak it had II=VI points, MSK-64). This earthquake damaged (by archaeoseismological data): the three-apsed church with tribolons in Chersonesos, II=VII-VIII points (EMS-98); monastery on the Vinery cape (Chersonesos region), II=IX points (EMS-98); basilica in the Karalez valley (Mountain Crimea), II=VII-VIII points (EMS-98).

The epicentral area of the 1292 earthquake was located in the South Crimean seismogenerating zone, near the cape Fiolent. Consequences of this earthquake were significant for all South-Western Crimea. Stratigraphic situation in Chersonesos as well as in many other sites of region demonstrate vast destructions of the end of 13th century. Traditionally, they were interpreted as military activities of the Golden Horde. After that, Chersonesos was partially restored but fell into the urban crisis: next to the renewed blocks and churches were the ruins of the end of the 13th century and no burials of the dead under the rubble. In the end Chersonesos was abandoned by its inhabitants. However, there are no narrative sources confirming military reasons for the decay. At the same time, narrative sources neither mention a seismic nature of the crisis.

The destruction of the end of the 13th century is also known in similar to Chersonesos cities of Mountain Crimea (e.g. Eski-Kermen). This town burned out at the end of the 13th century (seismic dislocations weren't found yet). The following features of the urban crisis were traced here archeologically: significant reduction in life expectancy and low health level (comparing to pre-earthquake time: from 40-60 years to 20-30 years), e.g. pathologies of porotic hyperostosis and cold stress; no burials of the dead under ruins; transforming blocks into necropolises. Residents of Eski-Kermen abandoned the town until the middle of the 14th century.

6 BETWEEN RUINS: ASSESSING THE IMPACT OF 3RD MILLENNIUM BCE PALEOSEISMIC EVENTS ON THE WALLED ENCLOSURES OF OTA AND ZAMBUJAL (PORTUGAL)

Sousa, Ana Catarina (School of Arts, University of Lisbon; UNIARQ, Center for Archaeology University of Lisbon) - Duarte, João (UNIARQ, Center for Archaeology University of Lisbon; Faculty of Sciences, University of Lisbon) - Texugo, André (UNIARQ, Center for Archaeology University of Lisbon; CEG, Centro de Estudos Geográficos) - Basílio, Ana Catarina (ICAREHB, Universidade do Algarve) - Kunst, Michael (German Archaeologica Institut Madrid (retired); University of Frankfurt)

The Estremadura region of Portugal is notable for its concentration of Chalcolithic walled enclosures (Sousa, 2021), stone constructions with towers and barbicanes that would be especially vulnerable to seismic activity during the occupation (c. 2900 - 2100 BCE).

Portugal's Estremadura is susceptible to seismic activity of two different kinds: 1) very high magnitude seismicity offshore (with magnitudes over 8), such as the Great Lisbon Earthquake of 1755; and 2) moderate to high magnitude seismicity onshore (magnitudes 6-7) on local faults such as the Tagus and Montejunto faults that can cause events such the 1531 earthquake, which was more destructive in the Lisbon region than the 1755 earthquake. Such events can generate local intensities of VIII to X, which implies considerable damage to any man-made infrastructure, including collapses.

This presentation seeks to contextualize the impact of large earthquakes (capable of producing intensities above VIII) into perspective through indicators in the oceanic and coastal environments, since some of these earthquakes usually occur or affect the sea, causing tsunamis and landslides and respective deposits that can be dated.

The geological evidence will be compared with the archaeological record of two fortified settlements with different characteristics and where seismic activity seems to have had an impact.

In Zambujal (Torres Vedras), a large settlement that has been extensively excavated (Sangmeister-Schubart, 1981; Kunst 2017), presents some of the best-preserved structures in terms of height in this region, particularly in the barbican. The collapses recorded in Phase 4c are especially significant.

In the settlement of Ota (Alenquer), located in a fault area, the archaeological surveys carried out showed the presence of huge collapses that affected the walled structures of this site.

The impact of seismic activity on these structures is analysed in this presentation, with the hypothesis that tectonics contributed to the process of abandoning these structures.

7 NEW EVIDENCE FOR TSUNAMIS AND VOLCANIC ASHES OF THE BRONZE AGE THERA ERUPTION FROM ÇEŞME - BAĞLARARASI IN WESTERN TÜRKİYE

Sahoglu, Vasif (Ankara University) - Goodman Tchernov, Beverly (University of Haifa)

Çeşme - Bağlararası, a coastal Aegean Bronze Age settlement located along the western-most tip of the Urla Peninsula, İzmir District, Türkiye, was no stranger to natural disasters. Fallen walls and other earthquake markers and renovations suggest resilience and renovation at the site already in the 17th century BCE. A deposit recognized from a century afterwards was shown to contain preserved tsunami debris associated to the Bronze Age Thera Volcanic Eruption. A human victim of this tragedy was also discovered among the tsunami debris. The archaeological sequences at Çeşme - Bağlararası present a unique opportunity to investigate the consequences and response of the people who witnessed these events, and how it impacted the trajectory of their communities. Earthquakes, volcanic eruptions, and tsunamis are the outcome of natural tectonic processes that are disconnected from social and cultural aspects of society, yet are also a major architect of changing physical and social landscapes. Much attention has been given to questions of spheres of influence in the Aegean, and in particular waves of cultural dominance producing hybridized or altered cultural remains, such as shifts between local western Anatolian linked styles versus 'minoanized' forms similar to westward-centered populations. In this paper we will discuss the archaeological evidence and methodologies used at Çeşme - Bağlararası that led to the discovery of multiple tectonically-linked events including earthquakes and tsunamis and how it relates to the cultural sequences associated to them.

95 SECOND MILLENNIUM BCE BURIAL PRACTICES IN THE CENTRAL AND EASTERN MEDITERRANEAN FROM AN INTERDISCIPLINARY PERSPECTIVE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Borgna, Elisabetta (University of Udine) - Bettelli, Marco (Consiglio Nazionale delle Ricerche - Roma) - Cavazzuti, Claudio (University of Bologna) - Moutafi, Ioanna (Ludwig-Maximilian Universität - München) - Stockhammer, Philipp (Ludwig-Maximilian Universität - München; Max-Planck Institut für evolutionäre Anthropologie, Leipzig)

Session format: Regular session

An abundance of Middle and Late Bronze Age burials has been excavated all over the Central and Eastern Mediterranean in the last decades and has widely increased our knowledge about burial types, material culture and their social dimensions. However, only recently excavations have focused more on the remains of social practices during and after burials, like treatments of the dead corpse, the use of fire even apart from cremation, or manipulations of burial goods and bones. It has become clear that especially in the case of collective burials like in the Aegean, burial practices were much more complex than just depositing the corpse: bones were broken, bodies mixed up, segregated, objects broken and reassembled, primary funerary sets were rearranged reflecting the intention to assign new meaning to the past. Every burial must be seen as a management and reconstitution of the past and the netherworld. Sophisticated fieldwork procedures based on geoarchaeology, spatial analysis, and cutting-edge scientific approaches in bioarchaeology and geochemistry, have been increasingly important for our understanding. Our session aims to bring together scholars working on second-millennium BCE burials in the Mediterranean, who integrate different approaches to unravel past social practices surrounding burials and their meanings, essential for the constitution of the community of the dead and the living.

ABSTRACTS

1 IDENTIFYING DEATH IN LBA NORTHERN GREECE: A DIALOGUE BETWEEN THE HUMAN REMAINS AND THE FUNERARY PRACTICES

Triantaphyllou, Sevasti (Aristotle University of Thessaloniki)

Extramural cemeteries consisting mainly of inhumations and only a few cremations appear to be the rule in Late Bronze Age northern Greece. Contrary to the mortuary homogeneity and laborious investment in grave types and prestige items observed in LBA southern Greek mainland (the Peloponnese, central Greece, and Thessaly), the mortuary scenery in northern Greece displays variability, particularly in regional terms. In the West, a standard funerary program in grave types, additional furnishing equipment, burial types, position and orientation, and associated artifacts is cross-cut by the variable deposition of wealth within the cemeteries including local artifacts and imports or imitations of foreign products such as gold, silver, amber, or glass jewelry, Mycenaean-type swords and seals, Mycenaean- and Danubian-style aromatic containers and luxurious matt-painted ceramic drinking sets. In central northern Greece, on the other hand, where tell settlements dominate the natural and symbolic landscape, formal mortuary practices are absent. Also, while single inhumations were common in the early phases of the Bronze Age, in the Late Bronze Age, there is a growing interest in multiple and secondary burials, both involving re-opening of the grave and manipulation of the body in a variety of modes ranging from relocation and grouping of body parts to incomplete burning of defleshed human remains. The formality in the layout of the cemeteries expressed particularly as an emphasis on the grouping of burials alongside the manipulation of the body and the well-planned and organized post-burial activities (e.g. feasting, rituals etc.) mark out a persistent display of descent and ancestral links. This paper aims to investigate the special features that constitute the mortuary program of LBA northern Greece and discuss them with the recovered human remains.

2 THE ASSESSMENT OF MORTUARY ACTIVITIES AND BURIAL INTERACTIONS FROM THE BLUE STONE STRUCTURE AT ELEON, GREECE

Herrmann, Nicholas (Texas State University) - Cruz, Krysten (Texas State University) - Van Damme, Trevor (University of Victoria) - Gaggioli, Amanda (University of Memphis) - Burke, Brendan (American School of Classical Studies at Athens; University of Victoria) - Burns, Bryan (Wellesley College)

The Bronze Age mortuary activity at Eleon provides a unique window into elaborate social practices surrounding the management of dead at this emerging Mycenaean community in Boeotia, central Greece. Since 2015, the Eastern Boeotia Archaeological Project (EBAP) has documented a complex mortuary construction at Eleon referred to as the "Blue Stone Structure" (BSS) (Burke et al., 2020). The BSS presents a honeycomb of burial contexts including large built chamber tombs, common cist graves, and a pit burial dating to the late Middle Helladic to Late Helladic

I period (ca. 1700–1600 BCE). The BSS construction combines elements seen in other contemporary cemeteries of the Shaft Grave period, including perimeter walls, stone markers, and a tumulus mound. This presentation focuses on tombs 5, 10, and 13, which highlight different grave types and varied burial activities including evidence of ritual interment, tomb visitation, body manipulation, skeletal interactions, and re-interment. This study explores the similarities in the formation, cultural practices, and timeline of use for these tombs, which in turn provides evidence of the social and ritual importance of the mortuary facility. The multidisciplinary team considers evidence from detailed excavations, geoarchaeological and soil micromorphological assessment of Tomb 5, ceramic and artifact analysis of grave offerings, and osteological observations of the human remains to contextualize these tombs relative to the social and ritual development of the early Mycenaean settlement at Eleon.

3 MULTIPLE INFANT BURIALS AT EARLY MYCENAEAN THORIKOS, SE ATTICA

Tsempera, Theofania (Institute of Archaeology, University of Groningen) - Theodoropoulou, Tatiana (CNRS - France) - Filioglou, Dimitris (M.H. Wiener Laboratory, ASCSA) - Stockhammer, Philipp (LMU Munich & Max Planck Institute for Evolutionary Anthropology) - Mittnik, Alissa (Max Planck Institute for Evolutionary Anthropology) - Balitsari, Anthi (F.R.S.-FNRS, Aegean Interdisciplinary Studies (AEGIS) UCLouvain) - Dederix, Sylviane (Belgian School at Athens) - Papadimitriou, Nikolas (Paul and Alexandra Canelopoulos Museum, Athens)

The “Shaft Grave period” in Mainland Greece (17th-15th c. BC) is characterized by marked diversity in funerary expression. The changes and innovations observed in the burial record (new tomb types, novel forms of multiple disposal, rich furnishing of the dead etc.) are related to wider sociopolitical transformations, one of which seems to be an increasing emphasis on familial relations. With reference to non-adult individuals and especially the very young ones, it is still unclear whether their disposal in graves found in residential areas should be seen as a sign of social inclusion or exclusion. Thus far, all available bioarchaeological analyses of such burials are outside Attica.

This paper focuses on Thorikos, a coastal site in the metal-rich area of Laurion in SE Attica. The site was inhabited since the Final Neolithic, and became important in the early 2nd millennium BC probably due to the exploitation of local metal ores. In the Early Mycenaean period (16th-15th c BC), metal trade brought great wealth to the site, as reflected in the presence of a tumulus, two tholoi, and other monumental tombs. In addition to these tombs, two funerary assemblages have been excavated in the vicinity of the settlement. Both contained non-adults and were unfurnished. In one of them, a concentration of seashells and faunal remains, some of them burnt, were retrieved in association with four fetuses. These remains have been studied at the M.H. Wiener Lab of the American School of Classical Studies at Athens, and human bone samples have been sent to the Max Planck Institute for aDNA analysis. Preliminary results of the bioarchaeological study suggest pathological alterations of the fetuses, which reflect maternal health, while the study of non-human remains raises the possibility of funerary meals. This evidence is examined within the wider context of Early Mycenaean Thorikos and Attica.

4 UNDERSTANDING MYCENAEAN LH III SECONDARY ACTIVITIES IN CHAMBER TOMBS: RESULTS OF THE INTERDISCIPLINARY STUDY OF THE ELATEIA-ALONAKI NECROPOLIS

Hoegner, Irene (Ludwig Maximilian University of Munich; Max Planck Institute for Evolutionary Anthropology)

Collective burials represent one of the most important evidence of the Mycenaean world and are a key element for understanding social belonging. This is especially true for the Late Helladic III periods where chamber tombs manifest as the main burial type and post-depositional manipulation evolves into a standard treatment, forming a characteristic expression of Mycenaean ideas of community, social belonging and descent.

Despite the rich material, the burial practices are still hardly understood in their complexity. Their study regarding their operations, their sequence, their degree of formalisation and – eventually – the steps of such a formalised cycle of treatments, is decisive for the understanding of the spatial structures within the chamber tombs.

In my PhD, I analyse selected chamber tombs from Elateia-Alonaki by integrating archaeological, archaeogenetic and isotopic datasets on an inter- and intra-grave level. I will discuss the current knowledge on secondary practices concerning the grave inventory, review the respective theoretical interpretations and present new thoughts based on my preliminary results from Elateia-Alonaki.

5 THE MYCENAEAN CEMETERY OF THE TRAPEZA: INDIVIDUAL HISTORIES FROM A LONG-TERM FUNERARY LANDSCAPE

Borgna, Elisabetta (Università di Udine -Dipartimento di Studi Umanistici e del Patrimonio Culturale) - De Angeli, Gaspare (Università di Udine - Dipartimento di Studi Umanistici e dei Patrimonio Culturale) - Freilich, Suzanne (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Högner, Irene (Ludwig-Maximilians University Munich, Germany & Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Stockhammer, Philipp (Ludwig-Maximilians University Munich, Germany & Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

The investigation of the Mycenaean cemetery of the Trapeza, near Aigion, Eastern Achaea, started in 2010 thanks to a collaboration between the Udine University and the Greek Archaeological Service with the Museum of Aigion, which coordinates the excavations at the Trapeza archaeological area for the Greek Ministry of Culture. This paper presents some results of our multidisciplinary archaeological, geoarchaeological and bioarchaeological analyses carried out in twelve archaeological campaigns. We have aimed to unravel the dynamic interplay between human and natural factors in the shaping of the landscape from the foundation of the cemetery in the early Mycenaean period or ca 15th BC to the abandonment and collapse including post-depositional processes well into the Early Iron Age. In order to better understand the long-term use of Mycenaean collective tombs, we applied stratigraphical methods to obtain an in-depth insight into the life-cycle of each single tomb, pointing in particular to connect the evidence of use and re-use of the corridors with the phases of occupation inside the chambers for both burial depositions and other ritual activities. Moreover, we studied different patterns of secondary practices with the dead bodies – possibly depending on changing social and ideological constraints over time – applying a multidisciplinary bioarchaeological approach in collaboration with the Max Planck Institute for Evolutionary Anthropology. These datasets enable us to study the dialectics of biological relationships and social belonging as factors for the deposition of individuals in collective burials.

6 THE EARLY MYCENAEAN AYIOS VASILEIOS NORTH CEMETERY, SOUTHERN GREECE: INTEGRATING ARCHAEOLOGICAL THEORY AND ARCHAEOLOGICAL SCIENCE

Voutsaki, Sofia (Groningen Institute of Archaeology) - Moutafi, Ioanna (Ludwig Maximilian University; The Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Tritsaroli, Paraskevi (Voula) (The Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Vika, Efrossini (University of York) - Erdil, Pinar (Groningen Institute of Archaeology; Centre for Isotope Research Groningen)

Ayios Vasileios in the Peloponnese, southern Greece, is the site of a spectacular recent (2009) discovery, the Mycenaean palace of Laconia. The Ayios Vasileios North Cemetery (AVNC) dates from the Early Mycenaean period (1750-1500 BCE), the period immediately preceding the construction of the palatial complex on the site. Therefore, studying the evolution of mortuary practices in the AVNC allows us to understand the social and political processes that led to the emergence of the palatial system in the Mycenaean world. The AVNC was excavated between 2010 and 2016 using state-of-the-art methods of excavation, documentation and analysis. In this paper we would like to briefly present the research design of the project: the research questions we are addressing (interpreting variation in mortuary practices; explaining social change), the theoretical framework within which we are situating our investigation (the importance of social practices; the concepts of personhood and agency), and the potential and limitations of the various geoarchaeological and bioarchaeological methods we are using (too many to list in an abstract).

However, the main aim of our paper is to go one step further and discuss the process of integration, synthesis and interpretation. What old questions can we re-examine using new methods of analysis? How do we deal with rapid advances in archaeological science and increasing specialisation? What new questions arise from combining different data sets? How can we bring about the integration of archaeological science and archaeological theory?

We hope that these questions will be relevant to many colleagues dealing with similar problems in the study of 2nd millennium BCE burials across the Mediterranean.

7 THE CHANGING POWER OF THE PAST AT THE LATE BRONZE AGE CEMETERY OF AIDONIA, GREECE

Kvapil, Lynne (Butler University) - Shelton, Kim (University of California Berkeley) - Price, Gypsy (SEARCH, Inc.)

Systematic excavations of chamber tombs at the Late Bronze Age cemetery at Aidonia by the Tombs of Aidonia Preservation, Heritage, and Exploration Synergasia (TAPHOS) have revealed a long history of use spanning the Late Bronze Age (c. 16th-12th centuries BCE). This paper explores the variety of ways that human remains and grave goods were managed in a context of reuse, sometimes over several centuries, and with reference to moments when past burials would be encountered anew by those reentering the tomb.

Many chamber tombs at Aidonia were reused over centuries. Some earlier burials consisted of curated inhumations of deceased individuals laid out with ornate adornments, vessels, and weapons. Anyone entering the tomb would encounter a spectacle that referenced the glory of the past embodied in the burials of each individual. The placement of the body appears to have been determined by familial relationships. Results from aDNA and bioarchaeological analysis suggest that women's familial relationships were equally or more important than those of men when positioning the body.

In the mid-14th century, individuality and familial relationships were traded for practices that appeared to privilege the corporate and the communal. Grave goods comprised a standardized assemblage creating the expectation of uniformity for those reentering the tomb. Commingled remains were often placed around the interior of the chamber, but there may have been a hierarchy of placement within the chamber, with the most valuable locations nearest those considered ancestors. Some human remains were intentionally arranged or, alternatively, removed from sight or from the tomb altogether.

The complexity of the burial practices at a single site is evidenced through careful excavation in combination with bioarchaeological approaches, pXRF analysis of metal finds, and aDNA analysis. The result is an important understanding of burial practices that were constantly negotiating and renegotiating the power of the past.

8 PRECOCIOUS PROSYMNA: MIDDLE HELLADIC III/LATE HELLADIC I TOMB DEPOSITS IN ARCHAEOLOGICAL AND ARCHIVAL CONTEXT

Cushman, Sophie (University of California, Berkeley)

With over 4,000 examples known, chamber tombs are the most common type of Late Bronze Age burial monument in Greece. Chamber tombs were first adopted on the mainland in Messenia in MH III followed shortly by sites in Lakonia and the northeast Peloponnese in LH I. However when, where, and most importantly why chamber tombs were established at specific sites has yet to be analyzed in detail. This paper reconsiders the role of Mycenae in the introduction of new burial practices at the transition to the Late Helladic period.

The ultimate emergence of the chamber tomb as the most common burial monument has significant implications for understanding the development of Mycenaean burial customs on the one hand, and the relationship between Early Mycenaean peer polities on the other. I suggest that the users of the Grave Circles at Mycenae successfully stifled competing displays of mortuary innovation by other groups at the site, but that their influence and authority did not extend beyond Mycenae at this time. By shifting assumptions about innovation and precedence away from Mycenae, this paper brings the early chamber tomb evidence into dialogue with broader trends in Mycenaean studies focused on the role of individuals and groups outside the main center(s).

I combine two methodological approaches. First, a systematic chronological and typological analysis of the pottery from Wace's chamber tombs conducted at the Mycenae Museum, enhanced by reference to the excavation records in the Mycenae Archive at Cambridge. Second, a contextual analysis of the early material from Prosymna and Mycenae to show how depositional practices and secondary ritual differed between the two sites. The combination of these two approaches demonstrates the value of returning to legacy material to challenge established scholarly assumptions about the development of chamber tomb use in the early Late Bronze Age.

9 DEPOSITION, DISARTICULATION, DESTRUCTION: THE PARALLEL TREATMENT OF BODIES AND OBJECTS IN EARLY MYCENAEAN BURIALS

Phillips, Rachel (University of Cambridge; British School at Athens)

Approaches to early Mycenaean burials (between 1600 and 1400 BCE on mainland Greece) often treat bodies and objects as two separate entities in the burial process. This paper examines the relations between the two, with a focus on the twin manipulation of bodies and objects within several early Mycenaean tombs from the southern Peloponnese. I use 'manipulation' to refer to the treatment of the body in death—its original placement within the tomb and subsequent arrangement(s). The term can also be applied to objects—the placement of specific objects and materials in direct relation to the body's remains. I focus on three actions, which were applied to both bodies and objects: deposition, disarticulation, and destruction.

I aim to show that human bodies were often manipulated in the same way as objects, in an attempt to create specific impressions of the deceased and in order to communicate specific beliefs. These acts of manipulation were transformative actions, which effected a transition from subject to object and from alive to dead. The burial, therefore, provided a visual expression of the loss of the person, as seen in the incorporation of the dead within the tomb context, and as effected in the manipulation and adornment of the bones. In this manner, the burial came to emphasise the affinities between bodies and objects, wherein bodies attained the status of objects and vice versa; a transformation of meaning appropriate for the liminal space of the mortuary sphere.

10 MORTUARY PRACTICES IN MYCENAEAN ATTICA: AN INTEGRATED ANALYSIS OF HUMAN REMAINS FROM THE CHAMBER TOMB CEMETERY AT KOLIKREPI-SPATA, GREECE

Papakonstantinou, Niki (Aristotle University of Thessaloniki; Fitch Laboratory, British School at Athens)

Funerary practices of the Greek mainland in the Late Bronze Age (ca. 1700-1100 BC) and especially the manipulation of the dead body have in the last decades become a central focus in prehistoric Aegean mortuary studies. In the Mycenaean context, tomb re-use and post-depositional activities result in the intentional disarticulation, fragmentation, redistribution and commingling of the dead and associated artefacts. The vast array of practices involving interference with past material culture and human bodies comprise a central, integral part of funerary rituals in collective tombs. Especially the Mycenaean chamber (rock-cut) tombs, which typically include multiple episodes of use, interference and secondary treatment of skeletal remains are challenging case studies for tracing and understanding the entire range of activities and rituals associated with the funerary cycle. The fragmentation of the skeleton, commingling of parts of different individuals in the same deposit, the circulation and dispersal of bones have been interpreted as important elements for establishing and strengthening social ties and corporate identities, in which the bones have an evident symbolic value.

In this framework, this paper aims to present the results of an integrated bioarchaeological analysis of the skeletal remains deriving from the Mycenaean cemetery at Kolikrepi-Spata in Attica. For the purposes of this research, a synthetic and contextual bioarchaeological approach was adopted that integrates a set of methodological and interpretative tools combining osteological data, macroscopic and microscopic taphonomic observations and archaeological evidence. The overall human bone sample includes over 95,000 bone fragments originating from 21 tombs. The results show that mortuary practices at Kolikrepi are characterized by considerable diversity, variously expressed in distinct modes of disposal, in different choices regarding the location of burial contexts within the tombs, and most importantly in the form and extent of interaction with human bodies.

11 WE VS THEM: FUNERARY COMPETITIONS AT THE PROTOPALATIAL NECROPOLIS OF PETRAS, SITEIA - CRETE

Tsipopoulou, Metaxia (Hellenic Ministry of Culture)

The Pre- and Proto-palatial un plundered necropolis at Petras, has been excavated since 2004. It comprises 29 house tombs (with complex plans), 15 burial structures (usually stone-lined pits), a rock shelter for burials, and 33 non-burial architectural features. Established in EM IB, it continued in use until the end of MM IIB. It constitutes the most extensive, long-lived necropolis of these periods on Crete, and the only one excavated in the 21st century, using all protocols, and studied by interdisciplinary experts. These analytical studies of the architecture, the stratigraphical sequences, and the various classes of artifacts and ecofacts offer new insights into the organization of the Minoan society in these periods. Within the necropolis competitive efforts are evident among the elite groups using it as suggested by the variability in architecture, grave goods, burial customs, and external relations.

During MM IB there was a major spatial re-organization and monumentalization of the necropolis. Two large ceremonial areas were created, one connected with House Tomb 2, the most important Protopalatial building, and the other associated with seven house tombs, especially with House Tomb 10, the only one facing it. House Tomb 2 was built in an area used for exceptionally rich elite burials in EM II and MM IA, thus, probably representing a claim on important ancestry going back to almost a millennium, while House Tomb 10 was built in MM IB on an area never used before. The paper presents a comparative study of these two Protopalatial house tombs, analyzing similarities and differences in the architecture, the burial customs, and the grave goods. They probably represent two antagonistic, elite social groups in the nascent palatial society, striving in life and in death for supremacy.

12 FROM DUSTY NOTES TO 3D-MODELLING: AN INTERDISCIPLINARY APPROACH TO RECONSTRUCTING THE BURIAL LANDSCAPE AT THE KOAN MYCENAEAN CEMETERY OF LANGADA

Nani, Francesca (Università di Pisa)

Chamber tombs are considered of primary importance in shaping Mycenaean culture. Thus, assessing the presence of a chamber tomb cemetery outside of the mainland plays a key role in understanding the emergence of local Mycenaean identities in the wider Aegean. This paper uses the case study of the Koan cemeteries of Eleona and Langada to show how modern interdisciplinary approaches can be combined with legacy data to offer new information on ancient landscape and burial customs.

Original excavation notes and plans, recently re-discovered in the archives of the Italian Archaeological School at Athens, have been integrated with L. Morriconi's 1967 published data and GIS-based approaches recently used in the context of the Serraglio, Eleona, and Langada Archaeological Project (SELAP). Interpolation techniques allowed to reconstruct a 3D model of the ancient landscape, irretrievably altered by human activities during the last seventy

years. By virtually sectioning the model, it has been possible to reassess stratigraphic problems and issues concerning the location of some of the tombs, improving the results of previous studies. Not only has this research provided a better understanding of Mycenaean funerary practices, but it has also shed more light on the emergence of a Mycenaean identity on Kos. Moreover, this work also provides crucial new data on Morricone's original excavation methods, demonstrating his attention for stratigraphy and landscape analysis both at the time of discovery and at the time when the finds were studied and published.

The final aim of this paper is to show how innovative approaches can be fruitfully applied to legacy data, in order to gain valuable information on past social and cultural practices surrounding burials and their meanings.

13 THE TOMBS OF THE COSMOPOLITAN LATE BRONZE AGE CITY OF HALA SULTAN TEKKE, CYPRUS

Fischer, Peter (University of Gothenburg)

This presentation deals with the results from the past years excavations in the cemetery of the cosmopolitan Late Bronze Age city of Hala Sultan Tekke, Cyprus, which flourished c. 1630–1150 BCE. The aim of the current project is the study of the complex burial practices and the tombs' diachronic use. The tombs, most often chamber tombs, were used over generations and provide an excellent complement to the sequence of occupation in the city. The tombs' contexts demonstrate, inter alia, moving and arranging human remains, and provide evidence of feasting in honour of the deceased, as well inside as outside the tombs. The aDNA results of a recent pilot study supported by the nature of the mortuary gifts and personal belongings confirm the multicultural character of the people of Hala Sultan Tekke. The material remains corroborate far-reaching trade, further underlining the role of the city as a trading center in the Mediterranean economic system. Connections, either direct or via middlemen, are confirmed with societies of the Mycenaean, Minoan, Hittite, Levantine, and Egyptian spheres of culture as well with regions as far away as Sardinia, the Baltic Sea, Mesopotamia, Afghanistan, and India.

14 IRON AGE TOMBS AT TELL ES-SAFI/GATH: NEW FINDS AND NEW ANALYSES

Maeir, Aren (Bar-Ilan University)

Tell es-Safi/Gath is a large multi-period site in central Israel, on the border between the southern coastal plain and the Judean foothills. Settled continuously from late Prehistoric through modern times, excavations for the last three decades have exposed finds from many periods and cultures. A major focus of the archaeological research was the remains of the Iron Age Philistine culture, found on the site from ca. 1200 to 830 BCE. As at other Philistine sites, while the Philistine culture is relatively well-known, insufficient data exists regarding mortuary customs and related finds relating to the Philistines. Throughout the excavations, a small amount of inter- and extramural burials have been found, part of which have been researched and published. Recently, several additional tombs were excavated to the east of the site. These tombs, the finds within, and the initial research on them, provide important on the deathscape of Iron Age Philistine Gath. In this lecture, I will present initial results of the study of these tombs, and how they related to other tombs and graves on the site and at other more or less contemporary Iron Age sites in the region. Also, I will detail the initial results of analyses of finds from the tombs, including analyses of pottery and other finds, and materials submitted for various bio-archaeological analyses (such as aDNA, isotope analyses, dental calculus analyses).

15 RECONSTRUCTING SOCIAL PRACTICES FROM 2ND MILLENNIUM BCE BURIALS IN THE NORTHWESTERN ARABIAN PENINSULA

Kremmer, Anne (University of Tübingen) - Zur, Alina (German Archaeological Institute, Orient Department) - Hausleiter, Arnulf (German Archaeological Institute, Orient Department)

Recent interdisciplinary research on late 3rd – to mid-2nd millennium BCE graves in the north-west of the Arabian Peninsula considerably expanded the material evidence of burial contexts in the region. So far, the analysis of architectural remains recognized different grave types, while stratigraphy, context, state of preservation, and taphonomic processes were less explored, thus preventing analysis of social practices. Therefore, between 2020 and 2022, a joint project of the Heritage Commission and the German Archaeological Institute funded by the DFG investigated a representative sample of graves in the burial ground at Rujum Sasa of the oasis of Tayma.

While the archaeological record indicates widely distributed communal practices, such as the presence of late EBA/early MBA Syro-Levantine status weapons, the MBA appears to be characterized by a tendency towards a locally attested architectural uniformity; systematic deposition of bones outside of graves implies the re-use of the existing grave chambers. Multiple burials and the occurrence of bronze weapons represent elements of continuity.

Preliminary analysis of the bioarchaeological record has not yet established whether multiple burials occurred simultaneously or in multiple phases. However, the presence of adult men and women, as well as subadults in the same graves, suggests that a sex or age-specific usage of the graves can be ruled out. So far relatively few pathological or

traumatic lesions could be observed, but the fragmentary and brittle nature of the remains complicates the analysis. Two individuals, whose upper bodies were partially preserved in situ, suggest that they were originally positioned on their right side.

Further interdisciplinary analysis should provide more information on the demographic profile, different burial phases and customs, and provide new insights into mobility patterns of the population. Comparative analysis will help to contextualize the Rujum Sasa burial ground with regional burial practices.

16 DEATH AND BURIAL IN THE SOUTHERN LEVANT DURING THE MIDDLE BRONZE AGE: ISRAEL AS A CASE STUDY

Cosijns, Lev (University of Oxford)

Death is an unavoidable aspect of life. Burials, the eternal resting site of a body, can reveal as much about the deceased as it does about the living the deceased left behind and their culture. The Middle Bronze Age in Israel is typically overlooked in favour of nationally and religiously significant archaeological finds from the Iron Age and Hellenistic-Roman periods. Nonetheless, important and diverse archaeological remains from the Middle Bronze Age have been discovered, including extensive undisturbed burial grounds. However, even those few who take an interest in this period largely concentrate on the region's re-urbanisation and the numerous fortifications that were constructed. This presentation aims to fill the lacuna by comparing and contrasting various burial sites, as well as highlighting how it is possible to see a shift in burial practice and the types of funerary goods found amongst the deceased. The burials will be discussed in light of several characteristics, including location, tomb type, and period. Moreover, burials that did not receive extensive analyses, such as those at Rishon LeZion and Sasa, will be highlighted in this presentation. Furthermore, new radiocarbon dates and isotopic data from the Middle Bronze Age remains of Nahal Refaim will be presented for the first time. The presented material can be used as a foundation for future investigations and comparisons of the burial culture in the Middle Bronze Age southern Levant.

17 CONCEPTUALIZING DEATH IN THE SECOND MILLENNIUM BCE LEVANT: A SEMANTIC WEB APPROACH

Pappalardo, Chiara (University of Catania) - Santamaria, Daniele (University of Catania) - Nicolosi-Asmundo, Marianna (University of Catania) - Laneri, Nicola (University of Catania)

The 'Godscapes' project seeks to combine a material approach to the study of religion with an innovative scientific model that is grounded in a semantic vision of the web, namely the Semantic Web. The ultimate aim of the project is to provide a paradigm that will scientifically define and interpret the relationship between exogenous and autochthonous elements of religiosity in the Second Millennium BCE polytheisms in the Levant. Through this methodological approach, in which machine-readable data enables software agents to query and manipulate information on users' behalf, and through the employment of selected case studies, the input archaeological data are dissected on an attempt to: 1) identify the exogenous and endogenous layers of religiosity, 2) define the diagnostic markers of Second Millennium BCE Levantine religiosity, and 3) demonstrate how the Israelite monotheism can be considered as the syncretic outcome of a complex network of inter-religious encounters originated during the Second Millennium BCE. To reach this goal, the project focuses on the analysis of four types of data – religious architecture, iconicity, funerary and textual data. In this contribution, we will address the process of metadata standardization and the output model ontology elaborated as a sub-domain of the semantic infrastructure of 'The Godscapes Ontology' (TGO) to conceptualize funerary contexts, with grave goods, body treatment, tomb concept and demographic information conveying details about mourning, burial and post-depositional practices, and thus about the personhood of the deceased on the one hand, and about conceptions of the afterlife on the other.

18 MEANINGFUL DEATHS: BURIAL PRACTICES IN BRONZE AGE SOUTH-EASTERN ITALY

Recchia, Giulia (Sapienza University of Rome, Department of Antiquities) - Canci, Alessandro (University of Udine, DIUM) - Cipolloni Sampò, Mirella (University of Tuscia) - Sabatini, Serena (University of Gothenburg, Department of Historical Studies)

Bronze Age funerary customs in south-eastern Italy show a high degree of variability even in the same regional district on a synchronic scale. Mostly, but not exclusively, the rituals entail collective burials, yet they encompass diverse practices and the use of various kinds of tombs and burial deposition places, ranging from artificial hypogea to caves, to dolmens, to, at least, one tumulus, some of which used over a certain timespan. Moreover, burials and deposition of selected human remains, reflecting complex funerary practices, are known from settlements, such as at the fortified settlement of Coppa Nevigata in northern Apulia. Attempting to reconstruct the socio-political dimension of the buried individuals, past and recent studies have explored many aspects, from the composition and variability of grave goods per gender and age, to the spatial distribution of individuals/burials, to the occurrence of both exotic goods and adopted foreign models in pottery and weaponry, to the demographic dimension reflected by the burials. Significant

links with the eastern Adriatic, particularly in northern Apulia, have emerged from stylistic affinities in pottery and metal objects, but also from symbolic aspects, such as the use of entombments closely related to fortification lines. Finally, refined biomolecular analyses to explore ancestry and mobility have been recently applied to human remains from some of these contexts.

By comprehensively reconsidering this multifaceted funerary record, we seek to explore three main points: 1) socially determined access to the grave and different burial treatments, including bones manipulation and secondary burials; 2) actual and socially constructed identities and roles, kinships and evidence of foreign components and exogamy; 3) insights from biomolecular and aDNA analyses.

19 THE BRONZE AGE CHAMBER TOMBS IN SOUTHEASTERN ITALY AND THE CHANGING ROLE OF THE DEAD AND ANCESTORS IN SOCIAL MEMORY

Cipolloni Sampò, Mirella (Università della Tuscia) - Canci, Alessandro (Università di Udine) - Wilkens, Barbara (libera ricercatrice)

Interpretations of both cultural and symbolic behaviours and social organization in the prehistoric communities of the Bronze Age are mainly based on the analysis of funerary remains. The study of archaeological evidence has focused on the data related to research for rank and power, chiefly pointed on the role of the grave goods (presence/absence, quality/quantity), ritual offers, ceremonial or cult activity that played a central role in social control.

Although the focus of interest on these data is obvious, the significance and relationship between the various practices associated with the placement of the dead all along the use of a collective grave, the potential and power of intentional management and rearrangement should not be underestimated.

The chamber tombs and their dromoi are the contexts in which ceremonies and important phases of the funerary rituals took place. These ceremonies involved manipulations of the earlier burials through several generations, and they appeared governed over time by different perspectives and needs.

The long-term change in the chamber tombs of southeastern Italy reflects different attitudes in the social memory and in the cult of ancestors and seems to have been a powerful means in communicating social identity and memory.

20 FROM THE NORTH AND THE SOUTH: NEW OSTEOLOGICAL DATA ABOUT THE TERRAMARE CULTURE FROM A MULTI-ANALYTICAL STUDY OF CREMATED REMAINS

Scalise, Lucia Martina (Department of Archaeology, University of Cambridge, United Kingdom) - Cavazzuti, Claudio (Department of History and Cultures, University of Bologna, Italy; Department of Archaeology, Durham University, United Kingdom) - Morigi, Maria Pia (Department of Physics and Astronomy "Augusto Righi", University of Bologna, Italy; National Institute of Nuclear Physics (INFN) Bologna Division, Italy) - Brancaccio, Rosa (Department of Physics and Astronomy "Augusto Righi", University of Bologna, Italy; National Institute of Nuclear Physics (INFN) Bologna Division, Italy) - Evans, Miranda (Department of Archaeology, University of Cambridge, United Kingdom) - Silvestrini, Sara (Department of Cultural Heritage, University of Bologna, Italy) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt am Main, Germany; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia, Italy) - Sommella, Eduardo (Dipartimento di Farmacia, Università di Salerno, Italy) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna, Italy) - Pomeroy, Emma (Department of Archaeology, University of Cambridge, United Kingdom)

The Terramare culture spread in the Po Plain (Northern-central Italy) between the 17th and 12th century BCE. Differences in burial practices have been observed between the Northern and Southern communities of this culture. Cremation is the only ritual documented in the South, while it is coupled with inhumation in the North. This study provides new osteological and funerary data about cremations from the Middle-Late Bronze Age necropolises of Vicofertile (Parma - Southern Po plain) and Nogarole Rocca (Verona - Northern Po plain) using a multi-analytical approach. 17 burials were analysed (12 from Vicofertile and 5 from Nogarole Rocca). We performed CT (Computerised Tomography) analysis of ten non-excavated urns from Vicofertile and one from Nogarole Rocca. After the extraction of the remains from all 17 urns, we reconstructed the individuals' biological profiles, analysed the heat-induced changes to the bones, and compared the results of the virtual analysis and excavation. We also selected some samples for Zooarchaeology by Mass Spectrometry to investigate taxonomy, and amelogenin analysis for sex estimation. The qualitative and quantitative virtual investigation of the distribution of the remains inside the vessels provided information about the funerary practices. Non-adult and adult remains were also identified. The results of the virtual approach were mostly confirmed by the physical investigation of the burials. The exceptions regarded taphonomy (e.g. the presence of concretions that were not identified in the scans), additional data about the Minimum Number of Individuals (MNI), and individuals' sex and age at death. The scans proved to be an essential tool to guide and speed up the excavation process and help preserve the integrity of the bones and vessels, as well as aiding sample selection to maximise the likelihood of successful proteomic analyses. Finally, ZooMS analysis allowed for the identification of two non-human remains, one of which was burned.

21 RITUALS, DEMOGRAPHY AND SOCIAL ORGANIZATION IN THE FINAL BRONZE AGE CREMATION CEMETERY OF VIA DEI CONSOLI IN GUBBIO: PRELIMINARY RESULTS

Bettelli, Marco (Consiglio Nazionale delle Ricerche-Istituto di Scienze del Patrimonio Culturale) - Bulletti, Clara (Alma Mater Studiorum Università di Bologna) - Caillaud, Florence (Alma Mater Studiorum Università di Bologna) - Cavazzuti, Claudio (Alma Mater Studiorum Università di Bologna) - Germini, Francesca (CNR-ISPC) - Leoni, Cristina (Alma Mater Studiorum Università di Bologna) - Postriotti, Giorgio (Soprintendenza Archeologia Belle Arti e Paesaggio dell'Umbria)

The 2007 rescue excavation carried out in the centre of Gubbio (Umbria, Italy) yielded 40 urn cremations that were probably part of a larger urnfield dated to the end of the Bronze Age (mid-12th-10th century BCE). The cemetery, located on the slopes of Monte Ingino, is related to the remains of the nearby Bronze Age settlement. After the field-work, we performed CT scan of 30 urns, which guided the micro-excavations that were carried out at the Restoration Laboratory of the History and Culture Department of the University of Bologna. The analysis of the archaeological and anthropological evidence allowed to investigate manifold aspects of life of this community, from the demography and funerary rituals to social organization and mobility dynamics. The preliminary study of cremated remains reveals that bone chromatism ranges from blu/grey to white-calcined, with the typical fractures, shrinkage, and modification of the medium and high-temperature cremations. The weight of bones ranges from 240 g (infant) to 1183 g (adult male). Urns contain only one individual, and no traces of pyre debris, which is also absent from the pits. This probably means that bones were collected from the ustrinum and washed to remove charcoal and other residuals before the final deposition in the ossuary. Bones were deposited in anatomical sequence, with the skull fragments on top of the assemblage, sometimes with bronze grave goods, mostly female ornaments. We observed the presence of adults of both sexes and subadults, which indicate the high degree of inclusivity of the Late Bronze Age urnfields in the Italian context. The cemetery of Gubbio also sheds new light on the adoption of the urnfield model across the Italian peninsula and central Mediterranean during the last centuries of the second millennium BCE.

104 ZOOCHANGES: ANIMALS AS PROXIES DURING PERIODS OF TRANSITION AND CHANGE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Almeida, Nelson (Department of History, University of Évora, Évora, Portugal; Uniarq, Centre for Archaeology, University of Lisbon, Lisbon, Portugal) - Valenzuela-Lamas, Silvia (Archaeology of Social Dynamics (ASD), Institució Milà i Fontanals de Recerca en Humanitats, Consejo Superior de Investigaciones Científicas (IMF-CSIC), Spain) - Evin, Allowen (Institute of Evolutionary Science-Montpellier (ISEM), University of Montpellier, CNRS, EPHE, IRD, Montpellier, France) - Wright, Elizabeth (BioArCh, Department of Archaeology, University of York, York, UK) - Detry, Cleia (Uniarq, Centre for Archaeology, University of Lisbon; School of Arts and Humanities of the University of Lisbon, Lisbon, Portugal)

Session format: Regular session

During the last years, the study of animal remains benefited, among others, from the implementation of molecular, isotopic and biometric techniques. These, together with other more traditional approaches, allow for the acquisition of a wide variety of information aiming to characterize human-animal relations and dynamics through time and space. In parallel, socio-cultural transitions and periods of climate fluctuation maintain their relevance in wider archaeological studies. The study of animal remains increasingly became an area of research that can enrich our knowledge in scenarios where human and environmental impacts had repercussions in animals, their management and exploitation. This session aims to bring together specialists working on the study of faunal remains with different methodologies independently of geography and chronology, aiming to understand human-animal and human-landscape relations during times of archaeological and environmental transitions and changes. Case studies and broader approaches are acceptable but studies where different techniques are combined are preferable.

1 PROXIES OF COASTAL ADAPTION: BIRD AND SEAL EXPLOITATION AT KLASIES RIVER, SOUTH AFRICA DURING THE MIDDLE TO LATER STONE AGE

Richardson, Leesha (Department of Archaeology, University of Cape Town, South Africa) - Sealy, Judith (Department of Archaeology, University of Cape Town, South Africa) - Wurz, Sarah (School of Geography, Archaeology & Environmental Studies, University of Witwatersrand, South Africa; SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Norway)

Klasies River is well known for remains of early modern humans dating to ca >110 ka and has contributed significantly to our understanding of early human lifeways on the South African coast. Initial faunal analyses reported patterns in the seal and bird remains from Middle Stone Age (MSA) deposits that contrasted markedly with those seen in most Holocene Later Stone Age sites. In the MSA, an apparent lack of clear patterning in age at death of seals, and scarcity of flying birds were used to argue that MSA hunter-gathers were less effective coastal foragers than their Later Stone Age (LSA) counterparts. These studies were based on assemblages recovered from half-inch (12.7 mm) mesh sieves, leading to accidental discarding of small fragments of bone. Preliminary work on more complete bone assemblages derived from more recent excavations is yielding a very different picture. Clear patterning in seal age profiles and species of birds indicate hunter-gatherers had already developed sophisticated coastal adaptations in the MSA and modified their bird and seal exploitation strategies with the periodical movement of the coast. There are strong differences in the seal and bird profiles through MIS 3 to 5, rather than a single "MSA pattern". Some bones show evidence of purposeful hunting. In combination with the abundant shellfish remains these results support intensive coastal exploitation at least as far back as the last interglacial.

2 EARLY MIDDLE PALAEOLITHIC AVIAN REMAINS FROM MISLIYA CAVE, MOUNT CARMEL, ISRAEL: HABITAT AND BUTCHERY PATTERNS

Amos, Linda (Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa, Haifa, Israel) - Yeshurun, Reuven (Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa, Haifa, Israel) - Weinstein-Evron, Mina (Zinman Institute of Archaeology, School of Archaeology and Maritime Cultures, University of Haifa, Haifa, Israel)

Some of the earliest anatomically modern human remains outside of Africa were discovered at Misliya Cave (Mount Carmel, Israel, ca. 250-140 ka). Current studies indicate that these humans were only one of several morphologically diverse populations which inhabited the Mediterranean landscape (Qesem Cave, Neshar Ramla Homo, Skhul and Qafzeh modern humans and the later Neanderthals). Genetic studies add to this complexity, suggesting that early interbreeding events between Neanderthals and anatomically modern humans took place in this setting, opening for the exchange of not only genetic material but of material culture and perhaps novel subsistence strategies. Using identified bird remains from the Misliya sequence paired with the ecological parameters of current bird species, we examine the palaeoenvironment and climate conditions in one of the areas where these major steps in human development took place, defining the habitats early modern humans exploited within the site's catchment area.

Additionally, we present direct evidence of human agency in samples throughout the depositional sequence in the form of cutmarks on the bones of rock doves (*Columba livia*) and two species of diurnal raptor (a large eagle - *Aquila* sp. And a griffon vulture - *Gyps fulvus*). While most of the striations could easily be assigned to disarticulation and the removal of flesh, cutmarks on the distal tibiotarsus of a large eagle (*Aquila* sp.) may indicate the removal of the pedal phalanges to extract the talons for non-utilitarian use. Additionally, we identified thermal modifications on dozens of specimens including rock doves, chukar partridge, corvids, songbirds, and Ostrich egg shells, some of which indicated cooking practices. The taphonomic results suggest that early modern humans dispersing into the Levant from Africa, like the archaic hominins at Qesem Cave (ca. 300-220 ka), exploited avian resources for subsistence and non-utilitarian purposes.

3 THE UPPER PLEISTOCENE FAUNAS OF FOZ DO ENXARRIQUE SITE (VILA VELHA DE RÓDÃO): TAPHONOMIC AND PALEOENVIRONMENTAL ISSUES

Antunes, Vanessa (Centro Português de Geo-História e Pré-História (CPGP); Centro de Geociências da Universidade de Coimbra) - Figueiredo, Silvério (Instituto Politécnico de Tomar; Centro Português de Geo-História e Pré-História (CPGP); Centro de Geociências da Universidade de Coimbra) - Raposo, Luís (Museu Nacional de Arqueologia; Associação dos Arqueólogos Portugueses)

Foz do Enxarrique is an open-air archaeological site from the end of the Middle Palaeolithic (upper Pleistocene), it is located on a terrace of the Tagus River (T6), on the right bank of the Tagus River, at the mouth of the Enxarrique stream, in Vila Velha de Ródão, about 10 km from the border with Spain. Several archaeological campaigns were car-

ried out on this site between 1982 and 2001, under the direction of Luís Raposo. It has faunal remains and Mousterian industry, it is dated between 44-32 Ka (Th/U and Qz-OSL and IRSL). The faunal accumulation shows evidence of human intervention and posterior fluvial/colovional inference. It can be seen as a paradigm for the interpretation of taphonomic processes typical of open-air sites and difficulties of interpretation. Foz do Enxarrique preserves a single archaeological horizon accumulated in low energy conditions, as shown by the fragmentary bones, the predominance of remains of human-hunted animals and the presence of cut marks on some bones. On this site there is a fauna accumulation with an anthropic component, unlike other sites, especially those that occur in caves, that document palimpsest, resulting more from the accumulation produced by predators, whether mammals, birds or even reptiles. Foz do Enxarrique has taphonomic processes, typical of open-air sites.

4 HUMAN SUBSISTENCE DYNAMICS BEFORE, DURING AND AFTER THE 8.2 KA CAL BP EVENT AT EL MAZO ROCK SHELTER (N SPAIN)

Arenas Sorriqueta, Elene (Universidad de Cantabria) - Marín-Arroyo, Ana B. (Universidad de Cantabria) - Gutiérrez-Zugasti, Igor (Universidad de Cantabria) - Cuenca-Solana, David (Universidad de Cantabria) - Yang, Fei (University of Tübingen) - O'Connell, Tamsin (University of Cambridge)

The El Mazo rock shelter, situated in Asturias (north Spain), contains a Mesolithic sequence from 9 to 7.4 ka cal BP, including the 8.2 ka cal BP climatic event. The impact of this climatic event on human behavior and subsistence strategies has been a matter of debate. The analysis of the macromammal assemblage based on archeozoology suggests that the main prey was the red deer, followed by wild boar and roe deer. It also shows a significant presence of adult and juvenile individuals. Taphonomic analysis indicates that the most recurrent anthropogenic modification was fire alteration. In addition, cut and percussion marks were related to disarticulation and skinning on the prey. The high fragmentation of axial bones and fetal/newborn elements led to identification based on mammal size, limiting detailed information about hunting strategies, site seasonality, and prey transport. ZooArcheology by Mass Spectrometry (ZooMS) was used to overcome this limitation, revealing a wider range of herbivores and carnivores than previously known. Proteomics analysis showed that axial and fetal/newborn remains were mainly from red deer and wild boar. In addition, ZooMS identified species previously undetected or poorly represented in the archeozoological study, such as humans, bovines, carnivores, or beavers. The sudden temperature decrease during the 8.2 ka cal BP had a significant impact on terrestrial animal exploitation and population decline, as evidenced by the mammal assemblage. After the event, there was an intensification of terrestrial and marine resources.

5 ANIMALS AS WITNESSES OF MAJOR CULTURAL AND ENVIRONMENTAL CHANGES: 8 MILLENNIA OF SIZES AND ABUNDANCE VARIATIONS IN SOUTHERN FRANCE

Mureau, Cyprien (CNRS, UMR 5554 ISEM, Montpellier) - Forest, Vianney (INRAP Midi-Méditerranée, Nîmes) - Evin, Allowen (CNRS, UMR 5554 ISEM, Montpellier)

Southern France has a long tradition of archaeological research, as well as intensive preventive work over the last 20 years. In this exceptional geographic framework, archaeozoology benefits from a very large and well-contextualised database, but diachronic analyses and socio-economic syntheses become increasingly complicated.

As part of the DEMETER project (resp. A. Evin), an exceptional collaboration of archaeozoologists in what are now the Languedoc and Provence regions has enabled the creation of an unprecedented database consisting of species quantification data (NISIP) and bone and dental measurements acquired in almost 220 archaeological sites. Long-term changes in stature (Log Size Indexes values) and livestock compositions (relative proportion of Number of Identified Specimens) were studied over the last 8,000 years ago, starting with the Neolithic period in the region. More than 200 000 remains from 225 archaeological sites were analyzed.

The construction of the diachronic trends of size and in abundance of species revealed common trend break episodes that were confronted to paleoenvironmental and paleoclimatic reconstructions. All of these elements have contributed to the identification of five main chronological sequences that retrace the great history of animal morphologies over the last 8 millennia.

6 FROM FARM FRENZY TO PIGGY PARADISE: RE-EVALUATING LBK ANIMAL MANAGEMENT STRATEGIES CONSIDERING A LARGE AGGLOMERATION SITE FROM SOUTHWESTERN SLOVAKIA(5500-4500 BCE)

Brandt, Henriette (Institut für Ur- und Frühgeschichte Christian-Albrechts-Universität zu Kiel) - Furholt, Martin (Institut für Ur- und Frühgeschichte Christian-Albrechts-Universität zu Kiel) - Makarewicz, Cheryl (Institut für Ur- und Frühgeschichte Christian-Albrechts-Universität zu Kiel)

The Linear Pottery Culture (LBK) represents one of the earliest agricultural societies in Europe, relying on domesticated crops as well as primary livestock of sheep, goats, and cattle for their animal-based subsistence. LBK groups ap-

pear to have engaged in regionally defined, relatively homogeneous animal exploitation strategies and livestock management strategies. However, this general characterization is based on zooarchaeological data derived from faunal assemblages recovered from individual homestead sites. In this contribution, we reexamine the animal management strategies in southwestern Slovakia during the LBK and challenge the notion of apparent homogeneity. This is done by comparing zooarchaeological and stable isotope ($\delta^{13}C/\delta^{15}N$) data from homestead sites with the large agglomeration site of Vrábľe-Velké Lehemby, focusing on domesticated cattle, pig, sheep/goat, and wild deer. In contrast to other LBK settlements in the region, it is evident that the large agglomeration site of Vrábľe indicates a preference for pig exploitation, hinting at the need for rapid production of meat as well as a need for effective waste disposal. We explore if differences in livestock production systems between the agglomeration site and the smaller settlements are influenced by new socio-economic needs for surplus, feasting, or even exchange within or external to the community.

7 PALEOGENOMIC STEP STONES TO SHED LIGHT ON CATTLE DOMESTICATION

Grange, Thierry (Institut Jacques Monod) - Geigl, Eva-Maria (Institut Jacques Monod)

Archaeozoological data suggest that cattle were domesticated in northern Mesopotamia at the beginning of the Neolithic. Paleogenomic data are in support of this conclusion (1). Nevertheless, little is known about the evolution of the ancestor of domesticated cattle, the aurochs, about its distribution and diversity and how these were affected by climatic fluctuations. Similarly, the evolution of early domestic cattle is still poorly understood. We only appreciate today through interdisciplinary research combining genomic and archaeological evidence that it must have been a multi-faceted process where climatic fluctuations, population dynamics and migrations, and admixture between diverse populations have played key roles. We will present some paleogenomic data as step stones that will shed light on some of the open questions related to these various aspects, thus contributing to a better understanding of these processes.

8 PUSHING THE BOUNDARIES. NEW DISCOVERIES FROM SUDAN REOPEN THE DISCUSSION ABOUT THE LOCAL DOMESTICATION OF CATTLE IN AFRICA

Osypinski, Piotr (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Osypinska, Marta (Institute of Archaeology, University of Wrocław)

Until recently, the prevailing belief was that the range of aurochs in Africa - the wild ancestor of domestic cattle - was limited to the Mediterranean zone, to Wadi Halfa in the south. Hence another belief that since there were never such animals in Upper Nubia, their domestication could not have taken place. Neolithic cattle and pastoralism must therefore have originated from Middle Eastern traditions.

Yet new discoveries from Affad (Sudan, between the 3rd and 4th cataracts) prove that the range of aurochs in the late Pleistocene extended much further south. Moreover, our findings suggest a specific hunting specialization focused on this species. Shifting the previously recognized range of the occurrence of *Bos primigenius* to the south, therefore reopens the discussion about the possibility of local African domestication of cattle, regardless of the Neolithization processes in the Middle East.

Further new discoveries of domestic cattle bones in contexts dating to the 8th millennium BCE at Letti (50 km N of Affad) provide groundbreaking arguments in this debate. Importantly, the cattle remains from Letti are accompanied by ceramics and stone artefacts analogous to the well-known collections from el-Barga, el-Arab and Nabta Playa, where the presence of bones of large ruminants was also reported. In the case of the latter collections, after more or less heated discussions, zooarchaeological identifications of the cattle remains were excluded due to a certain discrepancy in the humanistic and natural science narratives. In the term “probably cattle”, the zooarchaeologist suggests, usually based on many years of experience, an indication of the species, while the archaeologist focuses on the lack of 100% certainty.

9 “IF IT AIN’T BROKE, DON’T FIX IT”: ANIMAL HUSBANDRY AT THE NEOLITHIC AND COPPER AGE SETTLEMENTS IN EASTERN CROATIA

Tomac, Goran (University of Zagreb Faculty of Humanities and Social Sciences)

Continental Croatia, especially its easternmost regions, is rich in archaeological sites dating to the Neolithic and Copper Age. During salvage excavations at the beginning of the 21st century and systematic excavations in the following years, numerous new sites were added to an already impressive list, and the obtained data greatly contributed to our knowledge of the way of life of the prehistoric inhabitants of this region. However, compared to neighboring countries, relatively little is known about the relationship between humans and animals that were present in the area at that time. Although the number of archaeozoological analyses and publications related to continental Croatia is

increasing, this is one of the first works that compares data on subsistence strategies in the Neolithic and Copper Age in this country. The significance of this work also lies in the fact that it deals with assemblages from the Neolithic sites of Gorjani – Kremenjača and Kotlina, and from the Copper Age horizons of the sites of Tomašanci – Palača and Čepinski Martinci – Dubrava, all of which are located in approximately fifty kilometer radius, which provides us with a unique opportunity to study the transition between these two periods in a narrow geographical area.

Therefore, the aim of this paper is to try to answer questions about diachronic changes in the taxonomic composition of animal species, the complexity of animal husbandry, the differences in the importance of domestic and wild animals for the diet of the local population, and overall about the subsistence strategies and their possible variations at the analyzed sites as parts of the network of settlements in the northern Balkans and the southern Pannonian plain.

10 SOCIO-ECONOMIC TRANSITIONS IN NORTHEASTERN IBERIA: A DIACHRONIC APPROACH THROUGH CHANGES IN EQUID DIET AND MORPHOLOGY FROM LATE NEOLITHIC TO ROMANIZATION

Hanot, Pauline (Institut des Sciences de l'Évolution de Montpellier (UMR 5554), Montpellier, France) - Grandal d'Anglade, Aurora (Grupo Interdisciplinar de Patrimonio Cultural y Geológico, Instituto Universitario de Xeoloxía, Universidade da Coruña, Spain) - Huet, Thomas (University of Oxford, School of Archaeology, 2 South Parks Road, Oxford OX1 3TG, UK) - Iborra Eres, M^a Pilar (IVCR+ i. Institut valencià de conservació, restauració i investigació, Valencia, Spain) - Aguilera, Isidro (Museo de Zaragoza, Spain; Grupo Primeros Pobladores y Patrimonio Arqueológico del Valle del Ebro, Departamento de Ciencias de la Antigüedad, Universidad de Zaragoza, Spain) - Seguí, Sofia (Grupo Primeros Pobladores y Patrimonio Arqueológico del Valle del Ebro, Departamento de Ciencias de la Antigüedad, Universidad de Zaragoza, Spain) - Picazo, Jesús V. (Grupo Primeros Pobladores y Patrimonio Arqueológico del Valle del Ebro, Departamento de Ciencias de la Antigüedad, Universidad de Zaragoza, Spain) - Moya, Andreu (Itirita Arqueologia S.L, Lleida, Spain) - Nieto-Espinet, Ariadna (Grup d'Investigació Prehistòrica (GIP), Departament de Geografia, Història i Història de l'Art, 2021-SGR-01607- ARQHISTEC, Universitat de Lleida, 25003, Lleida, Spain)

Since the Late Neolithic, the Northeastern Iberian Peninsula has provided exceptional archaeological evidence of interactions between equids and human communities. However, the timing of the appearance of domestic equids in the region and the nature of these relationships remain unclear. Beyond the symbolic aspects related to the emergence of elites during the Iron Age, did equids have a decisive impact on the development of local economies in these regions?

From the Neolithic to the Roman period, archaeological records reflect cultural and economic transformations in these territories. Material culture and settlement patterns suggest that social inequalities were consolidated during the Early Iron Age, accompanied by processes of territorialization and intensification of local economies, influenced by growing contacts with Mediterranean trade networks. These socio-political changes seem to coincide with observed changes in equid treatment and archaeological contexts, implying a change in their perception and use from the Iron Age onwards.

Through the CENTAURO project, hundreds of equid bone remains from 15 sites in the Ebro Valley spanning from the Late Neolithic to the Roman period are analyzed. This research explores the potential of equids as bioindicators to study economic and political changes in archaeological contexts. This is achieved through a diachronic multiproxy analysis combining archaeozoology, geometric morphometrics, bone microanatomy and stable isotope analysis (N and C). Our objective is to contextualize these changes to assess whether domestication and changes in equid uses are reflected in dietary shifts and modifications in skeletal morphology. This will shed light on how they have been shaped and managed by humans and, in turn, assess their impact on agricultural and economic systems in these inland areas.

Note: Due to organisational restrictions, we include here additional co-authors without whom this work would not have been possible: À.Pallardó, A.Torra, J-M.Rodanés, A.Oliver, M.Morán, X.Payà, S.Valenzuela-Lamas, G.Prats, N.Alonso.

11 CATTLE HUSBANDRY AND THE ARRIVAL OF CORDED WARE IN CENTRAL AND NORTHERN EUROPE: A BIOARCHAEOLOGICAL STUDY OF A MAJOR TRANSITION

Wright, Lizzie (University of York)

The arrival of the Corded Ware Culture during the 3rd millennium BC across many areas of Central and Northern Europe was a major period of cultural transition, which recent ancient genomic work has linked to a series of migrations from the Pontic-Caspian steppe region. Previous work has also indicated that this may have been a time of economic and agricultural change, with the potential for a shift in cattle husbandry in at least some parts of the Corded

Ware range. It is not known, however, how widespread this shift was, the exact nature of it or whether or not it can in fact be linked to the arrival of new people into the region.

The CatCoW project aims to explore these issues by investigating how animal husbandry and agricultural practices may have changed at this time, and considers the hypothesis that migration from the steppe may have led to the introduction of new cattle stock and an increasing economic reliance on dairy products. In order to do this the project is taking an interdisciplinary approach integrating Archaeozoology, Archaeogenetics and Organic Residue Analysis. This paper will introduce this project and present some preliminary results.

12 ZOOARCHAEOLOGY IN PORTUGAL: DIACHRONIC PERSPECTIVE FROM THE MESOLITHIC TO THE ROMAN PERIOD: METHODS, PRACTICES AND DATA, FROM SADO TO TAGUS

Lima, Rafael (Uniarq - Centro de Arqueologia da Universidade de Lisboa; FLUL - Faculdade de Letras da Universidade de Lisboa; MNA - Museu Nacional de Arqueologia; FCT - Fundação para a Ciência e a Tecnologia) - Santos, Ana (Uniarq - Centro de Arqueologia da Universidade de Lisboa; FLUL - Faculdade de Letras da Universidade de Lisboa; FCT - Fundação para a Ciência e a Tecnologia) - Rodrigues, Miguel (Uniarq - Centro de Arqueologia da Universidade de Lisboa; FLUL - Faculdade de Letras da Universidade de Lisboa; FCT - Fundação para a Ciência e a Tecnologia) - Delicado, Cátia (Uniarq - Centro de Arqueologia da Universidade de Lisboa; FLUL - Faculdade de Letras da Universidade de Lisboa; CIAS - Centro de Investigação em Antropologia e Saúde; FLUC - Faculdade de Letras da Universidade de Coimbra; FCT - Fundação para a Ciência e a Tecnologia)

We intend to revisit the context of investigations carried out to date, revealing the diachronic changes in methodologies and the State of the Art of zooarchaeological studies in Portugal, from the Mesolithic to the Roman Period, in the area of the Tagus and Sado river basin.

We will compile data relating to mammalian, malacological, avifauna and ichthyological fauna from collections recovered in the Greater Lisbon and Sado Valley region and their integration with new ongoing research projects. This data will be analysed by chronology, from the Mesolithic to the Roman Period, as well as the different methodologies used in terms of recovery, recording and study of the fauna.

Finally, we will seek to understand which species are most and least present in ancient collections and compare those with newer projects of those same places, between the periods we will cover, thus observing preferential patterns of species recovered by archaeologists, or whether, on the contrary, these criteria do not exist.

13 TRACING THE ECOLOGICAL IMPACT OF HUMAN EXPLOITATION AND ENVIRONMENTAL CHANGES IN BALTIC SEA HARP AND GREY SEALS

Glykou, Aikaterini (Archaeological Research Laboratory, Stockholm University) - Lidén, Kerstin (Archaeological Research Laboratory, Stockholm University)

Bioarchaeology and historical ecology have shown that past ecosystems offer valuable comparisons and insights into ecosystem degradation over time. This paper presents the effects of climate and environmental changes, coupled with human activities, on two seal species in the Baltic Sea: the extinct harp seal (*Pagophilus groenlandicus*) and the grey seal (*Halichoerus gryphus*). Seal hunting was economically crucial for prehistoric Baltic coastal societies. Our analysis integrates radiocarbon dating, zooarchaeology, stable and strontium isotopes, and ancient DNA with paleoenvironmental data. Our data show that grey seals, the most dominant seal species in this area during the Early Mesolithic became locally extinct around 6,600 BCE due to intensive hunting and environmental changes. A recolonization around 4,500 BCE, is linked to a permanent connection with the Atlantic Ocean that established a gradually more marine environment. Also harp seals, immigrated into the Baltic Sea during this time and dominated faunal remains all around the Baltic for the next 2,000 years. Our data suggest that reduced salinity, interspecies competition for shared food resources, and human exploitation led to the harp seal decline or local extinction, with their final disappearance coinciding with the onset of the Medieval Warm Period. This study highlights the complex interplay between human intervention and environmental changes in shaping seal populations in the Baltic Sea.

14 BEHIND THE COPPER - GEOMETRIC MORPHOMETRIC ANALYSIS OF COPPER AGE CATTLE STOCKS FROM THE CARPATHIAN BASIN

Csippán, Péter (Eötvös Loránd University; MTA-ELTE Lendület "Momentum" Innovation Research Group) - Erdős, Olívia (Museum of the Hanság; MTA-ELTE Lendület "Momentum" Innovation Research Group) - Siklósi, Zsuzsanna (Eötvös Loránd University; MTA-ELTE Lendület "Momentum" Innovation Research Group)

After the abandonment of Late Neolithic tells and large flat settlements around 4500 BCE, a dense network of small farm-like settlements were established in the Carpathian Basin during the Early and Middle Copper Age (4500–3650 cal BCE). We suppose these small-scale communities necessarily maintained social relations with other con-

temporaneous communities. Various new materials like copper, gold, and stone products that were circulated among the communities of these small, contemporary settlements prove this assumption.

These products had high prestige value, so behind their spread were social relations, networks of knowledge, and a "Silk Road" of valuable raw materials. But what about the animals? Were they part of this network as a product of long-distance interactions? Did that influence animal keeping? Could these connections also transform the morphology of the animals of certain Copper Age settlements?

As part of our multidisciplinary research, we want to reconstruct these relations based on geometric morphometrics investigations of the stocks of the main domestic species: cattle. Following earlier studies and methods, we also used 3D and 2D techniques on metapodials and astragali to find possible similarities and dissimilarities between Early and Middle Copper Age settlements throughout Hungary.

In our presentation, we will show our preliminary results, their interpretations and discuss possible following steps.

15 GENOMIC REFUGIUM OF PRE-DOMESTICATION HORSE LINEAGES IN THE BRONZE AGE CARPATHIAN BASIN

Gerber, Dániel (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities; MTA-BTK Lendület "Momentum" BASES Research Group) - Herpai, Kornél (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities) - Borbély, Noémi (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities) - Major, István (HUN-REN ATOMKI) - Szabó, Géza (Wosinsky Mór Museum) - Bozi, Róbert (Bozi Ars Med. Vet. Clinic) - Kiss, Viktória (Institute of Archaeology, HUN-REN Research Centre for the Humanities; MTA-BTK Lendület "Momentum" BASES Research Group) - Kulcsár, Gabriella (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Mende, Balázs (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities)

Recent archaeogenomic studies (Fages et al. 2019, Librado et al. 2021) unveiled the major past population events that shaped the genomic landscape of modern day horses but regional processes, however, remained mostly unexplored. This is largely due to the extremely poor aDNA quality of prehistoric horse remains that restricts analyses to only a few individuals from the study region of the Carpathian Basin. We applied a new teeth-sampling method that yielded magnitudes higher endogenous aDNA content from samples that were previously ineligible for whole genome analyses. We shotgun sequenced new horse genomes from modern day Hungary associated with Bronze Age Bell Beaker and Vátya cultures, which provided insight into the horse keeping practices in the most crucial period for horse domestication in the turn of the 3rd and 2nd millennia BCE. Our results challenge the rapid replacement of ancient lineages by the domestic horse (labeled as DOM2 by Librado et al.), after around ~2000 BCE. We observed remnant populations as late as the middle of the 2nd millennium BCE in the Carpathian Basin, indicating regionally variable customs for horse keeping. The project is funded by the MTA-BTK Lendület "Momentum" BASES Research Group (LP2023-8).

16 AT THE DAWN OF CHANGE: ANIMAL HUSBANDRY IN THE CENTRAL EUROPEAN LA TÈNE CULTURE THROUGH ZOOARCHAEOLOGICAL AND ARCHAEOGENETIC ANALYSES

Saliari, Konstantina (Naturhistorisches Museum Wien) - Trebsche, Peter (University of Innsbruck)

Our research presents the analysis of animal remains from the Middle La Tène central settlement Haselbach in Lower Austria (>6000 identified specimens) and compares for first time published zooarchaeological data from 46 sites in nine countries in Central Europe, dating to the La Tène period (c. 450 BC to the end of the first century BC) and representing different types of sites (lowland settlements, hilltop settlements, central settlements, oppida, assemblages of ritual activity, and mining sites). The zooarchaeological results strongly suggest different husbandry strategies and indicate major changes, especially during the Middle La Tène period indicating agricultural intensification. Osteometric studies and recent genetic analysis (mtDNA) on cattle bones and teeth from La Tène sites in Central Europe provided novel insights into the complex socio-economic behavior as well as long distance networks, involving animal supply and mobility in a period of change involving centralization and increasing influence from the South during the pre-Roman late Iron Age.

17 GENETIC AND ECOLOGICAL CHARACTERISATION OF THE EXTINCT HARTEBEEST (*ALCELAPHUS SP.*) POPULATION IN THE LEVANT

Wolkowski, Uri (Department of Evolutionary and Environmental Biology, University of Haifa; The Steinhardt Museum of Natural History, Tel Aviv University) - Kolska Horowitz, Liora (National Natural History Collections, The Hebrew University of Jerusalem) - Marom, Nimrod (School of Archaeology and Maritime Cultures, University of Haifa) - Meiri, Meirav (The Steinhardt Museum of Natural History, Tel Aviv University)

The hartebeest (*Alcelaphus* spp.) is an antelope genus with an extensive range throughout Africa, where it is mostly confined to nature reserves. The hartebeest has suffered a major range contraction in the late Holocene, when the northernmost populations disappeared from the Levant at about 800 AD, and the last North African population went extinct a century ago. Hunting and habitat loss due to climate change and pastoralism are the presumed drivers of this extirpation event. In view of this fairly recent presence of a hartebeest population in the Negev region of modern-day Israel, we lay out preliminary groundwork for its potential future restoration. First, we determine the taxonomy of the extirpated local hartebeest using ancient DNA, in order to find the closest living population; and second, model the future availability of the environmental niche of the hartebeest in Israel using species distribution models.

We extracted aDNA from 21 archaeological hartebeest bones from the Late Holocene Negev and compared them with reference sequences from other populations, to determine the taxonomy of the Levantine hartebeest at the species/subspecies resolution. We also generated Species Distribution Models (SDMs) based on recent hartebeest distribution in Africa and extrapolated it to the Levant, over different time periods. Both MaxEnt and BART model extrapolations indicate that the hartebeest's climatic niche in the region is greater today than in the 8th century AD, and furthermore – will expand in the future under global warming scenarios. This research, therefore, lays necessary foundations for future decisions regarding the restoration of the hartebeest to the northernmost extent of its historical range.

18 BIOGEOGRAPHY OF LATE ANTIQUE MEDITERRANEAN SHIP RATS (*RATTUS RATTUS*) EXPLORED WITH 2D GEOMETRIC MORPHOMETRIC ANALYSIS

Harding, Sierra (University of Haifa) - Cvikel, Deborah (University of Haifa) - Marom, Nimrod (University of Haifa)

Originating in the Indian subcontinent, the black rat (a.k.a ship rat [*Rattus rattus*]) was likely introduced to the Levant in the 1st millennium BCE via trade with Persia. Recent research has explored their palaeogenomics, suggesting that there were two pulses of invasion into the Mediterranean Basin and Europe: first by the “European” ship rat (haplogroup A) and later by the “Arab” ship rat (haplogroup C). Evidence from the archaeological record indicates that this commensal rodent initially flourished along with the Rome's urbanism and transportation networks until the 5th century CE. Black rat populations waned with the collapse of the Western Empire, yet lingered in the Byzantine Levant. The second wave of colonization likely arrived in Egypt in late antiquity (6th century CE) via Red Sea maritime trade with the Arabian peninsula and again dispersed into Europe. The paucity of archaeological ship rat remains from the Byzantine/Islamic transition (7th–9th centuries CE) has impeded a more refined understanding of the dispersal patterns of the second colonization of ship rats around the Mediterranean Basin. The discovery of six black rat individuals aboard the early Islamic period shipwreck Ma'agan Mikhael B (mid-7th–mid-8th centuries CE) has allowed an opportunity to investigate the biogeography of ship rats during this obscure interval. We applied 2D geometric morphometric methods to study variations in dental morphology as a proxy for the diversity of regional origins among the archaeological group in relation to modern comparative samples from Europe, North Africa, and the Levant. Preliminary results suggest that the archaeological ship rats display greater morphological variability than any extant regional population, highlighting the role of Mediterranean ships as a nexus for maritime interaction between rat populations and potentially revealing previously unknown trade interactions between the Christian West and Islamic East during this dynamic and turbulent period of history.

19 USING FAUNAL REMAINS TO ASSESS THE IMPACT OF SCANDINAVIAN RAIDS AND SETTLERS ON ANGLO-SAXON JARROW

Leake, Megan (Newcastle University)

The Anglo-Saxon monastic site of Jarrow, home of the Venerable Bede, is one of the most extensively excavated sites of its type in Europe (Turner et al 2013). The recovery of 44 boxes of faunal remains, which went missing before the site's publication, has allowed for new research to broaden our understanding of this important site. Specifically, I will consider whether the monastic site was abandoned following raiding as previously believed (Cramp 2005), as the number of animal bones increased (Noddle and Stallibrass 2006), suggesting an occupation greater than intermittent presence. Given that diet is culturally significant (e.g. Holmes 2016), and so are animal management strategies (e.g. Valenzuela-Lamas and Albarella 2017), studying these faunal remains can give an insight into any cultural changes which occurred at Jarrow. This is especially important given the degree of uncertainty surrounding the impact of

Scandinavian settlers on Northern monastic sites after the Anglo-Saxon chronicle shifted its attention to the south. Through a combination of traditional faunal analysis, radiocarbon dating and isotope analysis the diet and grazing locations/management strategies of both the Mid-Saxon and Late-Saxon phases of the site are being reconstructed. This will provide our first understanding of how people at this site were using the landscape around them, and to what extent the arrival of a new cultural group affected this.

20 RECONSTRUCTING THE RURAL LANDSCAPE OF SALENTO DURING THE MIDDLE AGES: THE CONTRIBUTION OF ANIMAL REMAINS ANALYSIS

Abatino, Claudia (University of Salento)

Reconstructing of the transformations of the rural landscape in the Salento region in southern Italy has been encouraged in the last decade by research projects involving numerous specialists, who have cooperated to outline the historical, political, cultural and environmental framework during the Middle Ages. Byzantine, Norman, Swabian, Angevin and Aragonese dominations followed one another during this long chronological span in that region. These historical events lead to significant changes in various aspects of society, such as settlement structure, material culture, agricultural practices, religious practices and foodways. The presence of new dominations on the territory has initiated a process of cultural assimilation which has resulted in a phenomenon of coexistence and cohesion of cultures and social habits.

The study of faunal remains from some medieval villages has made it possible to reconstruct livestock management strategies over the centuries and to observe changes and/or improvements in breeding techniques. The contribution of zooarchaeology and the importance of the interdisciplinary approach to reconstruct social dynamics and historical phenomena on a chronological scale will be discussed in this paper.

21 URBANIZED ELITES AND THE PASTORALIST LANDSCAPES OF THE MONGOLIAN STEPPE: ZOOARCHAEOLOGICAL AND ISOTOPIC PERSPECTIVES FROM THE MEDIEVAL UYGHUR CAPITAL KARABALGASUN

Kohlhage, Lea (Institute for Prehistoric and Protohistoric Archaeology, University of Kiel) - Makarewicz, Cheryl (Institute for Prehistoric and Protohistoric Archaeology, University of Kiel)

The establishment of the Uyghur Khaganate (mid-eighth century CE) on the Mongolian steppe marked the first urban centers among the pastoral-nomadic polities within this region. The Khaganate's capital Karabalgasun in particular was characterized by extensive and monumental permanent architectural features inhabited by people of different ethnic, cultural and social backgrounds, including foreign craftsmen and advisors, indigenous pastoralists, travelling merchants, and a presumably itinerant royal court. Precisely how elites, who occupied a central but exclusive area of the city replete with representative buildings and high-status objects, acquired livestock products and engaged, if at all, with livestock management systems, remains unexplored. Similarly, how the adoption of Manichaeism, with its religious protocols discouraging the consumption of meat, as state religion during the Uyghur reign may have affected pastoral subsistence systems and consumption practices is unknown. We apply zooarchaeological analyses with carbon and nitrogen stable isotope analyses to faunal remains originating from the so-called citadel, the political and administrative center of Karabalgasun, to explore how the Uyghur elite preserved – and probably even emphasized – their pastoral heritage by retaining direct access to livestock and livestock products. These animals and their products were most likely sourced both from the elite's own herds as well as partially acquired from supra-regional areas – perhaps as tribute or gifts supplied by high-status visitors.

22 CHANGING ANIMAL HUSBANDRY STRATEGIES AND SOCIOPOLITICAL TRANSFORMATION IN MEDIEVAL NORTHWESTERN TUSCANY

Zaneri, Taylor (International Institute of Social History)

Archaeological research demonstrates that increasing socio-complexity transforms relationships between cities and their hinterland communities – leading to wider exchange networks that move goods, food, people and capital in larger numbers and longer distances. These transformations are often explored through the lens of the core-periphery paradigm, and as such, large-scale changes are implicitly assumed to be driven by elite or state actors and urban demands. But such changes also involve the activities and decisions of rural communities as they navigated and contributed to their shifting sociopolitical landscapes, that bring new possibilities, opportunities and constraints.

This paper offers some important insights on the changes to the late medieval economy through the lens of subsistence choices in northwestern Tuscany from 1100 to 1400. This period saw significant changes in the ways that humans exploited animals and their environments, fueled by rising populations in cities and the development of commercial industries. This paper will combine zooarchaeological analysis with GIS land-use modeling to provide an integrated picture of how medieval people in northwestern Tuscany responded to and interacted with their changing

sociopolitical landscape through their animal husbandry strategies. I will highlight the importance of the decisions of rural producers, who over this period, shifted their subsistence activities to participate in wider commercial interactions. As such, food production became increasingly specialized by environmental zone. Using this integrated methodology, I will argue that the shifts in animal husbandry strategies and human exploitation of the environment were not only driven by elite and urban demands but were, in part, the result of the decisions of producers themselves, who altered their productive activities to advance their own situation and to better position themselves in their changing sociopolitical surroundings.

23 BARDHA'A: STABLE ISOTOPES AND THE CHANGING ANIMAL HUSBANDRY PRACTICES OF A MEDIEVAL CITY

Garner, Daniel (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan) - Haruda, Ashleigh (School of Archaeology, University of Oxford) - Larson, Kara (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan) - Cooper, Zaria (Department of Anthropology, University of Michigan) - Wordsworth, Paul (Institute of Archaeology, University College London) - Ventresca-Miller, Alicia (Department of Anthropology, University of Michigan; Museum of Anthropological Archaeology, University of Michigan; Department of Archaeology, Max Planck Institute for Geoanthropology)

The site of Bardha'a is located in a large floodplain and within the modern-day city of the same name in Azerbaijan. Excavations of the site show a densely packed urban space that was occupied for thousands of years. This research examines fauna recovered from stratigraphic layers that have been dated from 1000-1322 CE. Zooarchaeological research indicates that a diversity of animals lived and were eaten at the site, including chickens, pigs, sheep, goats, cattle, and water buffalo. However, by 1322 CE the diversity of the animal taxa used to provision the city had been drastically reduced to primarily sheep and goat. Accompanying the decline in species diversity, is a decrease in the average age of livestock at the time of slaughter. The exact reasons for this overall shift in food procurement are still not fully understood. This study aims to investigate animal husbandry practices and livestock management practices at Bardha'a through sequential stable carbon and oxygen isotope analysis of sheep and goat dentition, as paired isotopic analyses ($\Delta^{13}C$ and $\Delta^{18}O$) of ovicaprine teeth have been used to understand landscape use, foddering, and birth seasonality. In addition, we will measure stable carbon and nitrogen isotopes of bone collagen from sheep and goats to examine the intensity of landscape use and pasturing around the site. The ultimate goal of this project is to understand if changes in food procurement were driven by changing herding practices or other factors.

24 CHANGING CATTLE HUSBANDRY IN LATE MEDIEVAL AND MODERN FLANDERS (BELGIUM): EVIDENCE FROM MORPHOMETRICS AND ISOTOPE ANALYSES

Gruwier, Ben (Archaeology, Environmental Changes and Geo-chemistry research group, Vrije Universiteit Brussel) - James, Hannah (Archaeology, Environmental Changes and Geo-chemistry research group, Vrije Universiteit Brussel) - Griffith, Jacob (Archaeology, Environmental Changes and Geo-chemistry research group, Vrije Universiteit Brussel) - Loeffelmann, Tessi (Archaeology, Environmental Changes and Geo-chemistry research group, Vrije Universiteit Brussel) - Lambert, Bart (Historical Research into Urban Transformation Processes Research Group, Vrije Universiteit Brussel) - Lambrecht, Thijs (Department of History, Universiteit Gent) - Snoeck, Christophe (Archaeology, Environmental Changes and Geo-chemistry research group, Vrije Universiteit Brussel)

In Northwestern Europe, the transition from the Late Middle Ages to the Modern era is marked by profound changes in agricultural practice. As part of the so-called (second) "agricultural revolution", innovations were implemented in animal husbandry, in response to an increasing demand for food products. Livestock, such as cattle, were improved to mature faster and become larger and more productive. These evolutions coincided with an expansion of the networks along which animals were traded. Despite having been extensively studied by agricultural historians, the timing, nature and regional variation of these trends remain poorly understood. Zooarchaeology offers an alternative line of evidence through which these issues can be addressed.

This study assesses (post)medieval evolutions in cattle husbandry in present day Flanders via a combination of morphometrics and oxygen ($\delta^{18}O$) and strontium ($^{87}Sr/^{86}Sr$) isotope analyses. Using skeletal measurements, spatial and temporal variations in the size and shape of cattle are explored as proxies for livestock improvement. Evidence of increasing morphological variability is used in concert with oxygen and strontium isotope analyses on teeth, to track diversification of source populations and mobility in animals. The results of the morphometric analyses suggest the appearance of improved cattle from the 16th century, but with notable regional variations. Postmedieval cattle assemblages show an increasing morphological variability, which is mirrored by particularly variable $^{87}Sr/^{86}Sr$ and some values suggesting trade with a coastal region. Our findings demonstrate that combining multiple lines of bioarchaeological evidence can highlight aspects of agricultural history that have been difficult to untangle using documentary sources alone.

105 HOW WERE MEDIEVAL TOWNS IN EUROPE FORMED? URBAN SETTLEMENTS BETWEEN THE EARLY AND THE HIGH MIDDLE AGES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Vassena, Mauro (Catholic University of the Sacred Heart - Milan) - Lefebvre, Bastien (University of Toulouse Jean Jaurès)

Session format: Regular session

European towns in the High Middle Ages are a somewhat little-studied topic from an archaeological point of view, which seems strange if we consider the great contribution that archaeology could make to their knowledge.

Generally, it is considered plausible that the main features of medieval towns, as we know and can still today often see them, are the results of a complex, progressive and long-lasting process of formation and development, which took a particular turn between the late Early Middle Ages and the 13th Century CE. In fact, urban spaces in the area of the Western Empire, already affected by deep transformations of the original Roman structure between Late Antiquity and part of the Early Middle Ages, persisted even afterwards in undergoing new radical changes (concerning the general configuration of urban fabric, the articulation of defensive systems, the topography and the architectural aspect of ecclesiastical buildings and seats of religious and civil power, the funerary areas, the typology of dwellings, the petrification of townscapes, the craft areas, the material forms of social stratification, the strengthening role as marketplaces).

This session aims to analyze Western European towns between the 9th and 13th centuries CE. By adopting a long-term perspective, it will be possible to identify the dynamics of urban contexts that led to more permanent and, a priori, more coherent towns. The discussion will examine and compare towns of Roman foundation with towns founded or refounded in the Middle Ages (for example wics and emporia, monastic and castral towns). A varied approach is welcome: contributions could be focused on urban organization, power and Christian topography and archaeology; significant urban excavations; archaeology and stratigraphic analysis of urban buildings and dwellings; manufactures as evidence of social changes; etc.

ABSTRACTS

1 FROM EMPORIUM TO CIVITAS IN SOUTHERN SCANDINAVIA

Søvsø, Morten (Museum WEST)

Urbanization in Southern Scandinavia began c. AD 700 with the formation of trading towns – by researchers often referred to as wics or emporia.

By AD 800, Ribe (Jutland, Denmark), Reric (Gross Strömkendorf, Mecklenburg, Germany) and Aarhus (Scania, Sweden) were all blooming trading towns situated in the border regions of the early Danish kingdom.

A controlled currency, the wotan/monster or series X sceatta, most likely issued by the Danish king, was used exclusively in these emporia hinting at royal control over the sites. This is backed by a small number of Frankish written sources shedding a bit of light over the otherwise illiterate Scandinavian societies.

In the early 9th C. the Danish king Godfred/Göttrick moved the merchants from Reric to Haithabu/Schleswig. This new town became a huge success and took over the former role of the Frisian/Carolingian emporium of Dorestad as the preferred international trading hub of northwestern Europe.

All three sites in the Danish realm; Ribe, Haithabu/Schleswig and Aarhus developed into Medieval towns allowing us to study in detail what happened between the 9th and 13th C. However, this has only to a limited degree been carried out partly since these three towns today are placed in three different countries with different legislation, research histories and research agendas.

The paper seeks to compensate for this bias by analyzing the longue durée development from Early Medieval trading town (emporium) into the more well known High Medieval town (civitas). Christianization played an important role in this process which drew much of its inspiration from Rome and ideals formed in Antiquity.

2 FROM THE STRONGHOLD TO THE TOWN. EARLY URBANIZATION IN MEDIEVAL CENTRAL EUROPE

Stefan, Ivo (Department of Archaeology, Charles University Prague)

In the 13th century, the phenomenon of the institutional, legally defined town was brought to Central Europe from the West. However, this fundamental change was preceded by a long and non-linear development of fortified settlements and proto-urban agglomerations, often linked to the seats of regional political and religious authorities. In some cases, socio-economic changes have led to the relocation of centres, while in the case of long-settled areas, signif-

icant changes in their internal structure have been observed. The paper will focus on the (dis-)continuity of central places and the changes in their functions over the long period from the 9th to the 13th century in the territory of the present-day, Czech Republic, Poland and Hungary, tracing the basic common trajectories and regional differences on the basis of well archaeologically known and documented case sites. The paper will focus primarily on tracing topographical changes, the transformation of urban area layouts and the emergence of urban stone architecture. Basic trends will be contrasted with developments in Western and Eastern Europe.

3 HIGHLIGHTING LONG TERM TRANSFORMATIONS IN MEDIEVAL SMALL TOWNS: REFLECTIONS ON SEVERAL EXAMPLES FROM BAS-ROUERGUE (FRANCE)

Chabanne, Eric (Université Toulouse - Jean Jaurès)

In the south of France, the Middle Ages have been conducive to the progressive creation of an important number of small towns that reached an apex during the 13th-14th centuries. These urban settlements have traditionally been categorized by their type of foundation (monastic burgs, castra, new towns, ...) in a determinist perspective. Moreover, the overdocumentation of the 13th-14th centuries fosters the illusion that almost nothing happened before, whereas a few research works from the last twenty years have shown that the 8th-12th centuries are also very important for small towns' development, and that these determinist categories are neither fixed, nor exclusive: small towns actually followed very diverse trajectories.

To inquire this question, the presentation will focus on several small towns located in the Bas-Rouergue territory, between the actual Tarn-et-Garonne and Aveyron's counties. In this area, urban development has not been determined by the proximity of bigger cities, and recent urbanization has not yet erased the medieval urban fabric. Hence, these towns are good cases to try and understand dynamics and trajectories that led to their actual form. By combining archaeological data and urban form analysis, it is possible to detect subtle transformations and render a long-term history of these towns' development, before the 13th century transformations.

4 NEW MONASTIC TOWNS AROUND THE AUDE RIVER IN THE MIDDLE AGES (8TH-12TH CENTURIES)

Foltran, Julien (Université de Toulouse, Traces-UMR 5608)

This research is based on the archeology of the building coupled with the analysis of ancient texts and plans.

In the second half of the 8th century, shortly after the departure of Muslims from the territories around the Aude River, in the South of France, communities of hermits were formed in sparsely populated areas, on the fringes of the cities inherited from the Antiquity. The Carolingian power favored them with the aim of religiously unifying the region, creating a network of faithful establishments and developing these territories on the fringes of the center of its power. He granted them important privileges and immunities which made them powerful abbeys, enriched by numerous donations from aristocrats. Having become spaces of peace and prosperity, they have attracted a socially diverse population with multiple activities. Thus, around the abbeys of Lagrasse, Alet, Caunes, Saint-Polycarpe, Saint-Hilaire and Montolieu, small towns were formed, with a grouping encouraged by the monks. The abbots thus provided them with large markets and, in the case of Lagrasse, determined the plan of a new town in the 12th century. Particularly dynamic, these towns constituted the network of secondary towns in the region, after the large cities of Carcassonne and Narbonne. Located on the first mountainous foothills on either side of the agricultural plain, they were key points in the urbanization of these transitional spaces until their slow decline began from the 14th century.

5 REVISITING THE (RE)CONQUEST OF SIGÜENZA: CHALLENGING MEDIEVALIST NARRATIVES THROUGH ARCHAEOLOGICAL AND HISTORICAL INQUIRY

García-Contreras, Guillermo (Universidad de Granada) - Mattei, Luca (Universidad de Granada) - Hernández-Casas, Yaiza (Universidad de Granada) - García Garcia, Marcos (Universidad de Granada) - Banerjee, Rowena (University of Reading) - Pluskowski, Aleks (University of Reading)

Sigüenza, situated in the heart of the Iberian Peninsula, currently part of the province of Guadalajara, once served as the capital of an ecclesiastical lordship during the Middle Ages. In commemoration of the nine-hundredth anniversary of its incorporation into the Crown of Castile by conquest (1124-2024), a systematic study of the entire archaeological record concerning the birth of this medieval town is undertaken. By meticulously examining various excavations and written documentation, this research challenges the purported Islamic origins of Sigüenza, advocating instead for a nuanced interpretation suggesting a deliberate establishment of a distinctly feudal city under episcopal leadership, emerging ex novo during the 12th and 13th century neither ex nihilo nor through Islamic influence.

This study aims to provide a local perspective that challenges the prevalent discourse of the Reconquista, often appropriated by certain sectors of medievalist scholarship and exploited by conservative and far-right political factions in contemporary Spain. By interrogating the historical narrative surrounding Sigüenza's inception, this research seeks

to contribute to a broader dialogue on medieval urban development and the socio-political implications of historical interpretations.

6 BITONTO (BARI): REBIRTH OF A CITY. FROM REPOPULATION DURING THE SECOND BYZANTINE DOMINATION TO THE NORMAN APEX (9TH-12TH CENTURIES)

Marinelli, Federico (Università degli Studi di Roma - La Sapienza)

In the Central Apulia region, during the High Middle Ages, a series of settlement transformations occurred, reshaping hierarchies and urban and rural spaces, each time with a distinctive outcome. An exemplary case is the city of Bitonto. For this center, after a long period of disintegration, a true "rebirth" began in the 9th century, primarily due to Byzantine administrative policies. Bitonto, once described as a minor center retaining the memory of a city "olim nobilem atque opulentam" once again became defined as a civitas during this period. The study will explore written and material sources from the urban area of Bitonto, coupled with a reconstructive analysis of the spaces. It will show how, starting from the area once occupied by the Roman municipium and traversed by the remains of the via Appia-Traiana, the synecism process began. This process involved an intensive repopulation of the area adjacent to the urban stretch of the road axis, preceding the expansion into new zones. Markers of these numerous changes, in addition to the evolution of the urban layout, include numerous ecclesiastical foundations, along with various construction and beneficence seasons affecting the main church. This church was reconstructed and expanded precisely during the significant early medieval repopulation. A fundamental economic contribution came from the Benedictine community, favored by the Normans, providing a decisive economic boost to the city. Bitonto became a center for the production and export of oil, hosting an important annual fair in the vicinity of the wealthy monastery. This complex narrative is examined with attention to both written and material sources, serving as testimonies to a prosperous period for Bitonto and Central Apulia at the dawn of the second millennium.

7 THE URBAN ORGANIZATION OF BERGAMO DURING THE MIDDLE AGES: APPROACH OF STRATIGRAPHIC ANALYSIS OF URBAN BUILDINGS

Matteoni, Federica (Università Cattolica di Milano)

The history of the city of Bergamo is well known through documentary sources, which can be enriched by the detailed study of the historical architecture preserved in town, through the stratigraphic method of architectural archaeology.

The original Roman urban system was known through archaeological excavations, but the dynamics of occupation in the early Middle age are less studied: in the 10th century church are the first concrete evidence of the bishop-count's affirmation, who began the controller of the city until 11th century before the establishment of the Municipality. This passage is documented by the civil architecture found in the upper part of Bergamo, according to an occupational process conditioned by the pre-existences, but with a new extensive occupation of the hill.

A decisive role in defining the city's organization was entrusted to the construction of the city's Cathedral, the Palazzo della Ragione and the church of Santa Maria Maggiore, which redefine the central square in the Romanesque period. The organization of the new suburban neighborhoods was conditioned by this squared, with the progressive construction of tower-houses by appearing urban family that defined the history of the city between the 12th and 13th centuries.

The houses are distributed along already marked routes, with in-line combinations which respect the property boundaries; traces of this occupation are also preserved in the current lower city. The contribute will be focus on local techniques of construction, with the archaeological analysis of the medieval buildings, to explain the development of urban organization.

8 MILAN BETWEEN THE 9TH AND THE 13TH CENTURY CE. THE FORMATION OF A MEDIEVAL TOWN

Vassena, Mauro (Università Cattolica del Sacro Cuore - Milano)

It is undoubtedly possible to affirm that at the end of the Lombard era (second half of the 8th century) the settlement fabric of Milan still maintained its Roman-imperial basic structure, even if during Late Antiquity it was affected by deep transformations (i.e. the appearance of buildings of Christian worship; the massive defunctionalization of water, sewerage, road and defensive infrastructures; the dismantling of public and private building; the spread of poorer residential buildings made of perishable materials; etc.). These transformations continued and intensified in the following period, between the 9th and 13th centuries. This paper aims to show the main topographical and archaeological features of Milan in that time frame, moving from the parallel examination of written sources and archaeological evidences. Through the synthetic presentation of the main transformations of the Christian topography, of the seats of ecclesiastical and civil power, of the defensive infrastructures and of the models and forms of living, it will be possible to identify the fundamental topographical, structural and infrastructural elements that characterized the definitive

overcoming of the Roman urban model and the progressive definition of a new typology of fully medieval urban settlement.

9 THE ADOPTION OF THE STREET FAÇADE IN MEDIEVAL HOUSES (11TH-13TH C.)

Lefebvre, Bastien (University of Toulouse)

Most of the medieval houses preserved in Western European towns have a street elevation, providing an immediate link between the public space and the private domain. Facades are generally organized in two registers, with a first floor wide open onto the street to facilitate exchanges (production or commerce) and one or more storeys dedicated to living quarters.

However, this organization was not always the rule in medieval housing. Houses of the late Early Middle Ages were usually set back from the street, separated by a forecourt. Many were also built around open spaces, with no shared walls. These houses reflect domestic practices and a relationship to urban space that is not found (or less) in the High Middle Ages.

This presentation will examine the transformations in housing between the 11th and 13th centuries, focusing on the reasons behind the fixation of facades on streets and the impact of this new organization on the structuring and dynamics of the urban fabric. Three main themes will be addressed in this presentation focused on France: firstly, the evolution of domestic activities and their requirements in terms of space; secondly, the architectural revival and, in particular, the petrification of buildings; and thirdly, the manifestations of the emergence of a new urban society.

120 DIVIDE AND CONQUER? ADVANCING MULTISCALE THEORETICAL FRAMEWORKS FOR ARCHAEOLOGICAL CERAMICS IN NORTHWESTERN EUROPE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Hudak, Eniko (Newcastle University; Pre-Construct Archaeology Ltd.) - Willems, Sonja (Art and History Museum, Brussels; Catholic University Louvain) - Sutton, Adam (Aurelius Archaeology) - Hawkins, Kayt (Archaeology South-East, Institute of Archaeology, University College London) - Vincent, Vaiana (INRAP)

Session format: Regular session

The study of archaeological ceramics in Northwestern Europe has seen giant leaps of development in the last half-century. The increasing accuracy of methods determining ceramic provenance, type, age, production, and consumption led to a proliferation of ceramic specialisms within the profession, the main divisions lying in chronology and materials. The workflows of developer-funded archaeology further encourage these divisions to maximise archaeological potential through being studied by the most appropriate specialists. Specialists, however, often work in isolation having little or no insight into the rest of the archaeological work on the same site which can lead to major epistemological problems (especially for transitional periods) and incompatible workflows between different organisations and countries. Furthermore, while scientific techniques and quantification methods continue to be updated, many of the mainstream theoretical frameworks for interpretation have changed little in the last 50 years.

This session offers a point of reflection on the current state of archaeological theory in ceramic studies and advocates for expanding the scope of ceramic interpretations. By stepping outside the modern boundaries of the material, chronological, geographical, and current theoretical frameworks, we can discover the intersection of approaches and enrich our understanding of archaeological ceramics.

We invite papers from specialists and researchers working on ceramics dated to between the 1st century BCE and the 15th century CE (pottery, ceramic building material, etc.) from Northwestern Europe including but not limited to these topics:

- Theoretical approaches to ceramic production and consumption
- Decolonising the ceramic narrative from production to perception
- Multi-perspective approaches to ceramic micro- and macroeconomies
- Ceramic identities in the Roman world: personal and collective choices of making, using, and discarding pots
- Ceramics of transitional periods (e.g., Late Iron Age – Roman, late Roman – post-Roman)
- Outside the sherd-centric world: intersections of interpretations of ceramics and other artefacts.

ABSTRACTS

1 LATE ROMAN GERMANIC POTTERY IN NORTHWEST EUROPE: FROM ETHNIC MARKER TO A COMPLEX MOBILITY NETWORK

Van Thienen, Vince (Ghent University, Department of Archaeology)

Germanic pottery from the late Roman period initially served as an ethnic marker to identify invading or immigrated Germanic groups. With the paradigm shifts regarding ethnicity in archaeology (Jones 1997, Lucy 2007), the ethnic interpretation was replaced by a cultural one, however with the same net result, i.e. an uncritical style-based provenance for Germanic pottery found within the Roman Empire supported by static classifications that mirrored historical divisions: the Saxons invaded/migrated from the North Sea, the Franks from across the Lower Rhine, the Alemanni from the Upper Rhine, etc.

In extension, the fabric-based classification of Germanic pottery is equally oversimplified as demonstrated by recent thin section analyses based on nearly 450 samples from northwest Europe. The use of unidirectional and monochronological migration models severely underestimate the complexity of the mobility of Germanic pottery, as well as their social and economic values.

The current theoretical framework is based on Burmeister's (2000) application of the sociological model of Bourdieu (1977) to study past migrations with material culture. Concerning the late Roman situation, this translates to the high chance of Germanic (handmade) pottery travelling with communities rather than being traded.

New evidence argues a more diversified approach where Germanic pottery can transition between private and public sphere depending on socio-economic context and exchange mechanisms are incorporated in the ceramic mobility. This approach is validated by findings from handmade pottery as well as Germanic pottery productions in Roman style and technique beyond the Rhine (e.g. the late Roman terra nigra foot-vessels).

By using a multiscalar model for mobility (e.g. Anthony 1990) in combination with distinctions based on concepts such as Peacock's (1982) modes of production and the chaîne opératoire (Leroi-Gourhan 1964, Lemonnier 1983), this paper provides an evidence-based application of archaeological theory to adjust our understanding of Germanic pottery in the late Roman world.

2 A ROAD LESS TRAVELLED? CERAMICS, SOCIALITY, AND THEORY IN ROMANO-BRITISH ARCHAEOLOGY AS CONSIDERED THROUGH THE WORK OF DAVID PEACOCK

Sutton, Adam (Aurelius Archaeology)

Romano-British pottery studies has recently attracted criticism for its uncritical adherence to the principles of economic formalism. The very structure of Romano-British pottery studies, centred as it is around the identification of categories of ceramic able to be provenanced (and A-to-B links between production and 'consumption' sites thereby elucidated) has arguably led to formalist approaches being hard-wired into the way that pottery is studied and interpreted. The uncritical ways in which formalist principles have been applied are arguably to the significant detriment of British ceramic analysis.

This need not have been the case. Romano-British pottery studies owes its chief debt to the University of Southampton, where between the 1960s and 2010s generations of the discipline's most successful specialists were trained under the eye of Professor David Peacock. Peacock's early work involved the fruitful application of provenance-based analysis and interpretation, and their enthusiastic adoption by his students, many of whom went on to become major figures in Roman pottery studies.

However, in the 1980s Peacock suffered perhaps his worst criticism. Peacock's Pottery in the Roman Economy: An Ethnoarchaeological Approach (1982) was a departure from much contemporary British scholarship in that it attempted to deal with the Roman economy in terms of the technological and social interactions of the (crafts)people who contributed to it. Response to Pottery in the Roman World was critical of its ethnoarchaeological methodology, and its influence within Romano-British pottery studies was limited as a result.

This paper will discuss the significance of Peacock's work and consider whether Pottery in the Roman World represents a 'road less travelled' in Romano-British pottery studies. The paper will also query the extent to which this is the case internationally, and propose that there is much to be gained by engaging with similar socially-oriented approaches which are current outside of British scholarship.

3 THE RATIONAL ROMANS OF BRITAIN: THE INTERSECTION OF NEOCLASSICAL ECONOMIC THEORY AND BRITISH IMPERIAL DISCOURSE

Hudak, Eniko (Newcastle University)

Roman pottery has long been regarded as one of the primary vehicles for discussions of the micro- and macroeconomic processes of Roman Britain. Traditional interpretations of every stage and aspect of Romano-British pottery production, exchange, and consumption are imbued with a focus on economic rationality: achieving the best possible returns, cost-reduction, and price value. While this seems to be mainly borrowed from neoclassical economic theory, it also reinforces the binary opposition of “Roman” and “native” as it was seen in the British imperial discourse of the Edwardian period. Post-colonial theory and globalisation in Roman archaeology have played a key role over the last four decades of research to de-centre and deconstruct these narratives – but are pottery studies late to catch up with these discussions? This paper explores the intersection of British imperial discourse and neoclassical economic theory and how this has shaped and continues to inform discussions of economic processes within the study of Romano-British pottery. It hopes to raise awareness of the perpetual nature of traditional reporting styles and open a discussion to widen the pottery perspective.

4 OF GAPS AND GEARS : ANALYZING DIVERGENCES IN METHODOLOGIES OF POTTERY STUDIES IN FRENCH PREVENTIVE ARCHAEOLOGY

Vincent, Vaiana (INRAP) - Willems, Sonja (Art and History Museum, Brussels)

French preventive archaeology has, since more than 20 years, recognized the necessity of appointing find specialist for the study of specific material categories such as metal and bone small finds or pottery, on which this lecture will particularly focus. Hereby, specialists were assigned to specific time periods, artificially dividing excavation data into Bronze and Iron age, Roman, Medieval and Modern periods. This division can lead to a segmentation of information and, by extension, to gaps in the overall interpretation of a site. In addition, Roman pottery has a long history of study, even beginning before the 19th century when Samian wares and amphorae began to get attention, thanks to sites such as Rome's Monte Testaccio. Methodology had time to evolve from simple typological observations to what is now called a more integrated approach including chronotypology, macroscopy, petrography, and distribution patterns. For a long time, the Medieval and Modern periods got less attention, with an interest in pottery only really developing from the 1970s onwards, and thus methodology-wise tagging along.

The lecture wants to focus on the how and why of these differences, partly institutional problems, but also resulting from historical processes, how archaeological periods are regarded leading to “colonial”-inspired interpretations of history. The study of hand-made pottery is thereby a good example, mainly thought of as an opposition of plain Gaulish wares with a less developed technical skill versus the cultural more important wheel-turned Roman wares, forgetting their persistence during Medieval and Modern times and leading to methodological problems for pottery specialists, as well as to differences in time-allocation and publication possibilities. We thus want to reveal the gaps between periods, where there should not be, and the different speeds at which the methodologies developed, hoping to encourage to adopt a more holistic approach of our specialization.

5 TIMES OF CHANGE FOR POTTERY TRADITIONS IN THE NORTHWEST OF THE IBERIAN PENINSULA. AN APPROACH TO ITS STUDY AND INTERPRETATION

Hernández-Tórtolas, Alicia (Institute of History - Spanish National Research Council (IH-CSIC))

I would like to present the first results of my research on the indigenous traditional pottery assemblages in the Iberian Peninsula NW, from the 2nd century BC onwards. The Iron Age communities (under an approach of agrarian and egalitarian as social forms), experienced dramatic changes after the Roman conquest. The organisation of the territory had a strong militar, administrative and jurisdictional presence from Augustus times and an intense gold-mining exploitation. This pottery manufactures will maintain Iron Age technological elements; handmade (with a gradual introduction of the potter's wheel), surface treatments (burnished, spatulated), decorations, functionalities... characteristic elements of the most abundant material founded in the villages.

My aim is to assess under what kind of social, identity, economic, cultural and territorial organisation are the indigenous pottery manufactures are being produced, consumed and distributed, considering the factors of change diachronically and widely. What changes can we identify through a contextualized research since first anti-hierarchization structures, that we propose only crumbled upon the presence of Rome. And then, after the conquest, how this wares under local and domestic spheres are being developed within an imperial-scale economy with macro-circulation of products, large-scale ceramic productions, and so on.

Therefore, I present an interpretative and methodological approach in which this artefacts studied in context (chronological and stratigraphical) with the rest of the material elements from the settlements (e.g. Roman common/luxury ware, glass, jewellery, architecture), may suggest the emerging forms of inequalities among the local people. Their

spatial distribution seems to be pointing different habitat areas inside the villages related to possible different purchasing power of the families/households, social status or bonds with the Roman hierarchies, for mention some examples. All this under the Landscape Archaeology's approach; understanding the territory as a dynamic thing result of the relationships between cultural groups and their interactions with the environment.

122 INDICATORS OF NONPRIVILEGED POPULATIONS FROM FUNERARY CONTEXTS: MULTIDISCIPLINARY APPROACHES TO ASSESSING DISPARITIES IN PAST POPULATIONS

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Gelabert, Pere (University of Vienna) - Marinato, Maurizio (Università degli Studi di Padova) - Zagorc, Brina (University of Vienna) - Novak, Mario (The Institute for Anthropological Research)

Session format: Regular session

The social status of past populations can be inferred from a wide range of archaeological indicators such as mortuary analysis (location and characteristics of the graves), diet (through archaeobotany and archaeozoology), health (linked to nutrition or malnutrition), and work patterns (deduced from osteological material). All these indicators show differentiated and unequal access to strategic resources between individuals, which creates different social statuses within a population. We therefore call ‘privileged’ those who hold the capacity to rule over the majority. In contrast, the large majority of the population. Commonly, burial complexes represent the most abundant source of information for the assessment of the social position and inequality of individuals in a society. The other main source of information comes from the bioarchaeological analysis of human remains. The study of human bones can inform us about the life patterns of the individuals (heavy physical work or equestrian practices among others), signs of physiological stress related to poor and deficient diets (e.g., caries, dental hypoplasia, cribra orbitalia, and cribra cranii, rachitis), signs of deficient hygiene levels, and even the causes of death. The analysis of dietary stable isotopes can also complement osteological analysis. In addition, the paleogenomics analysis can link the previous indicators to the origin of the individuals, and family connections or even depict the presence of hereditary diseases, representing a very effective connection between genetics and archeology. We invite contributions that cover topics about privileged and unprivileged societies using different bioarchaeological, genetic, and archaeological methods, such as funerary archaeology, genetic analyses, dietary stable isotope analyses ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$), and various osteological methods for assessing the life conditions the analyzed individuals have lived in. We are most interested in the contributions with a specific focus on the period from the 3rd to the 8th Century AD and post-classical times.

ABSTRACTS

1 SOCIOCULTURAL INEQUALITY AT THE LANGOBARD-AGE (6TH-7TH CENTURIES AD) SITE OF CORTE ROMANA (NE ITALY) REVEALED THROUGH STABLE ISOTOPE ANALYSIS

Martinoia, Valentina (Department of Archaeology, Simon Fraser University, Burnaby (BC), Canada) - Saccheri, Paola (Department of Medicine, University of Udine, Udine, Italy) - Borzacconi, Angela (National Archaeological Museum of Cividale, Cividale del Friuli, Italy) - Travan, Luciana (Department of Medicine, University of Udine, Udine, Italy) - Richards, Michael (Department of Archaeology, Simon Fraser University, Burnaby (BC), Canada)

The arrival of the Langobards (Lombards) in Italy significantly reshaped the territorial and socio-political landscape of Friuli-Venezia Giulia (FVG, NE Italy). Between the 6th and 7th centuries AD, both the local population and the ruling Langobards coexisted in Cividale del Friuli (FVG), which became the first capital of the new Langobard Duchy. Archaeologically, one of the most striking differences between the two groups in Cividale lies in their burial practices: the local population was buried within the city walls, while the Langobards were buried in organized necropolises situated outside the city. The local population buried within the residential area of Corte Romana in Cividale includes adult individuals (n=16) and an astonishing number of subadults (<18 years; n=24), including stillborn (n=12). In this study, we used bulk tissue stable isotope analysis ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, and $\delta^{34}\text{S}$) to investigate the dietary and mobility patterns of the local individuals from Corte Romana. Our results revealed that the local population of Corte Romana relied heavily on the consumption of C4 plants, with a notable inequality between adults and subadults in terms of access to protein-rich foods. Furthermore, the comparison of our results with previously published data for Langobard individuals of the same age recovered from nearby sites accentuates this dietary inequality, serving as a clear indicator of socio-cultural disparity in resource access between the rulers and the ruled in the area of Cividale in the Early Middle Ages.

2 BETWEEN CONTRASTS AND ANALOGIES: ARCHAEOLOGICAL AND ANTHROPOLOGICAL DATA WITHIN THE AVARICUM NECROPOLISES FROM 3RD TO 5TH CENTURY (BOURGES, FRANCE)

Durand, Raphaël (Service d'archéologie préventive Bourges Plus)

The definition of the social status of individuals remains a sea serpent that archaeology and biological anthropology regularly attempt to bring to the surface. In Antiquity societies, this status induces very distinct modes and qualities of life so that stratigraphy, typology and osteology could constitute effective reading tools if they were not limited by homogeneity of funerary rites and global health status.

If occasionally some burials clearly demonstrate a wish for ostentation and distinction on the part of the deceased, these are rare cases and therefore easily identifiable. In contrast, non-privileged individuals are more difficult to distinguish. Absence or overabundance of grave goods sometimes results more from a strict application of tradition, of rite, escaping any social consideration and respecting the rule of the group, *lato sensu*.

In Bourges (Avaricum), two large ancient funerary areas illustrate these methodological difficulties. Both used from the 3rd to the 5th century, one urban, the necropolis of Saint-Martin-des-Champs, houses buildings and funerary containers attesting to the wealth of their occupants; the other, the necropolis of Lazenay, dependent on a villa, mainly brings together individuals who worked within this important rural estate. Obviously, that population should bear the bone stigmata of a life of labor and its burials limited to the simplest expression of the funerary rite. A comparative study of the two necropolises strongly nuances this postulate, providing contrasting funerary and archaeo-anthropological evidences, only a few kilometers apart.

3 STRESS-MARKERS IN CHILDREN OF THE SCYTHIAN AND LATE SCYTHIAN CULTURE

Kotova, Nadiia (Institute of Archaeology of Ukrainian National Academy of Sciences, Kyiv, Ukraine) - Kozak, Oleksandra (Institute of Archaeology of Ukrainian National Academy of Sciences, Kyiv, Ukraine)

Stress-markers are a good identifier for precarious living conditions on skeletal material. When conducting a sample analysis, the most valuable data can be obtained by examining children's skeletons. However, to fully assess the impact of negative factors on the population's health, the research's results of only one sample may not be enough. This requires synchronous or chronologically close comparative samples, where the human habitat can be similar.

Our research concerns materials from Scythian cemeteries Vyschetarasivka, Medvin, Svitlovodsk, Skelki (VII-III c. BC) and Late Scythian cemetery Chervony Mayak (II c. BC- III c. AD), which are located in the steppe and forest-steppe zone of Ukraine. The following skeletal and odontological stress-markers are analyzed: porotic hyperostosis, cribra orbitalia, linear and pit enamel hypoplasia. The problem of the farming method's influence on physiological health is also discussed.

After a comparative analysis, it was found that the greatest number of stress markers and the highest child mortality were in the Scythian group of the late culture's period (cemeteries Vyschetarasivka, Svitlovodsk), which may indicate a significant deterioration in living conditions during this period. According to the results of anthropological research, we can also consider the possibility of different welfare's level among representatives of the Scythian and Late Scythian culture, since the number of stress markers in the forest-steppe population is much higher.

4 INDICATORS OF NONPRIVILEGED POPULATION FROM THE FUNERARY CONTEXT OF THE HIGH ROMAN RURAL SETTLEMENT IN CUTICCHI (ASSORO - ENNA)

nicoletti, rossella (ANA) - Pennisi, Ghiselda (ANA) - Draïà, Eleonora (Università telematica Internazionale UniNettuno, Roma) - Manenti, Marco (ANA) - Palazzolo, Grazia (ANA) - Frittitta, Riccardo (Sezione di Scienze Preistoriche e Antropologiche Dipartimento di Studi Umanistici. Università degli Studi di Ferrara (Italy)) - Galassi, Francesco (Department of Anthropology, Faculty of Biology and Environmental Protection, University of Lodz, Lodz, Poland) - Varotto, Elena (Archaeology, College of Humanities, Arts and Social Sciences, Flinders University, Adelaide, SA, Australia)

The archaeological exploration in Località Cuticchi, started in 2020 and still in progress as a phase of Preventive Archaeology for the Italferr project of the Palermo-Catania-Messina railway axis, led to the discovery of a rural settlement whose living spaces and a vast necropolis have been put into light. The Roman imperial settlement, dated to the 1st -3rd century A.D. and placed in the centre of Sicily on a hill dominating one of the most important rivers of the island, the Dittaino, is made up by a master residence surrounded by a series of service structures. On the top of the hill, beyond a buffer zone, a large necropolis characterised by different burial typologies, revealed a microsocial structure where few privileged individuals emerged whilst the majority of the residents were humble workers of the latifundium. The preliminary analysis of 168 burials is allowing us to outline different social statuses emerging not only from the very characteristics of the graves (simple pits, Cappuccina tombs, funerary urns), from the funerary rituals (just 3 cremations, 1 bustum and 165 inhumations) and from the diverse grave goods (many of the tombs were very poor, lacking any grave goods, others contained just a simple lamp, others rich sets of glasses or bone-made items,

few others even golden jewels), but also from the bioarchaeological analysis of human remains that is revealing us their activities during life (heavy physical work suggested by some patterns on their bones), poor dietary patterns suggested by dentoalveolar conditions, stress markers visible on cranial and post-cranial remains. The preliminary results show a high coherence between the archaeological and bioarchaeological data and the on-going excavation and systematic analysis of all the burials will eventually offer a comprehensive overview of this extremely significant Roman-era site.

5 'NON-PRIVILEGED' INDIVIDUALS FROM OSIJEK (COLONIA AELIA MURSA): BIOARCHAEOLOGY OF A ROMAN PERIOD MASS BURIAL

Novak, Mario (Institute for Anthropological Research) - Filipović, Slavica (Archaeological Museum Osijek) - Carić, Mario (Institute for Anthropological Research)

The paper presents the results of a comprehensive bioarchaeological analysis of a skeletal assemblage recovered from a Roman period mass burial in Osijek, eastern Croatia. Osijek was one of the most important settlements in the province of Pannonia and the Danube limes during the Roman period. Located on the southern bank of the river Drava, it was founded as a military outpost and elevated to the status of a colony (Colonia Aelia Mursa) in 133 CE.

Due to the construction of a new campus of the University of Osijek, recent salvage excavations revealed a number of "typical" inhumation burials. However, in 2011 a large pit was discovered containing complete skeletons of seven adult males found in various positions indicating that the bodies were thrown in without any care for the deceased. The recovered artefacts date the use of the pit to the 2nd/3rd century CE while a direct radiocarbon date places the burial between 240 and 340 CE. The main characteristic of the assemblage is the presence of active new periosteal bone formation on the pleural side of the ribs recorded in all skeletons suggesting these individuals suffered – and probably died – from some kind of pulmonary infection. The other notable feature is a high frequency of ante- and perimortem traumatic lesions associated with intentional violence. And finally, various indicators of intense physical activity were recorded in most of the skeletons. Based on the archaeological context as well as the biological characteristics of the studied remains, one may assume the individuals in question were either slaves or soldiers, physically very active during their lifetime. They died from infections or as a result of violence, and their bodies were unceremoniously disposed of in a used pit, thus strongly suggesting they can be considered as the 'non-privileged'.

6 BIOARCHAEOLOGICAL ANALYSIS OF THE HEALTH STATUS AND LIFESTYLE OF A LATE-ANTIQUITY HUMAN SAMPLE FROM THE NECROPOLIS OF PIAZZA CORRUBBIO (VERONA)

Bigo, Lorenzo (Università Ca' Foscari, Venezia, DSU, Italy) - Cottica, Daniela (Università Ca' Foscari Venezia, Italy) - Iacumin, Paola (Università di Parma, Italy) - Giacometti, Valentina (Università degli studi della Campania L. Vanvitelli, Italy) - Boaretto, Elisabetta (D-REAMS Weizmann Institute of Science, Israel) - Bertoldi, Francesca (Università Ca' Foscari, Venezia, Italy)

From the site located in the heart of the city of Verona 394 tombs have been excavated between 2009 and 2011 belonging to various typologies (cappuccina, brick coffins, lithic coffins, amphorae, burials in the ground) and spanning from IIIrd to VIIIth century AD as indicated by grave goods, coins and adornments. We present here the preliminary data of two burial typologies selected to be analysed up to date (cappuccina graves and brick coffins) and comprehending the archaeological and taphonomical contexts, paleobiological and paleopathological analysis of adults and juveniles, together with stable isotope data of nitrogen and carbon for dietary reconstruction and C14 datations to better understand the exploitation phases of this area. Experimental methods of age determination through dental radiographic analysis (the so called "Cameriere method") and new measurements for juveniles' health status evaluation (diameters and circumferences of long bones other than lengths) have been applied to the sample of this human population.

7 THE POOR AND THE DEAD: A NEW INSIGHT INTO THE MIGRATION PERIOD CEMETERY IN DRAVLJE (LJUBLJANA, SLOVENIA)

Karo, Špela (Zavod za varstvo kulturne dediščine Slovenije) - Županek, Bernarda (Museum and Galleries of Ljubljana) - Leskovar, Tamara (Department of Archaeology, Faculty of Arts, University of Ljubljana) - Koncz, István (Institute of Archaeological Sciences, Eötvös Loránd University) - Vyas, Deven (Department of Ecology and Evolution, Stony Brook University) - Veeramah, Krishna (Department of Ecology and Evolution, Stony Brook University) - Tian, Yijie (Department of Ecology and Evolution, Stony Brook University)

On the outskirts of Roman colony of Emona (Ljubljana/Slovenia), alongside the road to Carnium, lies a cemetery from the Migration Period. It is dated to the late 5th and early 6th century, when the Roman colony was either in decline or had already been abandoned. Rescue excavation of the cemetery in 1968 and 1969 yielded 49 inhumation graves.

Archaeological and anthropological research attributed the burials to the local population as well as to the Ostrogoths and revealed a rather high number of deformed skulls. 50 years later, new scientific approaches offer the opportu-

nity to gain a more comprehensive understanding of this apparently turbulent migration period. Initial revision of the skeletal remains has already provided new information on their state of health, intentional cranial deformations and non-metric variations, indicating anomalies for the time and place in question.

The preliminary results of the preserved bone material indicate that the group buried in this graveyard was in a relatively poor state of health. Signs of malnutrition, vitamin C deficiency, inflammation or metabolic diseases are frequently present. Furthermore, some show consequences of heavy physical labour or long periods of squatting. Both the women and the men are smaller on average compared to the late Roman inhabitants of Emona, but with quite some variability between individuals.

These discoveries will be further examined using isotope and aDNA analyses in conjunction with the archaeological context and material culture to identify differences in status and lifestyle.

8 **UNEARTHING SOCIAL DYNAMICS IN LATE ROMAN LIGURIA: INSIGHTS FROM THE WESTERN NECROPOLIS OF ALBINTIMILIUM**

Defant, Sarah (Freie Universität Berlin) - Carabia, Alessandro (University of Birmingham) - Sołtysiak, Arkadiusz (University of Warsaw)

The Western Necropolis of Albintimilium/Ventimiglia, Liguria, in use between the 3rd and late 5th centuries, offers a compelling case study for understanding social dynamics within an under-researched Italian region during a period of changing societal structures and power dynamics.

New insights into this Late Roman community have emerged from combining osteological assessment of the burials and isotopic analysis of human and faunal remains, with a reassessment of the archaeological documentation and materials, and an in-depth review of the available regional zooarchaeological and archaeobotanical literature.

The isotopic data ($\delta^{13}\text{C}$: -20.0‰ to -16.3‰, $\delta^{15}\text{N}$: 7.3‰ to 11.1‰) suggests that the community relied on a terrestrial diet, based primarily on C3 plants and terrestrial animal protein, which was likely supplemented by marine resources. However, we were able to identify a significant difference in both $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values between female and male individuals interred within the necropolis. This suggests a disparity in access to dietary resources, for example foodstuffs with higher $\delta^{15}\text{N}$ baseline values such as marine fish, which hints at systemic biases in resource distribution and access. This pattern echoes a traditional Graeco-Roman society, characterised by gender-based inequalities. One particular individual, exhibiting various pathologies and below-average dietary isotopic values, could hint at an additional possible differential treatment based on specific health conditions.

This necropolis serves as a comprehensive case study wherein various disparities may be observed through a diverse array of analytical methods, offering a more nuanced understanding of the multifaceted social dynamics present within this site and therefore contributing to a deeper understanding of this pivotal time period in a previously often overlooked part of the Roman Empire.

9 **BIOARCHAEOLOGICAL PERSPECTIVES ON LATE ANTIQUITY IN DALMATIA: PALEOGENETIC, DIETARY, AND POPULATION STUDIES OF THE HVAR RADOŠEVIĆ BURIAL SITE**

Zagorc, Brina (Department of Evolutionary Anthropology, University of Vienna, Austria; Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Austria) - Blanz, Magdalena (Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Austria; Vienna Institute of Archaeological Sciences (VIAS), University of Vienna, Austria) - Gelabert, Pere (Department of Evolutionary Anthropology, University of Vienna, Austria; Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Austria) - Sawyer, Susanna (Department of Evolutionary Anthropology, University of Vienna, Austria; Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Austria) - Carić, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research, Ljudevita Gaja 32, 1000 Zagreb, Croatia) - Visković, Eduard (Kantharos, d.o.o.) - Ivanova-Bieg, Maria (Vor- und Frühgeschichtliche Archäologie, Johannes Gutenberg-Universität Mainz, Mainz, Germany) - Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research, Ljudevita Gaja 32, 1000 Zagreb, Croatia) - Reich, David (Department of Genetics, Harvard Medical School, Boston, MA, USA; Howard Hughes Medical Institute, Harvard Medical School, Boston, MA, USA; Broad Institute of MIT and Harvard, Cambridge, MA, USA) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna, Austria; Human Evolution and Archaeological Sciences (HEAS), University of Vienna, Austria)

This research investigates a Late Antique burial site on the Croatian Dalmatian island of Hvar, spanning from the 3rd to the 5th centuries. Using paleogenomics and stable isotope ratio analyses ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$), a total of 33 individuals buried at the site were examined. Among them, 18 were buried within a confined grave tomb, while the remaining individuals were buried in separate burials within the tomb's proximity. Utilising this interdisciplinary approach, our objective was to address questions regarding the ancestry, dietary habits, and population structure, aiming to gain insights into the lives of the inhabitants of this island during this historical period.

Ancestral origins were assessed through the application of qpAdm, while genetic diversity was evaluated using Principal Component Analysis. Results indicated a diverse population, reflective of the genetic variability characteristic of the era. Genetic outliers were identified, suggesting affiliations with distinct regions of the Roman Empire, connected with the trade routes associated with the Late Antique port in ancient Hvar. Paleodietary analysis, involving bone collagen extraction from the ribs of 15 individuals, revealed a predominant consumption of C3 plants, with limited to potentially negligible intake of marine foods.

Exploration of kinship and dietary patterns revealed no discernible distinctions between individuals buried within the tomb and those buried outside, indicative of an absence of differential burial practices based on social status. The outcomes of this investigation contribute not only to a better understanding of the specific community analysed in this paper but also enrich our broader understanding of the lives of individuals in Dalmatia during the Late Antiquity within the Roman Empire.

10 **DOUBLY MARGINALISED? UNFREE, PARAHUMAN AND SOCIALLY DEAD 'BODY OBJECT' CHILDREN IN LATE IRON AGE SCANDINAVIA**

Marshall, Brad (University of Leicester (UK); BODY-POLITICS Project (ERC Funded))

As social stratification intensified during the Late Iron Age (c. AD450-1050) in Scandinavia, at the very bottom of the social ladder there emerged significant nonprivileged populations of individuals, unfree and denied social personhood. Significantly, children within these populations might be considered to represent doubly marginalised group(s), both through age and social status. However, to date there has been no focussed study of unfree children in Scandinavia. Nonetheless, extrapolating from archaeological, terminological and textual evidence, we can be confident unfree children were present in Late Iron Age Scandinavia and it is not implausible they represented a not insignificant fraction of the demographics of unfree and wider populations. To better enable identification of possible unfree individuals in the Late Iron Age mortuary record calls have been made for more multi-stranded investigations where burials and grave goods are assessed alongside bioarchaeological analyses such as of isotopes, aDNA and/or osteology. Such research has already begun to demonstrate intriguing, if contentious, results. And, moreover, this methodology could prove fruitful in explorations of children as 'bodied objects' – a recent reconceptualisation of potential non-personhood of infants and children, whose bodies were broken apart and/or deposited in settlements and wetlands.

This paper will combine bioarchaeologies with social theory and build on departures in the archaeologies of slavery and personhood and multi-stranded appraisals of the burial record, alongside taking inspiration from reconceptualisations emerging from the posthumanist and Ontological Turns which have reframed unfree individuals as a distinct kind of non-humans, that is parahumans, and application of a framework of 'The Archaeological Post-human (child)'. Through this it will explore a methodology for enabling identification of not only possible cases of unfree and 'body object' children encountered within normative, atypical, cemetery and non-cemetery burial contexts – but also opening a route to investigating such individuals' possible lifeways and deathscapes.

11 **UNLOCKING THE POTENTIAL OF BIOARCHEOLOGICAL ANALYSIS TO UNDERSTAND SOCIO-ECONOMIC STATUS DURING THE EARLY MIDDLE AGES IN NORTHERN ITALY**

Marinato, Maurizio (Dipartimento dei Beni Culturali Università degli Studi di Padova) - Chavarria Arnau, Alexandra (Dipartimento dei Beni Culturali Università degli Studi di Padova)

Recent research in bioarchaeology of early medieval populations in northern Italy has predominantly focused on sites such as churches and Lombard cemeteries. Consequently, the findings cannot be regarded as a comprehensive representation of medieval society. This paper aims to underscore the necessity of comparing diverse burial contexts of the early medieval population. It seeks to investigate whether factors such as diet, health, and occupation were predominantly influenced by the socio-economic status of the population and to what extent, while also exploring the impact of environmental factors on these parameters.

As a case study, this paper will examine the Veneto area where multidisciplinary studies have allowed for intriguing interpretations of urban and rural transformation phenomena. Despite limitations in available archaeological data, this study aims to shed light on these transformations in contexts where the social status of the deceased cannot be precisely determined.

Bioarchaeology offers a valuable opportunity to integrate historical and molecular research on diet and health. Additionally, it provides insights into the interplay between environment, diet, and health, and examines how migrating populations contributed to dietary habits during transitional periods.

135 ALL IN ONE BREATH: (BIO)ARCHAEOLOGICAL APPROACHES TO RESPIRATORY DISEASES

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Casna, Maia (Leiden University) - Davies-Barrett, Anna (University of Leicester) - Magalhães, Bruno (University of Coimbra)

Session format: Regular session

According to the World Health Organization, respiratory disorders (e.g., sinus, ear, or pulmonary infections) are currently among the greatest contributors to the global burden of disease and constitute one of the most recurring causes of impairment and death. The aetiologies of these conditions vary greatly and range from environmental conditions (e.g., climate change, poor air quality) to cultural factors, such as tobacco and alcohol consumption, occupational hazards, diet, and more. Because of their prevalence today, many archaeological studies have recently begun to address the impact that respiratory infections may have had on the well-being of past populations. However, the intricate aetiology of most respiratory disorders often makes it difficult to interpret results in past populations and, to date, there are only few, limited guidelines on how to assess their prevalence.

The goal of this session is to provide valuable insights into the intricate nature of respiratory diseases and their study in archaeological and/or historical populations, utilizing diverse research methodologies and approaches produced from both bioarchaeological and clinical studies. By generating discussion on respiratory diseases and exploring the intricate connections between these diseases and human environments, our goal is to contribute to the current archaeological comprehension of respiratory infections and to create a platform for future research endeavours.

We welcome both papers and posters that:

- Analyse patterns of prevalence and distribution of respiratory diseases among ancient populations through different (bio)archaeological methods.
- Explore the methodologies employed in diagnosing respiratory diseases in archaeological remains, showcasing innovative techniques and/or technologies.

As we collectively investigate patterns of prevalence, distribution, and innovative diagnostic techniques, we not only enrich our understanding of the human past but also lay the foundation for more comprehensive research in the future.

ABSTRACTS

1 A SLOW DEATH: INVESTIGATING ENVIRONMENTAL POLLUTANT EXPOSURE AND ITS INFLUENCE ON HEALTH IN ROMANO-BRITISH TO POST-MEDIEVAL ENGLISH POPULATIONS

Falco, Paige (University of Reading) - Lewis, Mary (University of Reading)

Traditionally, research into past environmental health has relied on comparing the prevalence of skeletal pathologies between urban and rural populations. This project investigates how environmental pollutants impacted past health in England and explores whether toxic trace element concentrations are connected to the development of skeletal pathologies. The pathologies investigated were determined through assessing modern environmental toxicology literature relating to toxic elements and the development of bone diseases. This study focuses on the impacts of aluminium, antimony, arsenic, cadmium, lead, and tin. The sample population comprised of 649 individuals, 170 from one Roman (urban), 137 from two Early Medieval (111 rural and 26 suburban), 153 from three Late Medieval (94 suburban and 59 urban), and 189 from two Post-Medieval (99 suburban and 90 urban) sites in Southern England, dating from 300 to 1896 CE. Individuals were evaluated for macroscopic signs of maxillary sinusitis, visceral rib lesions, vitamin D deficiency, anaemia, osteoporosis, and neoplastic disease. A subsample of individuals from Post-Medieval Redhill, with and without these skeletal pathologies, were tested for the presence of toxic metals using portable-X-Ray Fluorescence (p-XrF) and Inductively Coupled Plasma Mass Spectrometer (ICP-MS). Preliminary results for the macroscopic assessment exhibited the highest rates of maxillary sinusitis during the Roman (28.0%) and Post-Medieval (27.0%) periods. Visceral rib lesions increased in prevalence from 2.0% in the Roman period, to 9.0% in the Post-Medieval period. Differences observed between periods are suspected to be due to changes in technology, housing, cultural practices, and the chemical makeup of fuel sources, material items, medicine, and cosmetics. Future trace element analysis results will be discussed in this session. This project is one of the few to allow for a more in-depth investigation as to whether there are direct impacts on disease development in the past through supplementing macroscopic evidence of disease with chemical data.

2 REEVALUATING MAXILLARY SINUSITIS DIAGNOSIS IN PALEOPATHOLOGY: INSIGHTS FROM SKELETONIZED INDIVIDUALS AND CLINICAL STUDIES

Magalhaes, Bruno M. (Department of Life Sciences, University of Coimbra, Portugal; CIAS – Research Centre for Anthropology and Health, University of Coimbra, Portugal) - Mays, Simon (Historic England; Department of Archaeology, University of Southampton; School of History, Classics & Archaeology, University of Edinburgh) - Santos, Ana (Department of Life Sciences, University of Coimbra, Portugal; CIAS – Research Centre for Anthropology and Health, University of Coimbra, Portugal)

Sinusitis is a common condition that results from the inflammation of the sinuses. Its symptoms can be disabling and lead to significant impairment of quality of life. Nevertheless, consensus is currently lacking in the criteria for diagnosing sinusitis in Paleopathology. The present study aims to (1) test if age at death is similar in skeletonized identified individuals who present 'bone depositions' and/or 'bone resorptions' (2) and which lesions usually recorded as evidence of sinusitis may or may not be considered pathognomonic of the disease. A sample of 2023 crania from the Medical Schools and International Exchange Skull collections (University of Coimbra) and from the Human Identified Skeletal collection (University of Lisbon) were used (19th-20th centuries). Individuals with at least one maxillary sinus were macroscopically inspected for bone depositions (spicule-type bone formations, remodeled spicules, lobules, and plaque) and bone resorptions (pitting and white pitted bone). Fifty-five point seven percent (486/873) of the individuals had evidence of bone depositions and resorptions. Mean age at death is higher in individuals showing isolated bone formations ($n=311$, $\bar{x}=48.44$, $s.d.=21.48$) compared with individuals with isolated bone resorptions ($n=47$, $\bar{x}=36.81$, $s.d.=25.70$), with significant differences (Mann-Whitney $U=5150.5$; $p=0.001$). Age at death of individuals with both types of lesions is 48.35 years old ($n=113$, $s.d.=25.17$). The present results reject our first hypothesis. These results show that a considerable number of individuals may exhibit pits either with physiological (e.g., posterior tooth eruption) and/or pathological (e.g., sinusitis, oral pathology) origin. Moreover, clinical imaging studies confirmed the identification of incidental mucosal sinus findings without the presence of clinical symptoms. These findings should also raise questions if paleopathologists should consider bone formations as pathognomonic of sinusitis since the clinical diagnosis of the disease does not imply its presence and there is still a lack of clinical studies concerning its etiology and symptomatology.

3 INVESTIGATING SINUSITIS PREVALENCE AMONG SEXES IN THREE SOCIOECONOMIC GROUPS IN THE POST-MEDIEVAL NETHERLANDS: A SEX-STRATIFIED ANALYSIS

Casna, Maia (Leiden University) - Schrader, Sarah (Leiden University)

Prevalence rates of chronic maxillary sinusitis (CMS) have long been associated with various causation factors, including exposure to indoor smoke and open fires. Prevailing archaeological narratives have often correlated a greater susceptibility to CMS with women, primarily based on the assumption that women occupied domestic spaces (e.g., cooking, tending to children and to household fires), resulting in increased indoor exposure. However, recent bioarchaeological studies have challenged this assumption by revealing no significant disparities between sexes in sinusitis prevalence among several populations, hinting at a more intricate narrative of women's role in past societies. To contribute to this body of knowledge, our research delves into CMS prevalence rates within three post-medieval Dutch populations of different socioeconomic status (i.e., low, middle-low, high). We hypothesize that variation in lifestyle among these socioeconomic groups might have differentially exposed both males and females to CMS.

A total of 341 individuals were analyzed macroscopically for CMS. Of these, 165 (48.4%) showed skeletal changes indicative of sinusitis (low status: 48.6%; middle-low status: 34.2%; high status: 54.2%). Interestingly, while females generally exhibited higher rates of CMS than males, differences were not statistically significant in any of the socioeconomic groups under study. Statistically significant differences were exclusively observed in males, between the low and middle-low socioeconomic groups ($X^2=4.672$, $p=0.04$), and in females, between the middle-low and high socioeconomic groups ($X^2=4.581$, $p=0.05$). Our results reflected the complicated relationship between socioeconomic status, sex, and sources of respiratory stress. Although people from different socioeconomic groups in post-medieval Netherlands lead extremely different lives, they seem to have faced similar health challenges. Factors such as working conditions, living environments, and cultural practices likely wielded significant influence over health outcomes of both males and females. Hence, our findings hold significant implications for gaining valuable insight into the complex interplay between socioeconomic disparities, gender, and health.

4 AN INVESTIGATION OF THE PREVALENCE OF RIB LESIONS IN SCOTLAND AND IRELAND THROUGH THE MEDIEVAL CLIMATE TRANSITION

Roshem, Irmine (University of Aberdeen) - Dittmar, Jenna (Edward Via College of Osteopathic Medicine; University of Aberdeen) - Carlsson, Stine (Queen's University Belfast) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (University of Aberdeen; Australian National University) - Murphy, Eileen (Queen's University Belfast)

Chronic inflammation of the lungs can be caused by a range of respiratory conditions (e.g., tuberculosis, pneumonia, lung cancer). In human skeletal remains from archaeological contexts, evidence of chronic pulmonary inflammation can be recognised by the formation of new bone on the visceral aspects of ribs. This research seeks to explore the prevalence rate of rib lesions in the medieval populations of Scotland and Ireland. In particular, the impact of the 14th-century climate transition from the Medieval Warm Period (MWP) to the Little Ice Age (LIA) is considered. The rib cages of adult individuals (>18 years of age) from two medieval Irish sites – Ballyhanna (n=408), Ranelagh (n=74) – and four Scottish sites – Aberdeen Carmelite Friary (n=46), Aberdeen Franciscan Friary (n=3), the Kirk of Saint Nicholas (n=155), and Tullilum Perth Carmelite Friary (n=24) – were analysed. The results show that the overall raw prevalence rate of rib lesions in Scotland (28%) was only slightly higher than in Ireland (22%). The odds ratio revealed that during the MWP, the odds of having chronic pulmonary inflammations in Ireland are twice that of Scotland (p=0.070). However, the opposite is seen during the LIA (p=0.000). In both regions, the prevalence of rib lesions is higher in biological male groups regardless of climate periods. The similarities between overall distribution patterns suggest genetic and sex-specific anatomical predispositions and/or consistencies in exposure to risk factors in Scotland and Ireland (e.g., gender-based activities). However, the regional disparities during the MWP and LIA highlight differences in everyday life experienced by the studied populations (e.g., environmental stress). The comparison between the Scottish and Irish groups living before and after the medieval climate transition is further investigated to understand the role of climate in the incidence of chronic pulmonary inflammation.

5 TUBERCULOSIS IN THE PAST - FROM SKELETAL DATA TO PALEOEPIDEMIOLOGICAL ANALYSIS

Pedersen, Dorthe (ADBOU - Unit of Anthropology, Department of Forensic Medicine, University of Southern Denmark)

Tuberculosis has caused the deaths of millions of people over the last several centuries, and it remains a major public health concern. Yet for most of human existence, the impact of tuberculosis on society is largely unknown. It is, indeed, unknowable without methods suitable for estimating disease prevalence in skeletal samples. Here a two-step approach is presented that associate skeletal indicators and disease diagnosis using a probabilistic approach and uses this method to model the prevalence of tuberculosis in Danish archaeological skeletons.

The skeletal lesions and disease diagnosis were associated in a case-control study including 480 skeletons from 20th century American collections. One-half of the skeletons were documented tuberculosis cases (Terry Collection). The remaining age and sex-matched skeletons were controls (Bass Collection). The association between 18 candidate skeletal lesions and tuberculosis was established by comparing lesion distributions in case and control groups. Bony indicators at six locations – visceral surface of ribs, ventral vertebral bodies, lateral part of ilium, acetabular fossa, iliac auricular surface, and ulna olecranon process – occurred significantly more often among cases than controls and were associated with one another.

These six indicators were recorded in 713 adult medieval and early modern Danish skeletons from the town of Ribe. A likelihood-based model using the sensitivity and specificity measures of the bony indicators were applied to data. The results showed that tuberculosis increased from 17% to 40% in the medieval to early modern periods in Ribe. Differences in the model's fit indicate the skeletal expression changed over time. Notably, rib lesions increased in frequency from the medieval to early modern periods.

The approach presented here can provide insights into the presence of tuberculosis in the distant past where no written sources are available and thus broadening our understanding of the impact of this disease.

6 A GLIMPSE INTO THE SPATIO-TEMPORAL DISTRIBUTION OF TUBERCULOSIS IN THE 1ST-5TH-CENTURY-CE CARPATHIAN BASIN - HOW DIAGNOSTICS DEVELOPMENT CAN EXPAND KNOWLEDGE

Spekker, Olga (Ancient and Modern Human Genomics Competence Centre, University of Szeged, Szeged, Hungary; Department of Biological Anthropology, University of Szeged, Szeged, Hungary; Institute of Archaeological Sciences, Eötvös Loránd University, Budapest, Hungary) - Kis, Luca (Department of Biological Anthropology, University of Szeged, Szeged, Hungary; Department of Archaeogenetics, Institute of Hungarian Research, Budapest, Hungary) - Madai, Ágota (Department of Biological Anthropology, University of Szeged, Szeged, Hungary; Department of Anthropology, Hungarian Natural History Museum, Budapest, Hungary) - De Andrés, Marcos (Department of Biological Anthropology, University of Szeged, Szeged, Hungary) - Szalontai, Csaba (National Institute of Archaeology, Hungarian National Museum, Budapest, Hungary) - Lukács, Nikolett (National Institute of Archaeology, Hungarian National Museum, Budapest, Hungary) - Patyi, Eszter (Kecskeméti Katona József Museum, Kecskemét, Hungary) - Varga, Sándor (Department of Archaeology, University of Szeged, Szeged, Hungary; Department of Archaeology, Móra Ferenc Museum, Szeged, Hungary) - Kiss P., Attila (Department of Early Hungarian and Migration Period Archaeology, Pázmány Péter Catholic University, Budapest, Hungary) - Tihanyi, Balázs (Department of Biological Anthropology, University of Szeged, Szeged, Hungary; Department of Archaeogenetics, Institute of Hungarian Research, Budapest, Hungary)

Diagnosing tuberculosis (TB) in past human populations is challenging, but the disease is well-known in the palaeopathological record. Reports of archaeological TB cases provide invaluable information about when and where the disease was present in the past. Although in Hungary, the palaeopathological research of TB was begun in the 1970s, little is known about the spatio-temporal distribution of the disease in the 1st–5th centuries CE. The aim of our paper is to present seven newly discovered archaeological TB cases – one (SPF19) from the Hun period and six (HK199, HK201, HK225, HK253, HK309, and KD429) from the Sarmatian period of the Carpathian Basin. Detailed macro-morphological evaluation of the skeletons focused on the detection of lesions likely related to different manifestations of TB, including endocranial alterations suggestive of TB meningitis (e.g., granular impressions/GIs). In all seven cases, it was the presence of TB-specific GIs on the inner skull surface based on which the diagnosis of TB could have been established. It should be emphasised that during the previous palaeopathological investigations, GIs have not been considered as their diagnostic value has been strengthened only recently. Thus, the presented cases highlight the paramount importance of diagnostics development. In addition, they expand our knowledge and understanding of TB in the 1st–5th-century-CE Carpathian Basin: 1) The identification of SPF15 proves the presence of the disease in the Hun period. And 2) thanks to the discovery of HK199, HK201, HK225, HK253, HK309, and KD429, the number of TB cases known from the Sarmatian period tripled, suggesting that the disease was likely more frequent in this period than previously thought. To get a more accurate picture about the burden that TB could have put on these past human populations, the systematic macromorphological (re-)evaluation of osteoarchaeological series from the 1st–5th-century-CE Carpathian Basin would be desirable.

7 METAL DETECTING: BIOMOLECULAR INVESTIGATIONS OF TRANSYLVANIAN CHILDREN WITH S(CU)RVY

Filipek, Kori (University of Derby)

The Jucu de Sus site (1070 – 1154 calAD) in Transylvania (Romania) is marked by numerous settlement sites and a large biritual cemetery (cremations and inhumations). To date, excavations have recovered the skeletal remains of 52 individuals, of which, 40% are children. Despite the high percentage of non-adults, age-at-death distributions lean towards a catastrophic mortality profile, potentially due to infectious disease, environmental pollution, food insecurity, or a combination of these factors.

Most grave goods are found in the non-adult burials (n=21), which are decorated with copper jewellery customarily associated with Slavic contexts spanning from Central Asia to Eastern Europe in the 11th – 13th centuries AD. Unusually, all non-adults with observable skeletal elements exhibit lesions consistent with scurvy. Currently, scorbutic lesions are attributed to dietary deficiencies, however, copper toxicity from elevated environmental exposure can inhibit collagen production thereby causing scurvy in affected populations. Given the presence of copper jewellery within children's graves, and the capacity for metal smelting practices to generate environmental plumes of copper dust, it is worth investigating the potential impact of these metallurgic traditions on community health.

This research aims to employ a novel approach combining measurements of copper and heavy metal concentrations from non-adults with scurvy to further explore whether the creation of their grave goods affected their lived health status. Trace element analyses using ICP-MS provide heavy metal concentrations reflect in vivo environmental pollution exposure, palaeopathological analyses demonstrate the ubiquity and distribution of metabolic lesions in non-adults, paired with carbon and nitrogen isotope analyses providing insight into lifelong dietary status, and amelogenin peptide analyses offers chromosomal sex to better understand children's burial customs. The results from

this research demonstrate both boys and girls buried with jewellery, and all show elevated heavy metal concentrations revealing the impact of environmental pollution on childhood metabolic health.

8 BREATHING TIME: A LONGUE-DURÉE MULTIDISCIPLINARY STUDY OF RESPIRATORY ILLNESSES AND AIRBORNE DISEASES (RIAD) IN SWITZERLAND (16TH - 21ST CENTURY CE)

Hofstetter, Tobias (University Center of Legal Medicine Lausanne-Geneva, Lausanne University Hospital and University of Lausanne, Geneva University Hospital and University of Geneva, Switzerland) - Fauvel, Aude (Institute of Humanities in Medicine (IHM), Lausanne University Hospital and University of Lausanne, Switzerland) - Grabherr, Silke (University Center of Legal Medicine Lausanne-Geneva, Lausanne University Hospital and University of Lausanne, Geneva University Hospital and University of Geneva, Switzerland) - Moghaddam, Negahnaz (University Center of Legal Medicine Lausanne-Geneva, Lausanne University Hospital and University of Lausanne, Geneva University Hospital and University of Geneva, Switzerland)

In 2017, close to 7% of the world population was affected by a form of RIAD; ranking them among the 3 leading causes of death worldwide (alongside cardiovascular diseases and neoplasms). This figure is on the rise according to recent studies, with substantial variations in regional and age-sex specific subgroups. To apprehend the local dynamics underlying the evolution of RIAD, this paper investigates their effect on Swiss mortality, from the 16th and the 21st century.

Historical, demographical, statistical, medical, and bioarchaeological data from archive material and previous studies were reviewed. An intersectional multidisciplinary approach was developed to organize and analyze data stemming from different disciplines. The following points were addressed: characterization of socioenvironmental factors guiding the risk of suffering from a RIAD, permanence of such factors through time and space, correlation of RIAD occurrence in regard to the history of a region and ways in which a better understanding of RIAD dynamics in the past allows to draw lessons for their future sustainable management.

These points were tackled by compiling available data into normalized crude mortality, natality, and respiratory disease mortality rates per thousand inhabitants and placing them within the demographic and epidemiological transition model. This model serves as reading grid to the observed pathological and demographic evolutions.

Our results underline the considerable impact of industrialization on the respiratory signature of perialpine populations. Further, they evidence the selective and versatile nature of the pressure exerted by RIAD on specific socio-economic and demographic classes. Albeit of uneven quality, the available sources provide a robust outlook on the longue-durée evolution of RIAD.

This paper's results might prove to be of interest to a wide array of scholars, clinicians, and policymakers, in search of a contextual basis while studying or managing respiratory diseases and their consequences.

9 EXPLORING THE HEALTH BURDEN OF SMOKING-RELATED RESPIRATORY DISEASE IN THE PAST

Davies-Barrett, Anna (University of Leicester) - Inskip, Sarah (University of Leicester)

It has long been recognised that respiratory disease was a common ailment in past populations. This can be identified in archaeological individuals by changes to the skeleton as a result of respiratory tract inflammation. Bioarchaeological studies of respiratory disease frequencies have found differences between groups according to biological sex, age, socioeconomic status, time period, and environment, which provide valuable information about the effects of different risk factors on respiratory health. However, little has been done to consider in-depth the impact that respiratory disease had on the quality and length of life of those who had it. Today, tobacco smoking is one of the major risk factors for respiratory disease, increasing susceptibility to developing conditions such as chronic obstructive pulmonary disease, asthma, bronchitis, pneumonia, rhinosinusitis, and tuberculosis. The introduction of the drug to Europe in the mid-sixteenth century is likely to have affected rates of respiratory disease, increasing health burdens. Using approaches stemming from bioarchaeology of care and modern methods for estimations of health burden, this paper will explore the possible lived experiences of smoking and non-smoking individuals who suffered from respiratory disease and the impacts this had on society as a whole. Using prevalence data for respiratory disease from post-medieval populations from Britain and the Netherlands, the paper seeks to marry palaeopathological data, historical context, and modern clinical knowledge to gain greater insight into the lived experiences of past individuals. This approach is applicable not only to respiratory diseases, but a range of palaeopathological conditions present in the past.

139 UNDERSTANDING THE BROADER PICTURE: MULTI-SITE AND LONGUE DURÉE APPROACHES TO THE STUDY OF RECYCLING, REPAIR, AND SECONDARY USE IN ANTIQUITY

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Intagliata, Emanuele (Università degli Studi di Milano) - Dobrev, Diana (Università degli Studi di Verona) - Barker, Simon (Ghent University)

Session format: Regular session

Circular economic models—based on reusing, repairing, refurbishing and recycling existing materials and products—have been the subject of much attention in the past decades by historians and archaeologists. However, most studies on the topic have been geographically or chronologically limited to single sites, periods, or archaeological contexts. Wider regional or suparegional perspectives have been hindered, for example, by the nature of the evidence and the costs of archaeometric analyses. Without multi-site or longue durée approaches, we lack the ability to delineate overarching patterns in the history of circular economies or the process, structures, and materials that made recycling and re-use important economic practices.

The scope of this panel is to go beyond the traditional approaches to circular economies in antiquity by exploring studies from broader temporal and geographic contexts that will attempt to answer the following questions:

- What are the challenges of studying circular economies in antiquity with multi-site and longue durée perspectives?
- What methodologies can be used to effectively and systematically collect and interpret existing datasets?
- What insights or results have broader studies of the circular economy shown? How do circular economies vary over time? How do circular economies differ across multi-sites?
- Are certain materials or products intrinsically more (or less) suited to circular economies?

Are successful circular economies organised around cost-saving—or profit-driven models? Does this vary according to the material or product?

- What is the circulation of high-quality compared to low-quality materials within circular economies? How does this change over time?

We welcome proposals for papers dedicated to circularity in antiquity with a specific focus on pottery, glass, metal, and building material from the Roman to the Medieval periods in the Mediterranean basin.

ABSTRACTS

1 WHAT'S NEXT? LONGUE DURÉE AND MULTI-SITE APPROACHES TO ECONOMIC CIRCULARITY IN ANTIQUITY

Intagliata, Emanuele (Università degli Studi di Milano)

Studies on economic circularity in antiquity have often been constrained by limited chronological boundaries or geographical scope. However, recent literature has advocated the necessity to go beyond this approach by investigating reuse, repair, and recycling over a long period. To what extent is this a feasible research approach? What are its benefits and disadvantages? How can we effectively implement a multi-site, longue durée methodology to study reuse, recycling, and repair in antiquity?

This paper aims to reflect on these and other questions by presenting some of the results of 'Project CircE: Drivers of change in ancient circular economies over the longue durée'. This PRIN 2022 PNRR-funded project aims to create a research protocol to explore qualitatively and quantitatively how circular economies changed and developed from the 1st century to the 6th century CE. The site case studies are in northern Italy and include Aquileia, Calvatone, Cremona, Verona, and Villa Bartolomea.

2 ENHANCING CONTINUITY: CASE STUDIES ON POTTERY ADHESIVES DURING THE QIN AND HAN DYNASTIES IN CHINA

Ge, Ruochen (School of Cultural Heritage, Northwest University) - Yang, Lu (School of Cultural Heritage, Northwest University) - Shen, Maosheng (Emperor Qin Shihuang's Mausoleum Site Museum) - Sun, Jie (Chengdu Cultural Relics and Archaeology Research Institute) - Zhou, Linlin (Qingzhou Museum)

During the Qin and Han dynasties in China (221 BC~220 AD), the utilization of pottery sculptures as burial artifacts in the tombs of emperors and nobles was prevalent. Residual adhesive materials were frequently discovered on unearthed pottery figurines and horses. In addition to restoring pottery products, these adhesives were often derived

from the recycling of other materials. This study conducted analyses of pottery adhesives unearthed from three sites: the No.1 burial pit of the Terracotta Warriors at the Mausoleum of Emperor Qin ShiHuang (S1), a Han Dynasty cliff tomb in southwestern China (S2), and a Han Dynasty burial pit in eastern China (S3). Various analytical methods, including microscopic observation, elemental analysis, phase analysis, chemical bond analysis, immunoassay, and proteomics, were conducted to explore the composition of these materials. The findings revealed that the adhesive from S1 comprised pottery powder (from grinding defective pottery figurines), animal glue, and eggs; the adhesive from S2 consisted of clay and protein binders, while the adhesive from S3 was composed of clay and bovine bone particles (possibly from grinding discarded animal bones). From the above results, it can be inferred that these adhesives on pottery products are usually a mixture of organic binder and inorganic mineral fillers. Organic adhesives, known for their high viscosity and longstanding historical use, contributed adhesion to the system. Fillers are often recycled waste materials such as defective pottery and useless bones, which can enhance the strength of the system. The practice of repairing damaged burial objects and employing waste materials as adhesives may seem incongruous with the grandiosity and luxury associated with the tombs of that period. However, it shows us the craftsmen's ingenuity in maximizing material usage, revealing how they applied their wisdom to construct magnificent burial sites during a period of low social productivity and scarce material resources.

3 **TABERNA 2 OF MIROBRIGA: CRAFT AND DOMESTIC ADAPTATIONS AND CERAMOLOGICAL EVOLUTION IN THE 5TH AND 6TH CENTURIES AD**

Quaresma, José Carlos (Universidade Nova de Lisboa)

This communication addresses three major issues.

The first is the architectural evolution of a commercial space from the Imperial Period to the Visigothic Period, a chronology of around five centuries during which it housed commercial, later craft and finally residential functions.

Secondly, the phasing of the stratigraphy from Taberna 2 have been made through the full quantification of the main typologies (terra sigillata, lamps, amphorae, glasses, and other minor typologies) calculating their degree of residuality and intrusiveness.

The third issue is the stratigraphic, technological and statistical analysis of the coarse ware (local or regional), particularly in a period that has not yet been investigated stratigraphically in what is now the Portuguese territory - the first half of the 6th century AD. This line of research follows other work carried out in Mirobriga, applying dating proposals by statistical comparison with stratigraphic data from other peninsular areas, such as Lisbon and Madrid.

4 **HOW THE REUSE AND MULTIPLE-USE OF AMPHORAE AFFECTED THE CIRCULAR ECONOMY IN ROMAN TIMES**

Dobrev, Diana (University of Verona)

Our ability to interpret trade networks and foodstuffs consumption and distribution in Roman times through using amphorae as proxy evidence is entirely affected by the assumption that an amphora type is linked to a particular foodstuff for single use. Nevertheless, recent developments, including chemical analysis, are increasingly offering the means to approach the reuse and multiple-use of containers as a valuable method for understanding how economic circularity evolved in ancient times. A particularly valuable perspective in this regard was driven by some sites in northern Italy where amphorae were first reused to contain different foodstuffs and then were recycled to drain and improve the soil's static capacity and dry building areas.

Starting from this point, we will analyse case studies in Verona and its territory to establish general trends in the consumption and trade of foodstuffs and how this would have affected the circular economy.

The organic residual analyses performed on some selected items have challenged the everyday type-prime use content relation. Thus, the results obtained confirm and better identify some hypotheses made on the typological basis and, on the other hand, illustrate a variety of food products that were stored and may be shipped in amphorae.

The possibility of reuse and multiple uses of transport containers made it possible to obtain a new overview of foodstuff consumption in Verona and its territory during Roman times. It significantly improved our knowledge of how the circular economy was affected by the range of foodstuffs and goods that can be traded in reused and multiple-used amphorae.

5 **STONE RECYCLING IN POTTERY PRODUCTION: EXAMPLES OF SUSTAINABLE PRACTICES IN NORTHERN ITALY AND BEYOND**

Riccato, Anna (Ministero della Cultura, Direzione Regionale Musei Veneto)

In the last few decades, several archaeological and archaeometric studies on Roman and Late Antique coarse wares have highlighted a peculiar phenomenon, i.e. the presence of fragments of marble, alabaster, and other ornamental

stones among the inclusions intentionally added to the fabric. This has been read as evidence for the use of stone-carving debris and recycled building materials for clay tempering.

Starting from some case studies of northern Italy and with a short glimpse at the neighbouring regions, the paper aims to discuss the possible technical and economic reasons for this particular artisans' choice. Moreover, an attempt will be made to reconstruct the supply chain of the recycled raw material and to hypothesise who could have been the main actors involved in its procurement. The topics will be addressed taking into account the economic context and the chronological frame of the production, following the development of the phenomenon from the end of the 1st century BCE to the 6th century CE.

6 **MAKING THE MOST OF WHAT YOU HAVE. LOOKING FOR ANALYTICAL EVIDENCE OF METAL RE- AND UPCYCLING DURING THE ROMAN AGE**

Grassi, Elisa (CRN-ISPC) - Anguilano, Lorna (ETC - Brunel University London)

In the past few years, researches on Roman metallurgy have been bringing to light increasing archaeological evidence of workshops devoted to bronze working. Analyses of debris showed that metalworkers engaged in different processes related to the creation of bronze artefacts, ranging from alloying and casting to "collateral activities" that can fall under the general definition of circular economy, such as recycling of scrap base metals and recovery of precious ones. The archaeological evidence suggests that these were carried out with varying, not always very effective methods. Several case studies from Northern Italy were investigated, in order to retrace the activities performed on each site, linking them with the historical and socio-economical context. Starting from them, it has been attempted to develop an analytical strategy aimed at the comparative reconstruction of the methodologies used, in order to shed light on the metallurgical knowledge underlying this practice, as well as on the transfer of technological know-hows throughout Europe during the Roman imperial age.

7 **REUSE OF STONE CONSOLE FROM THE ROMAN LEGIONARY CAMP BURNUM**

Jadic-Kucan, Ivana (University of Zadar) - Zaninovic, Josko (Burnum Archaeological Collection, Puljani)

A fascinating monument was discovered during the systematic archaeological research of the Roman legionary camp Burnum in 2017. It is an architectural console measuring 132.5 cm in height, 26 cm in length, and 19 cm in width. Initially, it was positioned horizontally and supported an essential part of the building, which may have been a balcony. The console had a decorative ornament of acanthus leaves and spirals, which were central and visible. Over time, the console was repurposed, the part under the acanthus leaves was carved over, and the thickness of the beam was reduced due to the addition of the Medusa relief. The console was given a new function as a fountain (lacus) by piercing a narrow spider's web-shaped opening on its back, through which a water pipe was inserted, which flowed out through the Medusa's mouth. The context of its discovery suggests that it dates back to the period from Emperor Tiberius to Claudius. It was made in Burnum, indicated by the material carved from local limestone. It is believed that the console was cut during the construction of the Burnum principle, with the arrival of XI along with legions of craftsmen, sculptors, and stonemasons who organized workshop production, producing sculptures in large quantities on the spot.

8 **QUALITY THROUGH QUANTITY: TRACING REGENERATIVE CONSTRUCTION PRACTICES ACROSS URBAN NETWORKS IN LYDIA, CARIA, AND PHRYGIA**

Kidd, Allison (Independent)

From the 3rd - 7th centuries AD, earthquakes rattled the densely populated regions of western Asia Minor. As destructive as these events were, recent excavations have demonstrated that this seismic activity was hardly cataclysmic for urban life. Often, it provided communities with an opportunity to update their cities in a manner that better reflected their contemporary lived experiences and expectations for the future. In cities like Laodicea, Hierapolis, Aphrodisias, and Tripolis, such construction works were so comprehensive that entire urban sectors were built anew, utilizing salvaged yet reprocessed building materials whenever possible and supplementing these with newly sourced materials.

At each of these sites, investigations to determine who undertook these efforts and how they were achieved are underway. One question that remains is whether the regenerative construction practices witnessed during later Roman periods in these cities reflect longer or broader historical patterns of urban renewal habits in Lydia, Caria, and Phrygia. The topic has not been systematically studied; most analyses are temporally or geographically isolated in purview. However, earthquakes and other instances of natural and human-derived destruction were nothing new to inhabitants in these areas. It therefore stands to reason that such widespread circular economic practices in later antiquity related to and probably derived from procedures established in earlier periods.

To advance this hypothesis, it is necessary to understand where and how circular patterns over the longue durée across multiple cities have been overlooked, even among proximate urban networks. This paper uses sculpted building

materials as key evidentiary entry points to the issue and proposes a potential methodological solution whereby existing datasets can be redeployed and new data can be generated more efficiently and effectively. It thus posits that a qualitative understanding of the phenomenon can be derived, but only through a more quantitative assessment of the evidence.

143 RESOURCECULTURES - SOCIO-CULTURAL DYNAMICS AND THE USE OF RESOURCES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Bartelheim, Martin (Universität Tübingen) - Della Casa, Philippe (Universität Zürich) - Scholten, Thomas (Universität Tübingen)

Session format: Session with keynote presentation and discussion

The question of what role do resources play in societies from early history to the present day in order to emerge, maintain and change is the focus of this session. Resources are understood as what moves societies and are thus the bases of social life. Beyond a naturalistic or economic perspective, resources represent much more. They are not only naturally given raw materials or economic means, but also specific foundations of the becoming and passing of societies. According to this view, all resources are culturally constructed and the results of historical developments. They can be both material and non-material, either in the form of soils, energy sources, materials, building materials or food, but also in the form of knowledge, speech or memories and related practices. The use of these resources gives rise to social relations and identities, which in turn have an impact on societies and on the things themselves. Resources are at the center of actions and processes, and specific ways of dealing with them can be identified.

This session focuses on the description and analysis of the multi-layered socio-cultural dynamics in dealing with resources. We invite contributions to the discussion of the role of resource use in historical processes, mirrored in the archaeological record and in artefacts with a special emphasis on a cultural perspective on resources. The resources in question can be of various kinds, the key element is that people attribute a cultural value to them for their form of living together. The aim is to make a contribution in archaeology and its neighboring disciplines to move away from an essentialist understanding of resources and to emphasize the importance of their manifold manifestations for social and political processes.

ABSTRACTS

1 RESOURCECULTURES - SOCIO-CULTURAL DYNAMICS AND THE USE OF RESOURCES. INTRODUCTION INTO THE TOPIC

Bartelheim, Martin (Universität Tübingen) - Della Casa, Philippe (Universität Zürich) - Scholten, Thomas (Universität Tübingen)

The question what resources are, stands at the beginning of understanding the handling of resources and their meaning for socio-cultural processes. This relates to one of the grand challenges in archaeological and anthropological research which is the question how societies emerge, maintain themselves and change. Here, relationships between resources, their networks and interconnections are of great importance, as well as the role of materiality, preservation and destruction, and knowledge resources.

Why do people of different societies choose very specific resources and why do they develop their own ways of dealing with them? This cultural dimension, it is thought, has an influence on the shaping of social order. It offers an evaluation of resources in relation to this order and provides guidelines for the appropriate use of resources. The associated cultural ideas and actions are not rigid and unchangeable. On the contrary, they are subject to continuous change, induced in particular by the way resources are handled. Thus, on the one hand, these resource dynamics are the product of specific social and cultural orders; on the other hand, they contribute to their change.

This presentation elucidates the theoretical basis of the concept of ResourceCultures and its applicability in archaeology. The possibilities to detect the role of resource use in historical processes and its implication for socio-cultural developments are discussed. This will be illustrated with examples from several disciplinary contexts.

2 TOPOGRAPHIC, CLIMATIC, AND DEMOGRAPHIC RESOURCES FROM A DIACHRONIC SOCIO-ENVIRONMENTAL SYSTEM PERSPECTIVE: THE CASE OF THE BERNESE SEELAND (CH)

Della Casa, Philippe (University of Zurich) - Blum, Jonas (University of Zurich) - Geitlinger, Timo (University of Zurich) - Griessen, Céline (University of Zurich) - Medarić, Igor (University of Zurich; University of Ljubljana)

Socio-environmental systems (SES) are defined as groups of humans, social factors, and environmental processes that interact with each other through time (Biggs et al. 2021). As such, they largely contribute to the shaping of landscapes by human impact, ecological responses, and socio-economic transformations.

The Bernese Seeland, part of the western Swiss Plateau, is a landscape with both an auspicious and challenging setting: mountain ranges, moraine ridges, fertile valleys, lakes, rivers and vast swamps form an ecotope constantly under morphological transformation by system dynamics, and not least also because of human activities such as the corrections of the Jura waters in the late 19th/20th century.

Human societies repeatedly established themselves in this environment, leaving a variety of traces and impacts comprehensible through archaeology, from seasonal hunting camps to lakeshore and rural settlements, strongholds, burial mounds, tracks, bridges, harbor facilities, and agricultural terraces.

In the long-term evolution, our focus is on the mid-2nd to mid-1st mill. calBC, a period of evident landscape transformations, pronounced climatic impacts, and rapid cultural changes, i.e. the rise and decline of practices embedded in a specific – temporal, spatial, and social – resource environment that we may term “cultural”.

The paper aims at investigating in particular aspects of topography, climate, and demography in our interpretation of the archaeological record and environmental history of the Seeland.

3 MORE THAN PILES - THE RESOURCE USE OF LATE BRONZE AGE SETTLEMENTS AT LAKE BIEL (SWITZERLAND) FROM A DENDROARCHAEOLOGICAL PERSPECTIVE

Blum, Jonas (University of Zurich; Archaeological Service of the Canton of Berne)

The numerous Late Bronze Age lakeside settlements in the “Seeland” (western Switzerland), encompassing Lake Biel, Lake Neuchâtel, and Lake Murten, have provided extensive wood inventories. They were subject to detailed dendroarchaeological studies. The high density of contemporary sites found in these contexts indicates a strong human presence, which inevitably corresponds with different social demands on the landscape and resources. In order to better understand such aspects, recent research has increasingly focused on human-environment relationships and chronological issues.

The fact that the management of forest stands and the use of wood in a densely populated area has a political and social component can be demonstrated using the example of the micro-region of the lower Lake Biel basin. The modelling of forest use patterns using the dendrotypological method not only reveals the joint management of forest stands by different settlements, but also provides information on the specific fostering of individual trees.

The aim of this paper is to present and discuss dendroarchaeological methods to identify the use of wood as a resource and to raise questions about its social and political implications.

4 THE USE AND AVOIDANCE OF RESOURCES DURING THE LATE BRONZE AND IRON AGES IN THE WESTERN MEDITERRANEAN

Díaz-Zorita Bonilla, Marta (University of Tübingen) - Marciales Daza, Mauricio (University of Tübingen) - Timm, Monice (University of Tübingen) - Baten, Jörg (University of Tübingen)

Human past lifestyles are shaped by choices and decisions regarding the use but also the non-use of certain resources. According to this, we are exploring at what extent resources were available and were used in the past in areas such as the western Mediterranean. The main goal of this paper is to explore past subsistence strategies in relation to mobility and therefore, explore isolation/connectivity, and colonization in island contexts using the RessourcenKulturen framework from Tübingen large-scale research group (SFB 1070). Throughout the archaeological case of the Biniadrís cave and their funerary practices, we are investigating how past populations are making use of their resources and how both tangible and cultural, were socially constructed and embedded within the Late Bronze and Iron Ages communities in Menorca. Therefore, through the application of scientific methods such as bioarchaeology, we could identify the use of some of them, but also the avoidance of others, particularly in Menorca, something that can be replicated to other islands in the western Mediterranean. The exploration of bioarchaeological methods such as stable isotope analyses, offers valuable insights into dietary patterns, allowing us to uncover the diet of this population and its relationship towards the sea. This analysis will contribute to the general understanding of the social and cultural structures of maritime and non-maritime populations. The resource use and avoidance in Menorca, specifically in the Biniadrís cave, during the Late Bronze and Iron Ages, has revealed intriguing patterns related to the avoidance of fish consumption due to established traditions, economic factors, and geographic determinants. It emphasises the

significance of environmental variables and cultural preferences in shaping dietary choices and, therefore, a unique cultural identity.

5 A STUDY ON WELLBEING IN THE WESTERN MEDITERRANEAN AREA BETWEEN THE NEOLITHIC AND THE BRONZE AGE

Tagini, Alessandra (University of Tuebingen)

This paper attempts to explore from different perspectives the diachronic development of wellbeing in the societies of the Western Mediterranean between the Neolithic and the Bronze Age.

The Western Mediterranean area sees a historical path distinct from the development of the Ancient Near East until the Bronze Age, but cultural and technological contaminations arrive in large part of the Western Mediterranean through continental Europe. Therefore, the Western Mediterranean area results as only relatively isolated, relatively to the institutional innovations of the Ancient Near East, but overall part of the complex exchange system of Eurasia.

It is interesting to notice elements of cultural persistence in the Western Mediterranean area since the Neolithic, which then enter in the framework of the whole Mediterranean Area in the preclassical period. I study the diachronic development of wellbeing in the Western Mediterranean area, in particular Iberia and Italy, and Greece, between the Neolithic and the Late Bronze Age, considering both bioarchaeological indicators of living standards and cultural expression. Interestingly, the trends of nutrition show very different patterns in the Western part of the Mediterranean area compared to the East, in accordance with different historical processes which affected these areas. In the study of cultural expression, written records are taken into account, with a statistical study, for example, of the most used keywords and themes in a determined period, distinguishing between prosperity periods and crisis periods. Representations are also used to study the subjects most frequently depicted in a determined society, inherently connected to key elements of the oral culture.

6 SOCIO-CULTURAL DYNAMICS IN THE MANAGEMENT OF BARTONIAN TERTIARY FLINT IN WESTERN ÎLE-DE-FRANCE

Brunet, Véronique (INRAP - National Institute for Preventive Archaeological Research)

I would like to present a paper on the role of Tertiary-Bartonian flint in historical processes. How this raw material influenced the organisation of lithic production on a territorial scale on a diachronic axis between 4200 and 2150 cal. BC. The study focuses on one flint extraction site, undoubtedly the most important in the northern half of France - Jablines in Seine et Marne (Bostyn and Lanchon, 1992). Based on twenty years of applied research on the flint knapping industry of the 5th to 3rd millennia BC, the aim is to study the coherences, complementarities and evolution of the technical subsystem associated with flint tools, in particular the emblematic polished stone axe, in the long term, from the cultural perspective of the resource.

I propose a territorial approach to the management of raw materials and the relationship between Neolithic communities and space. Based on an assessment of the technical and quantitative over-investment in the production of axes in particular, we try to understand how this object may have influenced territorial organisation and, secondly, its role in the establishment of social networks (dissemination of value-added products such as polished axes in the tertiary sector) in these societies, which see differentiated production and exchange as an alternative to conflict (Keeley, 1996).

My suggestion, therefore, is that there may have been a chronological shift in the organisation of axe workshops and their integration into Neolithic society. During the Middle Neolithic II they were highly integrated and relatively collectively managed, whereas during the Late Neolithic they seemed to dissociate and become a matter for specialists, gradually giving way to more remote forms of production in the Final Neolithic.

This model provides a dynamic and stimulating picture of agro-pastoral societies.

7 WATER DYNAMICS: EXPLORING A SOCIO-CULTURAL APPROACH TO WATER MANAGEMENT FOR LONG-TERM VIABILITY IN SOUTHERN JORDAN

Marsal, Roser (Departament de Ciències de l'Antiguitat i de l'Edat Mitjana, Universitat Autònoma de Barcelona) - Carpallo, Jesús (Independent researcher) - Graham, Angus (Department of Archaeology and Ancient History, Uppsala University)

Water, a dynamic force throughout history, profoundly shapes societies, embodying a unique agency pivotal between communities and their environment. Influenced by cultural, historical, and social factors, water transcends being a mere substance; it is a narrative woven into the fabric of communities, deeply rooted in humanity's historical experiences. This integral perspective recognises water's agency, actively shaping cultural practices, influencing societal structures, and forging connections between communities and their environment.

Our research delves into fundamental aspects of water conceptualization, distribution, and use in contexts of water scarcity, using a socio-cultural approach to analyse the archaeological record of water infrastructure. Focused on the site of Sela in southern Jordan, featuring a unique water supply system spanning the Bronze Age, our study employs innovative methods, including a 3D model and Digital Elevation Model, to enhance the analysis of Sela's hydrotechnological development, encompassing hydrological and spatial assessments of the site. The investigation reveals the technical expertise of local communities in managing water supply systems, ensuring long-term viability. Additionally, it emphasises varied social organization patterns among groups in Sela, specifically related to available water resources. The examination of water use spaces reveals group dynamics, ranging from private to collective areas. Through material culture analyses, we illustrate how water stimulates human agency, playing a crucial role in shaping socio-technical and political relationships. Highlighting the agency of water, our study contributes to a broader understanding of its importance beyond natural or economic value, recognising its dynamic role in shaping the human experience and influencing the cultural identity of communities.

8 THE ORIGINS OF THE CROPS COMMODIFICATION IN A SMALL COMMUNITY. THE CASE OF THE EBA KANI SHAIE IN IRAQI KURDISTAN

Joka, Karolina (Adam Mickiewicz University)

According to Jane Jacobs, (2000) (Algaze 2008) social differentiation results from economic differentiation, and both – social revolution and urban growth – depend on economic expansion. Therefore, it is possible to investigate how variety arises inside the system, how outside resources are integrated, and finally, how they contribute to the future development causing unpredictable results. During many years of intensive studies on past social and settlements development it become evident, that emergence and development of centrally administered exchange activities known from Bronze Age urban hubs of South – Western Asia are closely linked to profound transformations in social and economic organization. Domestication of plants and emergence of agriculture in the Neolithic era were one of the major factors that triggered a series of economic and social changes which ultimately made urbanization and complex societies possible. One of many outcomes of agriculture was the increase in population, which was associated with the emergence of non-agricultural specializations and extensive forms of distribution of goods and trade. Plants therefore played an important role both as one of the factors leading to the socioeconomic changes which underpinned commodification, but also became a subject of these processes. In the current study we aim to examine the new evidence for agricultural crops distribution within the small, non - urban community and discuss it within the wide context of early commodification and redistribution of natural resources/staple goods. The archaeobotanical and archaeological insights derived from Early Bronze Age Kani Shaie (Bazyan valley, Iraqi Kurdistan) will serve here as the subject of reflections on the nature of plants in the transformative state from staples to commodities.

151 THE BEASTS AMONG US: A CLOSER LOOK AT SYNANTHROPIC HUMAN-ANIMAL RELATIONS IN THE PAST

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Hornkjøl, Ingeborg (University of Stavanger) - Baumann, Chris (University of Tübingen) - Orton, David (University of York) - Feider, Michelle (University of York)

Session format: Regular session

Synanthropism, a concept closely related to commensalism, refers to a behaviour of free-ranging animals benefiting from their shared ecology with humans. Human activities provide food resources, such as food waste or stored agricultural products, and the human-modified environment provides security and homes for these animals. As consequences of synanthropic behaviour, the population density, reproductive rate, and survival advantage of synanthropes increase. Individual home ranges typically decrease as animals feed on spatially concentrated anthropogenic resources, yet species distributions may increase as anthropogenic environments (and human transport) permit dispersal to new regions. Synanthropes are an important aspect of the human experience of animals, often taking on particular cultural significance and encouraging unique human-animal relationships, ranging from pests to pets. At the same time, their archaeological presence may provide valuable information on the conditions of past human settlements and landscape modifications.

In this session we will take a closer look at synanthropic behaviour in the past, from the palaeo-synanthropic behaviour of small scavengers in the Pleistocene, through cultural successors and introduced species such as house mice and domestic cats from the Neolithic onwards, to rats and other taxa often associated with urban settlements. We welcome submissions on any animals that have benefited from a human-made environment through time – including birds, reptiles, and even invertebrates in addition to mammals – as well as broader reviews, theoretical perspectives, and methodological contributions. We hope the session will provide a fruitful discussion encompassing all aspects of

synanthropic research, from cultural studies to the natural sciences. Finally, we want to explore how the study of syn-anthropism can illuminate aspects of past societies and provide clues to future human-animal interactions.

ABSTRACTS

1 THE PALEO-SYNANTHROPIC NICHE: THE ADAPTATION OF SMALL CARNIVORES TO A HUMAN-MADE MICROENVIRONMENT DURING THE LATE PLEISTOCENE

Baumann, Chris (University of Tübingen)

The study of paleo-synanthropic behavior, i.e., behavior of wild animals that benefit from a shared ecology with humans during the Late Pleistocene, is a very new field in archaeological research. This talk will describe and discuss the concept paleo-synanthropic behavior and the associated paleo-synanthropic niche and present the current state of research. Key features of this new niche are anthropogenic food waste from mobile hunter-gatherers as a stable food base for small opportunistic scavengers and a human-near environment safe from large predators. By linking the niche to human behavior rather than to a specific location or structure, this niche was accessible for a long time, even in the Late Pleistocene. Like modern synanthropic animals, members of the paleo-synanthropic niche experienced an increase in population density and a decrease in home range. This, in turn, made it easier for humans to capture these animals and use them as resources for meat, fur, or feathers, as seen in the zooarchaeological record of many European Late Pleistocene sites. As a disadvantage, diseases such as zoonoses may have spread more easily.

2 MOVING HOUSE(MOUSE): A LOOK AT MICROFAUNAL ASSEMBLAGES AND THE ANTHRODEPENDANT NICHE IN ANATOLIA

Feider, Michelle (University of York) - Jenkins, Emma (Bournemouth University) - Clarkson, Paul (Bournemouth University) - Renaud, Sabrina (Université Lyon) - Papayiannis, Katerina (University of Athens) - Cucchi, Thomas (Muséum national d'Histoire naturelle - CNRS)

The transition to settled communities in Southwest Asia had a profound effect on microfaunal species and led to the development of the synanthropic or anthropogenic niche. One of the earliest species to take advantage of this new niche was the house mouse (*Mus musculus*) which became a global coloniser due to its association with people and its subsequent human mediated dispersal.

This paper examines the microfaunal assemblages from three early sites in Anatolia; Pınarbaşı, a transitory rock-shelter site (14150-11000 cal. BCE), with a settled early Neolithic settlement (9800-7800 cal. BCE), and a transitory late Neolithic phase (6500-6000 cal. BCE); Boncuklu Höyük, a small early Neolithic village (c9200-7800 cal. BCE); and Çatalhöyük, a large proto-urban settlement (c7100-5950 cal. BCE). It explores settlement structure and species diversity, including the impacts people had on both their surroundings, and the small creatures that lived amongst them. Were the inhabitants of these sites aware of the presence of small mammals that may have been eating and fouling their food? Is there any evidence of attempts at pest control in these early settlements? And what can the bones of these small animals tell us about trade and exchange networks at these early sites? A taxonomic, taphonomic, geometric morphometric, and CT scan analysis of these assemblages highlights the unique information that can be found in these often overlooked remains.

3 INSECT SYNANTHROPY AND PATHWAYS TO COSMOPOLITISATION

Panagiotakopulu, Eva (School of GeoSciences, University of Edinburgh)

The expansion of agriculture, crops and domestic animals, from the Neolithic onwards has led to biogeographic change, including the spread of various insect species which have hitched a hike during this process. This involved the distribution of distinct faunas of a range of insect pests and parasites associated with humans to new areas across Europe during the Neolithic and in subsequent periods. While ectoparasites travel on their hosts, other synanthropic insects spread via different pathways, often relying on transport on shipping vessels. The biogeography of insect synanthropic species, their spread from their original niches and their early distribution indicate different processes for these invasions. A comparison of new and existing data from shipwrecks with assemblages from ports, provides an understanding of the mechanisms of spread of synanthropic insects to and from these entry points. Most of the shipwreck data and relevant literature come from the medieval and post-medieval period. Together with early records of synanthropic insects, they map the specific timing of the expansion of the geographic ranges of particular species, from the granary weevil in the Neolithic to American cockroaches in the post-medieval period. In addition, records of synanthropic insects from islands, in particular from Britain, give detailed information regarding the timing of relevant biological invasions, and the consequences of the development and expansion of human environments as a driver for ecological change over time. The palaeoecological record of insect accidental travellers provides a different point of view on ecological imperialism and the homogenization of the biota.

4 BEE VS PEOPLE: RECONSTRUCTING ANCIENT BEEKEEPING THROUGH AN ANALYSIS OF APIARY SITES

Francis, Jane (Concordia University)

Ancient texts on agricultural themes include information about apiaries, their locations, their handling by people, and the responses of the bees to these interactions. A recent increase in attention to beekeeping remains, specifically beehives and related ceramic equipment, from excavation and archaeological survey contexts now has the possibility of augmenting these written testimonia, but also of honing details and correcting erroneous information.

This paper examines the Greek and Roman archaeological contexts for beekeeping and investigates the extent to which and how people were able to modify ancient landscapes to better suit their bees and maximize their output of honey and wax. This research focuses on how apiaries can be identified and assessed today, especially in reconstructions of ancient landscapes, the construction and use of ancient bee enclosures, the relationship between settlement and apiaries, and other animals, and people's conversions of the botanical environment to accommodate the work of bees. The success of such strategies will be assessed alongside the natural inclinations of bees and their adaptability to the desires of man.

5 REASSESSING THE DISPERSAL OF BLACK RATS THROUGH LATE IRON AGE AND MEDIEVAL NORTHERN EUROPE

Orton, David (University of York) - Feider, Michelle (University of York) - Presslee, Sam (University of York)

One of the most successful of synanthropic mammals, the black rat (*Rattus rattus*) dispersed worldwide from south Asian origins thanks to its association with humans. It is now well established that it spread into Europe north of the Mediterranean with Roman expansion, and that the break-up of the Roman Empire from the 5th C CE saw a marked decline or even extirpation of rats in the northern provinces. Recent archaeogenetic research confirms that medieval rats across central and northern Europe represent a distinct dispersal event with minimal admixture from Roman populations. The contours of this event remain obscure, however, as does the source population. While sporadic cases are reported as early as the Viking Age (9th-10th C CE), rat finds only become truly widespread in northern Europe from perhaps the 13th C – and it is from this latter horizon that existing aDNA data overwhelmingly derives.

This paper explores black rats' colonisation of northern Europe via a synthesis of reported Late Iron Age and medieval finds from around the North and Baltic Sea catchments, supported by new direct radiocarbon dates and ZooMS identifications. Does the distribution of finds suggest dispersal from the east, the west, or perhaps from the south via the central European rivers? Do the early finds represent the beginning of a gradual expansion and establishment, or isolated and short-lived populations linked to long-range trade? How does the presence of rats correlate with that of other synanthropic taxa, such as mice? Crucially, data on other micromammals allows us to control for research bias and isolate genuine trends in the distribution of rats. Finally, we consider what insights these patterns may provide into trade networks and evolving settlement ecology in the region.

6 THE BROWN RAT (RATTUS NORVEGICUS) IN BRITAIN

Albarella, Umberto (Dept of Archaeology, University of Sheffield)

Much of the discussion about rats in European archaeology has focused on the Black Rat (*Rattus rattus*) as this was the species that was introduced in antiquity and is associated with the debate regarding the spread of the plague. The Brown Rat (*Rattus norvegicus*) was introduced into Europe and Britain a lot later – in the 17th – 18th century and started stimulating the interest of archaeologists only when postmedieval archaeology became better established in our field. Yet the Brown Rat has a very important role in the understanding of our past societies, both in cultural and ecological terms. In Britain, it pushed the Black Rat towards marginal areas and, like in other parts of the world, soon became ubiquitous. Unlike the Black Rat, the Brown Rat is a burrowing and highly social animal, which is why it has ended up occupying sewages in very large numbers. In this paper, I will review the discussion about the introduction of the Brown Rat in Britain and will also mention how archaeological and historical evidence can help us to understand how this commensal species managed to become so prominent in a relatively short time.

7 DIVINE SYNANTHROPES? THE CASE OF CATS IN EGYPT, AND HOW THEY CLAWED THEIR WAY TO THE TOP

Hornkjøl, Ingeborg (University of Stavanger)

During the 7th century BC in Egypt – the beginning of the Late Dynastic Period – the domestic housecat received a prominent position in Egyptian religion, much more so than in the preceding centuries. While much popular and scholarly attention has been paid to the cat in Ancient Egypt, little systematic and theoretically explicit research has been done to clarify which factors contributed to this significant change in the cat-human relationship. Virtually no

attention has been paid to the animal itself and its practical engagements with people in Egypt. From the perspective of Human-animal studies, animals are imbued with agency - the ability to affect the world and human lives. Through their agency, animals can contribute to shaping human societies, including those societal aspects that are left for us to study as archaeologists. As such, a missing perspective on the research on cats in Egypt is that cats and their practical engagements with people have had a direct effect on its religious role. In this paper, I will present how the cat as an independent synanthrope may have affected the Ancient Egyptian life-world, and how the changing conditions for human-cat engagements consequently shaped its religious role.

8 HUMAN-CAT INTERACTIONS AT DIFFERENT TIMES AND GEOGRAPHIES: MODELLING DIETS AND HYDROGEN ISOTOPE ANALYSIS OF CATS FROM TURKEY, JORDAN, AND BELGIUM

Shev, Gene (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Brozou, Anastasia (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - Fuller, Benjamin (Géosciences Environnement Toulouse, France) - Mannino, Marcello (Aarhus University, Department of Archaeology and Heritage Studies, Højbjerg, Denmark) - Peters, Joris (ArchaeoBioCenter and Institute of Palaeoanatomy, Domestication Research, and the History of Veterinary Medicine, Ludwig Maximilian University Munich, Munich, Germany; SNSB, State Collection of Palaeoanatomy Munich, Munich, Germany) - Bouillon, Steven (Department of Earth and Environmental Sciences, Soil and Water Management, University of Leuven, Belgium) - Van Neer, Wim (Royal Belgian Institute of Natural Sciences, Brussels, Belgium.) - Ottoni, Claudio (University of Rome Tor Vergata, Department of Biology, Rome, Italy)

A synanthropic relationship between domestic cats (*Felis catus*) and humans has been well established for more than 10 thousand years and has affected the close cohabitation between our species. As part of the ERC-funded FELIX project, collagen stable isotope ratios (nitrogen, carbon) of cats and of other animal taxa have been analysed from three geographically and temporally distinct sites: Late Roman - Early Byzantine Sagalassos in southwestern Turkey, 14-15th century Brussels, and Ottoman period Aqaba in southern Jordan. Our aim is to assess the similarities and differences expressed in cat diets and how these relate to human activities at these different sites. These isotopic data are examined using dietary mixing models (FRUITS), and isotopic niche space modelling (SIBER, nicheROVER), to facilitate more succinct interpretations of cat dietary inputs compared to traditional scatterplot visualizations. Additionally, the measurements of non-exchangeable hydrogen stable isotope ratios of collagen samples from cats and other key animals allow us to further investigate how this isotopic proxy may prove useful specifically in examining human-cat interactions. We also explore the possibility of determining water intake, mobility, or trophic level of the other species analysed.

9 ANCIENT DNA AND THE DISPERSAL OF THE DOMESTIC CAT IN ITALY

De Martino, Marco (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - Rovelli, Valentina (University of Rome Tor Vergata, Department of Biology, Rome, Italy) - De Cupere, Bea (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Alhague, Francesca (Museo delle Civiltà, Rome, Italy) - Minniti, Claudia (Sapienza University of Rome, Italy) - Wierer, Ursula (Soprintendenza Archeologia Belle Arti e Paesaggio per Firenze, Pistoia e Prato, Florence, Italy) - Wilkens, Barbara (Independent researcher Alghero, Italy) - Peters, Joris (ArchaeoBioCenter and Institute of Palaeoanatomy, Domestication Research, and the History of Veterinary Medicine, Ludwig Maximilian University Munich, Munich, Germany; SNSB, State Collection of Palaeoanatomy Munich, Munich, Germany) - Van Neer, Wim (Royal Belgian Institute of Natural Sciences, Brussels, Belgium) - Ottoni, Claudio (University of Rome Tor Vergata, Department of Biology, Rome, Italy.)

From wild animals to pest controllers and finally to pets, the evolutionary success of domestic cats is indisputable. However, cats are understudied, especially if compared with other domesticates and their wild relatives. Zooarchaeological and genetic evidence demonstrated that domestic cats originated from the North African and Near Eastern wildcat, *Felis silvestris lybica*. The interaction between humans and cats most likely started 11 thousand years ago in the Neolithic Levant. More recently, ancient mitochondrial DNA (mtDNA) evidence suggested that domestic cats spread to Southeast Europe as early as 4400 BC, however their dispersal to the rest of Europe is controversial due to the paucity of data. This is particularly true for the Italian peninsula and major islands (Sicily and Sardinia), notwithstanding their key role as crossroads for ancient trade routes in the Mediterranean basin.

We generated 17 low-coverage ancient genomes from Italian wild and domestic cats. In addition, to provide a broader view of wildcat present-day genetic variation so far largely unexplored, we produced modern high-coverage genomes of wildcats from Italy (n=10, including Sardinia) and Tunisia (n=1). Our genomic dataset shows that the earliest domestic cat in Italy dates back to the late Iron Age, in Sardinia. Interestingly, this specimen appears to be genetically distinct from later Italian domestic cats spreading since the Roman Imperial era, thus highlighting the complexity of the cat domestication process. Finally, we address questions around potential admixture patterns between Italian wild and domestic cat populations.

157

MULTIDISCIPLINARY APPROACHES TO HUMAN BEHAVIOR AND ENVIRONMENTAL DYNAMICS OF LATE EARLY PLEISTOCENE AND MIDDLE PLEISTOCENE EUROPE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France) - Lombao Vázquez, Diego (GEPN-AAT, Dpto. Historia, Facultad de Xeografía e Historia, USC, Praza da Universidade 1, 15782, Santiago de Compostela, Spain.; Institut Català de Paleocologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; UMR7194 - HNHP, MNHN Musée de l'Homme, 17 Place du Trocadéro, 75116, Paris, France) - Pineda, Antonio (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France; Institut Català de Paleocologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.) - Mecozzi, Beniamino (Department of Earth Sciences (PaleoFactory Lab), Sapienza University of Rome, p.le Aldo Moro 5, 00185 Rome, Italy)

Session format: Regular session

The Early-Middle Pleistocene Transition (EMPT) (ca. 1.2 -0.5 ka) is marked by significant climatic, environmental, and cultural changes. They are transformations at different spheres that interplay with each other. It encompasses a faunal renewal with the extinction of the "Villafranchian" fauna and the diffusion of modern mammals. Culturally, it's marked by the appearance of the Acheulean culture in Western Europe, a milestone in the evolution of Homo genus' technological behavior.

The biocultural changes documented during this period seem to have been abrupt. Nevertheless, this impression may result from the paucity of data, as well as the way researchers have approached the study of this period. For example, the European record provides no evidence of a clear transition between the Oldowan and the Acheulean, suggesting that the latter arrived along with a population influx. However, the limited paleoanthropological record does not allow us to reconstruct population dynamics. Regarding the second matter, the characterization of the behaviors of these human groups has primarily centered on certain technological aspects, particularly the study of Large Cutting Tools, paleoeconomic questions, subsistence behavior, and prey acquisition strategies. In Paleontology, both limitations act together, when the different taxonomies used, and the doubtful chronology of key sites jeopardize the identification and contextualization of bioevents.

This session aims to bring together researchers from diverse disciplines to provide an interdisciplinary approach to characterize the EMPT faunal renewal, the changes in human behavior, and the interplay between the natural and cultural spheres. Both case-specific research (e.g., presentation of archaeological and paleontological sites) or broader syntheses from a geographic and temporal perspective will be valued. These approaches may involve one or multiple disciplines, including lithic technology, taphonomy, taxonomy, paleoenvironmental reconstructions, computational modeling, and spatial analysis, among others.

ABSTRACTS

1 UNDERSTANDING THE ENVIRONMENTAL CONTEXT OF THE FIRST HUMAN OCCUPATION OF WESTERN EUROPE DURING MIS 35-19 FROM MARINE POLLEN RECORD

Catrain, Maé (Muséum National d'Histoire Naturelle, UMR 7194, CNRS, Histoire Naturelle de l'Homme Préhistorique, Paris, France) - Combourieu-Nebout, Nathalie (Muséum National d'Histoire Naturelle, UMR 7194, CNRS, Histoire Naturelle de l'Homme Préhistorique, Paris, France) - Lebreton, Vincent (Muséum National d'Histoire Naturelle, UMR 7194, Histoire Naturelle de l'Homme Préhistorique, Paris, France) - Fauquette, Séverine (Institut des Sciences de l'Évolution de Montpellier, ISEM, Université de Montpellier, France) - Peyron, Odile (Institut des Sciences de l'Évolution de Montpellier, ISEM, Université de Montpellier, France) - Joannin, Sébastien (Institut des Sciences de l'Évolution de Montpellier, ISEM, Université de Montpellier, France) - Toti, Francesco (Dipartimento di Scienze della Terra, Università degli Studi di Firenze, Firenze, Italy) - Bertini, Adele (Dipartimento di Scienze della Terra, Università degli Studi di Firenze, Firenze, Italy) - Moncel, Marie-Hélène (Muséum National d'Histoire Naturelle, UMR 7194, CNRS, Histoire Naturelle de l'Homme Préhistorique, Paris, France)

Hominins are documented at the doorstep of Europe at around 1.78 Ma in Dmanisi (Georgia), and they were already present in Asia at around 2.1 Ma. However, in Western Europe, the first evidence of human occupations dates back to 1.4 - 1.2 Ma in Sima del Elefante and Fuente Nueva 3 (Spain) and Pirro Nord (Italy). This period is associated to the beginning of the Early-Middle Pleistocene Transition (1.4 - 0.4 Ma), a contrasted climate period characterized by important changes in the glacial-interglacial cyclicity. Glacial-interglacial climate cycles are assumed to have influenced human migrations. Nevertheless, to this day, the hominin environmental context (e.g., vegetation, climate) is poorly known. In the Mediterranean area, the Early Pleistocene vegetation is only documented by two continental key

sequences, Tenaghi Philippon (Greece) and Lake Ohrid (Albania). Our study provides the first results of vegetation changes in the western Mediterranean between Marine Isotope Stage (MIS) 35 to MIS 19 (1.141 - 0.761 Ma). These new data are retrieved from the palynological analysis of the marine sequence of Leg 161 ODP site 976 located in the Alboran Sea, south of the Iberian Peninsula. Here we complement previous palynological studies: MIS 30-23 (1.141 - 0.9 Ma) and MIS 20-19 (0.814 - 0.761 Ma) with analysis of MIS 35-31 (1.141 - 1.062 Ma) and MIS 22-21 (0.9 - 0.814 Ma). Our pollen analyses show rapid vegetation changes during transitions between glacial and interglacial periods with a resolution never reached before. Our results are compared with Tenaghi Philippon's and Lake Ohrid's pollen records to provide a precise environmental and climatic framework for human occupation in western Europe during this key time period.

2 CLIMATE CHANGES AND SETTLEMENTS DYNAMICS IN ITALY DURING MIDDLE AND LOWER PLEISTOCENE

Villa, Valentina (CNRS CEPAM UMR 7264) - Nicoud, Elisa (CNRS CEPAM UMR 7264) - Arzarello, Marta (Università degli studi di Ferrara) - Aureli, Daniele (ArScAn AnTET UMR 7041) - Pereira, Alison (Université Paris-Saclay, GEOPS UMR 8148) - Peresani, Marco (Università degli studi di Ferrara) - Rocca, Roxane (Université Paris 1 Panthéon-Sorbonne, TEMPS UMR 8068)

Over the last decade, the PALEO programme, led by the École française de Rome, focused on the environmental and chronostratigraphic contexts of Palaeolithic settlements in central and southern Italy. This includes the Valle Giumentina and Atella archaeological sites, as well as new surveys in the Marche, Abruzzi, and Sicily regions. Particular attention has been paid to the study of the sedimentary sequences of the archaeological sites. The use of a high-resolution stratigraphic, sedimentological, micromorphological, and geochronological approach enabled a detailed reconstruction of the environmental context and chronology of Palaeolithic occupations. Furthermore, it documented the impact of millennial climatic variability on the Mediterranean ecosystems. These new data allow for a discussion on the impact of these fluctuations on Palaeolithic human populations in terms of subsistence, adaptation, and mobility. Therefore, they make a significant contribution to the development of models of settlement and cultural evolution in southern European regions during the Pleistocene.

3 THE ITALIAN PENINSULA: A KEY ZONE TO UNDERSTAND THE ANCIENT PREHISTORY EVOLUTION IN THE MEDITERRANEAN AREA

Rocca, Roxane (Université Paris 1 Panthéon-Sorbonne, UMR 8068 TEMPS) - Arzarello, Marta (Università degli Studi di Ferrara) - Aureli, Daniele (Umr 7041 ArScAn AnTET) - Nicoud, Elisa (Cnrs, UMR 7264 CEPAM) - Pereira, Alison (Université Paris-Saclay, UMR 8148 GEOPS) - Peresani, Marco (Università degli Studi di Ferrara) - Villa, Valentina (UMR 7264 CEPAM)

Current research on the Lower and Middle Pleistocene indicates that Italy, constitutes an area characterized by significant technical innovations. Indeed, the peninsula includes among the oldest evidence of human settlement (c. 1.4 Ma), some of the first occurrences of handaxes (c. 0.7 Ma) and Levallois concept (c. 300 ka) found in Europe so far. Over the past 10 years, a substantial amount of research has focused on the environmental and chronostratigraphic contexts in central and southern Italy, making it possible to compare and discuss lithic assemblages with confidence.

We intend here to present the main results obtained during the PALEO Program funded by the École française de Rome since 2012. This project focuses on the interdisciplinary study of three main zones of Italy: Centre (Abruzzo, Marche), South (Basilicata) and Sicily. It contributes to the renewal of settlement patterns of Italy, Europe and the Mediterranean area by providing new and original primary data.

4 ZOOARCHAEOLOGICAL REVIEW OF THE LOWER PALEOLITHIC AND EARLY MIDDLE PALEOLITHIC IN BELGIUM

Dedrie, Tristan (ArcheOs: Research Laboratory for Biological Anthropology, Department of Archaeology, Ghent University; Research Foundation – Flanders) - Abrams, Grégory (ArcheOs: Research Laboratory for Biological Anthropology, Department of Archaeology, Ghent University; Scientific Department, Espace Muséal d'Andenne) - Di Modica, Kévin (Scientific Department, Espace Muséal d'Andenne) - De Groote, Isabelle (ArcheOs: Research Laboratory for Biological Anthropology, Department of Archaeology, Ghent University)

Although rare, several sites related to the Lower Paleolithic and Lower to Middle Paleolithic transition are present in Belgium (\pm MIS 14 - MIS 8) in different topographic environments. These include the alluvial terraces of the Haine Basin, the Loess sequences of the Lower Meuse valley, and possibly some karstic environments such as La Belle Roche Cave (Sprimont, BE). Faunal remains were sporadically unearthed in association with lithic artifacts and studied since the 19th century but extensive zooarchaeological research had not yet been applied on a larger scale.

This preliminary approach reviews zooarchaeological research conducted in the latter half of the 20th century and places it in a wider geographical context. More specifically, using recently published biochronological data from neighbouring sites, we question the dating and context of the Belgian sites. For example, at La Belle Roche Cave (Sprimont, BE), Villafranchian species such as *Pachycrocuta brevirostris* (Gervais, 1850) and *Stephanorhinus etruscus* (Falconer, 1868) were identified among fauna typical of the Upper Cromerian. At Mesvin IV (Mons, BE), preliminary review of previously published dental biometric data from *Mammuthus* sp. corresponds with the suggested dating of the site to MIS 8- MIS 7. In addition to the review, we also present the first results from the zooarchaeological analysis on Layer 6 and 7 (MIS 7 - MIS 8) at Scladina Cave, as a test-case for the biochronology that was used in the literature review.

5 THE MAMMAL FOSSILS FROM THE MIDDLE PLEISTOCENE SITE OF NOTARCHIRICO (VENOSA, SOUTHERN ITALY)

Mecozzi, Beniamino (Department of Earth Sciences (PaleoFactory), Sapienza University of Rome) - Iannucci, Alesio (Department of Geosciences, Section of Terrestrial Palaeoclimatology, Eberhard-Karls-University Tübingen) - Carpentieri, Marco (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) - Pineda, Antonio (UMR 7194 HNHP (MNHN-CNRS-UPVD), Département Homme et Environnement, Muséum National d'Histoire Naturelle; Institut Català de Paleocologia Humana i Evolució Social (IPHES-CERCA)) - Sardella, Raffaele (Department of Earth Sciences (PaleoFactory), Sapienza University of Rome) - Moncel, Marie-Hélène (UMR 7194 HNHP (MNHN-CNRS-UPVD), Département Homme et Environnement, Muséum National d'Histoire Naturelle)

Notarchirico is one of the most important sites for the human evolution in the Mediterranean Europe during the Middle Pleistocene and for paleoenvironmental reconstruction during the Early-Middle Pleistocene Transition. The first findings date back to 1950s, when Virginia Ginetta Chiappella opened the first trench along the hill of Notarchirico. About 30 years later started the first systematic excavations in 1979, coordinated by Marcello Piperno and with support of the Italian Institute of Human Paleontology (IslPU), which continued until 1995. Based on the extraordinary richness of the archaeological and paleontological material, a building was realized to protect and to keep the material in situ, thus arising the Paleolithic Park of Notarchirico. Since 2016, fieldwork activities restarted on this important site, coordinated by one of us (M.-H. M.).

Piperno reported 11 archeological levels in a seven-meter-deep sequence, from alpha (α), to G (named from top to bottom). New excavations focused on the lower part of the sequence, never systematically investigated, but only known as a result of boreholes outside the original building. Additional levels were carefully recognized and are being excavated, from H to J, allowing for the expansion of such a unique bone and lithic record. Piperno and colleagues described the fossil sample collected in the levels alpha and A, while the other remains were preliminary listed in tables.

Here, all fossils collected from the whole sequence of Notarchirico are presented, including the samples excavated by Chiappella, Piperno and the new findings, preserved at the Paleolithic Park of Notarchirico (Venosa), the National Archeological Museum of Venosa "Mario Torelli" and the Museum of Civilizations (Rome). The results remark the importance of the site in the study of terrestrial ecosystem of Mediterranean Europe during the Early-Middle Pleistocene Transition.

6 WHEN AN ELEPHANT DIES ALONG A STREAM: THE CASE STUDY OF THE MIDDLE PLEISTOCENE SITE OF CASAL LUMBROSO (CENTRAL ITALY)

Mercurio, Stefano (Dipartimento di Scienze delle Antichità, Sapienza Università di Roma) - Alhaique, Francesca (Museo delle Civiltà) - Spinapolice, Enza (Dipartimento di Scienze delle Antichità, Sapienza Università di Roma) - Argento, Alessia (Soprintendenza Speciale Archeologia Belle Arti e Paesaggio di Roma, Ministero della Cultura) - Fiore, Ivana (Museo delle Civiltà; Dipartimento di Biologia Ambientale, Sapienza Università di Roma) - Giaccio, Biagio (Consiglio Nazionale delle Ricerche (CNR), Istituto di Geologia Ambientale e Geoingegneria) - Giustini, Francesca (Consiglio Nazionale delle Ricerche (CNR), Istituto di Geologia Ambientale e Geoingegneria, Area della Ricerca di Roma 1, I-00015 Monterotondo, Rome, Italy) - Lemorini, Cristina (Dipartimento di Scienze delle Antichità, Sapienza Università di Roma) - Sardella, Raffaele (Dipartimento di Scienze della Terra (PaleoFactory), Sapienza Università di Roma) - Mecozzi, Beniamino (Dipartimento di Scienze della Terra (PaleoFactory), Sapienza Università di Roma)

During the construction work of a new building complex along via Casal Lumbroso, located in the north-west sector of Rome (central Italy), a rich archeological and paleontological deposit was found in 2017. After excavations in 2017-19 requested and scientifically directed by the Soprintendenza Speciale Archeologia, Belle Arti e Paesaggio di Roma, fieldwork resumed in 2023 coordinated by Sapienza University of Rome, with the collaboration of the Museo delle Civiltà (Rome) and the Istituto di Geologia Ambientale e Geoingegneria, Consiglio Nazionale delle Ricerche.

The discovery of the Casal Lumbroso deposit confirms the extraordinary importance of the Rome territory for the study of the Middle Pleistocene, especially the north-west sector of the city, where a remarkable number of largely

coeval localities, such as Castel di Guido and La Polledrara di Ceganibbio, have been already recovered and investigated.

The preliminary results of the geological, archeological, archeozoological and paleontological investigation are presented here. The archeological and paleontological horizon of Casal Lumbroso occurs at top of the Tiber River aggradational succession related to the MIS 11c sea level highstand, dated by 40 Ar/ 39 Ar geochronology at ca. 404 ka.

The research revealed the presence of scattered remains of an adult individual of straight-tusked elephant *Palaeoloxodon antiquus*, with sporadic bones referred to *Stephanorhinus* sp., *Bovinae*, *Cervinae*, *Dama* sp., *Canis* sp. and *Talpa* sp., *Lagomorpha*, *Testudines*. Two bird remains document the occurrence of *Anatidae* and *Strigiformes*.

The archeological sample includes lithic tools mainly made of flint, including two bifaces. The taphonomic analyses indicates that the *P. antiquus* carcass was exploited also as a source of raw materials as documented by the presence of several intentionally fractured elephant bones, some of them also with flake removals, with localized use wear traces.

7 TRACKING TECHNOLOGICAL INNOVATIONS DURING LATE-EARLY PLEISTOCENE: INSIGHTS FROM THE EARLY ACHEULEAN ASSEMBLAGE OF EL BARRANC DE LA BOELLA (TARRAGONA, SPAIN)

Lombao, Diego (GEPN-AAT, Dpto. Historia, Facultade de Xeografía e Historia, USC, Praza da Universidade 1, 15782, Santiago de Compostela, Spain.; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; UMR7194 Histoire naturelle de l'Homme préhistorique (HNHP), Museum National d'Histoire Naturelle (MNHN), CNRS, Université Perpignan Via Domitia, Alliance Sorbonne Université, - Musée de l'Homme, Place du Trocadéro 17, 75016 Paris, France) - Morales, Juan Ignacio (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002 Tarragona, Spain.) - Mosquera, Marina (Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002 Tarragona, Spain.; Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.) - Ollé, Andreu (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002 Tarragona, Spain.) - Saladié, Palmira (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002 Tarragona, Spain.; Unit Associated to CSIC, Departamento de Paleobiología, Museo Nacional de Ciencias Naturales (MNCN), Consejo Superior de Investigaciones Científicas (CSIC), Calle José Gutiérrez Abascal 2, 28006, Madrid, Spain) - Vallverdú, Josep (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA), Zona Educacional 4, Campus Sescelades URV (Edifici W3), 43007 Tarragona, Spain.; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art, Avinguda de Catalunya 35, 43002 Tarragona, Spain.; Unit Associated to CSIC, Departamento de Paleobiología, Museo Nacional de Ciencias Naturales (MNCN), Consejo Superior de Investigaciones Científicas (CSIC), Calle José Gutiérrez Abascal 2, 28006, Madrid, Spain)

This study delves into technological behaviours in Unit II of the Pit 1, La Mina, and El Forn localities in El Barranc de la Boella (BB), Spain, dating back to approximately 0.99-0.78Ma ago. Recognized as the oldest Acheulean site in the European subcontinent, it provides a unique opportunity to explore technological features associated with the emergence of Large Cutting Tools (LCTs) in Europe.

The analysis focuses on five key aspects of technological behaviours: 1) raw material management and blank selection; 2) core knapping strategies; 3) length of reduction sequences through reduction intensity; 4) reduction sequences integrity; and 5) large-flake production.

Results indicate a differential raw material management in the three BB's localities: a) the exploitation and configuration of small-sized tools, linked to chert, and b) the configuration of LCTs and the production of large-sized flakes (>10cm), especially linked to schist. Additionally, c) spatiotemporal fragmentation of the reduction sequences of these LCTs and large flakes is observed.

Concerning core reduction strategies, some cores exhibit a more structured volumetric organization in the knapping strategies and a greater independence from raw materials characteristics due to a procedural template with sequentially organized actions, facilitating the production of more flakes, though not greater control over their morphology.

However, these structured strategies coexist with expedient and/or opportunistic types like those in Oldowan lithic assemblages, featuring partial management of core volume. This mixture of complex and expedient strategies is reflected in the variability of core reduction intensity and the degree of volumetric exhaustion exhibited by the cores.

Furthermore, the characteristics of LCTs and associated behaviours distinguish BB not only from earlier and contemporary Oldowan sites but also from European Middle Pleistocene Acheulean assemblages. This underscores the

uniqueness of BB and provides crucial insights into the evolutionary trajectory of hominin technological capabilities during the late Early Pleistocene.

8 UNRAVELING THE EARLIEST OCCUPATIONS OF WESTERN EUROPE: A BOTTOM-UP MODELING APPROACH

Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France) - Reschke, Jan-Olaf (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France; Institute for Ecology, Evolution and Diversity, Goethe University, Frankfurt am Main, Germany.; ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany) - Hall, Harry (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France; Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK) - Longborg, Kamilla (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France) - Hertler, Christine (ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany) - Grove, Matt (Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK) - Saqalli, Mehdi (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France) - Moncel, Marie-Hélène (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France)

The spatiotemporal patterns of the first "Out of Africa" continue raising questions. Notable attention has been paid to understanding the delay in the occupation of Western Europe (i.e., dated Spain and Italy around 1.4 Ma) when compared with the arrival of the first hominins to the Levant and Asia (i.e., at around 2.1 and 2 Ma respectively). There is a wide list of dynamics and variables that could explain the aforementioned pattern. The geographic, climatic or environmental conditions could have prevented the population dispersion by closing suitable corridors or/and, the settlement of populations with enough entity to be archaeologically visible. Equally important could have been the role played by the hominins' cognitive capabilities which would have prevented or allowed them to adapt to new environments and climatic oscillations. The archaeological record from this period is sparse and has a very low temporal resolution. This poses a great challenge to archaeologists trying to understand the process of colonization of Western Europe. To overcome these limitations, we have designed a bottom-up modelling approach.

The Lateurope team approach consists of four different agent-based models. On the one hand, three sub-models are designed to understand different spheres of hominin-environment interactions that interplay at different temporal and spatial scales. On the other, the Central model. Here, we present the architecture of the latter, which integrates three different implementations that gradually increase its complexity. It starts as a model to test our null hypothesis, i.e., that the spatiotemporal pattern can be explained by distance and topology. Later, it will integrate the spheres of the three sub-models: climate and environment, subsistence and adaptability. After being validated against the archaeological record, the sequential build-up of the model will allow us to identify the relevant dynamics/variables that could explain the current spatiotemporal pattern of the occupation of Western Europe.

9 ENVIRONMENTAL DRIVERS OF HOMININ DISPERSAL PATTERNS DURING THE EARLY- MIDDLE PLEISTOCENE TRANSITION - A METHODOLOGICAL ENQUIRY

Lomborg, Kamilla (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse II Jean Jaurès) - Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine) - Hall, Harry (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine; Department of Archaeology, Classics and Egyptology, University of Liverpool) - Reschke, Jan-Olaf (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine; Institute for Ecology, Evolution and Diversity, Goethe University; ROCEEH Research Center, Senckenberg Research Institute) - Grove, Matt (Department of Archaeology, Classics and Egyptology, University of Liverpool) - Hertler, Christine (ROCEEH Research Center, Senckenberg Research Institute) - Gaudou, Benoit (Institut de Recherche en Informatique de Toulouse, Université Toulouse I Capitole) - Saqalli, Mehdi (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse II Jean Jaurès) - Moncel, Marie-Hélène (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine)

Various drivers of the dispersal of past hominins and how these dynamics are approached have been debated in archaeology for decades. Especially the changing glacial- and interglacial stages of the Middle Pleistocene Transition (1.25-0.7 Ma) effects on the environment are interesting with their potential influence on the population dynamics in Western Europe. This presentation addresses a methodological approach to this topic:

- What data has been used to reconstruct the Early-Middle Pleistocene environments in Europe, and how is this data best integrated into this research?

- How are hominin dispersal patterns in this period addressed, and how can computational modelling support these investments?

Paleoenvironmental reconstructions are used to understand the environmental circumstances of past societies through an interdisciplinary approach. By reviewing the current use of climatic and environmental data in large spatial reconstructions, the foundation and strategies for mapping climatic and environmental conditions in the Early and Early Middle Pleistocene are evaluated. From this, an approach with biomes as building blocks for the reconstruction of Eurasia during the MPT is presented to enable large-scale analysis of hominin dispersal. The second part of the presentation presents agent-based modelling (ABM) as a method to test the relationship between environmental factors and hominin dispersal. A review of existing ABM analyses of dispersal scenarios will demonstrate the capacities and insights of ABM. To connect the previously presented reconstruction of Eurasia and hominin behaviour, we suggest constructing agent behaviour from niche models of the biomes. This method links the archaeological material to the simulation functions, which enables us to observe hominin agents directly in the paleoenvironment. From paleoenvironmental reconstructions to simulations of hominin dispersal, this presentation reflects the possibilities of applying computational methods to the archaeological record, and how the changing environment of the MPT could have affected the hominin dispersal dynamics.

10 THE GOOD, THE BAD AND THE HUNGRY: USING AGENT-BASED MODELS TO PREDICT HOMININ MOVEMENT AND SURVIVAL

Reschke, Jan-Olaf (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.; ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany; Institute for Ecology, Evolution and Diversity, Goethe University, Frankfurt, Germany) - Cucart-Mora, Carolina (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.) - Lomborg, Kamilla (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France.) - Hall, Harry (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.; Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK.) - Saqalli, Mehdi (CNRS UMR 5602 GEODE Géographie de l'Environnement, Maison de la Recherche, Université Toulouse 2 Jean Jaurès, 5, Allées Antonio Machado 31058 Toulouse, France.) - Grove, Matt (Department of Archaeology, Classics and Egyptology, University of Liverpool, 8-14 Abercromby Square, Liverpool L69 7WZ, UK.) - Hertler, Christine (ROCEEH Research Center, Senckenberg Research Institute, Senckenberganlage 25, 60325 Frankfurt am Main, Germany; ROCEEH Research Center, Heidelberg Academy of Sciences and Humanities, Heidelberg, Germany) - Moncel, Marie-Hélène (CNRS UMR 7194 HNHP, National Museum of Natural History, Institut de Paleontologie Humaine, Rue René Panhard, 75013 Paris, France.)

The behavior of early hominins, including their foraging strategies and which factors determine their survival, remains largely unknown. This is even more the case for Europe between 1.4 million and 700 thousand years ago, which seem to have been colonized much later than Asia and its northern regions most likely have only been occupied temporarily. In the Lateurope ERC project we plan to use an agent-based model to study the first hominin settlement in Europe to identify which factors may have allowed or prevented the initial colonization and later occupation by early hominins. As the incomplete archaeological record provides limited insight into their foraging behavior, we will use recent hunter-gatherer societies as reference models for early hominin behavior. These studies show that hominin foragers can survive in poor environments by moving frequently to find enough resources to eat, but this extensive movement can limit their ability to maintain social connections with other groups. We plan to modify an existing agent-based model, which simulates individual foragers leaving a central camp to gather plants or acquire meat through hunting or scavenging while moving similarly to recent hunter-gatherer societies living in comparable environments. This new implementation of the model will help us to identify the challenges early hominins would have faced in terms of finding enough food in Pleistocene Europe. We will recreate and test three different regions both during Glacial and Inter-Glacial periods: the more forested Mediterranean coast, central France, and north-west Europe, with the latter two regions becoming increasingly open during Glacial periods. A key goal of our study will be to establish threshold values that can be used to identify uninhabitable regions or periods based on the observable outputs as early hominins would not have been able to sustain a population for long under the given conditions.

160 MYSTERIOUS MUD: A TRANSVERSAL APPROACH TO INTERPRETING UNSOLVED EARTHEN REMAINS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Sánchez Polo, Alejandra (Universidad de Valladolid) - Mateu, Marta (Institut Català d'Arqueologia Clàssica) - Ruano Posada, Lucía (Universidad Complutense de Madrid) - Pastor Quiles, María (Universidad de Alicante) - Péfau, Pierre (École Française de Rome)

Session format: Session with presentation of 6 slides in 6 minutes

The fragility of the earthen remains found in the archaeological record entails some difficulties in identifying building and production processes, as well as related social practices. Our aim with this practical session is to analyze evidence collaboratively by sharing case studies from archaeological and ethnographic contexts, including experimental studies. By examining these materials, we want to discuss and share proposals and solutions that not only allow us to reflect on our interpretations of past societies, but also consider future and sustainability perspectives.

The mud remains preserved in museums or described in reports or publications are often true unsolved cases as they are insufficiently described. When confronted with these artefacts, some questions arise, such as whether these remains were part of the rooftops, other building sections, or some kind of furniture, who made them, and so on. With these concerns in mind, we are searching for case studies that address enigmatic fragments, undetermined earthen elements, to try to propose a function. Additionally, attending the different life stages of the buildings, we would like to discuss examples of repairing, rebuilding and abandonment processes.

How will we work at this special session? It aims to be a practical workshop where participants share archaeological materials and discuss them together. At this point, we refer to the identification of earthen materials (from a macroscopic view to a microscopic approach, including XRD, XRF, FTIR, petrology, etc.), paying attention to imprints, decoration and composition to understand the different construction techniques (wattle and daub, cob, mud brick, plasters, etc.), as well as earthen furniture (ovens, grills, benches, shelves, buckets, ornaments, etc.). We welcome papers from any era, as long as the material presented is raw earth. We aspire to collectively solve our cases, strengthening individual research and shedding light on this fundamental part of humanity's material past.

ABSTRACTS

1 UNICORNS AND LEAF IMPRESSIONS: INTERPRETING SHAPES OF BURNT DAUB PIECES FROM THE CARPATHIAN BASIN IN THE BRONZE AGE

Anvari, Jana (University of Cologne)

In this presentation, we will put forward for discussion difficult-to-interpret daub shapes from the sites of Toboliu and Borsodivánka, both tell sites located in the Carpathian Basin and dating to the Bronze Age. In the context of the project 'A Multimethod toolkit to study burnt daub' at the University of Cologne, our team employs an analysis approach that starts with sorting fragments by shape as a basis for – together with information on the excavation context – interpreting which part of a building they represent. This reconstruction spatial context represents the basis for further detailed macroscopic and microscopic analyses. After sorting several thousand fragments of burnt daub, we have identified several shape types for which we cannot securely identify what parts of the house construction they represent. Presenting these shapes and our preliminary thoughts on them, we hope to collect further insight into possible interpretations of these pieces through this practical workshop.

2 MUD AND POTTERY ALLIANCES IN ARCHAEOLOGICAL AND ETHNOGRAPHIC CONTEXTS. COMPARATIVE INSIGHTS FROM EGYPT TO THE IBERIAN PENINSULA

Correas-Amador, María (Independent researcher) - Pastor-Quiles, María (University of Alicante (Spain))

The role of earth goes far beyond being the raw material for pottery-making. Without earth there is no pot, but once the pot becomes a reality, there are many forms in which humans employ mud to complement fired by-products, such as providing physical support and insulating and protecting their walls. But it is a two-way relationship: pottery and pottery sherds also serve to compact, strengthen and fix mud walls and renders, and cover mud roofs, amongst other uses. The combination of mud and pottery both for artefacts and construction can even convey cultural meanings.

Using examples where mud and pottery combine (from past and present, and a variety of geographical locations), this presentation would like to bring up for discussion the relationship between earth as a raw material and its products. Is the circular relationship between both inherent to this material, and is earth a unique case where raw material and product continue to “help” each other throughout their useful life and beyond? More practically, it also aims to con-

tribute to the interpretation of pottery remains which have left imprints in mud, which are often found in different archaeological contexts.

3 INTERPRETING 4TH MILLENNIUM BCE DAUB FINDS FROM WESTERN VOLHYNIA (SE POLAND)

Szutenberg, Zofia (Maria Skłodowska Curie University)

The Sokal Ridge is a small part of the Volhynian Upland within the territory of present-day Poland, where Eastern - Pontic and Central European cultural elements have always meet. In the 4th millennium BC this region was inhabited by the communities of the Funnel Beaker culture. Connections with the Cucuteni-Tripilia culture which occupied the territory of today's Ukraine, are visible in the pottery and we can also expect some influences in the architecture, as daub is particularly abundant on FBC (Funnel beaker cultere) sites in this region.

Unlike the well-recognized architecture of dwelling houses in the CTC, it is not known exactly what the FBC houses looked like. Daub was neglected in the research, mostly only noted to be there. There are no studies, there are no standards for determining what parts of the house or clay installations in it represent the relevant patches of daub. The project that is presented here, is subject of my MA thesis, and it is pioneering in this field. My goal is to reconstruct building processes, based on the daub finds.

The presentation shows the most distinctive pieces of daub, with unusual shapes and containing macroscopic remains.

4 STRANGE MUD REMAINS FROM THE NORTH OF IBERIA BETWEEN THE LATE BRONZE AGE AND EARLY IRON AGE (C. XIV-VI BC)

Sánchez Polo, Alejandra (Universidad de Valladolid) - Ruano-Posada, Lucía (Universidad Complutense de Madrid)

Huts from the Bronze and Iron Age of Northern Iberia (c. XIV-VI BC) remain not well understood and characterised. Throughout the Bronze Age, communities in the Northern Plateau lived in heterogeneous and isolated earthen huts that were dismantled once the family left the territory, leaving small traces of their presence. However, in the Early Iron Age, there was a substantial change and villages came to be dominated by mudbrick buildings, leading to the emergence of authentic tells, true landmarks in the landscape. Upon studying the earthen remains of these different phases, we find fragments that can be attributed to the walls of the structures, both in wattle-and-daub and mud-bricks. However, other mud fragments are also found, whose identification is more difficult to infer.

This paper aims to showcase several "mysterious" earthen construction materials found in different settlements across time and territories. Our current challenges involve deciphering these shapeless remains marked with imprints of leaves, textiles or basketry. For this purpose, macro and microscopic analysis are significantly enhancing our comprehension of different technical building solutions, maintenance practices and other uses not previously considered, such as furnishings, ovens, containers or lids. As these settlements have not experienced a Pompeii-like event, it is challenging to reconstruct the appearance of these houses in the past. Therefore, this approach helps to build more accurate narratives about daily life within these settlements.

5 THE "BLOB": A VITRIFIED COLLAPSE OF A RAW EARTH STRUCTURE

Sgromo, Maria Teresa (Università di Pisa)

Since 2022, the University of Siena, in collaboration with the University of Oxford, has resumed excavation activities at the Acropolis of the ancient city of Populonia (LI). The new investigations have focused on the road and the large domus located at the foot of the monumental terracing of "Le Logge".

This contribution will focus on the particular stratigraphy found within the domus, a building constructed at the beginning of the 2nd century BC and destroyed in the second quarter of the 1st century BC by a fire, after which the house was no longer occupied. The walls of the building, found both standing and collapsed, were constructed both in stone and in earth, the latter in the form of incannucciata and mudbricks. The new investigations in the southern area have allowed for a detailed analysis of the sequence of collapses, which remained almost intact and better preserved than the rest of the dwelling.

Of particular interest was the excavation of room B1, a room under renovation at the time of the collapse and equipped with an upper floor used as a warehouse. The removal of the roof collapses revealed a mysterious layer formed by a large concretion of vitrified earth, extremely compact and up to 60 cm thick, which occupied the entire space, with a large amount of fused materials inside it. The layer appears to be related to the collapse of the upper floor, however, it does not seem comparable to any of the previously identified collapses of earth structures. The characteristics of this particular finding, the possible reconstruction of the peculiar circumstances that led to such a transformation and its probable interpretations will be presented, in search of a comparison that allows for an understanding of the original appearance of the structures of which it constitutes the decay.

6 REPORT OF THE EARLY ARCHAEOLOGICAL EXCAVATIONS AND NEW DATA IN THE SO-CALLED BOSCO LITTORIO AREA

Panvini, Rosalba (Università di Catania) - Ferrara, Bianca (Università degli studi di Napoli Federico II)

From 1996 to 2023 the archaeological research in the Bosco Littorio area allowed to discover a raw bricks architectural structure buried by the sand in the early 5th century BC.

Located near the sea, 800 meters west of the mouth of Gelas river, this area extends on the southern slopes of the Molino a Vento hill, the acropolis of the Greek Gela, founded by Rhodes and Cretans in 689-688 BC.

Archaeological data revealed that this architectural structure extraordinarily preserved was used between the second half of the 6th and the first quarter of the 5th century BC when it was destroyed by an earthquake or a tidal wave, which buried it under a layer of sand that prevented a later settlement.

The surviving structures are N/E-S/W oriented and aligned with those of the northern slope of the hill.

Based on the archaeological finds and the way they were arranged in the ground, the architectural structure can be interpreted as a residential area, while only one of its sectors can be considered as the marketplace of the archaic city. In fact, a large amount of black- and red-figure Attic pottery, local and indigenous pottery and transport containers were found.

Three clay altars stand out for their rarity: two of them are 1.19 and 1.20 meters high while the third smaller is 0.70 m. The scenes on the front faces are very particular: on the first altar a running Gorgon is depicted holding Pegasus and Chrysaor in her arms; on the second altar a divine female triad is represented (Demeter, Kore and Hecate) and finally, on the third altar, Eos is represented fleeing and holding in her arms the hunter Kephalos. These are significant and original artefacts, made in local workshops and found outside a room of the same structure.

7 FROM THE HEARTH: DIFFERENTIATING COMBUSTION SURFACES FROM OTHER HARDENED FLAT EARTHEN FRAGMENTS

Mateu, Marta (ICAC (Catalan Institute of Classical Archaeology)) - Belarte, Maria Carme (ICREA (Catalan Institution for Research and Advanced Studies); ICAC (Catalan Institute of Classical Archaeology)) - Pastor Quiles, María (University of Alicante) - Saorin, Carme (GRAP (Grup de Recerca en Arqueologia Protohistòrica), IAUB (Institut d'Arqueologia de la Universitat de Barcelona))

Regularised surfaces are common in archaeological mud remains and can be one of the key traits of their morphology to interpret their original nature and function. These materials are commonly parts of buildings, but they can also belong to domestic structures, such as the ones made for cooking, lighting and heating of spaces.

Hearths and ovens are central in protohistoric architecture, but their remains can be easily overlooked when found inside silos. In this paper we reflect on which characteristics, observed macro and microscopically, are indicative to identify fragments of combustion installations made with earth and found in secondary depositions. These traits can be, on the one hand, the above-mentioned flat surfaces, as well as certain imprints in these hardened materials, such as the ones resulting from cobbles or pottery added as part of preparation layers. On the other hand, presence or absence of components and effects of heating, detected with thin-section micromorphology and FTIR.

For this we focus on a series of well-preserved earthen materials coming from negative structures of different sites in coastal Catalonia, with a methodology adapted to making these remains less enigmatic.

8 THE MICROARCHAEOLOGY OF SUBMERGED EARTHEN MATERIALS: THE UNKNOWN REMAINS FROM LA MARMOTTA, ROME

Pejoan-Quiroga, Sofia (Institució Milà i Fontanals, Spanish National Research Council; University of Barcelona) - Mateu, Marta (Catalan Institute of Classical Archaeology) - Portillo, Marta (Institució Milà i Fontanals, Spanish National Research Council) - Ibáñez-Insa, Jordi (Geosciences Barcelona, Spanish National Research Council) - Quevedo-Semperena, Izaro (Institució Milà i Fontanals, Spanish National Research Council) - Cubas, Miriam (University of Alcalá) - Remolins, Gerard (ReGiraRocs S.L., Research, Conservation and dissemination. Cultural and Natural heritage of the Pyrenees.) - Mazzucco, Niccolò (Università di Pisa) - Mineo, Mario (Museo delle Civiltà, Museo Nazionale Preistorico Etnografico "L. Pigorini", Rome) - Gibaja, Juan (Institució Milà i Fontanals, Spanish National Research Council)

The current study deals with earthen remains (namely concotti) which have been traditionally considered building materials, from the early Neolithic site of La Marmotta. The settlement is located on the shore of a lake of volcanic origin on the present-day Lake Bracciano in the Lazio region, central Italy. It presents an extraordinary preservation of organic material by water-logging, with radiocarbon dates placed in the early 6th millennium BC. We conducted an integrated microarchaeological approach, including thin section micromorphology, X-Ray Diffraction (XRD), phytoliths and other biomicrofossil analyses, in order to investigate earthen constructive systems, as well as the range of raw

materials used. Phytolith results indicated the nature of the vegetal matter, composed mainly by the leaves and stems of Pooidae grasses, including cereal agricultural by-products such as barley and einkorn wheat, which dominate the macrobotanical records at the site. In addition, other siliceous biomicrofossils were noted within the phytolith slides, including both diatoms and sponge spicules, which are common in lacustrine environments, and found to be postdepositional and notably abundant in their external surfaces. Furthermore, micromorphological observations contribute to the contextualization of these remains, and the distinction of those original raw materials including local volcanic components, additionally supported with XRD, from those that are the result of postdepositional processes. The nature of plant components is supported to a greater extent in thin section within the voids displaying phytoliths, some anatomically connected. These results further point to the value of integrated geoarchaeological approaches and direct microfossil evidence for exploring the nature of earthen materials and constructive systems in early Neolithic built environments.

9 DIRTY PREHISTORIES: PHOSPHATE MAPPING AND MICROMORPHOLOGICAL ANALYSES OF A LA TÈNE PERIOD BUILDING IN BIRGITZ (TYROL, AUSTRIA)

Prackwieser, Isabella (University of Innsbruck) - Cereda, Susanna (University of Innsbruck) - Müller, Florian (University of Innsbruck) - Trebsche, Peter (University of Innsbruck)

The “Hohe Birga”, a late Iron Age hilltop settlement in Birgitz (Tyrol, Austria), was discovered in 1937 and extensively excavated in the following years. These initial excavations were primarily dedicated to the documentation and publication of archaeological finds. The context in which artefacts were found remained mostly overlooked and especially neglected were the imposing structures known as “Casa Retica” (a debated term) that characterize the settlement. New investigations, conducted between the years 2018 and 2022 by the University of Innsbruck, aimed to fill this gap by focusing on a more detailed examination of these still-debated archaeological structures.

In this talk, we present new research results of the La Tène period House II on the Hohe Birga. We collected three undisturbed sediment blocks and 141 loose sediment samples from the floor of the structure and subsequently analyzed them by means of micromorphology and phosphate spot-tests. The aim of the study was to gain a deeper understanding about the nature of the floor (e.g. formal/informal, plastered/rammed, covered/uncovered), to identify potential renovation phases and to trace post-depositional processes following the abandonment of the building.

Microarchaeological approaches proved crucial in obtaining microscopic information from features without a “Pompeii premise” and in identifying traces of activity. The new results offer valuable insights into the use of the building and enable its history to be reconstructed.

10 EXPLORING MUD BRICKS IN THE EARLY BRONZE AGE III AT TELL EŞ-ŞÂFI/GATH: A MULTIDISCIPLINARY STUDY OF DOMESTIC ARCHITECTURE

Wang, Jiamin (University of Manitoba, Department of Anthropology and Near Eastern and Biblical Archaeology Lab) - Greenfield, Haskel (University of Manitoba, Department of Anthropology and Near Eastern and Biblical Archaeology Lab) - Maeir, Aren (Bar-Ilan University, The Martin (Szusz) Department of Land of Israel Studies and Archaeology)

Mud brick, also known as unfired brick, is an air-dried brick, that is an understudied and unique building material generally composed of sand, clay, water, shell, and organic temper agents (such as straw) in the Near East. It contributes to the understanding of site architecture, social questions related to buildings, human behavior, labor structure, the organization of early urban societies, and the influence of these activities on Near Eastern social complications.

Although Levane is one of the most attractive regions for archaeologists, to the best of my knowledge, there were few English publications about the techniques and applications of mud brick in Tell eš-Şâfi/Gath. While archaeological research on mud brick has primarily focused on Egypt and Mesopotamia. This study represents the first investigation into mud brick production during the Early Bronze Age III (2850-2550 BCE) at Tell eš-Şâfi/Gath (Israel), with a focus on texture, coloration, and recipes. These aspects enable the identification of production techniques and chaîne opératoire. It is worth mentioning that all mud bricks in this study originate from domestic buildings and exhibit varying distances from the roof or bottom. The diverse locations may suggest potential variations in production methods and a more intricate division of labor, along with distinct functions for each type of mud brick.

We propose to investigate the recipes of mud brick production in an early urban setting, which especially focuses on the mineral and organic agent composition. This study was first put forward to try to use the Gas Chromatography-Mass Spectrometer (GC-MS) to analyze the main components of organic tempering agents. By combining results from geoarchaeology and mass spectrometry, it is possible to define the petrographic and chemical characteristics of the mud brick and investigate mudbrick's unique role in early urban planning and social labor arrangements during the EB III.

173 EARLY CAREERS ON THE ROMAN FRONTIERS ? CONNECTING PEOPLE, EXPLORING INNOVATIVE METHODS, ADVANCING INTERDISCIPLINARITY

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Alberti, Marta (Vindolanda Trust; Newcastle University) - Stevens, Saskia (Utrecht University) - Stemberger Flegar, Kaja (PJP d.o.o) - Hingley, Richard (Durham University)

Session format: Regular session

UNESCO's Frontiers of the Roman Empire World Heritage Property, originally designating Hadrian's Wall alone, has since been extended to embrace the Upper German-Raetian Limes, the Antonine Wall and, most recently, the Lower German Limes. Roman frontiers are researched by a multicultural group of scholars: Italian postgraduates examine finds from Cumbria, Canadian researchers study the Vindolanda Trust Leather collection, Turkish and Belgian post-graduates investigate the function and impact of the Limes in the Netherlands. An ever-increasing number of early career colleagues from different backgrounds seek introduction to the established northern European scholarship. The Frontiers of the Roman Empire ECR network and the Dutch research project 'Constructing the limes' both take steps in this direction, fostering international collaboration and transdisciplinary approaches. This session offers ECRs from various disciplinary backgrounds the opportunity to present their research in a welcoming international setting. The organizers welcome papers ranging from small finds to bulk data, papers on the application of bio-archaeological methods, the impact and significance of the Limes from antiquity until today, the development of knowledge of frontier infrastructure, frontiers as zones of interaction. The latter can be presented either through a theoretical lens, or through studies of standing remains and/or material culture. During the session, attendees will have a chance to anonymously vote for the most innovative paper, which will then feature in the ECR newsletter and website.

ABSTRACTS

1 BREATHING NEW LIFE INTO ROMAN FRONTIERS STUDIES: 'CONSTRUCTING THE LIMES' AND THE ECR NETWORK

Stevens, Saskia (Utrecht University) - Alberti, Marta (Vindolanda)

The archaeology of Roman frontiers boasts a rich scholarship, with roots as deep as the birth of the archaeological profession. Thanks to the abundance of archaeological evidence, and to the range of interpretations offered around it, one might feel like the field has been thoroughly explored. Yet new technologies and multidisciplinary approaches can still breathe new life into the topic. This paper discusses two projects aiming to do just that: the Constructing the Limes project (C-LIMES), spearheaded by Utrecht University with as many as 20 academic and societal partners, and the Roman Frontiers ECR Network. C-LIMES focuses on three main aspects of the study of the lower German Limes: the influence of the border on the dispersion of goods and people during the Roman period, how the Limes has become Heritage, and the way our understanding and perception of Roman frontiers has shaped the way we think about borders today. The project, set to continue until 2026, encourages multidisciplinary research by historians, art historians, bio-archaeologists, and political geographers, as well as fostering community participation through the involvement of non-academic society, such as metal detectorists. At the same time, with seed funding from the Roman Society, a new network for Early Career Researchers has been established. The network aims to connect researchers and their research across the whole of the Frontiers, and to offer a safe space for new researchers to discuss their ideas and contributions.

2 FIBULAE IN THE BORDERLANDS

Ruiter, Arjan (Vrije Universiteit Amsterdam; Constructing the Limes)

The idea that the distribution of artefacts in the limes borderlands along the Lower Germanic Limes is severely influenced by the presence of Rome's imperial border on the Rhine is not a new one. A familiar image is that of material culture displaying a concentration on the southern levee of the great river. It seems evident that the Romans placed restrictions on cross-border exchange of material culture. The limes is therefore often seen as a dividing line, a hard border for all actors.

Brooches, or fibulae, are no exception in regards to such clear distribution patterns. More problematic is that certain fibula types and forms are dated based on a historical narrative. Prime example is the 1st century spoonbow brooch. When emperor Claudius orders his general Corbulo in 47 CE to fall back to the Rhine, a number of new fortifications are erected in the Rhine delta and the regional infrastructure is greatly improved. A regional spoonbow brooch form is dated before the 40s of the 1st century CE, because the fibula had spread on either side of what would become the limes. Implicit in this assumption is the idea that the establishment of the limes in the 40s may have halted mobility from north to south.

To understand the effects of the establishment of the limes around 40 CE, distribution maps from both before and after that time must be studied. This paper presents a diachronic comparison of fibulae types that are dated using archaeological contexts and display clear distribution across the limes borderlands. Contemporary distribution patterns can however, differ wildly and show a far more complex and dynamic situation than a single mapped artefact type might suggest.

3 **GOOFY GRAVES: A CRITICAL LOOK AT THE DEVIANT BURIALS OF THE LOWER GERMANIC LIMES AREA**

van der Weij, Anna (Utrecht University)

Strangled bog bodies, children buried under the hearth, human bones chewed by dogs: all of these have been found in the archaeological contexts of the Lower Germanic limes area. Even though these are mentioned in several publications, they are hardly ever discussed as being meaningful finds. This is because they are labelled as “deviant” and therefore as less important than comparatively normative burial practices. But how atypical are these burials really? In this paper, I will discuss some of these and compare them to known examples from neighbouring areas to put them into a broader historical context. In line with the research aims of Constructing the limes, the geographical scope of this paper will not be limited to respectively the “Roman” south or the “Germanic” north, but analyse the borderland of the Lower Germanic limes as a whole. By compiling the available, scattered data, I hope to show the significance of burial practices that are generally considered trivial. Furthermore, with this paper, I wish to explore whether certain patterns can be discerned regarding the spread of these practices.

4 **LATE REPUBLICAN/EARLY IMPERIAL FRONTIERS: THE CASE STUDY OF GORNJI TRG 30 IN LJUBLJANA (SLOVENIA)**

Jenko, Matjaž (Skupina STIK) - Mitrova, Danica (University of Ljubljana, Faculty of Arts, Department of Archaeology) - Draksler, Matej (Skupina STIK)

This contribution presents the preliminary findings of the 2021 archaeological investigations at the site of Gornji trg 30 in present-day Ljubljana, Slovenia. Positioned on the right bank of the Ljubljanica River, beneath the Grajski grič hill, this site stands in contrast to the early Roman Imperial colony of Emona (Colonia Iulia Emona), which was located on the left bank of the river, occupying a large open terrain at the convergence of the roads leading from Aquileia to Pannonia and Siscia. The site in question is part of a wider area where several rescue excavations have been carried out in the past, leading to the conclusion that it was a Roman vicus, inhabited prior to the establishment of Emona. The chronology of the area ranges from the first half of the 1st century BC (Phase I) to the post-Claudian period (Phase IV), during which it became integrated into the eastern suburbs of Emona. Recent excavations in 2021 have provided new insights into previously unanswered questions, particularly regarding the earlier phases of settlement. The vicus was built on the sloping terrain of Grajski grič, with natural terraces extended and certain parts cut into the slope. The architecture of the earliest phase was relatively simple, characterised by wooden foundations and walls constructed from vertical wooden posts connected with branches and covered with clay. After a fire destroyed the buildings of this initial phase, reconstruction began with sturdier stone foundations, although still predominantly with wooden structures. With the establishment of Emona, the strategic importance of the vicus gradually declined.

5 **FEEDING THE ROMAN ARMY IN BRITAIN (FRAB): ROMAN ARMY SUPPLY NETWORKS AT THE BRITISH FRONTIER**

Reynolds, Leah (Cardiff University) - Mion, Leia (Cardiff University) - Ma, Hongjiao (Cardiff University) - Guest, Peter (Vianova Archaeology) - Lamb, Angela (BGS) - Madgwick, Richard (Cardiff University)

Maintaining provision was key to the success of Roman imperialism, but we still know remarkably little about how Roman soldiers on the frontiers were supplied and the impact this had on the provincial countryside and its population. ‘Feeding the Roman Army in Britain’ is a Leverhulme Trust funded project which seeks to address these issues using a multi-isotope approach applied to domestic fauna at sixteen sites in three frontier regions of the Roman province of Britannia: South Wales, Hadrian’s Wall and the Antonine Wall.

This paper will present the results of the project to explore the networks of supply and animal husbandry that supported the Roman army and the impact of these on the rural inhabitants of the frontier regions. It will situate these within their archaeological, historical, and environmental context to enrich our understanding of Roman military provisioning, animal husbandry, and supply strategies of the Roman frontier in Britain.

6 **A MOUNTAIN OF MOLEHILLS? SURVEYING EPIACUM ROMAN FORT**

Breen, Frances (Bournemouth University; Epiacum Heritage CIO)

The site of Epiacum in the North Pennines has a rich and varied history of over 5,000 years of occupation, most notably Epiacum Roman Fort. Unusually shaped and geographically isolated, the fort has numerous banks and ditches surrounding stone ramparts and is one of the most complex defensive earthworks of any fort known in the Roman Empire. This valuable landscape also provides a unique opportunity to further investigate the cultural material that lies beneath the surface of a Scheduled Ancient Monument by non-intrusive means: moles. An innovative approach, molehill surveys use a grid system to record material that has been deposited above ground level when moles have been active, carefully studying the molehills, recording their contents, and analysing the finds. From 2011 - 2015 molehill surveys were conducted on the site by archaeologists and volunteers. In 2023 a final fieldwork survey was carried out, collecting artefacts from more than 1,800 molehills located across the fort’s interior, bathhouse, and vicus, providing insights into the archaeology of this remarkable upland landscape. Bringing together five years of evidence with the final fieldwork survey this paper will explore the methodological approach, finds analysis and interpretation, and provide a comprehensive report of the findings.

7 **AN ANALYSIS OF INSECTS AT ROMAN VINDOLANDA**

Wyse Jackson, Katie (University College Dublin)

Archaeoentomology, or insect analysis, offers valuable insights into the living conditions of people in the past. Insects that have been preserved, often through anaerobic waterlogging, can inform on factors such as food sources, waste disposal, hygiene, storage, trade, and the surrounding environment. The Roman site of Vindolanda, just south of Hadrian’s Wall in northern England, is rich in anoxically preserved archaeological material. Despite this exceptional preservation, thorough insect analysis has not yet been conducted at the site.

This presentation outlines the initial findings from an archaeoentomological analysis undertaken at Vindolanda, offering a new angle from which to consider this well-known site. A small room within the Period III fort (AD 100 to 105) was extensively sampled for insect extraction, identification, and analysis to understand better the use of space within the early fort, and the living conditions under which people lived during this time. The talk will focus on key species recovered from the samples, including numerous grain pests, indicators of dung, and taxa that feed on mould, as well as very likely evidence of early bed bugs. Without archaeoentomological analysis, this easily overlooked form of biological evidence would be lost, along with the crucial insights the remains provide into the daily lives of Vindolanda’s inhabitants.

8 **APPLYING 3D STRUCTURED LIGHT SCANNING TO ROMAN LEATHER INSOLES FROM VINDOLANDA TO VISUALISE FOOTPRINT IMPRESSIONS: RESULTS, BENEFITS, AND CHALLENGES**

Glanfield, Maria (The University of Western Ontario)

This paper presents the results of MA thesis research completed in 2023, which tested the feasibility of a new interdisciplinary 3D imaging and digital enhancement methodology for capturing and digitally visualising indistinct footprint impression evidence left on the surfaces of Roman leather insoles from Vindolanda. The methodology adapts recent digital approaches from forensic podiatry, paleoichnology, and epigraphy to expand approaches to the collection of podiatric data from Roman footwear and refine the accuracy of data that can be extracted from Roman leather shoes. Traditionally, podiatric data gathered from Roman leather shoes (i.e., foot length, width, and relative size) has been manually measured from the total length and width of the insole of the shoe, resulting in inaccurate podiatric data and unclear divisions between categories of shoe sizes attributed to certain sex and age categories (i.e., children, female/adolescents, and adult males) (van Driel-Murray 2007, 360; Groenman-van Waateringe 1982). Thus, it has been difficult for researchers to assign accurate ownership to individual Roman leather shoes and thoroughly analyse the demographic variables, health, and disabilities of the local Roman populations to which the shoes belonged. The data analysed so far, including foot size, shape, placement, and pressure distribution, suggests the need for refined measurement practices for podiatric data collection, provides insight into several questions scholars have posed about certain Roman footwear practices, and indicates irregularities in the walking gait of some individuals.

In addition to presenting promising results, I evaluate some of the advantages and disadvantages of this new methodology, with particular focus on its applicability for researchers with Roman footwear collections and the next stage of development of this research in the future. Finally, I conclude with a discussion on the challenges surrounding the subjectivity and accuracy of 3D data visualisation.

9 CROSSING THE ISTHMUS: MODELLING OPPORTUNITIES FOR CONFLICT ON HADRIAN'S WALL

Clark, Matthew (University of Exeter)

The Roman frontiers are often considered as a system of fortifications encircling, defending, and controlling access to the Roman world. The frontiers consist of a complex interweaving of various structures which leads to researchers struggling to integrate their findings when tackling such a geographically large network. Additionally, there is evidence of military operation, civilian trade and the movement of material crossing the boundaries. The frontiers, therefore, are more zonal than linear and for research into the operation of a zonal landscape; a new approach focusing on spatiality and synthesising various data types is required.

My PhD focuses on developing a method to assess the landscapes of the Roman frontiers and compare them at a macro and micro level. The method I am developing adapts Harvey Starr's 'Opportunity and Willingness' (O/W) approach to study of the ancient world and uses ArcGIS to assess the ease of movement and the incentives to move across the frontier zones. By comparing these factors to the design of the frontier systems it is possible to detect patterns in Rome's approach to frontier zones.

At EAA 2024, I intend to present the results of applying this method to Hadrian's Wall. This innovative research will later be expanded to study sectors of the frontiers in Germany and Romania. Even at this early stage in the PhD, preliminary data collection indicates a relationship between locations of high north-south mobility and the prioritisation of Roman structures on Hadrian's Wall. This suggests that the Roman military did not approach landscapes uniformly but instead expended energy, manpower and resources to tighten control over potential weak points and high traffic areas. The ability to detect these patterns of Roman response to the landscape through the O/W approach makes it a vital new tool to study these large and complex Roman militarised landscapes.

10 MORPHOLOGICAL AND TOPOGRAPHICAL ANALYSIS OF THE VALLUM OF HADRIAN'S WALL USING LIDAR

Bithell, Sam (Durham University)

The use of LiDAR in archaeology is well established, especially in terms of prospection for new sites, and the Hadrianic frontier in Britain is no outlier. However, LiDAR derived data, such as relative elevation, slope, and aspect has been underutilised in the study of Hadrian's Wall. A recent paper (Breeze and Graafstal, 2022) used LiDAR data to gain new insights into the Vallum's interaction with Wall forts. However, this paper goes a step further, utilising a multitude of LiDAR derived datasets to better understand the morphology of the Vallum, and its interaction with localised and broadscale landscapes. Environment Agency LiDAR data was analysed for the full length of the Vallum, from Newcastle to Bowness-on-Solway. Initially, the best-preserved sections were identified, and topographic profiles extracted every 10m. Measurements such as (eroded) mound width or ditch depth could then be compared at a large scale, rather than just between excavated section situated miles apart. The course of the Vallum through its landscape is highlighted in a new way, thinking less about Roman military surveyors, and instead about how the course might have been informed by the intended function. The morphology and topography of the Vallum, along much of its length, are in this way defined and their interaction determined with broad implications for our understanding of its function.

182 INVISIBLE OR HARD TO SEE: NON-BURIAL TREATMENT OF THE DEAD IN THE ARCHAEOLOGICAL RECORD

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Klevnäs, Alison (Uppsala University) - Brownlee, Emma (University of Cambridge) - Bergerbrant, Sophie (Uppsala University)

Session format: Regular session

Mortuary remains provide key archaeological evidence not only for beliefs related to the treatment of the dead, but also for life courses and social existence. But in many periods and places, the full population is not represented in the burial record. In others, there is little archaeologically visible funerary activity at all, or evidence may be fragmented across the landscape.

Human remains are most readily recovered where active steps have been taken to make funerary depositions in graves or equivalent preserving spaces. However research now tries to go beyond immediate contexts to reconstruct the full stretch of mortuary processes, not only depositional acts. This can include alternative treatments of corpses, which may or may not end in whole or partial burial, or long-term preservation of bodily coherence, far exceeding the traditional dichotomy of cremation and inhumation. Further, graves may be complex features comprising several phases and post-burial actions, such as remodelling or retrieval of corporeal elements.

Moreover graves are far from the only destination: there is increasing recognition of the informational value of human remains and funerary acts in settlements or spaces otherwise considered non-mortuary. More attention is now given

to times and places, or social groups within them, for whom burial was never a question, but where the dead were disposed of in ways which were not intended to leave lasting traces.

This session aims to open up discussion of funerary pathways beyond burial to explore variety in how past people related to the remains of the dead. The potential of different methodological approaches to capture and reconstruct signs of non-burial corpse treatments is a central question. We invite papers from all over the world presenting a wide spectrum of deathways and their material correlates, including those which by their nature are difficult to pinpoint in the archaeological record.

ABSTRACTS

1 PRIMATE PERSPECTIVES: USING PRIMATOLOGY TO AID THE ARCHAEOLOGICAL RECORD IN UNDERSTANDING NON-BURIAL MORTUARY BEHAVIOR OF EARLY HOMINIDS

Ford, Jay (Durham University)

This paper adopts a cross-disciplinary methodology to examine early hominid mortuary behaviour, integrating insights from primatology and observations of contemporary primates. The primary aim is to enhance comprehension of the mortuary practices of early hominids, through establishing primate data as a valuable source of information. By comparing mortuary behaviours evident in both the archaeological record and primatological observations, this research aims to shed light on aspects less evident in the archaeological record. A focus on chimpanzees will be taken, as they are our closest living relative and there exists a plethora of relevant observational studies. The investigation delves into the influence of inter-group relations and kinship on individual engagement in mortuary activities. Additionally, the study considers the potential impact of the cause or nature of death on mortuary behaviour. This study proposes that in order to advance our understanding of pre-burial mortuary behaviours, that are challenging to observe archaeologically, the application of innovative interdisciplinary approaches and techniques is necessary. The field of primate thanatology is growing, and this research aims to aid in this advancement; further evidencing the benefits and importance of including primate (in particular chimpanzee) data in discussions of hominid mortuary behaviours.

2 REST IN PEACE OR RESTS IN PIECES? NEW DATA ON THE MORTUARY PRACTICES OF THE LAST HUNTER-GATHERERS IN BELGIUM

Glas, Clémence (Paris 1 Panthéon-Sorbonne University; UMR 8068 TEMPS) - Polet, Caroline (Operational Directorate Earth and History of Life; Royal Belgian Institute of Natural Sciences)

Until recently, the mortuary practices of the last hunter-gatherers in Belgium have been mostly described as successive deposits of fresh human cadavers in sepulchral caves. These bodies, dated to the Early Mesolithic, were then only disturbed by taphonomic processes. The scattered human remains discovered in the Autours rock-shelter (Province of Namur, Belgium) allow questioning this apparent homogeneity.

The site, excavated in 1992-1993, delivered, among others, an assemblage of several hundreds of disarticulated and dispersed bones of several adults and children (AA2; 9090 +/- 140 BP, OxA-5838). Early anthropological studies demonstrated that AA2 was a collective burial recovering the remains of at least six juveniles and five adults. However, the constant renewal of knowledge of Mesolithic mortuary practices through an increasing number of discoveries makes it possible to question some of these interpretations. A recent revival of the Autours rock-shelter anthropological collection has been realized. In addition to the "classical" archaeo-anthropological analyses (calculation of MNI, estimation of age at death and sex determination), less common protocols such as the study of the fragmentation of long bones, the analysis of the osseous surface modifications and an examination of the spatial distribution of the remains in order to determine the form of the initial deposit have been made. The results demonstrated that the human remains of AA2 would rather be the residual bones left after a selection which occurred after the decomposition of fresh human cadavers successively or simultaneously deposited in the cave.

The mortuary practices implemented at the Autours rock-shelter thus correspond to a complex mortuary "chaîne opératoire" still unheard in Belgium, involving a complementarity with the other Mesolithic sepulchral caves found in the Meuse Basin.

3 THE ARCHEOLOGY OF DEATH IN NEOLITHIC SICILY

Giannitrapani, Enrico (Arkeos - Servizi integrati per i beni culturali s.c.; Confederazione Italiana Archeologi - Sicilia; Dipartimento Culture e Società, Università di Palermo)

The funerary landscape characterising the Neolithic in Sicily is a field still ambiguous and ill-defined. Despite a long tradition of research, started at the end of the 19th century, the quantity and quality of the available evidence on the island is scanty, limited to a few isolated earth-pit graves, sometimes assuming a more consistent appearance because of the use of lithic cyst. Only in the late Neolithic did these take a proper necropolis configuration. For preceding pe-

riods, the Palaeolithic and Mesolithic, and for the later Metal Ages, data are relatively more abundant, with the latter phase characterised by substantial rock-cut graves. However, studies have focused so far mainly on the material and formal aspects of death, more easily detectable and analysable by archaeology, assigning greater importance to the analysis of funerary architecture and the associated material culture and much less on those issues that are instead central to the anthropology of death: what happens to bodies after death and before the deposition? What is the role of the community in this crucial phase or after the closing of the grave? How is the memory of the deceased created and empowered? In the contribution, after a synthetic overview of these issues as applied to the long prehistory of Sicily, the presence/absence of funerary evidence on the island during the Neolithic, ranging from the 6th to the 4th millennium BCE, is discussed. Furthermore, suggestions on the possible relation between this crucial issue and a more appropriate definition of the Sicilian Neolithic communities and their social, cultural, and economic structure are advanced to define a theoretical and methodological line of enquiry useful for future research.

4 **GONE AND FORGOTTEN? TOMBLESS DEAD IN THE LINEARBANDKERAMIK CULTURE IN THE ALSACE PLAIN (CA. 5300-4950 BC)**

WALDVOGEL, Laura (University of Strasbourg, UMR 7044)

In the context of the European Neolithic, the Linearbandkeramik (LBK) culture stands out for its numerous examples of unburnt human remains found mainly in graveyards, and sometimes in domestic settings. While the funerary nature of the human remains discovered in the first type of context can be firmly established, the same observation is harder to assert in the second one: this is evidenced by the dissensions between researchers, who sometimes equate them with burials (Sonderbestatungen), sometimes with deviant practices (Verlochung).

This communication focuses on the case of human remains unearthed in Alsace (France) to highlight the complexities involved in interpreting the dead found in domestic contexts. The comparison of practices identified in graveyards (eg. position and orientation of the bodies, presence of objects) with data from habitats suggests that some of the dead can be identified as funerary deposits, even though some are located in pits that were diverted from their original function. Conversely, other human remains stand out for their disordered positions: a fact that indicates a lack of care given to the body and which therefore pleads in favor of their non-funerary nature. In Alsace at least, this observation suggests the existence of three categories of individuals: those with access to the graveyard, those whose graves are located within the village, and those deprived of burial. While the latter group includes individuals of both sexes and all ages, ethnological references and historical sources open several avenues for reflection on the possible interpretations of these deposits (deprivation of burial, treatment of the body as waste, malemort, etc.).

5 **REVISITING "ANOMALOUS" BURIAL PRACTICES: A CROSS-CULTURAL PERSPECTIVE**

Cvecek, Sabina (Field Museum of Natural History; Austrian Academy of Sciences)

The prevailing literature on burials in the European Neolithic adopts Euro-American hegemonic perspectives, focusing on burying the dead in (nuclear) family graves and analyzing remains as individual entities. Utilizing advanced natural science techniques like ancient DNA extraction, scholars aim to decipher biological relatedness and construct kinship trees, often emphasizing the presence of nuclear families in central European Neolithic contexts. However, the prehistoric record from Neolithic southeastern Europe and western Asia challenges this individualistic narrative. Here, the dead are frequently interred beneath house floors, defying neat categorization based on biological kinship. This raises intriguing questions regarding death rituals, kinship structures, and social organization within these communities.

This paper proposes a shift in perspective by considering the dead and burials not merely as individuals but as persons embedded within broader social contexts. My analysis will be informed by extensive cross-cultural ethnographic evidence, which will be used to contextualize burial practices that may initially appear anomalous within Euro-American frameworks. By reexamining the funerary record through this lens, I seek to illuminate the diverse and nuanced death practices of Neolithic communities in southeastern Europe and western Asia, including the possibilities of non-burial treatment, and challenge prevailing Eurocentric interpretations of burials and kinship in the region. Lastly, I seek to highlight why considering non-European ethnographic examples remains crucial to better understand burial practices in prehistoric Europe.

6 **WHERE DO BURIAL PRACTICES BEGIN AND END? VARIABILITY IN THE TREATMENT OF THE DEAD AT AN EARLY BRONZE AGE SITE**

Verdianu, Domnika (Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Prehistoric and Historical Archaeology, University of Vienna)

Placing bodies in settlement pits as well as in graves within cemeteries is a recurrent practice in the Early Bronze Age Únětice Culture – for instance at the site of Ulrichskirchen in Lower Austria. The case study includes 12 graves and 5 settlement pits with human remains. While the graves have the same orientation and the deceased were positioned

similarly, the depositions in the settlement pits do not have a specific orientation or body position. It is unclear whether these bodies were buried, stored for excarnation, or simply disposed of in the former storage pits. All 12 graves were reopened in antiquity and in almost half of the graves the skull was removed. It is unclear what happened to the skulls after they were excarnated. One grave contained no human remains, only grave goods. Was there never a body or was it excarnated? In the robbery funnel of that 'empty' grave the remains of an infant were found, commingled with animal bones. How should this feature be interpreted? It is interesting to note that remains of newborns are almost never visible in the archaeological record of the Únětice Culture. The issue is, what happened to their bodies? The variety and complexity of funerary rites and practices during this period are not yet fully understood. Many of these knowledge gaps are related to practices that are difficult to observe or even invisible in the archaeological record.

7 **HUMAN REMAINS OUTSIDE FUNERARY CONTEXTS IN BRONZE AGE CRETE**

Kiorpe, Sotiria (Aristotle University of Thessaloniki)

During the Bronze Age in Crete, the landscape was littered with burials made either in caves and rock shelters, or in isolated tombs and cemeteries. Despite regional differences in mortuary practices, burial places were always separated from those of the living. However, recent work has brought to light an increasing number of human skeletal remains excavated outside of funerary contexts in explicitly domestic and ritual spaces. These are not only found in a variety of forms, as isolated body parts, fragmentary and scattered bones and burials, but also in diverse contexts, generating many questions regarding their meaning. Over the years, the presence of skeletal remains in non-mortuary spaces has been interpreted as funerary paraphernalia which represented the ancestors, and were introduced in the realm of the living during rituals which aimed to shape a collective memory and promote the continuity of the community. While the latter hypothesis can possibly explain the presence of isolated body parts, it does not take into consideration the entire corpus of evidence and its contextual complexity. Therefore, the present talk aims to review the available evidence, provide a descriptive framework which separates between burials, post-funerary and non-funerary processes, and suggest a theoretical framework under which the presence of corporeal elements in non-mortuary spaces can be studied in a more fruitful way.

8 **A DATE WITH DESTINY: FORGOTTEN OR REMEMBERED HUMAN REMAINS IN SCANDINAVIAN WETLANDS**

Bergerbrant, Sophie (Uppsala University)

The study of human remains in wetlands has traditionally focused on bog mummies. Recent studies have also looked at human remains preserved as bones only – bog skeletons. The focus of much of this growing area of research has been on Iron Age remains. However, a recent study has shown that when skeletonized body parts are taken into account, the phenomenon of depositing human remains in wetlands can be seen to have a much longer history. Remains date both much further backwards in time and even into the modern period. Bodies were sometimes incomplete or partial at the time of deposition.

The influence of Tacitus on interpretative frameworks has been strong and lasting, but the possibilities raised are increasingly wide-ranging. Although sacrifice is often inferred, some finds have been seen as regular graves, and other cases are convincingly interpreted as remains from battlefields. The liminal nature of wetlands is often cited as a quality attracting mortuary use, although other aspects may have played in, including their preserving capacities. Taking this broader perspective on the nature of the remains, the variety of individuals involved, and the range of cultural contexts, this paper will ask: were individuals deposited in wetlands meant to be remembered or forgotten? The question will be discussed through a number of examples from Scandinavian wetlands.

9 **INVISIBLE DEAD – VISIBLE RITUALS. ANALYZING THE FUNERARY RITES AND RITUALS IN LATE IRON AGE TRANSYLVANIA (ROMANIA)**

Rustoiu, Aurel (Institute of Archaeology and History of Arts Romanian Academy Cluj-Napoca)

Transylvania has a well-defined geography, being part of a larger area known as the eastern Carpathian Basin.

The Late Iron Age in Transylvania covers two distinct cultural horizons: the "Celtic" horizon (ca. 350 – 200/175 BC), and the "Dacian" horizon (ca. 200/175 BC – AD 106).

The funerary practices are very different from one horizon to another. Unlike in the 4th – 3rd centuries BC, when dozens of cemeteries consisting of hundreds of cremation and inhumation graves are attested in Transylvania, during the Dacian horizon of the 2nd century BC – 1st century AD the cemeteries are almost non-existent, and when some do appear, they seem to belong exclusively to certain social groups (warriors, small children, ancestors, local and foreign individuals who were perhaps sacrificed for various purposes, individuals suffering an unusual death etc.). From the funerary perspective, the corpses of most members of the community were treated in an archaeologically "invis-

ible” manner. Perhaps they were cremated and the remains were then scattered in water bodies or other uninhabited places outside the settlements.

However, some rites and rituals of passage performed during the funerary ceremonies, which allowed the integration of the deceased into the other world and the reintegration of the mourners into the social body of the respective community, could be reconstructed on the basis of archaeological evidence, often with the support of other interdisciplinary analyses. The scope of this paper is to identify this kind of archaeological evidence in Late Iron Age Transylvania. On the other hand, some graves, from the beginning of this chronological/cultural period, which have traces of multiple manipulation, are giving suggestions about the mechanisms of ritual, ontological and physical transformations in the treatment of the deceased’s corpses from “visible” to “invisible”.

10 HEADS ON DISPLAY AND BODIES LOST

Wählin, Sidsel (Vesthimmerlands Museum)

In Vendsyssel (Denmark) skulls had a special place in the ritual practice in the 1st century BC-3rd century AD. They were carefully defleshed and eventually at times centuries later deposited in peat pits in the bogs among other ritual offerings. Signs of violence are absent from the skulls and the ritual setting. Thus, where were the skulls between the time of death and final deposit what afterlife did they have?

Also the sole focus on the skulls leave us with the question what happened to the post cranial body? There is a rich contemporary burial record in Vendsyssel that clearly demonstrates that the wetland skulls were part of a very different ritual practice, not only in the beheading but also in the placement in still water most likely visible as opposed to interment in graves underground and out of sight.

Through analysis of the skulls and their final ritual setting this paper will discuss the afterlife of the skulls what was their place in society and why were they eventually set on display in the clear water of the peat pits.

11 HUMAN REMAINS FROM “NON-BURIAL” CONTEXTS SUCH AS WETLANDS

Pantmann, Pernille (Museum of North Zealand, Denmark)

When working with bog bodies the discussion is often concerned whether they represent human sacrifices. In a few cases burials is also suggested as a possibility. However, in a study of pure skeleton bog bodies within a distinct area, new questions arise. Because on several of the sites within this area, Northeastern Denmark, there is only one or a few bones from a human being. Do these finds represent actual bog bodies then, or are bog bodies defined by being complete or near complete bodies? But returning to the finds of single human bones, then what is the implication of a single human bone in a wet environment? At the time of deposition, was it already a bone or was it covered with tissue and flesh? When one considers the impact of each possibility, then the questions which naturally follow is: what happened to the rest of the body? Should bog bodies be integrated in the broad understanding of the complexity of burial customs and other ritual activity with human remains?

Furthermore, bog bodies are generally considered to be human remains from wet contexts. But what if human bones are found amongst layers of household waste within a wetland environment, which context defines the impact of these bones? Can human bones be considered waste, or do they always represent burial customs or other ritual activities? Traditionally, we have had clear definitions of what constitutes a grave, but recent years discussions have questioned or broadened these definitions. But maybe we should also ask ourselves if ritual activities are the only explanation to human remains from “non-burial” contexts, whatever these may be?

12 ANCIENT REOPENING IS WIDESPREAD IN BOTH TIME AND SPACE: RITUALLY RE-ENTERED GRAVES IN SOUTHWEST DENMARK THROUGHOUT THE IRON AGE

Qvistgaard, Sarah (Museum Vest)

A broader time perspective of ritual re-entered graves from cremation to inhumation practice provide a new perspective on why graves were revisited in several periods of the Iron Age in Southwest Denmark.

The re-entering of graves is often a phenomenon associated with inhumation graves, but it is a tradition that goes way back to the Pre-Roman Iron Age (500-200 BC). Examples of use of cenotaphs and clear evidence of exhumations performed shortly after the initial burial reveal ‘pars-pro-toto’ burial rituals in an urnfield with urn graves from a period of the Iron Age, when the cremation grave custom dominated in Southwest Jutland. New excavations on the urnfield Korsvanggård exude evidence to the burial practice.

In 2023, in the vicinity of 7 km, at Tjæreborg Sønderby a section of an excavation trench went through a gravesite of iron age inhumation graves (300 AD) and 16 were excavated. A comparison to the more familiar context, namely the 2nd-4th century inhumation graves, where the re-entering is well known will be presented. All of the inhumations have been re-entered in the head and chest area not long after burial. The coffins appear to be degrading as well as

the metal objects, so was it indeed for the objects? What happened to the corpses? The south-west Jutland material does not have its strength in a well-preserved bone material but in clear traces of fill change.

Especially unique, is the adjacent, contemporary settlements to which the gravesites belong. Close by, two contemporary gravesites in Tjæreborg have been excavated and they show no sign of interference or re-entering. Can it shed new and clearer light on the question of who carried out the reopenings?

These examples show a representative pattern in the larger area.

13 CREMATED, CURATED, OR CAST ASIDE: EXPLORING THE COMPLEX MORTUARY PRACTICES OF IRON AGE BRITAIN

Legge, Michael (University of York)

The Iron Age in Britain (c.800 BC to AD 43) was a period of great diversity in the treatment of the dead. Cremated, buried, fragmented, or curated, the dead were simultaneously separated from, and integral to, the communities of the living. Disarticulated human remains are notably found across Iron Age Britain, from domestic spaces, to hillforts, and mortuary centres; they are interred within living spheres and deposited in liminal spaces. However, despite the variety of treatments afforded to Iron Age peoples, the majority of the population is still thought to have been disposed of in archaeologically ‘invisible’ ways.

Since at least the 1970’s, sub-aerial exposure has often been suggested as the explanation for the missing population, but more recently, developments in scientific methodologies, research into bone taphonomy, and large-scale study of the archaeological data has shown the reality to be much more complex.

This paper presents a holistic approach adopted to investigate Iron Age mortuary practices, utilising a dataset of over 5000 individuals from more than 600 sites compiled as part of the COMMIOS project. The research reveals evidence for the selection, curation, and transformation of skeletal elements as part of complex multi-stage funerary processes. The collated data also supports alternative deposition practices to sub-aerial exposure, including the deposition of the dead in watery contexts or their dispersal within the landscape; as well as allowing for the identification of new regional patterns of treatment and the quantitative support of existing ones.

14 SELECTIVE FUNERARY RITUAL IN SOUTH-EAST BRITANNIA: KINSHIP AND TRIBAL CONTINUITY IN AN IMPERIAL PERIPHERY?

Weekes, Jake (Canterbury Archaeological Trust)

Occupancy of particular cemetery plots in the late Iron Age and Romano British East Kent, UK, was clearly highly selective. Emphasising this selectivity is in itself an interpretive shift that moves the study of funerary traditions at this time forward, and raises important questions about all of the other dead who were apparently excluded, and remain (largely) archaeologically invisible. This paper looks at several urban and rural case studies from this region, within Durovernum Cantiacorum (Canterbury) and its wider hinterland, including examples of: the newly identified “Deal” inhumation rite from c 150BCE (named after the eponymous site in Kent), and its continuing influence well into the Roman period; latest Iron Age and early Romano-British cremation traditions; and Late Antique resurgences of inhumation, all often evidenced within the same small cemetery area. The paper moves on to consider a hypothesis for what may have been a particular driver of such funerary selectivity: localised and deep-set prehistoric kinship and tribal affiliations. These may have remained a significant facet of the selection of particular individuals for spatial emphasis through burial grouping, mediated through funerary features invoking broader identities: constructions of local late Iron Age affiliation, and eventually “Romanness”. Even these wider references were localised within the wider polity of the Roman north-west provinces, a regional palette of funerary choices shared with the Near Continent, leading to a specific and changeable funerary creole in the south-east peninsular of “Roman” Britannia. This overall framework is proposed as a more nuanced way of viewing structure/agent dialectics in a marginal province, as demonstrated by the selective treatments of the dead.

15 WHERE IS EVERYBODY? THE UNBURIED DEAD IN EARLY MEDIEVAL ENGLAND

Klevnäs, Alison (Uppsala University)

A scarcity of mortuary material from the fifth century AD, especially its first half, has long been noted in areas of eastern and southern England. Some regions, for example Kent and Essex, have very small numbers of cemeteries and graves datable to this phase. Inadequate artefact chronologies, or possibly a phase of unfurnished inhumation, probably contribute to this apparent absence. That said, this paper suggests that many of the dead are truly missing from the archaeological record.

Corpse disposal methods which leave little or no archaeological trace are well-established as a component of mortuary pathways in Iron Age Britain, but until recently were thought to come to an end with prehistory. This picture has changed: in the last few years, a comprehensive survey has shown that formal burial remained rare in the countryside

into and throughout the Roman period. We now know that the rural population under Roman rule never substantially adopted the urban custom of gathering the dead in cemeteries, but instead continued their earlier near-invisible funerary rites.

Here it is argued that the low levels of visible burial in the century after the collapse of Roman rule should be explained at least in part in the same way as the under-representation of Romano-British funerary remains. Local populations in all likelihood maintained their non-burial mortuary customs for some time, making their dead invisible or hard to see during the 'missing fifth century'. This has significant implications for understanding cultural transitions from the Roman period into the early middle ages, and especially for the representativity of the burial record during the continental migrations to southern and eastern England.

16 SOME OF THEM ARE HERE. THE ACCIDENTALLY PRESERVED DEAD IN EARLY MEDIEVAL ENGLAND

Brownlee, Emma (University of Cambridge)

The fifth to seventh centuries in England are usually seen as characterised by cremation and inhumation cemeteries in which the dead were buried in costume and with other artefacts. The dominance of formal cemeteries in this period means that archaeologists have rarely considered whether other methods of corpse disposal may have been practised. This paper presents a series of disarticulated human remains which have been radiocarbon-dated to the first millennium AD, all from contexts outside formal burial places, primarily caves and rivers.

These remains have mostly been identified by prehistorians, for whom caves and rivers are expected places to find corpse disposal. For them, the early medieval remains are little discussed late aberrations, and the significance of these finds has yet to be identified by early medieval archaeologists. Yet the dates point to a range of disposal practices taking place throughout the Roman and early medieval periods. These include exposure and water burial, neither of which would ordinarily be archaeologically visible. The unique preservation environments of caves in particular mean that these 'invisible' practices can be seen, even if only through indicative traces. The finds in exceptional environments also imply that these disposal practices may have been more widespread beyond the areas where environmental conditions enable their rare survival. If burial in cemeteries was part of a spectrum of practice, that opens up the possibility that truly archaeologically invisible practices also persisted into the early medieval period.

17 TEETH AS MATERIAL CULTURE: RITUAL DEPOSITION OF TEETH IN IRON AGE SCANDINAVIA

Tollefsen, Emma (University of Leicester; ERC StG 'Body-Politics') - Eriksen, Marianne (University of Leicester; ERC StG 'Body-Politics')

The BODY-POLITICS project (ERC StG) is the first large-scale effort to collate and analyse human remains deposited in settlement contexts in the Scandinavian Iron and Viking Ages. These remains are often fragmented — bodies broken apart — such as cranial fragments or long bones, or consist of fetuses and infants incorporated into floors, postholes, ditches and pits in and around people's homes. These depositional events cannot easily be slotted into the universalising category 'burial', and we question whether these practices necessarily reflect the commemoration of social individuals. We term the remains 'body-objects', on a continuum between subjects and objects.

While synthesising this material, a specific pattern emerged: the deposition of single teeth — both permanent and deciduous — deposited in domestic structures, especially concentrated to the turn to the first millennium CE in southern Scandinavia. Teeth are a particular kind of material object. They intersect with growing, ageing, and specific socio-cultural rites of passage. Teeth are intriguing because they are (like nails and hair) detachable parts of the body — they can be removed without danger to the living body. Tooth removal can be part of body modification practices as well as health interventions. Simultaneously they may be believed to contain some substance or essence of the body whole. This partible quality means that teeth are malleable and manipulable.

In periods where cremation was the norm, the distribution of human teeth in floors, pots, posts and floor layers raises intriguing questions such as: from whom were the teeth harvested? Were they taken from living or dead bodies? How does this practice reflect ideas of what the body is, its capacities, and how bodies should be treated in life and death? We present initial bioarchaeological analysis of several such teeth, and explore the theoretical provocation for the archaeology of bodies.

18 THE BODY IN PIECES: ATTITUDES TOWARDS THE DISPLAY AND RETENTION OF HISTORICAL FLUID PRESERVED SPECIMEN COLLECTIONS

Sutton-Butler, Aoife (University of Bradford)

Across Britain many institutions are home to historical fluid preserved anatomical and pathological collections, mainly dating from the 18-19th centuries. These collections consist of human remains obtained under dubious circumstances, often taken after lawful burial through bodysnatching, without familial permission at autopsy, or simply from op-

erations at which surgeons deemed the tissue appropriate to preserve. These human remains exist in a liminal space after death — on a spectrum between an educational object and the living person they once were. There has been a transformation of these bodies into a commodification or 'scientific object', taking on a social role in death as a 'thing' (Seale et al 2005). Many historical dissected bodies are present in the archaeological burial record, indicative of dissection techniques, the historical consideration of 'clinical waste' and of the tissue not selected for long term preservation. The dissected body has been 'broken' apart, now suspended in a glass jar preserved from decomposition using fluid such as alcohol or formalin — not disposed of or deposited in ways the dead body so often is. What are these body parts considered as today — object, person, or something in between? How do we consider these non buried remains? In recent decades there has been deterioration of such collections as they have become less relevant in teaching and research (Bocaege et al 2013), but there have been recent suggestions that these collections are still relevant in the fields of ethics, bodily display, personhood, archaeology, and the biomolecular sciences (Irving 2023, Sutton-Butler et al 2023). This paper will present data from the authors' PhD project exploring professional attitudes towards the display and upkeep of these collections, exploring public attitudes towards different tissue types displayed in museum spaces, and how they can open up conversations on death today.

184 ARCHAEOLOGY OF FOODWAYS: TOWARDS A CROSS-CULTURAL COMPARATIVE PERSPECTIVE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Wang, Jiajing (Dartmouth College) - Parque, Óscar (CASEs (Culture, Archaeology and Socio-Ecological Dynamics). Pompeu Fabra University, Barcelona) - di Matteo, Martina (Sapienza University of Rome) - Li, Weiya (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; University of Science and Technology of China) - Jiménez-Arteaga, Carolina (CASEs (Culture, Archaeology and Socio-Ecological Dynamics). Pompeu Fabra University, Barcelona)

Session format: Regular session

Food serves as a fundamental link that unites people from diverse cultures and regions. Recent archaeological research on ancient foodways has undergone a remarkable expansion in both theoretical frameworks and methodological innovations. Departing from the traditional emphasis on "diet" and "subsistence," which primarily focuses on how ancient communities sourced and produced the essential sustenance for their cultural survival, recent research explores broader themes like "foodways" and "cuisine." This approach investigates how food-related practices intersect with social phenomena, including status, gender, religion, and cultural contact. The shift in theoretical perspective is supported by innovative scientific methods, particularly in fields of archaeobotany, zooarchaeology, and biomolecular archaeology.

This session provides a platform for disseminating recent methodological and theoretical innovations in the study of food and culinary practices in ancient societies. It aims to bring together archaeologists from diverse geographic regions to present case studies that hold comparative values for other specialists to incorporate into their own research projects. We especially welcome contributions that engage in cross-cultural comparisons of past foodways. Potential themes include, but not limited to, the domestication of plants and animals, the spread and adoption of food technologies, the role of food in both daily routines and ritual contexts, and the relationship between foodways and social organizations.

ABSTRACTS

1 MAGDALENIAN BUTCHERY TECHNIQUES BEYOND A NATURALISTIC PERSPECTIVE

Birouste, Clément (TRACES UMR 5608 Université Toulouse Jean Jaurès)

The study of the diets of nomadic hunter-gatherers of European Palaeolithic has largely developed around the idea of profitability. As a result, the large ungulates consumed by these populations (reindeer, bison, horse, ibex, saiga antelope, etc.) have often been considered by zooarchaeology as mere resources. However, food-related practices, beyond a naturalistic or economic perspective, can shed light on more complex human-animal relationships.

I present an archaeozoological study of animal bone remains from various sites attributed to the Middle Magdalenian in southwestern France (19000-16000 Cal BC), which reveals that certain butchery techniques are not limited to economic or nutritional factors. This is the case with the systematic disarticulation of the carpal and tarsal bones. This activity is directly associated with food practices, but has no obvious objectives. It doesn't fit in with a bone marrow recovery process, or with a desire to share carcasses within the group, for example. Archaeological experiments carried out on Cervus elaphus legs have helped me to understand more precisely these gestures, which were performed in the Middle Magdalenian period. Ethnoarchaeology describes the same type of practice in Siberia, notably among the Evenk, where it is explained by « animal ceremonialism ».

I propose to put this first observations into perspective with other particularities of carcass processing in the Middle Magdalenian that escape a logic of economic profitability, such as the systematic fracturing of ungulate phalanges to consume the marrow, or the tendency to introduce the skulls of hunted animals into the occupation sites. The ways in which animals are depicted in rock art and on numerous objects in the same context can also be mobilized, showing that various domains seem to be interconnected within an overall system that I interpret as an animism.

2 GLIMPING ETRUSCAN FOODWAYS: DAILY PRACTICES AND FOOD RITUALS IN PYRGI, PORT OF CAERE

Servoli, Sofia (Sapienza Università di Roma)

Ancient port of one of the most famous Etruscan cities in Southern Etruria, Pyrgi is a coastal site characterised by a residential area and two sanctuaries, places of deep spiritual significance for both Etruscans and foreign believers (such as Latins or Greeks). In such multicultural context, between the 6th and the middle of 3th century BC, food-related practices played a crucial role during rituals that took place in the so-called “Monumental Sanctuary” - with its two remarkable temples - and in the “Southern Sanctuary” where, by following a strict ritual procedure, liquid and solid offerings of food were poured from or presented in specific ceramic vessels in honour of the Chthonian gods. Ritual practices were carried out also in the residential area, where the main domestic structure is a large palatial building facing a street connected to the principal road system leading to the inland city of Cerveteri (the ancient Caere); inside this building, investigations have brought to light evident traces of ceremonies involving the consumption of meat: thanks to these remains, zooarchaeological studies have also contributed to the reconstruction of indigenous eating and ritual habits. Furthermore, clues regarding daily culinary practices are offered by the analysis of coarse and cooking wares collected from both the residential area and the sanctuaries: the study of the adoption of different types of vessels and tools used for example to process cereals or to boil food, such as mortars, basins, jars and cooking stands, certainly helps to add new interesting data concerning Etruscan foodways.

3 FOOD FOR HUMANS AND FOOD FOR GODS: CASE STUDIES FROM POMPEII (1ST CENTURY AD)

Corbino, Chiara Assunta (Pompeii Archaeological Park) - Comegna, Chiara (Pompeii Archaeological Park) - Amoretti, Valeria (Pompeii Archaeological Park) - Zuchtriegel, Gabriel (Pompeii Archaeological Park)

Animal and vegetal products were particularly important in human life. Differences in diet are linked to the social status of the people. However, in the past, foodstuffs provided not only the fundamental nutrition for life but also suitable offerings for Gods and Goddess.

Roman writers, such as Pliny the Elder and Columella, inform us about the use of some foodstuffs in diet and rituals but, with few exceptions, their actual use in Italian roman cities has not yet been archaeologically investigated.

The contexts from Pompeii are particularly suited to reflect the complex network of circumstances and behavior that characterized the past urban communities in the roman imperial period. Indeed, recent archaeological investigations at that site revealed a number of zooarchaeological and archaeobotanical remains associated with every day and ritual contexts.

Animal and vegetal products were recovered from both ritual and consumption contexts, even if with different proportions. The social status of the people played a considerable role in the selection of the foodstuffs employed in diet, while a general trend, linked with ritual activities, has been identified.

This study, based on three ritual and five everyday contexts, aims to identify similarities and differences in the animal and vegetal components included in diet and offerings at Pompeii in the 1st century AD. The obtained results highlight considerable insight about the everyday life of the city inhabitants at that time.

4 FOODWAYS THROUGH TIME. A ZOOARCHAEOLOGICAL PERSPECTIVE FROM SW LIBYA

Alhaique, Francesca (Museo delle Civiltà) - Di Matteo, Martina (The Archaeological Mission in the Sahara, Department of Ancient World Studies - Sapienza University of Rome) - Rotunno, Rocco (The Archaeological Mission in the Sahara, Department of Ancient World Studies - Sapienza University of Rome; McDonald Institute for Archaeological Research, University of Cambridge, UK) - di Lernia, Savino (The Archaeological Mission in the Sahara, Department of Ancient World Studies - Sapienza University of Rome; GAES, University of Witwatersrand, Johannesburg, South Africa)

Eating habits arise and consolidate in accordance with a wide range of cultural, ideological and interpersonal factors. Food is a powerful symbol of cultural identity and material expression of culturally defined behaviours. All food-related actions (e.g., procurement, cooking, waste management) are intimately linked to the ideological and cultural reality of a group.

Decades of research by Sapienza University of Rome in SW Libya (1955-2011) enabled the collection of a wide corpus of archaeological data that in turn allowed reconstructing the social and cultural dynamics of the human groups

that inhabited the region from the last hunter-gatherers to pastoralists and finally to the first caravan societies of the Garamantes (ca. 10,200 cal BP-600 CE).

Here we present a synthesis of the zooarchaeological and taphonomic data from Late Acacus, Pastoral and Garamantian contexts, both in a synchronic and diachronic perspective, also highlighting similarities and differences between more residential sites and ritual contexts. The analysis of the numerous archaeological contexts over an area of approximately 60,000 sq km allowed to detect trends and changes, as well as parallels, in the relationship with various animal taxa through time and space, evidencing how such relationship varies over this long time span, both in relation to the different social and cultural dynamics and to the changing climatic conditions, even extreme ones, that characterize this region.

5 POST DOMESTICATION BODY SIZE OF CATTLE FROM LATE NEOLITHIC TO LATE BRONZE AGE: COMPARATIVE STUDY BETWEEN CHINA AND EUROPE

Yu, Chong (Sun Yat-sen University)

The introduction and the later dispersal of domestic cattle in China had played an enormous part in food production, handicraft manufacture and ritual activities. However, we lack the details of pastoral economies, herding strategies and utilization patterns of cattle in ancient China. This paper uses biometrical assessments to investigate post domesticated cattle husbandry and how it changed over time. Biometric data from the Late Neolithic to the Late Bronze Age was evaluated using mixture analysis. Results indicated that the general body size of cattle first decrease than increase. By combining the estimated distribution of male and female individuals, we can see that sex ratios affect size variation during Bronze Age times. Although no breed improvement has been detected so far, the herding and slaughtering strategies over time is different. We also compare published parallel dataset from Europe. Preliminary results indicate that cattle from China is smaller than those from Europe.

6 THE LAST MEAL OF A SACRIFICED HORSE IN XINJIANG

Ge, Yong (Institute of Vertebrate Paleontology and Paleoanthropology (IVPP), Chinese Academy of Sciences (CAS))

Horse sacrifice was a common phenomenon across Eurasia in prehistory, however, what had happened to the sacrificed horse or the details of the sacrifice ritual largely remained unknown. The arid environment of Xinjiang allowed organic materials to be preserved in cemeteries, such as the Shengjindian site, a public cemetery 2000 years ago in the Hami basin. In a tomb of Shengjindian cemetery, a full skeleton of a horse has been unearthed and large stomach organic remains were preserved. The shape of the organic remains varies among different parts, which represents the gastric, intestinal, and dung remains. The remains in the gastric area contain a large number of undigested seeds from *Echinochloa* and *Panicum* (C4 plant), while in other remains no visible seeds have been found. Multiple methods have been applied to find out what the horse eats during its last one to two days, as digestion could last 24-48 hours. The result showed that the horse was fed with seed-rich forage before its death. And this behaviour is different from the common foraging strategy as the horse was fed with C3 plant forage in the last months as revealed by stable isotope analysis. Our research showed an intentional feeding ritual with better forage before sacrifice, which reflected the details of burial activities in prehistory Xinjiang.

7 FOOD RESIDUES FROM DENTAL CALCULUS REVEAL HUMAN-PIG COMMENSALISM 8000 YEARS AGO IN THE LOWER YANGTZE RIVER OF CHINA

Wang, Jiajing (Dartmouth College)

The beginning of pig management and subsequent domestication has brought profound social and ecological transformations within human communities. From symbols of the sacred to a mundane sustenance for urban populace, pigs have functioned as a form of social currency in gift exchanges, a pioneering species for human colonizing the New World, and hosts of various infectious diseases. Zooarchaeological and genetic analyses have shown that pigs were independently domesticated in at least two regions: Mesopotamia around 9000 cal. BP and China around 8000 cal. BP. However, the question of how pigs became domesticated, especially in ancient China, remains underexplored. This study presents a new method for investigating human-pig relationship by applying microfossil analysis to pig dental calculus from Kuahuqiao, a site that captures the initial phase of pig domestication in the Lower Yangtze River. Starch, phytolith, and parasite data demonstrate that pigs consumed human-prepared foods and possible human feces, providing the earliest known evidence for commensal relationships between people and pigs in south China. These results provide comparative data for archaeological studies on animal diets and domestication worldwide.

8 FLAVOURS OF URBANISM: EXPLORING THE INDUS CIVILIZATION CUISINE IN BRONZE AGE SOUTH ASIA

Madella, Marco (Universitat Pompeu Fabra; ICREA) - Suryanarayan, Akshyeta (University of Cambridge) - Jiménez-Arteaga, Carolina (Universitat Pompeu Fabra) - Parque, Óscar (Universitat Pompeu Fabra) - Lancelotti, Carla (Universitat Pompeu Fabra; ICREA) - Abro, Tasleem (Shah Abdul Latif University) - Chandio, Amin (Aror University of Art, Architecture, Design and Heritage)

This presentation delves into the culinary practices of the Indus Valley Civilization, offering a unique exploration of the diverse foodways that shaped the dining tables of the first urban civilization of Bronze Age South Asia. The Indus Valley Civilization, known for its advanced urban planning and complex socio-cultural systems, has left behind enticing clues about its food culture through a wealth of proxies spanning plant and animal remains as well as organic residues.

Drawing on recent excavations at two key sites (Bhandu Qubo and Taloor Jee Bhatt) as well as a regional comparison, and through an interdisciplinary approach, our exploration focuses on the types of food consumed by the Indus people and their culinary techniques. From agricultural practices to food preparation, we aim to reconstruct the ingredients and the practices of the ancient Indus cuisine.

The presentation will incorporate findings from residue analysis of pottery and food remains, plant macro- and micro-remains and faunal data. Additionally, we will explore the socio-economic implications of the food, shedding light on the way it was produced and consumed.

By unravelling the gastronomic mysteries of the Harappan civilization, this presentation contributes to a deeper understanding of the cultural richness and daily life of Bronze Age South Asia.

9 SCIENTIFIC INVESTIGATION OF ARCHAEOLOGICAL BREAD-LIKE OBJECTS DISCOVERED AT DACIAN SITES IN THE TRANSYLVANIAN REGION, ROMANIA

Beatrice, Ciuta („1 Decembrie 1918” University from Alba Iulia)

The aim of our research was to identify the nature of carbonized organic remains at Dacian sites, particularly determining whether they were remnants of ancient bread. We conducted extensive examinations, including microscopic analysis of cereal product microstructures, content analysis, and detailed photography. By utilizing advanced technologies such as a 3D digital Keyence microscope, SEM (Scanning Electron Microscopy), and XRF (X-Ray Fluorescence) spectroscopy, we gained new insights into the dietary and agricultural practices of ancient Dacia.

Our analysis of organic fragments from Sarmizegetusa Regia (Hunedoara County) and Simleul Silvaniei (Sălaj County) Dacian sites in Romania, indicated the use of cereals in porridge preparation and other food preparation techniques. A significant focus of our study was differentiating food fragments from charcoal and other organic materials, which was essential in isolating relevant remains for our research. We applied various techniques and technologies to categorize the samples based on visible particles and porosity, enhancing our understanding of the types of food preparation and their preservation states.

Special attention was paid to identifying inclusions such as grain fragments and bran, shedding light on the cereals and ingredients used in the Dacian diet. A crucial part of our analysis involved distinguishing between bread-like and porridge-like materials based on their texture, particle size, and structural characteristics observed under the microscope. This differentiation was instrumental in interpreting the culinary practices of the Dacians.

These scientific and methodological approaches provided a comprehensive understanding of ancient dietary habits and food preparation techniques. The integration of advanced technologies and detailed analytical methods in our investigation opened a window into the culinary world of the Dacians, significantly enriching our knowledge of their culture and lifestyle.

10 RITUAL FEASTING AND THE CONSTRUCTION OF CULTURAL IDENTITY: THE DISPERSAL OF PROTO SINO-TIBETAN POPULATIONS IN NEOLITHIC CHINA

Liu, Li (Stanford University, USA)

The Yangshao culture (c. 7000-5000 cal. BP) represents one of the most widespread archaeological material assemblages in Neolithic north China. Its extension towards the Tibetan Plateau, in westward and southwestward directions, is associated with the dispersal of Proto Sino-Tibetan populations. Noted for centripetal settlement layouts, sizable public structures, advanced painted pottery, and the utilization of amphorae for producing and consuming fermented alcoholic beverages, the Yangshao culture fostered communal ritual feasts. Particularly, fermentation methods involving rice and the red mold (*Monascus* spp.) qu starter compound might have driven the spread of rice cultivation to western and southwestern China. These communal feasts played a vital role in establishing diverse social relations and reinforcing cultural identity through the production, processing, and sharing of food and alcoholic

beverages. Emphasizing collaboration and connections among related groups, these practices occurred during the expansion of proto Sino-Tibetan populations into new territories, coinciding with a period of climatic fluctuations.

11 DRINKING WINE IN BEER COUNTRY: A LOOK INTO EARLY BRONZE AGE NORTHERN MESOPOTAMIAN ALCOHOL PRACTICES DURING SOCIO-POLITICAL COLLAPSE AND TRANSITION

Heale, Michaela (Independent Researcher; University of Edinburgh alumna)

Within the category of alimentary substances, alcohol holds a somewhat unique position. Though all food is embedded within the social and cultural framework within which it is prepared and consumed, due to alcohol's psychoactive effects, it is often more symbolically charged. Acting as a social lubricant, alcohol can allow new bonds to be formed and old ones to be strengthened. This is all the more relevant when looking at the Early Bronze Age of northern Mesopotamia, wherein alcohol seems to take on a more active role in the elaboration and reformation of political, economic and social life.

This study aims to highlight as well as to investigate the underlying reasons behind the changes in patterns of alcohol's production and consumption following the collapse of centralised urban and trade systems at the end of the 4th millennium BCE in northern Mesopotamia. Drawing insights from both the known literature as well as novel results from computational methodologies (such as space syntax and point pattern analyses for communal drinking venues and production locales) to investigate the contexts within which alcohol was being made and consumed, this exploration will reveal the role of alcohol as a powerful tool in the reconstruction and transformation of the social, political, and economic order at the beginning of the 3rd millennium BCE.

12 WHAT'S IN A RECIPE?: APPLYING LESSONS FROM HISTORICAL ARCHAEOLOGY TO THE STUDY OF PREHISTORIC CUISINES

Johnakin, Anne (University of Oxford)

One of the ultimate goals of methods like starch and phytolith residue analyses is to move ever closer towards reconstructing a recipe. With the field's increased focus on cuisine, the nuances of plant and animal preparation and uses become increasingly important. While our methods continue to advance, allowing for example, the identification of individualized baking and brewing processes, we are reminded again of their limits and the need for interpretive frameworks to fill in the gaps. This paper will discuss three case studies from historical archaeology in the Americas where written recipe books can inform archaeological study. These case studies cover a wide range of culinary traditions, geographic areas, and social pressures. Starting off first with San Jose's Market Street Chinatown, then discussing recorded recipes of the Tacuma and Taino peoples, and ending with enslaved Afro-American foodways across the mid-Atlantic. Through these case studies, we can see the broad range of uses and methods of preparation for a single ingredient, as well as the knowledge creation and distribution networks involved in making cookbooks. We can ask, more broadly: what makes a recipe? How can we better interpret archaeobotanical and zooarchaeological remains when there are recipes, and then, as is the case in many "old-world" contexts, what do we do without them?

13 BILMA- A MENU FOR THE CENTRAL SAHARA. PRESENT-DAY AND LATE PLEISTOCENE/ HOLOCENE FOOD RESOURCES AND FOOD STRATEGIES

Schulz, Erhard (Institut für Geographie und Geologi Universität Würzburg) - Adamou, Aboubacar (Département de Géographie UAM Niamey République du Niger)

This paper combines palynology/archaeobotany, investigations on present vegetation, and on traditional plant use in the Central Sahara. It allows an estimation of Late Pleistocene-Holocene food resources.

The Bilma-pollen record (NE-Niger)-reaching down to the Late Pleistocene- evidenced a mixed plant cover of the Central Sahara out of Acacia-savannas and some Sudanian vegetation units around lakes and along rivers - up to the 7th millennium BP. However, these Sudanian elements reached only to 20° N and disappeared around 5000 BP. The Acacia-Panicum -savannas - of various densities - dominated from that time on. Achabs (short time- grass and herb floras) could reach to large extensions and represented the aleatoric component of vegetation and resources.

People had two main food sources:

1. As hunter-gatherer they could base on various plant resources, fishing and game.

From surveys on the traditional plant use and alimentation in the desert of northern Niger we could estimate the collecting resources for the human population in the Late Pleistocene and Holocene. For grasses it was possible to quantify them. Wild millets and sorghos could provide up to 250 kg grains/ha. Panicum turgidum-stands gave chances of 70kg grains/ha, whereas Aristida- or Eragrostis- species might have reached to 40kg/ha. Trees represented an

important source of food especially from the Sudanian-typed river vegetation. Game and fish were additional sources. However, they were not to quantify.

2. A rising pastoralism from about 8000 BP on introduced food production and provided milk and milk products as a second base of nutrition.

14 A MEAL FOR THE DEAD AND FOR THE LIVING. REFLECTIONS ON FOOD IN FUNERAL AND SETTLEMENT CONTEXTS

Józefowska-Domanska, Anna (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Consumption practices, particularly in the context of feasting, played a major role in early Iron Age societies. An opportunity to study various behaviors related to eating and drinking is provided by work on remarkable sites from the Hallstatt C-D period in southwestern Poland. Research on the cemetery in Domasław, with over 800 cremation burials, including 300 richly furnished chamber graves, and the settlement in Milejowice, partly fenced with palisade-like circular constructions, interpreted as the seat of the elite, allows to examine foodways and their connection with rituals, gender, social status and cultural contacts. The considerations are supported by a huge range of analyses, including an organic residue study of pottery for the presence of lipids. The analyses provide valuable information on what kinds of food may once have been cooked and consumed, as well as the kinds and functions of vessels used in everyday and ritual actions: in food preparation, cooking, storing and consumption. Combined with the analysis of botanical and faunal remains, these serve as a basis for investigating various interactions in culinary practices. This approach allows to determine the role of food activities in cemeteries and settlements, among social elites and non-elites, and further in cross-regional comparisons between Hallstatt communities.

15 PROTEOMICS OF ANCIENT SUBSISTENCE

Wilkin, Shevan (University of Zurich)

In archaeology, indirect proxy information that can be used to identify human-animal-plant interactions, are of paramount interest. As recovered amino acid sequences can reveal information about the taxonomic classification and tissues recovered proteins derived from, successful proteomic analyses can provide critical insights into the types of animal products people used that would otherwise remain invisible. While shotgun proteomics has been widely applied to human dental calculus to explore dietary intake through the recovery and identification of plant and animal proteins, it has rarely been applied to novel types of archaeological materials. Metaproteomic analysis can be used to investigate many types of ancient and historic artifacts, however, organic preservation is often a limiting factor. Identifying materials or contexts that function as preservational reservoirs has the potential to extend how far back into the past we can apply biomolecular methods to these questions in the past. This presentation will detail recent findings from three studies that investigate examples of archaeological residue proteomes via liquid chromatography, tandem mass spectrometry. From copper alloy cooking vessels from the eastern steppe, to bronze vessels from Mongolia, and residues from symbolic objects from southern Africa we identified unique animal products in each instance, demonstrating the diverse uses of animal products across time and space.

16 FOODS FOR AFTERLIFE FROM THE BURIALS OF DHANETI, GUJARAT, INDIA: NEW LIGHT ON THE HARAPPAN MORTUARY ARCHAEOLOGY OF SOUTH ASIA

Ghosh, Ahana (Indian Institute of Technology-Gandhinagar)

Harappan grave vessels have been subjected to several traditional ceramic studies, specifically under the typological lens covering forms, shapes, and designs. However, attempts to understand their utility are still limited to ethnographic parallels or vessels recovered from the habitational contexts. Research on the nature of mortuary food and vessels they were offered in using scientific techniques is in its infancy. This study goes a step beyond the above, and the twelve ceramic sherds from grave vessels of Dhaneti's excavated human burials (Kachchh, Gujarat, India) are assessed for their lipid content to evaluate the symbolic significance of food in the mortuary rituals. It examines the relationship between 'forms' and 'utility' by considering functional groups like 'cooking pots,' 'basins,' 'globular pots,' and 'Dish on stand' available within the sample set. The biomarkers, such as fatty acids derived from the matrices of the sherds, were characterized through lipid residue analyses and demonstrated the possible processing of animal-based products and plant oils inside them and the offerings to the deceased for safe passage to the other world. Methodologically, the quantity of preserved lipids and fewer contaminants from the studied vessels uphold the necessity of a planned sampling strategy specifically intended for residue analysis. Finally, this paper, from a broader perspective, makes an effort to contribute to the essentiality of considering the inclusion of the study of burial food practice within the corpus mortuary archaeology of South Asia.

17 ORGANIC RESIDUE ANALYSIS AT THE TRANSITION TO THE IRON AGE IN SOUTH IBERIA

Revert Francés, Elena (Eberhard Karls Universität Tübingen)

That the Phoenicians crossed the Mediterranean at the beginning of the first millennium, reaching the Atlantic coasts of the Iberian Peninsula is well documented archaeologically. Their feats as navigators and merchants are also famous. But what about agriculture, did they influence in any way the local agriculture and husbandry in the south of the Iberian Peninsula, which they inhabited three millennia ago? I am mainly trying to answer these questions in my postdoctoral project within the CRC 1070 ResourceCultures. Within this framework, I have carried out, among other things, organic residue analyses in pottery and sediments from various archaeological sites from the south of the Iberian Peninsula, in order to see, on the one hand, if any changes can be detected in the diet or the cooking before and after the arrival of the Phoenicians and, on the other hand, special interest has been placed on the location of any non-endemic elements that can be associated with the Phoenicians or with trade with the eastern Mediterranean.

18 A PALEOPROTEOMIC CASE-STUDY ON MEDIEVAL COOKING: THE "PIETRA OLLARE" VESSELS FROM NOGARA (VERONA, ITALY)

Monaco, Dario (University of Verona, Department of Cultures and Civilizations) - Brandi, Jessica (University of Verona, Department of Biotechnology) - Sorio, Daniela (University of Verona, Centro Piattaforme Tecnologiche) - Ceconi, Daniela (University of Verona, Department of Biotechnology) - Saggiaro, Fabio (University of Verona, Department of Cultures and Civilizations)

The study of food in past societies presents itself as an increasingly dynamic and innovative research field, combining archaeological methodologies with those of disciplines such as physics and chemistry. The fruitful encounter of this knowledge makes it possible to enrich our understanding of past habits with new data. Food allows us to observe every day-to-day and social behaviour from a privileged angle, which lies at the intersection of physiological needs, economy, society, and culture.

In this project, we have evaluated a case study regarding archaeological remains found inside and around two houses of the medieval settlement of Nogara (Veneto Region), dating to its 9th- 10th-century phases, centuries that are crucial for understanding a period of profound change in the Po Valley.

In particular, the analysis of incrustations adhered to fragments of "pietra ollare" vessels, soapstone vessels, has been performed. The "pietra ollare" vessels are a type of cooking pot produced during the Early and High Middle Ages on an industrial scale, mainly in the Alpine valleys of the current province of Sondrio (Lombardy Region), which met with enormous success and commercial diffusion, appearing in large quantities in many sites of that period in the Po Valley. Our research involved optimising a protocol for extracting and analysing proteins and/or polypeptides preserved within such encrustations. These carry specific information, i.e. the proteins to which they belonged and the animal or plant species from which they came.

Interestingly, the proteins identified belonged to *Bos taurus*, *Capra hircus*, and *Ovis aries* species, suggesting the preparation of meat obtained from those animals.

Even if preliminary, the results can contribute to an in-depth study of the dietary habits of the Nogara dwelling, giving us the possibility to look at the ordinary life of a country settlement during the Early Middle Ages in Northern Italy.

19 THE EASTWARD SPREAD OF GRAPE WINE AND ITS SINICIZATION -- ARCHAEOLOGICAL EVIDENCE FROM THE NORTHWEST REGION OF THE TANG DYNASTY

Li, Jingpu (Department of East Asian Languages and Cultures, Stanford University; Department of Archaeology and Anthropology, University of Chinese Academy of Sciences)

Grape wine, a product of mono-fermentation, found its way into Central China (the Central Plains) no later than the 2nd century BCE, coexisting with cereal-based alcohols, like Qu starter alcohol, a product undergoing a two-stage fermentation process. However, it wasn't until the 7th century CE that elites among Han Chinese mastered the natural fermentation method of grapes. Meanwhile, due to the cultural habitus in ancient China, a grape wine fermentation method initiated by Qu was invented, leading to a trend of localization of grape wine in the following centuries. This study employed a comprehensive multi-proxy approach to analyze a liquid sample unearthed at the tomb of Zhi Murong (649-691CE), who was the last prince of the Tuyuhun Kingdom (313-663 CE) and served as a Grand General in the Tang (618-690 CE & 705-907 CE) and Wuzhou Dynasties (690-705 CE), in today's Wuwei, Gansu, China. Through metabolomics, proteomics, and microfossil analysis, it was determined to be an alcoholic beverage crafted from a blend of grape juice, japonica rice, indica rice, barley, wheat, and millet, with artificially cultivated Qu serving as the fermenting agent. The method shared similarities with those used in huangjiu production in China. As grape juice was the primary fermentation substrate, the beverage is aptly designated as "grape-huangjiu. Thus, this study confirmed the distinct existence of a grape fermentation product in combination with the local method in the 7th century CE. This blend of wine and Qu alcohol, probably invented by Emperor Taizong of Tang (598-649

CE), symbolized the sinicization process within the Tuyuhun royal family, and represented a remarkable example of cross-cultural exchange and technological fusion along the Silk Road. Moreover, the identification of several novel substances underscores their potential as valuable biomarkers for the analysis of ancient grape wine for the study in the future.

20 LIFTING THE LID ON THE HEBRIDEAN NEOLITHIC: USING ORGANIC RESIDUE ANALYSIS TO RECONSTRUCT FOODWAYS IN THE OUTER HEBRIDEAN SOCIAL LANDSCAPE

Brown, Daniel (University of Bristol) - Cramp, Lucy (University of Bristol) - Garrow, Duncan (University of Reading)

This contribution will present preliminary results from the analysis of dietary practices of the early farming communities of the Early-Middle Neolithic of the Outer Hebrides, c. 3700-3200 BCE. This project uses cutting-edge organic residue analysis of pottery lipids from both water-logged islet-related contexts and dryland domestic settlements. My project utilises GCMS analysis to scan for specific trace biomarkers and stable isotope analysis to determine the origins of animal fats. These methods will uncover and allow for the interpretation of past foodways that were present at these different sites in this region at the northwestern edge of the European Neolithic.

Hebridean crannogs are artificial islets set within lochs. Underwater surveys have recovered archaeological material from the loch-beds surrounding some of these islets and the waterlogged conditions have enabled the recovery of elusive lipid biomarkers for cereals. It has been proposed that these sites were important centres for the formation of community identity via feasting activities. Therefore, by re-constructing the foodways of these sites, the functions and activities taking place at these centres can be explored. The dietary patterns on islets will also be compared to domestic settlements such as An Doirlinn and Screvan Quarry as well as tomb sites. This will allow me to compare and understand how foodways and specific foodstuffs were related to activities taking place at the islet sites, funerary monuments and in domestic contexts.

My work builds-on previous analyses of pottery residues from four Hebridean islets, bringing in additional islet, domestic and tomb sites for comparison and increasing the representation of key forms of pottery to test hypothesised differences in use. This will allow a greater understanding of how cuisine intersected with past ceramic forms. Overall, by reconstructing and comparing the foodways of these sites, a more detailed interpretation can be constructed of their social role.

21 THE USE OF APTAMERS IN THE ANALYSES OF FOOD RESIDUES ON ARCHAEOLOGICAL CERAMICS. INTERPRETING THE CUISINE OF EARLY MEDIEVAL PTUJ

Magdic, Andrej (Cultural Heritage Service, Institute for the Protection of Cultural Heritage of Slovenia) - Kosel, Janez (Research Institute, Institute for the Protection of Cultural Heritage of Slovenia)

The characteristics of food preparation, the cuisine, is an essential part of the cultural identity of individual societies. Analyses of food residues on archaeological ceramics can provide important information for the interpretation of ancient cuisine. An established method in the analysis of food residue analyses is the characterisation of proteins, which can provide information about the type of food that was prepared in the ceramic vessel in question. Immunological methods such as the enzyme-linked immunosorbent assay (ELISA) can be used to characterize protein residues. ELISA is antibody-dependent, which has many disadvantages, including antibody cross-reactivity and rapid denaturation.

The main goal of our research is to overcome these problems by replacing antibodies with aptamers. These are single-stranded oligonucleotides obtained by chemical synthesis with repeated selection cycles that bind with high affinity to selected target proteins in their secondary structure. Rigorous selection with a customised isolation procedure ensures their very high specificity for the target proteins. The performance of 16 different aptamers was tested on model samples using immunofluorescence microscopy. The model samples were prepared by boiling different suspensions (egg white suspension, trout, wheat flour, gelatin, beef, blood clots, hemoglobin, lysozyme from egg, raw milk, ovalbumin from egg) in modern replicas of ceramic finds from the Early Medieval site on the castle hill of Ptuj in north-eastern Slovenia.

The functional aptamers giving appropriate signals on the replica vessels were also tested on archaeological samples of ceramic finds excavated on the castle hill of Ptuj, which provided new insight into the cuisine of the Early Medieval inhabitants of Ptuj.

188 CULT PRACTICES IN THE ANCIENT MEDITERRANEAN: MOBILITY, CHANGES, AND PERSISTENCE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Angliker, Erica (British School at Athens) - Ustinova, Yulia (Ben Gurion University of the Negev)

Session format: Session with keynote presentation and discussion

In ancient Greece, some cults were commonly transferred from one locale to another with the appropriate adaptations to fit into the new context. Such transfers occurred from the Dark Age, when cults were moved from Balkan Greece to Asia Minor, during the Archaic period, when they were transplanted from metropoleis to apoikiai, and throughout Greek history, among communities engaged in synoecism. Even the cults of divinities worshipped under local epithets could undergo this process. When scholars examine these transferred cults, they tend to focus on the similarities between the new and the old sets of practices more than the changes that inevitably occurred. The modalities of cult transformations which occurred in different historical and cultural situations, in particular, the differences between changes in rituals and beliefs, resulting from population movements during the Dark Age, Greek colonization, and other historical periods, are to be put into focus. The aim of the present panel is to help fill this gap in the research by considering the impact of mobility on the transformation of cult practices in the Greek world from the Geometric to the Classical period, focusing on archaeological evidence.

The participants will address the following questions:

- 1) What types of changes occur when cults are transferred?
- 2) What kind of practices persisted in the locale to which a cult was transferred?
- 3) What material and epigraphical evidence are there for these changes?
- 4) What factors inspired and affected these changes?
- 5) How were cults adapted to the new territories that Greeks occupied in the Mediterranean?
- 6) How did the cults of divinities and heroes interact with the local pantheons when they were transferred to colonial communities?
- 7) Which elements of the original cults were retained, and what new elements did the local cultural and physical environment contribute?

ABSTRACTS

1 CULT AT THE CROSSROADS: SELINUNTE AND A MULTISCALAR FRAMEWORK FOR APPROACHING CULTIC TRANSFER

Ward, Andrew (Fairfield University) - Marconi, Clemente (Institute of Fine Arts - NYU; Università degli Studi di Milano Statale)

Selinunte, the site of ancient Selinus, a Greek apoikia founded jointly by settlers from Megara Hyblaea and Megara Nisea in the third quarter of the seventh century BCE, has featured prominently in debates concerning both the influence of mother cities on the cultic landscape of new foundations, as well as the influence of non-Greek ritual traditions on settlements deemed to be on the “peripheries” of the Greek world. Similarities in the sacred topographies of Selinunte and Megara Nisea, mythical allusions made in the public art of temples, as well as epigraphy are all evidence drawn on to demonstrate continuity between mother city and apoikia. Selinunte’s evident integration into the diverse multicultural milieu of Western Sicily, meanwhile, has been pointed to so as to explain a very different form of cultic transfer evidenced in contexts like Gaggera’s Campo di Stele.

New excavations exploring the sanctuaries of Selinunte’s acropolis, conducted jointly by the Institute of Fine Arts-NYU and Università degli Studi di Milano Statale under the directorship of Clemente Marconi suggests that a nuanced multiscalar approach to cultic adaptation allows for these competing narratives to meaningfully coexist in a place like Selinus. A continuous stratigraphic sequence from time of the city’s foundation survives within the southern portion of the city’s main urban sanctuary. These ritual assemblages, when contextualized in the broader historical and archaeological context of Selinunte, demonstrates an ability to balance cultic traditions consistent with the motherland and novel practices more in keeping with the indigenous practices of a not-insignificant proportion of Selinus’ early population. These rites persistence, change, or outright abandonment as the site’s sacred structures were expanded, renovated, or abandoned demonstrates the flexibility of Selinuntine cult to resonate with multiple scales of significance – local, regional, and Mediterranean-wide.

2 MAGNESIA ON THE MAEANDER: THREE MODES OF CULT TRANSFER

Ustinova, Yulia (Ben-Gurion University of the Negev)

Three cults performed in Magnesia on the Meander, a city founded by Magnesians from Thessaly, and the Meander valley, offer an intriguing opportunity to examine three different modes of cult transfer and adjustment to the new environment.

A cave of Apollo at Hylai bestowed strength for every endeavour, including uprooting big trees. At Hierakome, Apollo gave oracular responses. In the sixth century, King Darius referred to 'sacred gardeners of Apollo' in Magnesia as dear to his ancestors. The Aetolians probably combined their cults of Apollo, the cave-dweller and oracle-giver, with a local cave ritual.

The tradition of maenadism was established in Magnesia in the third century BCE, when the Pythia commanded the Magnesians to erect temples of Dionysus and bring maenads from Thebes. Maenadic celebrations in Magnesia were associated with the city and its surroundings, but fully complied with the Hellenic model.

Eastwards from Magnesia, at Acharaca, a sulphur cave was used for two types of initiations. Sick pilgrims were healed by means of oracular visions that were attained during their stay in the poisonous 'den', and instruction by the priests. The local youths who entered the cave underwent a rite of passage. A cave environment, initiations, and healing by physicians living near the sacred place, as well as the comparison of participants in the ritual to animals, are present in the cult performed in Cheiron's cave on Mount Pelion in Thessalian Magnesia.

Three main patterns of cult transfer are manifest in Magnesia: a unique amalgamation of a dominant local and a Greek tradition (Apollo); a ritual following the Greek pattern (the maenadic cult of Dionysus), and a cult which functioned in broad conformity with the Aeolian prototype, but with the addition of a significant enhancement conditioned by the local environment (Acharaca).

3 CULT CAVES IN ARCHAIC NORTHERN GREECE: A COLONIAL CULT-PRACTICE?

Georgiadis, Fotis (EPS (Ephorate of Palaeoanthropology - Speleology), Hellenic Ministry of Culture)

In the Greek metropolitan area, mainly at the archaic period, shrines of several deities were established (or re-established) in a number of caves. Some of these shrines acquired great fame and supra-regional significance. The present paper examines the transfer of a whole cult practice in North Aegean in the context of the second Greek colonisation. It is not so much about the transfer of cults from mainland Greece metropoleis to the apoikiai of the shores of North Aegean as it is about the transfer of a cult practice: the cult practice of veneration in caves.

Out of the numerous caves that hosted past human activity in northern Greece, only a few were used as cult caves during the archaic and classical period. In the 7th c. B.C., in the course of the Greek colonisation, Greek cities were founded in the coastal zone of northern Aegean. The territory of these colonies ("chora") was confined to the area surrounding them and did not extend inland (not until the expansion of the Macedonian kingdom in these areas). All of the archaic cult-caves discovered in the northern Greece territories, are located into this coastal zone and none further inland. Their establishment, is associated with the foundation of the Greek colonies. Indeed, the research carried out over the last 15 years has provided new evidence supporting the thesis that the establishment of these cult-caves took place within the first generations of the colonial settlement.

4 THE SPREAD OF DELIAN SANCTUARIES ACROSS THE MEDITERRANEAN

Angliker, Erica (University of London, Institute of Classical Studies, Research Associate)

Literary and epigraphic sources tell of Delian sanctuaries (branches of the sanctuary on Delos) across the Aegean in Paros, Chios, Amorgos, Calymnos, Cos, Nisyros, and Syme. As of now, twenty-two such sanctuaries have been identified, based mostly on epigraphic evidence and, in rare cases, on archaeological materials. Though a handful of scholars have studied these sites in terms of their geographical position in relation to Delos, none has considered their nature and function from the perspective of the transformation of the cult in various historical and cultural situations or, in particular, their differences in terms of changes in rituals and beliefs resulting from the transplantation of the cult from Delos to other parts of the Aegean.

The focus of this paper is on the function and cultic nature of the Delian sanctuaries indicated by the rich and distinctive epigraphic and archaeological evidence. In particular, the evolution of sanctuaries such as those on Paros and Kalymnos exemplifies the implantation of the cults and the differences and similarities among them.

5 APOLLO DELPHINIOS AND THE MOLPOI - FROM MILETOS TO OLBIA

Andreev, Sofia (Ben-Gurion University of the Negev)

The cult of Apollo Delphinios in Olbia, a Milesian colony on the Black Sea coast, was one of the most prominent. It was transferred by the Olbiopolitans from Miletos and until the late Hellenistic period it retained some archaic features: Apollo Delphinios was the protector of the state institutions, his sanctuary was situated in the centre of the city and

served as a city archive, the aisymnetai of the molpoi, and later the priests of Apollo Delphinios, were city eponyms. Many subjects concerning this cult remain disputable. The inscriptions of the molpoi suggest that, similarly to Miletos, the Olbian cult of Apollo Delphinios included singing and dancing processions, however instead of marching outside the city, from Miletos to Didyma, in Olbia the processions remained in the central part of the city, and all the ceremonies were performed in the central city temenos. This paper uses the case of Olbia in order to highlight the challenges of the colonial environment in the cultic sphere. In particular, it demonstrates that since sacred places could not be transferred, crucial elements of many rituals, including the main cults of the city, had to be modified and adjusted to the new surroundings.

6 KOUROTROPHIC DEITIES IN ARCHAIC CRETE: A BLACK FIGURE DEPICTION THE BIRTH OF ARTEMIS FOUND IN THE TEMPLE OF DEMETER, PHALASARNA

Zervoudakis, Panagiotis (iap1109@ia.uoc.gr) - Bendon, Michael (Independent Researcher, Sydney 2086, Australia) - Hadjidaki, Elpida (Director of the Phalasarna Excavations, 73400 Kisamos, Greece)

Ancient Phalasarna, a maritime city with a long prehistory that reached its peak during the 4th cen. B.C., is located in the NW corner of Crete, on and around Cape Koutri. The ancient geographer Skylax refers to the polis (city) of Phalasarna as a closed port, and Dionysius Kalliphontis mentioned the temple of Artemis. In 365 A.D., one of the largest earthquakes in recorded history raised Phalasarna 6.5 meters above the sea in a few seconds. This made its once-famous harbour useless while what remained of the city was flooded by subsequent tsunamis. Excavations have confirmed the impressive extent of the ancient port as well as fortifications and towers attesting to a once thriving city (Hadjidaki, 1988; Frost & Hadjidaki, 1990, Liestol & Hadjidaki, 2020). On top of the Koutri Cape, excavations in 2022 revealed a temple of Demeter. However, a plethora of figurines, fragmentary inscriptions and jewelry raise the possibility of an association of the sanctuary with more than one deity. Fragments of a black-figure vase were recovered from layers associated with ash, possibly from an altar east of the main temple. These depict at least four engraved figures and a floral pattern. The depiction has parallels with the birth of Artemis and Apollo by Leto in libation scenes on Attic vases of the 5th cen.B.C. (Foukara, 2017, 64) and the birth of Athena from Zeus' head (Penn Museum, Amphora MS3441). The fragments of the black figure painting provide us a unique find for Crete, a very rare example of Archaic black figure depiction related with Leto, Artemis, and Eileithyia, possibly attesting to a gradual transition from an earlier cult to the worship of Demeter as a childbirth goddess. These changes can be related to Phalasarna's function as a port, and the exchange of ideas with mainland Greece. The port was used as cultural center for exchanging ideas and connections with very ancient eastern cults such as Demeter whose cult reached from Crete to Athens, Sicily, and later to Egypt.

7 GODS AND HEROES IN CLASSICAL FOUNDATIONS AND SYNOECISMS

Montel, Sophie (Université de Franche-Comté, Institut des Sciences et Techniques de l'Antiquité) - Pollini, Airton (Université de Haute-Alsace, Mulhouse, UMR 7044 Archimède)

To shed light on Cult Practices in the Ancient Mediterranean: Mobility, Changes, and Persistence, we propose to look at Gods and heroes in Classical foundations and synoecisms.

We wish to highlight the archaeological markers of cult transfers, focusing on the changes in places and practices as well as their visibility. We intend to analyze the places where offerings of all types and sizes were presented, the display devices that enabled the population to assimilate new gods and heroes, but also new buildings and their typological or stylistic links with earlier ones. We concentrate our analysis on transfers linked to new foundations and synoecisms in the Classical period, drawing on examples in South Italy, Sicily, the Peloponnese and Northern Greece. Besides the transfers of the cult of the gods, we will also consider the transfer of bones in the case of hero cult (Orestes between Tegea and Sparta, Theseus between Skyros and Athens, Rhesus from Troy to Pangaion Hill, and Lamis, founder of Megara Hyblaea from Thapsos).

8 RETRACING SACRED ELECTRICITY IN THE ANCIENT SARONIC GULF - OUTLINES OF OLYMPIAN AND HERO CULT TRANSMISSION (650-350 BCE)

Delacruz, Michael (University of Oxford; Newcastle University; Blue Shield International)

This paper examines the phenomenon of cult transmission in the Saronic Gulf during classical antiquity through the employment of overlapping network analyses to identify linkages between cult, economic relations, and political instrumentality. Although certain instances affirm a solid correlation between cult transfer and prevailing conditions of economic exchange and political affiliation,* other examples of appropriation or migration of cult suggest modalities of influence less specifically determined. On the one hand, localised manifestations of deities or heroes evidently reinforce an insistent territorial consciousness; on the other, commonalities of practice and belief appear to activate synaptic 'bridges' which transgress political division or logical patterns of transportation and exchange. This overview of a multivalent network approach will highlight the interrelation between the instrumental use of the Aiakidai, as a

heroic cult complex, and broader signatures of Olympian residency within the emerging and competing polities of the Saronic from the late Archaic to the early Hellenistic. While current research strongly indicates that deterministic and highly data-centric approaches can provide insight into the environmental, economic, and political conditions that encouraged the transmission of cult, it likewise appears that the character of gods and of heroes themselves helped shape the dynamics of conductivity that sparked the transfer of cultic energy across land and water. It is hoped that a small world examination of this phenomenon may illuminate wider patterns of cult transfer throughout the ancient Greek maritime universe.

*The expansion of the cult of Asklepios from the Eastern Peloponnese to Western Attica in the sixth and fifth centuries BCE is a primary case in point.

9 MACEDONIAN MATERNALISM? THE CULT OF THE MOTHER OF THE GODS IN THESSALY

Fowler, Michael (East Tennessee State University)

With her migration from Anatolia to Greece in the Archaic period, Kybele/Mother of the Gods is a particularly instructive example of the mobility and adaptability of cults in the ancient Mediterranean world. The Mother of the Gods' cult grew particularly strong in Macedonia from the Late Classical through the Hellenistic period, as attested by Metroa in Aigai and Pella, among several other sites. The development of the Macedonian cult overlaps with the kingdom's annexation of Thessaly. In Thessaly, the worship of the goddess is documented epigraphically or archaeologically in seven distinct polities, from as early as the fourth century BCE. The most recently identified site, a roadside shrine at the western entry to the Tempe pass (Chani tis Kokkonas) persists until the early second century BCE—precisely when Macedonian influence is waning amidst conflict with Rome. Should these historical coincidences and the short-lived nature of the Mother of the Gods' pre-Roman cult in Thessaly be taken as evidence that the goddess was introduced from Macedonia? This paper shall review the available evidence for Thessalian cults of the goddess, with a particular interest in identifying their individual characteristics and comparing them to other known cults (esp. Macedonian).

10 TAURIS, LACONIA, ATTICA: ARTEMISIAN NETWORKS IN THE ANCIENT MEDITERRANEAN

Valletta, Lucio Maria (None)

The foundation of two among the main cults of Artemis in the Greek world (the one of the Tauropolos at Halae and/or at Brauron [1], and the one of the Orth(r)ia at Limnai) is directly linked to the events involving Agamemnon's two children, Iphigenia and Orestes, whose myths are differently developed and rooted both in Attica and in Laconia.

Each of the two cults finds its founding act in the importation – by Orestes and Iphigenia – of the cult statue of the goddess of Tauris in Attica or in Laconia [2]. Moreover – in both local contexts (the Athenian one and the Spartan one) – the cult of the Taurian goddess is integrated in a quite similar (but not identical) way in what J.-P. Vernant defined [3] the “structures du panthéon” of each community.

This is the case with respect both to other divinities (primarily Athena on the acropolis of the two cities) and to some cultural features characterizing each cult: the ritual of the sword at Halae and that of the diamastigōsis or bōmolochia at Limnai [4], or the function of kourotropos of the Orth(r)ia at Limnai – equally highlighted in order to define the main function of the cult of the goddess of Brauron.

Starting from various kinds of sources (archaeological, epigraphical, textual ones), the paper will describe the way in which the “barbarian”/forbidden practices linked with the Taurian cult have been adapted to the cultic system of the two Greek communities.

11 TRAVELLING FOR HEALING VISIONS: PERFORMANCE, INSULARITY AND THE SPREAD OF ASKLEPIOS' CULT AND RITUAL IN THE 4TH CENTURY BCE

Lafasciano, Luigi (The Diakron Institute; Università degli Studi di Salerno)

The widespread dissemination of the cult of Asklepios and its associated practices throughout the Greek Mediterranean, starting from the late 5th century BCE, has prompted numerous inquiries within the realm of religious studies. Scholars have sought comprehensive explanations for how this cult and its rituals propagated, and the key figures involved in this process. In addressing these questions, much attention has been given to the resemblances in the transferred ritual practices, with a particular focus on the distinctive feature of Asklepios' cult: incubation. This practice involved devotees entering a visionary state to seek healing or prophecies through dream visions.

This paper delves into the intricate interplay among dramatic performances, dream visions, and therapeutic practices in the diffusion of the Asklepios cult across the Mediterranean. Our analysis concentrates on the case studies of the Asklepieia in Lebena (Crete), Paros (Cyclades), and Akragas (Sicily), all of which were established in the 4th century BCE. By employing a theoretical framework that explores the nexus between healing visions and dramatic performances, we contend that it offers a more comprehensive understanding of both the similarities and differences in the adaptation of Asklepios' cult to diverse cultural contexts. This approach leverages a broad spectrum of sources, en-

compassing miracle tales conveyed through epigraphy and literary sources, material and immaterial votive practices, and the spatial organization of sanctuaries discerned from archaeological evidence.

192 FRONTIERS OF HERITAGE: CULTURAL LANDSCAPES, COMMUNITY INTERACTIONS, AND METHODOLOGICAL APPROACHES

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Gao, Qian (Durham University, Department of Archaeology) - Bonacchi, Chiara (University of Edinburgh, School of History, Classics and Archaeology) - Hanscam, Emily (Linnaeus University, Archaeology) - Cartwright, Rachel (Independent Researcher)

Session format: Regular session

In the complex tapestry of archaeology and heritage, frontiers emerge as dynamic and evolving zones of cultural interaction, negotiation, and identity construction. Our session encourages a rich dialogue surrounding the study of frontiers from a heritage lens, embarking on a multifaceted exploration of cross-cultural comparisons. By delving into the interplays between cultural landscapes of frontiers and the communities inhabiting or interacting with them, we aim to unearth the nuanced ways in which values and identities are shaped, negotiated, contested, and re-imagined. Furthermore, we intend to foster reflection on the methodologies employed in examining these dynamic interactions. Through a range of empirical and theoretical lenses, we aim to unravel the complex layers of frontier heritage, offering fresh perspectives on the entangled histories and futures of frontier landscapes and communities. Collectively, we will enhance our understanding of frontier heritage and its pivotal role in shaping broader discourses of cultural diversity, social cohesion, as well as inclusive and sustainable heritage practices.

We welcome contributions that explore:

1. The role of frontiers in shaping cultural landscapes and the ways in which they have been experienced, interpreted, and managed.
2. Cross-cultural comparisons of frontier heritage landscapes and their associated values and identities.
3. Methodological innovations and challenges in studying the dynamic interactions between cultural landscapes and communities within and across frontiers.
4. Case studies illustrating the interplay of local, national, and transnational narratives in shaping frontier heritage.
5. The implications of frontier heritage studies for contemporary heritage management and policy discourse.
6. Engaging communities in the discourse of frontier heritage: practices, challenges, and opportunities.

This session endeavours to contribute to the growing body of knowledge in critical frontier studies and chart new avenues for the interdisciplinary exploration and understanding of frontier heritages.

ABSTRACTS

1 THE UNSEEN HERITAGE OF THE EVERYDAY ENVIRONMENT; RE-BUILDING COMMUNITY COHESION OF AN ABANDONED RURALITY

Krag, Mo (Aarhus School of Architecture)

In contrast to classic restoration practices based on prolonging and upholding, this paper reports on a series of fulfilled, and on-going, temporary preservation attempts. These were developed and tested as radical preservation of abandoned buildings undertaken at full scale through a subtractive architectural practice.

At first, the practice was initiated in Danish rural villages, testing temporary preservation strategies for the challenged rural built environment with emphasis on engagement with the local village communities. The intention was to re-activate obsolete buildings as material anchorage points of place-specific collective memories and thus, contribute to the rebuilding of the community cohesion and local identity.

Since 2020, the preservation practice has engaged a larger scale. It now revolves around the on-going preservation of the entirety of a depopulating station town. By expanding the scale, the involvement of the local community has increased. The local residents play a crucial role by taking part in the preservation practice and at the same time contribute with personal place-specific memories triggered in the process. The paper reports on the latest preservation experiment (fulfilled spring 2024) that involves a former medical care centre located at the central square.

On the landscape scale, the preservation practice combines a governmental afforestation plan with redirected government funds for strategic demolitions. The afforestation takes place by expanding an existing forest south of the station town into depopulated areas. The forest emerges gradually into the abandoned gardens, in which the buildings are reduced to curated ruins through subtractive interventions.

The curated ruins maintain clearings in the emerging forest and will gradually interweave with a dynamic mesh of pathways made by the community itself. The clearings constitute culture-historical gathering points that catalyze exchange of memories among the local residents and hence, preserve the buildings immaterially as a strengthened collective memory while their physical presence diminishes.

2 BETWEEN KINGDOMS AND CULTURES, THROUGHOUT EPOCHS - FRONTIER, ETHNOGRAPHY AND CULTURAL LANDSCAPES OF THE THIRD CATARACT REGION (SUDAN)

Kurcz, Maciej (Jagiellonian University)

The paper examines the links between the processes of shaping cultural landscapes and the border/lands phenomena in the context of the Third Cataract – a region in historical Nubia with features of a centuries-old cultural and political borderland (Adams 1977). It also highlights the de/heritization processes in such areas. Frontier is understood as a kind of natural resource that local actors use to negotiate, question and reproduce identities and cultural values (“fertile frontier”) as well as the zone of continuity and conservatism (Igor Kopytoff 1987).

What is the role of the frontier in shaping cultural landscapes in the region of the Third Cataract? What opportunities and methodological challenges are associated with studying the heritage of cultural and historical borderlands in Sudan?

The paper relates to ongoing ethnographic research on “Miseeda Island,” a group of villages in the Third Cataract area (Sudan). The fieldwork is carried out as part of the archaeological project Miseeda (Masida) – Between Kingdoms, Throughout Epochs.

3 VIKING AGE HERITAGE IN A FLUCTUATING FRONTIER: CHANGING INTERPRETATIONS AND CONTESTED PERSPECTIVES IN THE GERMAN-DANISH BORDERLANDS

Cartwright, Rachel (Independent Researcher) - Bonacchi, Chiara (University of Edinburgh)

All borderlands are complex cultural landscapes, with multifaceted layers of interconnectedness and often also conflict. In this sense, frontier regions represent ideal case studies for analysing contesting views of past heritages and their fluctuating interpretations over time. Our paper will focus on the changing views of, and approaches to, the Viking Age heritage of the German-Danish borderland. In particular, we will explore how the remains of the Viking Age town of Hedeby/Haithabu and the Danevirke system of earthwork fortifications have been interpreted and valued over time by cultural management practitioners, researchers, and the public in relation to wider socio-political developments. While nowadays located in the German federal state of Schleswig-Holstein, in both cases the archaeological remains have experienced the turbulent history of changing borderlines between the two countries during the 19th and 20th centuries. Now with their inscription as UNESCO World Heritage sites in 2018, they are used to show a common cultural heritage in the German-Danish borderlands.

4 HERITAGE MANAGEMENT AND RURAL ATTACHMENTS: RE-VISIONING THE GREAT WALL OF CHINA AS DYNAMIC CULTURAL LANDSCAPES

Gao, Qian (Durham University) - Cheng, Fei (Chinese National Academy of Arts) - Xiao, Dong (Beijing University of Civil Engineering and Architecture)

This paper aims to reshape our understanding of the Great Wall of China, re-visioning it as dynamic cultural landscapes. The concept of “cultural landscape” signifies the interplay between nature and culture, where landscapes hold not only physical presence but also symbolic meanings, historical narratives, and social practices. As an iconic architectural marvel traversing northern China’s rugged terrains, mountains, and valleys, the Great Wall is mostly situated in rural and semi-rural areas, where the majority of the local populace are rural residents. These communities, sharing their landscapes with the Wall, have developed traditions, customs, and stories intricately linked to its presence. Proximity to the Wall has also made them deeply influenced by heritage management decisions, conservation endeavours, and tourism activities related to it. Nevertheless, the prevailing perception and management of the Wall predominantly emphasises its monumental and historical significance, often overlooking its cultural, social, economic, and emotional significance for local rural communities. To re-conceptualise the Great Wall as living cultural landscapes, understanding rural residents’ perspectives and attachments becomes pivotal. Their experiences and narratives are integral to unveiling the multifaceted meanings and values associated with the Wall.

Our investigation delves into the correlation between evolving heritage management interventions and the attachments and values that rural residents neighbouring the Wall attribute to this historic monument. Anchored in a case study of Tianxianyu Village, part of the “Great Wall International Cultural Villages” nestled beneath the Mutianyu and Jiankou sections of the Wall, we scrutinise the repercussions of heritage management decisions on villagers’ emotional bonds and perceived values of the Wall. Through this study, we propose a transformative shift in heritage management strategies for the Great Wall. By adopting the cultural landscape framework, we advocate a holistic approach

that transcends physical preservation to embrace the intricate relationships between the Wall and its adjacent rural communities.

5 MORE VOICES FOR EMANCIPATORY ARCHAEOLOGICAL AND HERITAGE PRACTICES

Jean, Joseph Sony (Leiden University)

This presentation is framed within the current trends of decolonization practices in archaeology and heritage studies by focusing on Haiti in its broader Caribbean context. People’s relationship with archaeological sites in postcolonial societies must be contextualized socially, politically, and historically, to provide a spatial and historical context for studying archaeology and heritage in parallel with studying distant past technologies and lifeways by examining the ongoing landscape renegotiation. By exploring the interlocking material and nonmaterial significances of places, one may wonder what critical methodologies or approaches can be used to address the ongoing re-imagining of archaeological and heritage sites. To formulate and theorize more cogent critical questions about heritage in society, this presentation takes a unique approach by combining ethnographic and anthropological research associated with archaeology to explore the significance of archaeological sites as historical elements, as well as their continuous re-interpretation in society. By sharing concrete information about research in Haiti and its outcomes, the presentation facilitates a discussion between actual research strategies and emancipatory archaeological and heritage practices and discourses.

207 DIVIDED BY ?FACTS?: RE-THINKING THE CHALLENGING RELATIONSHIP BETWEEN ANCIENT WRITTEN SOURCES AND THE ARCHAEOLOGICAL RECORD THROUGH TELLING CASE STUDIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Saccoccio, Fabio (University of Nottingham, Department of Classics and Archaeology) - Collis, John (University of Sheffield, Department of Archaeology) - Karl, Raimund (University of Vienna, Institute for Prehistory and Historic Archaeology) - Ruiz Zapatero, Gonzalo (Universidad Complutense de Madrid, Departamento de Prehistoria, Historia Antigua y Arqueología)

Session format: Regular session

As suggested by Kristiansen (1998: 2), “[d]uring the 1st millennium BC [in Europe] we are for the first time confronted with literary evidence about prehistoric people, so we cannot and should not escape... the question of the meaning and maintenance of cultural traditions, of ethnicity and of cultural change...”. The ancient written sources seem to provide us with a plethora of potentially crucial information which archaeologists should use to get deeper insights into the past. It is, however, true that the link between historical data and archaeological record is at times very loose, ambiguous to say the least. A telling case is the c. 390 BC Gallic sack of Rome, still not supported by archaeological evidence. And the list goes on and on: e.g. the Galatian campaigns in Greece and Turkey and the plunder of Delphi, or the Roman warfare impacting Celtic sites – Numantia, Alesia, Gergovia and the battle sites of Orange and Bibracte – just to mention a few cases.

As suggested by Barker (1995: 2), ancient written sources are not unproblematic, as they are “written by the literate minority, frequently with a bias towards their own concerns”; it is, however, crucial to rely on them. In 1995 Barker suggested approaching both historical and archaeological data as material culture advocating for a unified theoretical framework. After nearly 30 years, where are we today?

This session particularly welcomes contributions (papers and posters) dealing with the complex relationship between ancient written sources and the archaeological record with no particular chronological and geographical boundaries. The main aim of the session is to compare theories and methodologies to understand whether Barker’s ‘unified’ approach is still supported by scholarship or a different path is preferred and why.

ABSTRACTS

1 A REAPPRAISAL OF THE WRITTEN SOURCES OF PYTHEAS’ VOYAGE TO BRITAIN WHICH INCLUDED HIS STONEHENGE VISIT ABOUT 325 BC

Meaden, Terence (Oxford University)

This case study uses archaeological and anthropological knowledge to check details dating from the time of the visit to southern England of Pytheas of Massalia who sailed to Britain in the fourth-century BC, as recorded in his travelogue *Peri tou Okeanou*. All copies of his book are lost, but some 40 fragments survive in the writings of 17 classical historians. Hecataeus of Abdera had read Pytheas’ volume and written about it, including a description of what Pytheas had

called a Temple of Apollo with a 'magnificent naos'. Fortunately, before that book got lost too, Diodorus Siculus (of the first century BC) read Hecataeus' account. Greek-language reanalysis of Diodorus' summary justifies the argument that Stonehenge was the monument in question, and that it was still in use. Some commentators preferred to overlook Stonehenge possibilities or deny them because of treating the text as if it meant there were two fine temples in proximity which is unlikely. The problem arose from confusing the meanings of temenos and naos which in the context of this case-study respectively refer to the precinct-with-temple and the presence of an inner sanctuary or naos that holds and safeguards the cult images. In fact, Stonehenge does have a splendid carved-stone phallus that stood 2.5 m high in the central zone, hitherto unrecognised because it has been knocked over and is awkward to view, but has been recently identified and photographed by the author.

2 LUERNIOS, VERGINGETORIX AND THE ARVERNIAN EMPIRE

Collis, John (University of Sheffield)

The Auvergne and the Arverni are frequently mentioned in Roman and Greek sources, and much research and writing has been devoted especially to the events and personalities of the 2nd–1st centuries BC: the wealth of Luernios, the defeat of his son Bituitos in 123 BC, and the defeat of Caesar by Vercingetorix at the battle of Gergovia. The Auvergne was also the home of the major Latin writer of the 5th century AD, Sidonius Apollinaris, the 'last of the Ancient Celts', and the location of his villa at Avitacum has also been a continuing topic of discussion. This obsession with locating historic sites for a long time distorted excavation and research on the Iron Age in the Auvergne and elsewhere in central France (e.g. Alesia) at the expense of wider social and economic questions (e.g. the development of urbanisation in the Late Iron Age), and led to distorted interpretations of the archaeological record in attempts to proving and interpretation rather than balanced questioning of the alternatives, e.g. attempts to relocate the Ancient Gergovia on the Côtés de Clermont. These history based questions can dominate popular discussions e.g. television presentations, and still have an impact on the narratives presented to the wider public, and affect the income from tourism at specific sites and museums. The concept of an 'Arvernian empire' was also a major narrative in French national history based on the writings of Strabo in the interpretations of historians such as Camille Jullian, but can it be identified archaeologically? On the other hand, locating these sites does awaken the imagination and our understanding of how ancient events like battles played out. How do we get the balance right?

3 STRABO VS STRATIGRAPHY : COMPARING TEXTUAL AND ARCHAEOLOGICAL INFORMATION NEAR MARSEILLE AROUND THE 2ND CENTURY BCE

Bernard, Loup (Université de Strasbourg; CNRS)

The excellent state of art, with dozens of excavated so-called oppida in the region, the numerous hillforts constructions and destructions during the late 3rd and 2nd centuries BCE (LTC/D1) in southern France give us an unique possibility to compare historical and archaeological contexts and the way archaeologists approach those. Numerous authors describe Provence for this time (from Strabo to Caesar), and lots of artefacts from sealed destruction layers – Mediterranean ceramics as well as Celtic weapons or clothing accessories – help us to approach very fine dating for the sites, sometimes under 25 years resolution. This presentation will concentrate on some of the best understood and excavated hillforts that suffered destructions around 200 BCE (Le Verduron, Teste-Nègre, but also later Entremont, Mouriès or La Cloche) and try to compare with textual narratives of these events, and how they are implanted deep in archaeologists' minds, even before interpreting their sites. The ups and downs of Celtic, Greek and Roman influence in the region and the concentration that archaeologists read is as a matter of fact different from the topoi the authors relate on southern Celts.

4 THE CELTIC CENOMANI BETWEEN ANCIENT WRITTEN SOURCES AND ARCHAEOLOGY: NORTHERN ITALY IN THE SECOND HALF OF THE 1ST MILLENNIUM BC

Saccoccio, Fabio (University of Nottingham, Department of Classics and Archaeology)

The Cenomani are one of the Celtic tribes recalled in the ancient written sources for having intruded into northern Italy around the mid-5th century BC; according to Livy (History of Rome 5.35.1-2), the Cenomani eventually settled at Brixia/Brescia and Verona. Livy (History of Rome 5.35.1-2) also provides us with the name of the Cenomanic oecist, i.e. Etitovius, and recalls that the Cenomani received Bellovesus' blessing to cross 'the Alps by the same pass'.

There are at least four issues linked to Livy's statement. First, chronology; scholarship is still debating on the 'long' and 'short' chronology of the Celtic migrations into Italy albeit the latter school of thought has more followers. Second, Ogilvie suggests that the name of the Cenomanic oecist, Etitovius, is not Celtic. Third, some of the manuscripts reporting Livy's passage provide the ethnic name Germani instead of Cenomani; and this pattern is also found in Cicero (Pro Balbo 14.32). Fourth, some of the manuscripts reporting Livy's passage also recall that Bellovesus and his companions crossed the 'Taurinos' and 'Juliae' Alpine passes to intrude into Italy; oddly enough the first has to be

located in the western Alps, the latter in the eastern Alps. Over time, scholarship decided to correct 'Germanorum' into 'Cenomanorum' and 'Juliae' into 'Durae', in the western Alps.

This paper aims to discuss the above issues by incorporating the available archaeological record. The date of the Cenomanic intrusion into Italy, the Cenomanic homeland, and the area they inhabited in northern Italy will be thoroughly examined highlighting how the scholarship is, in some cases, characterised by circular arguments and by Snodgrass' 'positivist fallacy', i.e. the misleading habit of equating what is archaeologically observable with significant events recalled by the ancient written sources and therefore create a biased reconstruction of the past.

5 EXPLORING CELTIC METROLOGY THROUGH ARCHAEOLOGICAL AND WRITTEN SOURCES

Poigt, Thibaud (Ausonius - University Bordeaux Montaigne) - Parachaud, Kevin (University of Limoges)

When investigating metrological studies, the ideal objective is to integrate written and archaeological references to achieve what is called "global metrology" (Alberti et al. 2006). Unfortunately, Late Prehistory Europe offers a limited dataset on ancient measuring practices, both in terms of textual and archaeological evidence. This scarcity is particularly pronounced in relation to Celtic societies. While sporadic works have explored the topic since the 19th century, the evidence remains limited, leaving us without a comprehensive understanding of their skill in using numbers and measurements.

This paper seeks to present a comprehensive overview and a fresh perspective on the subject, specifically by comparing insights collected from written sources and archaeological findings.

The grounds of this study rests on the examination of various Iron Age scale weights discovered across Europe, along with subsequent findings that attest to the continuity of ancient local units post-Roman conquest. The exploration of modular architecture and the quest for a Gallic foot will be also exposed. This data will be analysed from various perspectives, including statistics and comparisons.

These findings will be compared with information derived from scattered written sources that directly or indirectly reference the Celts' use of measures. Examples include Caesar's mention of the Britons using weighted iron for payment, Isidore of Seville's commentary on Gauls employing a vigesimal weighing system, the use of "fake weights" by Brennus, and evidence supporting the use of the Gallic league, among others.

The central aim of this paper is to gather the sources and offer a comprehensive research overview on this topic to propose a renewed perspective on the Celts and their relationship with measurements. This paper is intended to lay the groundwork for future research in this domain.

6 THE MARCOMANNI AND QUADI ELITES IN THE NORTH FROM THE MIDDLE DANUBE DURING THE EARLY ROMAN PERIOD

Droberjar, Eduard (Institute of Archaeology of the Slovak Academy of Sciences) - Elschek, Kristian (Institute of Archaeology of the Slovak Academy of Sciences)

At the turn of the era during the reign of Emperor Augustus, the first Germanic empire – a tribal union led by the Marcomannian king Maroboduus was founded. According to the presence of rich urned cremation and inhumation graves (e.g. Dobřichov-Piřhora, Prague-Bubeneč) and numerous Roman imports, the centre of Maroboduus' empire is to be located in Bohemia. Gradually, the Germanic tribes of the Marcomanni and Quadi moved to the territory north of the central Danube region, i.e. to southern Moravia, Lower Austria and south-western Slovakia. Here new ruling dynasties were formed which were represented after the turn of the 1st/2nd centuries AD by rich princely inhumation graves. One intact richly equipped princely grave has been excavated at Zohor in western Slovakia in 2010. The princely inhumation graves and the graves from the cemetery were equipped with numerous Roman imports. Relations between the Romans and Germans gradually changed from a client relationship to various military conflicts. These then culminated in the 2nd half of the 2nd century AD in the Marcomannic wars during the reign of Emperor Marcus Aurelius. Among the most active fighters were the tribes of the Marcomanni and the Quadi. Their elites are best documented by the richest tomb of a Marcomanni king excavated in southern Moravia near Mušov. The authors of this report will deal with the formation and significance of the elites of these Germanic tribes during the 1st and 2nd centuries AD and compare archaeological sources with written sources of ancient authors Velleius Paterculus, Tacitus, Cassius Dio and others.

7 THE CASSITERIDES ISLANDS (1586 - PRESENT): ARCHAEOLOGY AS A MEANS TO CONFRONT A LONG-TERM HISTORIOGRAPHICAL DEBATE

Herrera Delgado, José Ramón (Departamento de Prehistoria y Arqueología (Universidad de Sevilla); Centro de Estudios Globais (Universidade Aberta, Lisbon))

The location of the Cassiterides, the Tin Islands mentioned by authors such as Herodotus (3.115) and later Strabo (3.2.9; 3.5.11), could be an outstanding example of the complexity of matching historical evidence, as scarce and

vague as it might be, to the archaeological record. In 1586, William Camden published his *Britannia*, where the author proposed, for the first time, that the Cassiterides should be identified with an existing archipelago: the Scilly Islands. The discussion remained within the field of ancient literature until the late 19th century, meaning that no archaeological explorations had been undertaken to gather evidence regarding the matter. Between 1899 and 1902, George Bonsor Saint-Martin travelled to the Scilly Isles in search of the Tin Islands, trying to contrast William Camden's hypothesis by means of archaeological criteria. This contribution analyses the underlying factors to the prevalence of Camden's proposal for over 3 centuries in order to put Bonsor's archaeological exploration in context. Furthermore, a summary of Bonsor's method and use of ancient literature is presented as a case study on the tools used to make this complex match in the early 20th century, chiefly diffusionism and philological archaeology. Finally, an updated, critical reinterpretation on the matter is given, considering up-to-date evidence, and ultimately reflecting on the limits of applying a certain approach to this historiographical discussion.

8 **KHIRBAT ES-SAR: A PIECE OF PUZZLE IN THE HELLENISTIC HISTORY OF TRANSJORDAN**

Mlynarczyk, Jolanta (University of Warsaw)

Khirbat es-Sar (Khirbat Sarah) is situated on the western outskirts of modern Amman, corresponding to the western border of the ancient land of Ammonites. The site is noteworthy for an "Ammonite tower" combined with a Roman-period sanctuary and its strategic location on the ancient road linking Rabbat Ammon with Jordan Valley via Wadi es-Sir and Wadi el-Kufrein. The fieldwork conducted by the University of Warsaw since 2018 has demonstrated a lengthy lifetime of the site, ranging from apparently the late Iron Age to a thriving Medieval settlement. Surprisingly, there is very little data pertaining to the Hellenistic phase of the site, a turbulent period when Transjordan was changing hands from the Ptolemies to Seleucids and Hasmoneans before the advent of Romans in 63 BC. Among the available hints prominent are Hellenistic ceramics. They include examples of fine tableware comparable to those found in the citadel of Amman; this strongly suggests that Khirbat Sarah of that period was something more than just an outpost or farmstead. However, despite its presumed importance, the site remains anonymous. S. Merrill (1877) and C.R. Conder (1881) suggested its identification with biblical Jazer, a town subdued by Judah Maccabee at ca. 163 BC. Probably the same locality appears as the Azōr (lazer) village in Eusebius' *Onomastikon* in the 4th century AD. An exciting option is to consider the site's identity as "Birta of the Ammanitis", mentioned in a papyrus letter dated 259 BC.

This paper aims to discuss the ancient identity and role of Khirbat Sarah based on the results of the fieldwork combined with scanty written sources, focusing in particular on an ill-known Hellenistic phase of the site.

9 **UNVEILING THE HERITAGE OF KURTUVĖNAI MANOR IN LITHUANIA: INSIGHTS FROM ARCHAEOLOGICAL DISCOVERIES AND MANOR INVENTORIES**

Jonauskienė, Viktorija (Klaipėda University)

Kurtuvėnai Manor first appeared in historical records in 1498, when its owner, Mikalojus Jaugėlavičius, donated a village with six inhabitants to the Kurtuvėnai church and parish. By the mid-16th century, Stanislaw Skaszewski had acquired the estate, which by 1592 comprised over 20 wooden buildings. Throughout the 18th century, three generations of the Nagursky family managed the manor, overseeing its development. Under the stewardship of the final proprietors, the manor thrived, witnessing the construction of a complex of wooden Baroque-style buildings within its grounds. During the 19th century, Kurtuvėnai Manor was acquired by the Pliateriai family, who modernized it and established the largest fish farm in Lithuania. They also embarked on a project to replace the wooden farm structures with brick buildings. The first archaeological investigations of Kurtuvėnai Manor were initiated by Kurtuvėnai Regional Park in 1995. From 1995 to 2013, B. Salatkienė served as the primary archaeologist responsible for researching the site, with archaeological research continuing under V. Ostašėnkoviėnė in 2014.

In terms of zooarchaeological findings, a total of 256 domestic bone fragments (71.51 %) and 30 fragments of wild fauna (8.38 %) were gathered and analyzed from the archaeological layers of the manor, dating from the 16th to the 18th centuries. Due to the fragmentary condition of the bones, 16.20 % could not be identified, while 3.91 % of the analyzed zooarchaeological material pertained to birds. Despite the limited sample size, certain patterns in the manor's animal husbandry practices emerge, with domestic fauna predominating. Notably, among these findings was a complete bovine first phalanx with an additional joint surface, suggesting its use in draught work. Such instances align with records from the 1664 and 1674 inventories of Kurtuvėnai Manor, which stipulate that peasants were obliged to provide labor for the manor using their own horses or oxen.

10 **LOST IN TRANSLATION. CHINESE ACCOUNTS OF THE FOREIGNERS IN AN ARCHAEOLOGICAL CONTEXT**

Zuchowska, Marta (Faculty of Archaeology, University of Warsaw)

The popularity of the concept of the so-called Silk Road, revived by recent Chinese transboundary economic initiatives, causes ongoing interest in ancient and medieval Chinese sources, devoted to descriptions of distant lands and their inhabitants. While the earliest translations of the "Accounts of the West", included in most of the official histories, focused on historical and geographic explanations of the texts, more recent works refer often also to archaeological data, seeking confirmation for interpretative theories. Very rare are however reflections on the reasons for the factual inconsistencies and incoherencies of the original texts.

After over a century of scholarly debate on the meaning and explanation of these sources, it seems that a more theoretical approach is needed, contextualizing not only the texts but also the process of their translation and interpretation.

Based on a few examples of the Chinese accounts of foreigners, dated to the 1st millennium AD, this paper aims to discuss the potential of a complex analysis of Chinese written sources (including historical, geographic and linguistic approaches) and archaeological sources pointing to the risks and profits of such an approach.

209 **NOT ANOTHER SESSION ON ETHNICITY! REPLACING ETHNIC WITH OTHER TYPES OF GROUP IDENTITIES**

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Giamakis, Christos (York Museums Trust) - Franković, Filip (Archaeological Museum in Zagreb)

Session format: Regular session

Group identities are central to the organisation of human societies, both past and present. Numerous recent studies of group identities show that people can be simultaneously part of different social groups (e.g. ethnic, class, gender, age etc.), as well as that the expression of diverse social identities is context related. Yet, a large part of current archaeological research still considers ethnic identity as the primary basis for organisational patterns attested in the archaeological record. Such an approach has been a fundamental part of the discipline since its very beginnings until today, constituting the basis of both cultural-historical and colonial discourses.

Nevertheless, various ethnicity-focused studies conducted in the last 60 years have clearly shown that cultural differences, including those in material culture and practices, have to be made relevant in social interactions to create an expression of ethnic identity. Unfortunately, this level of intentionality is commonly imperceptible in the archaeological record, especially among oral societies. Interestingly enough, the archaeological record can instead provide us with lucid insights into other types of group identities. Therefore, the aim of this session is to provide a more nuanced approach to the emergence of different group identities by exploring alternatives to ethnicity-based approaches. Simultaneously, it questions the very importance of ethnic identities for the self-definition of past societies.

We would like to welcome studies focusing on, but not limited to:

1. Examples where expressions of different group identities (e.g. class, gender, age) were previously wrongly interpreted as an expression of ethnic identity
2. Use of same types of objects and practices in the expression of different group identities within the same socio-cultural context
3. Relationship between ethnic identities and social class
4. Reconciling social class and funerary data
5. Interactions between social class and gender.

ABSTRACTS

1 **DYING TO MAKE A DIFFERENCE. QUESTIONING FUNERARY PRACTICES AS MARKERS OF ETHNICITY**

Relaki, Maria (The Open University, UK)

Funerary practices have a long history of being treated as strong expressions of cultural identities. When specific funerary practices are thought to originate in particular geographical contexts they have also been treated as markers of ethnic identities, with the implication that, when these features occur outside of their presumed zone of geographical origin, they may be linked to population movements and migration events. In recent years, the advent of a-DNA studies has provided renewed impetus to 'pots equal people' interpretations of the archaeological record, particularly

in prehistoric periods where discursive articulations of ethnic identities are lacking. Using the mortuary landscape of Bronze Age Crete as a case study, this paper aims to critically assess the insights that funerary data may offer into the construction and performance of ethnic identities. The study will specifically examine how a series of diverse social identities were actively manipulated through mortuary behaviour to subvert narrowly perceived ethnic origins and instead create necro-topologies that accounted both for diversity and integration.

2 NOT ANOTHER PAPER ON MYCENAEANS! REPLACING ETHNIC WITH OTHER GROUP IDENTITIES IN THE 2ND MILLENNIUM BCE EAST AEGEAN-WEST ANATOLIAN REGION

Frankovic, Filip (Archaeological Museum in Zagreb)

Group identities are central to the organization of human societies. However, they are also crucial in creating scholarly interpretative narratives about societies from the past. In the process of creating such narratives, burial practices often play a central role. Unfortunately, the creation of interpretative narratives about burial practices in past societies is not devoid of the influence of cultural-historical discourse. More precisely, narratives about burial practices created within the framework of cultural-historical discourse commonly consider ethnic identity as the primary basis for the formation of patterns attested in the funerary record. The East Aegean–West Anatolian region in the 2nd millennium BCE is a good example of such practice.

The appearance of Mycenaean-type funerary forms in the region during the 14th and 13th centuries BCE was commonly interpreted as a sign of colonization and “foreign” settlers, impacting the ethnic composition of “local” communities. Aside from the obvious issue of equating people with material culture, a detailed re-examination of the available data sets suggests that the strong focus of previous research on ethnicity completely overlooked all other possible types of group identities that might have been expressed through similarities (and differences) in funerary culture. On the basis of 2nd millennium BCE burial practices in the East Aegean–West Anatolian region, this paper will: (a) demonstrate that expressions of class and age were previously mistaken for expressions of ethnic identities; (b) show that the same types of objects and practices were commonly used to express more than one type of group identity; (c) present how “foreign” forms of material culture were actively incorporated by “local” communities into already existing expressions of group identities.

3 BREAKING OUT OF THE ‘EGYPTIAN’ VS ‘NUBIAN’ DICHOTOMY: THE CASE OF A COMMUNITY IN NEW KINGDOM SAQQARA

Ayers, Natasha (Austrian Archaeological Institute / Austrian Academy of Sciences)

While excavating large Early Dynastic mastaba tombs at Saqqara in the 1950’s and 1960’s, Walter B. Emery unexpectedly uncovered intrusive burials of the early New Kingdom (ca. 1550–1450 BCE) displaying a complex combination of burial practices and material culture with connections to Egypt, Nubia, the Aegean, and the Levant. This group of burials presents the opportunity to investigate strong evidence for a ‘community of practice’ at Saqqara that, so far, seems to be unique in Egypt and unexplainable with the rigid ‘Egyptian’ and ‘Nubian’ ethnic labels. A wealth of diversity in material culture and social practice is often subsumed into this binary categorization in Egyptology, and in the process the visibility of complex communities and material culture with different chaînes opératoires and performance characteristics are erased. Only one of the Saqqara burials has been published in part by other scholars, with the existence of the other burials remaining mostly unknown until now. After a fresh appraisal of Emery’s excavation records and re-recording of objects from the burials now held in UK museums through the implementation of both well-established and new technologies (e.g. Reflectance Transformation Imaging), as well as a tailored combination of theoretical approaches (i.e. communities of practice, behavioral chain, and assemblage theory), these burials now can be viewed outside of the limited culture-historical lens. The larger aim of this research is to shed more light on the diverse identities and concepts of community that co-existed in ancient Egypt.

4 THE DEAD DESERVE A PROPER BURIAL: THE QUEST FOR THE ETHNICITY OF BRONZE AND IRON AGE BURIAL MOUNDS IN ALBANIA

Trinder, Ermelinda (Staffordshire University)

Between 1945 and 1991, Albania experienced a totalitarian communist regime. The systematic research of Bronze and Iron Age burial mounds in the country commenced in 1948 and was a byproduct of the communist ideology. One of the central tenets of the communist state was the glorious ancestry and ethnogenesis of Illyrians. The interpretation and narrative of burial mound findings were frequently exploited to illustrate the uniformity of ethnic Illyrians and their uninterrupted continuity to modern-day Albanians.

Additionally, burial rites were considered the final proof for illustrating, analysing and interpreting the ethnicity of the deceased in burial mounds. The burial rite of inhumation was interpreted as a direct reflection of the ethnicity of

Illyrians. Cremation, on the other hand, was associated with the presence of foreign ethnic groups. The ethnicity of Invisible graves (cenotaphs) was seldom analysed and considered of little importance.

Three decades after the fall of communism in 1991, this one-dimensional approach to the understanding of burial rites continues to be interpreted within the context of and primarily through the lenses of ethnicity.

In this paper, I present an alternative interpretation of the importance of burial rites. Through the analysis of 123 burial mounds excavated during the communist period, I explore how the choice of inhumation, cremation and invisible burials reflected the community’s perceptions of the treatment of the body and beliefs in the afterlife.

5 SOCIAL IDENTITIES IN ANCIENT MACEDONIA: A RE-EXAMINATION

Giamakis, Christos (York Museums Trust)

Ancient Macedonia is an area long associated with themes of identity and politics. Past narratives have been largely influenced by the current socio-political circumstances with archaeology more often than not functioning as a vehicle for different political agendas.

Archaeological discourse has primarily approached the material through a cultural-historical lens in its quest for similarities in the archaeological record which would in turn prove the existence of certain ethnic groups, acting as ancestors of the contemporary nation states. The aim of this paper is to move beyond such narratives and adopt a more nuanced approach strongly rooted in social theory. Material from the main source of information, that is cemeteries, in Ancient Macedonia, will be examined taking into account both the similarities but also the differences between sites across the region. The topography of the cemeteries, grave goods, tomb types and burial rites will all be studied concurrently as part of the same ontology as evident in the archaeological record. It will be argued that multifaceted groups identities, not necessarily tied to an innate list of ethnic criteria but to multiple cycles of stability and change, uniformity and variation, and conformity and individuality gradually emerged in early Macedonia. It is because of these social dynamics

that both shaped and were shaped by the lived social reality of the people across the region that what was ultimately created was a spectrum along which multiple identities coexisted and interacted with one another.

6 NEW PERSPECTIVES ON LATE ANTIQUE BURIALS: THE CASE OF CEMETERY LAJH IN KRANJ (SLOVENIA)

Pavletic, Kaja (Filozofska fakulteta, Univerza v Ljubljani)

The Late Antique cemetery Lajh in Kranj (Slovenia) was initially discovered and excavated in the late 19th and early 20th century. With more than 600 burials discovered so far, dating roughly to the 6th century AD, it is the largest Late Antique burial site in the region.

Despite its significance, the published literature on the cemetery, particularly the seminal work from 1980, has been plagued by inaccuracies and oversights. A comprehensive revision of all the excavation data from the Lajh cemetery was required to reevaluate the reliability of grave assemblages. This, in combination with new data from archaeological excavations from 2004-2010, has enabled a data-driven study of the cemetery as a whole and has led to new insights into the social structure of the Late Antique population who lived in the dynamic region between Italy, Pannonia and the Alps.

While existing scholarship predominantly inferred ethnic affiliations from the rich and geographically diverse grave goods of people buried at Lajh, this study focuses on other highly interconnected aspects of identity such as status, gender and age. This study will attempt to contribute to a more nuanced understanding of Late Antique society through a multidisciplinary approach encompassing examination of grave goods, osteological analysis and contextual interpretation. The presentation will mainly concentrate on women buried at Lajh, whose graves have previously been interpreted mainly through the lens of brooches and the assumed ethnic backgrounds they might have conveyed.

7 HOW DEEP THE ARCHAEOLOGICAL MATERIAL ALLOWS US TO DIG INTO IDENTITY OF INHABITANTS OF EARLY MEDIEVAL SOUTHERN PANNONIA AND DALMATIA?

Skrgulja, Jana (Department of Archaeology, Faculty of Humanities and Social Sciences University of Zagreb) - Niksic, Petra (Department of Archaeology, Faculty of Humanities and Social Sciences University of Zagreb)

In the works dealing with the identity of the Great Migration Period in the area of Southern Pannonia and Dalmatia, regarding the period from the 5th to the 7th century, the authors who published rare but valuable archaeological finds were mostly interested in determining the ethnic identity of the inhabitants of the early medieval Southern Pannonia and Dalmatia. Although we should consider the time and circumstances in which most authors published such findings, as well as the fact that most of such archaeological finds were found out of context, which adds to its problematic research, we want to explore other options that these finds offers. We will examine how justified the ethnic

determinations of material culture are based on accidental finds, whether the finds that were published together were really found together, and deal with other identities about which these objects may say more. Those finds could be the testimony of ethnicity in the unstable times of the beginnings of the creation of modern Europe but they could also be proof of other forms of identities, such as social identity, gender identity and religious identity.

8 FUNERARY VESSELS AND THEIR SIGNIFICANCE IN THE LATE ROW-GRAVE CEMETERIES OF TRANSYLVANIA

Beata, Barbocz (UBB)

The row grave cemeteries are a well-known archaeological phenomenon present from Gaul to the Eastern Carpathian Basin. The funeral inventory can be related to sex, age, and social status. Despite this fact, funeral vessels are present in both male and female graves, child graves, and the graves of the elderly. Considering aspects of the pottery manufacturing process, such as shaping the vessel from clay, burning it in an oxidative or a reductive environment, and employing various decoration techniques, different types can be observed. The funeral vessels can be cross-dated using objects from the funeral inventory and their analogies. The Band-Noslac group is the latest group of row-grave cemeteries related to the Gepids. Using case studies from different cemeteries from the aforementioned group can be of great use in the future to improve our understanding of the presence of different vessel types in funeral contexts, and their positioning in the graves, and they could offer more information about funeral rites.

9 THE HARAPPAN VENEER AND GROUP IDENTITY IN THE INDUS VALLEY REGION, C. 2600-1900 BCE, SOUTH ASIA

Miller, Heidi (Middlesex Community College)

The material culture of the Bronze Age Indus Valley Tradition, also known as the Harappan Culture, was described as homogeneous by many of the early excavators, and assumed to represent a single ethnic identity. Yet, as Barth (1970), Jones (1997) and others have demonstrated, ethnicity is emergent and contingent, affected by myriad socio-economic factors. Individuals within any culture have multiple ethnicities, and thus from an archaeological context, if we rely solely on material patterning, is ethnic identity the best interpretation of material homogeneity?

Today, most scholars of the Indus Valley Civilization, ascribe to the idea that a particular assemblage of artifacts, along with a number of shared technologies and building practices, is a veneer overlying many local identities within the greater Indus Valley region. Thus, it appears that many groups may have co-existed, not just a single ethnic group. This resonates with the work of Damm (2012) who describes how 'entangled identities' may exist in many cultures. She notes that identities are built from "numerous networks...[of] economic, social and cultural practices...these will provide a multitude of partly latent, partly active collective identities at many different levels and scales (2012:26). In turn, Damm's research resonates with the work of Anthony Cohen on the concept of community in human societies (1985). He notes that people use symbols to construct community and that these symbols may be interpreted quite differently by individuals, but the commonly shared form of the symbol "aggregates the various meanings into a singular community", and thus "...community' provides not so much a model, but more an expedient medium for the expression of very diverse interests and aspirations (1985: 108). Thus instead of an ethnic identity, the Harappan veneer could be such a tool.

10 BEYOND THE (ETHNICALLY) GREEK IN POMPEIAN SECOND-STYLE WALL-PAINTING

Schreuder, Nicky (Leiden University)

Republican Rome and its social-cultural landscape changed drastically following expansionist conquests and the subsequent influx of foreign objects – primarily spoils captured and taken back after successful campaigns. This included all sorts of things ranging from artworks or precious metals, to animals and human beings. Everything 'Greek', as scholars would recognize it, increased in presence, leading to what has been termed a 'cultural revolution' that was to have a lasting impact. Concurrently, the repertoire of frescoes that could decorate the domestic spaces of houses and villas changed. Famous for their depictions of perspectival illusionism and Hellenistic architectural features, the 1st century BCE paintings of the so-called Second-Style began to include a wide array of objects and styles that circulated in the Hellenistic oikouménē and were imported into Rome.

Whereas previous scholarship has generally interpreted these paintings as representations of social status and a desire for a private Greek (cultural-ethnic!) lifestyle, I would like to approach the frescoes from the angle of the impact of objects and style and their active role in the formation of changing (social-cultural) identities and knowledge during this era of increasing connectivity. To regard them as expressions of the desire for doing or being 'Greek' might, then, be reductive. Rather, by highlighting depicted (imported) objects in the paintings, I attempt to explore how these murals might have perceptually established a new social imaginary or self-consciousness beyond the ethnically 'Greek' by instead cognitively orienting the viewer into the longstanding (cultural) traditions of the Hellenistic world Rome became part of.

By putting aside the ethnic bias when interpreting objects, we might, then, explore new emerging group identities in Rome during the pivotal moment of global dynamics in the (Late) Republic.

11 "AS THEIR ANCESTORS DID": MEMORY, IDENTITY, AND FAMILY TRADITION IN THE CITIES OF CARIA

Tsolakis, Georgios (The University of Chicago)

This paper delves into the political and social significance of family traditions for the understanding of communal identity and memory in the cities of Hellenistic and Imperial Caria. While there is an abundance of literature on the historical and mythological ancestors of political communities and interstate entities, the role of family ancestors and familial tradition in constructing and transmitting collective cultural memory and identity remains largely understudied. Drawing primarily upon epigraphic sources such as honorific inscriptions and epitaphs, this study seeks to elucidate the role of familial traditions in affirming the social standing of families within their respective communities through the commemoration of the deeds of their ancestors. It further investigates how familial traditions served as a mechanism not only for asserting familial status but also for establishing political values, further enhancing social norms, and creating competition among the wealthy elites for dominion over the public sphere. Finally, this paper aims to provide fresh insights into the dynamics between families and the community and the construction of cultural memory conferred by ancestry in the ancient Mediterranean world, thus enriching our understanding of the institution of the polis in the Hellenistic and Imperial world.

210 BREAKING TRADITIONS: SUDDEN CHANGE AND ABANDONMENT IN ARCHAEOLOGICAL LANDSCAPES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Ljung, Cecilia (Uppsala University) - Klevnäs, Alison (Uppsala University) - Hattori, Marcia (Institute of Heritage Sciences (CSIC)) - Sallum, Marianne (Laboratório Interdisciplinar de Pesquisas em Evolução, Cultura e Meio Ambiente LEVOC (MAE-Universidade de São Paulo, Brasil)) - Lau-Ozawa, Koji (UCLA)

Session format: Session with keynote presentation and discussion

Archaeology is often a discipline of the long durée, tracing resistant frameworks of thought and action over lengthy periods. But there are points in the material record where we see rapid disruption and remodelling, or even abandonment, of ways of life. One of the most archaeologically visible forms of change is in the use of space. The distribution and spatial organisation of mortuary and dwelling sites, land-use, cultic devotion, artistic expression — all and any human traditions may be subject to abandonment or fundamental reshaping if their maintenance is no longer warranted or if active distancing from the past becomes desirable.

This session will explore sudden change or abandonment in the use of space at levels from landscape down to archaeological feature. Can we identify the trajectories, agencies and timescales of cataclysmic change? Under what circumstances do communities radically relocate their places for the living and the dead? Do spatial changes necessarily involve new practices and new ontologies? What are the implications of spatial change for community life? What becomes of those who cannot or will not adapt?

One approach to radical change in the archaeological record has been to show that stops are not as sudden as they may appear, with aspects of older practices continuing or adapted. Instead, in this session we ask what happens if archaeology recognises moments of total change? Can we study multiple forms of abandonment that traverse our societies? How do we understand time and material being if we look at the from the idea of their abandonment? And not least how do we deal with abandonment in situations of displacement by colonialism and wars?

We welcome papers which deal with aspects of the ending of spatial traditions in any chronological or geographical perspective, including both material memories and their loss.

ABSTRACTS

1 BOTTLENECKS OF CHANGE IN THE MEDIEVAL LANDSCAPE

Brookes, Stuart (UCL Institute of Archaeology)

Archaeologists have long wrestled with the confrontation between short-term events (typical of 'historical' descriptions), and long-term change ('processes'), with many advocating for the need to consider multi-scalar changes taking place at all times. Extending this argument, some have suggested we should recognize and describe fluctuating changes in the relationships between the human and non-human worlds. Such approaches, they argue, are a way to engage more fully with the complexity and messiness of a past that is constantly in flux. These ideas open up interesting debates about 'moments' of rapid upheaval, such as those produced by, for example, conflict, colonialism, mo-

dermy and environmental catastrophe. How can we describe such processes in terms that avoid monocausal, simple explanation? Can we provide interpretations of periods of rapid and emphatic transformation in ways that remain detailed, complex and human-centred? In the second half of this paper I will attempt to eschew determinism, describing instead how a series of heterogeneous processes converged at a 'bottleneck' to produce significant changes in the landscape of early medieval England.

2 THE REPETITION OF FORMS RETHINKING ARCHAEOLOGICAL ABANDONMENT AND SOCIAL CHANGE FROM PHENOMENOLOGY AND COGNITIVE SCIENCES

Millan-Pascual, Rafael (CSIC (Spanish National Research Council), Institute of Heritage Sciences.)

In this presentation I rethink the relationship between abandonment, in any of its archaeological forms and expressions, with the idea of social change. Generally, this association is more or less straightforward: the change of material forms is enough to prove the change of social and cultural forms. From this perspective, the archaeological record offers a wide range of "cultural crises" that have entailed the definitive loss of many and varied ways of life. However, the development of research in recent decades has complicated this archaeological premise. Broadly speaking, we could say that the timing of material change does not always coincide with social and cultural change. One example of this temporal disparity is the identification of ancient styles and forms in supposedly more recent materials. The archaeological record offers numerous examples of this repetition of forms, but, in our view, we need a theoretical elaboration of the social and anthropological dimension of this endurance of the past. In order to advance a possible answer, I will re-examine some archaeological examples based on the most recent contributions of phenomenology and cognitive sciences. As we shall see, this implies assuming a different idea of abandonment, social change, and time.

3 CULTURAL CHANGE AND CONTINUANCE - THE CASE OF THE PRZEWORSK AND WIELBARK CULTURES IN THE LUBLIN REGION, EASTERN POLAND

Cyran, Marta (Doctoral School of Humanities and Art, Maria Curie-Skłodowska University, Lublin, Poland; The National Museum in Lublin)

One of the most spectacular examples of sudden change and abandonment in archaeological landscapes in the Roman and early Migration periods in the Central European Barbaricum took place in the Polish lands at the end of the 2nd and the beginning of the 3rd century AD, when the Goths (identified as the Wielbark culture) arrived in the area settled by the Vandals (connected with the Przeworsk culture). The emergence of communities representing these cultures in particular areas, their development, mutual contacts and influences are, among the most intriguing cultural phenomena.

Especially the area of the Lublin region, due to its location between two rivers: Vistula and Bug – important for migration processes and trade in this part of Europe, is significant for the reconstruction of settlement organisation and the genesis of many cultural changes in the period between the Marcomannic Wars and the invasion of the Huns.

The presentation involves a characterization of the distribution and spatial organisation of burial and dwelling sites and the process of replacing the Przeworsk settlement with the Wielbark settlement, including the verification of the previously (in old research) demonstrated lack of chronological continuity in the use of bicultural sites. Reanalysis of the materials from old research and new finds, as well as the implementation of interdisciplinary studies will make it possible to determine whether there was a real cultural hiatus or an apparent one resulting from the outdated state of research and/or misinterpretation of source materials. The thesis of the paper is that cultural changes are not as sudden as they may appear and an attempt will be made to answer the question if the "exchange of population" from Przeworsk to Wielbark on the example of the Lublin region, was based mostly on armed conflicts, or there is some evidence of peaceful coexistence.

4 TERRITORIAL SOVEREIGNTY AND PERSISTENCE OF TRADITIONAL COMMUNITIES OF SÃO PAULO, BRAZIL: MATERIALITIES, SELF-DETERMINATION, AND LANGUAGE

Sallum, Marianne (University of São Paulo; UNIARQ – Centre for Archaeology. School of Arts and Humanities. University of Lisbon.) - Noelli, Francisco (UNIARQ – Centre for Archaeology. School of Arts and Humanities. University of Lisbon) - Casimiro, Tânia (Universidade Nova de Lisboa)

This paper shows the territoriality of traditional communities in São Paulo that have been erased by academic interest. This research collected information that contradicts the idea of demographic collapse, cultural loss, and European domination that transformed the Indigenous populations into a homogeneous mass and a blank slate for the Portuguese. It is the case of an extensive region occupied for 2,000 years by speakers of the Tupiniquim language. This population established alliances with some Portuguese in the 16th century, forming the largest colonial demographic in the state of São Paulo. This alliance proved to be more powerful than the attempts of other Portuguese to colonize the Tupiniquim territories and their occupants in the Tupiniquim-Portuguese kinship relationship. In this context, the

Portuguese coarse ware was appropriated and transformed in the sixteenth century by Tupiniquim women from the São Vicente area for use in colonial settlements, which their descendants and newcomers reproduced until the present day in the southeast region of São Paulo.

5 LIFE FINDS A WAY. SETTLEMENTS' ABANDONMENT AND REUTILIZATION IN THE HORN OF AFRICA

Llorente García, Mario (Incipit - Institute of Heritage Sciences)

In this paper, the abandonment dynamics of the settlements of a region of the Horn of Africa will be explored. During the period between the 13th and the 16th centuries, this region, covering both sites of the western borderline between Somaliland and Ethiopia, witnessed the emergence of a series of settlements that transformed the landscape. From nomadism to sedentarism, from tents to houses, from an exclusive herding economy to a mixed one incorporating agriculture. However, driven by the conflicting atmosphere that afflicted the region since the mid-16th century, all these settlements were abandoned. Nonetheless, no evidence of destruction has been recorded, though some fortified elements can be found throughout the territory, neither these settlements show signs of decline. Thereupon, the abandonment of the settlements from this region of the Horn of Africa must be analyzed from a different perspective, all the more so everything points to a reutilisation of some of these abandoned spaces by the nomads that inhabited the region when the sedentarism passed away. With this aim, the StateHorn project has been undertaking surveys and excavations at both sides of the borderline, in sites such as Qararu and Aiyanle in Ethiopia, as well as Abasa and Dameraqad in Somaliland. These new data can shed light on the dynamics that drove this phenomenon.

6 RADICAL CHANGE? SOCIAL ABANDONMENT AND THE ARCHAEOLOGICAL RECORD

Hattori, Márcia (Instituto de Ciencias del Patrimonio (INCIPIT-CSIC))

The study of abandonment is particularly important for understanding cultural change and continuity over time and is commonly understood to shed light on how and why certain communities thrived, declined, or relocated. Critical perspectives in postcolonial theory have challenged the focus on abandonment, suggesting that persistence and presence should be considered first (e.g. Laluk and Aguilar 2023). Abandonment can materialise not only in the practice of suddenly altering the archaeological record, but also in the deliberate process of making it disappear: structures from other groups and cultures, objects and even bodies. In contemporary contexts, the concept can manifest itself in exaggeration and three forms of waste – production waste, nature-as-waste, and the human-as-waste as expressions of the late capitalism. This paper explores twentieth-century abandonment, the last layer of a stratigraphy that shows sudden changes in the landscape, but some continuities over time, through two specific contexts: landfills and collective ossuaries. Using ethnography, archival research and archaeological data, this paper aims to show how social abandonment can materialise in a radical change of the landscape or in the normalisation of some practices.

7 'EMPTY' PLACES FILLED WITH MEMORIES: THE POLITICS OF ABANDONMENT AND JAPANESE AMERICAN INCARCERATION

Lau-Ozawa, Koji (UCLA)

The ideas of abandonment and empty landscapes permeate sites of WWII incarceration of Japanese Americans in the present day. Often far away from population centers, these sites are frequently considered open areas devoid of structures with only the ruins and foundations of the once populous incarceration camps. These conditions were integral to the design of incarceration camps, large temporary structures that could sustain populations of 10-20 thousand people for two to four years and then be promptly disassembled. However, the landscapes that the camps were constructed on were never empty to begin with. Indigenous tribes in particular saw land expropriated for the creation of camps, and the enduring legacies of tribal history and Japanese American incarceration has permanently marked these sites. Further, numerous heritage organizations and communities lay claim to the use and treatment of the sites, mobilizing frameworks of place-based memory. Consequently, in the present day, as land managers and multiple publics contest how to use these sites and what claims of the past have legitimacy in the present, the concepts of abandonment and emptiness create powerful avenues for mobilizing new projects and interactions with the landscape. This paper looks to multiple points of friction around sites of Japanese American incarceration, questioning what it means for a place to be abandoned and by whom?

217 MATERIALISING THE INVISIBLE. THE ANALYSIS OF RURAL SOCIETIES IN THE TRANSITION TO THE EARLY MIDDLE AGES IN THE IBERIAN PENINSULA

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Rodríguez-González, Celtia (Universidad de Santiago de Compostela) - Rolo, Monica (UNIRARQ - Centro de Arqueologia da Universidade de Lisboa) - Salinero-Sánchez, Irene (Universidad Rey Juan Carlos) - Tobalina-Pulido, Leticia (Instituto de Ciencias del Patrimonio, CSIC) - Martins, Ana (CHAIA - Universidade de Évora; Universidade de Granada; FCT – Fundação para a Ciência e Tecnologia (2021.06047.BD))

Session format: Regular session

The study of the period between Roman and Medieval times (4-9th centuries) has become increasingly relevant in recent years. In fact, in many parts of the Iberian Peninsula, there is a growing renewal of lines of research related to the period. This is mainly due to the involvement of commercial archaeology and the development of research programmes linked to the period comprising the transition to the medieval world. Nevertheless, the scarcity of known data about this territory during the post-classical period still results in a rather lacunar knowledge. The identification and recognition of Late Antique archaeological evidence is still complex, as is the dating of archaeological contexts and material culture from this period. In addition, the literary sources on the fields of Hispania, and particularly of ancient Lusitania, are insufficient when it comes to outlining a diachronic reading of the Late Antique/ Early Medieval landscape. This gap still exists today in some areas. The failure to associate habitation, cult and funerary sites has created a knowledge gap in terms of better understanding these population groups and the reasons for their establishment and/or continuity in each region. Focusing on the Iberian Peninsula, this session aims to open a debate on several questions such as the following: What difficulties do we have in the characterisation of the sites of this period, both chronologically and functionally? How can the lack of theoretical analysis affect the characterisation of the archaeological sites of this period? What data can we find from the settlements and necropolises of this period about the daily life of the period? How can we deal with the archaeological gaps we face in the study of this period?

ABSTRACTS

1 REDEFINING CAVE FREQUENCIES: THE PRESENCE OF ROMAN ARCHAEOLOGICAL REMAINS IN THE CAVES OF THE BASQUE COUNTRY (SPAIN)

Tobalina-Pulido, Leticia (Incipit - Institute of Heritage Sciences)

The study of human occupations in caves has been a prominent topic in the Basque Country since the early days of archaeology. While specialized literature has predominantly focused on the prehistoric period, relegating later periods such as the Roman or Late Antique to a secondary position, the presence of material remains from historical epochs in these caves is evident, yet it has not received adequate attention. Until the 1980s, the lack of data and scarcity of specialized research demonstrated the lack of interest and inherent difficulties in their study. However, progress has been made since then, with an increase in research on this topic. Although still considered quantitatively marginal, these new works have allowed for a reconsideration of cave occupation during the Roman period both in France and Spain. These contributions highlight the need to reassess the status of these sites, which appear to be more common than generally believed and defy reflections on the organization of mountainous territories. Caves do not seem to serve as places of permanent habitation but rather as spaces with a variety of functions, from funeral rituals to temporary shelters or areas for livestock activities. Nevertheless, further work is needed to determine the permanence of populations in these settlements during the Roman and Late Antique periods. Therefore, the objective of this work is to provide a comprehensive review of cave frequentation during the Roman and Late Antique periods in the Basque Country, through the revision of chronologies, the study of materials and the creation of a GIS to virtually highlight these sites. This approach will better characterize these poorly understood settlements for the Roman and Late Antique periods.

2 SPATIAL ANALYSIS OF MEDIEVAL FORTIFICATIONS IN THE RIAZA, DURATÓN, AND DUERO INTERFLUVE THROUGH GIS TOOLS

Polo-Romero, Alberto (Rey Juan Carlos University)

The area of the Rianza, Duratón and Duero interfluvium played a crucial role in the understanding of the conquest and subsequent Castilian defense of the southern part of the northern plateau during the medieval period. Despite the vital importance of the fortifications in this area for understanding its defensive network in the Middle Ages, only partial analyses have been carried out so far. This talk, based on data extracted from historical documentation and the archaeological record, addresses the problem of fortified spaces by applying a spatial analysis focused on first order factors related to the system of fortifications through GIS software. The main objective is to unravel the patterns of

visibility, distribution and intervisibility networks of the fortifications in this territory, thus providing a more complete view of their strategic function from a relational perspective. Therefore, the conference seeks to provide a more solid framework for understanding the strategic interconnectedness of the enclaves and their role in shaping the medieval defensive landscape in the region.

3 ANALYSIS OF EVERYDAY LIFE IN RURAL SETTLEMENTS DURING THE EARLY MIDDLE AGES IN THE NORTHWEST OF THE IBERIAN PENINSULA

Rodríguez-González, Celtia (Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais (CISPAC), Universidade de Santiago de Compostela)

The analyses of everyday life in archaeology within the northwestern peninsula for the period of social transformations occurring between the 4th and 6th centuries AD, within rural societies, are scarce or nonexistent. In fact, the small contributions that exist are made solely from written sources, with a comparative perspective that barely covers the spatial levels of the everyday. Our study encompasses various aspects related to materializing experiences from the past from an inclusive perspective, involving people in historical processes, and discussing ways of life within rural settlements in the Northwest. The methodology used draws from different approaches, such as the archaeology of domestic spaces and gender archaeology. For this purpose, two settlements associated with this chronological period in the interior of Galicia, in Ourense, have been chosen as case studies. They will be examined for the scale of the everyday, highlighting different aspects that speak to the relationships between individuals, including gender dynamics.

4 TRENDS IN LANDSCAPE AND AGRICULTURE IN NW PORTUGAL IN THE LATE ANTIQUITY ACCORDING TO ARCHAEOBOTANICAL RESEARCH

Magalhães, Catarina (CITCEM – Center for Transdisciplinary Research Culture, Space and Memory. Faculty of Arts and Humanities of University of Porto) - Seabra, Luís (Faculty of Sciences, University of Porto; CIBIO-BIOPOLIS - Research Center In Biodiversity and Genetic Resources/University of Porto) - Oliveira, Cláudia (CIBIO-BIOPOLIS - Research Center In Biodiversity and Genetic Resources/University of Porto) - Arezes, Andreia (FLUP – Faculty of Arts and Humanities; CITCEM – Center for Transdisciplinary Research Culture, Space and Memory. Faculty of Arts and Humanities of University of Porto) - Filipe, Ana (APPA-VC – Association for Protection of Heritage, Archaeology and Museums of Vila do Conde) - Varela, José (Matosinhos City Municipality) - Almeida, Pedro (Vila do Conde City Municipality) - Tereso, João (CIBIO-BIOPOLIS - Research Center In Biodiversity and Genetic Resources/University of Porto; Centre of Interdisciplinary Studies, University of Coimbra; Centre for Archaeology. UNIRARQ. School of Arts and Humanities. University of Lisbon; MHNC - UP - Natural History and Science Museum of the University of Porto)

The transition between Late Antiquity and the Early Middle Ages represents one of the most significant gaps in historical knowledge in NW Iberia. There are few documentary sources for these chronologies, so Archaeology plays a unique role in their study.

However, the low number of excavations and studies focusing on that chronology prevents the configuration of a well-defined archaeological identity in chronological and material terms, even if recent archaeological investigations, especially of local and regional nature, have put forward new research lines. The inclusion of multidisciplinary teams in different projects has highlighted the role of the archaeological sciences, such as Archaeobotany, in broadening possible levels of interpretation.

However, archaeobotanical analyses addressing this transitional moment have been seldom conducted, contrasting with the high number of studies for previous periods, particularly from the Iron Age and the Early Empire. Earlier works suggest significant landscape changes occurred in this period, in articulation with broad climatic, socio-economic, and political trends. Nevertheless, this hypothesis needs further enquiry, with new and consistent data. In this presentation, these issues will be explored by addressing in detail the archaeobotanical record from two sites in NW Portugal, Castro de Guifões and Cividade de Bagunte, including unpublished data, and by integrating them in the historical and environmental dynamics of NW Iberia. The information obtained so far suggests some crops became increasingly disseminated in the region, which can eventually be related to changes in settlement and environment. These and other trends in agriculture and landscape will be examined in full articulation with the palaeoenvironmental and archaeological data available.

5 SHADOWS ON THE PEAKS: EXPLORING THE ELUSIVE REALMS OF MOUNTAIN COMMUNITIES DURING THE EARLY MIDDLE AGES

Medina Gordo, Sonia (University of Barcelona)

In the last forty years, we have witnessed a significant improvement in the knowledge of early medieval materiality in Spain. The recognition of this heritage as a public domain asset has driven a remarkable increase in the collection of

archaeological data in the country, providing a more complete vision of its past. However, despite these advances, mountain regions continue to lack a narrative of their own that reflects their historical and cultural uniqueness. This absence has contributed to crafting an elusive and ill-defined image of these environments. Paradoxically, progress in research has led to addressing these areas in two distinct ways: either they are considered marginal spaces with little historical significance, or they are interpreted through a lens that equates their historical evolution with that of valley spaces.

In this context, our contribution aims at highlighting the issues that have been sidelined in the agenda of medievalists. In this sense, our intention is twofold. On the one hand, we present an alternative proposal that allows us to examine and understand the gaps in the existing information on the Sierra de la Demanda (Spain). On the other hand, we create room for other forms of 'knowledge-making' that may shed light on these regions. By exploring these challenges, we aspire to foster a pluralistic approach that captures the complexity of these spaces and accommodates alternative perspectives on understanding landscapes, challenging prevailing perceptions.

6 DEATH IN TIMES OF CHANGE: FUNERARY PRACTICES IN LUSITANIA DURING LATE ANTIQUITY

Rolo, Mónica (Centre of Archaeology of University of Lisbon (UNIARQ))

One pretends to present a portrait of the funerary practices in Lusitania during Late Antiquity (4th – 9th c. CE). We will focus our attention on the countryside of this ancient Roman province in the West of the Roman Empire, taking as case-studies an assemblage of rural necropoleis located in the nowadays Portuguese territory. The analysis of the archaeological funerary record in rure shows us how local communities have adapted their attitudes towards death through the downfall of the ancient socio-political, economic and cultural frame, echoing a world of the living in profound change. The known evidences suggest the persistence of the classical legacy (e.g., the practice of the incineration rite until the 4th c. CE, or the maintenance of the epigraphic habit in late antique tombs), as well as a frequent stability of the funerary topography (i.e., the relevance of necropoleis in use since Late Iron Age or High Empire as places of memory for late antique communities). In parallel, the uprising importance of Christianity dictated a new cosmogony and new funerary practices (e.g., the preference for the inhumation rite and East-West oriented tombs, or the progressive diminution of grave offerings).

7 STUDY OF RURAL FUNERARY SPACES IN THE IBERIAN PENINSULA BETWEEN THE 5TH AND 7TH CENTURIES AD. A COMPARATIVE PERSPECTIVE

Sánchez, Irene (Universidad Rey Juan Carlos)

The aim of this paper is to present several case studies related to funerary spaces dated between the 5th and 7th centuries AD in the Iberian Peninsula. The traditional historiography of the 20th century assumed that these funerary spaces had a specific location according to different parameters, being or landscape, related to habitational or religious spaces. In this sense, based on several case studies, the aim is to observe whether this phenomenon is common to the necropolises of the Iberian Peninsula or whether it is an exclusive regional phenomenon. The working area will be defined on the basis of geographical factors such as river basins, and orographic and historical elements.

Likewise, the fossils used to date and characterise the funerary assemblages have generally been based on the objects found in these contexts. This fact has led to certain problems when we have subsequently faced the study of necropolises, for example, in the south of the Iberian Peninsula.

In order to better understand this transition period and the rural population groups themselves, this study will be based on historical, cultural and territorial aspects. However, we will not neglect the study on a micro-spatial scale, i.e. to understand the articulation of the enclaves themselves, the typology of the tombs and associated grave goods, whether ritual or personal, as well as anthropological studies -if any-.

From the perspective of funerary archaeology, we can approach the different rural population groups that inhabited the peninsular territory, as well as study the rural world in the transition between Antiquity and the Middle Ages.

8 THE METALLURGICAL WORKSHOP OF CERRO DE LOS ALMADENES. AN EXAMPLE OF LATE ANTIQUITY COPPER PRODUCTION IN IBERIAN PENINSULA

Álvarez García, Juan (Universidad Autónoma de Madrid) - Morato Marqués, Carlos (Asociación para la Difusión de la Arqueología y la Minería Antigua (DAMA)) - Ayarzagüena Sanz, Mariano (Sociedad Española de Historia de la Arqueología (SEHA))

Cerro de los Almadenes is located on the southwestern border of the province of Segovia (Spain), specifically in the municipality of Otero de Herreros, and in a geological context of extraordinary mineral wealth. This site was already identified as an important area of metallurgical production in antiquity by Professor C. Domergue in the 1970s, who studied several materials from two large slag heaps, now disappeared, located in front of the hill; two slag heaps that were the result of centuries and centuries of metallurgical production. Since 2009, a team of archaeologists belong-

ing to the Spanish Society for the History of Archaeology (SEHA) has brought to light the remains of a first-class mining-metallurgical settlement, judging by the findings. Within this settlement, there were important metallurgical production facilities that would correspond to an *officina metallorum*, which consists of different spaces in which the copper extraction process was carried out. One of these spaces is located on the western side of the complex and consists of two batteries of five furnaces each, dated to the Late Antique period (ca. 6th century AD), although research into the remains of previous smelters dates metallurgical production on the hill to the 1st century BC. These archaeological remains, together with the location of the mine entrances, have allowed us to reconstruct the entire production process: from the extraction of the ore, the crushing and washing of the ore, the first roasting process and the reduction of the ore to the extraction of molten copper.

9 CONSUMPTION PATTERNS OF TERRA SIGILLATA AROUND THE GUADIANA (SOUTHERN PORTUGAL) DURING LATE ANTIQUITY

Martins, Ana (CHAIA - Universidade de Évora; Universidad de Granada; FCT - Fundação para a Ciência e a Tecnologia)

The research of recent decades, which has focused on the Roman and Late Antique rural world in southern Lusitania, more specifically in the vicinity of the Guadiana river basin, allows us to understand the complexity of settlement dynamics in this region. The number of archaeological sites identified in this area reflects the existence of a dynamic and hierarchical landscape in the past, divided into different categories of sites, some of whose nomenclature still gives rise to debate and in which the *villae* are clearly the protagonists.

The aim of this communication is to present the current state of knowledge about the consumption patterns of *terra sigillata* in this rural world, particularly with regard to the period of transition to the Early Middle Ages. It also aims to analyse the redistribution of these imported fine ceramics based on existing data, identifying flows and patterns in import rhythms and attempting to understand some cultural contrasts across the region under study.

10 A VIEW OF THE MONETARY CIRCULATION IN NORTHEASTERN LUSITANIA DURING LATE ANTIQUITY, BASED ON THREE ROMAN COIN HOARDS

Ribeiro Machado Neto, Newton (Universidade de Évora)

The discovery of Roman coins in archaeological contexts occurs frequently in Portuguese territory and can provide relevant information about the economic life in Late Antiquity. This paper analyzes three large hoards from Northeast Lusitania, found in close proximity to each other and near other Roman archaeological remains. Such hoards were formed over a long period, either for their monetary value or for the subsequent smelting of the metal.

The chronological distribution shows a concentration of coins minted between 330 and 364. Contrary to what occurs in hoards from other regions of Lusitania, there is a predominance of bronze coins of lower denominations, issued in Gaul and Rome, possibly due to restricted access to maritime commerce and the greater use of land routes in local trade.

There are similarities in the composition of the hoards, resulting from the circumstances in which they were formed. The oldest coins are counterfeits from the late 3rd century, with no coins issued after the early 5th century. This reflects the interruption of the cash supply, which kept the existing coins in circulation even after the Visigothic invasion, as shown by their high degree of wear and tear. These common attributes indicate that the hoards are the result of similar political, economic and social contexts of Northeast Lusitania. They thus differ, in several aspects, from hoards from other regions of Hispania.

There are still large gaps in our knowledge about life in Northeastern Lusitania during Late Antiquity. What are the stories and motivations behind the hoards? When were they formed, and by whom? How much were the coins worth? For what purpose were they hidden? Why were they never recovered? And what can these hoards tell us about life in the later years of the Roman Empire in its westernmost province?

223 MONUMENTAL ISSUES: ARCHAEOLOGICAL APPROACHES TO THE PUBLIC MATERIALITIES OF CONTESTED PASTS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Munawar, Nour A. (Doha Institute for Graduate Studies) - Symonds, James (University of Amsterdam (UvA)) - Gonzalez Zarandona, José Antonio (Newcastle University)

Session format: Regular session

In recent years, the defacement and toppling of historic monuments by the BLM and other protest movements has filled the headlines and prompted public debates. Monuments are powerful and politicized physical structures that can endure for centuries in city centres.

As the passage of time obscures their original meaning, they can acquire a quality of benign anonymity. However, monuments often embody links to dark pasts and traumatic memory, particularly when statues commemorate one-sided narratives of war, colonization, and slavery.

In this session we will discuss the monument as a concept, using biographical and semiotic approaches to explore the changing lives, management practices, and embedded meanings that may be found in public monuments. Our starting point is the position that monuments are more than commemorative objects. Erected in ordinary and mundane locations, such as public squares and parks, monuments are integrated into the everyday lives of city and/or countryside dwellers. Monuments are sites of remembrance, although only if people recognize them as such. Often, their weathered stone facades and oxidized patina bestow a sense of historical time depth and continuity upon a place, creating ontological security. But as recent protests have shown, the latent powers associated with historic monuments can be re-exposed to kindle public outrage and dissent.

Our session invites contributions that investigate what a monument can be, reasons to build and/or remove them, and the meanings of its management acts. We welcome papers working on theories, methodologies, and case studies not only in Europe and North America, but also in the Global South. Our aim is study how the rise of voices that seek to decolonize urban space, as well as changes in global power dynamics and the efforts to promote multipolarity, may have the potential to transform the public perception of monuments to become potentially inclusive healing apparatus.

ABSTRACTS

1 MONUMENTS AND/AS RESTORATIVE JUSTICE IN AFRICA: THE CASE OF MEMORIALS DEDICATED TO THE MAU-MAU UPRISING IN NAIROBI (KENYA)

Labadi, Sophia (University of Kent; University of Bonn)

This paper aims to analyse whether monuments can serve as inclusive healing devices, focusing on their potential for facilitating restorative justice. Restorative justice is a concept that has been increasingly used in recent years by African states and groups, seeking to address the harms and injustices inflicted by colonisation and slavery. It seeks to empower victims, hold offenders accountable, and build stronger, more interconnected communities based on principles of respect, empathy, and mutual responsibility.

However, the significance of monuments in promoting restorative justice remains largely unexplored, particularly in the context of contentious histories. This paper aims to address this gap by critically analysing the often-overlooked monuments dedicated to the Mau-Mau uprising against European colonialists, notably the statue to Dedan Kimathi and the Mau-Mau memorial in Nairobi, Kenya.

Grounded in in-depth archival and ethnographic data collection, this paper also draws upon interdisciplinary perspectives from history, anthropology, and memory studies. More specifically, this paper will delineate the evolving nature of restorative justice and public memorial practices, using the selected cases of the statue of Dedan Kimathi and the Mau-Mau memorial in Nairobi. This section will particularly discuss why this memorial was included as part of a larger out-of-court financial settlement from the UK, marking one of the first financial compensation packages from a European country to Africans for abuses committed under colonial rule. The paper will then explore the limitations and oppositions to these monuments, as they are perceived as partial and inadequate in addressing certain key questions and aspects related to British colonialism and the Kenyan fight for freedom from British rule.

2 UNSETTLED MEMORIES TURNED TO STONE CONTENTIOUS COLONIAL HERITAGE IN BELGIUM AND CENTRAL AFRICA

Vande Keere, Nikolaas (UR architects (Belgium); Faculty of Architecture and Arts, Hasselt University (Belgium))

The current attention to contentious statues and monuments is an international phenomenon. In many countries, national symbols associated with colonialism or slavery pose a critical challenge to heritage policy and management. Their artistic or historical value is often overshadowed by the perception of a negative iconographic role in contemporary society. As symptoms of the historical construction of national identity, however, the sculptures are only the tip of the iceberg. As expressions of propaganda, many buildings, sites or other (tangible or intangible) heritage objects can equally be labelled as contentious.

This paper places the debate in a broader perspective, beyond the current media attention and its overly ideological focus. By analysing different international examples, it examines and compares the existing strategies of restoration, adaptation and removal of monuments. By studying specific sites of colonial heritage in Belgium and Central Africa, it extends these strategies into a museological and architectural context. The latter is further elaborated through the research-by-design of two historical sites of colonial encounter developed by International Master students of Adaptive Reuse at the Faculty of Architecture and Arts of the University of Hasselt (Belgium).

The aim is to challenge the binary nature of the public debate and to explore the potential of the architectural practice of adaptive reuse and its growing discourse to contribute in a constructive way. Beyond reprogramming or defining new functions, adaptive reuse is able to repair and decolonise contentious heritage by mitigating some of its negative characteristics. How can adaptation and reuse generate new meanings for existing buildings that were designed and constructed according to social or political views that are now being challenged? How can a design-led approach to the built environment contribute to the (re)construction of a (new) identity? How can the unsettled memories turned to stone be activated in a positive way?

3 THE MATTER (AND MEANING) OF MONUMENTS. TALES FROM SARDINIA, AN "ITALIAN INTERNAL COLONY.

Panetta, Alessandro (Institute of History of Mediterranean Europe (ISEM), National Research Council (CNR))

This paper aims to address the Sardinian decolonial debate topic, by comparatively analyzing some monuments located respectively in the two largest cities of the island: Sassari and Cagliari.

In recent years, Sardinia has seen a public debate, relaunched by the explosion of the Black Lives Matter movement, centred on the symbolic legacy of the House of Savoy domination exercised on the island from the 18th century and especially in the 19th century. This debate has fuelled the idea of Sardinia as an Italian Internal Colony which continues to this day, even later to the deposition of the Savoy monarchy, replaced by the Italian republic.

Here we will address this complex and slippery topic through the reconstruction of the individual biography of the monuments which in different historical periods have been at the centre of public debate and disposal projects, and which have lived trajectories with somewhat different meanings depending on the era and the social, political or gender perspective of those who entered into a relationship with them.

In this sense, we want first to explore the possibility of applying a the (post-)colonialist theme of Historical Archaeology to an internal European case. Therefore, through the cases discussed here, we want to propose a reflection on the processes of selection and stratification, both material and symbolic, which affects monuments in their historical evolution, highlighting their continuities and discontinuities with previous (and subsequent?) dominations.

But, starting from their materiality, we also want to investigate other themes, highlighting what the active role of these objects has been during the various historical and social contexts they have crossed (therefore not only in the contested present), or what are the substantial differences between the monuments themselves and the other results of the Savoy presence in Sardinia (primarily buildings, but also public spaces, urban topography, etc.).

4 CONCRETE MEMORIES AS HERITAGE OF INFRASTRUCTURAL VIOLENCE

Breithoff, Esther (Birkbeck, University of London)

From 1954 to 1989, Paraguay endured the longest military dictatorship in the history of 20th century South America. Indigenous people in particular suffered immensely under General Alfredo Stroessner's authoritarian regime, as they were considered a hindrance to progress and modernisation. In a push for economic growth and agricultural development, Stroessner invested heavily in the development of the country's concrete transportation infrastructure. This included the construction of the Ruta Transchaco, Paraguay's longest highway - referred to by Indigenous people through whose territories it cuts as 'the endless asphalt snake' that 'is the beginning of the dispossession of the lands of the indigenous peoples at the hands of the whites'(www.tierraviva.org.py/). On October 7, 1991, almost three years after the country's tentative return to democracy, the only existing statue of Alfredo Stroessner was toppled outside the capital city of Asunción. This was followed by several years of debates over what to do with the almost five me-

tre tall and over a thousand-kilogram heavy alloy metal statue, until in 1995 artist and writer Carlos Colombino was granted permission to recycle what had become an effigy of repression into a monument of resistance. Today, a dismembered and fragmented Stroessner remains himself cast between two concrete slabs held down with metal chains inside the city's Plaza de los Desaparecidos, remembering Paraguay's 'disappeared' victims of state violence. Following a material approach, this paper uses the reconfigured monument of Stroessner as a type of countermonument that challenges the notion of 'concrete' as both physically and symbolically cementing ideas of progress and modernity. By doing so, it will discuss authorised monuments as part of a network of concrete material memories that show the social and ecological impacts of 'infrastructural violence' on communities and the environment.

5 THE ARMED FORCES OF THE SOVIET UNION IN THE CONTENT OF MONUMENTS IN POLAND AFTER WWII. FROM AFFIRMATION TO CONDEMNATION

Lawryniewicz, Olgierd (Institute of Archaeology, University of Lodz) - Krupa-Ławryniewicz, Aleksandra (Institute of Ethnology and Cultural Anthropology, University of Lodz) - Latocha, Sebastian (Institute of Ethnology and Cultural Anthropology, University of Lodz)

Since 2022, the research project "Lexicon of Katyn Archaeology (1990–2015)" has been carried out, the aim of which is to collect, systematize, archive and widespread information on Polish archaeological research of traces of the Katyn Massacre – the 1940 Soviet crime against 22,000 Polish prisoners of war. The scope of the planned research also includes a broad historical and cognitive context in which these studies can be reinterpreted today and new research possibilities demonstrated.

An important aspect of the ongoing research is the commemoration of the victims of this crime. When Poland was an Eastern Bloc country, this was not possible. The communist Polish authorities opposed any narrative that might undermine the contribution of Soviet armed forces to the liberation of Poland from occupation by Nazi Germany. The symbols of 'brotherly assistance' were therefore numerous monuments, street and square names, affirming the Red Army. The struggle to remember the victims of Soviet crimes was one of the most important grassroots motivations, which resulted in the removal of these propagandistic commemorations from public space after 1989. In their place began to appear commemorations of the victims of Soviet and communist crimes, including above all the victims of the Katyn Massacre.

In the paper, the authors will focus on presenting the results of their research based primarily on ethnographic interviews conducted mainly with the descendants of the victims. They show what is recorded in individual experience, in family memory; they talk about the practiced and postulated forms of commemoration. Researchers assume that this is a way of reaching not only individual memory and experience, but also the supra-individual resources that make up the particular community of discourse. This approach enables a dual reading – at the level of historical truth and narrative truth, in the perspective of communicative and cultural memory.

6 INSCRIBING SECTARIANISM: RELIGIOUS MONUMENTAL ARCHITECTURE IN POST CONFLICT ENVIRONMENTS

Hourani, Najib (Michigan State University; Department of Anthropology)

Over the last thirty years, cultural heritage, once a marginal concern in processes of post-conflict and post catastrophe reconstruction, has become a central concern, especially in the work of the post-conflict reconstruction complex (PCRC). Today, the international, bilateral and non-governmental institutions that constitute the PCRC, take seriously the role of archaeological sites, heritage architectures and historic urban districts in efforts to support transitions from extended moments of violence and war toward a positive peace. Drawing upon personal interviews, planning documents and a range of other primary sources, this paper explores the place of monumental buildings and their urban environments in the reconstruction of two war-torn cities, Beirut and Mosul. Through an examination of restoration of religious buildings surrounding Nijmeh Square in the Beirut city center and the Al-Nouri Mosque in Mosul, this paper asks how both the physical structures and the meanings they are meant to convey are transformed within operant discourses of heritage preservation. The final section of the paper draws out implications of dominant approaches to such heritage structures in other post conflict contexts in the region, with specific attention to ongoing planning processes in Syria.

7 A MONUMENTAL PARADOX. THE LIVORNO 'FOUR MOORS' BETWEEN LOCAL IDENTITY AND MEDITERRANEAN MIGRATIONS

Paolillo, Costanza (Bibliotheca Hertziana-Max Planck Institute for Art History; New York University)

My paper investigates the interplay between heritage preservation policies, local identity, and political discourse in contemporary Italy, focusing on the case of the 'Four Moors' monument in Livorno. The Tuscan free port city has been known as a space for the pluralistic cohabitation of peoples and religions thanks to special laws enacted by Ferdinando

I de' Medici soon after its foundation. However, the city's most iconic monument, dedicated to the Grand Duke, is a Renaissance symbol of Christian supremacy over Muslim and Black peoples, with four black enslaved male figures, writhing in a humiliating pose and manacled to the plinth. Nonetheless, the sculptural group soon became a landmark and thus the city's emblem, exposing a blatant paradox between the shared values underpinning local identity and its representation on public space.

I examine the contradictions surrounding Livorno's icon, surfaced during the global wave of Black Lives Matter protests in 2020. The monument square became the gathering point for several peaceful rallies of the Italian BLM movement, meant to raise awareness around the migration crisis in the Mediterranean. A large portion of the local community reacted by vehemently expressing concern about the preservation of the statue, drawing more attention to the monument than the protest itself. As a response, unlike what happened all around the world, the Four Moors underwent complete restoration thanks to a grassroots initiative, showing a unique collective attachment to the artwork.

Drawing on the analysis of media coverage and social media, I argue that the conservative responses towards the BLM protests that brought the community together were only possible because of a selective memory process. By obliterating any references to colonialism and the slave trade, Livorno's case demonstrates, on a local level, why Italy is failing to address racism effectively in public discourse on heritage.

226 MARITIME HETEROTOPIAS: NOVEL INSIGHTS INTO THE ARCHAEOLOGY OF MARITIME CULTURAL LANDSCAPES IN THE MEDITERRANEAN AND BEYOND

Session theme: 6. The Mediterranean from Within

Session organisers: Nakas, Ioannis (Centre of Hellenic Studies, Harvard University) - Krieger, Anja (Independent researcher)

Session format: Regular session

Heterotopia as a term was initially coined by Michel Foucault in the 1960s. According to his definition, a heterotopia is an "other space", an "enacted utopia", a place differing from its surroundings and serving a particular or possibly deviant purpose in society. Analyzing a space as such can prove to be a useful approach to examine and establish the context of places, while gaining a deeper insight into their purpose and role. The concept of heterotopias offers an ideal theoretical framework to study space and place in maritime cultural landscapes. Foucault describes ships as the perfect example of a heterotopia, since they houses a distinct society voyaging between coasts. Similarly, harbours can form specific spaces within maritime cultural landscapes, delineating the boundary between hinterland and foreland, the familiar and the unknown. These areas can be interpreted as distinctive meeting places for individuals from diverse backgrounds and origins. The entire maritime cultural landscape constitutes a border heterotopia, acting as a pathway bridging land and sea.

This session seeks to critically assess various notions of space and place in maritime cultural landscapes and invites case studies drawn from the Mediterranean and other regions, not limited to specific time periods. We invite contributions that explore heterotopias through a range of sources, including but not limited to archaeology, history, material analysis, textual sources, and art that address other places in maritime landscapes and seascapes: the sacred, the forbidden, the floating, the real, the imaginary, the in-between, and the ephemeral.

ABSTRACTS

1 IRRESISTIBLE ANALOGIES AND UNIVERSAL ADAPTORS: NEGOTIATING UNFAMILIAR LANDSCAPES AND MARITIME INTERCULTURAL CONTACT IN THE BRONZE AND IRON AGE MEDITERRANEAN

Yasur-Landau, Assaf (University of Haifa)

This paper will examine the creation of Mediterranean heterotopias as an adaptive process, facilitating human existence in conditions of uncertainty. It will present two interrelated phenomena in maritime adaptation in the Bronze and Iron Age Mediterranean, both connected with place making and both of which can be used to explore the boundaries between topos and heterotopia.

The first phenomenon is the adaptive urge to find familiar patterns in unfamiliar landscapes, reducing the dread of the unknown. Terrain and ecology similarities between areas of the Mediterranean often create an irresistible analogy, resulting in the superposition of well-known landscapes on the new ones, including transferring of place names, typology of landscape features and even mythology related to landscapes. An example of such a process is the spatial distribution during both the Bronze and Iron Ages of the iconography of the god with the fenestrated axe, standing on top of two sacred mountains overlooking the sea.

The second phenomenon is the role of maritime interface installations, among them harbour structures, storehouses and coastal shrines, serving as universal adaptors. These devices facilitate intercultural commercial contact and mobility and are read here as an architecture of inclusion, providing services and spaces for interaction. Examples of such architecture are the coastal shrines of Nahariya and Phylakopi, as well as ashlar architecture of the Phoenician homeland and its vast diaspora.

2 DESOLATE SHORES: LATE BRONZE AGE AEGEAN HARBOURS AS HETEROTOPIAS

Fuller, Elliott (University of Toronto)

Foucault's concept of the heterotopia as an "other space"—associated with marginality, crisis, and transition—offers a compelling framework for thinking about interaction in maritime spaces. Harbours, intuitively, represent quintessentially liminal areas and can thus provide fruitful ground for empirically investigating the concept of maritime heterotopias. I ground my analysis within the historical context of the Late Bronze Age Aegean, ca. 1700-1200 BCE, a period which achieved a high degree of economic and cultural connectivity enabled in part by a constellation of coastal anchorages along key trade routes that facilitated the movement of goods, people, and ideas. Through three case studies, I explore how harbours embody tension and contradiction in ways which make them distinctly "other." Firstly, they incorporated several economic activities which were central to the functioning of the Eastern Mediterranean world-system but whose operation was displaced onto marginalized maritime agents because of the risk, disrepute, and unpleasantness associated with them. These include metalworking, barter, and murex dye production. Secondly, harbours existed within several distinct temporalities—Foucault's "heterochronias." They were often imbued with permanent, monumental architecture, and yet they existed within a shifting, dynamic coastal landscape. This dynamism could alter the historical trajectory of these places dramatically, thus undercutting the very idea of continuity in an inherently unstable and liminal environment. Finally, harbours were transitional spaces, areas of encounter between maritime agents and their settled, land-based counterparts. These encounters brought with them the risk of delay, harm, and marginalization—therefore, they required mediation through acts of commensality and exchange. As spaces of encounter and mediation, harbours have produced distinctive lifeways and material culture. This study thus demonstrates the power of maritime heterotopias to challenge traditional notions of political economy, monumentality, and cultural purity.

3 THE HARBOURS OF THE GRECO-ROMAN ANTIQUITY AS HETEROTOPIAS. A NEW APPROACH ON THE HARBOUR REALITIES OF ANTIQUITY

Nakas, Ioannis (Centre of Hellenic Studies, Harvard University)

In 1967 Michel Foucault introduced the idea of heterotopia in a lecture he gave in Paris to a group of architects. He defined the heterotopia as an "other space", an "enacted utopia", and a place where "the other real sites that can be found within the culture are simultaneously represented, contested, and inverted". Various human spaces such as prisons, brothels, cemeteries and ships, were identified by Foucault as heterotopias. This rather sketchy account has thereafter provoked a 'disproportionately' large but equally fruitful discussion in humanities, particularly in urban studies, geography and anthropology and has included a long list of other spaces that can be considered heterotopias. It has promoted and is still promoting interdisciplinary approaches, disrupting established thought and eventually the construction of new relationships and approaches.

One space, which has not yet been discussed, however, as a heterotopia, is the harbour. Despite a series of characteristics of harbours that could place them well within the realm of a heterotopic analysis (centres of commerce and human interaction, meeting points, interfaces between the different worlds of land and sea etc.), harbours of antiquity have never been studied as heterotopias, neither by Foucault nor by any other scholar. This paper uses the harbours of the Classical Mediterranean as its main case study and explores the possibility of them being in any way heterotopias by suggesting a new approach to their realities, an approach based on their special and unique nature as human spaces and following the principles set by Foucault.

4 SETTLEMENT DEVELOPMENT AND LAKE-LEVEL CHANGES OF THE LAKE OF TIBERIAS, ISRAEL: PRELIMINARY RESULTS OF THE SOUTH TIBERIAS LAKE AREA PROJECT

Nantet, Emmanuel (University of Haifa)

On the shore of the Sea of Galilee and to the south of the city of Tiberias is a site comprising three structures. At its northern end is a remnant of a Byzantine city wall built on a W-E axis continued by a pier built of concrete extending eastward into the lake. This structure that extends beyond the city wall of Tiberias has been interpreted as either the most important and the largest preserved harbor of the Sea of Galilee or as a mere seawall. Although long neglected, it deserves closer attention since the concrete pier seems to have been built in an innovative construction technique that utilized wooden caissons. This construction method has been documented only in early Roman imperial maritime harbors and never in a lacustrine context, nor for the Late Byzantine and Umayyad periods. The excavation on the

inner and outer sides of the southern city wall contributes to a better understanding of the environmental challenges this half-submerged extension faced due to lake-level fluctuations. The presentation offers an overview of preliminary results from the first three years of this ongoing project that began in 2019, which combines land and underwater excavations. Also considered are future research perspectives on the relationship between the city of Tiberias and the lake.

5 UNITY AND DIVERSITY IN THE MARITIME CULTURAL WORLD OF THE LATE BRONZE AND EARLY IRON AGE EASTERN MEDITERRANEAN

Hulin, Linda (University of Oxford)

Harbours are acknowledged as powerful nodes within maritime cultural worlds: they bridge the gap between land and sea and act as both social, economic, and cultural petrie dishes and filters. They provide spaces where diverse agents, objects and ideas react to and with one another, while at the same time they act as filters, selecting and transferring innovations into and out of the hinterland. However, the very diversity that harbours represent has resulted in fuzzy thinking within the literature. Simple binaries are applied—maritime vs terrestrial, institutional vs individual, foreign vs local—and in so doing, real differences in maritime worlds are obscured. While increasing attention is being paid to the archaeology of fishing and its relation to trade, in practice the terms are often used interchangeably, as both occupy the same watery space.

How much then, is the shared experience of acting in the same waters, a justifiably unifying factor? Sailors who fish are surely not the same as fishermen who may occasionally trade and their relation to merchants is equally difficult to distinguish. There are common pragmatic requirements of sailing, but these are manifested in institutional and subaltern social networks that overlap in sailor's quarters in harbours and at interstitial points in between, where local relations with fishing villages may be significant.

This paper will consider the criteria for navigating the intersecting archaeologies of fishing, sailing and trade to be applied by project NISAME (Navigating Intersecting Social and Maritime Ecosystems in the Bronze and Iron Age Mediterranean), a large-scale mapping and data-gathering project (2024-2027).

6 MARITIMITY AND THE EMOTIONS OF THE SEA IN MYCENAEAN GREECE

MacDonald, Max (University of Southampton)

The maritime cultural landscape of the Mycenaeans has not been explored to the same extent as in other regions in the Late Bronze Age. Much of this is due to the lack of any major hallmarks of maritime cultures in mainland Greece, such as harbour infrastructure, evidence for fishing, or shipwrecks. This paper argues that a connection to the sea can still be understood in Mycenaean Messenia by thinking about the emotional and sensory impact the sea stimulates through its presence in the landscape, and its effect on material culture. Tuddenham's (2010) critique of maritime cultural landscapes questions where maritime culture stops, and suggests that rather than a dividing line between maritime and terrestrial culture, people's relationship to the sea might better be understood through the concept of maritimity. Maritimity can be conceived of as a gradient, the degree of the sea's impact on individuals and communities. By identifying the markers of Mycenaean maritimity, and exploring how these markers can highlight the emotional and affective relationships between people and the sea, this paper intends to refocus the discussion towards the phenomenological experience of the sea from the land. This paper explores the maritime world of Late Bronze Age Messenia by assessing the evidence for Messenia's maritime material culture for direct and indirect evidence of a relationship with the sea and the maritime world from across the region. It then undertakes computational, spatial, and visibility analyses to establish the presence of the sea in the landscape while reflecting on what the lived experience of the sea was like for the people living in Messenia during the Late Bronze Age.

7 SINOPE AND SISTER COLONIES NEXUS: EXPLORING MARITIME HETEROTOPIAS AND CULTURAL INTERCONNECTEDNESS IN THE BLACK SEA THROUGH COMMON COIN TYPES

Mentesidou, Eleni (International Hellenic University)

Sinope, known as the inaugural Greek settlement on the southern coast of the Black Sea, occupies a pivotal geo-strategic position. The Milesian apoikoi strategically selected a site on a narrow isthmus, flanked by natural harbors, positioned at the heart of the Black Sea, equidistant from Bosphorus and Colchis, and directly opposite the Crimean Peninsula. The city's unique geographical and morphological features dictated its maritime orientation, propelling it to become the foremost trade center in the region. Consequently, Sinope owes its birth and existence to the sea.

Istria and Olbia, Miletus' other notable Black Sea colonies, exhibit parallels with Sinope in terms of foundation, maritime character, and cultural tradition. Despite these similarities, the extent of interconnectedness among the three colonies remains insufficiently explored. An intriguing avenue for investigation emerges through the shared use of a

significant symbol on their main coin types: the eagle with the dolphin, reflecting the centrality of the Zeus cult in the colonies' religious life.

The three Milesian colonies, Sinope, Isthria, and Olbia, existed as distinct enclaves within diverse population. This paper aims to delineate the heterotopic nature of these colonies. The exploration of the Zeus cult, particularly the Zeus Ourios cult, proves crucial in understanding the shared cultural landscape of the Milesian colonies. Furthermore, the study explores the role of the Hieron of Zeus Ourios on the Bosphorus, serving as a landmark for those entering the Black Sea, and its contribution to shaping the heterotopia of the three Milesian maritime-oriented colonies.

8 HETEROPOIAS OF THE COASTLINE: DYNAMICS OF TRANSFORMATION IN THE MEDITERRANEAN COASTAL LANDSCAPE THROUGH A RESEARCH PROJECT ON ROMAN MARITIME VILLAS

Cataldo, Concetta (Università di Catania)

"Roman Villas Shaped Nature" (M. Zarmakoupi 2018, 85 - Landscape at the "Villa of Poppaea" (Villa A) at Torre Annunziata, in A. Marzano, G.P.R. Métraux (eds.), *The Roman Villa in the Mediterranean Basin: Late Republic to Late Antiquity*, Cambridge, New York 2018, 85-96) demonstrates how Romans transformed coastal landscapes by constructing maritime villas from the late 1st century BC through late antiquity. This methodological approach combines archaeological analysis with Foucault's heterotopia theory to interpret maritime villas as spaces of alterity that mirror the internal tensions and contradictions of Roman society. Contrary to their depiction in literary sources as inutiles, these villas housed productive spaces and sources of income, depicting scenes of activity tied to marine resource exploitation. In some instances, these activities overlapped with descriptions of traditional rustic villas, esteemed in Roman agricultural literature.

Roman engineering prowess managed to tame the ruggedness of cliffs and coastlines, allowing villa owners to harness a new kind of fundus comprised of water and sea. This study on the microcosm of Mediterranean maritime villas is part of a doctoral research project in Sciences for Heritage and Cultural Production at the University of Catania, funded by CHANGES - Cultural Heritage Active Innovation for Sustainable Society - SPOKE 6 (supervised by Prof. Daniele Malfitana), aiming to define one or more architectural typologies of Mediterranean Roman maritime villas. The research will explore these constructions' role in creating "other spaces" beyond traditional urban and rural settings, through an interdisciplinary approach that integrates archaeology, architectural history, literary sources, and economic studies. The management of the digitized data from this research will be incorporated into an interoperable platform for the scientific community. Maritime villas serve as interfaces between land and sea, daily productive life and spaces for contemplation and otium, embodying Foucault's concept of heterotopic qualities.

9 DIGITAL ECOSYSTEM FOR MARITIME CULTURAL LANDSCAPE RECONSTRUCTION IN SOUTH-EASTERN SICILY

Martinez, Gianluca (Università degli studi di Bari Aldo Moro)

The Mediterranean sea has always represented an ideal context for development of complex cultural systems. Societies of all eras that have sailed its waters have left material traces of their ways of living the sea. What we find today are the scattered signs of a maritime cultural landscape that has stratified over the centuries. Since ancient times the south-eastern Sicily's sea and shore are characterized by the presence of numerous port call, natural and artificial harbor as well as for the numerous presences of wrecks from all eras, which testify an uninterrupted use from the classical era to the present day. Different studies have suggested the presence of a coastal landscape, characterized by a scattered settlement and various little landings, that highlights a widespread attendance of the maritime space. This paper proposes an in-depth investigation of the maritime cultural landscape along the south-eastern coast of Sicily, focusing on the area between the ancient Greek settlement of Kamarina and the modern tourist destination of Marina di Ragusa. Employing modern technologies and a holistic GIS-based approach, the objective is to analyze and narrate the evolution of this landscape. Utilizing geographical, archaeological, and historical data, along with new photogrammetric and survey records, the intention is to model maritime activity areas and analyze the relationships between submerged and coastal sites. The methodology involves creating a digital ecosystem, integrating data from various sources for a global, comprehensive understanding of the maritime landscape. The project aims to move beyond the traditional approach of considering the sea as a two-dimensional space with isolated findings, proposing instead a perspective of the sea as an inhabited place.

10 PIRATE SHIPS AS HETEROTOPIC SPACES: TRANSFORMING DYSTOPIAN -SCAPES IN THE 12TH CENTURY BCE

Hitchcock, Louise (Independent Researcher)

At the recent international Aegean conference on the theme of water resources, I discussed the role of maritime activity in creating a Late Bronze Age agoracracy. An agoracracy is made up of trading systems competing with others, and incentivized by market forces. Composed of ships, harbors, and centers these locations can be regarded as heterotopias, that is other spaces bringing the Mediterranean together through globalized trade in indispensable commodities and technology transfers. With the developing wealth of this era, sea lanes were protected and political tensions were ameliorated by diplomacy and royal gift giving known through the Amarna letters, with occasional instances of piracy as recorded in Ugaritic texts.

By the 12th century BCE, this system was on the brink of collapse. It was a period where ruling elites shared more in common with each other than with the populations they ruled over. Elite power was maintained through the provision of imported goods and feasts, and the manipulation of symbols. Propaganda formed a visual language within these societies and information was guarded by the scribal classes in each. They became dystopias through their political decay. The alienated populace eventually found refuge through populist revolt, turning to the heterotopic spaces of pirate ships. Their growing numbers are illustrated through mixed tribal groups collectively known as the "Sea Peoples." This paper will discuss how through the pillaging of many Bronze Age island and coastal centers, globalization was reversed, resulting in new Mediterranean societies that characterized the Iron Age.

11 THE HETEROTOPIA OF DOLIA CERAMIC VESSELS: A REASSESSMENT OF THEIR MARITIME ROUTES AND HISTORY

Iossifidis, Thomas (University of Thessaly)

The dolia were the largest known storage clay containers in antiquity. They first appeared in the 4th c. BC in Gaul, although it is proposed that their provenance is the Caucasus region. Between the 2nd half of the 1st c. BC and until the middle of the 3rd c. AD they were used as tanks in the cistern-boats, the first merchant ships to transport bulk wine in the western Mediterranean. It is confirmed that the Roman tankers transferred inexpensive wine of average quality from the Tyrrhenian Sea to the Hispania Tarraconnensis province. These unique and innovating vessels became surrounded by legend due to their obscurity, since our only sources of knowledge are the, limited in numbers, wrecks. The key finding of identifying a wreck as "cistern-boat" are the preserved submerged dolia. However, it is difficult to clarify whether the dolia found underwater were indeed contained in a specialized cistern-boat or just belonged to a merchant ship transferring them as cargo. The finding of submerged dolia in several sites of the Adriatic Sea and the rumours of immersed dolia in the waters of Magnesia region in Greece have raised expectations about new alternative maritime routes of the ceramic vessels. The development of the dolia was interwoven with the boats that carried them. The intention of the author is to try to provide a new perspective on the dolia heterotopia by unravelling their evolution as a result of being a boat cargo in a relentless progression to maritime spaces.

12 MARITIME CULTURAL LANDSCAPE OF THE BAY OF KOTOR CASE STUDY: SHIP GRAFFITI FROM ST. TRYPHON'S CHURCH

Celebic, Jelena (Koc University)

Ship graffiti are an international phenomenon and these engravings depict a vast variety of vessels from a vast chronological range. Ships have clear connections to ecclesiastical sites in which these representations are often found. As Foucault argued, there is a strong dichotomy between sacred and profane places. His term "heterotopia" describes at the same time the place of real and unreal existence that is usually not freely accessible, the entry is compulsory, or the individual needs to submit to rites and purifications. This notion could explain the location of ship graffiti in churches, i.e. in places with a strong sacred connotation. In addition, his definition of a ship as "floating piece of space, a place without a place", makes it heterotopic place par excellence.

As part of my research on the maritime cultural landscape of the Bay of Kotor (Montenegro), I will present ship graffiti in the church St. Tryphon in Moringj, so far the only examples known from the region. I recorded these engravings (made photogrammetry models, and traced the features from the photographs in Rhino software) and consulted data from the Historical Archive of Kotor to compare them with ship types used in the area in the 17th and 18th centuries.

Considering the development of the maritime trade in the Bay of Kotor between the 15th and the 18th centuries, it is indisputable that ships were of vital importance for this entire region and its hinterland. By studying these ship graffiti and other ship representations from churches from the Bay (e. g. ex voto tablets with ship representations from the church of the Our Lady of the Rocks), I will try to answer a challenging question: can we identify any particular ship type from these representations? And what did these representations mean to those who made them?

THE MULTIPLE HETEROTOPIAS OF A SHIPWRECK SITE: THE CASE OF THE NISSIA SHIPWRECK, CYPRUS

Demetriou-Patsalidou, Anna (Cyprus Marine and Maritime Institute (CMMI)) - Demesticha, Stella (University of Cyprus)

The Nissia shipwreck, site is located at -28m, less than a mile off the coast of Paralimni, Cyprus. Two excavation seasons have provided evidence for a preliminary assessment of the site: a) the ship's function remains uncertain, as no cargo has been preserved; b) the artifacts that have been recovered provide glimpses on life on board: a considerable amount of wooden poles and firewood, four cannons and very few pottery vessels, that probably belonged to the crew; c) the ship must have been of considerable size (possibly longer than 30m) and operated in the eastern Mediterranean, at least before it sank. Still, the wood species analysis indicate associations with north Europe; d) The wreck has been dated to the 18th century based on the type of the pottery, as well as dendrochronological and C14 analysis of organic remains.

Given its easy accessibility, the shipwreck has been engaged for decades into interactions and constant negotiations with contemporary society (i.e. divers and fishermen). In order to investigate further its social links, an ethnographic survey was conducted along with the excavation, aiming to explore the distinct engagements and practices developed around the Nissia shipwreck by the maritime-oriented communities active in the area.

This paper discusses the particular character of the Nissia shipwreck site not merely as a static site that preserves the tangible remains of the ship, but also as a place of the present. We are going to unfold the diverse and often competitive pursuits developed around the site, which often develop independently from their cultural and historical importance. Our aim is to address the multi-levelled, relational, and fluid qualities of the socio-cultural heterotopic space of ancient shipwrecks, where established relations are characterised by their own social dynamics, rules, and processes.

TALES OF DISCOVERY: DEVELOPING NEW NARRATIVES THROUGH DIGITAL TWINS AND OPEN LINKED DATA

Pink, Jack (Centre for Maritime Archaeology, University of Southampton) - Pedrotti, Felix (Southampton Marine and Maritime Institute, University of Southampton) - Hammant, Henrietta (Department of Archaeology, University of Reading) - Grant, Michael (Ocean and Earth Science, National Oceanography Centre, University of Southampton)

RRS Discovery holds a significant place in the annals of Antarctic exploration. Led by Commander Robert Falcon Scott the ship's inaugural expedition (1901-1904), including notable figures such as Ernest Shackleton and Edward Wilson, provides invaluable resources for environmental, biological, physical, and archaeological research. However, over time the stories and materials of the ship have been dispersed among various UK institutions including Dundee Heritage Trust (DHT), National Oceanography Centre Southampton (NOCS), and Scott Polar Research Institute (SPRI). The result is a fragmented scientific narrative, which is difficult for the public to access due to issues of limited public knowledge of the collections, restricted geographic spread, mobility, and financial constraints.

To address this disarticulation, the University of Southampton has embarked on a project in collaboration with the DHT, NOC, and SPRI. This project presents a refined understanding of one of the United Kingdom's most significant scientific research vessels, documenting its changing life and purpose over more than a century. By combining 3D recording tools, cutting-edge processing techniques, and the latest approaches to linked-open data, our research reunites a significant collection spread across three organizations and develops a multi-disciplinary approach driven by archaeological, historical, and scientific understanding. Our multi-layered approach illuminates complex fragmented collections and highlights how objects, documents, and people are related, engaging the public with new archaeological narratives.

While this project spans a wide array of disciplines, this paper will focus on the novel approach to creating Linked Data of a research vessel, its objects, people, and stories, and their integration with Mixed Reality media. This combination will demonstrate how RRS Discovery's collection has been unlocked, explored, and presented, deploying new archaeological narratives from the ship and its material culture, contributing to ongoing debates in the field and having practical implications for STEM education.

MEGALITHS AND THE COMMUNITY: OPPORTUNITIES AND CHALLENGES OF COMMUNITY ENGAGEMENT IN THE MANAGEMENT, PUBLIC PRESENTATION, AND PROTECTION OF NEOLITHIC LANDSCAPES

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Jameson, John H (ICOMOS ICIP/ ICAHM; U.S. National Park Service, Retired) - Sebire, Heather (English Heritage)

Session format: Regular session

UNESCO's updated Operational Guidelines on managing World Heritage sites are useful as an advisory guide for interpretation and community engagement across many types of sites and landscapes. The objectives are to: a) enhance capacity building and research; b) raise general public awareness, understanding, and appreciation of the need to preserve cultural and natural heritage; c) enhance the function of World Heritage in the life of the community; and d) increase equitable, inclusive, and effective participation of local and national populations, including indigenous peoples, in the protection and presentation of heritage. An important element in any interpretation scheme for long-term sustainability is the effectiveness of its community engagement programmes. Our proposed session aims to augment our EAA 2023 session that focused on the public interpretation and presentation of Megaliths with case studies that address the broader landscape with attention to community involvement in both private and public spheres. The goal is to provide a wide geographic scope of exemplary case studies as a basis for developing an ICOMOS-endorsed best practices document. We also plan to use these best practice examples to create an edited volume that will be informative and useful for both professional and public audiences.

Papers will address topics such as:

- 1) Roles that Megaliths and Neolithic landscapes play in shaping the identity of local communities, recognizing public values of the resource, and supporting the local economy as a driver for tourism;
- 2) Examples of community engagement in developing effective management strategies for public interpretation, conservation, and protection;
- 3) Examples of enhanced stakeholder involvement in cooperative relationships among special interest groups, local government, and non-profit organizations in fostering effective protection of natural and cultural features of the landscape;
- 4) Case studies on the interpretation of Megaliths in their landscapes, not just in World Heritage sites, but in any context.

ABSTRACTS

1 THE ESSENTIAL ROLE OF COMMUNITY ENGAGEMENT IN THE MANAGEMENT AND PUBLIC PRESENTATION OF NEOLITHIC LANDSCAPES

Jameson, John H (ICOMOS) - Sebire, Heather (English Heritage)

In keeping with UNESCO's updated Operational Guidelines on managing World Heritage sites, the effectiveness of community engagement programmes plays a key and indispensable role in developing long-term sustainability for effective public interpretation schemes. The papers from this session will augment our EAA 2023 session that focused on public interpretation and presentation of Megaliths and broader Neolithic landscapes with a focus on community involvement in both private and public spheres. The goal is to provide a wide geographic scope of exemplary case studies as a basis for developing an ICOMOS-endorsed best practices document, as well as to provide best practice examples for an edited publication that will be useful for both professional and public audiences. These examples demonstrate differing approaches to public audience and stakeholder interactions in defining and promoting the protection, appreciation, and public use and enjoyment of Neolithic landscapes that have global application to a great variety of heritage sites.

2 WORLD HERITAGE FOR ALL? ASSESSING ACCESSIBILITY AMBITIONS IN WH NOMINATIONS

van den Dries, Monique (Faculty of Archaeology, Leiden University)

UNESCO strongly encourages community engagement and social inclusion in its policies. It states in its thematic factsheet on social inclusion 'Access to and participation in cultural life have long been appreciated as crucial elements in enhancing well-being and creating a sense of belonging and shared identity' (UNESCO, n.d.)¹. No exception is being made for heritage sites which are acknowledged as locations of outstanding universal value. No exceptions are being made for any of us. It endorses the United Nations mission to 'leave no one behind' (United Nations 2017) and considers it 'crucial to create an environment that favours the inclusion and empowerment of persons with disabilities

so that they can live to their full potential and make a meaningful contribution to society' (UNESCO, n.d.)². What does this mean for World Heritage listings? In this paper, we will look at the degree to which the theme of social inclusion and 'accessibility for all' plays a role in contemporary nominations for World Heritage sites.

² <https://en.unesco.org/themes/access-persons-disabilities>.

3 THE MAYOR, MEGALITHS AND ME: CHANNELLING MASS ECO-TOURISM AND PRESERVATION IN A UNESCO GLOBAL GEOPARK BY CREATING SHARED OWNERSHIP

de Roest, Karla (Hunebedcentrum, Head of Education; Groningen Institute of Archaeology, University of Groningen)

Every year around 250.000 people have their photos taken next to the largest dolmen (Dutch: hunebed) of the Netherlands. The adjacent scientific archaeological museum (the Hunebedcentrum, Borger) hosts around 85.000 paying visitors, including many pupils as megaliths represent prehistoric farmers in the Dutch curriculum.

The museum is a non-profit organisation with a clear mission: raising awareness and activating the public in protecting all prehistoric monuments in the province of Drenthe, where most of the megaliths are situated. The majority are located in nature preservation areas on the Hondsrug, which is a unique landscape formed by the Ice Ages and therefore a UNESCO global Geopark. Many megaliths are indeed themselves mini-ecosystems hosting unique species of lichens.

The challenge the museum faces, is to channel interests of national and regional political stakeholders, local residents and entrepreneurs, nature conservation groups - and the mass public attracted by the promotion slogan of the province that invites people to come experience prehistoric times. The aim is thus not only to raise awareness, but striving to create ownership for this unique geological and prehistoric cultural landscape in groups and individuals.

I showcase how the Hunebedcentrum achieves this while adhering to fair practice governance in a sustainable way. The message is addressed through, amongst others, heritage education and hands-on workshops for varied backgrounds; living history (EXARC-member) in a re-enactment park; a permanent archaeological excavation; and a native tiny forest. Hereby, the museum works closely together with stakeholders and maintains an expanding national and international network of partnerships. To effectuate its goals, the Hunebedcentrum relies on its approximately 160 volunteers.

The museum invites the public according to the FARO-treaty, giving you and me the change to actively participate in heritage from a bottom-up approach from a young age. And fortunately, the mayor loves megaliths.

4 COMMUNITY ENGAGEMENT WITH MEGALITHIC MONUMENTS: THE IRISH EXPERIENCE

Gleeson, Pauline (National Monuments Service; Department of Housing, Local Government and Heritage) - Breen, Claire (National Monuments Service; Department of Housing, Local Government and Heritage)

Megalithic tombs are Ireland's oldest surviving monumental stone structures and provide a tangible link to our ancestors. There are four distinct types of megalithic tombs in Ireland: portal tombs, court tombs, passage tombs and wedge tombs. Some of the most spectacular examples of megalithic tombs are classified as passage tombs and these tend to be found in concentrations known as cemeteries. There are four large passage tomb cemeteries in Ireland, Loughcrew and the Boyne Valley in Meath and Carrowmore and Carrowkeel in Sligo.

Some of the more well-known megalithic monuments, such as the passage tombs at Newgrange, Knowth and Dowth, within the UNESCO World Heritage Property of Brú na Bóinne, are managed by the State and are visited and enjoyed by the public. Other megalithic monuments are located in private ownership on farmland and in many cases these are also very visible within the landscape. Whether in private or public ownership, megalithic monuments play a significant role in our shared identity and for local communities they are part of their daily life and sense of place. Often there is a wide range of stakeholders for whom the monuments hold particular meaning and value. This paper examines how, when and why the public and communities engage with megalithic monuments and Neolithic landscapes in Ireland. What can we learn in terms of how this heritage is valued among the various communities and stakeholders and importantly what are the steps that need to be taken to ensure meaningful engagement with those communities in the management, public presentation and protection of these monuments.

5 A TIMBER CIRCLE AND HENGE IN A MODERN LANDSCAPE: COMMUNITY ARCHAEOLOGY AT ARMINGHALL HENGE, NORWICH, NORFOLK, UK

Hutcheson, Andrew (University of East Anglia)

Wing Commander Gilbert Insall unexpectedly discovered and photographed Arminghall Timber Circle and Henge on the edge of Norwich in 1929 while out flying, looking for crop marks. Soon after, in 1935, Graham Clark recognised

that the monument and its associated landscape was threatened by the development of infrastructure serving the growing city. We returned to undertake fieldwork at the site in 2022 with a group of volunteers and professional archaeologists. Clark's work acted as a template and an inspiration. During the work the participants formed a community focused on adding to Clark's work and understanding the monument in its landscape. Archaeological research, art, well-being and public involvement led to wider re-engagement with this much altered ancient landscape. Such work is necessary to foster attitudes of stewardship and create the conditions for people to value and enjoy ancient landscapes. There is no doubting the fascination that these places engender, but without archaeological information, projects of investigation and appropriate public engagement work they remain inaccessible.

6 WHAT ARE WE LOOKING AT? THE CHALLENGES OF ENGAGING WITH, PRESENTING AND PROTECTING NEOLITHIC ASTRONOMICAL SITES IN THE STONEHENGE LANDSCAPE

Chadburn, Amanda (Bournemouth University, University of Oxford, EAA Executive Board (2020-23))

Many people will be aware of the annual summer solstice celebrations at Stonehenge, but will be less aware that there are a number of other archaeological sites in and around the Stonehenge World Heritage Site which were apparently designed in relation to the heavens*.

Although the astronomical importance of the World Heritage Site is recognised as one of its "attributes" of Outstanding Universal Value by UNESCO, skyscape archaeology - the relationships between material culture, the sky and society - is often poorly understood. Even less thought has been given as to how the astronomical importance of these sites can be interpreted and protected in a landscape setting, despite its importance to UNESCO.

8 or 9 sightlines for observing the sun and moon have been identified in and around the Stonehenge World Heritage Site* some, but not all of them, relating to megaliths. Essentially, these are precise, narrow views out from the Neolithic sites to particular points in the landscape. This paper will explore these views and how they might be protected and interpreted, with especial reference to Woodhenge where the sightlines are particularly well preserved. The challenges of engaging communities in this will be explored.

Finally, 2024 and 2025 are major lunar standstill years - those years where the moon will rise/set in its most northerly and southerly positions in the landscape around Stonehenge, due to the 18.6-year cycle of the Moon. At Stonehenge, sightlines to view the moon at these rare celestial events may have been designed into the megalithic architecture of the monument. I will briefly discuss community engagement at Stonehenge in relation to these lunar sightlines and the major standstill events in 2024.

7 FORMATIVE MONUMENTAL LANDSCAPES IN THE ATACAMA DESERT THROUGH MOVABLE AND NON-MOVABLE THINGS (TARAPACÁ, SOUTH-CENTRAL ANDES)

Uribe, Mauricio (Universidad de Chile)

The dynamics of complexity in human societies inhabiting the Atacama Desert during prehistoric times have traditionally been addressed through a Neolithic model applied to local instances (Formative Period). These approaches have relied on progressist and linear conceptualizations, framing the Formative as an outcome of economic "achievements," such as agricultural development and the adoption of a village way of life. However, current archaeological research has challenged these conventional narratives. Not only have new interpretive perspectives come to the fore, but the material evidence itself bears witness to heterogeneous historical trajectories, enabling critical understandings of these local social complexities.

To further contribute, we present an archaeological study of a Monumental Landscape actively constructed from the Formative Period onward (3000 - 400 AP) in the Pampa del Tamarugal, South-Central Andes. Specifically, we focus on a Formative Monumental Complex situated in the driest desert in the world, named Iluga Túmulos. This is an archaeological assembly of hundreds of tumuli set in thousand hectares of raised fields, representing the establishment of social spaces that diverged from those of Archaic periods and extended to Inca times. This complex comprises formative villages and an exceptional cemetery, accompanied by ancestral and novel technologies and materialities. Within these frameworks, we detail our results in examining the movable and immovable materials characterizing these social expressions over time.

Alongside the Longue Durée exploration of this case, we delve into the micro-historical trajectories undergone by these societies. Our findings indicate that the transformations emerging from the Formative period onward are not solely ecological and economic. This allows us to address global processes of social change while acknowledging the existence of subjective and heterogeneous stories shaped by locally established sociopolitical relationships. Instead, people signified and re-signified the novel ways of experiencing the world, serving as the foundation for formative and subsequent transformations.

8 BENEFITS AND CHALLENGES TO MULTISCALAR PUBLIC ENGAGEMENT SURROUNDING THE CALLACPUMA MEGALITHIC PLAZA IN THE NORTHERN PERUVIAN ANDES

Toohey, Jason (University of Wyoming) - Murphy, Melissa S. (University of Wyoming) - Chirinos Ogata, Patricia (University of California-Santa Barbara)

The Callacpuma archaeological complex in the Cajamarca Valley of northern Peru has been the subject of investigation since 2015. Recent publication of preliminary dates and analyses of a 3750-year-old megalithic circular plaza on the summit of the site has brought this plaza and its surrounding archaeological landscape rapidly increasing attention by multiple stakeholding groups at varying scales in the local and national communities. Although the monumental plaza has probably always been known to some members of the nearby community, its recent local, national, and international press has created both new opportunities for community engagement, and new potential threats from increased visitation and by potential looters. The recent uptick in attention paid to the site is illuminating the wide range of public perceptions and interests related to the importance of the site culturally, symbolically, and perhaps economically at various scales. Concomitant with these developments is an increase in awareness and action on the part of the archaeological project in terms of community engagement, education, and collaboration on several fronts, balancing an increase in public engagement with an increased focus on site preservation.

247 ESSENTIAL OR ESSENTIALIST: SEX AND GENDER CATEGORIES IN ARCHAEOLOGICAL INTERPRETATION

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Arnold, Bettina (University of Wisconsin Milwaukee) - Rebay Salisbury, Katharina (University of Vienna)

Session format: Round table (without formal abstracts)

In Europe, gender archaeology has tended to operate by differentiating between the concepts of biological sex – male/female as the basis of our reproductive system, and gender – the cultural elaboration of sex-based differences between men and women. It has long been recognized that neither sex nor gender are strictly binary, and archaeological evidence has demonstrated decisively that non-binary gender variation was present in many past human societies. However, an emerging trend to negate the existence of biological sex and conflate it with gender has called archaeological and bioanthropological practice into question. In a recent case two major professional organizations in the US and Canada have argued that archaeologically recovered bodies should not be assigned a biological sex based on morphological or genetic characteristics, and studies of past identity that distinguish between sex and gender should no longer be undertaken or presented in academic conference settings. In this roundtable, we would like to discuss methodological, theoretical and societal shifts in the meaning(s) of sex and gender, and debate how we can constructively advance gender archaeology under these complex and often contentious conditions.

248 LITHICS, FAUNA: LET THEM REFIT!

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Lamotte, Agnes (University of Lille France) - Wenban-Smith, Francis (University of Southampton) - Mathias, Cyrielle (Institute of Archaeology, Tel Aviv University)

Session format: Regular session

In the study of Palaeolithic sites, use of refitting as part of lithic and faunal analysis remains patchy, although has a long history and is becoming more widespread. Practical difficulties may affect its application such as time, resourcing and space, but it is an important technique for studying lithic and faunal remains, both during and after excavation. For site integrity, refitting can clarify the extent to which the material from different stratigraphic units can be treated separately, or should be grouped together. And then from a taphonomic perspective, the degree and patterning/length of refit connections can lead to understanding of site formation processes, and the degree to which intra-site distributions of material may relate to depositional and/or post-depositional disturbance or behaviour. After allowance for taphonomy, faunal and lithic refitting can help identify site function and specific intra-site activity areas, providing insight into specific activities of the past and details such as the number of hunted animals, the movement of faunal remains or lithic tools within a site and the relationship between different site areas. Refitting also has a vital role to play in technological and typological analysis, providing a more complete understanding of knapping strategy, typological profile and the chaîne opératoire than can be achieved from studying artefacts separately. For sites with varying raw materials, refitting can help demonstrate how raw material characteristics influenced the knapping chaîne opératoire, and show choices made by the knappers to overcome problems. This session will cover all periods of the Palaeolithic, with the aim of highlighting the importance of refitting as a specific archaeological method, that contributes to understanding past societies, depositional and post-depositional processes, unlocking on-site behaviour and

complementing technological and typological analysis. We welcome papers that highlight applications of lithic and/or faunal refitting, or provide discussion of its potential or pitfalls.

ABSTRACTS

1 CONTRIBUTION OF LITHIC AND BONE REFITS TO THE COMPREHENSION OF OCCUPATIONAL LEVELS AT LA CAUNE DE L'ARAGO (TAUTAVEL, FRANCE)

Capellari, Félicien (Muséum National d'Histoire Naturelle, HNHP, UMR 7194) - Giuliani, Carla (Aix Marseille Université, CNRS, Ministère de la Culture, LAMPEA, UMR 7269) - Grégoire, Sophie (Muséum National d'Histoire Naturelle, HNHP, UMR 7194; Université de Perpignan Via Domitia) - Magniez, Pierre (Aix Marseille Université, CNRS, Ministère de la Culture, LAMPEA, UMR 7269) - Moigne, Anne-Marie (Muséum National d'Histoire Naturelle, HNHP, UMR 7194) - de Lumley, Henry (Institut de Paléontologie Humaine)

Faunal and lithic refitting provides a better understanding of site formation processes and the disturbances affecting them, thus improving interpretations of Palaeolithic assemblages. At La Caune de l'Arago cave (Middle Pleistocene, Lower Palaeolithic, Tautavel, France), joint analyses of fauna and lithic artifacts have been conducted, along with systematic attempts of refits. These analyses focus on three archaeo-stratigraphic units corresponding to glacial and interglacial periods, each exhibiting distinct lithological characteristics that facilitated their individualization during excavation: levels L, K (MIS 14) and J (MIS 13). Levels L and J include the majority of the material and reflect different occupations modalities by human groups alternating with carnivore occupations. During MIS 14, reindeer (*Rangifer tarandus*) exploitation predominated. In contrast, during MIS 13, red deer (*Cervus elaphus*) and fallow deer (*Dama roberti*) were the primary prey of human groups. Depending on raw materials, knapping activities either took place on-site or were carried out from elsewhere and tools were directly brought into the cave.

Our study is based on 158 bones refits and 83 lithic refits and allow us to confirm the validity of these archaeo-stratigraphic units as well as perceive the post-depositional processes that might have disrupted them. The spatial analysis enables the documentation of lithic production activities and in-situ carcass processing, including dismemberment, disarticulation, and bone fracturing. Thus, the comparison of intra- and inter-level refits enhances our understanding of cave occupation patterns by Hominins and Carnivores in changing climatic contexts during Middle Pleistocene.

2 BETWEEN FLINT AND MAMMAL BONE REFITS: A DOUBLE SPATIAL MIKADO GAME AT CAGNY-L'ÉPINETTE

Peudon, Floriane (Aix Marseille University, CNRS, LAMPEA, UMR 7269, Aix-en-Provence, France) - Lamotte, Agnès (University of Lille, CNRS, HALMA, UMR 8164, Villeneuve d'Ascq, France)

It is acknowledged that bone and lithic refits constitute suitable complementary tools to address site archaeostratigraphy and site formation processes. However, there are few sites – especially Lower Paleolithic ones – where both lithic artifacts and faunal remains have been refitted, making detailed combined spatial analyses of the two even rarer.

Therefore, possessing both flint and mammal bone refits, the Acheulean open-air site of Cagny-l'Épinette (Somme Valley, France) has provided a rare opportunity for their simultaneous spatial analysis. The refits have been included in the first site-wide multidisciplinary analysis of the assemblages embedded in fluvial deposits (MIS 9), rich in thousands of flint artifacts and faunal remains. Several criteria were assessed for both lithic artifacts and faunal remains, as individuals and as part of refittings: grain-size, orientation patterns, surface alterations, breakage patterns, anthropogenic marks and skeletal part representation.

Our analysis has brought new conclusions to the decades-long debate on the archaeostratigraphic division of the Acheulean assemblages and their taphonomic status. This paper presents the contribution of refits that helped to demonstrate the presence of a single, primary context archaeostratigraphic level. We discuss how, when combined with multidisciplinary data, refits have proved to be a determining tool for identifying the different agents, natural and anthropogenic, involved in the site formation and in assessing their role in any movements. Our research highlights the informative potential of refits, essential in any Pleistocene site formation analysis, thus encouraging us to engage more in the, unfortunately time-consuming, task of refitting.

3 BEYOND LAYERS: UNDERSTANDING DEPOSITIONAL AND POST-DEPOSITIONAL PROCESSES IN MAS DES CAVES (MIDDLE PLEISTOCENE, FRANCE) THROUGH BONE AND LITHIC REFITS

Giuliani, Carla (Aix-Marseille Université, CNRS, Minist. Culture, LAMPEA, UMR 7269) - Mathias, Cyrielle (Centre de Recherche Français à Jérusalem (CRFJ), USR 3132; Muséum national d'Histoire naturelle (MNHN), CNRS, HNHP, UMR 7194) - Magniez, Pierre (Aix-Marseille Université, CNRS, Minist. Culture, LAMPEA, UMR 7269) - Brugal, Jean-Philip (Aix-Marseille Université, CNRS, Minist. Culture, LAMPEA, UMR 7269)

The Mas des Caves (Lunel-Viel, France) deposits (cave 1 or LV I) have yielded abundant and diversified faunal assemblages, with characteristic late Middle Pleistocene taxa – Hyaena, Canis, Haploidoceros, ... (Brugal et al., 2021) – in association with an early Middle Palaeolithic lithic assemblage. Prior studies showed that mammal bones were primarily accumulated by hyaenas. Moreover, first bone and lithic refits had called into question the validity of previously established layers. In fact, several origins and modifying agents are suspected – natural, non-human and human predators – resulting in mixtures (amalgam/palimpsests) that need to be distinguished and dissociated to better understand the role of human groups within the cave.

Our revision of lithics and faunal remains from excavations undertaken at the end of the 20th century, combined with data from a new research program initiated in 2019, allowed to increase the number of bone and lithic refits and to carry out a multi-factorial spatial analysis based on more than 10,000 coordinated remains. The integration of paleobiological and taphonomic information into an intra-site GIS enables a comprehensive understanding of deposits formation as well as the post-depositional processes involved. Thus, this multi-disciplinary approach helps to specify the nature of occupations and their temporalities in a redefined stratigraphic framework.

Brugal J.P., Giuliani C., Fosse P., Fourvel J.B., Magniez P., Pelletier M., Uzunidis A., 2021. Preliminary data on the middle Pleistocene site of Lunel-Viel I (Hérault, France). *Alpine and Mediterranean Quaternary*, 34 (1): 1-13, doi.org/10.26382/AMQ.2021.08

4 RECONSTRUCTING NEANDERTHAL LEARNING PROCESSES OF QUINA LITHIC EXPLOITATION THROUGH REFITTED EXPERIMENTAL ASSEMBLAGES AND ARCHAEOLOGICAL REMAINS FROM DE NADALE CAVE, ITALY

Cattabriga, Gloria (IPHES, Institut Català de Paleoecologia Humana i Evolució Social, Tarragona, Spain; Universitat Rovira i Virgili, Tarragona, Spain) - Bargallo Ferrerons, Amelia (IPHES, Institut Català de Paleoecologia Humana i Evolució Social, Tarragona, Spain; Universitat Rovira i Virgili, Tarragona, Spain) - Delpiano, Davide (University of Ferrara, Ferrara, Italy) - Livraghi, Alessandra (TRACES UMR5608, Université Jean Jaures, Toulouse, France) - Palomo, Antoni (Universitat Autònoma de Barcelona, Barcelona, Spain) - Peresani, Marco (University of Ferrara, Ferrara, Italy)

Lithic refits provide us with a broader understanding of our ancestors' technological strategies, exploitation methods, social dynamics, spatial distribution, and site organization of activities. Another fascinating aspect of refits is their ability to focus on individuals. Interested by these potential insights, we decided to use lithic refits to investigate knapping learning, specially comparing archaeological refits with lithic assemblages produced by modern humans.

The first instance comes from Middle and Upper Palaeolithic lithic assemblages, mainly produced with Levallois, Quina and Laminar exploitation. In particular, we will present the results of the study of a Quina-oriented lithic assemblage found at De Nadale Cave (northern Italy, 70200 ± 1000/900 cal BP).

The second evidence arise from experimental knapping sessions, where participants with different knapping background were tasked with obtaining the same lithic blanks found in the archaeological record, either through imitation or by following direct instructions given by an expert knapper. After analysing archaeological and experimental lithic assemblages by selecting common technological attributes to identify knapping skills levels, we used refits to get a closer look into learning behaviours.

In our situation, experimental lithic refits proved particularly useful because they allowed us with an almost complete understanding of knappers' choices and reduction sequences. Overall, thanks to refits, we were able to dissect the sequences of core reduction actions to determine knapping abilities. We identified differences at the level of knappers' choices and problem-solving and, more interestingly, recognized patterns of exploitation and how these evolved throughout knapping sessions. Therefore, we would like to emphasize the crucial role of refits in this type of analysis focusing on knapping skills determination and the investigation of learning behaviours.

5 MULTISCALE REFITTING TO ASSESS LARGE OPEN-AIR SITES DURING THE MIDDLE PALAEO-LITHIC: THE EXAMPLE OF ROUTE DE BRIAL - LIOUNET (FRANCE)

Viallet, Cyril (Paléotime / HNHP) - Mathias, Cyrielle (HNHP / CRFJ) - Vaissié, Erwan (Paléotime / ArScAn-An-TeT) - Fernandes, Paul (Paléotime / TEMPS) - Rué, Mathieu (Paléotime / ASM)

An excavation conducted recently as part of rescue archaeology yielded more than 15,000 lithic artifacts at the Route de Brial – Liounet site in Southern France. Archaeological material was found within four sedimentary units covering an area of over 30,000 m². The archaeological material uncovered can be attributed to the Middle Palaeolithic, and the sedimentary deposits date back to the Upper Pleistocene. Raw materials are diverse and include different types of quartz, quartzites and silicites. Field data and the overall spatial analysis of the remains reveal a wide disparity in distribution both in plan and in vertical profiles, showing significant lateral variations.

Understanding the dynamics of sedimentary deposits and post-depositional processes is fundamental and raises questions about the notion of the archaeological site itself. What does the archaeological record of the Route de Brial - Liounet represent? In order to specify the stratigraphic distribution of the artifacts and to examine the impact of human activity on their distribution in plan, a vast campaign of refitting was carried out.

Given the archaeological context (artifacts more or less concentrated, extensive excavated area) and the time constraints of rescue archaeology, methodological choices had to be made for both excavation methods and post-excavation processing. For this study, it involved varying the scales of analysis, depending on the initial field data quality and research questions (manual excavation, mechanical excavation). We selected specific units excavated manually to conduct exhaustive refitting and more precise tests on specific raw materials within the material excavated with mechanical excavators.

In this paper, we present our protocol, the results of our analysis, and their impact on geoarchaeological and spatial interpretations for this extensive Middle Palaeolithic occupations.

6 UNEXPECTED REFITTINGS IN THE LEVALLOIS WORKSHOP OF SAINS-EN-AMIÉNOIS (HAUTS-DE-FRANCE)

Tuffreau, Alain (University of Lille, UMR 8164 HALMA, CNRS) - LAMOTTE, Agnès (University of Lille, UMR 8164 HALMA, CNRS) - MARCY, Jean-Luc (Maison de l'Archéologie, Dainville (France))

The Sains-en-Amiénois Middle Palaeolithic site is located 8 kilometres south of Amiens. 834 artefacts (Levallois, non-Levallois cores, numerous flakes from these two types of cores and a large amount of retouched tools) were recovered from surface collections and archaeological surveys dating from 1979 (Series B at the top of the slope) and 1981 (Series A at the bottom of the slope), 50 metres apart. Senonian chalk is present throughout, yielding numerous flints, and Levallois and non-Levallois chaînes opératoires can be observed. In 1996, a new, enlarged test pit at the bottom of the slope, close to that of 1981, enabled the stratigraphy of an asymmetrical valley and a Levallois workshop near the banks of « the carrière watercourse » to be confirmed. Here, the archaeological level consists of silty-chalky formation underlying a complex of humus-bearing silts attributed to the early glacial period (Warneton complex). These, in turn, underlie the soft, bedded silts and limestones of pleniglacial phases. Series A contains 331 artefacts, series B 537 artefacts and the 1996 excavation 493. The expanded 1996 survey yielded a large number of lithic refittings that illustrate all stages of exploitation of very large blocks of flint. The refittings help us to describe the precise content of a knapping Levallois workshop including the variability of several Levallois and non-Levallois production. Some cores are mainly exploited by the production of natural back-knives. Preferential Levallois flakes are missing and are certainly exported outside of the site as they are also missing from the refittings. The spatial distribution of the lithic and faunal remains tends to show that the highest densities of remains belong to the workshop and the lowest (lithic) are associated with the exploitation of the bison. Although rare, they nevertheless illustrate a connexion in activities between the two parts of the site.

7 IUP BOHUNICIAN TECHNOLOGY AND REFITTING OF ITS LITHIC ELEMENTS

Škrdla, Petr (Institute of Archaeology of the CAS, Brno)

The refitting of individual lithic elements back into its original chert nodule provides an invaluable contribution to technological studies. When successful, it allows a detailed reconstruction of the whole chaîne opératoire and allows comparisons between individual sites. The refitting approach has been utilised in the Czech Republic by the author since the 1990s. Lithic material excavated from the IUP workshop sites located directly at the Stránská skála raw material outcrop have been successfully refitted into sequences with a high degree of completion. Fourteen nodules or blocks of raw material were almost completely reconstructed. Usually only one or several constituent pieces were missing (they were probably removed from the site). In addition, a series of less complete sequences allowed a detailed study of each step of the knapping process, contributing to the development of a theoretical model for Bohunician technology. In contrast to the workshop sites at the raw material outcrop, the completeness of refitted sequences

tends to be significantly lower with increasing distance from the outcrop, in contexts of more intensive consumption of blanks or tools, and more intensive off-site transport.

In order to express the differences between individual assemblages in a more standardized form, two indices were defined – an index of conjoinability (ic) and an index of size (in).

At a broader scale, the refitted assemblages also allowed extra-regional comparisons, in our case between Bohunician technology from Stránská skála and Emiran technology from Boker Tachtit, levels 1-3.

In addition, if we assume that knapping of every individual core represents a single chronological event, the spatial analysis of refitted artifacts then provides invaluable information about site formation processes, integrity of the artifact bearing horizon, as well as the internal organization of the site.

8 **REFITTINGS IN THE EPONYMOUS OPEN-AIR SITE OF SAJÓBÁBONY (BÁBONYIAN) (HUNGARY) : A KEY TECHNIQUE TO RESOLVE ARCHAEOLOGICAL PROBLEMATICS**

Lamotte, Agnes (University of Lille, UMR 8164 HALMA, CNRS) - Mester, Zsolt (University of Budapest, UMR 7194 HNHP, Paris)

In the Northeastern part of Hungary, in the town of Sajóbáony is located the eponymous site of Mész-tető (Babonyan). This Middle Palaeolithic open-air site is attributed to last glacial cycle. The cultural facies is characterised by leafpoints, Micoquian bifacial tools, Bábonyian knives and very rare core. The raw material used for both shaped tools and flake production is mainly quartz-porphyre.

Since 2019, the international programme of excavations led by A. Lamotte and Zs. Mester, started at the site with many aims. Among them, the new programme wish to provide a clear typo-technological characterisation of the industry, get radiometric dating, explore and resolve the problem of one or several recurrent occupations, explain the function site. For that, many refittings have been done recently with 63 group of refitting integrating quartz-porphyre and limno-silicite. Refitting decline many possibilities such like flake on flake, flake on leafpoint, leafpoint tip on base, distal with proximal part of the flake etc... To define the activities yielded on the site and to clarify the site function become realizable since refittings are done. Two excavation of 12 and 6 m2 distant from 14 meters are now on connexion thanks to them, helping us to show large places of activities. Also, refittings help us to think about one main occupation instead of several short one. The 63 refittings finally help us, as a key technique for investigation in taphonomy, site formation and its integrity, human behaviour by the prism and help of spatial analysis.

9 **USING REFIT STUDIES TO IDENTIFY SITE FORMATION PROCESSES AND LITHIC PRODUCTION CONCEPTS IN THE AURIGNACIAN OF GEISSENKLÖSTERLE CAVE**

Schray, Svenja (University of Tübingen) - Conard, Nicholas (University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment)

Geißenklösterle Cave plays an important role in assessing the beginning of the Upper Paleolithic in Europe and in contextualizing Aurignacian technological innovations and symbolic artifacts including personal ornaments, figurative art and music. The site was excavated between 1974 and 2002 revealing deposits rich in finds from the Mesolithic to the Middle Paleolithic. The Aurignacian is comprised by archaeological horizons (AH) II and III. These layers date to between 42,500 and 35,000 cal. BP representing a pivotal phase in the spread of anatomically modern humans in Europe.

In 1988, Hahn presented first results on the study of lithic refits in the Aurignacian assemblage of Geißenklösterle highlighting its use as a crucial tool for understanding site formation processes and reconstructing lithic production concepts. In this contribution, we present an updated record of refits from decades of research. Additionally, we combine our data with spatial analysis to assess the stratigraphic integrity of the deposits and to determine areas of activity. This approach allows us to identify two different patterns of find accumulation corresponding to AHs II and III. Within these find concentrations, lithic refits allow to reconstruct technological production concepts of blades and bladelets. From the artifacts missing from the chaîne opératoire we can infer about their transport for use outside the cave indicating a dynamic settlement system of Aurignacian people in the Swabian Jura.

10 **FROM LAUREL TO SPLINTERS: THE DETAILED BIOGRAPHY OF A LARGE-SIZED LAUREL LEAF PREFORM**

Gomes de Almeida, Miguel (Morph / Grupo Dryas; Uniarq - Centro de Arqueologia da Universidade de Lisboa; SERAP Claise – Société d'Études et Recherches sur le Paléolithique de la Vallée de la Claise) - Aubry, Thierry (FCP - Fundação Côa Parque; Uniarq - Centro de Arqueologia da Universidade de Lisboa; SERAP Claise – Société d'Études et Recherches sur le Paléolithique de la Vallée de la Claise) - Walter, Bertrand (SERAP Claise – Société d'Études et Recherches sur le Paléolithique de la Vallée de la Claise)

Located in central France, close to an exceptional flint source, the Maîtreaux site is characterized by the abundant lithic remains of the successive passages of a small Solutrean group. Though knapping activities were clearly the focus of the group, the archaeological remains and excellent preservation of spatial information demonstrate the presence of non-experienced knappers and other activities unrelated to flint during the group's short stays at Les Maîtreaux.

Two main contributions result from the analysis of the site:

1. The thorough description of the microhistory of every activity that left behind mineral remains;
2. A dynamic view of the group's economic strategy, as evidenced by (1) incoming objects and raw materials, (2) on-site activities, and (3) exported lithic tools and blanks.

Intensive refitting of the lithic remains provided a detailed technological characterization of the group's knapping activities, directed towards the production and exportation of laurel leaf preforms, backed bladelets, and reserves of blade blanks for later modification into shouldered points.

Alongside this primary knapping production, the technological and spatial analysis of the large refitted sequences yielded crucial insights into the group's daily life and unusually detailed evidence of technical and social processes.

In this presentation, we examine a single large laurel leaf preform: a first accidental fracture, during bifacial shaping, is followed by two intentional impacts on the flat surface of the broken preform, causing the fracture of the piece.

This intentional fracture of accidentally broken preforms or laurel leaves has been documented in other Solutrean sites and interpreted as evidence of either an instant rage attack of the unfortunate knapper or a demonstration of the symbolic value of these pieces.

The site's abundant technological information and exceptional preservation of spatial data allows us to delve into this matter, as we trace the broken piece's trajectory throughout the site.

11 **CONNECTIONS IN TWO SHORES: LITHIC TAPHONOMY OF MAGDALENIAN ASSEMBLAGES FROM THE ATLANTIC AND MEDITERRANEAN FAÇADES OF IBERIA**

Bel, Miguel Ángel (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Historia Antiga, Universitat de València; UNIARQ-Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras de Lisboa, Universidade de Lisboa) - Zilhão, João (UNIARQ-Centro de Arqueologia da Universidade de Lisboa, Faculdade de Letras de Lisboa, Universidade de Lisboa) - Villaverde, Valentín (PREMEDOC-GIUV2015-213, Departament de Prehistòria, Arqueologia i Historia Antiga, Universitat de València)

Knowledge about Palaeolithic societies depends highly on the integrity of the material record preserved at archaeological sites. For this reason, it is necessary to assess the role played by formation processes in the configuration of the archaeological assemblages. In that sense, one of the most powerful tools for the taphonomic study of Palaeolithic sequences is refitting. We present the lithic refitting analysis of two open-air sites, Bairrada and Olival da Carneira (Santarém, Portugal), and a cave site, Cova de les Cendres (Alicante, Spain), with Magdalenian occupations from different moments. The quantification and spatial analysis of refits allow us to assess the degree of integrity of these deposits. We interpret the different results considering each site's specific geoarchaeological characteristics, especially regarding the influence of their open-air or karstic character. Some questions arise when we analyse the data: Do the refits found relate mainly to the formation processes of each site? How could methodological factors influence the detected patterns? Are the studied assemblages well-suited to reconstruct cultural evolution through the Magdalenian? Our work underscores the need to develop these taphonomic analyses as a previous step to behavioural or paleoenvironmental studies and demonstrates the critical requirement that such approaches be underpinned by stone tool refitting studies. The final objective is to place on a more solid ground our understanding of the Magdalenian of the Atlantic and Mediterranean façades of the Iberian Peninsula.

12 INVESTIGATING TECHNICAL BEHAVIOUR AND SITE FORMATION PROCESSES THROUGH LITHIC REFITTINGS FROM COVA GRAN DE SANTA LINYA (NORTHEASTERN IBERIA)

Sánchez Martínez, Javier (CEPAP-UAB - Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona; ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve; IPHES-CERCA, Institut Català de Paleocologia Humana i Evolució Social) - Martínez Moreno, Jorge (CEPAP-UAB - Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona) - Mora, Rafael (CEPAP-UAB - Centre d'Estudis del Patrimoni Arqueològic de la Prehistòria, Universitat Autònoma de Barcelona)

The study of human behaviour in prehistoric societies constitutes a primary objective of archaeological and anthropological research. One avenue to observe behavioural aspects within past populations involves analysing their technical organization. This analysis can be conducted in greater detail, depending on how the formation of sedimentary deposits influenced the preservation of the archaeological record. To solve this, lithic refittings have emerged as a valuable method to enhance the contextual resolution of Palaeolithic sites. However, this method is not uniformly applied for explaining site formation in archaeological research.

The site of Cova Gran de Santa Linya (NE, Iberia) hosts numerous archaeological contexts that allow evaluating the impact of post-depositional events on the preservation of human occupations, especially in the Platform Sector. This is exemplified by unit 7P (20505-18294 calBP), which has been partially affected by intra-site erosive processes, resulting in complex vertical and horizontal stratigraphical relationships during the Last Glacial Maximum sequence of the site.

To assess whether the impact of natural and anthropic disturbances affected the resolution of unit 7P, we conducted lithic refittings and technological analysis, combined with spatial data. Refittings indicated the lithic assemblage remained unaffected by erosive events at the site, reinforcing the in-situ preservation of the occupation. The spatial distribution revealed a cluster of core-blank and dorso-ventral refittings in 2m². This cluster may correspond with a specialised area associated to knapping activities that supports the integrity of the assemblage. Further examination of the main cluster, in conjunction with a hearth, facilitates visualizing site organizational patterns characterised by low-distance intra-site mobility.

All in all, we underscore the necessity of conducting refittings as an indispensable and holistic method to enhance the contextual resolution in archaeological assemblages, thereby precisising the natural and human factors involved in the formation of Palaeolithic sites.

13 HOW TO MAKE A BIG BLADE? A CONTRIBUTION FROM MIDDLE MAGDALENIAN REFITS AT VILLAZETTE (CREYSSE, DORDOGNE)

Bocquel, Manon (CNRS UMR 5199 PACEA, Université de Bordeaux) - Beauvais, Pierre-Antoine (Fyssen Post-doctoral Fellow University of Cape Town; UMR 5608 TRACES, Université Toulouse Jean-Jaurès) - Dijkstra, Lukas (UMR 5608 TRACES, Université Toulouse Jean-Jaurès) - Dachary, Morgane (SRA Nouvelle-Aquitaine; UMR 5608 TRACES) - Delvigne, Vincent (CNRS, UMR 8068 TEMPS, Université Paris Nanterre; Service de Préhistoire, Université de Liège) - Langlais, Mathieu (CNRS UMR 5199 PACEA, Université de Bordeaux)

Around 17,000 cal BP, the Magdalenian in south-western France was marked by the presence of blades in 'Bergeracois' flint, whose exceptional quality questions the socio-economic status of the men and women who created them. These blades are almost exclusively discovered in the form of batches of finished objects. However, the methods used to produce them have yet to be described and discussed in relation to what is currently known about 'standard' blade production.

Located in the Aquitaine Basin, the Villazette site (Creysse, Dordogne) is settled on the low terraces of the Dordogne river, whose immediate environment harbours many high-quality 'Bergeracois' flint resources. Excavations have revealed a series of open-air occupations, including two layers relating to the recent Middle Magdalenian and Early Upper Magdalenian phases. As one of the few deposits to have yielded an abundant and well-contextualized flint industry for this period, this site provides a unique opportunity to understand the technical and spatial organization of the different types of blade production.

Refitting is a fundamental tool for a detailed description of blade production chains, particularly in early stages, as yet undocumented for the Magdalenian of the Southwest. By employing this method of analysis in our study, we can not only appreciate the technical variability of the products, as seen through the management of different knapped volumes, but also investigate various degrees of expertise, especially in relation to the production of large supports.

14 REFINING CULTURAL FRAMEWORKS THROUGH DEMONSTRATION OF TYPOLOGICAL AND TECHNOLOGICAL ASSOCIATIONS BY REFITTING: A LATE LAST GLACIAL CASE-STUDY FROM SOUTHEAST BRITAIN

Wenban-Smith, Francis (University of Southampton)

Despite substantial historical critique, the attribution of material cultural remains within a culture-historical framework remains a fundamental aspect of archaeological practice. For the Palaeolithic, this is focused upon the recognition of lithic industrial traditions based on distinctive tool-types and technological practices. Based on stratigraphy and dating, the Palaeolithic material cultural record has been structured into cultural frameworks that reflect perceived trajectories of the continuity and dispersal of populations, or at least of cultural practices. The late Last Glacial of the North European plain - and in particular its western part: the northeast Paris Basin, the southern North Sea area and southeast Britain - is one arena with a reasonably well-established framework for the spread and subsequent development of Final Magdalenian populations in conjunction with climatic oscillations at the end of the Last Glacial. However, there are various problems integrating the frequent open-air sites of this period into this framework. These typically lack well-dated layers of occupational evidence with high stratigraphic integrity, and represent unknown durations of occupation. Thus, there is uncertainty over the contemporaneity of the accumulation of tool-types and knapping waste products that might be present at a site. Here, refitting is applied to a late Last Glacial flint scatter, and used to demonstrate the associations of various flint tool-types (a) with each other, and (b) with distinctive knapping strategies for blade production. Confirming these associations provides a more robust basis for the cultural attribution of sites within the late Last Glacial framework. In the context of southeast Britain, and the northeast Paris Basin, this work suggests that some (or many) Long-Blade, Belloisian and epi-Ahrensburgian sites may not represent a Terminal phase of the Late Upper Palaeolithic. Rather, they may represent (or at least substantially include) occupation contemporary with (presumed older) Federmessengruppen sites.

15 LITHICS & FAUNA REMAINS OF PIT 6, MEZHYRICH SITE: WHAT DO THE PALAEOLITHIC HOUSEHOLD PITS TELL US ABOUT?

Dudnyk, Diana (The Institute of Archaeology of the National Academy of Science of Ukraine; Centre for Paleoethnological Research) - Chymyrys, Marharyta (Taras Shevchenko National University of Kyiv; Centre for Paleoethnological Research) - Shydlovskiy, Pavlo (Taras Shevchenko National University of Kyiv; Centre for Paleoethnological Research) - Alekseienco, Daria (Taras Shevchenko National University of Kyiv; Centre for Paleoethnological Research)

The Upper Palaeolithic record of Eastern Europe is rich with spectacular mammoth-bone dwellings and numerous features, comprising at least 13 sites, with Mezhyrich being one of them. Radiocarbon dating places the Mezhyrich site at 15-14.3 kyr BP.

One of the main features of the Mezhyrich is the remains of four dwellings constructed with mammoth bones, each surrounded by several household pits. Pit 6 is associated with the structure of the Dwelling 2. The investigation of this pit occurred over a span of more than 20 years, with several episodes. The Palaeolithic cultural layers of the site lie 2.5-3 m below the modern surface. Stratigraphic studies indicate three episodes of sediment accumulation in the pit, potentially corresponding to different human activities on the site.

Typically, flint artefacts might be found in the pit due to garbage falling. Analysis of the lithic assemblage revealed a continuous core reduction strategy conducted directly on the site. Flintknapping aimed to produce blanks for tool manufacturing such as bladelets, micro-blades for distant weapons insets and blades, bladelets for domestic toolkits.

Analysis of the faunal remains reveals several patterns of human activities, including the use of bones for cooking, fuel, raw materials for tools, and adornment making. The zooarchaeological analysis identified several main categories of materials, including blanks of mammoth ribs, bone tools crafted from long bones of small/medium-sized mammals, and ornaments made from teeth.

The discovery of products within a single enclosed assemblage and in a clearly defined stratigraphic position enables us to comprehend the technological processes characteristic of the Mezhyrichian variant of the Eastern European Epigravettian, thereby deepening our understanding of the household and everyday life of Upper Palaeolithic hunter-gatherers at the settlement. Studying the collection further expands the description of this site and provides insights into the lives of its inhabitants.

16 REVISITING THE ANALYSIS OF LITHIC REFITTED ARTEFACTS AT THE UPPER PALAEOOLITHIC SITES IN JAPAN: ITS POTENTIAL AND CHALLENGES

Takakura, Jun (Archaeological Research Centre, Hokkaido University)

Research at the Upper Palaeolithic sites in Japan has yielded a large number of lithic refitted pieces since the late 1960s and early 1970s. The importance of the analysis of lithic refitted artefacts has been emphasised as they provide essential insights into the study of lithic production technology and site formation process, leading to the reconstruction of human behaviours conducted at the sites. Such studies appeared at about the same time that the studies of Palaeolithic sites using lithic refitted artefacts began in western Europe. In this paper, I will review the history of the study of lithic refitted artefacts in the Palaeolithic sites of Japan and investigate what problems have been identified as challenges and what methods of analysis have been chosen to deal with these challenges. Through this review of research trend, the possibilities and problems of analysing the lithic refitted artefacts at the Upper Palaeolithic sites will be discussed.

17 RE-COMPOSING TIME AND SPACE: INTEGRATING LITHIC AND INTRA-SITE SPATIAL ANALYSIS WITH REFITTINGS. THE OPEN-AIR SITE OF MALGA STAULANZA (BELLUNO, ITALY)

Cecchetti, Marzio (Dipartimento di Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara, Ferrara, Italy) - Visentin, Davide (Dipartimento di Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara, Ferrara, Italy) - Bertola, Stefano (Dipartimento di Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara, Ferrara, Italy) - Fontana, Federica (Dipartimento di Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara, Ferrara, Italy)

The study and interpretation of open-air Palaeo-Mesolithic sites is often challenging, even when a solid excavation methodology is applied. Multidisciplinary analysis (e.g. geoarchaeology) may contribute to the identification of the post-depositional dynamics that occurred at the site. However, circumstances such as bioturbation can still limit the interpretation of the stratigraphic record. This is particularly true when dealing with "persistent places", sites in which multiple occupations occurred over time. In these cases, the potential of refittings is even more evident as a tool to prove the consistency of the single assemblages within the total record.

In this communication, we present the case-study of Malga Staulanza (Belluno Dolomites, Italy), an open-air high-altitude site occupied during the Late Upper Palaeolithic (Late Epigravettian) and the Early Mesolithic (Sauveterrian). Considering the weak stratigraphic reliability due to soil formation processes and the low depositional rate of mountain environments, the high frequency of refittings was pivotal for a) the accurate identification of the exploited raw materials and b) the study of the lithic reduction sequences. The spatial information provided by the refitting assemblages also allowed us to confirm c) two spatially distinct areas of dispersion of the lithic artefacts, broadly corresponding to the two occupations and d) a major post-depositional disturbance (i.e. treefall) occurring between the two. Refittings strongly contributed to the general discussion of distinct chrono-cultural phases of the site, as well as the spatial organisation and taphonomy of the occupations. In conclusion, the analysis highlights the potential of refittings as a powerful tool for complementing traditional techno-economical and intra-site analysis for the reconstruction of the occupational and post-depositional dynamics of prehistoric sites.

18 RECONSTRUCTING SITE FORMATION PROCESSES THROUGH FAUNAL ANALYSIS AND REFITTING AT THE UPPER PALEOLITHIC AND MESOLITHIC SITE OF KOHLHAU-ABRI, SOUTHWESTERN GERMANY

Toniato, Giulia (State Office for Cultural Heritage of Baden-Württemberg, Germany) - Tafelmaier, Yvonne (State Office for Cultural Heritage of Baden-Württemberg, Germany)

Kohlhau-Abri is a rock shelter site located close to the Lone Valley, in Southwestern Germany. It was excavated between 2015 and 2018 yielding a thick stratigraphy spanning the Late Pleistocene to the Holocene. Preliminary analyses of the lithic remains have identified the presence of two cultural complexes pertaining to the Magdalenian and Mesolithic, with the Mesolithic assemblage displaying both Early and Late Mesolithic technological components. However, the study of the faunal assemblage provides a more nuanced picture around the history of the depositional and post-depositional processes that affected the distribution of the archaeological remains. Bone refitting allowed us to recognize the vertical and horizontal movement of some of the finds, and the presence of conjoined elements attributable to a large cervid species whose AMS 14C dates pertain to the Late Palaeolithic. Some of the bones also display anthropogenic marks providing possible evidence of human occupation during the Late Palaeolithic that is not clearly recognizable from the lithic artefacts. Our study highlights the importance of bone refitting as a valuable tool for disentangling the impacts of human activities from taphonomic processes, especially at sites with a high degree of post-depositional alteration.

19 CAN WE DO MORE WITH REFITS? SOME EXAMPLES FROM THE PLEISTOCENE/HOLOCENE TRANSITION IN BELGIUM

Vandendriessche, Hans (University of Ghent)

The benefits of refitting for our understanding of the lithic technological aspects of a specific industry or a time period are well known. Refitting first and foremost provides highly detailed information on the knapping methods used by prehistoric artisans. Besides that, by combining artefacts that were differently distributed across a site, vertically or horizontally, refitting also has the potential to provide information on the spatial aspects of lithic technology and on site taphonomy.

In this contribution, we use refit data from several Belgian sites situated at the Pleistocene/Holocene traditions (e.g. Ruien, Remouchamps, Kerkhove; Vandendriessche, 2022; Vandendriessche et al., 2023) to explore two main research topics: (1) How refitting can be used as an epistemological tool to increase our understanding of knapping methods at these sites, but also of the limitations of other types of technological analyses (quantitative attribute-based analyses, as well as schémas de lecture diacritique) with regards to the reconstruction of these methods; (2) How we can gain a better understanding of the systemic and post-depositional processes that impacted the spatial organization of the sites, by making use of refit line lengths and orientations, as well as refit dispersal rates and for example, movements of burned and non-burned lithic artefacts.

Vandendriessche, H. (2022) – Flintknapping from the Lateglacial to the Early Holocene. The Belgian Scheldt valley sites of Ruien and Kerkhove. Sidestone Press, Leiden.

Vandendriessche H., Vanmaldegem E., Crombé P. (2023) – Catching a glimpse of Mesolithic settlement patterns and site re-occupation through lithic refitting, raw material characterizations and absolute dating. *Journal of Archaeological Method and Theory*, 30 (1), p. 239-267.

20 UNLOCKING THE STRUCTURE OF A MESOLITHIC OPEN-AIR SITE THROUGH REFITTING: A CASE FROM GAILIŪNAI 2, SE LITHUANIA

Gaižauskas, Lukas (Lithuanian Institute of History)

Refitting of lithic finds, while very common in research of Palaeolithic contexts, is not as often applied in the studies of Mesolithic sites. The usefulness of refitting is especially limited in the research of Stone Age sites in the South Eastern Baltic, where unstratified archaeological layers formed as a result of multiple occupation episodes are usually found and where lithics from just one raw material type predominate. One recently excavated site Gailiūnai 2, located in SE Lithuania and dated to the mid 7th millennium BC, departs from this stereotype as it was found to represent the remains of a single-period hunter gatherer camp. The site contains a shallow archaeological layer that was not significantly disturbed by later post-depositional processes. Despite scant knapping activities carried out on the site and the minute nature of debitage, the application of refitting has allowed to reconstruct many links between flint artefacts found within debitage clusters. In particular, refitting results have been useful as an indication of the intensity and frequency of activities carried out on the site that would be difficult to assess using a different approach. The predominantly small refit sets indicate limited, possibly task-oriented knapping at the site. It seems that knapping products – blades and their fragments were carried away from the site as well as brought from outside and discarded. Data from refitting was complemented by findings of spatial analysis and use-wear analyses on lithic remains found at the site. From these multiple lines of evidence a case could be made for Gailiūnai 2 to have been a short-term, occasionally revisited campsite. The approach used in the case of this particular site sheds more light on the residential mobility patterns of local small Mesolithic hunter-gatherer communities and would be much more difficult at many contemporary sites.

301 WHAT IS A VILLAGE? COLLECTIVE ACTION, SETTLEMENT PATTERNS AND RURAL COMMUNITIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Quirós Castillo, Juan Antonio (University of the Basque Country; University College London) - Eva Svensson, Eva (Karlstad University)

Session format: Regular session

The study of settlement patterns has been one of the major topics of rural archaeological studies from the beginning of the discipline. As a result, the definition of different categories based on the shapes of the sites, the study of creations, transformations and desertions of villages, hamlets, farms and other domestic spaces, or the analysis of the social and political impact of these trends have played a relevant role in the comprehension of rural landscapes. What is more, villages and other rural settlements have provided the bases for macroscale (landscapes studies) and microscale analysis (household studies, church archaeology, funerary archaeology), etc.

However, in the last few decades new approaches focusing the agrarian and outlying productive landscapes, and how peasants have organized their land use, have opened new avenues for revisiting site-center studies and, in general, the settlement-patterned paradigms. Within social archaeologies definition of communities and collective action, despite the morphology of their settlements, have been forwarded. New methodological and theoretical approaches to rural landscapes have added to the possibilities of studying peasant action beyond the settlement areas.

The goal of this session is to promote a collective reflection and discussion about rural settlements in Europe beyond the morphological and descriptive approaches, promoting long-term analysis and comparative perspective. In order to deal with the topic, theoretical informed papers and holistic landscape studies are welcomed.

The aim of the session should be to publish a collective book gathering different experiences all around Europe.

ABSTRACTS

1 WHAT IS A FARM? WHAT IS A HAMLET? COLLECTIVE PRACTICES AND CO-OPERATION IN THE RURAL LANDSCAPE

Svensson, Eva (Risk- and environmental Studies, ISK-department) - Johansson, Annie (County administrative Board (Värmland)) - Pettersson, Susanne (Independent)

Whereas regulated villages dominated champion agriculture southern Scandinavia, boreal Scandinavia has been depicted by historians as “single farmstead land” during medieval and early modern times due to single farms being listed in the cadastres. However, both more detailed investigations by historians and archaeological excavations have shown that the “single farmstead” was a construction, most likely for tax evasion, and that instead small hamlets were common. The hamlets appear to have been far less regulated than the villages in southern Scandinavia, but still included a high degree of co-operative and collective, and labour division, elements. Many of which went beyond the hamlet as organisational unit. Such strategies allowed the exploitation of many resources in the forested outlands, including transhumance practices. Instead, work co-operatives could include several hamlets or mix farmsteads from different hamlets. Also, labour division and specialisation in certain trades were organised within the hamlets as well as in between hamlets, and even on parish levels.

In this paper we will present several examples of such collaborative practices and labour divisions pursued by the peasants in boreal Scandinavia within livestock rearing, different handicrafts and exploitation of outland resources.

2 WHAT IS A VILLAGE FROM AN ARCHAEO-GEOGRAPHICAL POINT OF VIEW? ANSWERS FROM FRENCH EXPERIENCES

Watteaux, Magali (University of Rennes 2, research unit “Tempora”; Association française d’archéogéographie; UMR 7041 ArScAn, team “Archéologies environnementales”)

A lot is now known or well established about the history of rural settlement thanks to historical and archaeological research, concerning communities of people embedded in legal, political and economic networks; the socio-economic functions of hamlets and villages; the ‘origins’ of villages; the role of elites and political decisions in the creation of villages; the spatial organisation of villages; the organisation of relations between villagers and agrarian territories, etc.

The aim of this paper is to show what an archaeogeographic approach to rural settlement (villages, hamlets, etc.) - in the sense that it has been deployed in France since the 2000s - can add to our knowledge of them. The use of planimetric documentation, multiscale work and morphological analysis offer tools that can complement and even shed new light on the results of historical and archaeological studies of villages. This means starting with the planimetric forms rather than the texts or the excavations, and then moving back and forth between the different documents and the different scales of analysis.

Lastly, this archaeogeographic approach provides a multi-scalar, long-term spatialisation of the archaeological data, which helps to tell the story of our villages and their territories. In this sense, the results of archaeogeographic surveys can be useful both for historical knowledge and for spatial planning.

In the end, the intention is not to oppose the contributions of other specialists, but rather to show the value of an alternative methodology, which works at several spatial scales and diachronically, over the long term, and which is based on a morphological analysis that has been profoundly renewed over the last thirty years in France. The examples presented are intended to highlight the various contributions of this archaeogeographical approach and offer a comparative perspective.

3 WHAT CAN A VILLAGE BE? A FUTURE-FIT VILLAGE PERSPECTIVE

Schepers, Mans (University of Groningen, Faculty of Arts, Centre of Landscape Studies) - De Haas, Tymon (University of Groningen, Faculty of Arts, Groningen Institute of Archaeology) - Haartsen, Tialda (University of Groningen, Faculty of Spatial Sciences, Rural Geography) - Pelgrom, Jeremia (University of Groningen, Faculty of Arts, History) - Salemink, Koen (University of Groningen, Faculty of Spatial Sciences, Rural Geography) - Six, Clemens (University of Groningen, Faculty of Arts, History) - Zwiers, Maarten (University of Groningen, Faculty of Arts, History; University of Groningen, Faculty of Arts, American Studies; University of Groningen, Faculty of Arts, Low Saxon Language & Culture)

Interdisciplinarity, and transdisciplinarity, have been buzzwords for so long that they seem to have lost some of their meaning. Within archaeology, interdisciplinarity is arguably related, but not synonymous, to multiproxy analyses. Multiproxy analyses are generally associated with (sciency) analyses of artefacts and ecofacts, sometimes carried out by specialists from various disciplines. Interdisciplinarity should ideally reach beyond materiality, generating conceptual and theoretical perspectives from scholars with various backgrounds. In many, although clearly not all cases, this still generally includes people directly or indirectly intensively involved in archaeology. This facilitates a certain basic degree of mutual understanding.

The societal challenges we are currently facing, however, sometimes demand an even broader perspective. At the University of Groningen, we have recently initiated the Future-fit villages research group, as part of the Rudolf Agricola school for Sustainable Development. The group, currently still small, includes historians, geographers, and archaeologists, working on very diverse time periods (including ‘now’ and the ‘future’) and regions. This generates diverse perspectives in itself, which is further strengthened by the diverse research themes addressed, ranging from Roman agricultural landscapes, the impact of European countries on the countryside in their (former) colonies, both domestic and abroad, to the development of digital entrepreneurship in the ‘remote’ Scottish Highlands and Islands.

In our paper, we will not address any of these studies in great detail, but rather highlight some of the more overarching observations made in our group so far, ranging from very concrete and applicable cases of inter-scholarly inspiration to examples in which we were seemingly speaking different languages. We are curious to learn about similar initiatives from other research institutes, but are also most interested in extending our group beyond the University of Groningen.

4 VARIANCE AND VARIETY OF NEOLITHIC VILLAGES IN NE SERBIA – SOME EXAMPLES FROM SERBIAN BANAT

Mirkovic-Maric, Neda (Medjuopštinski zavod za zaštitu spomenika kulture Subotica) - Marić, Miroslav (Balknološki institut SANU)

The Neolithic period in NE Serbia, although well documented in its intensity is still rather poorly researched systematically. Neolithic villages, whilst numerous, are often only fragmentary examined, with few and far between excavated structures, seldom with just a single or only a few trenches. Larger scale excavations engulfing multiple structures or areas of Neolithic settlements is still missing.

However, the larger availability of magnetometry surveys in the area over the last decade has made it possible to some degree to better overview the size and structure of villages in the area with many

landscape and environment constrictions present during the Neolithic period. The surprising variety of settlement sizes, appearances and organisation indicates multiple approaches, most likely influenced by local landscape requirements and constrictions to settlement construction and organisation. It also indicates that the creation of regional centres was well underway towards the end of the Neolithic, with larger centres covering dozens of hectares and consisting of several hundred wattle and daub structures, appearing in the first half of the 5th millennium BC. The formation of the regional centres may have led to the gradual abandonment of smaller villages over the course of several hundred years and contributed to the aggregation of the population noticeable

towards the end of the Neolithic. In the presentation we present several examples of Neolithic villages from the Serbian Banat region predominantly recorded using magnetometry surveys.

5 GRADED VILLAGES SINCE THE 2ND CENTURY BC; RECORDING PERSISTENCE AND CHANGE IN THE DISTRICT HALFAMBT (GRONINGEN, THE NETHERLANDS)

Nijboer, Albert (University of Groningen)

The paper examines the settlement hierarchy that emerged during the Middle Ages in the present province of Groningen (The Netherlands). Before seawalls were constructed as low dikes during the 13th century, the region was prone to flooding resulting in highly fertile, alluvial deposits. The flooding, furthermore, led to artificial, settlement mounds of which there were hundreds, most of them small, a few hectares or less. Some of these minor mounds developed into villages during the early Middle Ages. A district of the city-state Groningen, is known as the Halfambt

with its main centre Baflo. Next to Baflo lies another man-made, settlement mound of ten hectares, Rasquert, that since the 2nd century BC never seems to have housed more than a couple of hundred people. Nonetheless, it developed into a separate jurisdiction due to a noble family that resided here during the 15th century. Both artificial mounds Baflo and Rasquert, roughly 15 kilometres to the North of the town Groningen, are separated by a waterway that connects the Wadden Sea with the inland. Both had their own focus; Baflo being more a medieval, ecclesiastical centre for the district Halfambt and Rasquert the home of some rising, noble families. This development can be explored well by examining an array of environmental, archaeological and historical data. In this paper, I describe the endurance of this landscape with small villages, grounded in the highly fertile, marine soils, which still accounts for its agricultural disposition. Nonetheless many changes occurred during its past 2000 years, becoming nowadays more like commuter villages. This account is a result of the “Project Rasquert”. Eventually, we intend to issue source publications of the archaeological and historical data available for the reconstruction of the ongoing adjustments occurring on the twin settlement mounds Baflo – Rasquert from onwards the 3rd/2nd century BC.

6 VETERANS AND SETTLEMENT PATTERNS ALONG THE LOWER DANUBE LIMES: INSIGHTS INTO THE ROMAN FRONTIER

Andreeva, Petya (National Archaeological Institute with Museum/Bulgarian Academy of Sciences)

The Roman army not only served as a pivotal force in organizing the administrative framework of the Lower Danube Limes but also played a central role in establishing and maintaining supply networks for the forts and the satellite settlements. After the incorporation of Moesia Inferior into the Roman Empire, the defensive frontier line experienced significant reinforcement. This marked the beginning of economic consolidation throughout the region, distinguished by fertile lands suitable for agriculture and abundant raw materials, including marble quarries and mines.

The constant need to deploy soldiers along the Lower Danube resulted in the discharge of a large number of veterans over time, many of whom likely settled in the region. Numerous veterans of Thracian origin, as evidenced by their diplomas and tombstones, often returned to their homelands. Moreover, the number of documented settlements at the frontier has notably expanded over time, hinting at a potential correlation with veteran settlements, for which evidence is steadily accumulating. Many of the preceding conclusions about the development patterns of the rural areas along the limes have traditionally relied heavily on epigraphic and literary sources. However, they often lack precision in representing the development and distribution of landholdings and domains.

In recent years, archaeological excavations and field studies have provided valuable insights into the structure and chronology of several villages associated with veterans along the Lower Danube. New evidence prompts inquiries into the development of settlement patterns and their interrelationships with both the frontier and the hinterland within the province. Field research of the rural landscape has also confirmed a sustained density of settlements and villae rusticae, some enduring into Late Antiquity. The accumulation of archaeological data has enriched our understanding of its economic viability within the broader context of regional and supra-regional trade and cultural networks.

7 SARCOPHAGI WITH RURAL LIFE THEME IN FARM NECROPOLISES BETWEEN ÇANDIR AND GÖKDERE VALLEYS

Akkaya, Ecem (Akdeniz University)

Bey Dağları Surveys, which took place within the borders of Antalya province, started in 1997 with a limited team. Since 2001, it has been conducted annually with a large team of 35–40 students and scientists. Within the scope of these researches, the exact locations of some settlements mentioned in the Stadiasmus Patavensis were determined and introduced to the scientific world, starting with major settlements. Not only major settlements but also their rural areas and farms were extensively examined. Through these studies, numerous sarcophagi predominantly dated to the 3rd century AD associated with farming were identified in Domuzağılı, Kartınpınarı, Hurma, and Hisançandır between Çandır and Gökdere. These sarcophagi, predominantly made of local limestone, exhibit similar decorative patterns. These include agricultural tools such as plows and scythes, as well as locally important animals such as oxen, deer and lions. At the same time, spears are depicted with tabula ansata, considering that they were influenced by Pisidia Termessos. The study focuses on rural life through sarcophagi scattered across a wide region, providing clues about rural life. There was a significant increase in sarcophagi production in the region between AD 170 and 250. Sarcophagi related to farms and farming suddenly increased in the 3rd century AD and lasted for only two generations. The common fabric of rural life is evident through the depictions on the sarcophagi. The study aims to decipher the identity of the rural areas through the significantly increased sarcophagi production, focusing on the rural identity through sarcophagi.

8 EARLY MEDIEVAL VILLAGES AND HAMLETS IN THE BASQUE COUNTRY: CONSIDERATIONS AT THE LIGHT OF A COMPLEX AND DIVERSIFIED ARCHAEOLOGICAL RECORD

Narbarte Hernández, Josu (University of the Basque Country) - Campos López, Teresa (University of the Basque Country)

In the last two decades, the Archaeology of early medieval villages and hamlets has experienced a considerable transformation in the Basque Country, due to the combination of different factors. First, the development of new theoretical frameworks has permitted to overcome the limits of the notion of ‘archaeological site’ and adopt a wider, landscape-based perspective. Second, the normalisation of preventive archaeological interventions has resulted in a notable increase -and diversification- of the archaeological data available. Third, the contribution of the archaeological sciences has added new possibilities to the informative possibilities of such records. Fourth, the chronological horizon of medieval villages has also experienced a shift, with an evidence for relevant changes occurring in the 6th–7th centuries, which eventually led to the establishment of the ‘classical’ hamlet network from the 8th century onwards. Because of these developments, the formation and evolution of early medieval villages appears to be a much more nuanced reality than it was previously thought, which means a need to re-think the concept of village communities itself in more contextual and holistically terms, based on the notion of collective action rather than in the definition of morphological typologies. In this communication, we present a revision of the state of archaeological records related to early medieval villages (6th–7th centuries) in the Basque Country, with the purpose of defining the main groups of elements of research, and their implications for the understanding of village formation.

9 NUCLEATED VS DISPERSED SETTLEMENT, PLANNING VS. SELF-ORGANIZATION OF THE SETTLEMENT SYSTEM IN THE MEDIEVAL LANDSCAPE OF SOUTHWESTERN FRANCE

Poirier, Nicolas (CNRS)

Macroscale models of rural settlement valid for France, identifying the emergence of agglomerated settlements between the 8th and 12th centuries, are mainly documented and operative for the northern half of the country. In the south (west), rural settlements remained largely dispersed, with “villages” playing only a marginal role in the management of populations and the organization of rural areas.

For reasons that remain to be clarified, the spontaneous “encellulement” of the early Middle Ages remained unfulfilled and gave rise to various initiatives throughout the Middle Ages driven by local elites (bastides, castelnaus, etc.). In the light of recent work involving pedestrian surveys and Lidar remote sensing, we will examine the relationship between grouped and dispersed settlements and their role in the management of agrarian and forest areas.

Indeed, systematic fieldwalking surveys carried out in the Garonne valley permitted to reconstruct the long-term dynamics of the settlement network and associated agrarian spaces, through the systematic collection of off-site material interpreted as the remains of agrarian manuring. This approach makes it possible to put forward hypotheses on the origin of present-day villages that are inaccessible to more invasive archaeological approaches. The use of Lidar technology enabled us to complete the map by revealing archaeological remains testifying to phases of occupation prior to forest settlement (motte-and-bailey castles, churches, plots of land). Lidar can also reveal forest management strategies that have ensured the sustainability of wood resources and the place of wooded areas in ancient agrosystems.

10 COLLECTIVE ACTION, COMMON RESOURCES AND RURAL COMMUNITIES IN THE EARLY MEDIEVAL PO VALLEY RIVERSCAPES (NORTHERN ITALY)

Panato, Marco (University of Nottingham)

Collective action, exploitation of common resources (comunalia) and rural communities in northern Italy have been recently re-examined by the historical and archaeological literature (Saggioro 2020, Santos Salazar 2020, Rao and Santos Salazar 2019). Case studies have been made regarding especially riverscape areas, such as the communities of Flexo (an unprecise area in the northern Emilian plain) or Lizzano, and their struggle to preserve their rights over a portion of woodland and wetland against the growing power of the abbey of Nonantola. While discussions and reconstructions of these communities have been extensive, limited efforts have been made to connect them with existing archaeological sites like the ninth- and tenth-century villages uncovered at Nogara and Sant’Agata Bolognese. Nor has there been an analysis of the ecological footprint of these archaeological sites and how their communities exploited the surrounding environments. This paper aims to describe these riverscape villages, delineating their social composition and ecological impact, while drawing comparisons between them. By integrating surveys from the early 2000s with a synthesis of written and archaeological sources, the research seeks to provide a more comprehensive understanding of early medieval villages, shedding light on settlement and social patterns in the post-Roman world. Eventually, for publication within an edited volume, the comparison would be extended to other northern Italian wetlands including new archaeological sites from Tuscany (Grosseto plain, Pecora Valley) and Romagna (Ravenna

hinterland); the aim of the chapter would be to define more precisely the nature of rural communities and villages in northern Italian wetlands between the sixth and the twelfth century CE.

11 **MEDIEVAL HAMLETS AT THE EDGE OF LAKE NEUSIEDLER RURAL SETTLEMENT DEVELOPMENT IN THE AREA BETWEEN PRESENT-DAY AUSTRIA AND HUNGARY**

Özyurt, Jasmin (Austrian Academy of Sciences) - Tobias, Bendeguz (Austrian Academy of Sciences) - Perstling, Claudia (Stadtarchäologie Wien) - Saliari, Konstantina (Natural History Museum Vienna) - Draganits, Erich (University of Vienna)

While high-medieval village-like structures are largely known, hamlets have hardly been investigated so far. In recent years, several hamlets have been archaeologically recorded south of the present municipality of Podersdorf am See (present day Austria), dating from the 10th to the 13th century CE. Characteristic of these hamlets is a small number of sunken featured buildings in a greater distance, most of them with ovens or fireplaces in one of the corners. The presentation discusses the structure and chronological development of these hamlets as well as their material remains. Questions will be raised as to the relationship of these settlements to larger surrounding villages, which are usually only known from historical documents. Their economic basis will be examined predominantly by animal-based food supply and animal husbandry. Further it will be investigated what material resources were available to them and how far the possible contacts went. Finally, the processes of landscape change during the Middle Ages will also be considered.

12 **OBSERVING THE MOVEMENT OF THINGS AND PEOPLE: SETTLEMENT PATTERNS IN A MICROAREA OF INLAND SICILY**

Lo Monaco, Viviana (University of São Paulo)

Sicily has always been a region with an agricultural and pastoral vocation. During Roman rule, it was known as the granary of Rome, and its feudal society structure persisted until the 19th century. Since the Neolithic period, human groups have occupied the island's inland areas, initiating a settlement pattern that adapted to the morphology and resources of the territory. During classical antiquity, before the significant expansion of the Roman Empire, both urban and rural organization in this area reveals that even the most inland territories were bustling with activities and people.

Between the late 5th century AD and the 17th century, it appears that many inland areas had transformed into semi-deserted regions, or at least, that's what can be inferred from written documentary sources. However, archaeology can tell a different story.

In this presentation, I will demonstrate how the approach of Collaborative Archaeology, utilizing Landscape Archaeology field methodologies, can unveil a part of the landscape's history that written sources remain silent about, and archaeological research has not adequately addressed. This collaborative effort, a three-way partnership between archaeologists and local residents interested in discovering and valorizing the territory, aims to observe the movement of people and things in the territory of a small inland town, San Cataldo (Caltanissetta), and its settlement patterns.

The ultimate goal is to try to understand how the needs of exploiting the territory and the necessity of adapting to its physical conditions may have influenced the development of society in this micro-region over the centuries.

13 **PRODUCTION IN THE VILLA FORENSIS „STARE MESTO“ NEAR ZDAR NAD SAZAVOU FROM THE PERSPECTIVE ENVIRONMENTAL ANALYSES**

Václavíková, Dominika (Charles University in Prag)

„Stare Mesto“ near Zdar nad Sazavou is a unique site for Czech archaeology, being the only village with a market right that was excavated completely. Its history is connected with the Cistercian Order, thanks to which there are also written sources about the development of the village and its market right; thus, the site provides an opportunity to compare written and archaeological sources, and a unique opportunity to investigate a village type well-known by written sources but scarcely investigated by archaeologists.

The paper introduces the results of various environmental analyses aimed at more detailed knowledge of iron production at the site. The study focused on the production chain of iron at the site, including special pottery types, by-products and carbons from the heating device. Finally, results of the analyses were contextualised into the results of the spatial analyses of the site. In second part paper is focused on other production for example pottery, stonework and limestone.

302 **LUXURY - STANDARD - POVERTY: ARCHAEOLOGY OF QUALITY OF LIFE IN MEDIEVAL AND EARLY MODERN TOWNS**

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague) - Piekalski, Jerzy (Institute of Archaeology, University of Wrocław) - Cembrzyński, Paweł (Cluster of Excellence ROOTS, CAU Kiel)

Session format: Regular session

The term quality of life describes the overall well-being, i.e. how the needs of individuals and societies are satisfied. Well-being consists of economic variables like material wealth and non-economic ones like social capital, human health, physical condition, and knowledge. Economists, as well as sociologists dealing with these problems based on contemporary approaches, mostly agree that the most critical determinants of broadly understood well-being concern good nutrition, the lack of diseases, the presence of personal freedom and dignity, respect for other group members, safety from aggression, economic security, a stable and just law. Many of these concepts are relative, depending on local cultural practices, perceptions, and financial capacities, which makes them challenging to study in past societies. Nevertheless, in the case of medieval and post-medieval towns, approaching the quality of life from an archaeological perspective can bring new insight. Contrary to written records, which often register the social position and wealth of the upper part of urban society, the material remains of past activities bring us information on household possessions, quality of materials, dietary practices, and actual physical condition of individuals. To measure the quality of life based on archaeological sources, one needs to put them into the relational framework: understand what people considered as luxury, what was a standard, and what was poverty in a given time and space.

This session aims to discuss various approaches to luxury, standards and poverty as indicators of quality of life and inequalities in later medieval and post-medieval urban environments. We are particularly interested in papers relating to urban studies concerning:

- Theoretical approaches
- Dietary practices
- Population status based on bioarchaeological research
- Architectural research
- Material culture.

ABSTRACTS

1 **EXPLORING QUALITY OF LIFE IN MEDIEVAL AND POST-MEDIEVAL URBAN ENVIRONMENT: AN ARCHAEOLOGICAL PERSPECTIVE**

Piekalski, Jerzy (University of Wrocław) - sawicki, Jakub (Institute of Archaeology of the Academy of Sciences of the Czech Republic)

Issues related to “Quality of Life” or standards of living have been extensively discussed by economists and sociologists. They typically involve challenging aspects for archaeological discernment, such as access to medicine, balanced diet, or economic stability. Nonetheless, some available data to archaeologists allow for a direct examination of certain issues. Anthropological studies on diet, migrations, and diseases provide insights into the medieval population. Moreover, recent studies in the economic sphere propose new, more holistic approaches to the analysis of material culture, which traditionally was divided into elite and non-elite categories. However, recently proposed approaches—based, among others, on consumption strategies; diversity of available object types, which may indicate wealth; or distinguished finds known as Barometer Objects—serve as indicators of status. Yet, all these issues rely on subjective attempts to assign specific archaeological finds, usually from very challenging urban archaeological contexts, to pre-defined categories. Indeed, within a highly diverse archaeological material, we are able to recognize luxury based on raw materials, craftsmanship quality, or origin. But how can we archaeologically define poverty? In this introductory text, we aim to examine how various archaeological sources allow for the exploration of luxury, standards, and poverty in medieval and early modern cities.

2 THE POTENTIAL OF ARCHAEOLOGICAL METHODS FOR IDENTIFYING POVERTY IN PRE-INDUSTRIAL CITIES: A WROCLAW CASE STUDY

Duma, Pawel (Institute of Archaeology, University of Wrocław, Poland) - Legut-Pintal, Maria (Institute of Archaeology, University of Wrocław, Poland) - Piekalski, Jerzy (Institute of Archaeology, University of Wrocław, Poland)

This paper explores the methodological challenges of using archaeological evidence to study poverty in medieval cities. Our primary focus lies on identifying the fundamental difficulties in defining poverty-related criteria. We acknowledge the relative nature of such criteria and recognize that referencing contemporary city standards would lead to inaccurate inferences.

The proposed method for identifying poverty involves comparing the living conditions of various urban population groups and highlighting the identified differences. Our assessment is based on two key factors: diversity of consumption models and its levels and quality of housing conditions with architectural and artistic standard and location of the house in the city.

Our analysis is mainly based on the results of archaeological research, architectural and spatial analysis supplemented by information obtained from written sources. We are aware of their specificity and limitations. Only exceptionally do we have the possibility of attributing discovered material culture objects to an exact person. However, most findings represent collective deposits accumulated by groups inhabiting a shared plot of land with a house and its infrastructure. We cannot distinguish the owner of the house from the servants and tenants. Differentiating gender and age of artifacts owners can be challenging. Due to these limitations, our findings represent general trends rather than conclusive individual assessments. They reflect the combined activities of multiple individuals occupying diverse positions within households and the urban community.

3 ARCHAEOLOGICAL GLASS AS AN INDICATOR OF CONSUMPTION STRATEGIES AND SOCIAL STATUS IN LATE MEDIEVAL AND EARLY MODERN WROCLAW (POLAND)

Kunicki-Goldfinger, Jerzy (Institute of Nuclear Chemistry and Technology, Warsaw, Poland) - Duma, Pawel (Institute of Archaeology, University of Wrocław, Poland) - Miazga, Beata (Institute of Archaeology, University of Wrocław, Poland)

Almost thirty thousand glass fragments excavated in the Old Town in Wrocław, dating from around 1400 to around 1800 C.E., were examined using a modified approach based upon that proposed by Haase and Whatley (2020). Statistical evaluation of the results of typological studies as well as chemical analyses of selected items allowed the distinction between various categories of conspicuous artefacts and the “standard setters” (the inconspicuous objects representing the baseline of consumption). The results show the proportions of different categories of glass in succeeding centuries and for individual quarters of the city. The distinction between different chemical types of glass turns out to be very important, especially when individual glass fragments do not show any diagnostic typological characteristics. For example, among others trends, it was observed that although the share of ostentatious glass objects increased over time, the proportion of imported soda-lime-silica glasses among them decreased. This tendency of a decreasing share of sodium glass in the period from about 1400 to about 1800 in Wrocław is fully consistent with the general trend that we observe throughout Central Europe in this period.

Haase K., Whatley S. (2020). Consumption Strategies and Social Implications in Two Danish Towns in the 13th–16th Centuries. *Medieval Archaeology* 64(1):116-44.

4 LUXURY OR STANDARD? RINGS AS GRAVE GOODS IN URBAN CHURCHYARD CEMETERIES

Szocs, Peter Levente (County Museum Satu Mare)

Rings are quite frequently in the inventory of graves discovered at churchyard cemeteries, and their number is steadily growing due to the extensive archaeological rescue researches. The discovered rings present a high variation of materials (from common metals to noble ones, and their combination), dimensions, forms and decoration: from the simplest ones, to those with realized with high artistry and decorated with precious stones. Some of the items are even personalized as they bear coat-of-arms, or names (or just initials). The relatively great number of discovered rings and their variety permit to analyze their contexts and possible role.

In this paper, I will present several examples of rings discovered at urban sites from medieval and early modern Hungary and Transylvania, and I will discuss their significance as indicator of social status of their bearers and to assess whether they are or not luxury items. In this sense, a special focus will be given on techniques of production, possible workshops and commercial contacts.

5 A STUDY OF FOOTWEAR IN LATE MEDIEVAL AND EARLY MODERN WROCLAW AS A MARKER OF SOCIAL STATUS AND WEALTH

Konczewska, Magdalena (University of Wrocław, Institute of Archaeology)

In late medieval and early modern Europe, footwear not only served a utilitarian function, but also satisfied the aesthetic and aspirational needs of its owners and determined their prestige and social status. From the Middle Ages onwards, guild statutes, sumptuary laws and other ordinances interfered with the way the population dressed and prescribed what they should wear. Certain styles of footwear (with extremely long or wide toes) and the raw materials (silk, gold, saffiano) from which they were made were reserved for the privileged classes. As a commodity, shoes and boots were part of the consumption strategies of different social groups. Consumer choices were undoubtedly influenced by a number of factors, including cultural factors and the imitation by the lower classes of the consumption patterns of the upper classes. Imitation often took the form of the use of cheaper substitutes.

The presentation aims to draw attention to the symbolic and social role of footwear and its significance as a positional good. It can be successfully used to study the wealth and social differentiation of earlier populations and is considered one of the criteria for distinguishing luxury goods. A multifaceted analysis of footwear found in the Old Town of Wrocław in Poland, based on archaeological, written and iconographic sources, as well as zoological, botanical and spectral (XRF) analyses, allowed conclusions to be drawn about the wealth of the inhabitants of individual plots and the city.

It should be emphasised that distinguishing between footwear worn by representatives of different social classes, and between everyday and festive footwear, without knowledge of the archaeological context and the connection with other accompanying objects, may lead to erroneous conclusions.

6 LUXURY IN THE CESSPIT! IN SEARCH FOR INDICATORS OF SOCIAL STATUS FROM THE CESSPITS IN TARTU, ESTONIA (14TH-16TH CENTURY)

Haak, Arvi (Tallinn University, Archaeological Research Collection; Tartu City Museum) - Johanson, Kristiina (University of Tartu, Institute of History and Archaeology)

The medieval town as a microcosm included a number of social groups, hierarchical in their organisation. There was a facade of relative uniformity, expressed in stone houses of largely similar construction (Diele-houses), yet this standardisation is clearly indicative of the upper middle classes. Turning to the household level, the representation of both luxury and (relative) poverty can be reached. For this aim, we investigate the cesspit material from Tartu. The context allows linking the finds to certain property/properties, and analysing consumption on the household level. Moreover, the cesspits include items of material culture rarely collected from yard and street deposits.

In analysing the cesspit material, we discuss the items indicative of conspicuous consumption and luxury (e.g., glass vessels), but also food remains, especially plant remains that have rarely been analysed from other contexts. Just as with objects, the archaeobotanical material allows making a distinction between species found in many of the households indicating conspicuous consumption, and isolating those that appear in a very limited number of cases (e.g., pepper and rice in the 15th and 16th c). We also present the species uncommon in the medieval urban households (e.g., buckwheat) and discuss their social significance.

The Tartu finds lack highly expensive materials, nevertheless, the single items that certainly were of great material value have been collected from a number of cesspits. Although the long deposition period of the cesspit material makes it difficult to assess how available certain items were at the time of their disposal, as some sumptuous items may quickly become indicators of above-average consumption, these stand out among the overall consumption pattern. We may thus interpret the finds as indicative of personal choices of communicating luxury, rather than an agreed standard of excessive consumption.

7 CONSUMPTION AND QUALITY OF LIFE IN MEDIEVAL MINING TOWNS IN CENTRAL EUROPE

Cembrzynski, Pawel (Cluster of Excellence ROOTS, Kiel University)

Mining towns emerged in Europe during the 12th and 13th centuries at a crossroads between urbanisation and the mining industry. They were hubs for technological, economic and social change. Meanwhile, the spatial relationship with ore extraction and processing zones created a specific mining-urban landscape. The question remains: How did the interaction between society and mining affect the quality of life?

This talk explores whether mining towns had specific consumption patterns visible in the built environment. To answer this question, I look at architectural features in a town, both private and public, as well as on material culture. For this talk, I use examples from towns in Central Europe like Kutná Hora, Freiberg, Banská Štiavnica, and several smaller mining settlements.

Mining towns and settlements were inhabited by workers, miners, subcontractors, mining entrepreneurs, and people providing services (artisans and merchants). Their living conditions varied, but standards seemed high. In mining settlements, it manifested in large houses and good-quality material culture. In towns, high-quality houses were built

quite early. It is not a very high level of conspicuous consumption. Much money was invested in sacral buildings. Meanwhile, they all lived within mines and smelters. Over time, urban fabric developed into much more coherent and representative. Much more conspicuous consumption can be registered in the 15th century with a new wave of mining investments and new ways of showing might and power.

8 HUMAN AND ENVIRONMENT IN PRE-INDUSTRIAL CITY. CASE-STUDY OF PRAGUE AND WROCLAW

Lech, Sylwia (University of Wrocław)

The relationship between societies and environment has its consequences. Some are predictable, but not all of them. In my research, I try to find patterns of adaptation developed by pre-industrial burghers to maintain safety and life comfort inside the city walls, as well as the side effects of anthropogenic impact on the environment. My specific interest concerns evolution of public space and urban infrastructure regarding scientific development and changes of mentality mirrored in material culture of the past. The state of research of Prague and Wrocław is advanced. Besides archaeological and historical sources, the scientists collected plenty of geological and botanical data which helps us recreate past environments and brings new possibilities of investigation. Archaeologists of both cities are cooperating with representatives of various fields. Thanks to multidisciplinary research we can raise questions about the relationship between social topography and quality of life as well as the evolution of townspeople preferences regarding hygiene, health or safety. The purpose of my research is making these cities comparable. I wonder how to answer similar questions using the variety of available data. To achieve it, I try to follow the concept of cities as socio-natural sites which is a useful approach for analyzing long-term processes.

9 DIFFERENCES BETWEEN THE MANIFESTATION OF SOCIO-ECONOMIC STATUS IN ARCHITECTURE AND THROUGH CONSUMPTION

Obrink, Mattias (National Historical Museums, Sweden) - Forsblom Ljungdahl, Veronica (National Historical Museums, Sweden)

The city Nya Lödöse was founded in 1473 on the Swedish west coast, about 5 km east of modern Gothenburg. The area was a war struck border region between Denmark and Sweden during that period, until 1658.

The city was founded on royal initiative with the intention to create a hub for trade and commerce. Nya Lödöse was only one of many attempts by Sweden to establish a town in the area in the period from mid-15th century to the beginning of the 17th century. In the 16th century, the city was considered one of the Swedish kingdom's most prominent ports and the kingdom's only access to the North Sea.

The city was built following a planned grid system in which the spatial organization and plot size implies a socio-economic stratification. The buildings, however, were simple with a lack of basements and masonry buildings. Most houses were uniform in shape and materials, with similarities between them and rural buildings. This differs with several other contemporary Scandinavian cities (for example Kalmar) where the urban landscape changed during the 15-16th century when members of the bourgeoisie erected prominent buildings and masonry basements.

Nevertheless, in Nya Lödöse there was a material culture and consumption that shows a high economic and social differentiation. The material culture also shows that the city belonged to a shared northern European urban culture.

This paper will try to understand this contradictory situation in terms of the regional conditions and variations in a borderland including a mistrust of the future intentions of the crown.

10 A TALE OF TWO CITIES. TOWNS WITHOUT MONEY?

Risvaag, Jon (Norwegian University of Science and Technology)

Money is one of the great measures of prosperity and poverty. Both as a means of payment and standardisation, money i.e., coins, seem to have become well established, both in Norwegian towns and rural areas during the thirteenth century. In the term of the sociologist Anthony Giddens, the general populace became knowledgeable agents concerning coin use. In the wake of the Black Death (1349) the Norwegian monetary system started rapidly to decline, and eventually broke down. By the end of 1380s all coin production in Norway stopped completely and was not resumed until c 1483. In this paper I will ask the question 'how did this affect the towns in terms of growing poverty and social dissolution?', with an analysis of the two major Norwegian towns Bergen and Trondheim.

Written records are very limited and the archaeological records i.e., coin finds, are challenging. Still, combined with written records some of the finds may give us an indication which coins circulated in the towns and in which social strata, helping us to assess the material and social standards in the late medieval and post-medieval Bergen and Trondheim.

11 IMAGES AS INDICATORS OF IDENTITY OF WROCLAW BURGHERS DURING THE ICONOGRAPHIC TURN

Macionczyk, Agata (Museum of Archaeology in Wrocław; University of Wrocław)

The presentation will concern iconographic motifs that were placed on everyday objects in the early modern period Wrocław, their functions and social context. Decorated objects that have been discovered during various archaeological excavations in city (stove tiles, cutlery, pottery and glassware), will be discussed as means of expressing and probably also shaping the aspirations, taste and identity of the citizens. The occurrence of such artefacts can be linked to the specific of the urban folklore of Wrocław, which remained an important component of the folk imaginary realm characteristic of the southern zone of Central Europe (southern Germany, Austria, Bohemia, Moravia) in the late Middle Ages and early modern period. There are noticeable symptoms of the opening up of creators operating within the local symbolic and artistic tradition which was strongly rooted in the Middle Ages, to the global iconosphere, penetrating to this part of Europe, primarily through the dissemination of prints. Especially, carnival motifs were playing an important role in urban culture, as a way of channeling social tensions and signs of society structuring. The objects became hybrids bearing features of global symbolism, but shaped for the specific needs of local citizens, for example serving by corporate rituals. Decorated objects can be considered symptoms of the formation of bourgeoisie self-awareness and a sense of separateness, through critically commenting on customs characteristic of other social states. They could be signs of realization of burghers social position, the advantages and disadvantages of their everyday life, a response to religious concerns, a warning against rebellion and trespassing social norms. The favoured iconography shows urban dweller's aspirations, being emanation of absorption of fashionable trends and education.

12 THE UNIQUE EXAMPLE OF THE PALATAL OBTURATOR PROSTHESIS FROM 18TH-CENTURY CRACOW (POLAND)

Spinek, Anna (Department of Anthropology, Hirsfeld Institute of Immunology and Experimental Therapy, Polish Academy of Sciences, Wrocław, Poland) - Kurek, Marta (Department of Anthropology, Faculty of Biology and Environmental Protection, University of Lodz, Lodz, Poland) - Drązkowska, Anna (Department of Archaeology of Late Middle Ages and Early Modern Period, Faculty of History, Nicolaus Copernicus University in Torun, Torun, Poland)

People have always tried to create objects that make everyday life easier, especially when it is difficult due to illness or disability. Some of them are palatal obturator prostheses, which, by separating the nasal cavity from the oral cavity, improve the quality of life of people suffering from hard palate dysfunctions.

The first attempts to replace missing parts of the palate date back to antiquity however, the first documentary information about such procedures comes from modern times (16th century).

The research aims to present the case of an adult male from 18th-century Poland with a large defect in the hard palate to which a well-preserved palatal obturator prosthesis was fitted. This is the first case of an object of this type that can be associated directly with human remains that came from archaeological research in Poland and probably also in Europe.

The sex and age-at-death of the individual were estimated according to the methodology used in anthropological research. The skull was subjected to a detailed macroscopic assessment. Imaging tests were also performed using computed tomography. The obturator's elemental composition measurements were carried out using SEM-EDX. The analyses of the structure and elemental composition of the found prosthesis and comparisons to the other obturators known from written sources were made.

The differential diagnosis indicates the most probable cause of the defect to be an isolated bilateral cleft palate. In the prosthesis, the following are distinguished: an elliptical-shaped metal diaphragm and a textile "tampon" entering nasal cavity. The metal part of the prosthesis was made of copper covered with a layer of silver and gold which suggests the high social status of the owner of the prosthesis. The comparison of the analysed obturator with examples from the literature demonstrates its great similarity to those used in the 16th and 18th century.

306 PHOENICIAN AND PUNIC ARCHAEOLOGY IN EUROPE (AND BEYOND): RECEPTIONS, HERITAGE, AND PROJECTS

Session theme: 6. The Mediterranean from Within

Session organisers: Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon) - Machuca Prieto, Francisco (University of Málaga) - Álvarez Martí-Aguilar, Manuel (University of Málaga) - Suárez Padilla, José (University of Málaga)

Session format: Regular session

Phoenician-Punic Studies have developed considerably since their emergence as an autonomous field of research in the 1960's. Phoenician-Punic Archaeology, in Southern Europe as well as in North Africa and the Levant, has played a major part in that development. The multiplication of fieldwork projects, as well as the consistent study of archaeological materials related to Phoenician and Punic societies and their interactions with other groups across the Mediterranean, have been key in fostering discussions about the nature of the Phoenician diaspora itself and its impact in the wider development of the Ancient Mediterranean.

This being said, the impact of Phoenician-Punic Archaeology in the broader panorama of European Archaeology remains to be explored. For decades, the field has been at the forefront of theoretical debates – e.g., on issues of identity/ ethnicity, or the applicability of post-/ decolonial approaches to Antiquity –, as well as methodological discussions – e.g., on dating techniques, environmental approaches, or the ongoing impact of the so-called “Third Science Revolution” in Archaeology. Nonetheless, its connections with the broader conceptual and methodological panorama in Europe and beyond remain unanalysed, and its contributions to the global archaeological panorama unacknowledged.

This session aims to address this issue by taking a triple-prong approach, combining: 1) an historiographic view of the development of the discipline and its reception beyond academic circles; 2) critical approaches to the (re)presentation of Phoenician-Punic cultural heritage; 3) case studies on the current state of research in the field, showcasing ongoing projects, with a special focus on the public outreach, academic dissemination and heritage management outlooks of those projects. Within these broad thematical axes, we welcome contributions exploring the broader impact of Phoenician-Punic Archaeology, and the way it is embedded in the wider theoretical, conceptual, and methodological panorama of regional or European Archaeology.

ABSTRACTS

1 PHOENICIAN POSTCOLONIALISM

Muñoz Sogas, Judith (University of Barcelona; Universitat Pompeu Fabra)

Traditionally, contacts between communities have taken for granted the indispensable role of the colonizers, as well as their superiority over the colonized. Dominant, colonizing groups acquire an active role, while the dominated societies are presented as passive and dependant. At the same time, the Phoenicians, many times identified with the dominant colonialist agents, have been seen as an obstacle to Greek expansion and, hence, an obstacle to civilization. They have, therefore, been conceived as a group that prevented the arrival of real culture, the Hellenic one, on the Central and Western Mediterranean.

Both in the case of Greek and Phoenician colonization, the indigenous groups have been ignored, and not considered when assessing the different processes of colonization that have taken place throughout the Mediterranean. In this paper, an attempt to conceal different views with regards to Phoenician colonization is made. Postcolonial theories are taken into account in order to build a more accurate history of colonial situations in the Mediterranean. Evidence from the Iberian Peninsula, the Central Mediterranean and the Aegean Sea can help us comprehend how Phoenician colonization should be understood, and how indigenous societies had a key role in the development of the so-called “colonial” interactions.

2 LANDSCAPES OF DEATH AND COMMEMORATION: WHAT CAN BURIAL PLACES TELL US ABOUT THE PHOENICIAN AND PUNIC CENTRE OF MALTA?

Cardona, David (Heritage Malta)

Malta's underground burials are the result of a thousand years of funerary practices that evolved between the Phoenician and Byzantine periods. These have long attracted the interest of scholars but none of these have looked at the data from tombs of different periods in a holistic manner, meaning that these sites have remained spatially and temporally isolated from each other.

This paper will present the results of Doctoral thesis submitted to the University of Leicester, the aim of which was to investigate the sizeable corpus of funerary data available from Malta's main ancient city of Melite in an attempt to

recognise clusters and cemeteries in order to identify regional and chronological developments in form, design, content, décor and placement. This includes relationships with the immediate environments of the tombs as a potentially important part in the burial rituals, such as access and visibility. It also includes the study of related features, such as quarries, roads and cart-ruts.

Focusing on the Phoenician and Punic material, these analyses aim at getting to know the people involved in creating and being buried in these sites. Primarily, were these sacred places within carefully selected landscape features or were utilitarian motives prevalent? Moreover, what is the information that such burial spaces can provide us on settlement formation and landscape use?

My material is studied through numerous steps, starting with the detailed cataloguing and analysis of tombs (many of which only partially published or reported, if at all) to integrate all the typologies previously identified. This forms the basis onto which differences and similarities in the form and placement of tombs and the landscape will be assessed. These relationships will be investigated both spatially and temporally, identifying links (or a lack of) between burial grounds and surrounding landscapes and settlements.

3 EXCAVATING AND EXHIBITING THE PUNIC SANCTUARY AT THE LAGO DI VENERE, PANTELLERIA

Murray, Carrie (Brock University)

This paper presents the current work at the Lago di Venere sanctuary site on Pantelleria. Several years of excavations have revealed the presence of a sanctuary lasting from the sixth century BCE to the second century CE with phases combining influence from indigenous, Punic, and Roman communities. This extra-urban sanctuary site is positioned within a volcanic crater on the shore of a thermal lake and located at some distance from the ancient acropoleis and navigable harbors. The recovered ceramics and votive figures demonstrate proveniences from many locations across the central, Punic Mediterranean. One of the main aims of this project is to communicate its findings to the local community on Pantelleria and the many visitors to the island. We are working with the government system, including the Parco Archeologico di Selinunte, the Parco Nazionale, and the Comune di Pantelleria, and well as with local interested groups and schools. Our organization of school visits, public open days, and local talks have served the needs of communicating recent discoveries on an annual basis. The project is now in the works of determining the long-term strategy of site conservation, presentation of on-site information, and an exhibition of materials in a local setting.

The Lago di Venere can serve as a valuable case study in developing strategies for public outreach and heritage management of a Punic site in the central Mediterranean.

4 THE STAGNONE (MARSALA, ITALY): HISTORY, NEW PERSPECTIVE OF RESEARCH WITH APPLIED APPROACHES AND TECHNOLOGIES

Zucchi, Tecla (Università La Sapienza di Roma)

The Stagnone, or Marsala Lagoon, has been frequented by human groups since the 4th millennium B.C for its strategic geographical position.

The Stagnone has been the scene of numerous investigations that have focused mainly on the island of San Pantaleo, the ancient Punic colony of Motya, along with the surrounding waters.

Nevertheless, entire area is assumed to be rich in artefacts of archaeological interest, as evidenced by the fact that some of the major discoveries in the Stagnone are located far away from Mozia. For instance, Honor Frost's Punic Warship Shipwreck was near the Isola Lunga, one of the islands that enclose the lagoon, not as archaeologically explored as the central San Pantaleo.

The complex geomorphology of the Stagnone, of its coastline and the island's coastlines, is influenced by a perpetual erosion process created by the constant movement of currents, sediments, tides, and winds, that has made extensive archaeological investigations difficult.

From the 19th century onwards, the area was subject to the first significant studies, including the research of underwater archaeology pioneer Honor Frost, who excavated the previously cited the Punic ship of Marsala.

Over time, entities such as the Soprintendenza del Mare - Regione Siciliana, the Honor Frost Foundation and more recently the Bayerische Gesellschaft für Unterwasserarchäologie (BGFU), among others, investigated its waters providing interesting additional data.

However, the advent of new technologies and methodologies promises to overcome the obstacles put on by the nature of the Lagoon in surveying the area, paving the way for a deeper understanding of its underwater heritage.

This paper aims to discuss the potential of these new approaches in relation to the Stagnone, forward looking new investigations that could take place next summer.

5 NEW APPROACHES TO GLOCALISATION IN THE PHOENICIAN PERSPECTIVE: RESEARCH ACTIVITIES AT THE CNR-ISPC

Lancia, Sara (CNR-ISPC Roma; Università di Bari) - Botto, Massimo (CNR-ISPC Roma) - Oggiano, Ida (CNR-ISPC Roma) - Garbati, Giuseppe (CNR-ISPC Roma) - Pedrazzi, Tatiana (CNR-ISPC Milano) - Porzia, Fabio (CNR-ISPC Roma) - Castiglione, Marianna (Università della Calabria) - Soldi, Sebastiano (Università di Firenze) - Tirabassi, Livia (Universiteit Gent)

The Phoenician and Punic Research Group of the National Research Council of Italy (CNR), Institute of Heritage Science (ISPC), aims to investigate, in a multidisciplinary way, the documentary evidence related to the Phoenician and Punic world, between eastern and western Mediterranean. The research group, with a dynamic approach, observes, examines, and analyses the archaeological and textual sources related to the ancient Phoenician space, in perpetual change and transformation, both geographically and chronologically. These phenomena are investigated in a specific “glocal” perspective that is, starting from the study of local cultural patterns, in order to understand global dynamics at the Mediterranean level. The group carries out many excavations, studies, and safeguarding activities, in Italy, North Africa, and along the Levantine coast, as occasions of research but also of interaction, thanks to the close collaboration with public and private institutions in the different areas of interest. The activities of the research group aim to recreate in the present the Mediterranean connections between East and West, of which the Phoenicians were protagonists in the past.

6 PHOENICIAN MARITIME TRADE IN THE CENTRAL AND WESTERN MEDITERRANEAN. HISTORIOGRAPHY, PROBLEMS AND RESEARCH PERSPECTIVES

Jacinto-González, Jesús (University of Almería, Departamento de Geografía, Historia y Humanidades)

The understanding of the economy and trade in antiquity remains contingent on constant theoretical development and empirical research on the economic, commercial and market institutions of pre-capitalist societies. Since the advances of Adam Smith, Karl Polanyi and more recently, efforts have focused on the empirical testing of these immaterial realities (Polanyi, Arensberg & Pearson, 1973; Chic García, 2009).

In the case of Phoenician and Punic studies in the Central and Western Mediterranean, one hundred and thirty years of historical and archaeological research have passed since the nineteenth-century times of the Belgian Louis Siret (Siret, 1908). In this time, theoretical and methodological debates have focused on the political and economic significance (Bisi, 1991) of the Western Phoenician cities, solving old problems and opening up new questions (Aubet, 2002). Thus, the high concentration of Phoenician settlements in the West and the numerous archaeological finds related to productive and commercial maritime activities invite us to examine the evidence, search for new data, apply new methodologies and reflect on the role of Phoenician maritime trade in Western Phoenician cities and its impact on the Central and Western Mediterranean.

For this reason, we propose an in-depth review of Phoenician maritime trade in the Central and Western Mediterranean. A review that chronologically covers both the increasingly less diffuse phase of initial commercial contacts, as well as the periods we call the Early Colonial Period (850-800 BC), the Archaic Colonial Period (800-600 BC) and the Urban Period (600-241 BC) (López Castro, 2010). And, above all, placing special emphasis on the historiographical development of the discipline; on the theoretical, methodological and empirical problems of the object of study; and on the multiple research perspectives that are opening up as new challenges.

7 FOOD PRACTICES IN PHOENICIAN-PUNIC RITUAL CONTEXTS: NEW PERSPECTIVES

Giardino, Sara (École des hautes études hispaniques et ibériques - Casa de Velázquez de Madrid)

The purpose of this contribution is to present a project on food preparation and consumption practices in western Mediterranean ritual contexts between the 7th and 2nd centuries BCE. The project is underway at the École des hautes études hispaniques et ibériques - Casa de Velázquez in Madrid. It combines archaeological data with the results of archaeometrical and bioarchaeological analyses, the latter widely developed in recent years in the Phoenician-Punic field. The information already published is supplemented by unreleased data. The study focuses not only on the religious connotations of dietary practices, but also on the social and economic aspects that such practices allow to investigate.

The contribution will be divided into two parts. The first part will be devoted to the archaeometric analyses that are being carried out within the project to identify organic residues on artefacts from some significant contexts. The second part will address the implications of the project in the context of Phoenician-Punic studies. Some reflections will be proposed on the collaboration of various European and non-European research institutes involved in the project, but also on the state of the research in the supporting country, i.e. France: on the one hand, for various reasons, it has been a key player in the birth of the discipline; on the other hand, it has played a leading role in the progressive affirmation of the archaeology of ritual and of bioarchaeological and archaeometric studies.

8 EGGXPLORING IDENTITY: PHOENICIAN-PUNIC OSTRICH EGGSHELLS IN VILLARICOS BEYOND AESTHETICS

Moreno Megias, Violeta (University of Sevilla) - Luciañez-Triviño, Miriam (University of Sevilla) - Rodero Riaza, Alicia (Museo Arqueológico Nacional - Ministry of Culture of Spain) - Montgomery, Janet (Durham University) - Morell Rovira, Berta (Institució Milà i Fontanals - Consejo Superior de Investigaciones Científicas)

The Punic necropolis of Villaricos (Almería, SE Spain), with almost two thousand tombs, has been the subject of archaeological research since the beginning of the twentieth century. Yet, its outstanding archaeological record is still largely unexplored and offers a great deal of scientific potential. It includes a vast collection of ostrich eggshells (hereafter OES). OES were traded and exchanged as luxury items, often with a symbolic value. During the Iron Age, their use and commercialisation boomed throughout the Mediterranean, with an important centre of production and consumption in the Iberian Peninsula and the Balearic Islands.

The Villaricos collection is the largest closed archaeological assemblage in the Mediterranean to date, with more than 700 documented OES. Phoenician-Punic OES have been intensively studied from an artistic point of view since the work of M. Astruc in 1951, thanks to exhaustive classifications based on their decoration. However, this material and this site still offer great potential for a techno-typological, stylistic and contextual analysis of the OES in terms of identity representation, trade and contacts. The project ‘Eggxotic and vital’ approaches how these groups defined their religious identity through specific technical and decorative choices from a multi-methodological perspective. Scanning electron microscopy, x-ray microdiffraction and x-ray microfluorescence are used to analyse traces of work or painting techniques and pigments, together with radiocarbon dating and provenance analysis to establish the geographical origin of the eggs. This project represents a step forward in the study of the technology of sacred craftsmanship, allowing us to see these materials beyond their aesthetic aspect and contributing to the study of the Phoenician-Punic world through the information provided by this extraordinary necropolis.

9 CERRO DEL VILLAR PROJECT (2022-2025): FIRST RESULTS ON THE ARCHAIC SETTLEMENT AND ITS ENVIRONMENTAL VULNERABILITY

Machuca Prieto, Francisco (University of Malaga) - Suárez Padilla, José (University of Malaga) - Álvarez-Martí-Aguliar, Manuel (University of Malaga)

The Phoenician settlement of Cerro del Villar (Malaga), southern Spain, was built around the second quarter of the 8th century BCE on a small island in the wide estuary of the Guadalhorce River. The excavation campaigns carried out in the site since 2021 have not only confirmed the importance of Cerro del Villar for the understanding of the Phoenician diaspora in the West, but also for the knowledge of the paleoenvironmental evolution of the Mediterranean coast.

The site of Cerro del Villar itself, with its coastal location and its setting on a river island, presents the typical characteristics associated with the Phoenician colonial strategy in Iberia. However, at the same time, these make the place highly vulnerable to both fluvial and marine extreme inundation events. In this sense, evidence of two extreme flooding events that affected the community settled at the Cerro del Villar during the 7th century BCE have been recorded.

The first results of the archaeological research (geophysical surveys and extensive excavations) begin to provide data on the various strategies developed in the settlement to mitigate the impact of these extreme events and increase societal resilience.

Assessing these strategies and the consequences that these catastrophes had on the dynamics of the Phoenician presence in the Bay of Málaga is one of the main objectives of the current Research General Project (2022-2025).

10 THE TEATRO COMICO PHOENICIAN SITE: PAST AND FUTURE

Torres Ortiz, Mariano (Universidad Complutense de Madrid) - Gener Basallote, José (Ayuntamiento de Cádiz) - López Rosendo, Ester (Equipo de Investigación Teatro Cómico; Centro de Estudios Fenicios y Púnicos) - Navarro García, María (Equipo de Investigación Teatro Cómico) - Pajuelo Sáez, Juan (Equipo de Investigación Teatro Cómico)

The archaeological excavations carried out under the former Teatro Cómico of Cadiz have attested the earliest Phoenician urban layout of the ancient Phoenician city of Gadir. It is placed in the former island of Erytheia and the Phoenician occupation has a chronological framework between circa 800 BC until the mid-6th century BC., although the site lingers until Late Roman times.

Excavations have provided a great number of archaeological materials such as pottery, metal objects, ivory and bone items, clay seals, faunal and plant remains and evidence of pottery making and metallurgical practices. Thus, this site is one of the more interesting Phoenician sites not only in the Bay of Cadiz but also in Southern Iberia.

Besides, the site is now open to the public, so it is an excellent example of the management of the Phoenician Archaeological heritage given the high number of visitors it receives, and it has become in one of the cultural resources of the city.

11 PHOENICIAN PRESENCE IN THE PORTUGUESE TERRITORY: NEW INSIGHTS FROM ARCHAEOLOGICAL RESEARCH DURING THE LAST DECADE

Sousa, Elisa (UNIARQ - Centro de Arqueologia da Universidade de Lisboa) - Gomes, Francisco (UNIARQ - Centro de Arqueologia da Universidade de Lisboa)

Research on the Phoenician presence in present-day Portugal has significantly advanced over the past two decades, primarily due to the increased implementation of preventive archaeological works in urban and rural areas. Additionally, noteworthy contributions have arisen from various research projects conducted to date.

The data obtained has enabled the recognition of a considerable diversity in models of cultural interaction that occurred during the Early Iron Age between different indigenous communities and Phoenician groups in the central and southern regions of the country. This diversity is evident in both coastal areas (Lower Mondego, Lower Tagus, Lower Sado, and Algarve) and in the interior regions (Central and Lower Alentejo).

In coastal spaces, a more intense Phoenician cultural matrix is clearly observed, sometimes even displaying characteristics related to a genuine colonization. Recent research has improved the understanding of this Phoenician presence, but also the dynamics of the local responses to that presence and the impact of the new geopolitical scenario in the development of local groups.

In contrast and following unsuccessful attempts by local groups to establish direct contact with the Southern Iberian Phoenician settlements, interactions in more interior regions appear to be indirect and to manifest in more specific spheres, particularly in the funerary context. This highlights the autonomy of pre-existing groups, which selectively adopt and adapt certain cultural and material features as part of their own sociopolitical practices and agendas.

This presentation aims to provide an overview of the current state of knowledge on this complex panorama, emphasizing specific case studies that have yielded unique insights into the early Iron Age in southern Portugal.

12 PHOENICIANS IN NORTHWEST AFRICA

Blaschta, Dirk (German Archaeological Institute)

Phoenician seafarers had already passed the Pillars of Hercules in the 9th century BC and subsequently founded new trading stations and established necropolises. The range of finds, especially in cemeteries, is very rich and documents the Phoenician trade network in a special way. In Morocco, two larger necropolises (Djebila and Ain Dalhia Kebira) from the Phoenician-Punic period (7th-5th century BCE) are known, which were discovered in 1965, finally excavated and published in 1967 by Michel Ponsich. Both necropolises are located in the Tangier region on the north-western tip of Africa at the edge of the ancient world. As part of a new project by the DAI, Madrid Department, in collaboration with the Fondation Nationale des Musées (FNM) in Morocco, the finds are to be reinvestigated and analyzed. The initial aim is to record, categorize and catalog the existing finds. In the past, Phoenician research has focused on interpreting the necropolis as a burial site of a predominantly indigenous population group with Phoenician-Punic finds. However, a closer look at the findings reveals a more differentiated picture. In Phoenician-Punic times, the Tangier area was an important centre for far-reaching long-distance trade relations. One example of this is the discovery of Baltic amber in this region, which can currently be regarded as the oldest evidence of Baltic amber in whole North Africa. Bronze and silver finds indicate that there were contacts with Carthage as well as the western Greek region.

The mapping of the sites in comparison with digital elevation models and hydrological modeling has also made it clear that the coastline north of the Atlas Mountains has changed considerably. The necropolis of Ain Dalhia Kebira is now located approx. 12 km inland and in Phoenician-Punic times was probably located at the eastern end of a bay that extended far inland.

13 LAST BUT NOT LEAST. PHOENICIAN-PUNIC INFLUENCES IN INLAND IBERIAN PENINSULA

Sánchez de Oro, Pablo (Universidad Autónoma de Madrid)

Iron Age in central Iberian Peninsula (i.e. the territory referred in the classical sources as Carpetania) is a period of changes and contrasts which has not been well characterized following biased research. Some imported Phoenician materials have been discovered in this territory belonging to Early Iron Age chronologies. However, the possible relations with Phoenician-Punic elements have been barely considered for the Late Iron Age. Classical sources have had a great influence over the archaeologists, conditioning the study and leading it into a dead end which distinguishes this area in terms of diffusionism, acculturation, and imitation. But what is the agency of these populations and what happened before Rome?

Recently, new critical perspectives have been applied, achieving some major knowledge of this territory. Nonetheless, a further step is required. This necessarily need to challenge former assumptions and to consider other realities. The revision of materials and classical works shows the wide bounds of this space not only with the rest of Iberian Peninsula, but also with the Mediterranean framework. Its inhabitants —mainly the elites following the preserved archaeological

record— were not petty elements of a bigger network, but active actors which demanded Mediterranean goods and adopted and adapted them into their inner social mechanisms. All of these, before the arrival of Rome.

We believe that the reviewing of this context following the optic of Phoenician-Punic archaeology could be helpful to fill the existing void of knowledge. In this process, questioning previous assumption through Postcolonial and non-mainstream perspectives is essential. Central Iberian Peninsula during Iron Age reaches as a fitting scenario to explore the impact Phoenician-Punic archaeology can have both on the Past and the Present.

14 BUILDING RELATIONS AT THE EDGE OF THE WORLD. THE BUILDING OF THE BAETYLS OF ELVIÑA (A CORUÑA, SPAIN)(3RD-1ST CENTURIES BC)

Niñón-Álvarez, Samuel (INCIPIIT (Instituto de ciencias del patrimonio), CSIC (Consejo superior de invest) - Castro González, María Guadalupe (Universidade de Santiago de Compostela)

The present study offers a brief portrait of the “Building of the Baetyls”, a cultic structure located on the archaeological site of Castro de Elviña (A Coruña, Galicia, Spain). The Building of the Baetyls not only reflects a religious expression but also embodies the relevance of the connections between Northwestern and Southern Iberian communities. This presentation aims to define the archaeological characteristics of the building, describing its chronologies, occupation, and functional organisation. These features will provide a solid depiction of the symbolic dimension of the structure and its value as a central element for sanctioning and legitimising long-distance cross-cultural relations. Finally, some reflections on Elviña’s relation with Gades and Rome will also be presented. The influence of Punic relations on the social dynamics of Elviña will be explored, focusing on the value of religion and feast as catalysts of social inequality. In addition, the effects of Roman interactions and its possible influence on the abandonment of Elviña also be assessed.

15 TOWARDS THE CHARACTERIZATION OF TARTESSOS AND EARLY ORIENTALIZING: RADIOCARBON CHRONOLOGY AND CERAMIC ANALYSIS OF LATE BRONZE AGE IN LOWER GUADALQUIVIR

Vicente Gálvez, Rafael (Universidad Autónoma de Madrid)

The archaeological investigation around Tartessos and the Early Orientalizing Period in southwestern Iberia has encountered significant challenges, particularly following the excavations of the El Carambolo site in 2002. These excavations yielded new radiocarbon chronology that contradicted the previously accepted assumptions surrounding the material culture established by relative dating methods and consequently called into question the identification and description of the irresolute concept of “Tartessos..

Prior to and following the revelation of this new radiocarbon data, there has been a lack of consensus and a clear understanding of the term “Tartessos” and its implications. This paper contends that any comprehensive effort aimed at elucidating and reconstructing the context of Tartessos and its material culture, requires a foundation based on meticulously executed and methodologically sound absolute chronology.

Building upon this premise, this paper seeks to help redefine the concept of Tartessos by exploring the feasibility of identifying “index fossils” that could serve as diagnostic markers for this historical period and culture. Drawing lessons from past archaeological endeavors in this field, it is emphasized that these index fossils can only be sought within sites and contexts that have been subjected to absolute chronology.

In this study, radiocarbon dating emerges as the most accessible option for establishing absolute chronology, given its widespread usage in contemporary archaeological practice. Concurrently, ceramic styles are proposed as potential index fossils, given their prominent role as primary material artifacts previously employed in the identification of Tartessos within the archaeological record.

This objective is integral and may serve as a foundation for future studies aimed at analyzing and defining complex aspects of this culture, including its social and political organization, economic system, and, of course, the impact of Phoenician contacts on these dynamics.

16 HORSES AND BULLS ON A BRONZE BOWL FROM GELA: CULTURAL HYBRIDISM AND ORIENTALISING MOTIFS IN ARCHAIC GREEK SICILY

Russo, Laura

The present work should be included in the tradition of studies dedicated to the contacts between Greek colonies in Sicily and the indigenous world in the archaic age, as well as to the relationship that they always kept alive with the motherland and the Levant. Indeed in the material culture, their iconography and style constitute an unmistakable indication of this.

Specifically, my contribution will focus on the results of a new examination of a bronze patera found in a Gela archaic cemetery, during Paolo Orsi’s excavation at the beginning of the XXth century.

First thought of as an imported Phoenician-Cypriot vessel of Phoenician craftsmanship, currently new facts suggests for this patera a local production, imbued with a significant artistic culture of Aegean origin. Moreover this aegean connection is widely attested in the archaeological record of the Geloan colony in the Orientalizing period.

The main decoration of this vessel consists of a frieze of faced bulls and horses arranged around a central floral motif. This iconography would recalls some features of the Orientalising Cretan Rhodian world and the style of horses and bulls recalls a cultural hybridism. Thus the bowl is dominated by heterogeneous marks, produced by artisans greeted by surroundings steeped in broad phenomena of people and goods mobility.

This is possible because both the iconography, the shape and the style of the phiale belong to the hybrid Geloan community, willing to appear as a society in construction and to show the setting of the young colonial community in social groups.

327 HUMAN INFLUENCE ON COASTAL PALEOENVIRONMENTS: A GEOARCHAEOLOGICAL PERSPECTIVE OF HUMAN-ENVIRONMENTAL INTERACTIONS FROM THE QUATERNARY TO THE ANTHROPOCENE

Session theme: 6. The Mediterranean from Within

Session organisers: Bulian, Francesca (University of Groningen, Groningen institute of Archaeology, Groningen, the Netherlands.) - Jiménez-Espejo, Francisco J. (Instituto Andaluz de Ciencias de la Tierra (CSIC-UGR), Armilla, Spain.; Research Institute for Marine Resources Utilization (Biogeochemistry Program), JAMSTEC, Yokosuka, Japan.) - Alessandri, Luca (Sapienza University of Rome, Department of Science of Antiquity, Rome, Italy.)

Session format: Regular session

Humans have been populating coastal areas for thousands of years. By exploiting the available resources, they have been deeply modifying such settings, becoming protagonists of global environmental and climatic changes since the late Quaternary. The development of infrastructures related to salt production, fisheries and mollusk harvesting together with the landscape modification linked with the expansion of harbors in bays, deltas and lagoons is visible both in the geological and archaeological record documenting the high level of human-environmental interaction. In parallel, inhabiting and manipulating dynamic coastal areas subject to floods, storms, changes in sediment supply, and variation in relative sea-level made infrastructures and environmental control indispensable. Consequently, it is crucial to get a better understanding of the changes of human-environmental interactions at different time scales. Such unique areas represent an exceptional chance to learn about landscape, ecosystem changes but also technological development of the past. To achieve these goals, multidisciplinary geoarchaeological studies offer a one-of-a-kind approach towards understanding the complex interaction between nature and humans. In this session, we welcome cross-disciplinary geoarchaeological studies where the exploitation of coastal areas is studied from a palaeoenvironmental evolution and human activity perspective. Contributions showcasing specific case studies in which human-environment interactions in coastal areas are reconstructed including both the developing infrastructures and resilient adaptation to the natural pressure are welcomed.

ABSTRACTS

1 THE PROCESSES OF PALEO-ENVIRONMENTAL CHANGES, THEIR IMPACTS ON THE MARMARA REGION, AND ITS EFFECTS ON THE EARLY NEOLITHIC SETTLEMENTS

Emre, Bedel (Istanbul Technical University, Eurasian Earth Sciences Institute) - Arıkan, Bülent (Istanbul Technical University, Eurasian Earth Sciences Institute)

The strategic location of the Marmara Region, serving as a bridge between Anatolia, the Near East, and south-eastern Europe, plays a crucial role in understanding early endemic movements. With its two elongated straits, the Dardanelles and the Bosphorus, the Sea of Marmara delineates the boundary between Europe and Asia, facilitating continent-spanning travel despite its modest size. Despite its historical significance for ties between Anatolia and the Balkans, the region has only recently become a focus of archaeological exploration, dispelling unfounded speculative interpretations.

Having served as a settlement area since ancient times, the Marmara Region bears archaeological traces of a continuous developmental process. Prehistoric evidence, found in caves like Ağaçalı, Gümüşdere, Domalı, and Yarımurgaz, İbonun Rampası, reveals the presence of hunter-gatherer communities. The transition to settled life marked a primitive form of environmental impact, later amplified by the Neolithic revolution. Settled communities built lasting structures and cultivated agricultural areas, ushering in a more profound environmental impact. The expansion of agricultural areas led to changes in the density and distribution of natural species.

2 HUMAN INTERACTION AND LANDSCAPE TRANSFORMATION AT IRON AGE SALT PRODUCTION SITE PISCINA TORTA NEAR OSTIA (ROME, ITALY)

Bulian, Francesca (Groningen Institute of Archaeology, University of Groningen) - Alessandri, Luca (Department of Science of Antiquity, Sapienza University of Rome) - Attema, Peter (Groningen Institute of Archaeology, University of Groningen) - Guarnieri, Alberto (Department of Land, Environment, Agriculture and Forestry, University of Padova) - Baiocchi, Valerio (Department of Civil, Constructional and Environmental Engineering, Sapienza University of Rome) - Sevink, Jan (Institute for Biodiversity and Ecosystem Dynamics, University of Amsterdam)

In antiquity, coastal and deltaic areas were crucial for food production and trade, with salt emerging as a vital commodity for preserving food in the late Bronze and early Iron Age. The control of salt resources became pivotal for early city-states in central Italy, leading to the transformation of Mediterranean deltaic lagoons into production areas.

The archaeological site of Piscina Torta (Ostia), currently under excavation, reveals a complex ancient landscape comprising a shallow coastal lagoon, beach ridges, and a sea inlet. Through archaeological excavation and coring, it became evident that it engaged in exploitation and processing of marine resources. Relative chronology based on pottery, indicates that a massive production began around the middle VII century BCE. This occurred when the inactive sea inlet and lagoon featured peat deposition in the centre and evaporitic facies at the margins. We suggest that the sediment was leached and used in the briquetage salt production process, consisting in boiling brine in locally produced ceramic containers to obtain salt cakes through evaporation. Subsequently the inlet was reactivated and the lagoon filled with marine sediments. The inlet would have been deliberately kept open by dredging to upkeep the site's functioning. So far the excavations have uncovered massive pottery shard heaps at the canal's edge, hinting at its role as a trade hub and possible mooring site. At the end of the VI century BCE, environmental shifts may have led to the site's abandonment, as conditions became unsuitable for these activities.

This paper highlights intentional landscape modifications (dredging the channel, artificial potsherd heaps) undertaken to sustain favourable environmental conditions for their "industrial" activities. Sedimentological, geochemical, and grain size analyses on samples from the channel and heap suggest seasonal dredging for navigability. Landscape changes are evident in recent LIDAR images while chronological constraints are provided through radiocarbon dating.

3 CLIMATIC AND HYDROLOGIC CHANGES VS. HUMAN RESILIENCE IN THE SYBARIS PLAIN (ITALY)

Cavasinni, Chiara (Sapienza University of Rome) - Forti, Luca (University of Milan) - Giaccio, Biagio (Institute of Environmental Geology and Geoengineering of the National Research Council) - Izdebski, Adam (Palaeo-Science and History (PS&H) Independent Research Group, Max Planck Institute of Geoanthropology) - Macrì, Patrizia (National Institute of Geophysics and Volcanology) - Masi, Alessia (Sapienza University of Rome; Palaeo-Science and History (PS&H) Independent Research Group, Max Planck Institute of Geoanthropology) - Vanzetti, Alessandro (Sapienza University of Rome) - Sadori, Laura (Sapienza University of Rome)

Coastal environments in the Mediterranean basin are defined "sensitive areas" to climatic changes and human influence during the Holocene. The Sybaris Plain is a coastal deltaic plain in Calabria (Italy) and is a perfect area to detect environmental changes and resilient strategies adopted by past populations during the last millennia. The active migrating shoreline, related to the Crati Delta eastward-seaward depositional system, caused an important accumulation of sediment in the area during the Holocene. The compaction of Crati and Coscile river sediments, in combination with the land low morphology, determines the high rate of subsidence. The human presence in the plain has been attested since the Neolithic time. The continuous construction-destruction-abandonment-reconstruction cycles attest different resilience strategies adopted by ancient civilizations. In order to produce a new and improved paleoenvironment reconstruction of the area, a 40 m sediment core was drilled in the centre of the plain (39°73'N; 16°40'E, at 13 m a.s.l.), thanks to the collaboration with ITALFERR group and studied using pollen analysis coupled with sedimentological and magnetic properties determinations. The complexity of the study area, characterized by changes in the water table, has been reconstructed for the late Holocene. Changes in the vegetation cover are recognizable in the pollen record, mainly drove by the alternation of dry open environments, lowland swamp, and alluvial forests, and in the trend of non-Pollen Palynomorphs indicators as well as in the lithology. The land-use for agriculture and grazing is also evidenced through the sequence by the occurrence of cultivated and synanthropic taxa together

with NPPs and charcoals. This data has been compared with the archaeological data in order to reconstruct the land use in the plain. The combination of palynological and sedimentological data describes an environment modelled by the fluctuations of groundwater and climatic variability as well as by the human pressure.

4 PRILE PROJECT: EXPLORING A CHANGING COASTAL LANDSCAPE IN ETRURIA

Colombi, Camilla (Deutsches Archäologisches Institut, Abteilung Rom) - Hoelzmann, Philipp (Freie Universität Berlin, Fachbereich Geowissenschaften, Physische Geographie)

Since 2016, the 'Prile Project' has been investigating the relationship between the Etruscan settlement of Vetulonia and the ancient lagoon known as Prile, located on the Tyrrhenian coast in southern Tuscany (Italy). Combining archaeology and geosciences, the project aims to understand the changes in the landscape caused by the lagoon's silting up in the past and the subsequent changes in the use of the shores. So far, two drilling campaigns and four excavation campaigns have been carried out by the German Archaeological Institute (Rome) in collaboration with the Institute of Geographical Sciences of the FU Berlin. The fieldwork and subsequent sedimentological and geochemical characterisation of the sediments have provided significant new insights into the extent and evolution of the lagoon: for the first time, the presence of navigable ancient waters in the immediate vicinity of Vetulonia has been documented, changing our understanding of the ancient landscape. Not far from the reconstructed shores of the lagoon, a monumental Etruscan terrace complex has been discovered and partially excavated. Although the currently available data does not allow an interpretation of the complex as a harbour, it is evidence of the use of the shores by the population of Vetulonia between the 6th and 1st centuries BC. The paper will present the results of the project so far and the possible interpretations in terms of human-environment interaction in a dynamic area such as the Prile lagoon.

5 LIVING COASTSCAPES: LANDSCAPES, RESOURCES, AND POLITICAL STRATEGIES IN THE NORTHERN TYRRHENIAN SEA (PECORA RIVER VALLEY, CENTRAL ITALY)

Buonincontri, Mauro (Department of History and Cultural Heritage, University of Siena, Italy) - Volpi, Vanessa (Department of History and Cultural Heritage, University of Siena, Italy) - Clò, Eleonora (Department of Life Science, University of Modena and Reggio Emilia, Italy) - Furia, Elisa (Department of Life Science, University of Modena and Reggio Emilia, Italy; Department of Biology, Tor Vergata University of Rome, Italy) - Florenzano, Assunta (Department of Life Science, University of Modena and Reggio Emilia, Italy) - Poggi, Giulio (Department of History and Cultural Heritage, University of Siena, Italy) - Dallai, Luisa (Department of History and Cultural Heritage, University of Siena, Italy) - Di Pasquale, Gaetano (Department of Agricultural Sciences, University of Naples Federico II, Italy) - Mercuri, Anna Maria (Department of Life Science, University of Modena and Reggio Emilia, Italy) - Bianchi, Giovanna (Department of History and Cultural Heritage, University of Siena, Italy)

In the Central Mediterranean basin, fluvial and alluvial dynamics played a central role for the evolution of coastal plains between sea and higher ground, producing variety of wetland areas. The Pecora river valley, in the Maremma region (south-western Tuscany, central Italy), was focus of multidisciplinary research connecting ecological processes and archaeological sources in a Mediterranean wetland to determine how humans and environment interacted. Off-site geo- and biostratigraphic records involved different "biodiverse" proxies, to detect climatic fluctuations and anthropogenic activities: sedimentary, bio-stratigraphic (pollen and micro-charcoal) and geochemical investigations on sediment cores; facies and sediment charcoal analysis from Pecora river palaeochannel; geomorphological and stratigraphical analysis of the river catchment. Excavated sites, fieldwork surveys, and bioarchaeological study, were considered on-site records of local human activities. Upstream valley marshy environments and small lagoon on the coast influenced range of settlement, land management, and resilience strategies in the last 3200 years. The river Pecora was characterized by natural gravel-sand meandering course at ca 2500 years BP. Q. cerris forest, much larger and extended, covered slopes and floodplain, while the distal valley reach had mostly open landscape, exploited for grazing resources into territory with specific vocation (salt and iron). Human-induced fires and land use driven changes in tree biodiversity, ensuring agricultural exploitation. From ca 1300 years BP (Early Middle Ages), hydraulic works and fire episodes contributed to upstream wetland reclamation and to vegetation clearing of swamplands, inducing braided gravel-bed fluvial phase and new arable lands. The resulting landscape depended on political strategies of the Medieval authorities and represented considerable impulse for new land usage determining permanent change in physical and biological environment, with definitive success of local cultural landscape until the modern era.

Research within funded European Research Council nEU-Med Project (Host Institution University of Siena, PI prof. Richard Hodges, Grant agreement 670792).

6 RISE AND DEMISE OF SALT PRODUCTION BY IGNITION DURING THE LATE PREHISTORY IN COASTAL SITES AT THE IBERIAN PENINSULA

Jimenez-Espejo, Francisco (Instituto Andaluz Ciencias de la Tierra (CSIC), Granada, Spain.) - López-Sáez, José (Environmental Archaeology Research Group, Institute of History, CCHS CSIC, Madrid, Spain.) - Bulian, Francesca (Groningen Institute of Archaeology, University of Groningen, Groningen, The Netherlands) - Valiente, Santiago (SEHA (Sociedad Española de Historia de la Arqueología) y CEDHAS) - Garrido-Pena, Rafael (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid, Madrid, Spain) - Ayarzagüena Sanz, Mariano (SEHA (Sociedad Española de Historia de la Arqueología) y CEDHAS) - Gonzalez-Ramón, Antonio (Instituto Geológico y Minero de España (IGME-CSIC), Spain) - Giles, Francisco (Museo Arqueológico Puerto de Santa María, Cádiz, Spain) - Camuera, Jon (Instituto Andaluz de Ciencias de la Tierra (IACT), CSIC-UGR, Armilla, Spain.)

Salt is an irreplaceable resource obtained in coastal settings among other locations. In the Iberian Peninsula coastal evaporite saltworks using ceramic vessels, known as briquetage, for the artificial evaporation of salt water has been described from Late Neolithic. Nevertheless, briquetage sites along the Atlantic Iberian coast are not active during the Late Chalcolithic/Early Bronze Age when they were abandoned. In this study, we discuss the climatic, social and cultural changes occurred along the entire Iberian Peninsula when these coastal production sites were not active. The comparison between the distribution of the archeological sites with Atlantic halberds and the copper mines, evaporites outcrops and salt interior briquetage sites point to a distribution network between Iberian interior and the Atlantic estuaries like Douro, Tagus, Sado, and Guadalquivir rivers. We also link the relevance of salt consumption with the extreme arid conditions established in certain areas of Western and Central Europe during the so called "4.2 kyr event", that in Iberia appears as two differentiate pulses at 4.5 and ~4.2 kyr cal BP (2.500 and 2.200 yrs BCE) in climatic stacked records.

7 HUMAN ADAPTIONS TO AN UPLIFTING COAST (BORRE ROYAL BURIAL SITE, OSLO FJORD, NORWAY) - A GEOARCHAEOLOGICAL APPROACH

Draganits, Erich (University of Vienna) - Doneus, Michael (University of Vienna) - Gansum, Terje (Norwegian Institute for Cultural Heritage Research) - Gustavsen, Lars (Norwegian Institute for Cultural Heritage Research) - Nau, Erich (Norwegian Institute for Cultural Heritage Research) - Tonning, Christer (Vestfold fylkeskommune) - Trinks, Immo (Vienna Institute for Archaeological Science) - Neubauer, Wolfgang (University for Continuing Education Krams)

The Nordic Iron Age and Viking Age royal burial site of Borre in the Oslo Fjord in Norway is a very important archaeological site in Northern Europe containing outstanding ship burials. Up to 7.5 m high burial mounds, associated archaeological structures and geomorphological features have been analysed by a 1x1 m digital terrain model derived from airborne laser scanning and targeted geoarchaeological fieldwork. Ground penetrating radar profiles investigated the internal structure of selected micro-topographic features. Scandinavia is strongly affected by ongoing post-glacial isostatic rebound, with a present mean surface uplift around 3.7 mm/year at Borre. Local sea-level reconstructions in the Oslo Fjord indicate that the burial site of Borre was located close to the shoreline in the period of its use (ca. 600 and 1000 CE) when the local sea-level was ca. 5-3.5 m higher than today. Elevated beach ridges were documented from within the burial site down to the present shoreline. Two prominent ridges, oriented perpendicular to the coastline, < 4.5 above present day sea-level are interpreted as Viking Age breakwaters facilitating safe landing on the otherwise little protected coast. The probable breakwaters are some 150 m and 170 m long and comprise of polymict, sub-rounded to rounded, up to 1 m sized boulders, which are very rare in the study area, except in the Ra Moraine, an impressive terminal moraine of the Younger Dryas, located only 450 m towards the west. While the beach ridges > 4.5 above present day sea-level are relatively straight and parallel to the coast, those < 4.5 above present day sea-level are strongly deflected around the two ridges. A 120 m long and 40 m wide, deepened area without beach ridges next to one breakwater is interpreted as a human intervention to prolong landing of Viking ships at the continuously uplifting coast.

330 TEXTILE RECORDS: PAST, PRESENT AND FUTURE OF TEXTILE-RELATED ARTEFACTS RECORDING IN THE MEDITERRANEAN AND BEYOND

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Iancu, Alina (National Institute of Heritage of Romania) - Sarri, Kalliope (University of Peloponnese)

Session format: Regular session

Since always textiles have been a necessity for daily protection, social display, home furnishing, transportation, war logistics and various other purposes. Even though textiles only survive under extreme environmental conditions, many

archaeological finds bear witness to these indispensable goods as well as to the craft itself. Finds such as fragmentary preserved fabrics, textiles mineralised on metal objects, carbonised fibres and textile imprints provide data on the quality and type of materials and techniques used to produce textiles in the past. In addition, a wealth of tools offers insights into the technologies used by prehistoric and ancient craftspeople to process the raw fibres into finished textile products.

Even though textiles were crucial to past societies, they are less represented in archaeological publications than other finds. One of the reasons for this could be their gender-specific character. For decades, they were thought to be the result of a modest domestic craft, mainly practised by women. Other reasons are the general lack of interest in the subject and the lack of knowledge about such objects. As a result, the publication of textiles and textile-related tools is still prone to confusion and misinterpretation.

Recent advances in the field of archaeological textiles provide good reasons for a reassessment of the old literature and for an in-depth analysis of how professionals in archaeology might approach and better publish textile-related artefacts in the future. We call on both archaeologists and textile experts to share their insights into the history of recording textile artefacts, and to suggest new methodologies to integrate these finds into general archaeological publications with the same consistency as other finds. We are also interested in producing, if possible, a short and comprehensive step-by-step guide with basic information on how to correctly record, describe, illustrate and publish textiles and textile tools in archaeology.

ABSTRACTS

1 RECORDING TEXTILE TOOLS' CONTEXTS? CASES FROM AEGEAN PREHISTORY

VAKIRTZI, Sophia (Hellenic Organization of Cultural Resources Development)

Recording textile tools ideally begins in the field, by documenting, in as much detail as possible, their context. Context is crucial, not only for their chronology and spatial associations, but sometimes even for their identification as textile implements. Furthermore, it often clarifies issues of textile technology, scale or mode of production.

This paper discusses early to recent cases of textile tools' context recording (or lack thereof) from the literature of Aegean prehistory and from the author's research experience. It showcases exceptional contexts of loomweights and spindle whorls as well as problematic cases whose interpretation remains open to research. It also presents examples of a particularly challenging circumstance for recording these contexts, which is rescue excavations, characterized by extraordinary fast paces of digging and recording.

The aim of the paper is to contribute to discussions concerning the establishment and communication of protocols for recording context data of textile tools during fieldwork.

2 NECROPOLIS OF THE WIELBARK CULTURE IN WILKOWO AS AN EXAMPLE OF SUCCESSFUL COOPERATION BETWEEN FIELD ARCHAEOLOGISTS, CONSERVATORS AND TEXTILE ARCHAEOLOGISTS

Przymorska-Sztuczka, Magdalena (Archaeological Museum in Biskupin, Poland)

On the necropolis of the population of the Wielbark culture (2nd half of the 2nd century - 1st quarter of the 3rd century A.D.) in Wilkowo, Poland, more than 200 graves were discovered, of which inhumation burials predominated. Numerous textile tools and metal artefacts were found, with remnants of textiles preserved (over 250 fragments in total). The excellent documentation of the archaeological objects during the excavation (marking the location on the grave plan of each artefact) and the later photographic documentation of the metal objects before their conservation led to the discovery that, in several cases, fabrics of different types were layered. This made it possible to determine with a high degree of probability that a deceased person was buried in several layers of clothing. There may have been a garment consisting of two parts: a sleeveless peplos-style outer garment made of thicker material and fastened with brooches at the shoulders and a long shirt or tunic with sleeves made of softer and thinner fabric. The field documentation has also made it possible to identify the co-occurrence of particular categories of textile tools, e.g. spindle whorls and hooked pins. The experience gained from working with field archaeologists and conservators has allowed the author to create textile object cards, which she uses in her research on the prehistoric textile economy.

3 GREY AREAS IN THE IDENTIFICATION AND RECORDING OF TEXTILE TOOLS. SOME ENIGMATIC CASES FROM AEGEAN PREHISTORY

Sarri, Kalliope (Postdoc researcher, Centre for Textile Research (CTR) Saxo Instit)

Weaving is one of the most important sustainable technologies of prehistory. However, the lack of actual fabrics and the production of tools from perishable or recyclable materials have resulted in a limited knowledge of textile technology for much of the prehistoric era.

Another reason is that most researchers are not familiar enough with the technology, production stages and development of textile art that would lead to the accurate identification of the relevant tools. Apart from the standard and easily identifiable finds (e.g. loom weights, spindle whorls and needles), several textile tool groups are hidden in other groups of finds. Some are included in the large and vague group of 'small finds' without their exact purpose being determined. Others are related to weaving or textile products due to similar materials and shapes (e.g. spools, miniature whorls and conuli). However, we are unaware of which production phase these have used. In some cases, a false interpretation is conveyed, and due to their enigmatic purpose, they have been placed not only in the realm of utilitarian objects but also in the context of rituals as objects of worship and symbolism (e.g. clay anchors).

The use of modern methods of analysis and recording, which could easily solve several problems of interpretation, such as traceology or experimental approaches, is still minimal. These problems in identification and museological management lead to misrepresentations of textile tools in many exhibitions and consequently to misinformation of visitors, perpetuating a knowledge gap. The paper will discuss the identification and purpose of some textile tool groups from the Aegean prehistory (e.g. hooks, bone awls, spinning bowls, conuli) that need to be understood and clarified and propose new reconstructions and methods to approach and record them.

4 ROMAN SPINNING TOOLS A HISTORY OF MISUNDERSTANDING

Dankovic, Ilija (Institute of Archaeology, Serbia)

Arguably, there is not a single item of Roman material culture that has more often been wrongly interpreted and recognized than that is the case with distaffs, and to some extent, spindles. Former are being mistaken for hairpins, stirring sticks, ointment applicators, etc. to this day. This is surprising as they are frequently depicted on grave stelae and found together in female burials.

In this paper, reasons for such a situation will be reasoned as parts of two wider occurrences in the archaeology of ancient Rome. First of these was the long and painful intrusion of women-related topics into the study of the mentioned period. The other is the general understudy of textile production.

With few notable exceptions, Roman spinning implements haven't been comprehensively studied and published. Many questions regarding dating, distribution, and functionality remain open. There is a clear necessity for gathering entire corpora of spinning implements, with the archaeological context where it is available, to make one step further in their understanding.

5 ANYTHING BUT A DISTAFF: THE MISIDENTIFICATION OF TEXTILE TOOLS IN THE NORTH-WEST PROVINCES OF THE ROMAN EMPIRE

Hamelink, Anique (University of Amsterdam)

Ritual staff, scroll holder, hair curler: these are some of the interpretations given to objects which textile specialists identify as distaffs. Due to their diversity in shape and material throughout the Roman empire, textile tools in general, and distaffs especially, are difficult to identify for the non-specialist. As a result, textile tools suffer from poor archaeological visibility and the study of their distribution, use and meaning is limited.

Yet it is their variety in form and material that makes distaffs especially interesting. Distaffs were objects that were functional tools used in the spinning of fibers as well as items of beauty, economic, and symbolic value. They were often decorated elaborately and/or crafted from precious materials such as amber, bronze or jet. Their placement in graves suggests they were meaningful objects that represent an aspect of the identity of the deceased.

The contemporary occurrence of both local and pan-regional distaff types is notable: some, such as amber bead distaffs, are found across large areas of the Roman empire, while others appear to be entirely local forms. The geographical distribution and archaeological context of distaff types merits investigation. It provides the opportunity to study textile tools and their users as active participants in empire-wide and local trends in textile production.

This paper will present a study of ornamented distaffs from Roman Britain and the Netherlands, discussing two types that are unique to the north-west provinces. These distaffs have been inaccurately identified as various other items unrelated to textile production. By presenting this study, I hope to contribute to the systematic and complete collection of textile tools in the Roman world.

6 IMPORT OF TEXTILE TOOLS TO ROMAN HISPANIA. SOME CASE

Bustamante Álvarez, Macarena (Universidad de Granada)

A set of textile tools found in Hispania is presented, which initially came from other parts of the Empire. Specifically, we are referring to some distaffs made of jet and amber, typical products of the northeastern border areas.

In addition to a typological characterization, an archaeometric as well as contextual study is addressed. Likewise, there are other parallels of similar typology located in others in the Mediterranean.

The analysis reinforces the cross-border nature of some technological practices such as textiles. This study serves to present these pieces in their context and evaluate them not only from a technical point of view, but also from cultural responses.

Likewise, we want this communication to serve to encourage tracking in other parts of the peninsula.

This study is part of the results of a research project developed by the University of Granada under the title *Texlus. The Economy Of Textile Craft In Roman Lusitania*.

7 LEAD SPINDLE WHORLS AND LOOM WEIGHTS IN THE AEGEAN AND IN PONTUS IN THE FIRST MILLENNIUM BC

Iancu, Liviu Mihail (Institute of Advanced Studies in Levant Culture and Civilization Bucharest)

Despite its huge importance, textile production was one of the ancient economic branches that required the most basic, affordable, and within-reach tools. Among other factors, the ability of spinners and weavers to produce their own tools – spindles, distaffs, and looms – from cheap materials like wood and clay contributed to the persistence of spinning and weaving largely as domestic crafts.

However, some components of the textile production implements, in particular the spindle whorls and the loom weights, could have been made of metal. More durability, standardization, and compactness were gained in exchange for increased manufacturing costs and limitation of production to specialized metallurgical workshops. Symbolically, the owners of metal implements could have claimed a higher position in the social hierarchy.

Against the lack of written sources about these textile tools, their correct identification in the archaeological record becomes a significant issue. Particularly numerous lead artefacts resembling spindle whorls and loom weights were discovered at various sites in the Aegean and Black Sea region, in contexts associated with the Greeks of the first millennium BC or other closely linked peoples, such as the Scythians. Most scholars interpret the finds as implements for textile production yet there are differing views on this assessment. Lead spindle whorls are sometimes treated as beads, buttons, and clothing accessories. Lead loom weights are alternatively considered to be fishing or commercial weights.

Based on the examination of the archaeological contexts and the functional parameters of these artefacts, the paper demonstrates that they can often be reliably connected to the production of textiles. A set of practical criteria for the archaeologists seeking to establish their functionality is proposed. Additionally, some observations are made on how these tools were produced, traded, and used by their final consumers.

8 FROM TEXT TO LOOM: WRITTEN AND ARCHAEOLOGICAL SOURCES ON LOOMS AND THEIR TOOLS FROM THE 1ST-5TH CENTURIES CE

Vega Medeiros, Claudia (Complutense University of Madrid (Spain)) - Morgado-Roncal, Leyre (University of Granada (Spain))

The aim of this paper is to put forth a diachronic interdisciplinary study that synthesizes the written and archaeological evidence available to shed light on the evolution of late Roman and early Byzantine looms and their tools.

To achieve this, we will offer a comprehensive philological examination of a selection of relevant Greek and Latin sources from the 1st – 5th centuries CE, ranging from literary works to lexicographies and glossographies. Our objective is to not only present the insights into weaving practices that can be deduced from these written testimonies, and, in this regard, we will revise Muthesius' commentary (2002: 156-157) of Theodoret of Cyrrhus' depiction of a 5th-century loom ("De Providentia", 83.617, 40-53), which in our understanding is an overinterpretation of the text; but also, to undertake a thorough analysis of the lexicon pertaining to loom tools within their respective contexts, which is crucial for a genuine understanding of the nature of these objects. Specifically, we will focus on the terms for pin-beaters, weft-beaters (Gr. κερκίς, σπάθη; Lat. "radius", "spatha"), and heddles (Gr. διάσμα, κανών, μίτος; Lat. "licium"), which vary extensively depending on the author, context and period.

In conjunction with this in-depth philological examination, several archaeological and ethnographic case studies of these "instrumenta textilia" (mainly beaters and heddles) will be presented. Although these implements were basic elements of the loom, they have rarely been identified "in situ", mainly due to insufficient expertise and polyfunctionality within this field of archaeology. As a result, these tools often lack a precise archaeological context, hence our

desire to showcase their morphological characteristics, drawing comparisons between the testimonies of the written sources and the tangible evidence of the archaeological record, in hopes of contributing to their future identification.

9 LOOMWEIGHTS THROUGH THE AGES. WHAT CAN THEY LOOK LIKE - HOW HEAVY SHOULD THEY BE?

Trinkl, Elisabeth (University of Graz)

Loomweights are an indispensable part of the warp-weighted loom, which has been the most important tool for the production of fabrics in almost the entire Mediterranean region in antiquity. The widespread use of this textile technique resulted in an equally widespread use of loomweights, usually made of clay, but there is also evidence of loomweights made of stone or metal. The other parts of the loom were made of perishable material and have therefore mostly disappeared – apart from a few in situ finds.

A comparison of loomweights in different regions and eras reveals strong regional and chronological differences. In addition to the textile raw material and the weaving technique, the shape and weight of the loomweights in particular determine the appearance and characteristics of the finished product. Hence, the analysis of the imperishable loomweights allows us to draw conclusions about the material properties of textiles made with them. Standardised documentation and publication are essential for this.

10 NET SINKERS OR LOOM WEIGHTS? PERFORATED SHERDS FROM THE PREHISTORIC SETTLEMENT ON KOUKONISI, LEMNOS AS A STUDY CASE

Boloti, Tina (National and Kapodistrian University of Athens)

Among the textile tools which usually survive archaeological deposition are the loom weights. The latter constitute a valuable source of information to archaeologists working with textiles and textile production, since they testify undoubtedly the use of the so-called warp-weighted loom, a loom type, which, according to E. Barber "was born and developed in southeast Europe and perhaps Anatolia in the Neolithic, expanding farther and farther to the north and west in the Late Neolithic, Bronze and Iron Ages, but not generally expanding to the south or east, presumably because the inhabitants of those territories already had a practical loom, the ground loom".

In the Bronze Age Mediterranean, the loom weights were usually made of either fired or low baked/ unbaked clay (simple pebbles may also have been used although these are almost impossible to identify in the archaeological record). Apart from a large variety of loom weight shapes (from flat discoid to flat rectangular, from spherical to hemispherical, and conical to pyramidal), there are also cuboid, cylindrical or spool shaped and crescent shaped types, although, since the first publications, it has been controversial whether all such shaped artefacts were in fact used as loom weights. Within this broad category (of potential loom weights) perforated sherds are included.

Despite the functional identification of perforated clay objects as loom weights is highly controversial (some are called 'net sinkers' or just 'perforated objects'), in this paper I aim at examining the corpus of perforated sherds from the prehistoric settlement on Koukonisi Lemnos as a study case, in order to contribute to the related discussion.

11 HOW WERE PERFORATED CLAY LOOM WEIGHTS MADE, AND WHY IS THEIR SHAPE SO DIFFERENT?

Boertien, Jeannette (Groningen University)

Loom weights appear in a wide range of different sizes and shapes. They are usually classified on morphological criteria. In a technological study of Iron Age loom weights from Transjordan a simulation experiment led to the reconstruction of the chaîne opératoire in the fabrication of perforated clay loom weights. The experiment showed convincingly that it is indeed probable to distinguish between traces originating from manufacturing techniques and traces caused by the weaving process.

Analyzing the chaîne opératoire paved the way for determination of variability in shape and perforation due to the production process, leading to a new classification for perforated clay loom weights.

Working with this new classification made it possible to categorize meaningful differences within assemblages of loom weights.

Variety in weight is essential for the weaving process, it is a key to reconstructing whether vegetable material or wool was being used. And finally, the shape and especially the thickness of loom weights on a loom tells what kind of cloth was being woven, be it open and fine, or thick and fluffy. The position and the amount of loom weights within a set ads information on the question if patterns were being woven.

Technical research on the production process of loom weights from five different Iron Age sites in Transjordan opened up new views on textile production in this region and period.

12 A LESS KNOWN YET ESSENTIAL CLASS OF TEXTILE TOOLS: CLAY SPOOLS IN ARCHAEOLOGY

Iancu, Alina (National Institute of Heritage of Romania; The Hellenic Centre for Research and Conservation of Archaeological Textiles (ARTEX))

Spools appear to be essential components for deciphering the art of prehistoric and ancient textile manufacture, together with loom weights and spindle whorls, given the regular quantity of such objects on many settlements.

Clay spools have been found at various prehistoric and ancient sites throughout the Greek world, including on the islands, on the mainland (e.g. on Crete, throughout the Peloponnese, Thessaly, Aetolia and Chalkidiki) and beyond in the Ionian and Pontic colonies. The Italic region, Sicily, the Iberian Peninsula and other parts of Europe (such as Switzerland, Germany, Austria, Romania, Bulgaria and Ukraine) are also known for consistent or at least sporadic occurrence of spools. They are also known throughout the Near East, which includes Israel, Palestine, Syria and Anatolia.

Nevertheless, among all the clay textile implements used by prehistoric and ancient craftspeople to equip their spinning and weaving installations, the objects identified in archaeology as spools, bobbins, reels, or cylinders seem to be ambiguous. For this reason, they are not so well represented in the literature. Therefore, while the traditional types of loom weights and most clay spindle whorls have already been published with detailed descriptions and classifications, spools remain a controversial topic in Mediterranean archaeology and beyond.

This paper aims to provide an overview of the topic, point out their enigmatic presence in the literature and offer a revised method for cataloguing and publishing clay spools. The following elements are among the most important that will be covered: 1. terminology related to spools; 2. typological classification of spools according to their morphology; 3. the proper method for describing them and the reasons why marks, wear traces, and clay properties are important for understanding the function of these tools. And last but not least, it will be suggested how to properly illustrate spools in archaeology.

13 TOOL BOXES FOR TEXTILE WORK? FUNERARY MODEL CHESTS FROM IRON AGE ATHENS IN THE LIGHT OF RECENT TEXTILE RESEARCH

Houby-Nielsen, Sanne (The Nordiska museet)

Model chests of pottery constitute a well-known feature in Iron Age burials in Athens, Greece. They have been the subject of much scholarly debate and seen as characteristic markers of rich female burials. Yet, the actual wooden chests which the models supposedly imitate have seldom been discussed from a functional point of view, nor the function of the models themselves. This paper will discuss the models in the light of recent textile finds from Iron Age and Archaic Athens (11-7th century BC) and in the light of recent research into Iron Age textile industries. Drawing on ethnological parallels from the Mediterranean, Scandinavia and other parts of the world, the paper proposes that the models imitate larger chests for various kind of specialized textile making, such as fine wool working, spinning of very fine threads, plying of threads and colour dyeing techniques, all of which signalled a very high status of the deceased woman and the degree to which complex textile products were a status marker. The models should therefore be registered as textile tool boxes in placed in the history of textile making along with items such loom weights, spindles, distaffs and the like.

14 RECORDING USE- WEAR TRACES ON TEXTILE TOOLS WITH REFLECTANCE TRANSFORMATION IMAGING (RTI): A CASE STUDY FROM ARCHAIC MESSAPIA

Sabetta, Gaia (Università del Salento)

This study aims to elucidate the application of Reflectance Transformation Imaging (RTI) in the study of archaeological artifacts from two sites in Archaic Messapia (Apulia, Italy).

By leveraging Reflectance Transformation Imaging (RTI), it is possible to explore the surface features of these artifacts. By capturing detailed surface data from multiple angles under controlled lighting conditions, we have been able to reveal subtle traces of wear, tool marks, and manufacturing techniques embedded within the surface. In archaeology, this process is successfully applied to various classes of materials, albeit not extensively. In the case of the presented Messapic sites, the method has been employed for the analytical description and examination of textile production indicators, such as terracotta spindle whorls, loom weights and bone pin beaters.

This research, developed within the framework of the author's doctoral project, has allowed the observation of various types of traces connected both to the manufacturing processes of the analyzed tools and their use in the operational chains in which they are inserted. The protocols used for image acquisition, the tools employed, and the processing times required for each elaboration are thus illustrated. Additionally, some of the results obtained from the experimentation of the RTI method on the examined materials are presented, followed by a discussion concerning the potentials and limits recognized during the application.

15 COMMUNICATING TEXTILE ARTIFACTS: TEACHING AND EXHIBITING THROUGH SCIENTIFIC AND DIGITAL STORYTELLING

Nikolovieni, Gerasimoula Ioanna (Brown University)

As modern-day people, we are currently used to consuming products that we have not produced ourselves or ignoring their production methods. For this reason, most of us are not quite familiar with ancient or traditional textile crafts. In such a context, the textile tools of ancient communities could be bewildering and unfamiliar. As textile craft researchers, we mainly communicate our work with two groups of audiences, students and the public, and we often have difficulties in communicating our research adequately. This paper will look into methods of teaching textile crafts through their material culture and use collections for hands-on teaching experiences. Microexhibitions will be suggested as a teaching and exhibition tool, as well as a method to connect collections, students and researchers, and the public. In addition, the paper will also discuss the benefits of scientific and digital storytelling and how both can be employed to communicate textile tools both to students and the public.

331 ACROSS DESERTS AND SEAS: TEMPOS AND MODES OF NEOLITHIZATION IN THE HORN OF AFRICA AND THE ARABIAN PENINSULA

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Scancarello, Olivier (Université Côte d'Azur, CNRS, CEPAM) - Maiorano, Maria Pia (Goethe University Frankfurt, Institute for Archaeological Sciences, Dept. Near Eastern and Classical Archaeology)

Session format: Regular session

The Holocene witnessed a profound shift from millennia of hunting, gathering, and fishing to the emergence of food producers worldwide. However, the timing and nature of this transition to domestication varied greatly across the globe. In the Horn of Africa, renowned for its diverse ecological niches, this period still needs to be fully understood. To date, the earliest evidence of herding in the region can be traced back to the Middle Holocene. In contrast, in neighboring regions such as Sudan and the Arabian Peninsula, evidence for domestication practices date back to several thousand years earlier. Moreover, substantial evidence of exchange networks and intercontinental human interactions across the two shores of the Red Sea has been demonstrated since at least the Middle Holocene. However, the adoption of production economies was not always an unambiguous choice. Furthermore, while hunting-gathering-fishing were the only practices known in the Horn of Africa during the Early Holocene, the presence of small-scale herding practices without any evidence of cultivation were common in several regions of the Arabian Peninsula. Finally, in different areas, the adoption of agropastoralism did not necessarily coincide with pottery production, and vice versa. These complex divergences underscore the need for a comprehensive understanding of when and how the phenomenon of neolithization unfolded. In light of this considerable variability, likely influenced by highly diverse local paleoecological characteristics and potential bias in the preservation of organic remains, this session aims to foster discussions on the linked processes of the emergence of the Neolithic era in the Horn of Africa and the Arabian Peninsula. We invite papers submissions in the field of archaeozoology, archaeobotany, lithics, pottery, rock art, and genetics, all of which serve as valuable tools for deepening our knowledge of the emergence of the Neolithic within and across these two key regions.

ABSTRACTS

1 HOW TO DIFFERENTIATE LITHICS FROM MESOLITHIC AND NEOLITHIC PERIODS DURING SURFACE SURVEY IN CENTRAL SUDAN?

Kapustka, Katarina (Institute of Archaeology CAS; Czech Institute of Egyptology FF UK)

Within the Nile Valley rather poor preservation of stratigraphic record has been a well-known problem of prehistoric research. High number of finds often comes from surface survey and similarity of Mesolithic/Neolithic toolkit and raw material economy complicate chronological association of sites. The only clear marker is the presence of gouges during the Neolithic period. This paper presents the methodological approach we employed to gather more systematic information of composition of lithic collections at sites in the regions of Sabaloka and Shaqadud in central Sudan. Our aim was to find a way to compare different surface records and to capture basic characteristics of recorded sites, not only to pick up some tools, but also to gather complex information on raw material proportions, production categories composition, size of lithic pieces and, of course, typology of the site. This approach consists of a series of total counts, in which several small spots are characterized as to raw material, size, production category and typological characteristics, with collected data suitable for comparison not only within the studied region, but with other published sites too. This approach enables us to discern basic economic trends in the lithic production and consumption, because it is not focused only on selected artifacts (e.g. tools), but is also coping with production waste, so it shows overall view of

the lithic collections from the sites. In this paper we point out the similarities and differences between sites associated with different chronological periods.

2 SPOTLIGHT INTO LATE PALAEO-LITHIC - NEOLITHIC TRANSITION IN SOUTHERN ARABIA: THE WĀDĪ SAYY ROCK SHELTER

Chlachula, Dominik (Research Centre for the Paleolithic and Paleoanthropology, Institute of Archaeology Brno, Czech Academy of Sciences, Brno – Czechia; Department of Archaeology and Museology at Masaryk University, Brno - Czechia) - Maiorano, Maria Pia (Institute for Archaeological Sciences, Goethe University Frankfurt, Germany) - Danielisová, Alžběta (Institute of Archaeology Prague, Czech Academy of Sciences, Prague – Czechia) - Garba, Roman (Institute of Archaeology Prague, Czech Academy of Sciences, Prague – Czechia; Nuclear Physics Institute, Czech Academy of Sciences, Prague – Czechia)

The area surrounding the port city of Duqm in south-central Oman has undergone significant industrial and economic development. In 2015, an Italian rescue archaeological mission documented hundreds of archaeological sites within the Special Economic Zone at Duqm (SEZAD). These sites include tombs, triliths, and abundant surface lithic scatters, tentatively dated to the Holocene and presumably the Terminal Pleistocene.

One noteworthy discovery by the Italian team is a small rock shelter (DUQ-25a) in the Wādī Şayy, representing one of the few stratified sites. Lithic material, including a biconvex tanged projectile point excavated from the initial test trench in 2015, suggested a placement in the Middle Neolithic period. However, subsequent excavation seasons in 2023 and 2024, conducted under the ARDUQ archaeological project, revealed a much more complex occupation history ranging from the Late Palaeolithic to the Middle Neolithic.

Through absolute 14C dating and material culture analysis, the ARDUQ project provides the first direct evidence of Late Palaeolithic occupation in central Oman. This evidence indicates continuous development, at least into the Middle Neolithic. Our presentation focuses on the technological study of lithic industries within the dated stratigraphical context.

Furthermore, the site serves as a crucial witness to the transition between the Early and Middle Holocene, a phase almost unidentified in the region. It offers a unique opportunity to compare this aspect of Arabian prehistory with surrounding regions. While the Early Neolithic in Oman is poorly documented, the exploration of central southern areas is providing new insights into neolithization processes and mechanisms of technological innovation in the broader context of Southern Arabia.

3 UNCHARTED PAST: UNVEILING THE NEOLITHIC PATHWAYS OF THE UAE'S FERTILE COAST THROUGH NEW ARCHAEOLOGICAL INSIGHTS

Lidour, Kevin (DCT Abu Dhabi) - Al Hameli, Noura (DCT Abu Dhabi)

This paper examines recent research on the Neolithic period along the 'Fertile Coast' of the United Arab Emirates. Archaeological evidence suggests the existence of a cohesive culture across the coastal regions of the lower Arabian Gulf from the mid-seventh to the fourth millennium BCE. Despite the regional development of agriculture and pottery manufacture lagging behind that seen in the Levant and Mesopotamia, the indigenous groups forged unique pathways in their Neolithisation processes. Notably, the absence of pottery manufacture did not preclude the presence of advanced pyrotechnology as early as the end of the seventh millennium BCE, which is linked to the production of plaster vessels on the Abu Dhabi islands.

Sclerochronological analysis of fish otoliths has recently revealed evidence of a sedentary lifestyle, accompanied by early stone architecture and an economy predominantly based on maritime resources. Coastal ecosystems, such as mangroves and coral reefs, provide ecological refuges in arid landscapes. These habitats support a rich marine fauna that serves not only as a staple food for daily subsistence but also as a source of raw materials for technological and symbolic productions, in the form of shell tools and personal adornments, respectively. Funerary practices also bear witness to a strong connection with marine animals such as dugongs, dolphins, and sea turtles. The evidence presents an exemplary case study of maritime adaptation by ancient human groups, further highlighted by advanced seafaring and fishing techniques, colonisation of offshore islands, and extensive trade networks that spanned the Arabian Gulf.

The paper endeavours to construct a revised chronology that integrates the latest findings from the Emirate of Abu Dhabi and Northern UAE. By examining the diverse facets of Neolithic economies and material cultures, it aims to contribute to a deeper understanding of this period and to underscore the region's heritage significance for archaeological research.

4 OBSIDIAN FINGERPRINTING AND BACKED GEOMETRICS: TRACKING MOBILITY AND THE ADVENT OF HERDING IN ARABIA AND THE HORN OF AFRICA

Khalidi, Lamya (CEPAM, CNRS, University Cote d'Azur) - Scancarello, Olivier (CEPAM, University Cote d'Azur) - Davtian, Gourguen (CEPAM, CNRS) - Ménard, Clément (CERP, Tautavel) - Gratuze, Bernard (IRAMAT - CEB - CNRS - University of Orléans)

The transition to herding occurred at different times and at different rhythms in South Arabia (~9 ka) and the Horn of Africa (~5 ka), and yet a synthesis of published and new data demonstrates that there was cross-Red Sea contact between populations throughout these periods. Since 2014, the VAPOR-Afar program has been excavating in the Central Afar region of Ethiopia, along the Lower Awash River and the paleoshorelines of northern Lake Abhe. Several Neolithic sites have been excavated and dated and study of the assemblages, which include domestic and wild fauna, impressed and incised pottery, and obsidian stone tools have provided a more detailed understanding of the socio-cultural dynamics of these first herders. Data from obsidian fingerprinting and lithic analysis, also demonstrate local and long-distance mobility during the Mid- Late Holocene transition allowing us to compare the movements, the material culture and the social trajectories of these societies with those of contemporaneous Bronze Age societies in Arabia and to better understand the process of cross-continental Neolithization and cultural exchange.

5 A GENETIC ANALYSIS OF A NEOLITHIC CATTLE FROM SAUDI ARABIA HELPS EXPLORE CONNECTIONS BETWEEN PREHISTORIC ARABIA AND AFRICA

Diquelou, Deborah (Trinity College Dublin) - Mattiangeli, Valeria (Trinity College Dublin) - Kennedy, Melissa (The University of Sydney) - Thomas, Hugh (The University of Sydney) - Mullin, Victoria (Trinity College Dublin) - Bradley, Daniel (Trinity College Dublin)

The shift from a nomadic society of hunter gatherers to sedentary communities cultivating plants and/or herding animals represents one of the major events in human history. Thanks to developments in paleogenomics, we can study this event from a genetic point of view, and reveal information hidden until now in past organisms' genomes. In this study, we focus on cattle remains found in an archaeologically rich region of North-West Saudi Arabia, in the town of AIUla. Recent work from archaeologists are shedding lights on mustatils, 7 000 years old stone structures that are believed to be pilgrimage sites, and where offerings were made, including cattle. However, aridic regions such as Saudi Arabia are challenging for paleogeneticists as the environmental conditions are not suited to DNA survival, thus, ancient DNA studies in Saudi Arabia are very limited. Despite these challenges, we present the first ancient cattle mitogenome from Saudi Arabia sequenced from a Neolithic cow from AIUla. The haplogroup, "T1", determined for this specimen is the predominant haplogroup for African cattle today. This specimen helps to highlight the connection between Africa and the Arabian Peninsula via the human mediated migrations of domesticated cattle.

6 SETTING THE STAGE FOR NEOLITHIZATION: FIRE IN THE MOIST HIGHLAND FORESTS OF SW ETHIOPIA

Bodin, Stéphanie (Senckenberg Gesellschaft für Naturforschung) - Neumann, Katharina (Senckenberg Gesellschaft für Naturforschung) - Brandt, Steve (University of Florida) - Vogelsang, Ralf (University of Cologne) - Demissew, Sebsebe (Addis Ababa University) - Hensel-Karamalakidou, Elena (Kiel University) - Hildebrand, Elisabeth (Stony Brook University) - Casas-Gallego, Manuel (Complutense University of Madrid) - Hahn, Karen (Goethe University Frankfurt)

By the Late Pleistocene, there is ample evidence of landscape burning by hunter-gatherers in the Horn of Africa. By influencing vegetation composition and structure, landscape burning may be regarded as a form of niche construction that can increase the availability of useful plants, or expand habitats for herbivore prey. In the moist highlands of southwest Ethiopia, charcoal from archaeological sites can preserve records of landscape burning through pyrophytes – plants well adapted to repeated burning events. Pyrophytes include grasses and pioneer tree and shrub species that grow quickly after a fire; increased representation of these taxa in archaeobotanical assemblages can signal increasing human efforts to manage ancient landscapes. Two highland rockshelters have intriguing records for pyrophytes and open vegetation taxa: Mochena Borago (2200 m asl, >50-1.5 cal kyr BP), and Sodicho (1900 m asl, 27-0.3 cal kyr BP). At Mochena Borago, the charcoal record shows the presence of forest taxa together with pyrophytes from c. 50 kyr to c. 2 kyr cal BP. The Sodicho record depicts a savanna/forest ecotone with pyrophytes after the African Humid Period. These data contrast with paleovegetation models that predict only Afromontane forest. The discrepancy between modelled and actual data, plus the presence of pyrophytes, suggest that humans managed local landscapes. Their actions might have aimed to improve growing conditions for local underground starch plants, increase ground-level forage to attract herbivores, open land for better hunting visibility, or other goals. Whatever the immediate motive, humans' intensified landscape burning just after the AHP would have created new environments amenable to the later highland cultivation of yams and enset, and laid the groundwork for eventual development of

pastoral fire practices still used in the region today. Southwest Ethiopia provides an important example of fire as a tool of niche construction, ultimately setting the stage for later neolithization.

7 REAPPRAISING PROCESSES OF 'NEOLITHIZATION' IN EASTERN AFRICA: REFLECTIONS ON THE UTILITY OF A COLONIAL CONCEPT

Lane, Paul (Department of Archaeology, University of Cambridge) - Merlo, Stefania (McDonald Institute for Archaeological Research, University of Cambridge)

The routes to the transition from foraging to food production in eastern Africa were extremely varied, entailing the introduction of domesticated plants and animals from both elsewhere on the continent and from outside of Africa, in combination with population movements and autochthonous innovations. In the early decades of research on the region's archaeology, the term 'Neolithic' tended to be used to characterise changes in stone tool technologies rather than the transition to farming. Subsequently, the use of the term was narrowed to refer solely to those archaeological traditions associated with the introduction of domesticated animals and transitions to a pastoral way of life, often marked by the archaeological occurrence of distinctive ceramics. Concurrent research both around Lake Turkana in the north and Lake Victoria in the west, documented earlier instances of pottery pre-dating the arrival of these initial herding communities, however. Nonetheless, the term Pastoral Neolithic has entered the regional archaeological lexicon and is still used to refer to those material traditions associated with the initial transition to food production in the region. While a handy portmanteau term, the of a Pastoral Neolithic concept retains some of its earlier colonial baggage and, as explored in this paper, may need to be replaced.

332 CHANGE AND PERSISTENCE IN THE TRANSITION FROM LATE HELLENISTIC TO EARLY ROMAN IMPERIAL TIMES IN THE EASTERN MEDITERRANEAN

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Beaujean, Bas (KU Leuven) - Daems, Dries (Vrije Universiteit Amsterdam)

Session format: Regular session

The transition from Late Hellenistic to Early Roman times in the Eastern Mediterranean constituted a time characterized by both dynamic transformations and historically layered persistence in societal, economic and political trajectories across a diverse range of communities and environments. This session seeks to examine the multi-dimensional aspects of this transitional period through a number of key processes, including urbanisation and urbanism, trade and exchange, mobility, and the (re)creation of deathscapes. Through a multidisciplinary approach, we aim to shed light on the intricate interplay of continuity and change within this fascinating spatiotemporal framework.

We are particularly interested in contributions using material culture to demonstrate and/or discuss the interplay of change and continuity in community formation, studies evaluating the potential discrepancies and/or congruities between the historical and archaeological record, and research attempting to bridge the gap between change in the local archaeological record (settlements/cities) and broader socio-political, cultural, and economic system shifts (states/empires).

Our session aims to foster a comprehensive understanding of the Late Hellenistic to Early Roman transition in the Eastern Mediterranean. Going beyond homogenising narratives like Hellenisation and Romanisation, and highlighting the social diversity and complexity of this spatiotemporal framework. By bringing together experts in archaeology, history, and related fields, we hope to create a rich tapestry of knowledge that contributes to the broader narrative of the pivotal Late Hellenistic to Early Roman transition in the Eastern Mediterranean. We invite researchers to submit their proposals, thereby contributing to our collective exploration of this topic.

ABSTRACTS

1 MODELLING CHANGES AND PERSISTENCE IN URBANISATION DURING THE HELLENISTIC TO EARLY ROMAN IMPERIAL PERIOD IN ANATOLIA

Beaujean, Bas (KU Leuven, Sagalassos Archaeological Research Project) - Daems, Dries (Vrije Universiteit Amsterdam)

The diverse geography of Anatolia – ranging from well-connected coastal areas to fertile inland valleys and rugged mountain ranges – provided different opportunities and limitations for urbanization in antiquity. As the Hellenistic and Roman Imperial period in particular represent peak urban development across large swaths of Anatolia, this spatio-temporal framework provides opportunities to study the impact of this socio-ecological diversity on urbanisation. As such, in this paper, we model settlements as hubs of energy, resources and information flows (Daems 2021). As our

starting point, we use a well-defined set of selection pressures: subsistence, cooperation, competition, interaction, distribution, production, governance, and demography. These act as probabilistic, multi-level causal factors for the decision-making processes of social groups that shape the energy, resources and information flows driving urban formation. For example, increased competition between cities might initiate increased settlement nucleation, resulting in denser urban centres and decreasing numbers of rural settlements. This could create trade-offs between the need to cultivate sufficient land to sustain the community or the desire to participate in trade networks. By simulating such synergies and feedback loops between multiple selection pressures in a probabilistic framework, we generate scenarios that we can compare to empirical data from the archaeological record. This allows us to better understand change and persistence in urban development trajectories, not only vis-à-vis environmental conditions, but also in relation to changing political dynamics like (official) imperial incorporation in the broader Hellenistic state structures at the time. This study provides therefore a valuable contribution to the broader debate on the relationship between cities and kings in the Hellenistic period and urban development within the political and economic framework of the Roman empire.

2 THE USE OF MUTUAL INFORMATION TO TRACE HELLENISTIC AND ROMAN NETWORKS OF INTERACTION IN THE EASTERN MEDITERRANEAN

Daems, Dries (Middle East Technical University)

The study of material interaction networks in the ancient Mediterranean is a dynamic and multidisciplinary field that encompasses important contributions from archaeological, historical, and geographical perspectives. Important topics include: (1) the identification of trade networks and economic exchange facilitating the spread of goods, ideas and technologies; (2) the production and distribution of material culture; (3) (urban) connectivity and port cities as important hubs of connectivity networks across land and sea; and (4) innovations in transportation technologies facilitating connectivity and interaction. Scholars throughout this research field continue to uncover the rich tapestry of complex interactions and exchanges that shaped ancient Mediterranean societies.

Yet, our insights are hampered by several important restrictions, not the least the almost general lack of direct traces of interaction in the archaeological network. Whatever material residues we have (e.g. amphorae and other forms of ceramics) offer only a limited reflection of the actual socio-economic dynamics of trade and exchange. Yet, they remain our most important material source of information to help us untangle the complex networks of intentions, relationships, interests, and opportunities underlying the production and distribution of material culture in the Mediterranean.

In this talk, I will present a new methodology that can unlock a new avenue of research to further scrutinize the available material. The methodology is based on the combination of standard GIS tools such as least-cost pathway analysis and novel approaches based on mutual information analysis. Using available datasets such as the ICRATES dataset of Hellenistic and Roman tableware, the ORBIS dataset of trade routes in the Roman empire and the Roman Roads Network data, this paper aims to uncover some of the underlying drivers of interaction and exchange in the transformative period of the Late Hellenistic and Early Roman Imperial period (150 BCE – 150 CE) in the eastern Mediterranean.

3 THE ROMAN AGORA DISTRICT OF ATHENS: TRANSFORMATIONS AND INNOVATIONS BETWEEN THE HELLENISTIC AND ROMAN AGES

Mendolia, Chiara (Sapienza, University of Rome; Italian Archaeological School at Athens)

Studies on the archaeology and topography of Athens, regarding the Hellenistic and Roman phases, which have recently received increased attention, are still limited and confined to a few contexts. The city of Athens, unlike many other centers in the province of Achaia, is distinguished in the transitional period between the end of the Hellenistic age and the beginning of the principate by the persistence of a local way of building, which did not take second place to the Roman way.

Within the urban landscape, a case in point is the complex of the Roman Agora at Athens, located along the northern slopes of the Acropolis in one of the nerve centers of the Roman city. This was characterized by a series of changes as early as the Hellenistic age, with the construction of the Tower of the Winds and other buildings along the eastern side of the ancient market. But it was in the early imperial age that the most significant architectural interventions took place, with the monumentalization of the square.

The complex of the Roman Agora, due to its long diachrony, is the key example of a way of building in the Greek tradition that was progressively influenced by Roman building techniques, the mixture of which would then give rise to a new way of building during the 1st-2nd century AD.

Building upon my recent study on the construction techniques and architectural phases of the complex, carried out within the framework of the research of the Italian Archaeological School at Athens and with the support of the Ephorate of Antiquities of the City of Athens, this contribution will attempt to outline the urbanistic developments

and constructed of the area of the Roman Agora during the Hellenistic and Roman age, through an examination of the site dynamics and production processes.

4 DEVELOPMENT OF THE URBAN WATER MANAGEMENT IN THE RESIDENTIAL QUARTER (MALOUTENA AREA) OF NEA PAPHOS DURING HELLENISTIC AND ROMAN PERIODS

Romaniuk, Marcin (Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences)

This presentation provides a diachronic overview of the evolution of water management within the residential quarter of the Hellenistic-Roman city of Nea Paphos, Cyprus. It follows the results of research project no. 2018/31/N/HS3/03319, financed by the National Science Centre, Poland, and focused on the relics of hydrotechnical infrastructure discovered by the Polish Archaeological Mission of the University of Warsaw at the so-called Maloutena site in 1965-2016. Thus far, over 300 water installations, such as bottle-shaped cisterns, street sewers, terracotta pipelines, hypocaust baths, multi-seat latrines or siphon towers, have been recorded there. Such abundance and diversity of objects reflect the complexity and sophistication of local water management. Closer analysis has revealed that it underwent several significant transformations over time in response to various natural and cultural circumstances. From relatively simple early Hellenistic installations designed to collect water from winter rainfalls and sparse local intakes to the introduction of the advanced Roman waterworks feeding heavily-water-consuming luxury features such as ornamental garden piscinae or public thermae, the vital symbols of Roman culture. This presentation aims to trace these transformations, exploring their possible causes and implications, on the background of the city's history and the lifestyle of its citizens.

5 CHANGE AND PERSISTENCE: CISTOPHORI AND IDENTITY IN ROMAN ASIA MINOR

McCoy, Marsha (Southern Methodist University, Dallas, TX)

Scott and Webster (2003) situate the role of material culture in the complex and diverse transformation brought about by Roman imperialism. This paper examines the images and language on cistophori, the standard silver currency originally introduced by the Hellenistic Attalid kingdom by the mid-second century B.C.E., and retained after the kingdom was bequeathed to Rome in 133 B.C.E. These Roman period cistophori reveal a little noted but striking development from the late Republic to the early Empire, through which the systemic shift caused by Empire and the multi-dimensional integration of this area into Roman socio-political, economic, and cultural life can be documented. Cistophori first begin using the Latin language while retaining Greek in cistophori issued by Roman magistrates from 58 B.C.E., and most notably in an issue commemorating Cicero's proconsular governorship of Cilicia in 51-50 B.C.E. (Metcalf, 2017). This dual combination of Latin and Greek legends both makes the coins readable to local Greek speakers as well as Roman officials and businessmen, and also acknowledges the ongoing presence of the latter groups, while it keeps intact the traditional visual images of these coins. A decade later, however, cistophori minted in Ephesus in 39 B.C.E. commemorate the marriage of Antony and Octavia by showing the bust of Octavia on top of the traditional cista mystica flanked by snakes, while on either side of the snakes the legend is in Latin alone (Sutherland, Olcay, and Merrington, 1970). This trend continues as Greek completely disappears and the traditional images are displaced or entirely replaced by images reflecting political and social policies of Rome. By the time of Hadrian, cistophori have been completely integrated into the propaganda apparatus of the Roman emperor, as Asia Minor itself has become a thoroughly Romanized territory (Metcalf, 1980).

334 ETHNOGRAPHIC ANALOGY AND THE PLEISTOCENE ARCHAEOLOGICAL RECORD: RE-ASSESSING POTENTIALS AND PITFALLS

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Fusco, Marianna (Sapienza University of Rome; Universitat Rovira i Virgili Tarragona) - Taylor, Nicholas (Stony Brook University, New York; Turkana Basin Institute)

Session format: Regular session

Ever since the concept of a deep human past rose to widespread scientific acceptance in the 1800s, ethnographic and anthropological data have been considered valuable tools for understanding and interpreting the prehistoric archaeological record. Severe criticism of the fallacious and dangerous belief in modern hunter-gatherers as 'living human fossils' – an idea particularly prevalent in the early 20th century – was levelled against this approach, from which emerged a more mature consideration of ethnographic data as a potentially powerful source of testable hypotheses, when applied with appropriate caution.

In Africa for example, the 1960s-1970s witnessed intense debate over the relevance of ethnographic observations and models to the Early Stone Age (ESA) the settled result being archaeological traces >1.8 Ma are better understood using primate rather than human analogues. Ethnography approaches found a new niche in the 1980s as the Middle

Stone Age (MSA) (~0.4-0.03 Ma) was recognised as the likely source of the behaviour of Homo sapiens and its immediate precursors. With current archaeological evidence pushing back the appearance of some characteristic MSA behaviours into the late Acheulean/Early Pleistocene, it is worth revisiting the potentials and limits of ethnographic approaches to the African Stone Age.

This session welcomes current data bearing on all Stone Age periods, as well as comparative work from Europe and Asia. How far back in time modern observations and datasets can be meaningfully employed? How does their applicability vary between social, economic, and technological spheres? To what degree does ecology impact the accuracy and usefulness of ethnographical parallels? We particularly encourage case studies focusing on the interpretation of multi-stranded archaeological datasets, lithic and organic technologies, wider socio-cultural and economic factors, and the role of site formation processes, among others.

ABSTRACTS

1 ETHNOGRAPHY AND DEEP TIME ARCHAEOLOGY: A REEVALUATION

Harmand, Sonia (CNRS, UMR 5608 TRACES; Turkana Basin Institute; Stony Brook University; IFRA) - Taylor, Nicholas (Stony Brook University) - Boes, Xavier (INRAP) - Arrighi, Vincent (INRAP) - Prat, Sandrine (CNRS, UMR 7194 HNHP) - Arroyo, Adrian (IPHES-CERCA)

Ethnography and deep time archaeology: a reevaluation.

Ethnography has historically been a valuable tool for archaeologists in drawing analogies and interpretations about past human behaviors including those during the Pleistocene from about 2.6 million years ago. Ethnographical models have been used to interpret the archaeological evidence in terms of settlement patterns, subsistence strategies, social dynamics, and territorial behaviors. Famous key contributions of ethnography to understanding past human behavior include the landscape models formulated in the 1980s by renown scholars including L. Binford, G. Isaac and R. Potts. This paper will attempt to give a state-of-the-art on the now applicability of these models in the light of new discoveries made in the archaeology of the Pliocene and Early Pleistocene. As the evidence of hominin behavior is becoming increasingly remote in time, this paper will also discuss the relevance of non-human primate models as an alternative perspective to understand our deepest past.

2 THE MISSING OLDOWAN AT NASURA, WEST TURKANA: A CASE STUDY IN NON-HUMAN PRIMATE MODELS

Wilson, Evan (City University of New York Graduate Center; New York Consortium of Evolutionary Primatology; Turkana Basin Institute) - Böes, Xavier (INRAP - UMR 7194 HNHP - Département Homme & Environnement) - Arrighi, Vincent (INRAP-Midi-Méditerranée) - Prat, Sandrine (CNRS, INEE, UMR 7194 HNHP PaléoFED, MNHN) - Harmand, Sonia (CNRS, TRACES, UMR 5608; Turkana Basin Institute)

The time between 2.3 and 2.0 million-years-ago (Ma) is a critical yet poorly understood point of transition in the hominin lineage due to a relative dearth of well-dated archaeological sites. This period saw the widespread dispersal of stone technologies from sporadic, spatially restricted occurrences prior to 2.3 Ma, and the expansion of numerous derived hominin taxa by 2.0 Ma. The Nasura (NAS) site complex from the Nachukui Formation of West Turkana, dated within this interval, offers a unique opportunity to explore diachronic changes in hominin behavior, cognition, and foraging patterns. NAS is comprised of four in-situ archaeological occurrences found close together in both space and time and associated with hominin fossils, as well as high-resolution paleoenvironmental records. Essential to understanding these sites and their formation is the application of appropriate models for reconstructing hominin behavior. Here we present NAS as a case study in the use of the alternative non-human primate models in the Early Stone Age of eastern Africa.

3 POUNDING TOOLS: LIMITATIONS AND ADVANTAGES IN USING PRIMATES TO RECONSTRUCT HOMININ BEHAVIOR

Bocioaga, Cerasela (La Sapienza) - Spinapolice, Enza (La Sapienza)

Pounding tools represent one of the earliest evidence of stone modification in the archaeological record (3.3 Ma) and they have played a significant role in the analysis of the earliest hominin technologies and behavior, making them a good proxy for evaluating the origin of human technology.

However, despite their importance, knowledge about these tools remains extremely limited.

The observation of primates, including modern humans, allows us to examine human technology through the direct observation of behaviors involving the use of stone tools, spatial data collection, chaîne opératoire approach, surface surveys, experimental studies, analysis of raw materials, use-wear, and lithics technology analysis.

Nevertheless, many researchers have criticized the validity of this approach due to temporal, ecological, and cognitive differences between non-human primates and extinct hominins. The limitations of this approach cannot be denied; however, there are also numerous potentials associated with environmental and/or social contexts that may have facilitated the origin and evolution of lithic technology within our lineage. As a result, collaborations among archaeologists, primatologists, and ethnographers have focused on how non-human primates can be utilized as proxies, leading to the emergence of Primate Archaeology, which represents a potential for the development of a methodology suitable to try to understand early technological behaviors.

To construct valid models, it is therefore necessary to adopt a multidisciplinary approach: the percussive behavior and gestures of current primates during the use of pounding tools will be recorded and analyzed through camera traps and field experiments. Subsequently, the tools used will be analyzed through techno-morpho-functional analysis and compared with archaeological ones.

The goal is to understand whether the way current primates manipulate pounding tools shows similarities and/or differences compared to archaeological ones. This approach aims to enhance the understanding of how hominids handled tools and the types of activities they may have engaged in.

4 **MODERN KNAPPERS AND OLD STONE TOOLS: USING ETHNOGRAPHIC AND EXPERIMENTAL COLLECTIONS TO UNDERSTAND THE PRODUCTION PROCESS OF BASALT TOOLS**

Sánchez-Dehesa Galán, Sol (ICArEHB) - Hermann, Aymeric (UMR 8068 TEMPS, Technologie et Ethnologie des Mondes Préhistoriques, CNRS, France.)

Stone tools constitute a major source of information for the study of human history. They can be produced from various types of rocks, utilizing different types of hammerstones and gestures, and resulting from short or long processes, with varying levels of planning. The operational sequences involved in their production and the knapping techniques employed inform us about the technical traditions and cognitive capacities of past knappers.

However, while knapping constraints and technical characteristics associated with different percussion techniques have been well investigated on siliceous materials such as flint or obsidian, volcanic rocks like basalts remain highly unexplored - even though these are among the most common in archaeological assemblages on a global scale.

This paper presents an ongoing repository of technological observations for knapped microlithic volcanic rocks. Our main goal is to provide a characterization of fracture mechanisms and associated characteristics based on reference collections (ethnographic and experimental), as well as detailed documentation on the technical parameters (gestures, techniques, and knapping tools), and for a wide range of volcanic rocks.

Built upon common methodological constraints encountered in two very different chronological and geographical contexts—the production of adzes in central Polynesia and the production of large cutting tools in East Africa—we explore the inputs and limitations of this baseline approach in these diverse case scenarios and its further developments.

Ultimately, this framework will allow for an understanding of strategies adapted to technical constraints and the expertise employed in producing archaeological material cultures, all accessible through an online open-access database.

5 **CENTRAL AFRICAN ETHNOGRAPHIC TOOL-USE AND ITS CONTRIBUTION TO UNDERSTANDING OF THE EARLIEST ARCHAEOLOGICAL TRACES IN THE CONGO BASIN**

Taylor, Nicholas (Stony Brook University)

The earliest archaeological signature of human presence across much of the Congo basin consists of distinctive stone tools attributed to the Middle Stone Age (MSA) Lupemban industry. Dated to ~260 thousand years old (kya) on the southern plateau margin of the basin, in recent years this stone tool industry has been considered potentially significant for understanding the evolutionary origins of our species, *Homo sapiens* ~300 kya (Barham 2001). Its modern geographical correlation with the tropical forest belt led, in the 1960s, to enduring speculation this technology developed as a prehistoric adaptation to rainforest foraging (e.g. Cornelissen 2002), but this association remains unconfirmed due to a lack of well-preserved sites and sequences (Taylor 2016).

Important hypotheses about the possible prehistoric functions of the stone lanceolate points, core-axes, and small blade tools found in the Lupemban have been drawn from ethnographic accounts of iron tool use by Congo basin hunter-gatherers (e.g. Miller 1988). This comparative work has, however, never been undertaken systematically, at least by archaeologists. In this paper I attempt to address this by revisiting available accounts (e.g. Turnbull 1965; Tanno 1981) of how modern tools are deployed to exploit closed-canopy environments in equatorial Africa. While recognizing there are critical differences in the qualities of metal and stone tools, and that there is no direct or continuous cultural ancestry between Lupemban and modern central African foragers, it is hoped a cautious reconsideration of anthropological and archaeological data might help develop further clues about the potential subsistence strategies of the Congo's first inhabitants.

6 **ETHNOGRAPHIC INSIGHTS INTO MSA HUNTER-GATHERERS LITHIC TECHNOLOGIES**

Fusco, Marianna (University of Rome La Sapienza S)

The analysis of stone tool production, in terms of reflection on the gestures, and the complexity of the technical behavior of the human groups that produced them, is among the most used sources of information to reconstruct past human societies. Experimental archaeology has significantly contributed to the development of what is now known as the technological approach to lithic analysis. Alongside theoretical and experimental frameworks, ethnographic observations of tool production, use, and discard have informed the creation of new methodologies for studying prehistoric lithic artifacts. These observations can shed light on the potentials and challenges associated with the application of key analytical concepts of the organizational approach, such as curation and expediency in lithic exploitation. While it's true that the ethnographic observation of modern hunter-gatherers may lead to problematic interpretations of past events, especially due to the different environmental contexts in which they lived compared to modern ones, most of the ethnographic data for stone tool use and production comes from semi-arid environments, which has been proposed to be particularly useful for some African Pleistocene contexts.

This talk aims to revise the application of ethnographic observations and analogy to the understanding of stone tool use and production among African Middle Stone Age hunter-gatherers. Despite the extensive use of ethnographic analogy in the past, it seems that we are still somehow stuck on the challenges of this method for creating a model of hunter-gatherers' behavioural complexity. Thus, it will be conducted an extensive review of what has been done so far to explore new hypotheses for the use of ethnographic data in interpreting MSA archaeological contexts.

7 **SITE FUNCTIONALITY AND MOBILITY PATTERN DURING THE EAST AFRICAN MIDDLE STONE AGE: DATA FROM THE GOT10 SITE, SOUTHERN ETHIOPIA**

Aureli, Caterina (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma, Italia) - Asrat, Seminew (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma, Italia) - Melaku, Sahleselassie (Ethiopia Heritage Authority (EHA), National Museum of Ethiopia, Addis Ababa, Ethiopia) - Fusco, Marianna (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma, Italia; Department of History and Art History, Universitat Rovira I Virgili, Tarragona) - Spinapolic, Enza (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma, Italia)

Through the analysis of faunal remains, in combination with other proxies, it is possible to clarify past human activities. The analysis of the traces present on the bones, combined with ethnographic studies, provide potential new insights on aspects of human behaviour including settlement patterns and site function; an opportunity to explore aspects of past hunter-gatherer territory occupation systems, mobility, animal resource exploitation, and adaptations to climatic changes during the Late Pleistocene. This approach has rarely been applied to open-air contexts in East Africa due to the scarcity of well dated MSA sequences with well-preserved bone.

In this view, of particular interest are the differences between sites and if and how are they relates to seasonality dynamics and movements of hunter-gatherer groups.

The aim of this talk is to discuss the organization of past hunter-gatherer groups systems through the combination of results from preliminary analyses of the GOT-10 materials in order to consider how much can be understood with the ethnographic analogy.

The GOT-10 site, Gotera area, southern Ethiopia is an open-air site in a modern savannah environment preserving a stratigraphic sequence rich in artifacts and fauna in primary contexts dated to MIS 3. Despite taphonomic processes can potentially affect faunal assemblage, the preservation of this record is good.

To develop a model regarding the patterns of site occupation, it would be ideal to draw it from multiple sources that give us insights regarding how the environment was, where these groups lived, how they exploited this environment and the available resources, how it changed through time. In southern Ethiopia, due to the difference in evidence and contexts, one of the few available proxies for comparison and behavior understanding in an open-air site, is the eroded faunal materials from GOT-10. Here, identification and resolution of knowledge gaps can be achieved through ethnographic studies.

8 **THE MIDDLE AND LATER STONE AGE SEQUENCE AT UMHLATUZANA ROCKSHELTER, KWAZULU-NATAL, SOUTH AFRICA: EXPLANATORY MODELS OF PLEISTOCENE CULTURE CHANGE**

Dusseldorp, Gerrit (Leiden University; Palaeo-Research Institute University of Johannesburg) - Sifogeorgaki, Irini (Leiden University) - Murungi, May (University of Algarve) - Carr, Andrew (University of Leicester) - Schmid, Viola (Austrian Academy of Sciences - Austrian Archaeological Institute)

Rescue excavations at Umhlatuzana rockshelter yielded a largely continuous 2.5 metre-deep sedimentary sequence, covering the last 70,000 years (Kaplan 1990). As the Pleistocene sedimentary sequence at the site is homogeneous

and no clear boundaries between sedimentary units are visible, different archaeological technocomplexes were previously defined on the basis of artificial spits. The site yielded some of the main technocomplexes figuring in discussions about early instances of complex behaviour in southern Africa such as the Howiesons Poort and the Still Bay. Importantly, a thick sedimentary package at the site yielded lithic assemblages considered transitional between the Middle Stone Age and Later Stone Age. However, suspicions of large-scale sediment movement in this part of the sequence made the interpretation of the assemblages complicated.

We conducted geoarchaeological fieldwork at the site in 2018 and 2019. Our work confirms many of the observations from the initial rescue excavations. Using geoarchaeological techniques as well as piece-plotting all excavated materials, we demonstrate no large-scale sediment movement took place.

The piece-plotting also affords greater resolution in the shifts in composition of the lithic assemblages. Our analysis to-date shows a far less gradual transition between Middle and Later Stone Age materials at the site. Raw material preference and debitage production strategies shift within a narrow band across the profile. We interpret these changes in light of recent proposals based on southern African ethnography. We propose that the transition may represent a change in the organization of social networks.

9 ETHNOGRAPHIC DIVERSITY AS A THEORETICAL FRAMEWORK FOR THE RECONSTRUCTION OF ARCHAEOLOGICAL HIDE-WORKING CHÂÎNES OPÉRATOIRES

Caurette, Natacha (University Paris 1 Panthéon-Sorbonne; UMR 8068 TEMPS; UMR 7264 CEPAM)

Many modern nomadic hunter-gatherer communities rely on hide-working to produce clothing, housing materials, and various utilitarian objects. This craft is often considered to be influenced by cultural, technical, and economic factors specific to each human group.

Numerous ethnographic studies have described hide-working, identifying a variety of chaînes opératoires. However, this literature is rarely taken extensively into account by archaeologists working on past hide-working crafts: studies usually present the few ethnographic case studies that parallel their observations, occulting the inherent variability of hide-working techniques.

This paper presents an extensive bibliographic database aimed at documenting the diversity of hide-working chaînes opératoires among sub-actual traditional societies, regardless of their environmental, economic, or social context. Focusing on the technical aspect of this craft, I did not consider groups who use industrial techniques of the manufacture.

This synthesis highlights three patterns: 1) the invariable steps of hide-working, 2) the uniqueness of each chaîne opératoire, and 3) the variability of gestures, tools, and their functioning mode. These conclusions can serve as a theoretical framework for reconstructing hide-working amongst archaeological hunter-gatherer societies. This work shows the usefulness of taking into consideration the ethnographic diversity of techniques for apprehending past crafts.

336 BURIAL AFTER THE END OF THE WORLD

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Meier, Thomas (Center for Apocalyptic and Post-Apocalyptic Studies (CAPAS), Heidelberg University; Institute for Pre- and Protohistory and Near Eastern Archaeology, Heidelberg University) - Turner, Sam (McCord Center for Landscape, Newcastle University) - Moragas Segura, Natalia (Equip de Recerca Arqueològica i Arqueomètrica, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona) - Müller, Kathrin (University Freiburg)

Session format: Regular session

Several cultures through space and time placed burials in ruins of a rather recent past still remembered in memory, e.g. burials in monumental ruins of the Classical Maya period or early medieval burials in the ruins of Roman villae. Frequently this locational choice for the dead is explained by the ruin as a haunted place, where the corpse as a haunted object or person is „naturally“ at home. But isn't this interpretation much inspired by romantic and Gothic appreciation and perceptions of the ruin?

Other explanations are possible. Is the ruin as a place of gradual decay especially suited for the dead body in decay as well? Both are processes of transformation of a cultural entity that came out of use into something different, a new status certainly less cultural, but more „natural“. Or were ruins as objects of devastation perceived as places where death cannot be ignored, as Sigmund Freud already stated in 1915? Do ruins introduce death into the „equation of reality“ (Realitätsgleichung)?

On the other hand, only a small selection of dead were buried in ruins and in many cases we don't know whether these bodies were especially privileged or discriminated against by this location. Were they selected at all? Were they treated in a special way?

In this session we want to explore the widespread phenomenon of burial in ruins of a recent past on a transcultural level. Both case studies and comparative papers are welcome.

ABSTRACTS

1 EARLY MEDIEVAL BURIALS AT ANCIENT RUINS AND MOUNDS. A REFLECTION OF DIFFERENT TALES?

Schumann, Robert (University of Hamburg)

It has long been recognized in archaeology of the early Middle Ages in many regions, that, in addition to regular burial sites, numerous Roman ruins and prehistoric burial mounds were reused as burial sites. In central European archaeology the re-use of Roman buildings in the Merovingian period in particular is usually seen either as space-saving, as potential agricultural land is not wasted on burial sites, or as a reference to buildings interpreted as Christian. For the burial mounds, their use is usually interpreted as a pagan statement to a fictive pagan past and it is implicitly assumed that the land was appropriated in the early medieval period through the re-utilization of these ancient monuments. What most interpretations have in common is that the original and earlier meanings of these ruins and old burial sites were lost and these monuments were thus charged with new meanings that are largely/completely detached from the older connotations. Taking into account memory studies and the question of the long-term significance of these monuments in the cultural landscape and their perception, this paper will explore the question of whether these monuments in the early Middle Ages were actually viewed largely beyond their former significance, or whether their subsequent use may not also reflect a reference to old narratives, using case studies from southern Germany. These pre-medieval narratives might echo in the Merovingian period and thus have an effect in the early medieval present, linking different archaeological periods.

2 BURIALS IN AN (ALMOST) FORGOTTEN CITY. TO BE BURIED IN POSTCLASSIC TIMES IN TEOTIHUACAN

Moragas, Natalia (University of Barcelona)

It is well known that the Teotihuacans built their main monumental buildings thanks to the extraction of materials from the earth itself, thereby creating a set of artificial cavities that, in turn, constituted a cultural landscape. The role of these cavities in the construction of Teotihuacan identity will change over time. After the collapse of Teotihuacan, some of these spaces were reopened and reoccupied as burial spaces. During Postclassic times, when the built space is clearly abandoned, an underground space is reconstructed in which the burials constitute a priority.

During the years 94-94, an underground ceremonial complex was excavated that gives us some ideas about the changes that will develop over time regarding the use of this space. The entire complex was sealed around 350 AD. when the city was in full splendor to be forgotten until the Postclassical era. While the exterior space is abandoned, the interior space is reinvented by new cultural groups.

3 BURIAL IN THE RUINS OF THE LATE MINOAN IIIC SETTLEMENT OF VRONDA: COMPREHENDING AND CONSTRUCTING THE PAST, PRESENT AND FUTURE

Bell, Sarah (Brown University)

Archaeological evidence from many parts of the Mediterranean suggests that, in the decades and centuries following the Late Bronze Age “collapse” of around 1200 BCE, Early Iron Age communities began engaging with the ruins of abandoned Bronze Age sites. Burial within these ruins represents the most extreme form of this kind of post-abandonment visitation. While we can only hypothesize the meanings embedded in these practices for those who performed them, the intentions behind them are likely to have been connected to specific narratives about the past that were understood by visiting communities to be represented by these sites. Practices such as those witnessed at certain Late Minoan IIIC (c. 1190-1070) sites on the island of Crete speak to the power of communally shared historical narratives that become embodied within specific places in the landscape, and the role that these play in the formation and perpetuation of social identity. The phenomenological and sensorial power of rites associated with burial in the ruins of upland subsistence settlements such as Vronda—performed as they were, in the wake of a period of social fracture and change—helped Early Iron Age participants to define and come to terms with the past, restructure and then reify their understanding of their own social reality and identity, and ensure that experiential frameworks supporting this reality and identity were projected forward to shape the future for descendent communities. In attempting to isolate the meaning and intention behind the practice of burial within ruins, this case study suggests that

we must work to understand the social function these rites were serving by considering, not only the archaeological evidence surrounding the practices themselves, but comparable practices occurring in the wider area, and, above all, the sociopolitical context in which these episodes of post-abandonment visitation take place.

4 **RESURRECTION OF A LOST WORLD? RECONSIDERING EARLY MEDIEVAL BURIALS IN ROMAN RUINS IN NORTHWEST NORICUM**

Hausmair, Barbara (University of Innsbruck)

Northwestern Noricum is the stepchild of Central Europe's transition from the Roman world to the Middle Ages. One of the many reasons for the region's transitional phase remaining under-researched is the assumption that the collapse of the Roman administration in the late 5th century led to the complete abandonment of the province, leaving behind a devastated and deserted land. But was this really the case? Did the end of the Roman Empire really constitute "the end of the world" in NW-Noricum? And if so, why did some communities settling the land in the Early Middle Ages chose to bury their dead in the ruins of an allegedly lost civilization? This paper looks at burials of the Merovingian period that were deliberately erected in abandoned (?) Roman settlements. Based on the identification of different forms of early medieval mortuary interaction with Roman structures I will discuss different possible motivations for this particular choice of burial places, ranging from pragmatic considerations, to the production of special social groups; the reframing of remnants of a distant past for forging a new society; changing religious beliefs; or even the possibility of a Roman descendant community aiming to "resurrect a lost world" through the reframing of ancient ruins.

5 **EARLY MEDIEVAL CEMETERIES IN ROMAN RUINS ACROSS SOUTHERN GERMANY AND ADJACENT AREAS**

Heidegger, Philipp (Amt für Kultur/Abt. Archäologie, Liechtenstein; Universität Freiburg)

The phenomenon can be regularly observed on numerous excavations and is very familiar to many archaeologists: burials inside and in the immediate vicinity of Roman ruins in the early Middle Ages. However, the current state of research hardly provides any interpretations of this behaviour – even a more detailed examination of its characteristics is not yet available.

By comparing available objective and measurable characteristics for as many of these sites as possible, I have tried to find structure within this poorly understood phenomenon. What emerges is a much more complex picture than is generally expected. Apparently, people are not buried in Roman ruins for one reason; instead, the Roman leftovers seem to be strongly integrated into everyday life and form points of reference for many different situations and groups of people within early medieval society.

While for some variations of the phenomenon, it seems quite easy to identify the background, many other manifestations are much more difficult to understand. However, it appears that the entire social spectrum of society at the time interacted in one way or another with the Roman legacies.

6 **FUNERARY OSTENTATION AND THE MEMORY OF ANCIENT BURIAL SITES: MEROVINGIAN BURIALS NEXT TO A PROTOHISTORIC TUMULUS AT RÉQUISHEIM (ALSACE, FRANCE)**

Fischbach, Thomas (Archéologie Alsace; UMR7044 Archimède) - Roth-Zehner, Muriel (Archéologie Alsace; UMR7044 Archimède)

The 2023 excavation of a vast area in Alsace at Réguisheim, between Colmar and Mulhouse, led to the discovery of a large Merovingian necropolis. This discovery is in fact the continuation of a complex already excavated in 2015. With 257 graves, this is one of the largest necropolises in the region, and all the necropolis's boundaries have been reached, making it unique in Alsace. Despite a high rate of looting, certain remains suggest the presence of a particularly wealthy population on the site. In particular, a large burial site surrounded by two concentric burial rings stands out.

Extensive stripping of the area was particularly marked by the unexpected discovery of a small group of around ten Merovingian burials, including one surrounded by a circular ditch, located next to a protohistoric enclosure and around 150 m north of the large necropolis. This type of settlement next to a protohistoric burial mound would be the fourth of its kind in Alsace, and is similar to a phenomenon known throughout the Merovingian world, notably in Scandinavia and southern England.

This small burial complex was used between the late 6th and early 7th centuries. Despite the high rate of reopening of the burials, the grave goods suggests a population of relatively high social status. Thus, the generally accepted interpretation of this Merovingian practice of installing burials alongside a protohistoric tumulus is that of asserting one's power over an area and legitimizing one's membership of a prestigious social group. It was also an opportunistic way of taking advantage of an existing marker in the landscape. The installation of these burials next to this protohistoric

tumulus was probably not done by chance, and the Réguisheim example therefore provides an opportunity to discuss this practice within the site, in Alsace and on a wider scale.

7 **RUINS AND MORE: EXPLORING THE CHOICE OF BURIAL SITES IN SOUTHERN GERMANY DURING THE EARLY MEDIEVAL PERIOD**

Müller, Kathrin (University Freiburg)

In the early medieval period, a variety of complementary burial sites can be observed in the Central European region. Southern Germany constitutes a central area whose burial landscape is strongly characterized by these very diverse types of burial sites. One of these variants is the burial at Roman ruins, an area shaped by structures from another time. The question arises why this particular place was chosen by certain individuals and relatives.

By closely examining burials at Roman ruins in southern Germany, the investigation aims to understand the possible reasons behind the choice of location. The analysis of occupancy patterns such as gender and age distribution, along with a closer look at the furnishings of the deceased, initiates the discussion on what background can be assumed behind the choice of burial place. This question is explored in particular through a comparison with the other complementary types of burial sites (e.g. in isolated locations, in settlements), thereby differences can be made clear.

motivations that may have guided these choices during the early medieval era in the southern German region.

8 **MAKING RUINS FOR BURIAL: REORIENTING EARLY MEDIEVAL LANDSCAPES WITH SPOLIA IN NORTHUMBRIA**

Turner, Sam (School of History, Classics and Archaeology)

The pattern of burial amidst the ruins of Roman villas and other ancient sites is a familiar one across early medieval Europe. In Britain prehistoric mounds and other features became increasingly prominent burial sites first for elite men and later for women as new polities emerged in the seventh century. It seems likely such places had a role in legitimizing their territorial claims.

But after the most powerful emerging kingdoms in Britain adopted Christianity as their main religion, elites stopped being buried on ancient sites and instead began to cluster around churches. In Northumbria, for example, the process which re-shaped the early medieval landscape involved the deconstruction of Roman structures to provide the material for new churches. Ancient ruins were therefore removed and reassembled in new configurations, but still used to underpin elite claims to legitimacy and territorial centrality. Indeed, by reconfiguring these ruins and giving them new symbolic importance, they became increasingly significant in strategies of power. This contribution will reflect on this process with reference to examples from the Tyne valley and Northumberland.

9 **BURIALS IN THE SETTLEMENT STRUCTURES OF GREAT MORAVIAN CENTRES - SOCIAL PHENOMENA, EVIDENCE OF COLLAPSE, OR GRAVES IN THE RUINS?**

Hladík, Marek (Institute of Archaeology Czech Academy of Sciences, Brno) - Přichystalová, Renáta (Masaryk University Brno) - Mazuch, Marian (Institute of Archaeology Czech Academy of Sciences, Brno) - Dresler, Petr (Masaryk University Brno)

In the 9th and 10th centuries, in the area of the Great Moravian central agglomerations such as Mikulčice and Pohansko, a large number of activities related to the concentration of political, economic or military relations took place. These profane activities were accompanied by activities related to religion, reverence, and funeral behaviour. In addition to the existence of churches and regular churchyards around them, it is not uncommon in Great Moravian centres to find human remains buried outside the so-called "locus sacer". We generally refer to these remains as dispersed settlement burials. In Mikulčice there are two very remarkable groups of these settlement burials: 1) burials in settlement situations in the stratigraphically youngest horizon of the fortifications 2) skeletal remains in the destroyed fortifications. These burials are usually characterised by the absence of an inventory or, at most, by the presence of ordinary personal effects or objects of daily use.

In the paper, we will deal with the problem of how to explain the existence of these graves in Great Moravian centers. Using the examples from Mikulčice, we will show the interpretation possibilities of this phenomenon. We will discuss whether it could have been a socio-cultural phenomenon, evidence of a collapse, or whether these are graves younger than the Great Moravian centres, and we are therefore dealing with the phenomenon of burial of survivors in the space of the ruins of Great Moravian sites in the period after their demise, and whether this phenomenon may be related to a short-term return to pre-Christian religious roots.

10 **DISPERSED BURIALS IN THE EARLY MEDIAEVAL (GREAT-MORAVIAN) STRONGHOLD BŘECLAV-POHANSKO (CZ)**

Prichystalová, Renáta (Masaryk University, Faculty of Arts, Department of Archaeology and Museology)

The stronghold of Břeclav-Pohansko (South Moravia, CZ), dating from the 9th to the first half of the 10th century AD, is a very interesting site in terms of burial behaviour. Two basic types of cemeteries can be distinguished: firstly, the cemetery around the church and secondly, the cemeteries identified throughout the central agglomeration, i.e. the scattered or dispersed cemeteries or small groups of graves within the settlement structures, situated between settlement features.

A total of 559 graves were investigated in the churchyards. Almost the same number of graves - 485 - were uncovered in the context of scattered cemeteries within the settlement structures. Outside the church cemeteries, 46.5% of all discovered graves were located. We have identified very heterogeneous burial practices, which include religious, social and chronological factors. We assume that burial areas and rituals were not organised centrally, but under the auspices of selected authorised persons from individual discrete settlement units. The community that buried its deceased here was well aware of the Christian religion and its burial rules, so why did they choose not to bury their dead in cemeteries around the church? Was it their choice, or could they not be buried there? Can these questions ever be answered?

11 **A RECONSIDERATION OF POST-ABANDONMENT BURIALS AT THE MAYA SITE OF ALTUN HA, BELIZE**

Novotny, Anna (Texas Tech University) - Houk, Brett (Texas Tech University)

The sociopolitical reorganization in the ancient Maya region during the Terminal Classic period, about A.D. 800 – 900, also referred to as the ancient Maya “collapse”, witnessed widespread changes to settlement patterns and ritual expression. Cities were largely abandoned, but archaeologists find evidence of human presence in the form of enigmatic refuse deposits in civic-ceremonial and elite residential locations. The content of these deposits varies, but they tend to contain smashed whole vessels, remains perhaps indicative of feasting, and occasionally human skeletal remains. Prior to the 1990s, archaeologists often attributed these remains to squatters who deposited their refuse in the palaces and temples of the abandoned cities. More recently, however, many Mayanists take a more nuanced approach, recognizing that these deposits represent complex abandonment-related behavior and not necessarily reoccupation. They continue to grapple with the significance of the human remains, however, and propose that they could be sacrificial victims, re-deposited ancestral remains, or evidence of re-settlement. These explanations all suggest a different type of memorialization. Are the interments part of the process of abandonment or evidence for continued ritualization of ceremonial space? In this paper we interrogate 25 previously published post-abandonment interments from the ancient Maya site of Altun Ha, located in eastern Belize, which the Royal Ontario Museum excavated in 1964–1970, reconsidering them in light of more recent scholarship on these types of features. Our bioarchaeological analysis combines their individual attributes, age at death, sex, etc., with details of their mortuary context to explore the significance of these interments in peri-abandonment deposits. We conclude by comparing patterns at Altun Ha to peri-abandonment deposits throughout Belize.

12 **REST IN RUINS – NEW APPROACHES TO DYNAMIC ABANDONMENT PROCESSES AND BURIAL RELOCATION AT THE NEOLITHIC SETTLEMENT OF GÖBEKLI TEPE**

Schönicke, Julia (Freie Universität Berlin; German Archaeological Institute)

For many years, the Neolithic settlement of Göbekli Tepe (9500-8000 calBCE) in SE-Anatolia was interpreted as purely a ritual center or mountain sanctuary without any traces of domestic activities. Since the site revealed large, monumental oval buildings with up to 5.5 m high monolithic pillars and outstanding iconography, this hypothesis was initially convincing. It was presumed that the buildings (often portrayed as “temples”) were intentionally backfilled (“buried”) at the end of their use phase with enormous amounts of soil and sediment debris. In the fill, considerable amounts of human bones were discovered that led to the assumption of burials, human sacrifice, and even cannibalism in the ruins.

However, recent research at Göbekli Tepe did not only reveal settlement architecture and everyday practices. A burial of two individuals below the floor of a domestic building was uncovered, reflecting common mortuary practices in the Early Neolithic of Western Asia. Also, by concentrating on the surrounding landscape and the undulating topography of the site, dynamic taphonomic processes and strong postdepositional relocation of settlement layers have been identified. As my studies focus on abandonment processes and ruin interactions at Göbekli Tepe, I analyzed the fill of several buildings in detail. I argue that the Neolithic people originally buried the deceased in houses. After the abandonment, the ruins collapsed and the building material including the burials eroded into the special buildings. So,

at the current state of knowledge were the ruins neither intentionally buried, nor were they the setting for post-abandonment sacrifice.

My case study demonstrates how archaeological interpretations often prefer the extraordinary to the supposedly simple which leads to misinterpretations and finally to a biased conceptualization of the lifeways of the Neolithic communities.

13 **MAYA RUINS AND POST-COLLAPSE BURIAL BEHAVIOURS**

Vidal Lorenzo, Cristina (Universitat de València) - Muñoz Cosme, Gaspar (Universitat Politècnica de València)

The reuse of Maya ruined buildings as burial places and sites of ancestor veneration was a very common practice in post-collapse Maya society. These abandoned constructions were chosen as places to celebrate rituals and to deposit offerings, especially to the rain divinities. This tradition continued during Colonial times, despite the efforts of the Spanish ecclesiastical authorities to eradicate it; in fact, in some communities in the Maya area it continues to this day.

Unfortunately, little of this post-collapse evidence has been properly documented by archaeological projects despite its enormous importance in the study of the famous final crisis of the Classic period. There are a number of reasons for this neglect. The first is the disdain that traditional studies in Maya archaeology have shown towards the Postclassic period, sometimes described negatively as the “3Ds”: decline, decadence, and depopulation. The second is the fascination aroused by the exploration of Classic buildings and their substructures, the discovery of royal tombs or the search for stone monuments bearing writing, in contrast to the difficulty of correctly distinguishing and dating the remains of later and, in general, less striking occupations. This has led to the interpretation of many of the post-abandonment contexts as vestiges of a transient and disorganized period, rather than as a reflection of a changing social organization and its beliefs. In addition, these remains are usually found mixed with others and in contexts that have often been altered, which hinders their stratigraphic interpretation.

Focusing on different Maya case studies, the paper aims to show how Postclassic offerings and burial data can reflect changing social behaviours, and how these ruined buildings were perceived and integrated into the cultural memory of this people over time.

14 **WHY TO BURY IN A RUIN?**

Meier, Thomas (University of Heidelberg)

The abstracts of this session show that burials in ruins are culturally widespread. Interpretations vary widely, mostly from a perspective of the burial. But what comes into view, if we start from the ruin? What is a ruin at all? The answers depend on the theoretical approach we take:

Functionally, ruins are piles of debris rendering the soil unsuitable for agriculture, they are overgrown by brambles, which rules out husbandry. To make any use of such places, burial is one option. Psychoanalytically, ruins are objects of desolation and as such are perceived as places where death cannot be ignored. Ruins introduce death into the „equation of reality“ and, hence, are appropriate places for the dead.

Cultural theories define ruins as decontextualised remnants from the past that need to be nested in new narratives in order to gain meaning in the present. Such meaning may vary widely. The romantic appreciation of ruins has populated them with the ghosts and turned them into haunted places. Equally, the corpse has been perceived as a haunted person of its own kind, at home in the ruin. In a less Gothic mindset the ruin can be understood as a place of gradual decay and transformation from culture to nature. The dead body is subjected to the same processes of. In a non-anthropocentric perspective, burial in ruins can be interpreted as a measure to maintain the consistency of networks: The network of life expels the no-longer-living body, and the corpse is integrated into the network of death, the funeral mediating between the two worlds.

Such a kaleidoscope of interpretations does not pose the question of “the” true and binding interpretation across time and space. Rather, it appreciates the colourful plentitude of cultural expressions as well as the archaeological imagination.

340 AFTERMATH OF WAR: PRECARITY AND CONSEQUENCES OF ARMED CONFLICTS FROM PREHISTORY TO EARLY MODERN PERIOD

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Matic, Uros (Institute for Classics, University of Graz) - Mihajlovic, Vladimir (Departement for Archaeology, Faculty of Philosophy, University of Belgrade) - Hello-Lapr erie, Germain (National Museum of Natural History) - Deforce, Koen (Ghent University)

Session format: Regular session

Archaeology of war and armed conflicts has often focused on the actors and weapons of war, placing strong emphasis on the conflicts themselves, and less on their consequences and resolutions. Considering the current political climate in the world, with several ongoing conflicts and new ones emerging, archaeology as a discipline needs to address the precarity and consequences of armed conflicts for the different parties involved.

The goal of this session is to examine the visibility of the short-term and long-term social consequences of armed conflicts in the archaeological record from Prehistory to the Early Modern Period. The consequences on the defeated side can, but do not necessarily have to, lead to poor diets or bad health conditions, physical trauma, and higher mortality rates, all of which can be visible in the osteoarchaeological record. Conversely, the victorious community can benefit from plundered resources, which can translate into wealth, opulence and better conditions of life, at least of some of its members. Furthermore, armed conflicts can result in migrations of varying scales, either through forced displacement or deportation. These are well-documented in written sources from historical periods but are less apparent in other periods where we rely solely on the archaeological and osteoarchaeological record.

Last but not least, armed conflicts can, to varying degrees, result in the destruction of settlements and landscapes, making places less hospitable or more precarious to live in. All of the above strongly indicates that understanding the trauma caused by war requires an examination of its corporeal and material components. We invite contributions that address these issues and those that attempt to answer which individuals and groups benefit the most and which suffer the most in the aftermath of war.

ABSTRACTS

1 ON THE HUMAN CONSEQUENCES OF PREHISTORIC WAR: THEORETICAL AND ARCHAEOLOGICAL PERSPECTIVES

Tornberg, Anna (Lund University) - Vandkilde, Helle (Aarhus University)

Skeletal trauma is often direct evidence of warfare defined as a flow of violent social action in several phases whose scale, intensity, organization, and *raison d' tre* vary. War may be strictly local or a population-scale conflict. It may be a short outbreak or endemic. Waging war may or may not be institutionalized. Reasons for warring can be honour, territorial, to acquire women and slaves, or to establish dominance and control of people and resources. In addition, there are co-influencing factors like climate shifts, famine, and population turnovers. One or more of these variables may affect the immediate and long-term consequences of war campaigns.

Theoretically inspired by these variables we focus upon the Nordic Corded Ware Complex. More precisely, we approach human consequences of warfare through a multiproxy analysis of human skeletal remains and related archaeological sources in a period of marked social change and genetic evidence of population turnover. We pinpoint high-resolution chronology of direct violence as the very key to distinguishing temporal trends in the scales of warfare, which in turn promotes understanding of the social practices of war and human consequences thereof. We address the institutionalization of war and control of desirable resources such as high-quality flint as likely key parameters. Socially rooted impairment, cohesion, and inequality are all potential consequences of war affecting individuals, while hierarchization and altered demographics might reveal consequences on a population scale.

2 THE SLINGS AND ARROWS OF OUTRAGEOUS FORTUNE. LARGE-SCALE VIOLENCE AND WIDER IMPACTS AT THE LATE NEOLITHIC BURIAL OF SJAPL, IBERIA

Fernandez-Crespo, Teresa (Universidad de Valladolid (Spain); University of Oxford (United Kingdom))

Expanded skeletal evidence from the site of San Juan ante Portam Latinam (SJAPL) (ca. 3200 BC) has recently provided evidence of large-scale, organized and sustained warfare in the Late Neolithic. Conservative estimations suggest that at least a fourth of the 338 individuals buried in SJAPL, essentially adolescent and adult males, died violently, some of them having previously been exposed to reoccurring confrontations. However, in war, conflict-related victims and casualties are not always a result of physical violence. Settlements can be raided, food stores plundered, fields burned, livestock stolen and daily labour activities and trade disrupted. In an exploratory approach, we have

recorded skeletal evidence for non-specific stress indicators (cribra orbitalia and linear enamel hypoplasia) and nutritional deficiencies. Results suggest unusually high rates compared to those generally estimated for other Iberian Late Neolithic and Chalcolithic sites, which may be interpreted as a glimpse of the health and environmental costs of early warfare.

3 HEALTH, NUTRITION AND INTERPERSONAL VIOLENCE IN THE AFTERMATH OF WAR: THE ANCIENT MIDDLE EAST (CHALCOLITHIC TO IRON AGE)

Baten, Joerg (Univ. Tuebingen) - Benati, Giacomo (Univ. Barcelona) - Sołtysiak, Arkadiusz (Univ. Warsaw) - Tagini, Alessandra (Univ. Tuebingen)

Our bioarchaeological study focuses on the consequences of armed conflict in the ancient Middle East from the Chalcolithic to the late Iron Age. The regions of our study are today's territories of Iraq, Iran, Turkey, Syria, and the Levantine coast. We have collected a new data set of more than 4,500 skeletons, studying the effect of conflicts on nutritional and health indicators (linear enamel hypoplasia and height), as well as on interpersonal violence (using cranial trauma data), because we observed that armed conflict also effects the interpersonal violence behavior of the populations. We assess the short-term and long-term consequences of armed conflicts in these archaeological records, and in particular study the Late Bronze and Early Iron Age conflicts and the corresponding post-war periods.

The data collection for the sub-regions consisted of a thorough review of archaeological reports containing information on dental pathologies from excavated skeletal samples, totaling 74 archaeological sites across the Middle East. We collected data about individuals older than 7 years old and we considered primarily hypoplasia defects encountered in canines and incisors, following the methodology and scoring scheme detailed by Bereczki et al. (2018). In order to assess interpersonal violence, we follow the methodology employed by Baten and Steckel (2018). We use as main indicator the share of individuals exhibiting weapon-related wounds or cranial trauma. This indicator is motivated by the fact that in historical populations, cranial traumas were the most evident skeletal indicators of interpersonal violence.

4 ENCOUNTERS WITH AN EXPANDING PREDATORY STATE: NUBIA DURING AND AFTER THE FIRST WAR WITH EGYPT (CA. 3100-2500 BCE)

Hafsaas, Henriette (Volda University College)

Violent state expansions from Egypt into Lower Nubia are gruesome examples of how the militarily strongest opponent in war could win at tremendous costs to the defeated people, as modern warfare also testifies. State formation processes often involve intense violence as new elites establish a monopoly of power and extract resources from their subjects and people on the frontiers of their territory.

The first kings of the unified state in ancient Egypt violently attacked their neighbours in Nubia between 3100 and 3000 BCE. When the war ended, the people of Lower Nubia either perished, fled their territory, or were reduced to such a basic level of existence that they no longer threatened the Egyptian state. These impoverished people left few traces in the archaeological record, and the Lower Nubian population only recovered from the wars with Egypt around 2500 BCE.

The presentation will discuss to what extent the Egyptian elites took advantage of being an expanding and predatory state. More importantly, I will examine the consequences for the defeated people. I will explore the topic using archaeological data, human remains, and historical records.

This case study aims to deepen our understanding of the enduring legacies of wars by examining the extent to which Egypt exploited its position as the militarily strongest opponent and the consequences of the brutal warfare for the people of Lower Nubia.

5 OUTSOURCING PRECARITY: IMPORT AND INTEGRATION OF FOREIGN LABOUR IN LATE BRONZE AGE EGYPT

Langer, Christian (Freie Universit t Berlin)

Precarity – from a modern perspective broadly understood as the lack in predictability in material life or psychological welfare – increasingly concerns more and more portions of contemporary western societies. To connect with that observation, this paper aims to shed light on the relationship between precarity and foreign labour in Late Bronze Age Egypt (ca. 1550–1069 BCE). That period was marked both by violent expansion of the Egyptian state in Northeast Africa/Southwest Asia and the widespread use of foreign labour power in the Egyptian economy (e.g. state institutions, estates, land holdings outside Egypt), often procured in the aftermath of war or as part of long-term dependencies and unequal relations facilitated by preceding military conflict. Departing from theoretical considerations on precarity, we can ask the questions: how was life in Egypt generally and how was that of foreign labourers in Late Bronze Age Egypt specifically precarious; what can we consider as precarious in the context of Egyptian society and

economy; how did the widespread use of foreign labour power affect precarity for different groups; and who were the ultimate winners and losers in Egyptian society relative to precarity. Combining archaeological, iconographic and historical source material allows approaching answers to these questions. The hypothesis is that the large-scale import of foreign labour power allowed the Egyptian state to effectively outsource precarity from (parts of) the Egyptian population to foreigners, which probably had economic, ideological, and political implications at the micro- and macro-levels. Ultimately an exercise in economic history, a look at the outsourcing of precarity offers a glimpse at the Late Bronze Age in contemporary economics and labour policies at the turn of the 21st century.

6 SUFFERING FROM MEMORIES: PSYCHOANALYTICAL APPROACH TO NEW KINGDOM EGYPTIAN POST-WAR STRATEGIES OF CONTROL IN NUBIA

Matic, Uros (University of Graz)

This paper aims to explore whether the New Kingdom Egyptian state suppressed revolts in Nubia by recreating traumatic experiences and evoking memories of loss and defeat in the post-war period. When examining trauma, contemporary archaeologists often focus on extreme cases of physical injuries which leave traces on the skeletons. However, it is crucial to acknowledge that not all physical injuries, such as beating, mutilation, or sexual violence, leave observable marks on the skeleton. From a psychoanalytic perspective, trauma is seen as an unrepresentable event for the victim. The process of remembering triggers a range of reactions, including flashbacks, overwhelming anxiety, and nightmares, much to the opposite of Cartesian mind-body split. When New Kingdom Egyptian state conquered Nubia, defeated local population was devoid of writing about the events which led to its defeat or depicting them. Monumental media in Nubia were under the control of the Egyptian state. Memories of these events could have been preserved by Nubians only through oral tradition. At the same time, New Kingdom Egyptian written sources indicate severe punishment for rebellions in Nubia, with mutilated bodies displayed in towns. Public events were staged in Nubia where enemies and rebels were mutilated in temple settings. Egyptian temples in Nubia feature reliefs and statues depicting Nubians being smitten or trampled by the Pharaoh. In this context, triggering memories of loss and defeat may have played a role in suppressing the identification with Nubian and fostering an embrace of an Egyptian identity.

7 ORPHANS OF DEMOCRACY – PERFORMING COMMUNAL CARE IN ANCIENT ATHENS

Babic, Staša (Dept. of Archaeology, Faculty of Philosophy)

Contrary to the idealized narrative of 5th century Athens as the realm of high culture, arts, and sophisticated political life, during its most celebrated period of history the famed polis was actually involved in all but constant armed conflicts of various intensity. The ways in which the Athenian democracy aimed at alleviating the losses and restoring the order after the wars reflect the values this very order was founded upon. Almost all its male citizens experienced taking part in the phalanx ranks and many were killed in the process. However, the dire consequences of the armed defence of democracy were not evenly suffered by all. The community celebrated some of its members in various forms, such as public memorials, as materialized expressions of honour and gratitude. The orphans of the Athenian citizens fallen in defence of the democracy were provided with financial and social support. However, not all inhabitants of Athens that perished in war were equally honoured, such as foreigners, metics or slaves, and their orphans did not enjoy equal benefits of communal care. When tracing the roots of the modern democracy to the Classical Athenian paragon, it may be prudent to bear in mind that the same practices of inclusion/exclusion, that determined the scope of the politically enfranchised citizens' body, regulated the extent of publicly expressed honours for the war dead and the subsequent wellbeing of their children.

8 THE AFTERMATH OF WAR: ROMAN VIOLENCE BEYOND THE BATTLEFIELD

Fernández-Götz, Manuel (University of Edinburgh)

The last few decades have witnessed a significant surge in the archaeological information about the Roman wars of conquest, which has led to a reassessment of many military campaigns and their impact on indigenous populations. Less attention, however, has been paid to forms of violence in the post-conquest period. As shown by numerous disciplines (from history to sociology and anthropology), violence is not only a physical phenomenon, but can also include other dimensions such as structural and cultural violence. Violence, from this perspective, did not end with the Roman military conquests, but often extended to many spheres of life in the aftermath of the campaigns: from dispossessing people of their lands in order to make room for colonial settlers to a wide range of changes in the political, economic, and religious realms. In this paper, I will focus on the aftermath of war in the Western Roman provinces, using Padilla Peralta's (2020) concept of 'epistemicide' as an underlying theoretical concept.

9 PREDATORY IMPERIALISM AND CULTURAL GENOCIDE: ROMAN TAKEOVER OF THE CENTRAL BALKANS

Mladenovic, Dragana (University of Southampton)

The paper aims to chart events that accompanied incorporation of the Central Balkans into the Roman empire in the late 1st c BC/ early 1st c AD: starting with conquest violence, followed by onslaught on land and resources, and ending with fragmentation of local communities and disintegration of indigenous social institutions through imposition of new political organisation. These events which took place over decades were not a result of a single decision or persistent policy: securing efficient rule was the only goal that Rome was actively pursuing, by whatever means they thought most effective at any given moment. Textual sources allow us to chart individual imperial actions, undertaken by different agents and for largely unrelated motives. Archaeological evidence, on the other hand, reveals that cumulatively these individual actions led to a genocidal process very much akin to indigenocide, as the observed phenomenon is referred to in colonial contexts. Roman imperialism has often been described as 'middle ground' colonialism, not as harsh, somewhat more respectful and inclusive, but this case study reveals a different imperial practice. After a surge in the past decades of scholarship that empowered the conquered peoples by concentrating on their interests and choices as main determinants of post-conquest trajectories, this case study should also serve as a warning that the agendas and acts of colonial forces should never be underplayed.

10 WHAT ACTUALLY HAPPENED TO SEGESTANI AFTER THE ROMAN CONQUEST?

Drnica, Ivan (Archaeological museum in Zagreb) - Radman Livaja, Ivan (Archaeological museum in Zagreb)

The Iron Age settlement at the confluence of the Kupa and Sava rivers, referred to in ancient sources as Segest(ic) a and Siscia, was one of the most prosperous settlements in southern Pannonia. With various settlement dynamics, it existed continuously throughout the entire 1st millennium BC and reached its peak in the last two centuries BC.

Following the foundation of Aquileia in 181 BC, the Roman Republic began its aggressive advance into the south-eastern Alpine region, in parallel with extensive operations in the eastern Adriatic region. This process culminated in Octavian's campaign in Illiricum (35-33 BC). After the successful conquest of the Iapodian territories, the Roman army besieged Segestica for 30 days. According to written sources, the settlement and its inhabitants – Segestani – were spared after the capitulation and a Roman garrison was stationed in the settlement, consisting of 25 cohorts under the command of Gaius Fufius Geminus.

Soon afterwards, an uprising broke out in the settlement, in which the local population almost drove the Roman garrison out of Segestica, but it was quickly put down before reinforcements arrived. The written sources are silent on the faith of the local population after the revolt, but similar cases indicate their bad faith. This lecture will attempt to provide some answers to this puzzle by analysing all available archaeological and epigraphic data.

11 MARCOMANNIC WARS – CONSEQUENCES OF CONFLICT BASED ON A COMPREHENSIVE DATASET

Vlach, Marek (Institute of Archaeology of the CAS Brno) - Komoróczy, Balázs (Institute of Archaeology of the CAS Brno)

During the first four centuries after the turn of the era, a specific borderland emerged within the Middle Danube region, marking the coexistence of the provincial and barbarian (predominantly Germanic) worlds. This region became a scene of multifaceted Roman-barbarian interactions, primarily peaceful. Although conflict periods constituted a considerably smaller proportion of the Roman Period, some had far-reaching implications for overall relations and geopolitical situations. The large-scale military conflict known as the Marcomannic Wars significantly impacted not only the borderland of the Middle Danube region but also extended deep into Germanic and Roman environments. The presence of direct and indirect evidence of Roman military operations, such as field camps, and their spatial distribution throughout Germanic territories allow for assumptions about Roman military leadership's strategic and tactical conceptions. The impact of this conflict and the post-war development of the region can be inferred from a dataset based on the large-scale collection of published archaeological information from the Marcomannic settlement zone west of the Lesser Carpathians. The dataset MARCOMANNIA emerged as part of a project with one of its objectives being the derivation of quantitatively representative proxies for various development trajectories of Germanic populations within the study region. They were based on archaeological components, primarily settlement and burial grounds, as well as contexts such as burials and finds such as brooches, coins, and militaria. These trajectories offer structured insights into Germanic societies' demographic, economic, political, and social developmental tendencies within the Marcomannic settlement zone and allow for quantification of the impact of the Marcomannic wars.

12 "HOW DOES THE GRASS GROW" - LOOTING OF THE SARMATIANS GRAVES DURING LATE ANTIQUITY

Šarkic, Tamara (Center of Bone biology, Institute of Anatomy, Faculty of Medicine, Belgrade) - Djuric, Marija (Center of Bone biology, Institute of Anatomy, Faculty of Medicine, Belgrade) - Djukic, Ksenija (Center of Bone biology, Institute of Anatomy, Faculty of Medicine, Belgrade)

The Sarmatian cemeteries in the Great Hungarian Plain were plundered extensively in the past. Historical sources and archaeological finds indicate that this area was subject to frequent wars, migrations and turbulent times. Although looting is reported in archaeological reports, a comprehensive study of this phenomenon is lacking. Looting was identified in the archaeological context through intrusion pits, disturbed burial contexts and displaced skeletal remains. Surprisingly, the human bone remains have never been investigated; consequently, bioanthropological and archaeothanatological data are lacking. The present work deals with the bioanthropological analysis and contexts of looted Sarmatian graves from the territory of Serbia (Vojvodina province) from Antiquity and Late Antiquity. The study will encompass 15 cemeteries with over 300 graves. The time of reopening of the grave will be reconstructed using archaeothanatological findings, taking into account the position of the skeletal remains in the grave structures and the progress of the body decomposition. Conversely, by examining the taphonomic characteristics of the skeletal remains, we will identify changes in the bones that indicate bone scattering during the looting, but also the time at which the skeletal remains were exposed to weather conditions after the looting, and whether or not the graves were backfilled after this act. All this data, combined with the stratigraphic details, will allow us to understand how the environment of the cemeteries changed during and after the looting, which ultimately affected the overall poor preservation of the skeletal remains. In addition, it will be possible to reconstruct the phenomenon of the systematic opening of the graves, i.e., the method and model of opening, the timing of reopening, and to further the discussion on the contextualization of the looting phenomenon in turbulent times, which could point to the identity of the robbers and their motives.

13 DISTURBING THE DEAD AFTER WAR? THE CASE OF GRAVE OPENING IN THE LATE ROMAN REMESIANA

Mihajlovic, Vladimir (University of Belgrade, Faculty of Philosophy) - Janković, Marko (University of Belgrade, Faculty of Philosophy) - Bandović, Aleksandar (National Museum of Serbia)

Remesiana was a Roman town in the province of Dacia Mediterranea living its heyday in the 4th century. New excavations unearthed a portion of the town's eastern necropolis with diverse burial forms and practices that reveal coexistence of pagan and Christian traditions. Additionally, in some cases the drywall foundations of funerary structures were partially demolished, while the soil immediately underneath disturbed. The formed pits were backfilled soon after they were dug, and at least in two instances their surfaces contained traces of ritual practices. However, only in one case the pit actually reached the grave, whereas in other four the dugouts missed them by being positioned at the lateral sides of funerary constructions. These failed attempts to get to the content of burials most probably occurred within the limited time span and could be dated to the end of 4th and beginning of 5th century. The period coincides with the several decades long consequences of the Battle of Adrianople (378 CE): after the Roman armies suffered devastating defeat, victorious forces of the "Gothic confederation" remained on the loose and/or settling within the Empire on permanent basis. Overall, this was the age of turmoil and instability in the Balkan provinces, with more aftereffects yet to come.

Such historical context and the mentioned archaeological evidence pose important questions: what was the "destiny" of buried members of defeated population in the aftermath of war; was the intrusion into funerary realm just another plundering practice or could it be something else; was this behavior conducted by "winners" or "losers" and what could have been the motives; what can the practice of graves defilement tell us about the (state of) people who practiced it; does this activities testify to precarity of population, and of which one - victorious or defeated.

14 ANALYSING AND UNDERSTANDING THE EFFECTS OF WAR IN THE EASTERN MEDITERRANEAN DURING THE 7TH CENTURY CE

Olshanetsky, Haggai (University of Warsaw) - Cosijns, Lev (University of Oxford)

Archaeology frequently identifies the effects of war only after destruction layers are discovered. The reality is significantly more nuanced, with destruction being just one possible manifestation of armed conflict. As archaeological finds from the 7th century CE Eastern Mediterranean indicate a decrease in settlement number, size, population, and commerce, but no significant destruction layers, numerous archaeologists and historians have attempted to argue that war was not the main culprit. Instead, many have suggested that climate or epidemiological outbreaks, which can be dated to the middle of the 6th century CE, were the primary cause for the deterioration of the region. However, as recent studies have shown, such chronology is erroneous, with the decline beginning gradually in the 7th century CE.

Thus, the immediate and clear catalyst for such a decline is the armed conflict between the Eastern Roman Empire and the Sassanian Persian Empire, and later the Arab Conquest and their continuous war with the Byzantines. This current presentation will analyse why archaeological finds are the best evidence for war being the primary cause of the decline, alongside an analysis highlighting how the side effects of war and geopolitical changes can result in such depopulation and a drastic decrease in naval traffic and trade. The current presentation will also be used as a case study to demonstrate that, while the abundant textual evidence in this period can be used to establish a clear connection between abandonment and decline in the archaeological record, this is not always the case for most periods. Thus, when locating evidence of abandonment in periods or places where written sources are scarce or non-existent, it is crucial to avoid dismissing war as the direct or indirect cause of abandonment due to the lack of destruction layers.

15 PRELIMINARY BIOARCHAEOLOGICAL RESULTS OF THE FIRST ARCHAEOLOGICAL STUDY CONDUCTED ON THE BATTLE OF MANZIKERT 1071

Bütün, Erge (Hacettepe University, Department of Anthropology; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Eroğlu, Serpil (Hacettepe University, Department of Anthropology) - Çevik, Adnan (Muğla Sıtkı Koçman University, Department of History; MSKU Research Center For Mediterranean Civilizations) - Alican, Mustafa (Muş Alparslan University, Department of History) - Sertalp, Evren (Hacettepe University, Faculty of Communication, Department of Radio, TV and Cinema; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Sütçü, Mehmet (Muğla Sıtkı Koçman University, Department of History) - Develi, Tevfik (Muğla Sıtkı Koçman University, Department of History) - Akbaba, Ali (Muş Alparslan University, Research Center Of Seljuk And Manzikert Studies (SEMAM)) - Dolmuş, Muhammed (Human Behavioral Ecology and Archaeometry laboratory (IDEA lab)) - Büyükkarakaya, Ali (Hacettepe University, Department of Anthropology; Human Behavioral Ecology and Archaeometry laboratory (IDEA lab))

The late 11th century battle of Mankizert, which took place on August 26, 1071 between the Eastern Roman and Great Seljuk Empires on the Mankizert plateau just north of the Lake Van basin in the east of present-day Turkey, and which resulted in the decisive victory of the Seljuk Turks, is considered to be one of the decisive developments in the process of breaking the military resistance to the Turkish migrations flowing from Central Asia to Asia Minor and, as an aftermath, the Turkification process of Anatolia. This important battle, which left deep political and social traces on the history of Anatolia and the Near East, has only recently been studied in archaeological contexts.

Launched in 2020 as a battlefield archaeology project in Turkey, the Mankizert Battlefield Detection, Historical and Archaeological Survey Project uncovered many metal objects related to the battle, as well as the Muslim Cemetery of Afşin Village (Seljuk Desolation?) dating back to the 11th century, where witnesses of the Battle of Mankizert were found. In this study, the human remains from this cemetery are examined bioarchaeologically. The study analyzes the socio-cultural change and consequences in the region by considering biological distance, antemortem and perimortem traumatic lesions and other paleodemographic and paleopathological information together with historical documents and intensive survey data.

In addition to evidence of earlier archaeological periods, the research has documented traces of the Christian society and culture of the village of Afşin. The Turkish invasions in the 11th century led to the settlement of the region by Muslim Turks, and bioarchaeological evidence suggests that social tensions and precarity in the region continued unabated after the war.

16 CHAINING UP THE DOGS OF WAR? - THE AFTERMATH OF WAR IN VIKING AGE SCANDINAVIA

Jensen, Bo (Kroppedal Museum)

The Viking Age in Northern Europe (circa CE 750 to 1100) was a period of almost incessant conflict somewhere. During this period, Scandinavian initiated and increased campaign of overseas piracy which eventually became campaigns of conquest. Clearly, many of these military campaigns were extremely successful. In turn, the success of elite warriors ended up transforming the homeland economy and political structure and led, briefly, to a unified North Sea kingdom. In turn, successful conquest (or successful defense) often ended conflict, locally.

Here, I build on Phillip Bourgeois' theory of overspill violence to argue that martial success had two somewhat contradictory consequences: victory allowed for peace and often made further military violence unnecessary for the victor, but fighting and winning wars also habituated victors to use violence as a solution for any and all problems. Fighters were redeployed in positions of civil authority and the martial violence once directed against military opponents was redirected into every other sphere of society.

I argue that we can see the overspill of violence from martial success in such spheres as the symbolism and political structure of kingship; the role of feuds and duels in jurisprudence; and the transformation of the silver economy and the slave economy alike. I argue that in the aftermath of war, violence was both exported to other spheres and brought under increasing social control. This latter development in its turn allowed nouveau riche aspirants to appropriate the symbolism of martial success without having the real-world experience underlying it.

17 **MARTIAL SOCIETIES OF MEDIEVAL DECCAN: A STUDY OF SCULPTURES OF GRAPPLING ON THE VIJAYANAGARA MONUMENTS**

Dhebar, Kush (Department of Archaeology and Museums, Haryana)

Right from the Early Historic Period, the Indian subcontinent had been wrought with rampant warfare. With time, this characteristic became more and more pronounced in Indian society. Various Indian states and kingdoms had been competing with each other and several foreign invaders for land and other resources. During the Medieval Period, with the coming of Perso-Turkic Sultanates, innovations started being noticed in the arts of war. The local indigenous states also had to evolve and adapt for their self-preservation in these arts. The Deccan region of India around the 14th to 16th century was an epicenter of conflicts between Vijayanagara Samrajya and the Bahmani and later the Deccan Sultanates. Martial prowess played a major role in the upward social, economic, and political mobility of the local and foreign populace. Practice and knowledge of Martial and Combat Arts, be it armed or unarmed were a common phenomenon at Vijayanagara and its neighbouring states. This paper will focus on the sculptures of Grappling/Mallavidya/Pehalwani/Kushti which are still visible on the monuments of Vijayanagara and will deep dive into their relevance and symbolisms during the Medieval Period in the Deccan particularly and India in general. Along with that, the paper will also focus on how the present-day arts of war and combat sports have evolved and what all new innovations have been introduced to make grappling an even more effective art.

18 **FLOODING AND LOOTING: THE SIEGE OF COASTAL TOWNS IN FLANDERS DURING THE EIGHTY YEARS' WAR (1568-1648)**

De Decker, Sam (Flanders Heritage Agency) - Pieters, Marnix (Flanders Heritage Agency)

In the middle of the sixteenth century, a revolt against Spanish rule in the Netherlands slipped into a long and continuous war with the Spanish crown on one side and the so-called Staatsen, commanded by the House of Orange, on the other. Finally and after eighty years of fighting, this war led to the splitting up of the Netherlands into an independent northern part and a southern part that remained under Spanish rule.

After the Spanish had reconquered large parts of Flanders, including Antwerp in 1585, the battle moved to the coastal ports and the mouth of the river Scheldt. The Staatsen turned these coastal towns into impressive fortresses, but they also proceeded to a systematic flooding of the surroundings of these towns. Although this proved to be an efficient military strategy, the impact on the population and the landscape was disastrous. For more than half a century, the hinterlands of towns such as Aardenburg turned into an almost uninhabitable no-man's-land, intersected by tidal channels. To this day, the many relics of these tidal channels contributed to the recent recognition of the area as a Flemish Landscape Park.

The fierce battle around the coastal towns and the impact on the local population is also demonstrated by a number of recent archaeological excavations in the vicinity of Ostend. Human inhumations from the late sixteenth century were found at three different locations, with the dead buried in a simple and shallow pit on or near a residential area or farm. The information from these sites makes it clear that these are likely to be civilian casualties caused by looting during the long siege of Ostend (1601-1604).

19 **EXPLOITATION OF WOODLAND RESOURCES BY EARLY MODERN ARMIES: ANTHRACOLOGICAL INSIGHTS FROM LANAKEN (1748, BELGIUM) AND MONTIGNY-LÈS-METZ (1552)**

Hello-Lapr rie, Germain (National Museum of Natural History) - Salavert, Aur lie (National Museum of Natural History) - Deforce, Koen (Ghent University) - De Raymaeker, Annelies (Studiebureau Archeologie) - Brkojewitsch, Ga l (Eurom tropole de Metz) - Callou, C cile (National Museum of Natural History)

The environmental impact of warfare remains a relatively understudied aspect in archaeology. Limited anthracological research has been conducted on this subject in Europe, particularly concerning modern military encampments. However, woodland resources were important to armies for building barracks or siege infrastructures, as well as for soldiers' daily lives. This paper presents the results of charcoal analysis of two siege camps: Lanaken-Europark, located in eastern Belgium (1748: war of the Austrian Succession) and Montigny-l s-Metz "La Horgne" situated in northeastern France (1552: 10th Italian wars). The goals are to improve our understanding of the firewood supplies of modern armies at the local scale and the impact of conflicts on the landscape.

The Lanaken site corresponds to the French siege of Maastricht in 1748. The study of fire pits reveals that the troops primarily sourced firewood from mature oak-dominated forest formations and nearby orchards. The results suggest that the French troops have mainly collected their firewood in the local vicinity. The site of "La Horgne" corresponds to the siege of Metz in 1552. The results show high proportions of oak and fir. However, fir groves do not occur near Metz and it is not commonly used as a fuel. Furthermore, iconography of the XVIth century does not show the presence of oak forests near Metz. These observations suggest that soldiers probably have used timber as firewood, potentially providing evidence of sacking at the end of the occupation.

These results show the diversity of wood resources exploited by armies during modern conflicts. These studies are part of a doctoral project (2022-2025) which aims to better understand the management of wood resources in wartime, the impact of conflicts on the diversity of forests and to provide complementary data to historical sources.

20 **ENVIRONMENTAL IMPACT OF THE BUILDING OF KISV RDA CASTLE ON THE HUNGARIAN-OTTOMAN BOREDERZONE**

N dai, Zs fia Csilla (Research Centre for the Humanities)

The research of the environmental history of Late Medieval and Early Modern Age emerged in Hungary in the last thirty years, thus microregional research questioned previous perceptions of how the war devastated the forests and turned the fields into marshlands. In my paper, I would like to show how human intervention changed the vegetation in the case of Kisv rda Castle. From the middle of the sixteenth century Kisv rda castle (situated near today's northeast border of Hungary), a former aristocratic residence owned by the V rdai family, became a fort on the border zone maintained by the Habsburg party.

How to measure the environmental pressure of the building of a palisade fortification? Due to the archaeological research which revealed the posts and postholes of the earth and wood structure and the analysis of military surveys of the time, one can calculate the estimated demand of raw material for building or maintenance. How many acres of woodland were needed for the defensive works? How did it impact the environment? To what extent can we talk about deforestation and desertion, as the sources recalled? How does it affect the natural process of reforestation?

21 **LIFE IN THE ENEMY CAMP - CONSEQUENCES OF WAR**

Simonsen, Rikke (Museum of Copenhagen)

The 17th century set the stage for numerous wars between the neighboring countries of Denmark and Sweden. In 1658, Sweden occupied Denmark, lacking only the conquest of the capital, Copenhagen, to make the victory final. The Swedish siege camp was surrounded by a bastioned fortification with ramparts and moats, housing 5,000 to 10,000 soldiers for more than 1½ years – not just Swedes, but to a large extent mercenaries from e.g. Finland, Poland, and Germany. Along with the soldiers came craftsmen, priests, traders, and others, likely including women and children too. It is estimated that the camp housed up to or more than 20,000 residents, living in tents and pithouses.

The siege has been subject of both military and memory historical studies, while daily life in the camp and the time after the siege is only sporadically researched. In one of the century's coldest winters, written sources tell of disease, frostbite, and death among the soldiers, while they complained about a desperate lack of food and clothing. What survival strategies did the camp's various inhabitants, encompassing national, social, and gender groupings, employ? They have left behind only few traces in the written sources, but archaeological remains are likely to provide new insights into the impact of war on the community.

Part of the tent camp and an adjoining, now partially filled-in, bog lies today hidden under the grass in a public park. There has never been an actual archaeological excavation of the camp, but in the surrounding gardens, helmets, cannonballs etc. have been found throughout the years. In an upcoming project, Museum of Copenhagen wishes to conduct a research excavation, supplemented by previous archaeological findings and historical studies, which could provide significant new understandings of the consequences of armed conflict and crisis solutions in Copenhagen's enemy city.

22 **MILITI IGNOTI. THE SHORT AND LONG-TERM CONSEQUENCE OF WWI ON THE SOLDIER'S BODIES**

De Luca, Lisa (Centre of Research in Osteoarchaeology and Paleopathology, Department of Biotechnologies and Life Sciences, University of Insubria, Varese, Italy) - Gorini, Ilaria (Centre of Research in Osteoarchaeology and Paleopathology, Department of Biotechnologies and Life Sciences, University of Insubria, Varese, Italy) - Larentis, Omar (Centre of Research in Osteoarchaeology and Paleopathology, Department of Biotechnologies and Life Sciences, University of Insubria, Varese, Italy; LaBAAF-Laboratorio Bagolini Archeologia, Archeometria, Fotografia Dipartimento di Lettere e Filosofia, University of Trento, Trento, Italy; SABAP per le provincie di Como, Lecco, Monza-Brianza, Pavia, Sondrio e Varese, MiC, Milan, Italy) - Gaudio, Daniel (Department of Archaeology, Durham University, United Kingdom)

The World War I devastated Europe reshaping global dynamics, economies, European intellectual discourse, as well as military strategies, armaments, and tactics. Over eight and a half million, with approximately twenty million individuals suffering severe injuries and mutilations occurred worldwide. Italy's main theatre was the Alpine front from 1915 to 1918, focusing on the mountainous regions of Lombardy, Trentino, Veneto, and Friuli Venezia Giulia.

Official records list 65.000 deaths and 800.000 prisoners and missing individuals. Post-war, state authorities encouraged civilians to recover the remains of the fallen, leading to the emergence of a phenomenon known as the "re-

cuperanti,” which remains active to this day. These individuals transitioned from being researchers of soldier’s remains to “relic researchers”. Unfortunately, this led to the despoliation of human remains, where all elements that could provide identity to the deceased are removed, leaving only “bare” skeletons. Additionally, the remains often suffer damage from picks and shovels, further complicating the situation by being moved from the original resting place or dispersed. Rigorous archaeological methods coupled with anthropological studies are crucial for restoring identities and returning remains to families.

This study analysed three skeletons of unknown WWI soldiers found in Vicenza’s mountains, two Italian and one Austrian. It aimed to investigate the biological profile, stress markers, lesions, pathology, and cause of death. Despite their youth, the individuals exhibit stress markers and present dentoalveolar pathologies and injuries from heavy artillery bombardment and postmortem factors. This study allowed the recovery and interpretation of information on the life and death of these men who fought on opposite fronts during WWI. Thanks to the recovery of the military tag and the cross-referencing of anthropological data with those contained in the military record, it was possible to achieve an important result: assigning a name, Gildo Tonello, to the remains cataloged as GM21.

23 TARGET POMPEII: UNEXPLODED BOMB (UXB) - GIS SURVEY

Tiede, Vance (Astro-Archaeology Surveys; Yale University, Alumnus)

An overlooked long-term social consequence of modern warfare is the lingering presence of Unexploded Bombs (UXBs) at major archaeological sites. For example, the UNESCO World Heritage Site of Scavi di Pompei has 160+ bomb craters inside its Archaeological Zone. Therefore, an estimated 16 to 24 (10 to 15%) UXBs may remain buried under the volcanic ash from Mount Vesuvius (AD 79). While the architectural damage wrought by ten RAF/USAAF air raids in 1941-1943 has been largely repaired, the risk of future spontaneous detonations grows; e.g., the M124 Very Long Delay fuze has a celluloid collar that deteriorates over time; eventually releasing the firing pin. To date, several UXBs from Scavi di Pompei have been located (e.g., Surgeon’s House, 14 July 2006) but not all have been publicly reported. Given the recent spontaneous detonations in Germany (Ahlbach, 24 June 2019; München, 1 December 2021), it is probable that an UXB detonation(s) will eventually occur to the detriment of Pompei’s tourist-dependent economy and anyone within the blast radius. The risk to tourists is increased by the fact that the heaviest concentration of bomb craters (and therefore UXBs) is in the south-west quadrant of Scavi di Pompei, i.e., where the heaviest concentration of Pompei’s four million (2023) visitors congregate around the Foro (Regio VII) and Teatro Grande (Regio VIII).

This paper presents a methodology combining Stick-of-Bomb Crater Analysis with RAF Bomb Damage Assessment (BDA) aerial photographs, RAF/USAAF Mission Reports and Operations Summaries correlated with wartime damage reports in the Scavi di Pompei archives, 1941-1943. Probable UXBs have been geo-referenced with Google Earth Pro and handheld Garmin Etrex GPS. A future phase involves Ground Truth confirmation with Ground Penetrating Radar (GPR) and Magcone UXO Tri-axial magnetometer, subject to approval by the Scavi di Pompei administration.

354 SCENE CITY. SETTLEMENT AGGREGATION AND COMMUNITY TRANSFORMATION IN THE BUILT ENVIRONMENT OF THE EASTERN MEDITERRANEAN BETWEEN IV-II MILLENNIA BC.

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: AMADIO, MARIALUCIA (Ghent University) - VOSKOS, IOANNIS (National and Kapodistrian University of Athens) - THEOTOKATOU, CHARA (National and Kapodistrian University of Athens) - BOMBARDIERI, LUCA (University of Siena) - YAVOURANAKIS, GIORGOS (National and Kapodistrian University of Athens)

Session format: Regular session

Archaeologists have focused a great deal of attention on exploring the evolution of village societies and the transition to more complex, especially urban, social formations. Past research has addressed coalescence from a regional perspective and has established that urbanism is a multilinear phenomenon, developed diversely within different geographical and chronological contexts. However, less is understood about the social dimension of this phenomenon, namely how aggregated communities established new spaces for interaction and exchange.

The purpose of this session is to explore the socio-cultural transformations which characterise the passage from villages to urban centres using architectural evidence as the favourite analytical data-set. It also aims to discuss this multiform phenomenon of change through examples from the Eastern Mediterranean region, including the Aegean, Cyprus and the Levant, during the IV to the II Millennia BC.

Transformations in the built and social environment of prehistoric and protohistoric Mediterranean communities are traced at three different analytical scales in order to discuss patterns of architectural variability and constancy and to

compare evidence from different spatial and temporal contexts. Papers dealing with one or more than one scale of analysis are welcome to enhance the discussion.

- The micro-scale includes transformations in the exploitation and use of natural resources and the materials and techniques employed in construction.

-The meso-scale concerns transformations in architectural installations, such as fireplaces and processing equipment, as well as changes in the use of space through the analysis of floors and occupation surfaces.

-The macro-scale is about variations in the architectural forms and structure types, including houses, palaces, fortifications, and about transformations in settlement layout and settlement constitutive elements, such as neighbourhoods, alleys and open spaces.

ABSTRACTS

1 FROM CURVILINEAR TO RECTILINEAR: ARCHITECTURAL TRANSFORMATIONS IN 4TH-3RD MILLENNIA CAL. BC CYPRUS AND THEIR SOCIAL IMPLICATIONS

VOSKOS, IOANNIS (National and Kapodistrian University of Athens) - KLOUKINAS, DIMITRIS (Numismatic Museum, Hellenic Ministry of Culture) - GEORGOTAS, ANASTASIOS (National and Kapodistrian University of Athens)

It is commonly noted that one of the most conspicuous changes in the architectural tradition of prehistoric Cyprus takes place at the very beginning of the Bronze Age (i.e. at around the mid-3rd millennium BC). During this period, the long-held tradition of curvilinear and monocellular ground plans disappeared and the construction of rectilinear/rectangular building complexes becomes the norm all over the island. This development has been invariably connected with major socio-economic transformations, as part of the so-called Philia facies, observable in a wide-range of categories of material culture, in daily practices and even in the ways the world was perceived.

In this paper, we intent to discuss some aspects of this fundamental shift by focusing on the Chalcolithic settlement of Erimi Pamboula and the Early Cypriot settlement of Sotira Kaminoudhia. Both sites are situated in the southern-central part of the island and include a rather rich architectural record. The latter will be examined in order to trace evidence of both change and continuity in the way domestic and communal space was constructed, performed and experienced. The paper will also explore whether certain features of the typical Bronze Age Cypriot ‘courtyard house’ were already present in the preceding Neolithic/Chalcolithic house clusters. Moreover, it will examine whether these features were associated with new social norms involving growing signs of ‘privatisation’ of food processing and storage, increased social competition, different forms of co-habitation etc. The main objective is to approach the transition from curvilinear to rectilinear architecture on a micro-regional and diachronic level and to discuss the wider socio-economic implications of this transformation.

2 THE URBANIZATION PROCESS IN THE SOUTHERN LEVANT DURING THE IV MILLENNIUM BCE: THE CASE STUDY OF JEBEL AL-MUTAWWAQ

Caselli, Alessandra (Perugia University)

The beginning of the Early Bronze Age period in the Southern Levant, dated around 3500 BCE, marked the starting point of several transformation processes which would determine the transition from a village system to a properly urban model. In fact, through the Early Bronze Age I (EB I), and especially in its final phase, it is possible to observe, for example, the slow evolution in the agriculture techniques and the appearance of community areas for food processing, together with the introduction of walls protecting the settlements. It is not easy to date a context between the first phase of the period, Early Bronze Age IA, still characterized by a semi-nomadic system, and the second one, Early Bronze Age IB, showing an incipient urban economy. In fact, the material culture testifies a common tradition for the entire EB I and there are few sites showing an occupation without interruptions between EB IA and EB IB.

The site of Jebel al-Mutawwaq, in the Zarqa Valley (Jordan), was occupied throughout the entire Early Bronze Age I and was abandoned at the beginning of Early Bronze Age II. The absence of later superimpositions and the state of preservation of the settlements allow to deeply analyse the processes occurred at different scale of evaluation. For instance, it was possible to investigate two cultic areas, one pertaining to EB IA and one dated to EB IB and to notice the differences between them. This paper has the aim to analyse how Jebel al-Mutawwaq changed at the end of the IV Millennium BCE and how its interpretation could help to better understand the entire area.

3 THE IV MILLENNIUM BC IN THE SOUTHERN LEVANT: CHANGING COMMUNITIES AND THE NEW SHAPE OF INHABITED SPACE AND NATURE

Paolucci, Domizia (La Sapienza University of Rome)

The IV millennium BC in the Southern Levant is a time frame of movement and change; after the faded, or decisive, end of the Late Chalcolithic period the Early Bronze Age emerged, gradually shaping its own identity, in socio-economic as well as ideological and visual terms. By observing the forms of use and habitation of the territory, which followed one another during the Early Bronze Age I, it is possible to investigate the creation of new social identities, the change in the relationship with the surrounding nature, and the subsequent shift in cult and ritual. In particular, this contribution aims to propose an analysis of some factors that influence such communities in choosing specific areas for the construction of vast and stable settlements. We have chosen four case studies of permanent sites in the Southern Levant, namely et-Tell, Tell Qashish, Bab edh Dhra', Palmahim Quarry, and Khirbet el-Batrawy, in which ritual and funerary attendance in the area before their foundation is observable. Moreover, at times it is possible to highlight an integration of such rituals and cultic imagery in the construction of subsequent sacred places. These observations allow us to delve deeply into the investigation of the connection with natural spaces and with ancestors and to reflect upon the continuous thread that unites groups, social occasions, and places, the latter understood as contexts full of acquired meaning derived by the imagination of humankind.

4 MAKING SPACE FOR THE COMMUNITY IN LATE 3RD MILLENNIUM MALIA (CRETE)

Devolder, Maud (Ghent University) - Caloi, Ilaria (Ca' Foscari University of Venice)

Extensive programs of stratigraphic soundings that explored the earliest levels under the Middle and Late Bronze Age settlement of Malia in northern Crete revealed the remains of an habitat that testifies to the continuous occupation of the site throughout the Early Minoan IIA and IIB phases (2650-2200 BC). Modest houses in mudbricks set on a stone socle and provided with cooking and craft installations, and sturdier structures considered by some to be 'monumental' indicate a flourishing Prepalatial settlement, which came to an abrupt end around 2200 BC. In the phase immediately following this destruction, the ruins of the Early Minoan II habitat were buried in an extensive terracing operation. This major, (early) Early Minoan III undertaking created a large levelled area of about 10,000 sq. m in the centre of the site, the top of which was covered with an earthen floor. In some soundings the pottery hints at ritual communal consumption, although most of the material on this surface was disturbed by the construction of the Palace around 1900 BC. The setting in perspective of this fragmentary but extensive evidence points to a transformative levelling that pushed the Prepalatial habitat away from the plateau at the centre of the site to create a large open surface, and that foreshadowed the construction of the monumental palace and its courts in the early 2nd millennium BC.

5 URBANISATION AND CONNECTIVITY IN THE PREHISTORIC AEGEAN: A BOTTOM-UP APPROACH

Vavouranakis, Georgios (National and Kapodistrian University of Athens)

The first urban centres in Greece and the wider area of the Aegean appeared in the course of the 3rd millennium BC. They are usually seen as manifestations of a high degree of social complexity, often attributed to the emergence of social asymmetries and the first indications for elites. The same applies to Crete, where the first Minoan palaces were often founded within newly formed towns at the beginning of the 2nd millennium BC. Contrary to these interpretations, it is here argued that the link between urbanisation and the first elites is not as close as traditionally accepted. Furthermore, there is evidence to suggest that there are cases where town life evolved without visible central authorities. As a result, their appearance was not the cause, but, instead, a symptom of prehistoric urbanisation in the Aegean. The roots of the latter should be best sought in the high degree of connectivity at the level of horizontal rather than hierarchical social organisation. This betrays a significant effort by these early societies to establish common codes of collective values, especially through ritual activity, so as to ensure the effective reproduction of social relations at a regional scale. Such a bottom-up perspective to the prehistoric Aegean sees the emergence of centralised authorities as a reaction to popular, low-level strategies towards non-hierarchical and inclusive modes of social organisation.

6 "IN THE BEGINNING WAS CHAOS": INVESTIGATING THE ORGANIZATION AND SOCIAL SIGNIFICANCE OF SPACE IN LATE CYPRIOT DOMESTIC UNITS

Theotokatou, Chara (National and Kapodistrian University of Athens)

Past anthropological research has taken significant steps forward in the understanding of the concept of space: moving from a static-unidimensional perception of space to a more dynamic one, research has stated that space is actively created through the synthesis of people and objects in daily activities. The concept of space, though, is also pertinent to archaeology, whose research includes the study of the built environment in order to better comprehend the organization of past societies. In what regards the Late Cypriot domestic environment, past research focused on

the spatial analysis of finds and activities in monumental and elite structures and, by extension, on their social significance. Consequently, non-elite dwellings of the same period have been largely excluded from relevant discussions. This presentation aims to address this research gap, through the spatial analysis of such lower-tier structures, such as the habitation units of Alassa-Pano Mantilaris and Building IX from Kalavassos-Ayios Dhimitrios. This approach aspires to demarcate patterns of intra- and inter-house social dynamics in Late Bronze Age Cyprus, for as Lévi-Strauss highlighted, social phenomena may not be understood separately from their social space.

7 URBANISATION IN PROCESS: FORMAL, TECHNICAL AND CULTURAL FEATURES OF ASHLAR ARCHITECTURE IN LATE BRONZE AGE CYPRUS

Amadio, Marialucia (Ghent University) - Devolder, Maud (Ghent University)

The use of ashlar echoes deep transformations in the social and built environment in Late Bronze Age Cyprus. Individual cut-stone blocks were already incorporated in some of the island's fortified structures at the end of the Middle Bronze Age (MC III, 1800/1750-1690/1650 Cal BC), but it was not before the mature phases of the Late Bronze Age (LC IIC-III A, 1300-1125/1100 Cal BC) that monumental structures showcasing a pronounced adoption of elaborate ashlar masonries were built in key urban settlements involved in prolific exchange networks with neighbouring and far-reaching regions. As a consequence, the late appearance of cut-stone architecture on the island during the Late Bronze Age has often been related to the presence of a foreign specialised workforce who mastered the technology necessary to construct elaborate ashlar buildings. The proposed paper seeks to explore the possibility that there was fertile ground for the development of ashlar in Cyprus well before the mature phase of the urbanisation process, as suggested by pre-LC IIC evidence which indicates progressive development and local experimentation in cut-stone building components and composite masonries. The paper is based on a reassessment of available data pertaining to stone architecture in middle and late 2nd millennium BC contexts on the island. The aim is to highlight the formal and technical features proper to ashlar architecture in Cyprus and to emphasise the role played by local workers in shaping specific architectural elements that would become progressively absorbed into the built environment of Late Bronze Age Cyprus.

355 OCHRE AND CULTURE: THE ODYSSEY FROM EXPLOITATION TO SOCIETAL SIGNIFICANCE

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Mauran, Guilhem (UMR 5199 PACEA, University of Bordeaux, France) - Rosso, Daniela (Main Address Departamento de Prehistoria, Arqueología, Universidad de Valencia)

Session format: Discussion session (with formal abstracts)

Across diverse human cultures, our perception of reality is profoundly shaped by cultural significant colours. Materials known for their strong colouring properties, often referred to as 'ochre', have been used for over 300,000 years. Starting around 160,000 years ago, the utilisation of ochre became increasingly common and encompassed a wide variety of functions. These ranged from symbolic purposes, such as its use as a pigment in rock art, body painting or as a nonverbal communication agent, to more technical-economical functions, including its use as an abrasive or tanning agent. This diversity of uses has provided a cumulative inheritance of knowledge and skills that allowed us to truly stand on the shoulders of giants.

While the study of ochre has been widely developed in the last two decades, several questions remain unanswered. We still lack clarity on when and how ochre exploitation was standardised according to social-cultural norms, and we seek to understand the timing and link between changes in ochre usage and the traditions identified through the study of other artefacts that can be related to cultural traditions. This session is designed to bridge these gaps. Specifically, we aim to explore two main questions:

(1) Ochre exploitation traditions: Can we identify distinct traditions related to ochre exploitation? When and how did these traditions emerge? What cultural, technical and environmental factors contributed to their standardisation?

(2) Synchronicity of ochre traditions with other cultural markers: How does the use of ochre align with the development and utilisation of other artefacts that can be related cultural traditions within various societies? What can these synchronicities reveal about the evolution of the human lineage?

Through a thorough examination of these questions, our session aims to provide a deeper insight into the prehistoric exploitation of ochre and its significance in human evolution study.

1 ASSESSING HEATING OF OCHRE AT THE 100 KA BP TINSHMET CAVE, ISRAEL

GAITERO-SANTOS, DAVID (The Hebrew University of Jerusalem, Institute of Archaeology) - ZAIJNER, YOSSEF (The Hebrew University of Jerusalem, Institute of Archaeology)

The obtention and use of mineral pigments, or ochres, in a symbolic context in the Middle Palaeolithic and the Middle Stone Age records has been previously discussed. This includes the preferential extraction of ochres of red colors, as well as the obtention of red color by intentionally heating chunks of originally yellow hues.

The new Levantine Middle Palaeolithic site of Tinsmet Cave (Israel) dated to ca. 100 ka BP constitutes the fifth site in the region containing ochres in context with numerous human remains, configuring a probable relation with complex social practices and symbolism. The ongoing excavations provided more than 7.000 ochre fragments clearly dominated by red pieces (>65%).

Here we present the methods and results for the assessment of the occurrence of heating of ochre. A new methodology that combines XRD and FTIR to differentiate the red ochres derived from heating from the red ones of geogenic origin was applied to 35 archaeological samples. The uneven widening of hematite unstable peaks is calculated as ratios in relation to its stable peaks in XRD, while remains of goethite bands are traced under FTIR as well as thermal changes in clay peaks. The spatial distribution of heated ochres (>50%) and red ochres of geogenic origin suggests that the transformation by heating of originally yellow materials was conducted and controlled by the occupants of Tinsmet, manifesting a clear preference for the use of ochres of red hues.

We consider that the clear preference for selection, production, and use of ochres of red colors constitutes evidence of a behavior related to chromatic symbolism used by the region inhabitants at Tinsmet Cave.

2 MINERAL PIGMENTS USE BY MICOQUIAN NEANDERTHALS IN CRIMEA

d'Errico, Francesco (University of Bordeaux-CNRS; Centre for Early Sapiens Behaviour, University of Bergen, Norway) - Mauraun, Guilhem (Université de Bordeaux, CNRS, PACEA, UMR5199, Pessac, 33615, France.) - Pitarch Marti, Africa (Departament d'Arts i Conservació-Restauració, Facultat de Belles Arts, Universitat de Barcelona, 08028 Barcelona, Spain; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), 08001 Barcelona, Spain) - Majkic, Ana (Department of Archaeology, University of Belgrade, Serbia) - Stepanchuk, Vadim (Institute of Archaeology of the National Academy of Sciences of Ukraine, Kiev, Ukraine)

Over the past two decades, the utilization of ochre has evolved into a crucial archaeological indicator for scrutinizing the foundations of cultures comparable to ours. Nevertheless, the processes and mechanisms responsible for colors assuming such a central role in the existence of several members of our lineage remain inadequately documented and understood. Although largely ignored in the Western literature on Neanderthal mineral pigment use, the utilisation of colouring minerals by Micoquian Crimean Neanderthals has long been attested. We present a taphonomical, technological, compositional and functional analysis of unpublished ochre pieces from Zaskalnaya V, Zaskalnaya VI, Prolom II, and compare their chemical composition with a local ochre source. The multiproxy approach applied in the study of this material enables, for the first time, to propose where ochre was collected by Micoquian Neanderthal in Crimea, and how it was modified and used. Our results support the hypothesis that ochre was actively involved in symbolic practices.

3 SHIFTING PERSPECTIVES: THEORETICAL AND ANALYTICAL TRENDS IN MIDDLE STONE AGE OCHRE STUDIES

Culey, Jasmin (SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Bergen, Norway) - d'Errico, Francesco (CNRS UMR 5199 De la Préhistoire à l'Actuel: Culture, Environnement, et Anthropologie (PACEA), Université Bordeaux, Talence, France; SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Bergen, Norway) - Van Niekerk, Karen (SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Bergen, Norway; Archaeology Division, School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand, Johannesburg, South Africa) - Velliky, Elizabeth (SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Bergen, Norway)

Ochre, a pivotal element in discussions regarding the emergence and evolution of cultural/behavioral modernity, is often subjected to extensive scrutiny surrounding analytical and interpretive methodologies. However, beyond this discourse, it is difficult to discern the extent of the inferences we have made regarding ochre use in the past (or how we can best apply these to future hypotheses). Addressing such topics could assist in creating comparative reference collections to answer emerging questions about ochre use, to explore the future trajectory of the symbolic versus functional debate, and in creating a framework to test the inferences we make about past ochre behaviours.

This presentation uses data from an original, comprehensive database of 80 peer-reviewed studies (many of which are frequently drawn on by ochre researchers) on the topic of Middle Stone Age (MSA) archaeological ochre and ochre residues, as well as modern geological ochre assemblages, from African sites. Additionally, we address the content of existing comparative collections (the processing activities and use-wear traces most frequently replicated) and the role of ochreous sediments, surfaces, or layers, once seen as ephemeral, in experimental and analytical research. By tracking the evolution of research on MSA ochre assemblages from the African continent through their objectives, methods, results, and inferences using a newly generated database, this presentation attempts to address the aforementioned topics. It offers an examination of the degree of linkage between research questions and chosen methods (both qualitative and quantitative), charts the historical trajectories of ochre studies, and outlines pathways for future investigations using the database. In doing so, it suggests a framework for addressing the broader research questions posed within this session.

4 OCHRE USE DURING THE UPPER PALAEOOLITHIC AT PARPALLÓ CAVE, GANDÍA, SPAIN

Rosso, Daniela Eugenia (Departament de Prehistòria, Arqueologia i Història Antiga, Grupo de Investigación Prehistoria del Mediterráneo Occidental (PREMEDOC), Universitat de València, Spain) - Roldán García, Clodoaldo (Instituto de Ciencia de Materiales (ICMUV), Universitat de València, Spain) - Murcia Mascarós, Sonia (Instituto de Ciencia de Materiales (ICMUV), Universitat de València, Spain) - Villaverde Bonilla, Valentín (Departament de Prehistòria, Arqueologia i Història Antiga, Grupo de Investigación Prehistoria del Mediterráneo Occidental (PREMEDOC), Universitat de València, Spain)

The use of colouring materials, such as ochre, is considered as a distinctive feature of behavioural complexity. In the past few years, numerous studies on Upper Palaeolithic sites have focused on the geochemical characterisation of ochre related to cave art. However, few studies have explored other possible uses of colouring materials, and there is a lack of information on how Upper Palaeolithic populations processed ochre. In this study, we present the first results of the technological and chemical analysis of ochre pieces found at Parpalló Cave, Gandía, Spain. This site, which has yielded one of the most important collections of Palaeolithic portable art, consisting of more than 5000 painted and engraved limestone plaquettes, features a sequence virtually spanning the entire Upper Palaeolithic. Our aim is to reconstruct different phases of the ochre chaîne opératoire at Parpalló cave and characterise raw materials using micro-Raman spectroscopy and X-ray diffraction. Our results allow us to understand how inhabitants of the cave processed ochre, and suggest that this feature was probably used for a wide range of activities beyond the production of portable art.

5 AN EXPLORATION OF REDS AND YELLOWS IN THE PARIS BASIN: SOURCING STRATEGIES DURING THE UPPER PALEOLITHIC

Chassin de Kergommeaux, Aurélie (Environnements, Dynamiques et Territoires de la Montagne Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Salomon, Hélène (Environnements, Dynamiques et Territoires de la Montagne Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Rossi, Magali (Environnements, Dynamiques et Territoires de la Montagne Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Chalmin, Emilie (Environnements, Dynamiques et Territoires de la Montagne Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Peschaux, Caroline (MSH Mondes, UMR 8068 TEMPS) - Lesvignes, Emilie (MSH Mondes, UMR 8068 TEMPS) - Caron-Laviolette, Elisa (MSH Mondes, UMR 8068 TEMPS) - Bodu, Pierre (MSH Mondes, UMR 8068 TEMPS) - Bignon-Lau, Olivier (MSH Mondes, UMR 8068 TEMPS)

Ferruginous coloring materials have been extensively used in various facets of material culture since the Upper Palaeolithic offering valuable insights into the deliberate choices made by ancient societies, illuminating their circulation routes, ideas, preferences, and traditions.

In the Paris Basin, rich in ferruginous coloring resources and numerous Upper Palaeolithic sites, a comprehensive study was undertaken. This involves documenting ferruginous resources from local formations and analyzing archaeological collections spanning from the early Upper Palaeolithic to the Upper Magdalenian period.

Archaeological collections from significant sites such as Grotte du Renne (Arcy-sur-Cure, Chatelperronian), Mont-Saint-Aubin (Oisy, Badegoulian), Pincevent (Upper Magdalenian), and Louviers (Upper Magdalenian) underwent systematic petrological analyses and identifications of traces of past technical modifications using stereomicroscopes. These allowed for the characterization of the nature, provenance (in comparison to geological references), petro-physical properties, working techniques, and uses of the various rocks.

Despite the availability of local lithologies (ferruginous sandstones, limestones, concretions and Oolithic Iron Stones - OIS), certain resources from outside the watershed were preferred and exhibit enduring usage patterns. For instance, ferruginous crinoidal limestones used for powder production at Grotte du Renne, Mont Saint-Aubin, and Pincevent originated from the Hettangian of the northeastern Morvan foothills (35-145 kilometers away).

New resources were introduced during the Badegoulian period and became widespread during the Magdalenian, such as OIS from Ordovician formations in Normandy (100-360 kilometers away), used for perforated disks shaping and powder production. At Pincevent, where twenty levels document recurrent settlements within a short timeframe, the transition in selection of OIS from Aalenian-Toarcian (300 kilometers south) to Norman Ordovician (200 kilometers west) formations underscores changes in material-sourcing practices.

Overall, petrographic and technological cross-examinations unveil specific material selection strategies among ancient human groups, prioritizing desired properties over geographical proximity. This highlights the intricate relationship between human behavior, resource availability, and technological innovation in prehistoric contexts.

6 RED MINERAL PIGMENTS FROM THE LATE UPPER PALAEO-LITHIC CHOCOLATE FLINT MINE OF OROŃSKO, MASOVIAN DISTRICT, POLAND

Kosciuk-Zalupka, Julia (Jagiellonian University) - Kerneder-Gubała, Katarzyna (Polish Academy of Science)

At the Late Upper Palaeolithic flint mine at Orońsko, exploited around 12.800 BP, well-preserved traces of intensive raw material quarrying were discovered. During the 2016-2022 excavations seasons, both mining shafts and various tools were found. Some of the unearthened artifacts bore traces of red material, classified tentatively as ochre.

To approach potential provenience of that pigment, two hypotheses were assumed. The first one implies the possibility of acquisition of red clays from the glacial deposits in the vicinity of the site. Such acquired material could have undergone additional heating in order to change its original hue. That hypothesis is supported by the fact that traces of fire were spotted in the archaeological layer, that was connected to the method of flint exploitation. Nevertheless, hearths could have also been used for other activities.

The second hypothesis assumes the possibility of ochre acquisition from the well-known ochre mine at Rydno, situated 25 km away from the discussed flint mine. Both Orońsko and Rydno were inhabited during similar timespan, thus such case cannot be rejected without further analyzes. If so, those societies could have exchanged flint from Orońsko for ochre from Rydno.

To address this issue and explore potential connections between the Orońsko and Rydno societies, both laboratory methods and experimental clay firing were employed.

7 SHIFTING SANDS AND HUES: INVESTIGATING CULTURAL RESPONSES TO ENVIRONMENTAL CHANGE THROUGH THE OCHRE ASSEMBLAGE AT BOOMPLAAS CAVE

Mauran, Guilhem (UMR 5608 TRACES, University Toulouse Jean-Jaures, Centre National de la Recherche Scientifique (CNRS), Toulouse, France; Rock Art Research Institute, University of the Witwatersrand, Johannesburg, South Africa) - McGrath, James (Tallgrass Archaeology LLC, Iowa City, Iowa) - Chase, Brian (Institut des Sciences de l'Evolution-Montpellier (ISEM), University of Montpellier, Centre National de la Recherche Scientifique (CNRS), EPHE, IRD, Montpellier, France; Department of Environmental and Geographical Science, University of Cape Town, South Lane, Upper Campus, 7701 Rondebosch, South Africa) - Faith, J. Tyler (National History Museum of Utah, University of Utah; Department of Anthropology, University of Utah; Origins Centre, University of the Witwatersrand) - Pargeter, Justin (Department of Anthropology, New York University; Rock Art Research Institute, University of the Witwatersrand, Johannesburg, South Africa; Department of Anthropology and Development Studies, University of Johannesburg)

Ochre found in archaeological layers bears witness to the extensive social and symbolic activities of so-called "modern human culture". Cultural abilities are likely a crucial part of the story explaining the success of the hominin lineage. However, it remains unclear when these cultural capacities came to be and what influence(s) cultural capacities might have had on our survival during periods of marked climate change and resource variability.

Here we present, the terminal Pleistocene (~40-10ka) ochre assemblage from Boomplaas Cave (Western Cape, South Africa). It is currently one of the few sites in Africa with the unique combination of well-dated multi-proxy paleoenvironmental, dietary, and sedimentary records to demonstrate significant climate, vegetation, and resources change during the terminal Pleistocene. Tracking the source and use of ochre at Boomplaas Cave allows us to examine how territoriality varies in relation to environmental change. According to the influential economic defensibility model, we expect a decrease of territorial behaviors during increased environmental instability and reduced ecological productivity (<18ka).

Relying on a naturalistic approach, the analyses of archaeological and geological raw materials by optical microscopy allow us to provide preliminary results about the evolution of ochre exploitation at Boomplaas Cave. Comparison of these preliminary results with paleoenvironmental records derived from nearby hyrax middens, micromammal assemblages, as well as lithic raw material diversity allows us to address the impact of environment changes on cultural behaviours at Boomplaas Cave.

8 RED OCHRE AT ARMA VEIRANA (ERLI, LIGURIA). ANOTHER PIECE OF MOSAIC FOR UNDERSTANDING OCHRE EXPLOITATION AND MANIPULATION IN NORTHERN ITALY

Cavallo, Giovanni (University of Applied Sciences and Arts of Southern Switzerland) - Negrino, Fabio (Department of Antiquities, Philosophy, History, University of Genoa, Genoa, Italy.) - Benazzi, Stefano (University of Bologna) - Hodgkins, Jamie (Department of Anthropology, University of Colorado Denver, Denver, CO, USA.) - Miller, Christopher (Institute for Archaeological Sciences and Senckenberg Centre for Human Evolution and Paleoenvironment, University of Tübingen, Tübingen, Germany; SFF Centre for Early Sapiens Behaviour (SapienCE), University of Bergen, Bergen, Norway.) - Orr, Caley (Department of Anthropology, University of Colorado Denver, Denver, CO, USA.; Department of Cell and Developmental Biology, University of Colorado School of Medicine, Aurora, CO, USA.) - Peresani, Marco (Prehistory and Anthropology Science Unit, Department of Humanities, University of Ferrara, Sezione di Scienze Preistoriche e Antropologiche, Ferrara, Italy.; Institute of Environmental Geology and Geoengineering (IGAG), National Research Council, Milan, Italy.) - Riel-Salvatore, Julien (Département d'anthropologie, Université de Montréal, Montréal, QC, Canada.) - Strait, David (Department of Anthropology, Washington University, St. Louis, MO, USA.; Palaeo-Research Institute, University of Johannesburg, Auckland Park, Johannesburg, South Africa.)

Past research on ochre fragments in Italy allowed to understand more in-depth specific behaviours peculiar in ochre exploitation and manipulation during Palaeolithic. Provenance studies demonstrated that the exploitation of the raw materials was conducted at a local level and that humans were capable of selecting appropriate materials. In addition, the technology of fire use was well known.

The site of Arma Veirana (Erl, Liguria) is located in the Neva Valley, inland from the town of Albenga. The stratigraphy revealed levels with evidence of Mousterian and Late Epigravettian occupations. The ochre samples analysed came from the Mesolithic burial pit, which contained the remains of a female newborn, or in any case from the deposit immediately around.

Eight red ochre lumps unearthened from the archaeological site of Arma Veirana were analysed using optical and electron microscopy (Plane Polarized Light Microscopy, PLM; Scanning Electron Microscopy coupled with Energy Dispersive X-ray Spectrometry, SEM/EDX), and X-ray Powder Diffraction (XRPD) with the scope to characterize the archaeological materials and correlate them with the aforementioned features.

The mineralogical composition of the analysed samples is very homogeneous as they are principally composed of hematite, quartz and muscovite/illite, in variable (relative) amount.

The XRPD profile of most of the samples exhibits the selective broadening of some diffraction peaks that is a robust clue of the presence of artificial hematite obtained through pyrotechnological process of natural goethite. The presence of muscovite/illite indicates that temperatures were lower than T 800 C.

In all the samples, hematite is associated with clay minerals exhibiting a crenulated micro-texture; poly-crystalline quartz displays the loss of intra-crystalline boundary.

The textural, mineralogical, and microstructural features confirm the homogeneity of the materials in terms of the mineralogical composition indicating the same geological source.

9 AN INTEGRATED APPROACH OF ROCK ART: UNDERSTANDING THE TRAJECTORY OF COLOURING MATERIALS FROM THE SOURCE TO THE WALL

Chalmin, Emilie (Edytem) - Defrasne, Claudia (Edytem) - Salomon, Helene (Edytem) - Delannoy, Jean-Jacques (Edytem) - Chassin De Kergommeaux, Aurelie (Edytem) - Le Turnier, Marianne (Edytem) - Martinetto, Pauline (Institut Néel) - Bordet, Pierre (Institut Néel) - Theron, Coline (Institut Néel; Edytem)

The creation of schematic art in rock shelters spanning from the Mediterranean rim to the Alps during the Holocene involved the search for raw materials to produce painting matter. Some of these shelters possess the unique feature of having colouring materials readily available at the base of their walls, such as Le Trou de la Féclaz (Saint-Jean d'Arvey, Massif des Bauges, Savoie), and Otello (Saint-Rémy de Provence, Massif des Alpilles, Bouches-du-Rhône). However, the mineral landscape of these sites also provides access to numerous other ferruginous rock formations suitable for supply. Did the proximity of these colouring materials influence the selection of these sites? Is it a matter of opportunism?

To comprehend the availability of these colouring materials in the environment, it is imperative to document these various outcrops and establish a library of geological materials, a task undertaken within the Pigmentoθήque project. This documentation relies on rock petrography, mineral identification, and geochemistry.

To establish a connection with the matter deposited on the walls, it is essential to seek clues within various remnants and scrutinise the support along with its alterations. Unfortunately, with the loss of material coherence during powder production, accessing the petrography of the raw material becomes significantly challenging.

The cross-referencing of information between geological materials and archaeological remains poses a substantial challenge, necessitating the implementation of an interdisciplinary approach that integrates archaeology, materials science, and geosciences. The collaborative examination of geological materials, wall micro-samples, and the taphonomy of the walls in several schematic art sites has already allowed us to discern diverse mineral landscapes and variations in the painting matter employed.

10 NEW DATA IN THE CHARACTERIZATION OF LEVANTINE ROCK ART STYLISTIC HORIZONS THROUGH PIGMENTS: LIMITES AND POSSIBILITIES OF NON-INVASIVE METHODS

López-Montalvo, Esther (CNRS UMR 5608 TRACES) - Gallelo, Gianni (University of Valencia) - Roldán, Clo-doaldo (University of Valencia) - Ramacciotti, Mirco (University of Valencia) - Goemaere, Eric (Royal Belgian Institute of Natural Sciences) - Murcia-Mascarós, Sonia (University of Valencia) - Morales-Rubio, Angel (University of Valencia)

Included in the World Heritage List in 1998, Spanish Levantine rock art is a unique form of open-air pictorial expression in recent prehistoric Europe. In the last decades, many researches have attempted to characterise the stylistic sequence, the thematic content of scenes or even the territorial distribution of the rock art shelters in order to make progress in its chronological framework, which is still uncertain due to the impossibility of obtaining radiocarbon dates. Despite these advances, little is known about the composition of the coloring materials, and stylistic approaches involving a technological dimension remain unexplored.

This contribution presents a non-destructive in situ protocol for the elemental characterization of Levantine pigments based on field portable X-ray Fluorescence (pXRF). A close observation of rock weathering and a stylistic approach to paintings, supported by multivariate analyses, allowed for investigating the pXRF capabilities in the characterization and discrimination of prehistoric pigments.

Our research proposes a non-destructive protocol to obtain a useful pre-screening to explore technical traditions at different temporal and territorial scales, and opens up new avenues for the redefinition of Levantine stylistic horizons, integrating both formal and technological variables.

11 OCHRE OR CINNABAR? WHICH RED FOR THE CHEVRON-DECORATED ANTHROPOMORPHIC STELAE OF SOUTHEASTERN FRANCE?

Le Turnier, Marianne (IPAG, Université Grenoble Alpes, UMR 5274; Edytem, Université Savoie Mont-Blanc, UMR 5204) - Beck, Lucile (LSCE, Université Versailles Saint-Quentin, UMR 8212) - Chalmin, Émilie (Edytem, Université Savoie Mont-Blanc, UMR 5204) - Defrasne, Claudia (Edytem, Université Savoie Mont-Blanc, UMR 5204) - Schmitt, Bernard (IPAG, Université Grenoble Alpes, UMR 5274)

This research aims to mobilize archaeometric data in a social and cultural interpretation of the use of coloring materials between the Monts de Vaucluse and Lubéron in the Neolithic period. It focuses on the coloring of engraved steles, associated in rare cases where it is present, with a funerary context, and aims to question the diversity of these coloring materials and their origins regarding their social and cultural uses. One of the challenges of this thesis is to question the presence of cinnabar on stelae, a singular coloring matter, absent from the region studied, which may have circulated over long distances and been reserved for the funerary sphere. Where did the cinnabar, used to color the stone bodies of the deceased in Spain, originate? While recent studies appear to support the funerary use of cinnabar in Spain based on materials from collective burials (bones and objects), this inquiry has yet to address two crucial points: (i) the application of cinnabar to steles, which represent real stone bodies, and (ii) its potential relevance to the herringbone steles of Provence.

Hyperspectral imaging could reveal traces of pigments that are no longer visible, as has been done on painted shelter walls. The second benefit of this non-invasive, portable method would be to characterize the mineral paint materials used, by studying the spectral signal of each pixel emitted by the image obtained from the stele. Other methods, such as XRF, XRD or isotopic analysis (lead), will also be used to cross-reference and complement the results for an integrated, multiscale study.

Finally, a comparison with the geological coloring materials, (ochre, bauxite) widely present in this geographical area, could contribute to a better understanding of exchange networks, the circulation of materials and cultural dynamics, and provide a glimpse of some fragments of Neolithic ideal universes.

12 COLOURS AT HOME - UNEARTHING THE TRADITION OF COLOUR USE IN STONE AGE NORWAY

Riise, Mari (University of Bergen)

Though the use of colouring materials, and more specifically ochre, is widespread throughout the European palaeolithic, the few reported cases on stone-age Fennoscandia are primarily from burial contexts. Even less is known about

Norwegian stone-age colouring behaviours, though there are some scattered reports of rock paintings and ochre pieces from archaeological sites.

Piecing together information from literature, site reports, and museum collections, we found that there are more materials labeled "ochre" than previously assumed. Most distinct is the occurrence of ochre in cultural layers in settlement and activity sites and not in grave contexts as in the neighboring countries.

With an intent to shed light on a possible tradition of colour use in Norway, two museum districts were chosen for comparison, the northern region (The Arctic University Museum of Norway) and the western region (The University Museum of Bergen). A multianalytical approach was chosen. We used visual, contextual, and elementary analysis to understand the composition of the ochre material and to possibly differentiated ochre from naturally occurring iron formations.

Preliminary results indicate that the ochre material contains great potential for further studies. As ochre sites are abundant and are dated to all time periods of the Stone Age it could contribute to a better understanding of social and symbolic aspects of the hunter-fisher-gatherer societies and its traditions. Future analysis should include material from other geographical areas and further geochemical analysis, to obtain more details regarding the distribution and origin of the ochre material.

13 THE RED WAY TO THE LIFE BEYOND

Zagorska, Ilga (LU Institute of History of Latvia)

During the Stone Age in the Eastern Baltic, ochre was in widespread use, constituting one of most important aspects of human life and death.

Evidence of ochre use has been recovered from burials and settlement sites, and in connection with various artifacts (ceramics, amber, bone, art pieces etc).

Due to the long duration of use of burial grounds in the Eastern Baltic (8th–4th millennium BC), it is possible to trace strong traditions as well as changing practices of ochre use.

The obtained radiocarbon datings permit identifying the pattern of use of ochre at Zvejnieku burial ground to follow in particular periods. The use of ochre in burials was more prevalent during the Middle and Late Mesolithic periods. Its usage decreased at beginning of the Neolithic era,

but more intensively was used again at the Middle Neolithic, when special votive deposits appeared. Ochre has not been found with the Late Neolithic crouched burials.

The burial traditions involving ochre use testify to the Stone Age people's firm belief in a life beyond the grave and their strongly structured social rites.

359 THE 4TH AND 3RD MILLENNIUM BC STEPPE IMPACT ON PREHISTORIC EUROPE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Heyd, Volker (University of Helsinki) - Kulcsár, Gabriella (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Dani, János (University of Szeged) - Topal, Denis (National Museum of History of Moldova) - Palalidis, Stefano (Università Ca' Foscari Venezia)

Session format: Session with keynote presentation and discussion

In January 2019, the ERC Advanced Project 'The Yamnaya Impact on Prehistoric Europe (YMPACT)' embarked on a journey to investigate the massive transformation that swept across Europe approximately 5000 years ago. Hosted by the University of Helsinki, Finland, and with partners working in the UK, Germany, and Hungary, the project has been an international and interdisciplinary team effort focusing on the western end of the huge Yamnaya distribution area, in the steppe landscapes of present-day territories of Romania, Bulgaria, Serbia, and Hungary. Despite the unforeseen obstacles presented by the COVID-19 pandemic and the Russian invasion of the Ukraine, close collaboration with local archaeologists in these countries facilitated intensive fieldwork and sample collection, culminating in three archaeological excavation campaigns, in Boldești-Grădișteța in Romania (2019), Mogila in Bulgaria (2021), and Hajdúböszörmény in Hungary (2023).

This session aims to offer a comprehensive overview of research conducted not only by YMPACT in the past five years, but also inviting other scholars to add data enriching our understanding of the Yamnaya impact on prehistoric Europe and opening up lines of future research. Drawing inspiration from the project's collaborative and interdisciplinary approach, the session will host contributions spanning archaeology, bio-anthropology, genetics/ancient DNA, biomarker lipids, and isotope biogeochemistry. Geo- and environmental sciences will contribute to discussions on palaeoclimatology, climate change research, soil formation processes, and landscape reconstructions. Lectures will present latest research, delving into the funerary archaeology of Yamnaya kurgans and material culture; exchange dynamics with southeastern European societies; the physical appearance and population dynamics of the Yamnaya; data

on their mobility, diet, occupation, and lifestyle; their intricate connection with the environment; and the profound nature of the wider Yamnaya Impact.

ABSTRACTS

1 **MIGRATION AND SOCIAL TRANSFORMATION: NEOLITHIC DECLINE AND CORDED WARE EXPANSION**

Kristiansen, Kristian (Department of Historical Studies, University of Gothenburg)

In this contribution I shall analyze the possible conditions and causes of a Neolithic demographic decline, preceding the Corded Ware migrations. This includes the effects of plague as a major killer, as well as possible contradictions between more closed Neolithic societies versus more open pastoral societies.

2 **THE YAMNAYA IMPACT ON PREHISTORIC EUROPE: CURRENT UNDERSTANDING AND PAVING THE WAY FOR FUTURE RESEARCH**

Preda-Balanica, Bianca (University of Helsinki)

Over the past decade, the migration of Yamnaya groups from the Pontic-Caspian steppes to Southeastern Europe 5000 years ago has sparked intense debate in both archaeology and genetics. The Yamnaya have attracted the interest of prominent research projects, including the ERC Advanced Project “The Yamnaya Impact on Prehistoric Europe” based in Finland at the University of Helsinki, which has contributed to the topic through fieldwork and interdisciplinary studies. Further efforts have been undertaken by scholars in Southeastern and Eastern Europe to research regional and super-regional aspects of the Yamnaya culture. Through intensive international cooperation in recent years, much more detailed knowledge of the burial practices and material culture of Yamnaya groups has been acquired. Additionally, a more precise and refined chronology of the various phases of their presence west of the Black Sea, has been developed. Furthermore, a deeper understanding of their lifestyle, which is reflected in their bio-anthropology, has been gained. Other research approaches integrate data provided by genetics and archaeology to explore the complex relationship between biology and culture in the creation of social identity within the context of the Yamnaya migration. This presentation aims to provide a comprehensive overview of the research progress accomplished in recent years and pave the way for future research on the topic of the Yamnaya impact on prehistoric Europe.

3 **SPATIAL MODELLING OF THE EARLY YAMNAYA EXPANSION USING RADIOCARBON DATES**

Suvorov, Alexander (University of Helsinki)

The expansion of the Yamnaya peoples in Europe around 5000 years ago has been in the center of interest for over a hundred years, but especially in the last decade. Recently acquired information from aDNA and isotope analyses conducted on Yamnaya individuals from kurgans in Russia, Ukraine, Moldova, Romania, Bulgaria, Hungary, and Serbia has led researchers to believe that while moving from the east to the west, the fierce Yamnaya brought war and diseases like *Yersinia pestis* over to Europe, which resulted in a rapid disappearance of local communities. However, the absence of archaeological evidence of violence and disease during that period challenges the suggested hypothesis of a vicious invasion, and thus archaeological material must be re-examined with a new multidisciplinary approach. In this paper, one such possibility, which combines archaeology, chemistry, and GIS, is explored. Radiocarbon dates obtained from Yamnaya graves are used to analyze the early stages of the expansion by implementing the spatial analysis method, kriging. Kriging is used to predict the progress of the expansion based on the distribution of radiocarbon dates expressed as Z-points. In this paper, known radiocarbon dates from publications have been gathered and divided into a comprehensive (not quality controlled) and an audited dataset (quality-controlled). Based on these categories, several models have been created to reflect the speed and direction of the expansion and to test, whether the Yamnaya did in fact move from east to west as has recently been hypothesized. The models are analyzed in a social and cultural context and the probability of violence in this expansion is discussed. The paper also presents possible centers of origin, the direction of the expansion as well as indicates several problems resulting from the lack of consistent and reliable radiocarbon sampling.

4 **INTERCULTURAL INTERACTIONS IN THE NORTHWEST PONTIC DURING THE EARLY YAMNA PERIOD (3350-2900 BCE)**

Nikitin, Alexey (Grand Valley State University) - Ivanova, Svitlana (Institute of Archaeology, The National Academy of Sciences of Ukraine)

The Yamna archaeological complex (YAC) exerted significant economic, cultural, and demographic influence on post-Neolithic Europe and Yamna's immediate neighbors in the North Pontic region (NPR). In the northwestern part of the NPR, Yamna closely interacted with various archaeological groups in the late 4th – early 3rd millennium BCE, as evidenced by archaeology and archaeogenetics. Archaeogenetics reveals the presence of Yamna genetic ancestry in the northwest NPR since approximately 3350 BCE. Apart from appearing in a Yamna culture-specific burial context, Yamna genetic ancestry was also found in burials exhibiting mixed material culture features with other archaeological groups such as Corded Ware, Globular Amphora, steppe Eneolithic, and Zhyvotyivka-Volchans'k. In burials displaying mixed features, Yamna genetic ancestry was often admixed as well. In some cases, burials displaying unadmixed cultural features of archaeological groups of local origin in the northwest NPR, such as Usatove, harbor unadmixed Yamna genetic ancestry. The presentation will also explore potential vectors and consequences of inter-cultural interactions in the northwest NPR from both regional and continent-wide perspectives.

5 **THE FUNERARY TRADITIONS IN THE YAMNAYA CULTURAL HORIZON (CA. 3400 - 2300 CAL BC): DEVELOPMENT AND DIFFERENTIATION**

Palalidis, Stefano (Università Ca' Foscari Venezia)

In 1968 the Soviet archaeologist N. Ya. Merpert submitted his doctoral dissertation on the study of the burial customs of the Yamnaya cultural horizon throughout its (almost) entire geographical and chronological extension. Since then, only studies focused on restricted regions have been conducted by scholars of the respective countries, in most of the cases showing a high degree of accuracy and detail, but on the other hand lacking the general picture that is provided by the comparison with neighbouring and more distant regions. With a dataset of more than 5700 graves attributed to the Yamnaya cultural horizon from the Tisza river in the west to the Ural mountains in the east, my PhD project aimed to investigate the Yamnaya cultural horizon in its entirety and study its different trends in the funerary practices of different regional groups and chronological phases, in order to renovate Merpert's approach with fresh methodologies and new data from more than 50 years of excavations.

This paper will summarise the main results of my doctoral dissertation, presenting an overview of the analysis conducted on the archaeological and anthropological data in order to investigate patterns in cemetery occupation, grave construction, funerary rituals, demographic structure, sex ratio and grave goods composition and distribution. A critical selection of the reliable radiocarbon dates for the Yamnaya cultural horizon will then be used as the basis for a multivariate statistical approach aimed at investigating whether the observed differentiation in burial customs can be explained by calibrated radiocarbon age.

6 **'YAMNAYA', 'CORDED WARE', 'BELL BEAKER' ETC. THE IMPACT OF ARCHAEOLOGICAL TAXONOMIES ON ANCIENT DNA RESEARCH**

Brami, Maxime (Palaeogenetics Group, Johannes Gutenberg University Mainz)

Over the last ten years, 'Yamnaya' or 'steppe' ancestry has been identified in human genomes all the way from Central Asia to Western Europe, supporting notions of large-scale population movements from the Pontic-Caspian steppes during the 4th and 3rd millennia BC. This ancestry component appears to be especially prevalent in genomes associated with 'Yamnaya', 'Corded Ware' and Northwest European 'Bell Beaker' graves, but is completely missing in 'Globular Amphora'-related individuals.

In this seminar, I want to turn the problem on its head and ask how far archaeological taxonomies (i.e. the categorical labels used by archaeologists to describe phenomena in archaeology) inform genetic research and influence the results. Indeed, the labels used to justify clustering genomes into sets of individuals for statistical modelling of genomic variation are usually provided by archaeology, based on criteria that are rarely made explicit. Individuals whose ancestry profile does not match their expected cultural assignment are often flagged as outliers and excluded from further analysis. I show how random sampling and reshuffling of archaeological labels can produce different demographic scenarios.

Parametrizing the material record in the most objective way is thus essential. I demonstrate how the use of Artificial Intelligence could help to mitigate taxonomic issues in archaeology by creating consistent datasets that can be independently sorted through machine learning approaches.

7 DEMOGRAPHY OF THE STEPPE

Blöcher, Jens (Johannes Gutenberg University) - Diekmann, Yoan (Johannes Gutenberg University; University College London) - Preda-Bălănică, Bianca (University of Helsinki) - Thomas, Mark (University College London) - Heyd, Volker (University of Helsinki) - Burger, Joachim (Johannes Gutenberg University)

Profound cultural transformations already beginning in the fifth millennium BC heralded the end of the Neolithic, in Eastern Europe most visibly materialising in the form of Kurgans. These have long been associated with mobility and westward migration of people and ideas from the Pontic-Caspian steppe, however, the demographic details of the expansion and interactions of populations and emerging cultures remain elusive. Here, we present 46 newly sequenced genomes, most of which were purposefully excavated in the interaction zone of the Yamnaya culture with local farming societies along the Black Sea in Romania and Bulgaria. We find population structure in the Pre-Yamnaya period, in which individuals with genomic ancestry indistinguishable from Yamnaya inhabited the westernmost Dobrudzha steppe ecozone in nowadays Romania and Bulgaria, coexisting with genomically predominantly local Neolithic individuals in the neighbouring mountainous Thracian and Ploiesti regions. After c. 3050 BC, this structure disappears and all individuals are dominated by steppe ancestry. Focussing on the steppe fraction of the genome, we infer a strong population size bottleneck around 3500 BC that reduced genetic variation in all descending individuals with steppe ancestry. This causes individuals to appear closer related, affecting estimates of the speed of expansion of steppe populations. We account for this effect by exclusively considering Neolithic ancestry as a marker, and find shared genomic segments between Polish Globular Amphora and late Neolithic Ukrainian individuals, to later Corded Ware in Germany, and ultimately to Fatyanovo in Eastern Europe. This may suggest the displacement of a Ukrainian population towards Poland, Czechia and Germany as the origin of the Corded Ware Culture.

8 EARLY CONTACT BETWEEN LATE FARMING AND PASTORALIST SOCIETIES IN SOUTHEASTERN EUROPE

Penske, Sandra (Max Planck Institute for Evolutionary Anthropology)

Around 3300 BCE, Europe experienced major cultural and genetic changes due to the expansion of pastoralist groups from the Eurasian steppe, predominantly associated with the Yamnaya cultural complex. This group has sparked intense scholarly debate as their spread was not only linked to new burial practices, namely kurgans into areas outside of the forest/steppe zone, but also suggested to have brought Indo-European languages to central and western Europe. The kurgan hypothesis, proposed by Marija Gimbutas, suggested that pastoralist groups from this region imposed themselves and the kurgan culture on local people as early as the 5th and 4th millennium BCE. The demise of the Copper Age in southeastern Europe ~4250 BCE was used as a primary example for this hypothesis. However, evidence to support this scenario is sparse since archaeological findings from the following ~1000 years suggest very little settlement activity in this region, whereas activity had increased in the northwestern Black Sea region.

By analysing 135 individuals spanning this critical time period and important eco-geographic zones, we have evidence for genetic continuity between Early Neolithic and Copper Age groups in southeastern Europe which even extends into the Early Bronze Age. This finding leads us to reject the idea of an early (lasting) spread of the kurgan culture into eastern Europe. By contrast, prehistoric groups from a contact zone in the northwestern Black Sea region, that are derived from the preceding southeastern European Copper Age carry a genetic component that is associated with pre-Yamnaya pastoralist groups from the eastern forest/steppe zone. This indicates cultural and biological interaction between the two groups and the introduction of steppe-related ancestry ~1000 years early than previously anticipated. Only later, during the Early Bronze Age, we find the expansion of Yamnaya-associated steppe ancestry in individuals from southeastern Europe and the northwestern Black Sea region.

9 GENOMIC STABILITY AND TRANSFORMATIONS IN PREHISTORIC TRANSYLVANIA

Rohrlach, Adam (Max Planck Institute for Evolutionary Anthropology)

The region of today's Transylvania has long been a region of rich natural resources, fertile farming land and relative protection from the surrounding Carpathian and Apuseni mountains. However, the genetic history of the people that have inhabited this region is poorly understood, and the archaeogenetic record in Transylvania is only represented by very few individuals. Conversely, the history of the regions in southeastern Europe surrounding Transylvania have been well studied, and attest to dramatic genetic turnovers accompanying the change from a hunter-gatherer to a sedentary agricultural lifestyle, and the arrival of steppe-related ancestry with the expansion of pastoralist societies from east of the Carpathian mountains.

In this study we report archaeogenetic results from individuals from Transylvania and the surrounding regions in Romania, spanning the Neolithic to the Late Bronze Age. We report a surprising level of genetic continuity within Transylvania, with little evidence for an influx of steppe-related ancestry into individuals associated with the main cultural groups until the Late Bronze Age, coinciding with the arrival of people associated with the Noua culture. In stark contrast to this, we also find evidence for Yamnaya and Yamnaya-related groups from the Early Bronze Age who appear

to have been unsuccessful in making a genetic foothold in the region. In summary, we find that Transylvania was at times a melting pot of genetic profiles, but still maintained a relatively continuous genetic legacy during the Copper Age and much of the Bronze Age.

10 STUDIES ON THE BIOANTHROPOLOGY OF INCOMERS FROM THE STEPPE AND LOCAL RESIDENTS OF SOUTHEASTERN AND CENTRAL EUROPE

Trautmann, Martin (University of Helsinki)

About two decades of intensive archaeological, bioarchaeological, and paleogenetic investigation have revealed stupendous details about the cultural and biological impact of Aeneolithic populations from the Eurasian steppes on their agrarian counterparts in Southeastern and Central Europe.

Now, a nuanced understanding of their interactions emerges, revealing a spectrum of disparities across genetics, physical characteristics, lifestyles, dietary habits, social structures and behavior - a complex pattern of displacement, assimilation, hybridization and adaptation that fundamentally reshaped the future development of Europe's human population.

With the osteological studies undertaken for the YMPACT project we add to the former research focus on genetic understanding of ancestry and population movement, replacement or admixture. Skeletal traces of environmental adaptation, physical stress and workload, health risks from diseases or violence, diet, gender- or lineage-dependent status differences provide insight into aspects of human life that transcend mere biology.

Analysis of bioanthropological data to date suggests that the region west of the Black Sea represented a borderland between two very different populations with very different lifestyles. From the 4th millennium onwards, an initially sporadic and later increasing influx of steppe groups to the west can be seen, which displaced and transformed the local resident population, but also changed and adapted to the new habitat.

11 THE DIETARY IMPACT OF THE YAMNAYA HORIZON ON EARLY BRONZE AGE AGRICULTURALIST POPULATIONS IN PREHISTORIC EUROPE

Sandoval, Elena (University of Bristol) - Heyd, Volker (University of Helsinki) - Cramp, Lucy (University of Bristol)

The ERC project "The Yamnaya Impact on Prehistoric Europe (YMPACT)," was started in January 2019 to explore the effect the Yamnaya Horizon had on the fabric of society in Europe. As a subsection of the YMPACT project, this study seeks to investigate the influence of the Yamnaya horizon on prehistoric Europe, through the lens of diet, via stable isotopic analysis and organic residue analysis. Based on the lack of settlement evidence, a pastoralist subsistence pattern is generally assumed for the Yamnaya populations, but dietary patterns are difficult to reconstruct due to this lack of associated material culture. This study reconstructs dietary practices within the Yamnaya from the human remains themselves, using bulk stable isotopic analysis. Samples of 208 skeletal individuals were chosen to reflect this angle of inquiry creating a sample group that is comprised of Eneolithic, Early Bronze Age, and Middle Bronze Age skeletal remains from across modern day Bulgaria, Romania, and Hungary, creating an in-depth study to enable comparison of both spatial and temporal dietary trends. The organic residue analysis was conducted on 170 pottery sherds of four Early Bronze Age settlements to compliment the skeletal dietary investigation and give insight into dietary patterns of sedentary Bronze Age societies.

Here I will present the findings from the analysis of multiple skeletal elements from Yamnaya individuals and non-Yamnaya individuals from 34 sites combined with lipid biomarkers. This study provides the first detailed picture of the subsistence patterns and change throughout the Yamnaya migration and subsequent contact with Early Bronze Age societies through a Bayesian statistical modeling framework. This research presents a multi-level modeling approach to investigate dietary patterns and potential cultural flow between the Yamnaya and Early Bronze Age settlements as well as dietary patterns within the Yamnaya, targeting differences in diet between sex and age categories.

12 'SUBSISTENCE, LIFE AND DIET IN THE WESTERNMOST YAMNAYA COMMUNITIES BASED ON BIOARCHAEOLOGICAL DATA.' (CASE STUDIES)

Dani, Janos (University of Szeged, Archaeological Department; Déri Museum, Debrecen) - Bálint, Marianna (Hajdúsági Museum, Hajdúböszörmény) - Volker, Heyd (University of Helsinki) - Lisztes-Szabó, Zsuzsanna (HUN-REN Institute for Nuclear Research, Debrecen) - Trautmann, Martin (University of Helsinki) - Hajdu, Tamás (Eötvös Loránd University, Budapest) - Kelentey, Barna (Faculty of Dentistry, University of Debrecen) - Angyal, János (Faculty of Dentistry, University of Debrecen) - Horváth, Anikó (HUN-REN Institute for Nuclear Research, Debrecen) - Gábor, Emese (Magyarságkutató Intézet)

The westward migration of the Yamnaya people and the resulting changes in the genetic make-up of Prehistoric Europe has been a very highlighted topic of archaeological research for about 10 years. The Carpathian Basin, and within it the Great Hungarian Plain, was the westernmost station of this migratory process, which provided the people

arriving here with very diverse living conditions, different from those of the Eastern European steppe. The burials excavated in prehistoric kurgans in Hungary during the last decade have given us the opportunity to investigate the lifestyle, subsistence and diet of the westernmost Yamnaya population, in addition to the traditional archaeological methods and aDNA analyses. At the same time, it also provides opportunity to compare the way of life of the local western communities with that of the eastern groups living in the Caspian steppes.

Beyond the basic physical anthropological analyses, the application of several new bio-archaeological methods (dental calculus & stable isotope analyses, paleo dentistry, facial reconstruction) will provide detailed insights into the daily life of this nomadic people. In this presentation, we will present some exciting case studies that significantly enrich the picture of the Yamnaya population.

13 PALEOENVIRONMENTAL AND PALEOSOIL STUDIES OF KURGANS WITHIN THE YMPACT PROJECT

Peto, Ákos (Hungarian University of Agricultural and Life Sciences) - Braun, Ádám (Hungarian University of Agricultural and Life Sciences)

Kurgans are man-made geomorphological values of the Eurasian steppe zone. During the construction of these structures, humans sealed one of the most important information sources of the ancient environment: the surface soil cover. This conscious human act – the building of these earthen features – isolated and therefore kept the original soil in untouched conditions. These buried soil profiles act as ‘time capsules’, which can be opened for the sake of the better understanding of the contemporary environmental conditions.

Current presentation provides an overview of the complex paleoenvironmental research conducted at multiple kurgan sites within the research area of the YMPACT project. Case studies and comparative analysis covers kurgans from Hungary, Bulgaria and Romania.

The main objective at each kurgan was to collect data on the possible construction phases of the mound structure, to identify and describe the buried paleosoil, and to collect paleoenvironmental data in order to complement our knowledge on the ancient environment of the Bronze Age.

14 KURGANIZATION WITHOUT KURGANS. PLANIGRAPHIC PATTERN OF SOME PRE-YAMNAYA FLAT CEMETERIES OF NW PONTIC AREA

Topal, Denis (National Museum of History of Moldova)

The kurganization of the south of Eastern Europe can undoubtedly be considered one of the most remarkable events in the history of this region. The praxis of erecting barrows over the dead appeared in the Northwest Pontic area of Eastern Europe not later than in 3900–3800 BC, and at least 134 tumuli with 254 burials belong to the period before the penetration of the Yamnaya communities. The mounds appear in their most developed form, with the most sophisticated monumental features of stone, ring ditches, sanctuaries, and various ritual manipulations with fire and sacrificial animals. However, the complexity and monumentality of these structures contrast with the poverty of the grave goods of the central burials, which can be explained by the change from intra-group competition to intra-group consolidation. The emergence of burial mounds and the further development of barrow architecture could influence the layout of flat cemeteries, which did not stand out in the landscape like tumuli. For example, the Usatovo culture flat burial grounds (Dancu, Dănceni, Usatovo, Mayaky, Koshary) are formed according to the same principle as the barrow sites by small groups of burials, according to a radial planigraphic pattern. However, not only were flat burials of the Usatovo culture (for which barrows are known) arranged according to this principle, but also the burial sites of the communities without any barrows. The burial site near Vykhvatintsy-Ofatinți is also formed by compact groups of 5-6 graves arranged in arcs, sometimes with a burial in the centre and a stone circle. These groups of burials have been interpreted as “family” or “influencers” cemeteries. Both interpretations suggest synchronous use of these burial areas. Still, there is every reason to assume that these groups were formed sequentially, similar to the mounds in barrow cemeteries.

15 THE WAGONS OF YAMNAYA CULTURE: THE EARLY STAGE OF THE DEVELOPMENT OF WHEELED TRANSPORT IN THE EURASIAN STEPPE

Rzonca, Justyna (PhD candidate, Jagiellonian University)

The oldest evidence for the usage of wheeled transport in the territory of the Eurasian Steppe comes from Yamnaya graves. Parts of wagons were included in the Yamnaya burial rite since the early stages of development of this cultural community: this type of practice first appeared in the late IV millennium B.C. or very early III mill. BC. Currently all grave finds amount to a total of 49, located in the territory between the Danube and Ural river basins and their frequency of occurrence seems to be regular, but also dependent on the cemetery at the micro-regional level. The parts used in the burial rites were mostly wheels and single pieces of the wagon’s body. The analysis of the wagon’s remains

placed in the grave pit can lead to several kinds of conclusions. Firstly, this allows the identification of the construction types of the earliest known wagons in this area. Secondly, this can lead to identifying how important wheeled transport was for a society of the Eurasian Steppe in the Early Bronze Age and why they were placed in such sacred contexts. And thirdly, it is important to identify who the people buried with wagons and their elements were for their immediate social environment and if it is possible to find a common trait among them. Because this rite was long-lasting and supraregional, the tradition survived to the later stages of the Yamnaya culture and would eventually be inherited by younger Steppe area groups. The question about similar Yamnaya influences on other parts of Europe, in both the technological and ritual spheres, is the subject of an ongoing inquiry.

16 LANDSCAPE ANALYSIS OF THE EARLY BRONZE AGE MOUNDS IN THE MIDDLE AND LOWER TUNDZHA RIVER

Valchev, Todor (Historical museum - Yambol) - Sobotkova, Adela (Aarhus University)

The second half of 4th and the first half of 3rd millennium BC is one of the most dynamic and interesting periods in Balkan history. This is a period of movement of people, ideas and innovations.

During this time, the Tundzha River Valley sees the arrival of the steppe people – mainly the Yamnaya culture communities originally spread from the Ural Mountain to the Hungarian plain. Their presence is attested by burial mounds, which represent a new way of depositing the dead within earthen monuments so as to facilitate remembrance of venerated relatives and claims to land.

This paper reviews the properties of ten excavated Early Bronze Age mounds in the Yambol Province, showing these mounds are substantial in size and tend towards high-prominence locations in the landscape. These attributes are then used to extract mounds of similar properties from a dataset of 1090 mounds registered in the Yambol province since 2009. Two different sets of criteria produce two subsets of 52 potentially Early Bronze Age mounds, differing slightly in location.

17 OCHRE IN THE PICTORIAL ACTIVITY OF PIT-GRAVE TRIBES OF CENTRAL UKRAINE

Syvolap, Mykhaylo (Cherkasy City Archaeological Museum)

The article deals with the few cases of the pictorial activity of Pit-Grave burial rite.

In 1989, the author excavated 5 burial mounds in the triangle at confluence of Sula tributary into Dnieper on the Left bank Dnieper terrace plain. The biggest mound No4 (h 3m, d 51m) was located 3km northeast of the Klishchyntsi village, Zolotonosha district, Cherkasy Region, Ukraine. It contained 9 ancient burials, 6 of which belonged to the Pit-Grave culture [Syvolap, 1989]. The burial rite of these burials was specific to the Northwest group of Yamna culture (Merpert, 1968). The inlet burial No4 was the latest in the mound, inserted according to the radial principle. The deceased was orientated with head to SW & laid on the back with arms extended along the body & legs bent with knees up. The most interesting feature of this burial were the remains of drawing in bright red ochre between two layers of three-layer bedding, traced on both sides of the upper part of the deceased. Due to significant damage of the burial, only one composition in the form of six-axis wheel (d 10cm) can be clearly distinguished.

Small unreadable remains of similar drawings were discovered by the author twice more in the burial No5 of the same mound & in the mound No11 “Valiavkyna Mohyla” [Syvolap, 1990] on the right bank of the Dnieper near Cherkasy City.

Another interesting case of ochre use in the ritual visual practice of the Pit-Grave tribes is evidenced in barrow No1 “Vorozhbyna Mohyla” some 6km to the northwest of “Valiavkyna Mohyla”. The primary burial contained the skeleton of teenager with same orientation as Klishchyntsi burial deceased. On the skull of deceased a layer of red ochre formed two parallel stripes 4-5cm wide (ochre drawing?) & traces of white plaque (white paint?).

18 TWILIGHT OF THE GOLDEN AGE

Burdo, Nataliia (Kyiv Domain Archaeological Museum) - Videiko, Mykhailo (Kyiv Borys Grinchenko University)

The impetus was climate change, thanks to which pasture resources for nomads increased. Before finally disappearing, Trypillia-Cucuteni led to the creation of a number of new cultural groups with other economic systems, including pastoralist ones.

These groups (the Usatovo, Zhivotilivka in the Steppe zone; the Gorodsk, Sofivka in the Forest zone), were considered by some researchers to be part of the Trypillia-Cucuteni for a long time. Their emergence can be considered as a process of adaptation of various population groups to new natural conditions.

There are several formations in the Steppe, the influence and participation in the formation of which Trypillia-Cucuteni was different. The Usatovo culture contains the most Trypillian components. Nomadic animal husbandry was the basis of the economy of the Usatovo culture. The Vykhvatyntsi cemetery was left by a group with mixed traditions – Trypillia and Usatovo. The origin of the not Trypillia tradition in the Usatovo culture is rightly associated with the

Chernavoda-I culture. Trypillian traditions were most clearly manifested in the barrow burials of the Usatovo eponymous landmark. The mixed nature of the population of the Usatovo culture is confirmed by DNA research.

The post-Mariupol culture and the Zhytylovka group show connections with Maykop. Trypillia-Cucuteni artefacts in their mound burials should be considered as imports and imitations of Trypillia-Cucuteni traditions. Archaeological materials show the penetration of Zhytylovka traditions along with carriers into the Usatovo area. This is also confirmed by DNA research.

After 3000 BC, the diversity of cultural traditions of the “twilight of the golden age” was replaced by the uniformity of the traditions of the pit culture nomads, whose way of life turned out to be more adapted to the new climatic realities.

360 THE 4TH AND 3RD MILLENNIUM BC STEPPE IMPACT ON PREHISTORIC EUROPE PART 2

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Topal, Denis (National Museum of History of Moldova) - Heyd, Volker (University of Helsinki) - Kulcsár, Gabriella (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Dani, János (University of Szeged) - Palalidis, Stefano (Università Ca' Foscari Venezia)

Session format: Session with keynote presentation and discussion

In January 2019, the ERC Advanced Project “The Yamnaya Impact on Prehistoric Europe (YMPACT)” embarked on a journey to investigate the massive transformation that swept across Europe approximately 5000 years ago. Hosted by the University of Helsinki, Finland, and with partners working in the UK, Germany, and Hungary, the project has been an international and interdisciplinary team effort focusing on the western end of the huge Yamnaya distribution area, in the steppe landscapes of present-day territories of Romania, Bulgaria, Serbia, and Hungary. Despite the unforeseen obstacles presented by the COVID-19 pandemic and the Russian invasion of the Ukraine, close collaboration with local archaeologists in these countries facilitated intensive fieldwork and sample collection, culminating in three archaeological excavation campaigns, in Boldeşti-Grăditea in Romania (2019), Mogila in Bulgaria (2021), and Hajdúszendrőd in Hungary (2023).

This session aims to offer a comprehensive overview of research conducted not only by YMPACT in the past five years, but also inviting other scholars to add data enriching our understanding of the Yamnaya impact on prehistoric Europe and opening up lines of future research. Drawing inspiration from the project’s collaborative and interdisciplinary approach, the session will host contributions spanning archaeology, bio-anthropology, genetics/ancient DNA, biomarker lipids, and isotope biogeochemistry. Geo- and environmental sciences will contribute to discussions on palaeoclimatology, climate change research, soil formation processes, and landscape reconstructions. Lectures will present latest research, delving into the funerary archaeology of Yamnaya kurgans and material culture; exchange dynamics with southeastern European societies; the physical appearance and population dynamics of the Yamnaya; data on their mobility, diet, occupation, and lifestyle; their intricate connection with the environment; and the profound nature of the wider Yamnaya Impact.

ABSTRACTS

1 SEPARATION, HYBRADISATION, AND NETWORKS: GLOBULAR AMPHORA SEDENTARY PASTORALISTS CA. 3200-2700 BCE

Mueller, Johannes (Kiel University)

Around 3000 BCE, a turning point occurred in Europe: Long-existing regional societies entered into a process of transformation. The result is a world in which new global communication networks brought different regions closer together.

From 3200/3100 BCE, the Globular Amphora phenomenon was the trailblazer in Eastern and Central Europe. Due to the focus on pastoral subsistence, new ritual practices were created. We initially observe the symbolic separation of sedentary pastoralists from more agrarian societies. The structural process is linked to the creation of supra-regional GA networks from the Elbe to the Siret, but also to hybridisation effects in different regions.

The emergence of the GA networks is described as social separation on the basis of social disharmonies within Funnel beaker societies, which is also visible via a reduction of the human impact in palaeoecological archives. A new connectivity of diversified groups developed as a form of levelling mechanism, which in the long term was part of the transformation of the entirety of European prehistory around 3000 BCE.

2 GLOBULAR AMPHORA AND YAMNA COMMUNITIES AS NEIGHBOURS: TOWARDS INTEGRATION OF ARCHAEOLOGICAL AND BIO-ARCHAEOLOGICAL DATA

Szmyt, Marzena (Adam Mickiewicz University in Poznan; Archaeological Museum in Poznan)

The forest-steppe zone between the Carpathians and Dnieper river is where the Globular Amphora and Yamna communities could stay in direct contacts. After many years of research, there is no doubt that they were partly synchronous and proximate. This was a consequence of two population shifts: the migration of a part of a Globular Amphora populations from the core area to the south-east and ultimately to the forest-steppe, and the movements of Yamna groups from the steppe into the forest-steppe. That they did indeed come into contact is shown by an increasing evidence that includes three series of features: Globular Amphora and Yamna ‘pure’ graves and syncretic ones (with traits from both units). The latter respected the principal rules of a ‘Yamna’ funerary ritual, supplementing it with single ‘Globular Amphora’ artefacts. At present, most archaeological information concerns the western end of the forest-steppe (on the Prut and Dniester rivers), less information is available on its eastern end (on the middle Dnieper), while the least is known about its central portion (on the Southern Bug).

Thanks to new data, it is now possible - at least in part - to test whether the diversity of material record is reflected in bio-archaeological data, mainly isotopic ones. For this purpose both archaeological sources and the results of isotopic analyses (carbon, nitrogen and strontium) will be used. This will become the background on which genetic data will also be discussed.

3 DISTANT EVIDENCE OF CLOSE CONTACTS: CENTRAL EUROPEAN FEATURES IN THE MATERIAL CULTURE OF YAMNAYA PEOPLE

Teslenko, Dmytro (Independent researcher)

The problem of the impact of the Yamnaya culture on the Central European region has become recently increasingly popular. The concepts of armed invasion by conquerors from the Northern Pontic do not seem relevant. But the presence of Yamnaya people to the south and west of the Carpathians is indisputable, supported also by anthropological evidence and isotopic analysis.

The first appearance of steppe groups in Central Europe dates to the Eneolithic, so it is unlikely that this territory was “terra incognita” for Yamnaya people. The topography of kurgans here suggesting a traditional pastoral way of life. The practice of constructing kurgans – monumental cult structures marking the occupied territory as well as the fact of ancestor burial, indicates that Yamnaya groups were not merchants or tourists. The artifacts from burials, as well as radiocarbon data, show the presence of Yamnaya people here throughout the entire period of the culture’s existence.

On the other hand, the cultural environment and opportunities for exchange transformed, for example, Transylvania into a major contact zone between Yamnaya people and their neighbors, like Northern Prut and Dniester regions.

Metal had a primary interest for pastoralists. The Northwestern Pontic became a kind of transshipment base for imports on their way to the east. European imports and imitations, together with, for example, Budzhak ceramics, traveled far to the east. Along with metal, other “exotic” artefacts, primarily ceramic products, also entered the Yamnaya environment through contact zones. Subsequently, through internal exchange these things traveled far to the east, reaching the Dnieper basin and beyond. The meaning and direct purpose of them sometimes became lost along the way, as in the case of a vessel of the Mako culture found in a Yamnaya burial on the Ingulets River. The journey of objects often was longer than the way of people.

4 THE HIDDEN PATTERNS OF THE PAST – CARPATHIAN BASIN IN THE 3RD MILLENNIUM BC

Kulcsár, Gabriella (HUN-REN Research Centre for the Humanities)

The existence, extent and orientation of prehistoric networks can be detected based on the analysis of various classes of archaeological remains from simple pottery forms to complex ideological structures. The background of these connections, an invisible world of concepts, ideas and innovations can, however, be revealed through thorough analyses, in which Big Data and network analysis should play a key role in the future.

The transition/transformation from Late Copper to Early Bronze Age societies in the Carpathian Basin, the issue of continuity and discontinuity, interactions from the final fourth to the mid third millennium BC, and the roles of locals and incomers, remain controversial. Current research faces a number of issues regarding the processes of eastwards and westwards mobility/migrations affecting the Bronze Age Carpathian Basin as well.

Network research and network visualization have proved to be one of the most promising scientific methodological innovations in recent years/decades, which seems to be an effective tool for the study of cultural and social phenomena, including the archaeology scene. This network approach promises a comprehensive, universal method by which almost any context can be examined with scientific accuracy.

How modern technologies and methods help us to understand and visualise the context of the past, the hidden networks of the 3rd Millennium BC.

5 'LOOKING INTO' THE EARLY BRONZE AGE MOUNDS OF NE ROMANIA. AN INTERDISCIPLINARY APPROACH

Brasoveanu, Casandra (Alexandru Ioan Cuza University of Iasi, Institute of Interdisciplinary Research, Arheoinvest Centre) - Asandulesei, Andrei (Alexandru Ioan Cuza University of Iasi, Institute of Interdisciplinary Research, Arheoinvest Centre) - Brunchi, Radu (Alexandru Ioan Cuza University of Iasi, Institute of Interdisciplinary Research, Arheoinvest Centre) - Enea, Sergiu ("Ion Neculce" Theoretical Highschool, Targu-Frumos) - Tencariu, Felix-Adrian (Alexandru Ioan Cuza University of Iasi, Institute of Interdisciplinary Research, Arheoinvest Centre) - Popovici, Sergiu (National Archaeological Agency, Chisinau) - Ciobanu, Ion (Orheiul Vechi Cultural-Natural Reserve, Institute of Bioarchaeological and Ethnocultural Research, Chisinau) - Boghian, Dumitru ("Stefan cel Mare" University of Suceava, Faculty of History and Geography) - Simalcsik, Angela (Olga Necrasov Centre for Anthropological Research, Romanian Academy) - Agulnikov, Serghei (National Archaeological Agency, Chisinau)

The northeastern region of Romania exhibits a significant presence of burial mounds, many of which remain unexplored and poorly understood. Previous research confirmed that the big majority of such monuments, located on the territory of interest, was erected by the Early Bronze Age communities belonging to Yamnaya culture, and re-utilized by later human groups, up to medieval times. However, there has been a notable lack of systematic efforts to document these monuments, establish their chronology, or analyze their geomorphological features. Additionally, many of these sites are under constant threat from natural and human-induced factors, leading to irreversible destruction.

This current study seeks to address these gaps by employing a novel methodological approach centered around high-resolution, non-destructive ground-based geophysical and airborne sensing techniques. These techniques include vertical gradient magnetometry, Electrical Resistance Tomography, oblique aerial photography, photogrammetry, and LiDAR. Focusing on the Bahluiet River catchment area, the first objective was to precisely locate and characterize the micro-morphology of the tumuli monuments. A quick view of the specialized literature for the aforementioned region revealed only 36 documented sites, with varying degrees of accuracy in their locations. Using high-resolution digital elevation models, derived from LiDAR measurements, we were able to highly increase the number of this type of sites (adding 129 novel sites) and to reconsider their spatial distribution within the landscape of the Bahluiet River catchment. Furthermore, the research involved conducting geophysical measurements for various case studies, which were subsequently excavated, providing valuable validation for the hypotheses generated through spatial and non-invasive research methods. Despite the challenges encountered during this endeavor, it is deemed crucial in the broader context of preserving these monuments, particularly in light of the ongoing threat posed by intensive modern agricultural practices.

6 SAME POTS, DIFFERENT PEOPLE? EXPLORING THE DUAL BURIAL CUSTOM OF WESTPHALIA'S FUNNELBEAKER CULTURE

Kopner, Lea (Universität Münster; Altertumskommission für Westfalen)

In the Late Neolithic, the groups of the Funnelbeaker culture (TRB) were the first farming communities to populate the North European Plain where they erected thousands of megalithic tombs. The Westphalia region in western Germany is located on the southern periphery of the TRB-West-group.

From the turn of the 4th and 3rd millennia, TRB burials in Westphalia also appeared in so-called flatgraves. This dual burial custom reflects the beginning of a cultural transformation: while the monumental megalithic tombs were used for collective burials, burials in flatgraves focused on the individual. Compared to more central TRB regions, Westphalia has a relatively high density of known flatgrave sites, while megalithic tombs only occur sporadically. This tendency towards spatial separation suggests that the flatgraves might be the expression of a separate group that made the transition to individual burials particularly early.

To date, no clear qualitative differences between the inventories of flatgraves and megalithic tombs have been identified. Using new methods for analysing communication networks on the basis of pottery, the aim is now to investigate the extent to which cultural differentiation can be retraced behind the two burial phenomena. Furthermore, the area will be examined from a landscape archaeological perspective in order to uncover possible differences in site selection. A third focus are possible cultural continuities of the sites after the end of the Funnelbeaker culture and how these differ depending on the type of burial.

7 "CORDED WARE SYMBOLS" IN THE LATE FOURTH MILLENNIUM BC OF CENTRAL EUROPE

Schultrich, Sebastian (Institut fuer Ur- und Fruehgeschichte Kiel)

In recent years, biochemical analyses have been increasingly applied in archaeology and have given us astonishing insights into the population dynamics of European prehistoric societies. In particular, the early third millennium BC, when a new material and immaterial culture, which we call Corded Ware (CW), appears across a vast area in Central and Eastern Europe, is accompanied by a significant shift in the genetic composition of societies. However, to better understand the emerging changes and the complex interplay of innovation diffusion, mobility and migrations, we need to consider the period before the initial formation of CW: The late fourth millennium BC.

From a Central European perspective, this paper shows which 'CW symbols' were present before the emergence of classical CW. In addition to well-known examples such as amphorae and cord decoration, single graves and hammer axes are highlighted in order to challenge the narratives associated with the initial spread of CW societies.

The paper will show that pre-CW and CW societies do share and specific symbols and patterns of mobility. It will argue that the archaeological complex we call CW is not something new at the time point of its emergence. Rather, this point is only one in a sequence of ongoing transformations. Thus, the originally formulated idea of a strong CW impact - or the wider Yamnaya impact on Europe - needs to be put into perspective.

8 SEMIAUTOMATED CLASSIFICATION, AN OBJECTIVE WAY TO DETERMINE CONTINUITY AND DISRUPTION IN CERAMIC EVOLUTION? CERAMIC TYPOLOGY IN SWITZERLAND BETWEEN 3400-2400 BC

Gottardi, Corina (University of Bern) - Hinz, Martin (University of Bern) - Hafner, Albert (University of Bern)

In Switzerland, in the first half of the 3rd millennium BC, more than a thousand years of continuous development of vessel pottery ended supposedly with the sudden appearance of the Corded Ware pottery. It is often assumed that this abrupt change is connected with a wave of immigration. But does this sudden interruption of a long ceramic evolution correspond to reality? Or was the arrival and adoption of the Corded Ware already foreseeable more than 100 years in advance? In order to test this hypothesis, a classification by eye, that is often highly subjective, was supplemented with an automated and therefore more intersubjective classification system. The unsupervised classification is informed by a database that contains information on measurements, shape, decor and the exact profile of the vessels. Using the example of the period between 3400-2400 BC in Switzerland and neighbouring countries, the aim is to show that a typological differentiation of vessels can be achieved with the help of autoclassification and whether corded pottery clearly separates itself from all preceding pottery styles. The results show that the semiautomated classification does not succeed in making a clear distinction between the Corded Ware and the western Swiss style Auvener-Cordé, which precedes the Corded Ware. On the other hand, in central Switzerland the change is far more abrupt. Therefore, at least for western Switzerland, a rapid wave of immigration is rather unlikely. It is more plausible that at first either individual people with new techniques in ceramics or even only the knowledge of the new techniques reached western Switzerland and a "mixed style" developed, and at a later point in time the Corded Ware style was adopted completely.

9 SOCIETIES FROM WESTERN SWITZERLAND AROUND 3000 BC: CONTINUITY AND DISRUPTION THROUGH MATERIAL CULTURE AND SETTLEMENT LAYOUTS

Schiess, Delphine (University of Bern) - Bolliger, Matthias (University of Bern; Archaeological Service of Canton Bern) - Hafner, Albert (University of Bern)

Understanding change in early societies is a longstanding key question in European Prehistoric Archaeology, but the decisive parameters of societal vulnerability and resilience were largely neglected so far. One of the most significant societal transformations occurred during the Late Neolithic around 2800 BC: for the first time an overarching cultural phenomenon spread across Europe, characterized by specific burial practices and similarities in pottery styles referred to as "Corded Ware".

To gain a better understanding of this phenomenon, we are studying the societies that preceded it in western Switzerland. Three pile-dwelling sites on Lake Biel, dated by dendrochronology between 3400 and 2700 BC, are exceptionally well preserved and have delivered a lot of archaeological material. The new study of the material culture (ceramics, stone and deer antlers objects) has enabled us to deepen our knowledge of these societies, which existed before the Corded Ware. We can then discuss the changes, or on the contrary the continuity, between the different settlements, as well as the exchange networks in place around 3000 BC. The question of resilience to social pressure and potential environmental changes (such as rising lake levels as a result of climatic changes) and its visible effects can also be discussed through the spatial organization of the settlements and the transformation of material culture.

10 PERSISTENT FEATURES AND DISRUPTIVE ELEMENTS IN THE EASTERN BALTIC SEA AREA IN THE 4TH-3RD MILLENNIUM BCE

Nordqvist, Kerkko (Helsinki Collegium for Advanced Studies, University of Helsinki)

The transformation of societies in the 4th and 3rd millennium BCE in boreal northeastern Europe shows a very different trajectory and dynamics compared to many southern areas of the European continent. In the eastern Baltic Sea area (Finland, the Baltic States, northwestern Russia), events are characterized by the development of diverse forager societies with advanced socio-cultural features in the 4th millennium BCE, followed by the introduction of the Corded Ware Complex, the first farming (animal-herding) population in the area in the early 3rd millennium BCE. This talk first outlines the stage set by these forager societies, as well as the boreal environment and climate change during this time. Second, it traces some of the continuities, persistent features, as well as disruptions that occurred before, during and after the arrival of Corded Ware Complex. Particular attention is placed to the gaps in our archaeological understanding of this period and the narratives created about it.

364 MODELING PLEISTOCENE SURVIVAL DYNAMICS: ECOLOGY, ENERGETICS AND EVOLUTION

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Prado Nóvoa, Olalla (Virginia Tech) - Vidal Cordasco, Marco A. (Universidad de Cantabria) - Zorrilla Revilla, Guillermo (Universidad de Burgos)

Session format: Regular session

It has been asserted that “energy is to ecology what genetics is to evolution” (Sibly et al., 2012), highlighting the fundamental role of energy transfer in almost all ecological processes. In essence, the flow of energy among living organisms underpins a wide array of phenomena throughout human evolution, being a key factor in understanding fitness and survival.

This session delves into the integration of bioenergetics, paleoecology, and human evolution, utilizing advanced modeling methods to elucidate the myriad factors that shaped the survival and adaptations of hominins within the dynamic Pleistocene landscapes. We welcome contributions that explore the integration of archaeological and paleontological data, human bioenergetic experimentations, and cutting-edge modeling methods such as species distribution models or network analyses, to assess how energy flux within ancient ecosystems influenced the survival challenges faced by hominins.

We invite proposals aiming at understanding the dynamics between human evolution, ecology, and energy fluxes during the Pleistocene through empirical case studies or theoretical approaches.

ABSTRACTS

1 THE ECOCULTURAL NICHE OF THE EUROPEAN ACHEULEAN

Leonardi, Michela (Department of Zoology, University of Cambridge, United Kingdom; Natural History Museum, London, United Kingdom) - Lycett, Stephen (Department of Anthropology, University at Buffalo (SUNY), Amherst, New York, USA) - Manica, Andrea (Department of Zoology, University of Cambridge, United Kingdom) - Key, Alastair (Department of Archaeology, University of Cambridge, United Kingdom)

The Acheulean is the most spatially and temporally vast stone tool industry ever produced by early humans, persisting for more than 1.6 million years across three continents. Bifacially-flaked core tools – which technologically define the tradition – are, however, sometimes regionally and periodically absent. Biface presence is broadly associated with, but rarely formally tested against, environmental conditions.

Here, we reconstruct the ecocultural niche of European Acheulean populations between 726 and 130ka. We performed ecocultural niche modelling using a comprehensive sample of European sites, and a set palaeoclimatic and palaeoenvironmental time series of the continent for the whole period considered.

We were then able to reconstruct the Acheulean distribution in Europe through the cycles of climate changes observed between MIS 8 and MIS 5. This allowed us to identify its geographic boundaries, their variation through time along with the climatic variables that drove the distribution itself. Our analyses also show clear associations between Acheulean presence and specific environments, especially warm forests.

2 THE ROLE OF MIS3 CLIMATE OSCILLATIONS AND MODERN HUMANS IN NEANDERTHAL AND CARNIVORES' DEMISE ACROSS EUROPE

Vidal Cordasco, Marco (1EvoAdapta Group, Dpto. Ciencias Históricas, Universidad de Cantabria. Av. Los Castros 44, 39005, Santander, Spain) - Marín Arroyo, Ana (1EvoAdapta Group, Dpto. Ciencias Históricas, Universidad de Cantabria. Av. Los Castros 44, 39005, Santander, Spain)

The ecological impact of invasive species mainly depends on their potential niche overlap with native species. Since the beginning of the Middle Pleistocene, Neanderthals evolved in Europe along with a stable carnivore guild. However, upon the arrival of *H. sapiens* on the continent, there was a notable decline in various secondary consumer species, such as cave bears and cave lions. To evaluate the potential competition associated with the arrival of our species, this study tests whether *H. sapiens* had a broader niche overlap with carnivores compared to *H. neanderthalensis*. We compiled 1,272 occurrences of 13 secondary consumer species in Europe and used Marine Isotope Stage 3 paleoclimate data to model the potential geographic distribution and overlap among secondary consumers (humans & carnivores). Results obtained show that the potential geographic range of *H. sapiens* was significantly larger than that of Neanderthals. Moreover, *H. sapiens* shared a significantly larger territory with all secondary consumer species than *H. neanderthalensis* did, which mirrors the potential ecological impact of the formers. Twelve of the thirteen secondary consumer species included in this study lost a substantial portion of their geographic range between 45 and 35 kya. Those species having narrower ranges, such as Neanderthals or *Ursus spelaeus*, became extinct first. These findings highlight the combined effects of climate change, niche breadth and the arrival of modern humans as key vulnerability factors for the Late Pleistocene extinctions in Europe.

3 SPECIES DISTRIBUTION MODELLING AS A TOOL FOR STUDYING CLIMATE RESILIENCE IN TWO HOMININ SPECIES

Burke, Ariane (Universite de Montreal; Oeschger Centre for Climate Change Research) - Paquin, Simon (Universite de Montreal) - Albouy, Benjamin (Universite de Montreal) - Riel-Salvatore, Julien (Universite de Montreal)

The permanent settlement of Eurasia by *Homo sapiens* during the Late Pleistocene coincides with the decline and eventual “disappearance” of other human populations. Whether they were driven to extinction by unstable climate conditions, competitive exclusion, demographic processes or a combination of these factors is still hotly debated. Recent archaeological discoveries, improved chronology and advances in paleogenetics, climate reconstruction and climate modelling have added fuel to the debate. It is now generally accepted that *H. sapiens* coexisted and interbred successfully with other species of human for several thousand years. These allied species appear to have possessed the ability to adapt to climate change through technological and social innovation. Why then did they become extinct? Species distribution modelling is used in this research to investigate the climate resilience of Neanderthals and *H. sapiens* populations in Europe in a context of rapid climate change during MIS 3, in an attempt to answer this question.

4 THE BEST HUNTING GROUNDS: RETHINKING HOMININ CHOICES ALONG THE LEVANTINE COAST, AND THE ROLE OF LEBANON

Russo, Gabriele (University of Tübingen)

Understanding the connection between paleoenvironmental dynamics and hominin paleoecology is essential for addressing questions about human evolution, including behavioral adaptations, subsistence strategies, and migration. The Mediterranean Levantine Coast (MLC) plays a pivotal role in this context. During the Late Pleistocene (ca. 130–70 ka), the Levant witnessed the habitation by Neanderthals and *Homo sapiens* in its favorable Mediterranean climate and environment. However, the lack of theoretically informed predictions on hominin-environment dynamics during this crucial timeframe for the eastern Mediterranean coast limits our inferences and understanding of this significant period in our evolutionary history.

The primary goal of our study is to formulate new predictions on hominin hunting strategies based on environmental dynamics in the MLC during the Late Pleistocene using a holistic approach. To achieve this, we first compiled existing records of vegetation and fauna distribution, incorporating isotopic records on ungulate tooth enamel, ungulate dental wear, zooarchaeological, and palynological data from Late Pleistocene archaeological sites along the MLC. We supplemented this review with previously unavailable paleoecological data on high-rank prey taxa hunted in three Middle Paleolithic sites located at the heart of the Levantine coast in Lebanon. Next, we verified the existence of regional ecotones and uniform ecosystems along the MLC and inferred animal habitat choice. The identification of suitable habitats is crucial to predict ungulate distribution and, consequently, hominin preferences for specific habitats or specific taxa for hunting.

Finally, we combined this data with the premise of the optimal foraging model to propose new hypotheses ad hoc for different regions of the MLC, enabling a more accurate inference of later *Homo* evolutionary and cultural adaptive behaviors.

5 RE-THINKING NEANDERTHAL ENERGETICS: AN ALTERNATIVE APPROACH TO ESTIMATING TOTAL ENERGY EXPENDITURE IN EXTINCT HOMININS

Prado Nóvoa, Olalla (Virginia Tech) - Zorrilla Revilla, Guillermo (Universidad de Burgos) - Howard, Kristen (Virginia Tech) - Davy, Kevin (Virginia Tech)

Introduction:

Estimates of extinct populations' total energy expenditure (TEE) are a useful tool to model survival needs and the interaction between humans and their environments. However, classic approaches which involve applying multiples of estimated resting metabolic rates (RMR) have proved inaccurate for recent populations. In addition, extinct hominins have been considered to have engaged in vigorous physical activity levels ($PAL \geq 2.5$), especially Neanderthals. However, these levels are not common for current hunter-gatherers. Therefore, the purpose of the present study is to estimate the TEE of Neanderthal individuals using an equation recently validated against the gold standard doubly labeled water method to measure free-living TEE.

Methodology:

The estimated age at death, body mass, height, and sex of 18 Neanderthals were collected from the literature. TEE was estimated for these individuals using the Leonard and Robertson (1997) equation, the FAO/WHO/UNU (2005) equation for RMR multiplied by different physical activity levels (PAL) (factorial method), and the validated Vinken et al. (1999) equation. The TEE obtained was compared between methods and with the literature regarding hunter-gatherers TEE.

Results:

Leonard and Robertson (1997) and Vinken et al. (1999) equations provided an average TEE for Neanderthals of 2544 ± 272 and 3042 ± 293 kcal/day, respectively. These values for TEE are close to those measured in hunter-gatherers, although slightly higher due to the larger body mass in Neanderthals. The factorial method resulted in 50-100% higher levels of TEE (i.e. 5009 ± 617 kcal/day).

Conclusions:

Recent literature on hunter-gatherers TEE suggests that classic approaches to estimating energetic requirements of extinct hominins' need to be re-addressed. Associating high PALs to Neanderthals resulted in TEE values that are only present today in extreme endurance events and thus, very unlikely to be characteristic of extinct hunter-gatherers' lifestyle. Vinken et al. (1999) equation can be used as an alternative when modeling past hominins' energetic demands.

6 MODELING THE HUMAN WALKING FLEXIBILITY. APPLICATIONS TO A LATE PLEISTOCENE HUMAN GROUP

Zorrilla Revilla, Guillermo (Laboratory of Human Evolution (LEH). University of Burgos (Burgos, Spain); Research Center for Anthropology and Health (CIAS). University of Coimbra (Coimbra, Portugal); Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Prado-Nóvoa, Olalla (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - García-González, Rebeca (Laboratory of Human Evolution (LEH). University of Burgos (Burgos, Spain)) - Laskaridou, Eleni (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Howard, Kristen (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Marinik, Elaina (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Ramadoss, Rohit (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Carretero, José (Laboratory of Human Evolution (LEH). University of Burgos (Burgos, Spain)) - Davy, Kevin (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA)) - Volpe, Stella (Department of Human Nutrition, Foods, and Exercise (HNFE). Virginia Polytechnic Institute and State University (Blacksburg, USA))

Understanding the variables that determine humans' mobility behaviors is fundamental to studying their interactions with their environment. Optimal locomotion speed (OLS) and its energy expenditure (minCoT) are some of the principal influencers on groups' mobility. In this context, sex/age may also play a role. We aimed to test how sex and age affect mobility variables and model locomotion behaviors of a Pleistocene group.

A predictive equation to calculate OLS (km/h) and minCoT (kcal/km) in children/adolescents was computed using 33 individuals (8-17 years old) walking at 5 speeds. OLS and predictive equations published by Wall-Scheffler (2012) were used to estimate adult females' and males' minCoT. CoT was calculated for each group walking at the OLS of the other sex/age groups and differences from their observed OLS were calculated. The same calculations were applied to the average speed estimated from Hatala (2020) for a mixed-sex/age Late Pleistocene group.

Males show the highest minCoT (66 kcal/km) and OLS (5.18 km/h). Children/adolescents were energetically penalized less (+0.16; +0.15 kcal/km for males and females OLS respectively) than adults while walking outside their OLS. However, males are the most penalized (+0.82; +0.42 kcal/km for females and children/adolescents OLS respectively). Females are penalized minimally walking at children/adolescents but more strongly so when using the OLS of males. When applied to a Pleistocene group, the average speed calculated from Hatala was the same as Wall-Scheffler's for males, with females penalized more (+0.94%) than children/adolescents (+0.27%).

Our results indicate that the human mixed group paced at males' OLS despite penalizing females and children/adolescents. This could be explained by higher walking flexibility for both females and children/adolescents at suboptimal speeds. The decision to adapt to the males' pace would reduce costs for the energetically less flexible members of the group, resulting in overall energy conservation for the entire group.

7 EXPLORING THE ENERGETICS OF GESTATION

Cordey, Cédric (Institute of Evolutionary Medicine, University of Zürich, Winterthurerstrasse 190, 8057 Zürich, Switzerland) - Webb, Nicole (Department of Palaeoanthropology, Senckenberg Gesellschaft für Naturforschung, Senckenberganlage 25, 60325, Frankfurt am Main, Germany) - Haeusler, Martin (Institute of Evolutionary Medicine, University of Zürich, Winterthurerstrasse 190, 8057 Zürich, Switzerland)

Human childbirth is uniquely difficult among mammals as inferred by high global maternal and fetal mortality and morbidity rates. These have been very high in the past and continue to be high in some regions of the world, translating in a dramatically high lifetime risk of between 1:6 to 1:16 of dying in childbirth. The traditional view, attributing human birth difficulties to bipedalism-related pelvic constraints and larger brain size, has been theoretically challenged in recent years. The "Energetics of Gestation and Growth" (EGG) hypothesis, posits that maternal metabolic limitations and fetal energy requirements are central to the observed secondary altriciality and birth timing in humans. According to the EGG hypothesis, labour is initiated when fetal energy requirements surpass a maternal "metabolic ceiling". Yet, upon reviewing 11 additional studies on pregnant women with varying geographic and socioeconomic backgrounds, we encountered enormous variability in maternal metabolic scope. In fact, they repeatedly exceeded the supposed maternal metabolic threshold during pregnancy. Maternal metabolic scope in twin-pregnancies also exceeded this suggested metabolic ceiling by the third trimester. Further, based on weight data of over 6.5 million livebirths, we found rapid growth of fetal energy requirements until pregnancy week 35 with substantial tapering thereafter. Collectively, these findings contradict the exponential growth pattern of fetal energy requirements towards the end of pregnancy and the starvation of the fetus immediately before birth, as assumed by the EGG hypothesis. Rather, our findings support recent research indicating a more intricate interplay of factors affecting birth timing, e.g., biological clocks and alarms. Our results thereby indicate that female metabolic capacity is not approaching its limits during pregnancy, thus making the EGG hypothesis alone insufficient in explaining birth timing. Rather, a series of factors likely influence this complex process including possible physical constraints imposed by the pelvis.

369 ANIMALS IN BRONZE AGE EUROPE: NEW PERSPECTIVES

Session theme: 7. Archaeology of Sustainability through World Crises, Climate Change and War

Session organisers: Bruck, Joanna (University College Dublin) - Houghton, Mark (Aarhus University) - Huisman, Floor (University College Dublin) - Kanne, Kate (University College Dublin)

Session format: Regular session

Other-than-human and multispecies perspectives have had an increasing influence on archaeology over the last decade, transforming our understanding of agency as distributed and relational. We have seen novel and sophisticated interpretations of the significance of animals in hunter-gatherer and early farming communities. Yet these new theoretical approaches have had relatively little impact on research in the Bronze Age. Bronze Age animals are usually figured as resources for human consumption: as food or sources of secondary products to support wealth production and human socio-political aspirations, or as symbolic resources – symbols of chiefly power and religious authority. In neither case are animals considered to be active co-participants in Bronze Age sociality – as sentient beings with whom humans negotiated meaningful relationships. In this session, we invite contributors to how consider how animals and people lived and worked together; how their lives and deaths were interwoven; how bodily, inter-species engagements shaped everyday experience; how animal attributes, characteristics and personalities were taken into account; and how relations of attachment, difference and inequality emerged between humans and animals in particular social settings. We welcome contributions that address these and related themes drawing on any type of archaeological data from Bronze Age Europe, including but not limited to animal iconography, isotopes, zooarchaeological analysis, architecture and landscape, animal materials, proteomics, depositional practices, etc.

1 THE SOCIAL WORLDS OF BRONZE AGE ANIMALS**Brück, Joanna (University College Dublin)**

Although cattle and sheep were central to the everyday lives and wellbeing of Bronze Age communities, they are often strangely lacking from our narratives of the period. After the Neolithic, it seems, archaeologists rarely consider domestic animals to be interesting. However, Bronze Age people clearly thought otherwise, as animal iconography and the careful deposition of complete and partial animal bodies in graves, pits and ditches suggests. The traces of cattle and sheep are present in other ways too, in hoofprints around waterholes and in landscape features like droveways that appear at this time, but we too rarely consider what such evidence can tell us beyond the economic significance of animals and their products. Integrating multispecies and posthumanist perspectives that highlight how living with animals involves intimate interaction and interdependency, this paper explores how it might be possible to explore the role of cattle and sheep as active participants in Bronze Age social worlds, considering animals on their own terms while not ignoring power asymmetries in domestication relationships. By reconstructing the intertwining of people and animals in life and death, we can consider how together they generated Bronze Age worlds of work, sociality and meaning.

2 FOLLOWING COWS: CATTLE AS GEOPOLITICAL AGENTS IN BRONZE AGE SCANDINAVIA**Wehlin, Joakim (Uppsala University) - Odebäck Ljunge, Magnus (Stockholm University) - Armstrong-Oma, Kristin (University of Stavanger)**

The paper explores the possibilities and benefits of tracking the life- and death journeys of cows in Bronze Age Scandinavia. How did cows inhabit different Bronze Age communities of Scandinavia, and where can we find traces of them? Following cows rather than humans inserts a novel angle into Bronze Age research. Such an approach allows for multi-species communities where humans as well as other-than-humans provided impetus for historical trajectories and change.

Like other mammals, cattle are sentient creatures with agency, and imbued with the particular abilities of their species - the “cowness of cows”. The paper draws inspiration from the animal turn and considers cattle as a range of states of being: as living agents, active producers of secondary products, meat, symbols, and art - good to live with, think with, and eat. We focus on the plethora of human-cow practices as they move through materialized networks and landscapes. This entails an approach whereby we follow the cows through life and death, as their state of being as well as their bodies are incorporated into beliefs, rituals, and myths, and as their being and bodies provide nurture ranging from economic subsistence strategies to social structures.

3 ANIMAL ARCHITECTURES - HUMAN-ANIMAL INTERACTION IN THE BRONZE AGE OF NORTHWESTERN EUROPE**Huisman, Floor (University College Dublin)**

One of the most defining characteristics of The Middle Bronze Age in northwestern Europe is the development of extensive fieldsystems, in combination with evidence for permanent settlement (including recognizable houses). These changes in the archaeological record are often explained in practical terms, as the result of economic intensification and the emergence of property ownership with competing warrior chiefs accumulating personal wealth. This capitalist interpretation of the Bronze Age results in a familiarization of the past, and several assumptions, including the idea that animals are products, used, traded and eaten by people. Yet ethnographic examples and historical sources demonstrate that human-animal relations in small-scale farming societies may be far more complex and dynamic. Here, animals may be seen as conscious beings with their own personalities, and everyday care and interaction may result in close bonds between animals and people. Recent research on human-animal relations equally argues that animals are part of human culture and society and actively participate in human sociality.

Seeing animals as more than resources and recognizing their agency has major implications for how we view the Bronze Age fieldsystem and settlement evidence in northwestern Europe. This paper aims to examine this evidence from a posthumanist, multi-species perspective, considering human-animal movement and interaction within houses, settlements and fieldsystems. Using case studies from the southeastern UK and West Frisia in the Netherlands, it will study different kinds of ‘animal architecture’ to reconstruct daily human-animal encounters and embodied engagement at multiple scales. Rather than relating this architecture only to the management or control of animals, it also views these structures and features as spaces of encounter where human-animal interaction created a shared social world.

4 OBTAINING THE CERTIFICATE OF TRADITION - BRONZE AGE ANIMALS IN NORTHERN DALMATIA**Grguric Srzentic, Maja (University of Zadar)**

So far, our knowledge about the Bronze Age archaeological sites in the area of northern Dalmatia in Croatia is mainly limited to the remains of material culture, i.e. to settlements and temporary habitats (hillforts, caves), graves, hoards, and mostly ceramic and metal finds from the given context. The remains of animal bones used to be observed as incidental findings that confirm the obvious, that there were animals involved in society’s economy. Namely, the observed geographical area was very active in livestock breeding, especially in the form of transhumant pastoralism, until several decades ago, when certain political and economic reasons led to the almost complete disappearance of this economic activity. As far as archaeology is concerned, no further analyses have been made and most of the animal remains are today lost. The proposed paper will present first preliminary data of zooarchaeological analyses from several new Bronze Age sites originating from different geographical areas – coast, inland and mountain. Parallel analyses of the ethnographic data from the given areas alongside with archaeological data coming from different environmental conditions will give new insights into the tradition of transhumant pastoralism.

5 ANIMAL CARE AND WELFARE IN BRONZE AGE BRITAIN**Osborne, David (University of Nottingham)**

How can the attitudes of prehistoric people towards their non-human animal companions be assessed? Among the often large quantities of animal remains found on prehistoric sites, are there any clues that might suggest how human/non-human relations played out in the past? The framework of the bioarchaeology of care (Tilley 2012; 2015) was devised to explore disability and care among humans in the past. From the perspective of the post-anthropocentric approach that is integral to posthumanist theory (Braidotti 2013; Crellin & Harris 2021), I suggest that the bioarchaeology of care could be extended to include non-human individuals. This widens the scope of traditional zooarchaeological analysis of bone pathologies, often approached from an economic viewpoint, to consider the care of non-humans as co-constitutive members of the communities of which they were part. Taking as a starting point the husbandry of cattle and sheep at the edge of the Lincolnshire Fens, this paper explores issues around the care of animals in the light of recent research on their cognition and communication.

6 NONHUMAN ANIMAL DEPOSITION PRACTICES IN BRONZE AGE EUROPE: A POSTHUMAN REANALYSIS**Swallow, Eleanor (University College Dublin)**

Our current understandings of the European Bronze Age are dominated by narratives that have been constructed through a humanist reading of the period. One significant result of this has been the projection of our modern western, cartesian ontology onto our central considerations of nonhuman animals in the Bronze age. Within studies of faunal deposition this can be exemplified by methodological and interpretative themes such as: a focus on “special” or “unusual” deposits defined as categorically distinct through contemporary perception; animals of the domestic sphere being considered ‘known’ therefore leaving their interpretative potential beyond commodification unconsidered; and the objectified remains of nonhuman individuals being passive to the human provision of agency.

Recent years have seen a rise in studies challenging such narratives. Amongst them, this PhD aims to contribute a more holistic, multiscale reanalysis of Bronze age animal deposition practices, particularly concerning ‘livestock’ species. Working through this, the theoretical framework draws heavily on concepts from multispecies archaeology, broader Human-Animal studies, and posthumanist thought with an emphasis on post-anthropocentrism.

This paper will discuss the project’s pilot study on a Bronze Age settlement site in Cambridgeshire, Eastern England, with regards to its methodology and implications for future directions of the research. The study examines (pre-) depositional processes and trajectories of contextualised deposits through demographic observations; spatial analyses of skeletal element’s placement, configuration, and associations; and taphonomic considerations. It will reflect upon how suited the approach proves in addressing some of the working research questions; investigating for instance how a subject’s treatment in death can elucidate their experience and role in life, and what the specificities and characterisations of deposition processes can inform us of the agentic potentialities of the animal remains.

7 METHODS IN PRACTICE: INTEGRATIVE APPROACHES FOR NEW INTERPRETATIONS OF ANIMALS AND SOCIETY IN BRONZE AGE EUROPE**Kanne, Katherine (University College Dublin)**

The rise of a multitude of cutting-edge scientific methods applied to animal bones, such as ancient DNA, dietary and mobility isotopes, and proteomics, has led to a rapid increase in high resolution datasets informing archaeologists

about human-animal relations in the past. Despite our newfound abilities to understand animals through ever more fine-grained analyses, many of these results are interpreted with older models of human-animal interactions, where animals are largely viewed passively as subsistence, wealth, or symbol. In the new European Research Council funded project, 'Animals and Society in Bronze Age Europe' (ANSOC), we merge novel theoretical approaches to animals with cutting-edge, multiproxy scientific methods to understand how animals and people laboured together in daily life, and what this may mean about Bronze Age societies more broadly. In this paper, I provide an overview of how ANSOC integrates the theoretical with the methodological in zooarchaeology and its complementary scientific analyses to explore how everyday life in the Bronze Age was a multispecies cohabitation and collaboration, social relations with animals shaped lived experience, and how animals actively participated in and structured society.

8 UNTIL THE PIGS COME HOME: THE ROLE OF ANIMALS IN MEDIATING CONNECTIVITY IN LATE BRONZE AGE BRITAIN

Madgwick, Richard (School of History, Archaeology and Religion, Cardiff University, UK) - Esposito, Carmen (Department of Cultural Heritage, University of Bologna, Italy) - Lamb, Angela (National Environmental Isotope Facility, British Geological Survey, UK)

During the Bronze Age–Iron Age transition in Britain, the scale and character of community connectivity changed. Whilst the situation is complex, evidence suggests that the status of bronze altered, and networks anchored on the exchange of artefacts dissipated. In southern Britain animals become increasingly important and a new site type, commonly termed a midden, emerges. These vast monumental mounds, some comprising millions of artefacts/eco-facts dominated by animal bone and ceramics, signal a societal refocus towards agricultural intensification and communal feasting on a grand scale.

This paper examines the role of animals in mediating landscape use and the networks that centred on these feasting middens. As part of the FEASTNET project (UK AHRC-funded), a major multi-isotope dataset of 252 animals from six middens has been generated. The integration of multiple isotope proxies on a large number of animals allows greater resolution on faunal management and movement than is usually possible. Results demonstrate that the vast faunal assemblages from middens represent much more than haphazard feasting waste. Structured practices are clearly evidenced with different domestic animals being sourced from distinct catchments and being subject to specific modes of management. These practices differ from site to site, but almost all show species-specific patterns. This demonstrates that animals were not viewed purely as meat for the feasts, but through husbandry and supply (and consumption), prescribed modes of treatment mediated human–animal relations and had an active role in landscape management and connectivity in Late Bronze Age Britain.

9 NEW PERSPECTIVES ON LATE BRONZE AGE FRENCH ALPINE PILE-DWELLINGS USING ZOOARCHAEOLOGICAL DATA

de Roux, Anaïs (Toulouse University) - Billaud, Yves (DRASSM) - Costamagno, Sandrine (Toulouse University) - Milcent, Pierre-Yves (Toulouse University)

"Tell me what you eat, and I'll tell you who you are", said Brillat-Savarin. Man maintains a privileged relationship not only with his environment, but also with the animals he breeds. The knowledge, uses, beliefs and representations associated with food, form part of culture. It also results from a set of multiple interactions: physiological needs, economic, technical and symbolic systems, social interactions and uses, etc. Reading food practices, and on a wider scale Human-animal relationship, thus enables us to approach the vision that societies have of themselves. However, Late Bronze Age societies in France are rarely examined through this prism, due to the scarcity of bone remains. The starting point of this paper is to study Late Bronze Age populations through the zooarchaeological study of remains from sites whose excellent level of preservation enables a detailed restitution of practices: the pile-dwelling of Conjux 1 in le Bourget lake. It was on this site that a ceramic and bone heap covered by boulders was unearthed. The presence of a horse skull associated with bracelets and bronze pins, suggest that this was probably the expression of a particular manifestation. By confronting these data with other Bronze Age sites, we will try to better understand the status of this area.

The zooarchaeological findings of Conjux 1 will be put into perspective with those of two sites on Lake Annecy and Lake Geneva. Differences in practices and choices will be examined. Various studies of pile-dwellings have already shown that cultural identities and spiritual domains differ greatly. However, this will be the first time this question will be raised for French pile-dwellings since no prior zooarchaeological have been carried out. It will allow to take a new look at the Human-animal relationship in the context of densely populated settlements of the European Bronze Age.

10 ASSEMBLING THE LATE BRONZE AGE HORSEHAIR ORNAMENT FROM THE CROMAGHS HOARD, CO. ANTRIM, NORTHERN IRELAND

Line, Oliver (University College Dublin)

This paper will interpret the horsehair ornament from the Cromaghs hoard, Co. Antrim, Northern Ireland, from a perspective principally influenced by the philosophy of Deleuze and Guatarri. Previous interpretations are dominated by explanations with rationalist and capitalist undertones that impose a modern, western dualistic understanding of how the world is structured onto the past. Underpinned by this ontological standpoint, the ornament is classed as a passive reflection of the status of its owner, as well as the prosperity and connections of the society from which it emerged. This paper considers the ornament as an actor in its own right with a complex history, that produced affects and possessed its own material reality.

To unveil the capacities of the horsehair ornament, this paper will explore the broader social and ontological significances of the techniques involved in its manufacture and the animal origins of the materials used to allow for a historically specific reading of the processes that brought the ornament into being. The analysis investigates the role of horses in late Bronze Age social worlds and how this may have affected the symbolic potential of the ornament. This will be achieved through a combination of the extant literature on the Bronze Age, animal ethologies, and theories of human-animal relations with the archaeological evidence for horses during this period. By exploring the social elements of the processes in which the ornament participated throughout its life history, this paper will demonstrate how analysts can incorporate cultural/symbolic components of entities without falling into the realm of generality, a common feature in interpretations of animal materials in prehistory. By giving a holistic account of the ornament, examining its material, technological, and symbolic aspects, the Deleuzian-inspired approach employed will illustrate how these different dimensions of the artefact are co-constitutive and should, therefore, be studied in tandem.

11 CROUCHING ARCHAEOLOGIST, HIDDEN DEER: EXPLORING ANIMAL-HUMAN RELATIONSHIPS THROUGH THE UNPARALLELED DEER CARVINGS OF DUNCHRAIGAIG CAIRN (KILMARTIN, SCOTLAND)

Valdez-Tullett, Joana (University of Glasgow; Wessex Archaeology)

Most European prehistoric rock art traditions include animal depictions, even if they are part of a wider assemblage of other figurative and/or abstract motifs. Britain and Ireland are an exception to this tendency, with a rock art tradition typically based on circular imagery, of which the cup-and-rings and cupmarks are most iconic. Recently, the unprecedented discovery of clearly prehistoric carvings representing two stags and other deer on the underside of a large capstone at the Early Bronze Age Dunchraigaig Cairn in Kilmartin (Scotland), has provided much food for thought. There are virtually no other representations of animals in prehistoric Scotland, and this find raises a number of questions regarding the wider carving practice, prehistoric inter-regional connections and relationship between these animal engravings and the cup-and-ring rock art tradition extensively created across the surrounding landscape. The context of the animal depictions, within a rather unusual burial with different characteristics to neighbouring monuments in Kilmartin, and the funerary context itself, also raises questions regarding the choice of representation and the potential animal-human relationships involved. This paper will examine the deer depictions relationally, considering the particularities of the carvings and their immediate archeological context within the cairn. It will also explore the relationship between these animals and other burials in Scotland, the process of 'becoming deer' and the implications this would have for both animals and humans in the Early Bronze Age (Conneller 2004).

Conneller, Chantal. 2004. Becoming deer. Corporeal transformations at Star Carr. *Archaeological Dialogues* 11: 37–56.

12 ELK IN THE DUTCH BRONZE AGE: A LIMINAL ANIMAL?

Brusgaard, Nathalie (Leiden University) - van Dijk, Joyce (Archeoplan Eco) - Aal, Jordy (BAAC)

Increasing attention is being paid to multispecies and more-than-human perspectives on animals in the past and their encounters with humans. However, in post-domestication settings, wild animals tend to receive less attention as nonhuman persons and agents than domestic species. This holds true for studies of the Bronze Age, in which the emphasis on animals overall lies on their use as resources, and in particular wild animals are often relegated to the role of 'extra' economic resource, hunted merely as an occasional supplement to farming. In this paper, we explore the many possible roles of elk (*Alces alces*) in the Dutch Bronze Age. Overall an infrequent occurrence in archaeological assemblages in the Netherlands – and now extirpated in this region – elk are a remarkably regular presence at Bronze Age sites. Moreover, they occur in various archaeologically interesting contexts, such as depositions of skulls and skeletal elements. In this paper, we discuss the evidence for elk in this period through (zoo)archaeological and isotopic data. We explore the ways in which humans and elk may have encountered one another in the Bronze Age landscape and, based on ethnographic analogies, the possible liminal role that elk may have had, blurring the boundary between

wild and domestic. Through doing so, we endeavour to open up new avenues for discussing multispecies perspectives on Bronze Age, and other post-domestication, human-nonhuman animal relationships.

374 FROM LAB TO FIELD, FROM VERTICAL TO HORIZONTAL. NEW APPROACHES TO THE USE OF PORTABLE X-RAY FLUORESCENCE (PXRF) IN ARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Dallai, Luisa (University of Siena) - Volpi, Vanessa (University of Siena) - Doonan, Roger (Archaeological Research Services LTD) - Cannell, Rebecca (Norwegian Institute for Cultural Heritage Research)

Session format: Regular session

Geochemical analysis of different environmental matrices has grown in popularity in recent decades, becoming a common practice in archaeological projects; the enrichment or depletion of specific elements in soil and sediments, their spatial distribution and statistical treatment have been used as a “chemical fingerprint”, with possible correlations with differing past human activities. Among the techniques available, portable X-ray Fluorescence (pXRF) has gained popularity for its affordability, flexibility and non-destructive nature. In addition, pXRF analyzers are now very easy-to use and this has taken geochemical analysis out of the lab and into the field, transforming archaeological sites and landscapes into primary locations for scientific enquiry. With this comes new challenges, especially with the ease of obtaining geochemical data for sophisticated and complex problems that include environmental, geological, archaeological and epistemological/training concerns. This means that the opportunity for the inappropriate use of geochemical analysis is now greater than ever before, highlighting the need for guidance and accepted protocols across the discipline and wider profession.

Following the ongoing scientific debate, this session invites contributions discussing the use and results achieved by application of pXRF within archaeological projects. A special focus will be posed on how the techniques can address:

1-archaeological issues (i.e. identifying functions of spaces within an archaeological site or human presence within historical landscape; identifying production cycles, particularly related to mining and metallurgical activities; analysing geoarchaeological contexts).

2-methods and protocols of use (i.e. define limits and contexts of use; outline protocols on site and landscape scale; define possible integration between pXRF and others analytical methods).

3-success and good practices (i.e. how and where a pXRF analytical approach, alone or in combination with other techniques, has made the difference in understanding an archaeological context, both in research projects and for professional archaeology).

We welcome examples from different geographical and historical contexts.

ABSTRACTS

1 P-XRF STUDIES DO NOT NEED STANDARD PROTOCOLS! ... OR DO THEY?

Schauer, Michaela (Vienna Institute for Archaeological Science (VIAS); Cifa Deutschland)

While p-XRF has been an important and sometimes integral part of many archaeological projects and studies, the method itself, as well as the best practices for handling and applications, are still not well defined. Unlike chemical laboratory-based methods, users and specialists of p-XRF do not have internationally accepted protocols and guidelines. There is no standard procedure or training scheme for data acquisition, processing, or interpretation. Despite arguments against implementing rigorous quality control schemes for p-XRF, this paper will discuss the contrary. It aims to outline the most crucial topics to be addressed and agreed upon for standard procedures, including daily testing for device performance, routines on device handling and sample preparation, and procedures to ensure high-quality, representative measurement data for archaeological samples. The paper will also highlight the importance of a specialist network and proper training schemes for the use and application of p-XRF in archaeological settings. Rather than just complaining, the paper will provide some initial ideas on what these guidelines could look like in order to foster thought and result in further discussions.

2 IS LABORATORY PREPARATION WORTH IT? USE OF PXRF FOR FIELD MAPPING MAGNA ROMAN FORT, NORTHUMBERLAND, UK

Taylor, Gillian (Teesside University) - Gillis, Franki (Vindolanda Trust) - Marta, Alberti (Vindolanda Trust) - Ebiesuwa, Oladipo (Teesside University) - Williams, Rhys (Teesside University) - Birley, Andrew (Vindolanda Trust)

A comprehensive field scanning exercise utilising pXRF was undertaken at the Roman Fort of Magna. Magna ‘the fort on the rock’ Roman fort and settlement remains one of the most intriguing Roman military landscapes along Hadrian’s

Wall, UK. Magna has a complex and multi-period history, no other single site along the Roman frontier has the combination of so many key elements of Roman occupation concentrated into such a small area, around 42 acres. These include Hadrian’s Wall, milecastle 46, the Vallum, a series of forts and their towns (both pre-Hadrianic and Hadrianic, and post-Roman), cemeteries, industry, temples, and three major Roman highways.

Firstly, a series of five bore holes across the Magna site were undertaken in 2021 and analysed using pXRF. Secondary, horizontal mapping of soil field samples were undertaken pre-excavation and during excavation of milecastle 46 during the 2023 field season. Furthermore, direct in-situ analysis using pXRF will be compared to the laboratory prepared samples, highlighting the importance of samples preparation, showing the critical need for standardising protocols for the use of pXRF in the field.

3 CALIBRATION OF P-XRF IN THE ANALYSIS OF ANTHROPOGENIC SEDIMENTS: A MULTI ANALYTICAL RESEARCH

Rix, Keelie (CASEs Research Group, Dept. of Humanities, Universitat Pompeu Fabra, Ramon Trias Fargas, 25-27, 08005 Barcelona, Spain) - Ibáñez-Insa, Jordi (Geosciences Barcelona (GEO3BCN - CSIC), Carrer de Lluís Solé i Sabarís, s/n, 08028 Barcelona Spain) - Biagetti, Stefano (CASEs Research Group, Dept. of Humanities, Universitat Pompeu Fabra, Ramon Trias Fargas, 25-27, 08005 Barcelona, Spain; School of Geography, Archaeology and Environmental Studies (GAES), University of the Witwatersrand, Johannesburg, South Africa)

This paper reports the initial results of an investigation within the framework of the project CAMP (ERC CoG 2022, CAMP-101088842) which aims to develop an in-field protocol and calibration of Portable X-Ray Fluorescence (p-XRF) for its implementation on anthropogenic sediments of pastoral sites that will allow for the generation of qualitative and quantitative data. This protocol and calibration will aim at creating an optimized method for the analysis of anthropogenic sediment that requires minimal sample preparation and still achieves reliable and reproducible results. The main objective of the calibration and implementation of p-XRF in-field, is to identify human activities through chemical signatures (anthropic markers) in the anthropogenic deposits from ethnographic settlements — inhabited and abandoned — and archaeological sites. By sampling known ethnographic sites some conclusions may be drawn on the expected elemental distributions of known use areas which may be used as references to recognize similar patterns in ephemeral archaeological pastoral sites.

The analytical setup involves analyzing hundreds of samples using the built-in calibrations of commercial pXRF devices (in this case the GeoExploration calibration implemented in the Bruker CTX portable benchtop analyzer). Additionally, Inductively Coupled Plasma Mass Spectrometry (ICP-MS) and X-ray Diffraction (XRD) will be employed for elemental and mineralogical characterization. The results from these analyses will form the basis of a purposely developed calibration.

4 PORTABLE X-RAY FLUORESCENCE (PXRF) FOR ARCHAEOLOGICAL SOIL CHEMISTRY: TOWARDS BEST PRACTICES

Doonan, Roger (Archaeological Research Services Ltd)

The advent of portable X-ray fluorescence technology has provided archaeologists with the ability to undertake chemical analyses rapidly in the field. While there are many benefits that come with in-situ analysis and instantaneous data, perhaps the most valuable is the ability for field directors to use this data to inform excavation or survey strategy while in the field. There are significant challenges in making prompt use of data and it is imperative that any approach or method for archaeological materials analysis has embedded systems for analytical control and reporting. While true for all archaeological materials, this paper focuses on the in-situ analysis of soil using hand-held pXRF (HH-pXRF).

When applied systematically across landscapes and archaeological sites, HH-pXRF soil analyses can be used to identify areas of past human presence/absence and/or map spatial patterns related to activity areas i.e. craft production, food storage etc. The kinds of datasets generated by HH-pXRF soil surveys differ from those produced by conventional lab-based methods in several ways, i.e. sampling protocol, precision, number of samples, and as a result they can invite different types of questions and demand new ways of scrutinising data.

By highlighting the current variation in methods, instrumentation, calibration, and research designs, in both academia and professional practice, an outline for what may constitute best practice for the use of HH-pXRF in soil analysis is proposed. The implications of different sampling and analytical protocols is assessed alongside the types of site/landscape and the kinds of questions that may be asked of geochemical survey data. The aim of the proposal is not only to generate dialogue on sampling strategy, calibration, and reporting formats but also to increase soil chemistry literacy among archaeologists so they are better able to critically assess and use the results from surveys undertaken across increasingly diverse sites and landscapes.

5 A MEDIEVAL IRON WORKSHOP ON ELBA ISLAND: NON-INTRUSIVE PXRF ANALYSIS ON MONTE SERRA

Monni, Giada (University of Siena)

The aim of this contribution is an update on medieval iron production on Elba Island (Tuscany, Italy) based on a multi-disciplinary approach that includes an on-site use of pXRF. The study focuses in particular on an ironwork located on Monte Serra, in the municipality of Rio (eastern Elba Island). First investigation on site dates back to the 1990s, and included surveys and excavation. New research undertaken in 2021 analysed the landscape geochemical characteristics in order to obtain a general background map; in addition, historical-archaeological data were collected and managed on a GIS platform. New pXRF surveys were planned with diagnostic and descriptive purposes; on-site measurements were collected following a regular grid using different scales. The results obtained within the site allowed us to observe how the distribution of chemical concentrations could differentiate possible metallurgical areas from residential spaces. The results of the analyses confirmed the hypotheses proposed by previous research and allowed us to highlight new areas of interest that had not been identified by past investigations.

6 WORKSPACES AND ORE DEPOSITS - REMOTE SENSING AND SOIL GEOCHEMISTRY AS TOOLS FOR IDENTIFYING PAST IRON PRODUCTION ENVIRONMENTS

Karavidovic, Tena (Institute of Archaeology, Zagreb, Croatia) - Brenko, Tomislav (Faculty of Mining, Geology and Petroleum Engineering, University of Zagreb, Croatia) - Sekelj Ivančan, Tajana (Institute of archaeology, Zagreb, Croatia)

In the past several years, part of the Croatian lowland Drava River valley region has been systematically studied for traces of iron production – from the identification of potential ore deposit areas to archaeological site recognition (field survey, geophysics) and excavation. An interdisciplinary multi-method geoarchaeological approach yielded recognition of physical parameters for potential bog iron ore occurrences unknown to the region previously and spatial-environmental patterns related to placement of archaeological sites with testified iron production activities. More than 150 sites were recognised through surface surveys and excavated workspace areas were dated to Late Antiquity and the Early Middle Ages (4/5th – 8/9th centuries). The latter sites could be referred to as iron production environments. These include workspaces with traces of past human iron production activities and adjoining areas with natural prerequisites for the development of bog iron ores or existing ore deposits beneath the topsoil level. In order to define the latter character of the site and the potential for non-destructive and remote site recognition in a specific lowland landscape, a multi-stage methodological approach was applied to a case study area – the Kalinovac-Hrastova greda site. The approach includes a surface field survey, geophysical investigation, excavation and a geomorphological, relief, pedological and hydrological analysis of the area, as well as geochemical and vegetational indicator analysis. Through the analysis, a number of parameters that can be used remotely and non-destructively were defined as high probability indicators for the recognition of iron production in the past environments – 1) predictive GIS analysis and satellite imagery analysis (vegetational and pedological indicators), 2) spatial and statistical analysis of topsoil geochemistry defined with the use of pXRF (pedological indicator).

7 PXRF ANALYSIS AND ARCHAEOLOGICAL RESEARCH IN THE COLLINE METALLIFERE DISTRICT: CHEMICAL FINGERPRINTS OF PRE-INDUSTRIAL MINING AND METALLURGICAL ACTIVITIES

Dallai, Luisa (University of Siena)

The Colline Metallifere district (Southern Tuscany, Italy) have a long-term mining history, due to the presence of polymetallic mineral deposits rich in copper and lead/silver sulphides, iron oxides and hydroxides. Mines in the area were active from Bronze Age until the 1990s and their impact on the environment has been extremely relevant, particularly after the second world war. Despite this final intense season of exploitation, the territory hosts outstanding historical evidence of mining works, as well as slag heaps, that are the remains of pre-industrial metallurgical activities. For all these reasons, the Colline Metallifere district represents a privileged area of research for Italian mining archaeology, where investigations have been undertaken from the 1980s on. Since 2015, within the ERC nEUMed project (<https://neu-med.unisi.it/>) the University of Siena has boosted a new multidisciplinary approach to the historical research in the area; this includes the systematic use of pXRF analysis at both site and territorial scales. Through the mapping of soil contamination, long-term mining and archaeo-metallurgical areas have been identified and described. pXRF analyses have soon become part of a multidisciplinary protocol that has made it possible to characterise numerous aspects of the landscape of production, through the identification of geochemical contamination patterns of specific chemical elements (i.e. As, Cu, Pb, Zn). The proposed contribution will present some case studies and discuss the multidisciplinary protocol applied in the field and in the lab, debating strengths and limitations of large-scale application of pXRF analysis in support of archaeological fieldwork.

8 LIVING METALS: PXRF AND UAV FOR DEFINING ACTIVITY AREAS

Sharp, Kayeleigh (Northern Arizona University)

Early and widespread practices of metalworking and metallurgy in the Central Andes presents abundant opportunities to examine the social context of metals and their significance. While copper constitutes the material foundation of many sought-after Andean goods on one hand, copper and its alloys were imbued with rich cultural symbolism, meaning and power, on the other. Beyond objects made of metal, examination of social context of practices that revolved around copper mineralization in general, mining and transformation of metallic ore more specifically, allow us to search for structures of meaning embedded within the metal itself. Were miners and metal workers granted privileged status because of their ability to locate, extract, and transform mineralized copper ore, or were they simply servants of the elite? Were metallurgical activities restricted to specific areas within early monumental centers or were metalworking activities supervised by elites? Can interconnectivity between resources, production loci, and living spaces be determined without disturbing fragile site components? Such questions are traditionally answered through site excavation which is destructive and sometimes unproductive. Our combined approach which tests the interconnectivity of site components and activity areas using UAVs (a.k.a. drones) and pXRF soil analysis to make determinations prior to excavating, however, is novel. This paper examines the efficacy of our combined methods for elucidating the social and geographical contexts of ancient mining and metallurgy at the site of Huaca Letrada, Peru, and the physical spaces where copper was transformed from raw mineral into usable materials for manufacturing. Despite both success and failures, we find several advantages when implemented as an inexpensive, environmentally friendly, hands-off, and non-destructive means for expedient diagnostic site evaluation.

9 GONE BUT NOT FORGOTTEN? USING PXRF ON THE VIKING CHAMBER GRAVE AT GJELLESTAD, NORWAY

Cannell, Rebecca (NIKU - Norwegian Institute for Cultural Heritage Research) - Rødsrud, Christian (Museum of Cultural History, University of Oslo) - Wenn, Camilla (Museum of Cultural History, University of Oslo)

The Viking ship burial at Gjeltestad was excavated in 2021-2022, however it was clear from the start that the ship was poorly preserved, that the grave chamber had been opened more than once, and objects removed. Comparatively, Viking burials within ships tend to be accompanied by a wide range of high-status objects, but the only remaining physical finds within the chamber were a horse skeleton, a bead, a possible spinal whorl, and a few fragmented fittings. Employing a vertical and horizontal sampling strategy, over 300 soil samples were taken from the chamber. These were analysed using pXRF (Bruker and Niton), and the results revealed the invisible traces 'remembered' by the soils within the chamber. The interpretation is challenging and requires an in-depth consideration of comparable Viking graves, whilst being open to new phenomena, the soil processes, and of course the limitations of the data. In this case, pXRF aided the archaeological interpretation of a poorly preserved site, which together with other analyses helped us to see invisible traces and build a more comprehensive interpretational platform. This was achievable because the method was integrated into the excavation, including site visits before samples were taken to gather information on the site conditions, and discussing the feasibility and aims of the approach with the project team.

10 MULTIPROXY APPROACH TO RECONSTRUCT HISTORICAL LANDSCAPE: PXRF DATA FROM SOUTHERN TUSCANY COASTAL PLAIN (ITALY)

Volpi, Vanessa (University of Siena, Department of Historical Science and Cultural Heritage, Italy) - Poggi, Giulio (Center for Cultural Heritage Technology, Istituto Italiano di Tecnologia, Italy; University of Siena, Department of Historical Science and Cultural Heritage, Italy)

The coastal territory of southern Tuscany located by the Pecora and Cornia rivers, the reliefs of Colline Metallifere and the gulf of Follonica (Grosseto and Livorno provinces), has been for many years at the centre of archaeological research projects undertaken by the University of Siena, aimed at reconstructing diachronic settlement patterns. The intense transformations of the territory caused by fluvial and coastal dynamics, as well as modern agricultural practices and land reclamation activities, make the reconstruction of historical landscapes in alluvial and coastal plains a challenging task.

Starting from the 2015 the ERC nEU-Med project has adopted a multidisciplinary approach to study the environmental complexity of the alluvial coastal plains. The study combines traditional archaeological survey and remote sensing techniques with on-site geochemical analysis (pXRF), coring, archaeobotany, chemical and geoarchaeological analysis providing absolute chronologies (C14 dates) to which to anchor the long-term landscape transformations.

In this contribution we will focus on the Cornia river coastal plain, a liminal landscape characterized by different features, including extensive lagoons along the coast and widespread flooded-swampy areas in its distal segment. These features persisted until the beginning of the 19th century AD, when reclamation activities were undertaken.

Within the project, extended geochemical maps and the use of chemical variables verified through statistical validation and combined with the archaeological record, greatly helped to characterize landscape forms, identifying environmental dynamics, and relating them to soil nature or anthropic activities.

In particular, we will discuss how both horizontal (i.e. an extensive geochemical survey that collected approx. 8000 measurements) and vertical pXRF data (data coming from a coring campaign), collected in selected area of the Cornia Valley, can contribute to identify and describe historical landscapes at different scales.

11 **PXRF AND ARCHAEOMETRY AS SUPPORTING TOOLS FOR THE PROVENANCING OF POTTERY. PRODUCTION AND DISTRIBUTION IN SOUTHERN TYRRHENIAN TUSCANY (ITALY)**

Russo, Luisa (University of Siena, Department of Historical Sciences and Cultural Heritage) - Ponta, Elisabetta (University of Siena, Department of Historical Sciences and Cultural Heritage) - Intermite, Davide (University of Siena, Department of Historical Sciences and Cultural Heritage) - Volpi, Vanessa (University of Siena, Department of Historical Sciences and Cultural Heritage) - Fornacelli, Cristina (University of Siena, Department of Physical, Earth and Environmental Sciences)

The strong interdisciplinary nature of the ERC nEU-Med project, carried out by the Department of Historical Sciences and Cultural Heritage of the University of Siena from 2015 to 2021, allowed for an in-depth archaeometric study based on the comparison between raw materials and finished ceramic products. The selected sample consists of over one-hundred common ware ceramics dating to the Medieval period and characterized by coarse, fine and selezionata textures, mainly from sites in the the district of the Colline Metallifere, located in the hinterland of Grosseto, and the royal court of Vetricella in the adjacent coastal board, together with a number of clays sampled from deposits in the same area. All the samples underwent mineralogical, petrographic and chemical analyses. For the latter the use of pXRF proved of fundamental importance as it constitutes a rapid method that enables the acquisition of significant volumes of data useful for initial screening. Processed results underwent a statistical review based on principal component analysis (PCA). The availability of such a large number of samples, coupled with an extensive compositional database, made it possible to establish preliminary groupings that were further defined by way of chemical and petrographic analyses (XRD and SEM-EDS). The identification of specific geochemical markers was key in understanding the provenance of the clays used in the production of the ceramics as well as the circulation of finished products in sites from the case study area, this last allowing to substantiate and formulate historical-archaeological hypotheses on the possible economic connections between settlements.

12 **TRACING LITHIC RAW MATERIALS FROM OUTEIRO DO CIRCO (BEJA, PORTUGAL) - PORTABLE X-RAY FLUORESCENCE (PXRF) UTILITY**

Soares, Sofia (Portuguese National Laboratory of Energy and Geology (LNEG)) - Silva, Teresa (Portuguese National Laboratory of Energy and Geology (LNEG)) - Serra, Miguel (Center of Archaeology, Arts and Heritage Sciences (CEAACP), University of Coimbra) - Porfirio, Eduardo (Center of Archaeology, Arts and Heritage Sciences (CEAACP), University of Coimbra) - Silva, Sofia (Outeiro do Circo Project)

The Late Bronze Age settlement of Outeiro do Circo in Beja, Portugal underwent archaeological excavations from 2008 to 2021. During these excavations, the lithic industry identified shows the maintenance of ancient traditions, that reveal a former chalcolithic occupation, but mainly the presence of an important set of lithic artefacts, mostly made up of sickle elements, which played an important role in some essential activities, to the Late Bronze Age community, such as agriculture. This paper focuses on the chemical characterization of the lithic materials found at the archaeological site using portable X-ray fluorescence (XRF) equipment. The results obtained from this technique were compared with those obtained from other techniques such as X-ray diffraction (XRD) and Raman spectroscopy. The aim was to establish “chemical fingerprints” that can be used to correlate the lithic materials with the different rock types found in the area. The preliminary results of this study are presented and discussed. Additionally, the utility of portable X-ray fluorescence as a non-destructive technique for determining the provenance of lithic materials is evaluated. In summary, this paper provides insights into the lithic industry found at the Late Bronze Age settlement of Outeiro do Circo and to the use of portable X-ray fluorescence, along with other techniques, for the determination of lithic raw materials.

13 **BRONZE AXES STUDY: A MULTIDISCIPLINARY APPROACH**

Volante, Nicoletta (Siena University) - Metta, Christian (Siena University) - Mustone, Gaia (Siena University) - Volpi, Vanessa (Siena University) - Dallai, Luisa (Siena University)

The present contribution illustrates a protocol for metal artefacts analysis following a multidisciplinary methodology, developed thanks to the observation on an Early Bronze Age conspicuous set of axes and “panelle” (ingots), found in storage places or in isolated contexts located in a wide area including Siena and Grosseto districts. The project aims not only the reviewing of the published material to date (typological and chemical analyses), but also a preliminary

approaching to the study of the techno-functional and post-depositional traces visible on the finds performed in the Laboratory of Techno-Traceological analysis (LaTT) and non-invasive archaeometric analyses such as XRF and FT-IR performed in collaboration with the Laboratory of Topography of Mining Territories (LTTM).

The observed materials come from very different contexts and their states of preservation is also very heterogeneous, which is why the analysis was conducted by elaborating targeted investigation protocols, based on the characteristics of the finds.

Specifically presented here are some preliminary results of the investigation conducted with pXRF, an analytical technique chosen for its non-destructiveness and versatility in the analysis of many finds of various types, which made it possible to obtain useful information regarding the chemical composition of the surface of the artefacts, alteration patinas, and possible contamination deriving from the different contexts of deposits.

381 **CAPACITY BUILDING FOR FAIR DATA SHARING AND DIGITAL PRESERVATION**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Rose, Thomas (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georesourcen/Deutsches Bergbau-Museum Bochum) - Richards, Julian (Archaeology Data Service, University of York) - Giaccari, Matteo (Department of Earth Sciences, Sapienza University of Rome) - Niccolucci, Franco (PIN, University of Florence) - Ercoles, Isabella (Department of Earth Sciences, Sapienza University of Rome)

Session format: Discussion session (with formal abstracts)

More than other disciplines, archaeology relies on the proper collection, documentation and publication of data because of excavations being an inherently destructive methodology. Moreover, research progress relies strongly on sharing this data to allow for comparison and contextualisation of findings and processes.

In the last decade, data sharing was boosted by the development of research infrastructures such as ARIADNE RI (Research Infrastructure), which now also provides the archaeological expertise in the EU-funded ATRIUM project. ATRIUM aims to consolidate and expand such services across the Arts and Humanities.

Despite all these activities, the SEADDA COST Action identified a fragmented landscape. Many countries lack the capacity and expertise to create and manage data according to the FAIR principles (Findable, Accessible, Interoperable, Reusable), or to ensure their long-term preservation. Moreover, researchers may have already heard about such research infrastructures but often are held back in sharing data through them. A major obstacle seems to be the lack of standards and guidance but also intuitive tools to feed one's own data into a research infrastructure. Consequently, data are still not as widely available and cannot flow as easily as would be desirable to boost archaeology.

Our session brings together researchers and infrastructure providers, archaeologists and archaeological scientists. We invite contributions spanning users and providers which identify and discuss the issues and challenges we face when using datasets, sharing data and keeping them available in the long-term, from the peculiarities of single data sets over the huge diversity of data archaeologists handle, to the current volatility of funding for research infrastructures. In the discussion, we will aim to define some guidelines on how data sharing can be facilitated on the different levels and what actions are needed by individuals and institutions to let data flow with research infrastructures as their safe and permanent havens.

ABSTRACTS

1 **RESEARCH INFRASTRUCTURES FOR FAIR DATA SHARING IN THE HERITAGE SECTOR**

Richards, Julian (University of York; ARIADNE RI) - Niccolucci, Franco (PIN; ARIADNE RI)

The European Commission is making major investments in research infrastructures and online data services in the heritage sector, with a plethora of national and European initiatives and a wealth of acronyms: Europeana, European Open Science Cloud (EOSC), E-RIHS (European Research Infrastructure for Heritage Science), and most recently the ECCCH (European Collaborative Cloud for Cultural Heritage), to name but a few. Many of these services are also being mirrored at national level. The landscape is crowded and confusing, but it is important that the archaeological and heritage sector makes the most of these new opportunities to leverage what we need. The ARIADNE Research Infrastructure has emerged from successive European investments as a Knowledge Base and data aggregator for our sector, now providing access to 4 million archaeological resources across 40 countries. Rather than a top-down initiative it is a community-driven membership association, developing and maintaining a sustainable aggregation service and research infrastructure for archaeological and heritage data. In 2024 it has embarked on a new 4-year EU-funded project, ATRIUM, to ensure it is embedded within broader Arts and Humanities research infrastructures (DARIAH, CLARIN and OPERAS) and the EOSC marketplace. It also a member of the ECHOES consortium, which is establishing the ECCCH, to be launched in September 2024. This paper will seek to introduce the rapidly changing landscape from the perspective of an infrastructure provider, seeking input from researchers and

heritage professionals on their needs and how these new European-level investments can best serve the archaeological community.

2 CAPACITY BUILDING AT NATIONAL LEVEL: ORGANISATIONAL AND TECHNICAL ISSUES OF ARCHAEOLOGICAL DATA INFRASTRUCTURE IN THE CZECH REPUBLIC

Novak, David (Institute of Archaeology of the CAS, Prague)

The Czech archaeological data infrastructure has changed radically in the last decade and is gradually catching up with advanced data repositories providing similar services abroad. The originally disparate environment based on intuitive approaches has been consolidated under the unified research infrastructure Archaeological Information System of the Czech Republic (AIS CR). Today, both individual datasets and related services are integrated in one place, but most importantly, the team responsible for managing and developing the infrastructure in a sustainable manner is involved. The paper will focus on several aspects of the whole process of building and managing the AIS CR: organisational, i.e. what conditions had to be created in order for the process to be successfully launched and maintained; technical, i.e. how the operation and development of the server and software environments is ensured and what problems need to be solved in this area in the long term; impact, i.e. what effect the existence of the AIS CR has on the archaeological domain in the Czech Republic and where there are still gaps that need to be filled. The aim of the paper is mainly to highlight the key decisions and prerequisites leading to a sustainable and actively used infrastructure, but also to point out the dead-ends we have encountered in building AIS CR. The whole topic will be placed in the broader context of the implementation of the EOSC initiative in the Czech Republic, allowing for an interdisciplinary comparison of the position of Czech archaeology in terms of FAIR data management. It will also give an outlook on where the development of AIS CR will go in the coming years and what we see as possibilities in terms of moving the state of the art.

3 DIGITAL ARCHAEOLOGICAL ARCHIVING IN POLAND - SEADDA COST ACTION AND BEYOND

Oniszcuk, Agnieszka (Narodowy Instytut Dziedzictwa/National Institute of Cultural Heritage)

During the SEADDA COST Action, the National Institute of Cultural Heritage in Poland investigated the preservation of digital archaeological data. The main focus was on state heritage service, which operates within the binding legal framework. The study has revealed that, despite the digital shift observed in many areas of life, particularly since the pandemic, state services responsible for archaeological heritage are lagging behind. The lack of a dedicated repository that would enable access and re-use, and the absence of a long-term national strategy for the digitisation of archaeology-related administrative processes has resulted in data fragmentation and general inaccessibility. Heritage professionals across the country are not fully utilizing the potential of properly preserved advanced archaeological records.

An analysis of archaeological archiving practices in state heritage services, combined with a European overview of the current situation, has allowed for the identification of various levels of an ideal digitisation strategy. This includes targeting law and policy makers, as expressed in the EAC's 'call for action' (Novák et al. 2023), developing and implementing digital tools, and ensuring systematic training and contact points for users. These findings are universal; however, the paper will discuss their practical application in the Polish context and provide an update on the current state-of-the-art.

*Novák, D., Oniszcuk, A. and Gumbert, B. 2023 Digital Archaeological Archiving Policies and Practice in Europe: the EAC call for action, *Internet Archaeology* 63. <https://doi.org/10.11141/ia.63.7>.

4 IS A DISTRIBUTED NETWORK OF SUPPORT STAFF THE WAY FORWARD? THE SND EXPERIENCE

Jakobsson, Ulf (Swedish National Data Service)

During the SEADDA COST action, it was identified that many countries lack the capacity and expertise to create, manage, and share data according to the FAIR principles. SND (<https://snd.gu.se/en>), member of that action, had the same experience when looking at the Swedish universities. In 2018, SND's mission was broadened to be a national research infrastructure for all research areas, resulting in the initiation of the SND network (<https://snd.gu.se/en/about-us/snd-network>). This happened due to the realization that without a massive increase of SND staff, the universities would have to do most of the data management/curation themselves, so research data could be shared in accordance with the FAIR principles (e.g., via SND's research data catalogue: <https://snd.gu.se/en/catalogue/search>), but also to make sure that each university had the capacity to archive and manage the data.

As a result, and initiated by SND, each university started a Data Access Unit (DAU), often consisting of librarians, archivists, legal advisors, and IT staff. The DAU was offered training by SND and gained access to SND's network, where exchange of knowledge, policies, guides on good practice, workflows etc. was done. Interest groups were started, seminars, workshops and thematic network meetings were planned and offered. A few years on, the activity in the network is steadily increasing, as is the number of published research (meta)data.

This presentation will demonstrate and highlight one possible way of building capacity for FAIR data sharing and reuse.

5 ARCHAEOLOGICAL INFRASTRUCTURES IN NORWAY

Uleberg, Espen (Museum of Cultural History, University of Oslo) - Pantos, George (Museum of Cultural History, University of Oslo) - Indgjerd, Hallvard (Museum of Cultural History, University of Oslo) - Callieri, Marco (Visual Computing Lab ISTI-CNR) - Dell'Unto, Nicolo (Museum of Cultural History, University of Oslo; Department of Archaeology and Ancient History, Lund University) - Bonelli, Letizia (Museum of Cultural History, University of Oslo) - Kimball, Justin (Museum of Cultural History, University of Oslo) - Kristensen, Steinar (Museum of Cultural History, University of Oslo) - Samdal, Magne (Museum of Cultural History, University of Oslo) - Aarseth, Bjarte (Museum of Cultural History, University of Oslo)

The Norwegian university museums cooperate in National data infrastructures for archaeology. The new web-based user interface for the Archaeology system was launched in January 2024, following the completion of the new system for Numismatics in 2021 and Ethnography in 2022. This work included migration of data from the Delphi-based MUSIT database to the new UniMus database, which is a Postgres system using an event-based datamodel. Data from all museums is published at the Unimusportal (unimus.no/portal) and is also downloadable from unimus.no. This georeferenced archaeological data from UnimusArk is also made available through the Ariadne portal (<https://portal.ariadne-infrastructure.eu/>).

Another part of the National infrastructure is ADED (Archaeological Digital Excavation Documentation). ADED mainly contains detailed GIS excavation information from 2011 onwards and includes links to excavation photos and artefact records held in the other shared databases. Earlier excavations will be included later.

The Museum of Cultural History (MCH), in close cooperation with DARK Lab (darklab.lu.se) at Lund University and the Visual Computing Lab (ISTI - CNR) has developed the BltFROST platform, based on 3DHOP, for the museum's 3D models. It is currently used for 3D models of artefacts, but extended applications will also include excavation data. The possibilities for sharing annotations and commented models are important features of BltFROST and there is potential for this system to be developed into another element of the national infrastructure.

MCH has come a long way in making its archaeological data FAIR. The aspect of reusability is especially receiving special attention this year through the project UI3D (Understanding and Immersion in 3D). UI3D aims to address reuse and active use of Heritage Data in Teaching and Research. It is funded by the University of Oslo's framework for competence hubs in IT research and will interact with the ERASMUS+ cooperation Virtual Worlds Teaching in Archaeology.

6 RE-ENGINEERING WHICH PROCESSES? TO WHAT EXTENT ARE POST-EXCAVATION PRACTICES, TECHNIQUES AND DOCUMENTATION AS WELL ESTABLISHED AS METHODS FOR ON-SITE RECORDING?

May, Keith (HE - Historic England; University of South Wales; University of Sheffield) - Taylor, James (University of York)

Current practice for archiving of digital records of the stratigraphic data from excavations is still very variable internationally, particularly for commercially excavated sites. Experience in the UK, as reported through ARIADNE+, shows "comparison of the number of archives deposited with the Archaeology Data Service (ADS) against an estimated number of projects found that, at best, 2-3% of all commercial projects have been digitally archived with the ADS" (Tsang 2021).

There is no commonly accepted consistent (FAIR & Open) practice for ensuring that primary stratigraphic data from excavations is included in digital archives. Although valuable initiatives, such as the ClFA "Dig Digital Toolkit" (<https://www.archaeologists.net/digidigital>), have begun to address what is included in the digital archive from excavations, the actual processes used in the post-excavation (PX) analysis stage of projects varies quite markedly and, therefore, the by-products from that stage of the archaeological process are far less consistent in any resulting digital archives. A big question remains: "To what extent are PX practices, techniques and documentation as well established as the methods for on-site recording" and what are the related opportunities and challenges, we still face?

This paper will present outcomes and published recommendations from The Matrix project [AH/T002093/1] which has addressed some of the current limitations in certain approaches to analysis and digital archives of archaeological stratigraphic and phasing data. It will introduce work and key deliverables from 'The Archaeologists Guide to Good Practice - Handbook' (AG2GP-Handbook) [AH/X006735/1] project. The aim of this new project is to draw together the collective expertise of the main archaeological contractors and associated researchers in the UK and, in consultation with other stakeholders from the sector, undertake the necessary feasibility work and organize the required collaborative activities to develop a consortium approach and online tools and resources to support best working practice for this work.

7 OVERCOMING BARRIERS TO PRESERVING AND DISSEMINATING ARCHAEOLOGICAL DATA: THE CASE OF PEPADB

Romero-Garcia, Galo (Universidad de Sevilla) - Sánchez-Gómez, Daniel (University of Lisbon) - Garrido-Cordero, José Ángel (Universidad de Sevilla) - Odriozola, Carlos P. (Universidad de Sevilla)

Archaeological research data preservation and sharing from publicly funded projects are severely limited, largely due to the requirement for data curators to have knowledge of software, programming, web technologies, international standards and data management systems. Similarly, a large proportion of archaeologists have not yet grasped the need to implement strategies to promote the dissemination of scholarly data in Open Access formats. This explains why there are only a few web-based tools offering Open Research Data (ORD) to users.

Given that the practices embedded in data curation represent a regulatory obligation by European bodies, as well as a methodological and technological support necessary to address issues of data quality and accessibility, significantly maximising their reusability, this work aims to highlight the importance of adhering to such practices in archaeological funded research. That is why we will detail the implementation of a methodology for curating prehistoric personal ornaments data from the PEPADB (Prehistoric Europe's Personal Adornment database) long-term project (<https://pepadb.us.es>).

8 LEVERAGING 3D REPOSITORIES FOR ARCHAEOLOGICAL DATA: STANDARDS, ACCESSIBILITY, AND FUTURE DIRECTIONS

Pallan, Carlos (University of Bonn; Bonn Center of Digital Humanities) - Grigowski, Edouard (University of Bonn; Bonn Center of Digital Humanities) - Lang, Matthias (University of Bonn; Bonn Center of Digital Humanities) - Bres, Ewa (University of Bonn; Research Data Service Center) - Zerr, Sergej (University of Bonn; Research Data Service Center)

The digital era has opened up unprecedented opportunities for archaeological data management, emphasizing the need for robust digital infrastructures to support diverse project requirements. Rising to meet these challenges, the Bonn Center for Digital Humanities and the Research Data Service Center at the University of Bonn have engaged in the development of a research data repository for 3D cultural heritage objects and archaeological data. The repository is closely linked to the National Data Infrastructure for Objects and attempts to implement and evaluate the standards developed here in an exemplary manner.

In this study, we will describe the technical foundations of the repository as well as the employed metadata schemas and vocabularies, with practical examples from both museum and field archaeological data collection. Furthermore, we will identify the subsets of the raw data and derived products that are the best predestined for long-term reuse, and determine the optimal data formats for their preservation. These challenges will be addressed and explored in detail using data collected from various contexts and with different data collection methods.

Finally, we will envision how the data stored in the repository can be seamlessly integrated with other data management systems in this research field, thus directly facilitating collaborations between researchers, museums, students and the general public. This integration will be discussed using a virtual reality environment and a museum database as case studies.

9 DIGGING COINS. NOMISMA.ORG, A CONTROLLED VOCABULARY AND ONTOLOGY FOR NUMISMATIC ... AND ARCHAEOLOGICAL? ... LINKED OPEN DATA

Wigg-Wolf, David (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts (RGK))

As more or less standardised, mass-produced serial products, coins are ideally suited to digital applications, in particular in the context of databases, linked open data and the semantic web.

Since 2011 the Nomisma.org consortium has developed a controlled vocabulary and ontology for numismatics that is now widely applied in the discipline and beyond. For example, by employing the concepts of Nomisma.org, The American Numismatic Society alone hosts data on more than 500,000 coins from 86 international projects and institutions that are accessible via portals such as Online Coins of the Roman Empire (<https://numismatics.org/ocre/>) and the Nomisma.org SPARQL endpoint (<http://nomisma.org/sparql/>). Many other projects such as Coin Hoards of the Roman Empire (<https://chre.ashmus.ox.ac.uk/>) implement the Nomisma.org vocabulary and so are fully integrated into the wider world of linked open data.

The ARIADNE EU-FP7 project "Report on the ARIADNE Linked Data Cloud" mentioned Nomisma.org as a particular example of good practice from which the archaeological community can benefit.

Whereas work initially focused primarily on coins from collections and typologies, coins from excavations, as well as finds made by the public, have increasingly become a focus. This not only involves resources such as the Portable

Antiquities Scheme of England and Wales aligning their data with Nomisma.org, but also portals such as Numisdata (<https://numisdata.org/>) that publish excavation coins.

This paper will present the development and architecture of Nomisma.org, as well as the philosophy behind it. Questions addressed will include how Nomisma.org can – and can not – be a paradigm for archaeological data, as well as how it can facilitate better integration of numismatic data (and thus numismatics) into archaeological research and discourse.

<https://nomisma.org/>

<https://nomisma.hypotheses.org/nomisma-org>.

10 RECENT ADVANCES IN QUERYING THE ROAD DATABASE TO MAKE DATA FAIR

Kandel, Andrew (Heidelberger Akademie der Wissenschaften) - Haidle, Miriam (Heidelberger Akademie der Wissenschaften) - Hochschild, Volker (Heidelberger Akademie der Wissenschaften; University of Tübingen) - Kanaeva, Zara (Heidelberger Akademie der Wissenschaften) - Conard, Nicholas (Heidelberger Akademie der Wissenschaften; University of Tübingen)

The "ROCEEH Out of Africa Database" (ROAD) is the largest compilation of archaeological datasets covering Africa and Eurasia from 3,000,000 to 20,000 years ago. When the project began in 2008 (<https://www.hadw-bw.de/en/research/research-center/roceeh/home>), one goal was to create an open-access, online, research database to answer large-scale questions about early humans expansions. ROAD gathers data from fields of archaeology, paleo-anthropology, paleontology and paleobotany in a geographic framework.

Here, we present recent advances in querying ROAD. We discuss how ROCEEH provides its users with data and focus on a new, user-friendly feature that facilitates data retrieval. The new interface, called "Ask ROAD," embodies our philosophy of making the data we collect as FAIR as possible.

Queries in ROADWeb are performed in various ways: simple filters on one table provide basic results; an SQL query tool allows the joining of several tables; a SPARQL endpoint is also available; finally, we collaborate with partners to tailor complex queries. Results can be viewed in ROADWeb or accessed through a URL, and exported in several interoperable formats.

Experience with users motivated us to create "Ask ROAD". This intuitive interface works in a scaffolded way with five sequential steps: 1) select geographic region and/or site type; 2) choose types of assemblages and/or define time-frame; 3) specify details about assemblages; 4) perform unions of datasets; and 5) conduct detailed searches. After each step, a table pops up, which users can download in their preferred format. References are generated after the first step and attributes displayed at any time.

We plan to add more features in the future, for example a routine to extract data from ROAD and process it using statistical packages such as R. We encourage you to visit ROAD (<https://www.roceeh.uni-tuebingen.de/roadweb/>) and provide expanded access to anyone interested. Discover for yourself what ROAD can do!

11 ABOUT GEOHISTORICAL FAIR DATA IN THE FRENCH CONTEXT OF RESEARCH. THE CASE OF THE PARCEDES PROJECT ON AGRARIAN LANDSCAPES

Odore, Angelo (Université de Rennes 2) - Watteaux, Magali (Université de Rennes 2) - Costa, Laurent (ArScAn – UMR 7041 « Mondes grecs archaïques et classiques »)

The PARCEDES project funded by the French National Research Agency (ANR) involve multiple institutions across France, Italy, and England and aim to study the organization and evolution of agrarian parcels or field boundaries from Protohistory to the present day in four different areas (Vendée, Nîmes, Maremma, Devon) in order to identify local particularities and general scenarios for the evolution of agrarian parcels. The project has a strong digital component, which complies as closely as possible with the FAIR principles, using a number of French digital tools, some of which are supported by the French government.

Since 2023, several actions have been undertaken to give access to an visualise certain data produced or used during the project and to promote the research carried out within the project:

- the production of webGIS with ArcGis online for public access enabling the display of datasets (<https://parcedes.hypotheses.org/category/webgis>);

- the storage and sharing of data sets on the "Fabrique Numérique du Passé.

(https://www.fabriquenumeriquedupasse.fr/pages/homepage_v2/) dedicated to the storage and dissemination of geohistorical data, backed by the "Projects Time Machine" consortium of the IR* Huma-Num (French State Research Infrastructure)

(<https://parcedes.hypotheses.org/1155>);

- the ongoing publication of data papers on certain datasets produced by ANR PARCEDES;
- promoting the results of PARCEDES research in the form of StoryMaps (<https://parcedes.hypotheses.org/984>)

The challenges outlined in the paper, such as the fragmented landscape of data sharing, lack of standards, and obstacles in feeding data into research infrastructures, highlight the importance of initiatives like PARCEDES. By addressing these challenges, the project contributes to facilitating data sharing in archaeology and ensuring the long-term preservation of valuable geohistorical information. The guidelines and actions proposed in the paper align with the goals of collaborative projects like PARCEDES in creating a more accessible and interoperable geohistorical data.

12 **RADIOCARBON DATABASES TOWARDS INTEROPERABILITY: THE CASE OF MEXICO AND THE ARQUEODATA PROJECT**

Alcántara Chávez, Luis Alberto (ArqueoData Project, Mexico; Museo del Templo Mayor, INAH, Mexico)

One of the major discussions in archaeology revolves around chronologies. This paper aims to present an overview of absolute dating databases in the web with radiocarbon results and discuss the information gap on Latin American archaeological dating, especially in Mexico. This paper will present some databases or datasets compilation projects in Latin America (AndesC14, BRC14, MesoRAD), Europe (p3k14c), and North America (CARD). The analysis of the information in these projects, allows us to identify the gap that exists in Mexico radiocarbon results in the web. Likewise, a database proposal for Mexico will be presented: ArqueoData, and we will discuss on the interoperability opportunities offered by the creation of an Application Programming Interface (API) for effective communication between projects and databases. API allows us to discuss standardisation, controlled vocabularies, and similar ways for presenting information to ensure interoperability and bridging the gaps. Also considering the importance of the different contexts between Latin America (Global South) - Europe and North America (Global North).

13 **KEEP CONTROL OF YOUR DATA! A DECENTRALIZED, OPEN-SOURCE AND COMMUNITY-DRIVEN APPROACH TO ARCHAEOLOGICAL DATA SHARING THROUGH THE "ARCHEOVIZ PORTAL.**

Plutniak, Sébastien (CNRS (France); Laboratoire CITERES-LAT) - Vignoles, Anaïs (Université de Liège) - Caron-Laviolette, Élisabeth (Université Paris 1)

Recent literature highlights several barriers to the availability of field archaeological data: 1) the absence of user-friendly tools, 2) a lack of data management training, 3) limited time to prepare data for publication, and 4) insufficient recognition of data publishing efforts. To address these issues, "archoViz" offers a solution as a stand-alone application for visualising and statistically exploring spatialised archaeological data. Designed as a cornerstone of a decentralised web network for excavation and survey data, "archoViz" supports multiple instances for individual datasets, allowing users to deploy these instances on their choice of institutional or personal servers, thus avoiding centralised data storage.

Importantly, "archoViz" serves as a data editorialising tool, making data publishing a desirable, though not mandatory, endeavor. It encourages the open publication of comprehensive workflows, including datasets, any necessary reprocessing code, and their respective "archoViz" instances, using third-party services.

However, decentralised approaches present challenges, such as the risk of component dispersion. To mitigate it, we propose: 1) detailed bibliographic referencing of "archoViz" instances as distinct editorial units and 2) the "archoViz Portal" for indexing and enhancing the discoverability of instances (<https://analytics.huma-num.fr/archoviz/home>). This portal allows for searching instances via keywords or a map, aligns metadata with standard vocabularies (e.g. Geonames), and integrates with "Openarchaeo", a semantic web repository for archaeological data.

Ultimately, the "archoViz portal" facilitates data sharing and the visual restitution of archaeological findings, benefiting scientists and the general public alike.

14 **GLOBALID: A NEW COMMUNITY-DRIVEN RESEARCH DATA INFRASTRUCTURE FOR SHARING FAIR LEAD ISOTOPE DATA**

Rose, Thomas (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany) - Greifelt, Tim (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany) - Westner, Katrin (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany) - Hornschuch, Annette (Forschungsbereich Montanarchäologie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany) - Hsu, Yiu-Kang (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany) - Wiethoff, Helge (Rechenzentrum, Technische Hochschule Georg Agricola, Bochum, Germany) - Klein, Sabine (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum, Bochum, Germany; Institut für Archäologische Wissenschaften, Ruhr-Universität Bochum, Bochum, Germany; FIERCE, Frankfurt Isotope & Element Research Centre, Goethe Universität Frankfurt, Frankfurt am Main, Germany)

Lead isotopes currently are the most powerful method for the reconstruction of the raw material provenance of non-ferrous metals. Crucial for the successful application of the Pb isotope method are reference data from all potential ore deposits or other suitable materials with a known production location. The first open-access database with such data was OXALID, and many more followed since. They all have two major drawbacks: They are static, i.e. either not maintained anymore or published as spreadsheets in, e.g. the supporting information of articles. They each follow their own approach in the description of the data, sometimes resulting in ambiguous or missing information. Consequently, Pb isotope data currently largely lack interoperability, making this strategy obsolete.

GlobalID aims to overcome this problem by developing an infrastructure to publish, access, and use Pb isotope reference data and supporting meta-information that comply as much as possible with the FAIR principles. Development will be carried out in close contact with the community to ensure that the infrastructure meets its needs and becomes deeply rooted in it. GlobalID's aim is to reuse already existing solutions, standards, and infrastructures wherever possible. These efforts are complemented by the development of corresponding open educational resources and the organisation of training workshops.

This contribution will present GlobalID with a focus on its strategy in positioning itself among already existing research infrastructures and within the Pb isotope community. A key element of this strategy is the combination of technological aspects to ensure interoperability and close interlinkage with a comprehensive effort to involve the community and all relevant stakeholders in all steps. A welcome side effect of this strategy will be the improvement of data literacy skills throughout the community regardless of the educational and research background of users, adding to the value of GlobalID beyond being a data infrastructure.

15 **CHROMA: TOWARDS INTEROPERABILITY OF ARCHAEOLOGICAL SURVEY DATA BY ADDRESSING COLOUR VISION DEFICIENCY IN THE MAP LEGEND**

McKeague, Peter (Historic Environment Scotland) - Cramer, Fabio (Undertone Design) - Binding, Ceri (University of South Wales) - Tudhope, Douglas (University of South Wales)

Archaeology uses a range of non-invasive approaches including airborne mapping, ground survey and a range of remote sensing techniques to identify, analyse and interpret archaeology in the landscape. In Scotland, Historic Environment Scotland (HES) has built up substantial datasets over thirty years from its ground survey and airborne mapping programmes. However, most survey work is undertaken on a project-by-project basis by the private sector, academia and community groups for a range of reasons. As archaeology is highly deregulated in Scotland, there is no consistent approach to collecting and sharing data beyond the project lifespan. Issues of accessing or archiving the primary data aside, little effort has been made to address aggregating survey data from different projects and techniques. A further challenge is to improve accessibility to that data, presented against already colour rich mapping and orthoimagery backgrounds, for about 4.5% of the UK population (according to Colour Blind Awareness) who have difficulty distinguishing shades of colour.

Drawing on the extensive HES survey datasets, the CHROMA (Cultural Heritage Review on Map Accessibility) project explored the challenge of aggregating data collected over many years to present a consistent colour vision deficiency friendly interpretation of the archaeological landscape. Mapped features were classified by the narrow terms in the Scottish Monument Thesaurus (published on [Heritagedata.org](https://www.heritagedata.org)). With eighteen top level term coupled with the poly-hierarchical nature of the thesaurus, results were cartographically unsatisfactory failing to adequately present the story of the archaeological landscape. Thesaurus values were further grouped into ten categories using SKOS:collection to model the connection of categories with the thesaurus for cartographic representation. As part of HES's Equalities Action Plan, the project worked with a colour scientist to improve colour vision accessibility for the key.

The interoperability of the approach was tested against the recently released Historic England Aerial Investigation Mapping Open Data.

16 "AS OPEN AS POSSIBLE & AS CLOSED AS NECESSARY"? UNCOMFORTABLE HERITAGES AND DATA SHARING OF HUMAN(REMAIN)S.

Alves-Cardoso, Francisca (Centro em Rede de Investigação em Antropologia (CRIA); In2PAST - Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory,)

Many museums and similar institutions have collections that include human remains. These collections are deemed essential for scientific research that aims to depict the history of human beings, exemplifying cases of past human behaviour, health, and wealth. Technological development has impacted on the information that can be retrieved from these collections. Nowadays, we are not just limited to the remains themselves. Virtual 3D models, datasets of macro and microscopic observation, aDNA, and geochemical analysis are also attached to these collections and must be curated. In addition, publication data resulting from the interpretation of raw data must also be managed. Therefore, ethical issues no longer relate to the human remains alone. They extend to their metadata, including repatriation, governance, circulation, and ownership issues. It is, therefore, essential to develop data management plans and sharing policies, which consider major ethical issues when data sharing and collection access is in place. This is pivotal for collections with uncomfortable histories due to historical legacies and procurement practices. These issues are already part of the academic discussion when addressing marginalized and BIPOC communities, and needing to be included when addressing contemporary built collections, such as modern cemetery-based collections. This paper explores the policies for managing and sharing data related to modern cemetery-based collections, by referring to published information and access guidelines provided by museums and institutions. By analyzing these results, we can identify major issues and offer solutions to shape existing access and data-sharing policies, proposing an approach similar to the data treatment and availability systems used in biobanks for biomedical research. This will support the ethical framing of collections, which provenance may be seen as unethical.

387 ARCHAEOLOGY & THE GLOBAL MIDDLE AGES: OPPORTUNITIES, CHALLENGES, AND FUTURE TRAJECTORIES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Herold, Hajnalka (University of Exeter) - Fazioli, K. Patrick (Mercy University) - Petts, David (University of Durham)

Session format: Regular session

This session aims to investigate how the concept of a "Global Middle Ages" can facilitate a more dynamic and inclusive medieval archaeology. Originally developed by medievalists in history and literary studies, the Global Middle Ages approach has sought to challenge the Eurocentric nature of medieval research by foregrounding long-distance connections, cross-cultural analyses, and non-western contexts. However, on the one hand, 'Eurocentric' medieval research has usually not included all of Europe, but only western Europe, or sometimes even only Britain more specifically. And, on the other hand, the notion of Global Middle Ages has received comparatively little attention in archaeology, especially outside of the Anglophone world, despite the tremendous potential to explore these themes based on the archaeological record.

We invite papers on the archaeology of the Global Middle Ages from any region, but especially those that have been traditionally underrepresented in this framework. Both synthetic, theoretical explorations and specific case studies are welcome. Possible themes include, but are not limited to: How does widening our geographical perspective shape the questions we ask of the archaeological record? Should a global framework be limited to investigating clearly related topics, like long-distance trade, migration, and communication, or should it infuse our entire understanding of the past? How can we make the geographical coverage within Europe more balanced? In what ways is the 'New World' part of Global Middle Ages? What are the advantages (and dangers) of framing non-western societies as 'medieval'? Can a global approach to medieval archaeology address inequalities in the contemporary research landscape?

ABSTRACTS

1 GLOBAL MEDIEVAL ARCHAEOLOGY - ACCESS TO THE 'BIG PICTURE'?

Herold, Hajnalka (University of Exeter)

This paper examines the use of the global medieval framework in archaeology on two levels, by a) looking into the emergence and effects of this approach and b) presenting a case study where this approach can be useful. Part a) explores the following questions: What is global medieval archaeology and how did it come about? What (conscious

and unconscious) factors have shaped its emergence and why did it emerge where it did (English-speaking world)? How does it shape current research landscapes? Where/how can it be useful to us and what implications does it have on research landscapes and potential research results? Is there scope to make this approach widespread beyond the English-speaking world? Part b) presents research on 'oriental' glass beads that are assumed to have been produced in the Middle East and found wide distribution in Europe and beyond in the 8th and 9th centuries CE, connecting areas that have so far largely been studied separately.

2 REVEALING AND OBSCURING LONG-DISTANCE CONNECTIONS AT EARLY MEDIEVAL LINDISFARNE

Petts, David (Durham University)

The notion of the 'global middle ages' is gaining traction within the world of medieval archaeology and history. Researchers are increasingly recognising that there are trans-global flows of both materials and objects, as well as concepts and ideas over the longue durée. At certain points in time and space, these links can be seen to expand and contract, whilst particular contexts (such as elite and religious spaces) can be seen to catalyse the clotting of distributions of globalised material resources. However, the ability of archaeologists to plot origin points for raw materials and trace networks of exchange mean that today we often have a better understanding the dimensions of trading networks that contemporary participants in these patterns of exchange may not themselves have had. This paper uses the case of early medieval monastery at Lindisfarne (England) and the relics of St Cuthbert to explore how a range of long distance material and intangible connections might have bound a monastery into the wider world, whilst trying to identify to what extent these long-distance links may have been recognised by those who participated in them at the time. It argues that in many cases, the recontextualization of exotic goods into new social contexts can serve to obscure or hide their original origins and trajectories. The notion of a global middle ages might look very different to modern scholars studying it, from the views of those participating in them at the time.

3 IT'S THE SOURCES STUPID! - OR IS IT DARKER THAN THAT..?

Hill, David (NIKU - Norwegian Institute for Cultural Heritage Research)

When the firework-loaded train that was the Viking Age crashed and burned at Stamford Bridge in 1066 taking with it the spectacularly mobile and ultimate Viking - Harald Hardrada - a very different period in Norwegian history begins. Seemingly those 'Vikings' who were left standing quietly exit the stage and vanish into thin air. The ensuing Medieval narrative becomes strangely pedestrian, domestic and institutional. In a lockdownesque way foreign travel becomes very rare, taxes and rents are conscientiously paid, the corners and edges of forests are diligently cleared, log cabins are built, and churches constructed in every district as if nothing else matters.

The sources from here on do indeed shift in nature and content such that history and archaeology no longer throw out tabloid headlines, and the statisticians and social historians of the Medieval period sharpen their pencils and get to work. However, by peeking behind the state-formation narrative, long-range contacts and global impulses continue to influence and shape political and economic society albeit in a silent way.

This paper will examine how the Medieval Norwegian narrative of the nineteenth and twentieth centuries favoured domestic rather than global impulses. Contemporary norms and trends allow us to explore the themes of globalization and decolonialization, however do we have enough sources to do undertake that task?

4 CAHOKIA MOUNDS AND THE GLOBAL MIDDLE AGES

Baires, Sarah (Eastern Connecticut State University)

How does the 'New World' fit into the Middle Ages? A period of time, roughly 1,000 years, that in our colloquial imagination focuses solely on Europe as marked by the plague, the Crusades, and a sustained reliance on the Christian religion. Yet, the Middle Ages was also a time of innovation in agriculture and art, and a population surge during the Medieval Warm Period contributing to a restructuring of social organization in this region. Expanding our comparative understanding of the Middle Ages to include sites in global contexts requires a reconsideration of how this period is defined geographically. To include sites from the Americas means we must grapple with the uniquely European derivation of this period--one that generally considers global history as confined to the era after Columbus landed in the 'New World'. To be 'global' was to be 'colonial' and we all know how that played out in the Americas. In this paper I consider how a focus on pre-contact Native America contributes to a global framing of the 1,000 years prior to 1500 through an examination of the extensive social and political networks characteristic of Mound Building societies in the Eastern Woodlands as well as the deep history of mound building across the region.

5 TEACHING AND RESEARCHING THE GLOBAL MIDDLE AGES ON AND WITH TURTLE ISLAND: ARCHAEOLOGICAL PERSPECTIVES

Knutson, Sara Ann (University of British Columbia, Vancouver)

This paper observes that 21st-century medieval studies has reached a critical inflection point as it engages important material-, global-, and indigenous turns as well as a shift towards the “Global Middle Ages. I argue in this paper that the updated “Global Middle Ages” label, however, demands more than artificially fashioning the traditional “middle ages” into a new, “global” costume. Instead, the adoption of “Global Middle Ages” signifies active commitments to transforming the multidiscipline with some critical methodological and ethical considerations. In this paper, I draw on my multidisciplinary training as an anthropological archaeologist and historian, my experiences as the designer and instructor of an undergraduate course, “Global History, pre-1500 CE” at a North American institution, and as a researcher working with archaeologically-uncovered materials in the Middle East and Europe. I argue for why societies on Turtle Island (“North America”) should be included in archaeologies of the Global Middle Ages and, more importantly, how. As a case study, I discuss my archaeological research on coinage from the ‘Abbāsīd Caliphate and Viking-Age Scandinavian burial practices (e.g. Knutson 2023) and I demonstrate why and how listening to people (past, present, and future) from and on Turtle Island also matters to the archaeological study of these “medieval” societies. I argue that archaeology offers important training for scholars to meaningfully and ethically engage the enduring material traces and oral traditions of non-European societies as well as to help destabilize Euro-western forms of knowledge production. There are also powerful ethical limits to this work that archaeologists must also respect. Ultimately, these current debates matter not only to researchers, teachers, and students of the “Global Middle Ages,” but more importantly, they have profound implications for the descendant communities of global indigenous societies.

6 GLOBAL MIDDLE AGES, ARCHAEOLOGY, AND POSTHUMAN LANDSCAPES

Fernández Fernández, Jesús (University of Oviedo)

The concept of the Middle Ages emerges within the construction framework of the modernity-coloniality civilizational project. The modern colonization of time, achieved through the conceptualization of terms such as prehistory or the Middle Ages, evolved parallel to the colonization of physical space, reinforcing the latter through the notion of the denial of coevalness. Over the past century and a half, these Eurocentric and ethnocentric concepts have been widely disseminated within the historical and archaeological disciplines.

Towards the end of the 20th century and the beginning of the 21st century, initial attempts at revision were articulated through postcolonial studies, and concepts such as the global Middle Ages emerged. However, these movements fail to address a central issue in this discourse, namely, the implicit anthropocentrism embedded in the humanistic disciplines. The idea of the existence of a nature separate from human and its culture is foundational to the entire modern and Western civilizational project, serving as a potent semantic tool of domination. This framework led to the establishment of dichotomous, hierarchical, and functional categories that sustained the modern patriarchal, capitalist, speciesist, and colonialist assemblage.

Disciplines such as history and archaeology, inherently anthropocentric, perpetuate through their epistemological programs and methodologies this naturalistic ontology, making it inherently challenging to relinquish these epistemic hierarchies. Consequently, I posit that a global Middle Ages cannot materialize without transcending its implicit anthropocentrism. In this paper, I present a critique framed in this ontological debate and assert the impossibility of undertaking the theoretical turn towards a global Middle Ages without integrating archaeology, environmental sciences, and a posthumanistic scientific project. This transdisciplinary approach is crucial in embracing this new concept.

7 SILK ROAD INTERSECTIONS: REDISCOVERING ARPA SETTLEMENT IN VAYOTS DZOR WITHIN THE GLOBAL MIDDLE AGES

Babajanyan, Astghik (Institute of Archaeology and Ethnography NAS RA) - Franklin, Kathryn (Birkbeck, University of London)

This paper presents results from excavations in the South Caucasus as a case study in the construction of locality in the context of the Global Middle Ages. This study focuses on the medieval Arpa settlement, located in the Vayots Dzor region in Armenia. Despite its role as a local government seat for the ruling Orbelyan clan and as a pivotal Silk Road node connecting major cities such as Dvin, Tabriz, and Partav during the 12th-15th centuries, this site and its region remain overlooked in discussions of medieval globality. To address this gap, the co-authors initiated the “Vayots Dzor Silk Road Survey” project in 2015. This ongoing interdisciplinary project was designed to comprehensively explore the area, offering a nuanced perspective and contributing to the broader discussion of medieval Eurasian connections.

The Armenian highlands, particularly the river canyons and mountain passes of Vayots Dzor, acted as crossroads for expanding Eurasian empires and population movements. Simultaneously, it stood apart from key Ilkhanate centres such as Tabriz, Dvin, Ani, or Partav. The region’s diverse political landscapes, and dynamic hierarchies collectively

contributed to a unique historical narrative, reflected in the rich archaeological record. Our discussion explores how the complexity of the Armenian highland influenced its cultural products, revealed through excavations at Arpa. A contextual examination of the material culture sheds light on the political and cultural polycentrism which characterized social life in the high medieval Caucasus and surrounding regions. The findings shed light on how Arpa, as a local government seat and Silk Road node, played a crucial role in shaping the broader medieval Eurasian landscape, challenging the narrow east-west binary of Silk Road narratives.

This research underscores the significance of incorporating peripheral regions into discussions of the Global Middle Ages, emphasizing the need to examine nuanced interactions in areas removed from major centres of power.

8 TOWARDS A GLOBAL HISTORICAL ARCHAEOLOGY OF EUROPE AND SOUTH ASIA

Hueglin, Sophie (University of Tuebingen)

Some archaeological disciplines are more predestined to develop global perspectives than others. I am thinking of maritime or landscape archaeology, numismatic or ceramic studies but also very much of the archaeological sciences. Regarding the historical periods, where we often are confronted with an abundance of historical sources, finds and features, archaeologists tend to work with a regional or even local focus. Often, they even lose sight of the larger geographical and historical contexts of their findings.

Adopting varying global perspectives in historical archaeology works best together with colleagues from other world regions. To develop a keen interest in and a deeper understanding of other cultures, students and scholars must have and seek opportunities to travel, acquire languages and experience other world views. Today, researchers can find each other and stay connected over great distances through purely online or hybrid platforms. Where, if not here in Rome, should we look beyond Europe and venture into the global chapter of historical archaeology?

Taking examples from recent publishing and teaching projects, I will describe the opportunities and difficulties of a global approach in historical archaeology.

9 WITHOUT EUROPE. SINOCENTRIC VISION OF MEDIEVAL AGES

Zukowski, Robert (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Although both written and archaeological sources confirm some contacts between China and the West, China developed in relative isolation from what we name „Western culture” for most of its long history. The geographic situation of the Zhongguo, as well as Chinese geopolitical theories, describing the world in terms of opposition of Tianxia (All Under Heaven)- the area accepting the Chinese values system, versus outer lands inhabited by barbarians, caused the general lack of interest in establishing contacts with the distant lands.

Although the Roman Empire, called Da Qin, and thereafter Byzantine Empire, named Fulin, are the subjects of relatively more abundant descriptions than the other countries in the Chinese official histories, the echoes of historic events occurring in Medieval Europe are particularly inexistent in Chinese medieval historiography. Moreover, the present state of archaeological research seems to confirm that the western influences in material culture were rare, and usually transient.

The Chinese map of the world, drawn in 1402, preserved only in Korean copy known as Gangnido “Map of Integrated Lands and Regions of Historical Countries and Capitals (of China)” shows a detailed representation of the whole Asia, small Africa and the Middle East, while Europe is practically not even marked.

This view seems to be interestingly parallel to the Eurocentric views, mirroring their biased, exclusive character. This paper aims to analyse its potential in understanding the Global Medieval Ages.

10 WHAT IS A GLOBAL MEDIEVAL ARCHAEOLOGY FOR?

Fazioli, Kirk (Mercy University)

Following broader trends in medieval studies, the concept of the Global Middle Ages has begun to appear more frequently in archaeological scholarship. While at first glance this framing seems relatively unobjectionable, archaeologists should carefully weigh the potential advantages and drawbacks before incorporating it into the disciplinary lexicon. For some scholars, the Global Middle Ages are about highlighting long-distance connections and cross-cultural comparisons during the medieval millennium, while for others the goal is to challenge the longstanding Eurocentrism/whiteness of the field. Is the inherent ambiguity of this term a strength or weakness? How well does it align with archaeological datasets and methods? Is it ultimately about refining our understanding of the past or addressing social inequities in the present? This paper will explore such questions while also considering what recent debates over the “global turn” in the historical and social sciences reveal about the promise and pitfalls of a global medieval archaeology.

390 MODELLING CONNECTIONS: NEW METHODOLOGIES TO UNDERSTAND HUMAN MOBILITY, ROUTE NETWORKS AND LAND USE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Montesanto, Mariacarmela (Università degli Studi di Firenze; Durham University) - Co-to-Sarmiento, María (Centre for Urban Network Evolutions (UrbNet); Aarhus University) - Cimadomo, Paolo (Università della Basilicata-ISPC CNR) - Ritondale, Manuela (Groningen Institute of Archaeology, University of Groningen) - Sommella, Virginia (Bilkent University)

Session format: Regular session

Human mobility has been translated in various ways, allowing the creation of networks between people for the exchange of ideas, goods, cultures and technologies. However, modelling mobility still presents some challenges, such as scant information about ancient routes in the past, environmental changes, or the difficulties of taking into account cultural and cognitive factors, engaging history, geography, environmental studies and anthropology.

The study of human mobility is important in understanding political, social, and cultural transformations of ancient trade networks and economies, as well as core-periphery interactions in the archaeological record. The last 20 years have seen an explosion of studies on ancient route networks, with much of this research using computational tools. However, while these approaches have the benefit to help in reconstructing road maps based on specific itineraries, there is a well-recognised mismatch between tracking the movements of people and material along these routes. The interpretation of the generated models of movements and their relation to settlement patterns and urban layouts needs to be contextualised, and much experimental work is required to better model different types of movements and to understand traffic patterns. In addition, the issue of how to validate and test terrestrial, maritime or riverine routes remains mostly unheeded.

This session aims to explore human mobility in the past by assembling contributions dealing with new methodologies and approaches. We welcome contributions focused on methods to analyse human mobility (GIS, modelling, remote sensing, among others), approaches to seaborne and riverine routes (seasonal navigation possibilities, shipping routes), route networks, urban layouts, or multi-scalar interaction among regions without any restriction in chronology or study area.

ABSTRACTS

1 RBASIS METHOD. A METHODOLOGY AND MODEL TO HISTORICALLY STUDY THE RELATIONSHIP BETWEEN AN ARCHAEOLOGICAL SITE AND ITS IMMEDIATE SURROUNDINGS

Trapero Fernández, Pedro (Cádiz University)

In the historiography of historical spatial analyses, the typical focus lies in scrutinizing the correlation between a designated point or polygon representing the archaeological site and the broader territory it inhabits. Additionally, detailed analyses of the space itself, incorporating aspects such as soil types, geology, and environmental conditioning factors, are commonly conducted. We have developed a method tailored to investigate the intricate relationship of an archaeological space, particularly emphasizing productive centres like villas or farmhouses, with their immediate environs. Our model introduces a nuanced approach, advocating for a mixed analysis methodology. In this approach, we delve into the calculation of the minimum mobility space associated with a settlement and production centre, aiming to unravel the intricacies of how the surrounding space was articulated. This involves the application of sophisticated techniques such as cost analysis and statistical studies, utilizing a diverse set of geographical and historical parameters. The culmination of these efforts yields what we term the RBASIS (Relationship Between an Archaeological Site and its Immediate Surroundings) method, a comprehensive framework that offers multifaceted insights into the dynamics between archaeological sites and their proximate environments. This method not only enhances our understanding of the spatial relationships but also provides a more nuanced perspective on the historical and environmental factors shaping these archaeological spaces. The RBASIS method holds great promise for advancing our comprehension of the complexities inherent in the interactions between settlements and their immediate surroundings.

2 APPLICATION OF LANDSCAPE ANALYSES TO TRACE THE FIRST OCCUPATION OF SICILY

Zaia, Sara (Harvard University) - Patania, Ilaria (Rutgers University) - Tryon, Christian (University of Connecticut)

Geospatial analyses and modeling have been increasingly applied to archaeology to investigate migrations and travel across great distances in ancient times. In such analyses, geomorphology, historical sources, and environmental factors are included in addition to the information from archaeological investigations. Such an approach is often applied to identify patterns that could lead to new archaeological evidence, such as predictive modeling combined with field

survey to locate sites. This paper presents the results of geospatial analyses of the human dispersal and occupation of the island of Sicily.

The oldest uncontroversial evidence for human arrival on a Mediterranean island is in Sicily at ~17 kya, with some evidence from ancient DNA suggesting that these early populations were small and focused on terrestrial foods. It is widely accepted that these groups entered the island through a short-lived land bridge that connected Sicily to Italy between 21.5 and 20 kya, following the Last Glacial Maximum (LGM ~26.5-19 kya) when portions of the coastal landscape were exposed by lower sea levels. The extent to which other parts of the habitably parts of the island now lie submerged by sea level rise since the onset of the Holocene is incompletely known. Our analyses use published geomorphological and archaeological data to calculate migration routes through the island following the LGM and model a sustained human occupation of Sicily.

3 TRANSCORDILLERAN PATHS AND INTERREGIONAL INTERACTION IN SOUTHERN SOUTH AMERICA: A PROPOSAL BASED ON GIS MODELING

Lucero Ferreyra, Gustavo (Universidad Católica de Temuco, Carrera de Arqueología, Chile.) - Barberena, Ramiro (Centro de Investigación, Innovación y Creación, Universidad Católica de Temuco.; Instituto Interdisciplinario de Ciencias Básicas, CONICET; Universidad Nacional de Cuyo, Argentina) - Mera, Rodrigo (Sociedad Chilena de Arqueología, Gorbea, Región de La Araucanía, Chile.) - Beron, Monica (CONICET; Universidad de Buenos Aires) - Paez, Florencia (Universidad de Buenos Aires) - Fernandez, María (Conicet) - Scartascini, Federico (Conicet; Universidad Nacional de Río Negro) - Sacchi, Mariana (Universidad de Buenos Aires, Facultad de Filosofía y Letras; Universidad Católica de Temuco, Carrera de Arqueología)

The Andean mountain range is South America's most remarkable mountain system, with average altitudes between 2500-3000 masl in its meridional sector. The complexity of this landscape has been central to archaeological discussions about landscape use patterns, movements, and articulation of their different environments. In the Andean Araucanía area of south-central Chile, an occupation model based on a tradition of hunter-gatherers adapted to temperate Andean rainforests was proposed. However, more recently this perspective is being discussed by means of new theoretical and methodological approaches. In this paper, we present the results achieved from the GIS application to the study of human mobility. This is based on the idea of the Andes Mountains as a sociocultural spatiality, an articulator of regions and relationships that allows ecological complementarity and movement of material goods, ideas, and people (social relationships). In this way, archaeology, anthropology, history and geography have provided enough information to show common Andean spatial historicities among groups from both slopes, including bioceanic connections throughout the last 5000 years. We aim to explore this phenomenon based on an actualistic prediction model that integrates geographic, environmental, archaeological and ethnographic data, and serves as a framework to discuss the incidence of these variables on mobility, use of space, transport of resources and distribution of archaeological sites along possible routes that connect a millenary transcordillera network. This approach seeks to test the internodal theory in a far southern environment and a much wider region (Araucania Andina, Chile, Norpatagonia and Pampa, Argentina) rather than the Circumpuna Andes, the environment for which the theory was modeled.

4 MODELLING MOBILITY IN THE NEOLITHIC: LEAST COST PATHS ON A LARGE CANVAS

Soriano Elias, Biel (Universitat Autònoma de Barcelona) - Bach Gómez, Anna (Universitat Autònoma de Barcelona) - Monforte-Barberan, Andreu (Universitat Autònoma de Barcelona) - Molist Montanya, Miquel (Universitat Autònoma de Barcelona)

Movement modelling through the use of GIS is a method that has shown stimulating results in its application to the study of past societies in the last decades. However, this usually refers to relatively small study areas and limited comparative cases. For these reasons, we aim to present an analysis focused on the bigger picture, a study designed to test the method's utility on a large canvas. Our main objective here is to assess the importance of mobility in the settlement pattern of past societies. For this study, we selected the communities in the northeast of the Iberian peninsula during the Middle Neolithic (4500-3500 cal BCE) and used least-cost paths and cost surfaces to model mobility networks. In this context, we constructed different models of natural movement for each zone and then compared them to the network of settlements. We also contrasted them with a network of surviving shepherd paths to verify their credibility.

5 ROADS AND RIVERS. THE IMPORTANCE OF REGIONAL TRANSPORTATION NETWORKS FOR EARLY URBANIZATION IN CENTRAL ITALY (1000-500 BC)

Prignano, Luce (UBICS (Universitat de Barcelona Institute of Complex Systems); Heurística Barcelona) - Fulminante, Francesca (Bristol University; Oxford University; University Roma Tre) - Cozzo, Emanuele (UBICS (Universitat de Barcelona Institute of Complex Systems); Heurística Barcelona)

Ancient routes were crucial for settlement interactions, influencing societal development and urbanization. Terrestrial routes, reflecting social interactions, required resources and cooperation for maintenance. Navigable rivers offered complementary connectivity, shaping the development of roads. Together, they formed a regional transportation system, a product of social relations and interactions with the environment. This study examines transportation networks in Central Italy (1000-500 BC), a period marking the emergence of regional groups and the first city-states in Western Europe.

We devise a methodology to assess the integration of fluvial and terrestrial transportation, applying multiplex network formalism to analyze the infrastructure's complexity. This approach considers settlements as nodes within a multi-layered system, where different transportation modes constitute separate layers connected by inter-layer links. This framework allows for an inverse engineering approach to qualitatively and quantitatively assess transportation modes' interplay without complete data on maintenance costs and transport speed.

We introduce two distinct parameters: the first quantifies the relative maintenance costs of rivers compared to roads, and the second represents the overall average costs associated with ports. Using these parameters, we define a quality function known as "algebraic connectivity." This metric evaluates network resilience, favoring systems with efficient paths and penalizing redundant ones susceptible to node failures.

Our study conducts a longitudinal analysis, dividing the timeframe into five slices, to explore changes over time. The results highlight how transportation systems in the Latin and Etruscan regions not only differed from each other but also evolved within each region across different periods. This comprehensive approach sheds new light on the dynamics of ancient transportation networks, highlighting the complex interplay of environmental, economic, and social factors in shaping regional connectivity and resilience.

6 THE LANDSCAPE OF THE RABAGÃO VALLEY: TRANSFORMATIONS AND DISPARITIES IN THE TERRITORY FROM THE IRON AGE TO THE ROMAN PERIOD

Dias, Bruno (Universidade do Minho (UM)) - Blanco Rotea, Rebeca (Laboratório de Paisagens, Património e Território (Lab2PT); Laboratório associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território (IN2PAST)) - Magalhães, Fernanda (Universidade do Minho (UM); Laboratório de Paisagens, Património e Território (Lab2PT); Laboratório associado para a Investigação e Inovação em Património, Artes, Sustentabilidade e Território (IN2PAST)); Unidade de Arqueologia da Universidade do Minho (UAUM))

The Rabagão valley, located in the north of Portugal, covers an area of around 248km² and is characterised by the abundance of natural and geomorphological resources such as gold, tin, copper, along with fertile land, as described in written sources by authors such as Strabo and Pliny the Elder. We intend to analyse this study area in order to understand how the landscape was constructed, modified and conceptualised by Iron Age and Roman communities. To answer these questions, we gathered a diverse amount of bibliographic, cartographic, photographic and spatial data from the area under study so that we could analyse it from a geospatial perspective. This combination allows us to approach the Rabagão valley from a macro-spatial scale, using Landscape Archaeology as our research strategy. Our methodological proposal combines data from bibliographic sources with spatial tools, such as geographic information systems. With this approach, we were able to locate various elements that characterise the landscape of the Rabagão valley, such as settlements and communication routes, especially the Via XVII. Once these elements had been geospatially located, they were reviewed in the field to characterise them based on the existing materialities. Then, we defined the types of analysis needed to understand the spatiality of each of the two periods and how the spatial organisation of the Rabagão valley changed. Although we are at a preliminary stage of geospatial analyses, it is possible to observe an intense occupation pattern along the via XVII, which runs through the entire valley and the mining areas in its vicinity. However, it is also important to understand the role of secondary roads in the construction of the valley's landscape.

7 MOVING AWAY FROM THE ROADS: RECONSTRUCTING LANDSCAPES OF MOBILITY IN THE DUTCH LIMES

Groenhuijzen, Mark (Utrecht University, Department of History and Art History) - Verhagen, Philip (Vrije Universiteit Amsterdam, Faculty of Humanities)

Research on transport and mobility in the Roman Empire is strongly focused on the surviving remains of the paved road networks that spanned Europe, the Near East and North Africa. While reconstructing the position and chronology of this Empire-wide road system is a challenge in itself, it provides us with only part of the picture. The great ma-

jority of rural Roman settlements were not located on or near a primary road but were connected through an extensive network of secondary, mostly unpaved roads. These are only known in small sections that have survived because of good local preservation conditions, and cannot be reconstructed as a network in any meaningful way. Furthermore, only part of all transport took place over land: in many parts of the Roman Empire rivers were of prime importance for the movement of goods and people. This means that we will have to use a wider variety of data and apply specific analysis tools to try to understand the day-to-day practices of transport and mobility in the Roman countryside.

In this paper, we will use the case of the Dutch Roman frontier zone to demonstrate how a combined approach of least-cost path modelling and network analysis can be extremely helpful in reconstructing possible landscapes of transport and mobility. The paper will discuss the potential of these methods for better understanding possible road locations, and to assess the role of roads and settlements in transport and mobility networks. Also, we will demonstrate how these methods can be used to model the development of transport networks through time, and to assess the effects of scale on mobility. While the paper will focus on reconstructing secondary connections in a specific corner of the Roman Empire, these approaches are also applicable to other case studies.

8 CONNECTIVITY, ROAD NETWORKS AND THE RURAL ECONOMY OF ROMAN ISTRIA

McLean, Andrew (Institut Català d'Arqueologia Clàssica (ICAC)) - Šprem, Katarina (Independent Researcher)

Attempting to understand rural economies is a complex and daunting undertaking, but one which often has far-reaching important implications. These economies are closely linked to the connectivity and mobility of a landscape, as well as the infrastructure that facilitates this connectivity. The Roman roads of the Istrian peninsula have seen numerous attempts to model them, most prominently by Bosio and Matijašić. Understanding the accuracy of these proposed routes and the landscape through which they ran has traditionally been tested through intensive survey. However, recent quantitative trends have allowed for greater and easier insight into landscapes of connectivity. In particular, the use of Least Cost Path analysis has started to be expanded upon with newer approaches such as Circuit Theory and cumulative cost surface corridors. These developments are leading to a better understanding of a hierarchy of connectivity, rather than simply identifying single routes. In this paper, differences between the outputs of the connectivity models are analysed in order to determine how far the outputs align with the proposed Roman road networks. These results are then compared to the distribution of Roman urban centres and routes between the urban nodes can be established. Moreover, when the roads take routes between these nodes that do not strictly follow the predicted routes of the model, something else other than low cost routes between urban centres must be at play. We show the extent to which these discrepancies can be explained by the rural landscape of Roman Istria. We show that the roads not only linked large urban centres, but acted to connect the rural economies with one another as well as the urban. Through detailed analysis of the models and available data, predictions can be made about the nature and makeup of the rural economic landscape, without need of survey.

9 CROSSING THE DESERT(S). SIMILARITIES AND DIFFERENCES BETWEEN THE LIMES MAURETANIAE CAESARIENSIS AND THE LIMES ARABICUS (3RD C. CE)

Cimadomo, Paolo (ISPC-CNR; Università della Basilicata) - Giordano, Vincenzo (Università di Bari)

This paper aims to analyse the defensive system of the Roman Empire through the analysis of the limes of Mauretania Caesariensis and the limes arabicus during the Severan age. These two systems have many points in common (i.e. both are 'open' systems, because they allow the circulation of goods and people, and both border the desert). As a matter of fact, the African and Arabic limes do not define a clear boundary between the Roman and the local cultures. They testify, instead, a number of exchanges amongst the populations inside and outside the empire.

This study is going to find similarities and differences that may allow us to reconstruct strategies and interventions promoted by the imperial authority during the first half of the third century. The main research activities will focus on a systematic analysis of the road system, by georeferencing the inscriptions connected to it and the building of fortifications that characterized these frontiers.

In this way, we will reconstruct the building, re-building, and maintenance phases of these roads. Whenever possible, historical satellite images, in particular the images taken by the American spy satellites during the 1970s, will be useful to integrate the archaeological remains. The purpose is therefore to reconstruct and date imperial interventions on these roads and to demonstrate the permeability of the borders.

10 EXPLORING MOBILITY IN SALENTO (SOUTHERN APULIA): A GIS-BASED INVESTIGATION INTO ROMAN ROAD SYSTEM

Pesce, Stefania (University of Salento) - Moderato, Marco (CAsES UPF)

This paper aims to investigate the characteristics that distinguish mobility through Apulia region and its connections with the City during the Roman domination. Thanks to the traditional sources of ancient topography, it is possible to

know which were the main roads of the region, the respective capita viarum, and the distance in miles between them and the different road stations. However, these sources alone can hardly help archaeologists understand the reasons behind selecting specific routes to connect locations. Therefore, this research aimed not only to reconstruct Roman roads in Apulia but also to identify factors that influenced their development in the past. The case study proposed is the Via Traiana "Calabra", located in the Salento peninsula (southern Apulia), which guaranteed Rome the access to one of the most important ports to the East: the city of Otranto. As for the second half of the road, still uncertain, there are two hypotheses of the path. Through a post-dictive approach, we used GIS applications to explore the complexity of the natural and anthropic factors that may have affected mobility in this area. The GIS approach consists of modelling cost surfaces based on geomorphological, hydrographic and archaeological data and calculating the least cost path, or the most convenient route to reach a point from another by moving in a certain direction. This framework aims to assess potential least cost paths to compare to the two hypotheses of the route in order to understand which could be the most reliable in Roman times. The reconstruction of the road routes serves as a proxy for modeling connectivity, understanding human mobility, route networks, and land use within the context of Roman Apulia.

11 HISTORICAL TRAVEL AND COMMUNICATIONS IN FINLAND (HISCOM)

Tiilikkala, Jasse (University of Helsinki) - Lahtinen, Anu (University of Helsinki) - Oksanen, Eljas (University of Helsinki) - Saarenpää, Ida (University of Helsinki)

The project Historical Travel and Communications in Finland, c. 1650-1917 (HISCOM) creates a comprehensive GIS road map database of late Early Modern (c. 1650-1809) and Autonomy Era (c. 1809-1917) Finland from various atlas sources. HISCOM will advance the study of cartographic materials in historical and archaeological research. It aims to assess changes in the structure and character of travel and communication networks from the Early Modern period to the early twentieth century.

HISCOM's goals therefore include methodological advancement, assessment of diachronic change and finding regional distinctions.

The main methodological question is: how can we best approach the process of digitizing and analyzing the historical travel network through an interdisciplinary mixture of computational and qualitative methods?

Using interregional, regional, and local case studies based on both quantitative (GIS) and qualitative (historical sources) data HISCOM will analyze the impact of economic, administrative, and demographic changes on the travel and communications networks that took place before, between and after the time-slices captured by the digitization process.

Given the differences in geography, social and demographic organization in different parts of Finland, the project considers what structural differences we can detect in the road networks within these broad regions, and do these results assist in refining our understanding of regional differences and long-term change.

12 VIABILITY AND TRADE IN JORDAN IN THE EARLY BRONZE II-IV: THE CASE OF KHIRBET EZ-ZERAQON TO REINVESTIGATE REGIONAL CONNECTIVITY

Lanzaro, Nicola (Sapienza Università di Roma)

The Early Bronze II-III are considered the periods in which urbanization emerges, spreads, and collapses throughout the Southern Levant. These dynamic phases are followed by a period of non-urban organization, the Early Bronze IV. These changes in settlement patterns, society, and material culture influence and are influenced by changes in the regional exchange network. Some sites are particularly interesting to analyze the connection between urban centers, territory, and economic dynamics. One such case is that of Khirbet ez-Zeraqon (Irbid Governorate, Jordan) and the neighbouring coeval sites. The main site seems to be part of those exchange dynamics over short and medium distances and is certainly in contact with the Jordan Valley and the Hula Valley. From a geographical point of view, Khirbet ez-Zeraqon is located at a strategic crossing point of Wadi el-Shellalah, halfway between the Jordan Valley and the settlements of the basaltic desert of Southern Syria. The other secondary sites between Khirbet ez-Zeraqon and the Jordan Valley seem to be located at strategic crossing points (such as narrow plain terraces between eroded wadis) in order to control them.

The aim of this study is to investigate if and how these sites were interconnected and through which paths goods, people, and ideas arrived at and moved from Khirbet ez-Zeraqon. In order to answer our research questions, all the data are processed in a GIS-based geodatabase to implement network and landscape analysis, including least-cost path analysis algorithms and viewshed analysis. Furthermore, the data available about the local paleo-landscape and geomorphology, the Roman Period viability (according to the route inertia principle), and are taken into account reconstruct what were the most suitable ancient routes and the actual degree of interconnectivity of the area during the Early Bronze Age.

13 MODELLING CONNECTIONS: NEW METHODOLOGIES FOR UNDERSTANDING HUMAN MOBILITY, ROUTE NETWORKS, AND LAND USE

Melfi, Roberto (Scuola Superiore Meridionale)

The proposed intervention aims to study the socio-economic and land ownership relations between Crete and Campania, with a focus on Capua. The study is based on ongoing doctoral research. Literary sources show a close relationship between Capua and Crete, as for example through the Augustus' foundation of a Capuan colony in the territory of Knossos (Vell. Pat. 2, 81, 2) and the presence of Campanians in Crete.

Here the aim is to analyze the maritime connections and modes of transportation of Cretan wine to the Gulf cities of Naples and Capua. It will be important to examine the port of Naples, given its likely relevance as revealed at the last conference in Taranto. The extensive presence of tituli picti on Cretan amphorae found in Campania, coupled with the extensive prosopographical studies by M.B. Bowsky (1999, 2001, 2004) for the Cretan side, and by D'Isanto (1993) and Camodeca (2005, 2008, 2018), for the Campanian side, would provide a useful database to initiate geospatial analyses. Through a GIS platform, the aim is to elucidate the nuances of human mobility and trade connections between regions by analyzing both the container typology and related inscriptions that mention characters, trade and production information.

Cross-analysis of such data allows for an update of the figures who intervened in these relationships and a better understanding of the transit of wine between the Bay of Naples and Capua, with a possible passage through Cumae or the Volturno River.

It is hoped to provide a preliminary overview of the interactions between the players involved in Cretan wine production, maritime connections and the reception of this product.

14 ROADS LESS TRAVELLED: GEOSPATIAL ANALYSIS OF POTENTIAL ROMAN STONE TRADE ROUTES

Ferjan, Ines (University of Edinburgh)

The transportation of stone during the Roman period required effective logistical solutions, primarily influenced by the feasibility of topography to facilitate the movement of such cargo, and economic considerations. This study aims to employ the application of geospatial models, specifically Circuit Theory, Least Cost Path Analysis, and Orbis, to unravel the intricacies of potential Roman stone trade routes. Using the abovementioned geospatial models, the research concentrates on the decision-making process involved in selecting specific routes for trading stone, examining the circumstances under which overland transport might be preferable to fluvial transport. The employment of these methodologies is evaluated through case studies in the inland Balkan region, where imported marble and porphyry traversed seas before continuing overland to reach distant Roman settlements. The results of the analysis present that frequently overlooked overland routes may offer faster alternatives compared to upstream fluvial routes, albeit at a potentially higher cost. Thus, the combined application of Circuit Theory, Least Cost Path, and Orbis sheds light on the intricate dynamics of stone movement during the Roman period. Circuit theory, in particular, emerges as a valuable tool, suggesting alternative routes that might be otherwise easily overlooked and providing a nuanced understanding of the potential stone trade network. The findings emphasize the importance of economic factors and logistical considerations in determining the most suitable modes of long-distance transport. Nevertheless, the results suggest routes that require further assessment, preferably complemented by an examination of other archaeological evidence. These modern analytical approaches undoubtedly contribute to the archaeological discourse but their limitations also need to be acknowledged.

15 MEDITERRANEAN AND EXOTIC GOODS WITH THE ARCHAEOLOGICAL RECORD FROM THE ANTIQUITY WITHIN THE DISTRICT PÍSEK, SOUTH BOHEMIA

Hiltscher, Tomáš (Prácheňské muzeum v Písku) - Jiřík, Jaroslav (Prácheňské muzeum v Písku; Charles University in Prague) - Pixová, Erika (Prácheňské muzeum v Písku; University of South Bohemia in České Budějovice)

District Písek is located in the South of Bohemia. Despite the recent more or less peripheral localization of the region within the territory of Bohemia, the abundant presence of imported goods originating from the supra-regional contacts with the territories to the south reflects the temporal increasing importance of this part of the country. Thus from the Iron age we observe the presence of the luxury items, which originated in the Etruria, Northern Italy or the Adriatic region, but also in Carthage or even Phoenicia. Later the Roman influence plays decisive role, which is reflected by a number of the costume accessories, luxury silver plate and rarely military equipment. Such a situation can reflect a temporal importance of the local sources and exploitation of the alluvial gold and the course of one of the branches of the amber trail. The imported goods reflect mostly the prestige items intended for the presentation of the elites in the wider area north of the Alps.

16 GOLD-GARNET JEWELLERY OF THE LATE ANTIQUITY - CLUES FOR THE MUTUAL RELATIONSHIPS BETWEEN MEDITERRANEAN AND CENTRAL EUROPE ?

Jiřík, Jaroslav (Institute of Archaeology, Faculty of Arts, Charles University in Prague; Prácheňské muzeum v Písku) - Pinar Gil, Joan (University Hradec Králové) - Calligaro, Thomas (C2RMF, Louvre Paris)

The recent archaeometrical research (undertaken by AGLAE C2RMF, Louvre Paris) confirmed the presence of the Bohemian garnets as an embellishing feature of the luxury jewelry in polychrome style related to the group of the finds from graves in Tournai and Apahida. This group of jewellery was likely produced within the Imperial workshops of Constantinople. The later finds of the same character from Mšec in Bohemia and Kranj in Slovenia underline these relationships. The gold buckle from Mšec in Bohemia with its dating probably corresponds to the chronology of the major finds of the Tournai - Apahida group, and likely reflects the relationships between Bohemia and the Odoacrian regime in Italy (re-distributing these insignia among the Barbarian representatives north of the Danube). The specimen from the grave in Kranj is, however, slightly younger and fits probably to the era of the reign of Theoderic the Great. But also in this case the presence of the Bohemian garnets was confirmed. This shows the continuity of the trade in Bohemian garnets to the turn of the 5th and 6th century AD and mutual relationships between Italy and Central Europe, which is not supported only by the written sources, but also by the abundant archaeological record.

17 WHY SAILING TIMES AND MARITIME ROUTES MATTER - TWO CASE STUDIES

Warnking, Pascal (Trier University; LEIZA - Leibniz-Zentrum für Archäologie)

Recent years have seen significant advancements in the assessment of sailing times and the determination of maritime routes, with further progress expected. The information garnered has often been directly useful in evaluating historical contexts. Moreover, these results can serve as crucial input data for advanced economic models, allowing the application of such models for the first time. This paper begins with a brief introduction to sailing times and includes a report on sailing tests conducted with a replica of a Roman freighter in the Mediterranean and in a towing tank. It then presents two case studies where the calculation of sailing times and routes resolves open historical questions. The case studies focus on sea routes between Greece and Syracuse, and the grain deliveries from Cyrene to Greece documented in the inscription SEG IX 2. These examples illustrate how modern methodologies can shed light on ancient maritime dependencies and contribute to our understanding of mobility, trade and politics.

18 NEW QUANTITATIVE MEASURES OF SAILING MOBILITY IN ANTIQUITY: OPPORTUNITIES AND CHALLENGES

Gal, David (University of Haifa, Department of Maritime Civilizations)

Recently developed quantitative methods to measure potential sailing mobility in Antiquity are providing novel measures of sailing mobility. The method for direct sailing passages derives potential sailing mobility by simulating millions of daily sailings of a period merchant ship throughout a 15-year meteorological dataset at high spatial and temporal resolutions (27km and 1 hour). Statistical analysis of the 5,400 simulated sailings on every passage, provides measures of practical potential sailing mobility previously unobtainable beyond the single measure of passage duration. The new monthly measures include: the probability of having a passage with favourable winds; expected time spent waiting to sail; distribution of points-of-sail encountered during the passage; and environmental parameters encountered on the passage. The data of more than 500 measured passages has been published in a continuously growing atlas of ancient sailing mobility from the Arabian Sea to the European Atlantic Coast. Data exists primarily for ships with single loose-footed square sail and on certain passages also for Lateen rigs.

The set of measures for potential sailing mobility present opportunities for deeper insight into the functioning of maritime links exposing likely routing preferences, mobility bottle-necks, seasonality of passages, and cost factors. Analysis of complex historic maritime contexts, such as the grain supply from Egypt to Rome, is well supported. New opportunities also raise new challenges in integrating quantitative processes. The quantitative output of the sailing mobility modelling can serve as one of the inputs for downstream quantitative modelling such as maritime network analysis or modelling of ancient economies. Integrating processes requires voyage costing strategies, whether in relative terms or in absolute prices, and these require a validation strategy. Strategies are also needed to match model temporal dimensions (annual, seasonal or monthly) as the downstream modelling may be based on a different temporal dimension.

19 AS THE WATER FLOWS: A METHOD FOR ASSESSING RIVER NAVIGABILITY IN THE PAST

Filet, Clara (University Bordeaux-Montaigne - France; UMR 5607 Ausonius) - Coto-Sarmiento, Maria (UrbNet - Aarhus University) - Laroche, Clément (EA 4345 SAMM)

Although textual and archaeological sources inform us about the importance of this mean of transport in Protohistory, Antiquity and the Middle Ages, integrating river navigation into studies of ancient mobility remains a challenge.

Empirical data on the navigable sections of rivers in the past are scarce and ambiguous and need to consider the intensity of human modification of wetlands over the last two centuries. Therefore, empirical studies of navigability are particularly time-consuming, and are only possible for rivers well documented by historical, archaeological and geomorphological studies.

This work aims to propose a method for realistically approximating navigable sections in the absence of empirical data, by algorithmically detecting the plain sections of a river, and test its reliability as an indicator for navigability. Using 18 rivers in central-eastern Gaul for which we have empirical knowledge of ancient navigable sections, we demonstrate that estimating river plain sections based on a break detection algorithm provides a good approximation of navigable sections. This method is then applied to 42 rivers in the Roman world for which empirical information is lacking.

The application of this method thus offers a new perspective on navigable areas in the Roman world, as a reasonable first guess that could guide future empirical research into the navigability of ancient rivers.

393 CONTINUITY AND CHANGE IN RITUAL LANDSCAPES DYNAMICS: REUSE AND TRANSFORMATION OF PREHISTORIC RITUAL PLACES

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Turek, Jan (Center for Theoretical Study, Charles University, Prague) - Křišťuf, Petr (Department of Archaeology, University of West Bohemia in Pilsen) - Przybyl, Agnieszka (Institute of Archaeology, University of Wrocław) - Vale, Ana (Faculdade de Letras da Universidade do Porto)

Session format: Regular session

The ritual monuments of prehistoric Europe symbolically structured the landscapes in which they were built, for several millennia. How did later prehistoric communities perceive these monuments? Did they respect and reuse the ritual sites of their ancestors? Did these places retain their sanctity or were they simply transformed into areas of secular settlement, thus losing their original sacredness? Awareness of the original ritual purpose of these monuments, which remain clearly visible in many parts of the European landscape, was certainly passed down in oral tradition. In this session we aim to investigate the development and perception of ritual sites and landscapes by successive generations of prehistoric farmers. Combining modern archaeological and scientific methods, it is possible to analyse and reconstruct how these monuments were reused and altered and, in some cases, destroyed, by later generations. We want to explore both continuity and change at these monuments and how they may have been perceived long after they were built. Archaeological evidence found at some monuments, reveals that they continued to function as arenas of ritual and social interaction. At others, the evidence shows that their original spiritual function was terminated. We believe that the new data provided by both remote sensing and interdisciplinary research, leads us towards a better understanding of prehistoric monuments and landscape dynamics, from the Neolithic to the present day.

ABSTRACTS

1 LONG-TERM LAND USE DYNAMICS WITHIN THE AREAS OF NEOLITHIC RITUAL PLACES IN BOHEMIA (CZECH REPUBLIC)

Turek, Jan (Charles University) - Křišťuf, Petr (University of West Bohemia in Pilsen)

In our view an important aspect of perception of the ritual areas represent monumental constructions. We are going to investigate the durability of individual monuments and their reuse and further development after abandonment of their primary functions. The first Neolithic monuments in Central Europe played an important role in symbolic 'colonization' of landscape as important territorial landmarks and places of far-reaching ancestral legacy. In the context of the study of Neolithic ritual areas, we ask several fundamental questions: How did communities living there hundreds or thousands of years later treat these sites? How did people use ritual areas? Did these sites retain their spiritual purpose? Or were they incorporated into the profane parts of the settlements and gradually overlaid with residential and economic features and why? The potential of the long term existence of Neolithic monuments is evident in the cases of constructions that survived in the landscape until present. In some regions, such as Bohemia, the visible evidence of such monuments (i.e. long barrows, causewayed enclosures) disappeared from the landscape entirely. The research on the erosion or/and deconstruction of sacred monuments was mostly neglected by archaeological interest. The intervals of use and destruction of monuments was only reconstructed according to field record of horizontal stratigraphy. In our current projects we have tested the range of scientific methods (geochemical analysis, soil micromorphology, OSL/14C dating) that produced valuable new quality data for the reconstruction of people's perception of monuments in landscape and overall land use dynamics.

2 THE LONG TERM CONTINUITY OF THE NEOLITHIC RITUAL LANDSCAPE: FROM LONG BARROWS TO THE RITUAL ENCLOSURE AT VŠCHLAPY IN BOHEMIA

Kristuf, Petr (University of West Bohemia) - Švejcar, Ondřej (Institute of Archaeology in Prague, Czech Academy of Sciences)

Causewayed enclosures in Bohemia occurred in the late phase of the Jordanów Culture (4200 BC) and early Michelsberg Culture (4000 BC). Based on the remote sensing data the causewayed enclosure at Všeclapy (Nymburk District, 3.6 ha oval shape) was presumed to be of the same date. However the 2017 excavation brought evidence of the Globular Amhara Culture (3000-2700 BC) and later use during the Bell Beaker period (2400-2200 BC). After the abandonment of the enclosure and final infilling of the ditch the site was levelled and covered with the middle Bronze Age occupation layer. Further on the site was used as an early medieval cemetery. Further non-destructive investigation of the site revealed that the ditch enclosure is a continuation of previous Neolithic ritual activity, as the plans of two long barrows were discovered in close proximity to the enclosure (4th millennium BC). The cultural landscape of prehistoric farmers was divided and structured in a continuous diachronic development and the archetypes of landscape divisions and monuments (enclosures, long barrows) as landmarks were part of the cosmological legacy for generations. In this way, some monuments, seemingly isolated, fit into a much wider spatio-temporal structure of prehistoric community areas. The evidence from Všeclapy suggests land use dynamics pulsating from ritual activities to profane farming use and later return to the funerary use of the site.

3 OLD HOUSES AS BURIAL PLACES FOR THE DEAD?

Kalabková, Pavlína (Palacký University Olomouc)

During a rescue archaeological research in the autumn of 2022 in Unicov (Czech Republic, Moravia), graves were discovered in a Neolithic settlement placed in the ruins of older houses. We believe that this was a deliberate selection of this burial site. Important finds in this site include three Lengyel inhumation graves located in the areas of older LBK buildings. In the graves, burials of an adult man and young individuals placed in the crouched position on their left and right sides were examined. The equipment contained vessels, chipped industry, a boar tusk and pigment. These are probably possible examples of the pattern for burial in the so-called long barrows. In addition, other evidence of special rituals has been discovered - double Lengyel burial in a storage pit and the find of a "hoard" consisting of seven Lengyel vessels on the bottom of a storage pit. Double Lengyel burials were women's skeletons in the crouched position on both the right and left sides. The colour of the surface and the carbonized inside of the bones indicate that the bodies were intentionally covered with a hot layer. Even these activities are not frequent in this period. The finds from Unicov are further evidence of the social changes accompanying the end of the Neolithic in Moravia.

4 HILLTOP „HENGE-LIKE” MONUMENT AND BURIAL SITE FROM THE BELL BEAKER PERIOD IN LOWER AUSTRIA, POYSBRUNN

Czene, András (Salisbury Régészeti Kft.)

During excavations ahead of the construction works of the A5 motorway between Vienna and Brno, Salisbury Archaeology has uncovered a prehistoric monument on a high plateau near Poysdorf in Lower Austria. One of the double posthole circles from the middle of the 3rd millennium BC was a burial place of a prominent person, while the other could have been the site of ceremonies. Traces of a palisade wall enclosed the sacred area have also been found, together with traces of various pile structures. The particularity of the complex is that the monument was prominent in the landscape. The two double circular structures, pillars and possible other structures in the area were located on a plateau on a higher mound, together with the palisade wall. Looking around the excavation, the surrounding area was clearly visible, which also meant that the ceremonial complex and burial site were visible from a distance in prehistoric times.

The most spectacular parallels to the enclosed round buildings are to be found among the 'henge' structures of the British Isles. The monument is one of the few very rare sites in Central Europe where a circular building of the Bell Beaker period with a sacred purpose has been found. It provides an insight into the beliefs and social customs of the period.

5 DIVIDING THE WORLD: SPACE FOR THE LIVING VS. SPACE FOR THE DEAD IN THE BRUSZCZEWÓ-ŁĘKI MAŁE REGION, 2500-1800 BC

Czebreszuk, Janusz (Adam Mickiewicz University in Poznan) - Szmyt, Marzena (Adam Mickiewicz University in Poznan)

The aim of our paper is to give a specific and, so far, unique picture of settlement on a small fragment of the Polish Lowlands, located in the middle Odra river basin. It extends from Łęki Małe site in the north to Bruszczewo site in the south. Both sites are well known due to the relics of the Early Bronze Age (specifically: Únětice) structures discovered

there: the so-called 'princely barrows' cemetery in Łęki Małe and the fortified settlement in Bruszczewo. Result of multifaceted analyses indicate a functional relationship between the two eponymous sites. Archaeological investigations (invasive and non-invasive) have been carried out there since the 19th century. Their results have outlined the division of the study area during the period 2500-1800 BC into two parts: a space used only for funerary purposes, and a space used actively for economic purposes and daily life. The beginning of this specific form of settlement organisation is related to the communities of the late Corded Ware culture. They inaugurated the use of the space, which stood out from the local natural landscape, for burial practices and located there a small cemetery consisting of several flat graves. This use for funerary purposes was later continued by the builders of Únětice barrows that were erected directly on the previous flat cemetery. It seems that the activities of the communities of the late Corded Ware and early Únětice, until recently considered two separate stages, in reality made up a common sequence of funerary practices, commencing after 2500 BC and continuing until ca. 1800/1775 BC. It should be emphasised that in the light of current knowledge, this is the only such clear indication of a long-term separation of the space for the living and space for the dead in the given period on the Polish Lowland.

6 COINCIDENCE OR PRINCIPLE? THE SUCCESSION OF BARROWS AND BURIALS FROM DIFFERENT PERIODS IN A FUNERARY COMPLEX IN THE MUSZKOWICE FOREST

Przybył, Agnieszka (University of Wrocław)

A small wooded area near Muszkowice village, in Lower Silesia (south-western Poland), represents a sacred landscape well established since the time of Neolithic. The landscape is marked by 35 separate burial places with the prehistoric and early mediaeval burial mounds of different shapes and sizes. Some of the barrows co-occur in the same locations. Is this a coincidence or was it a principle? That was the basic question asked, when in 2018, the excavations, carried out at the site Muszkowice 45, revealed two small artificial round mounds. They were established in superposition to the Neolithic earthen long barrow. Even despite previous non-invasive surveys, with the use of both airborne and terrestrial laser scanning, till the time of the site excavations these small cremation mounds remained undiscovered.

In my presentation I would like to ask if this is an outstanding example of long-lasting social memory, deeply embedded in space, which was cultivated continually by the communities inhabiting these lands from the Neolithic well until the modern times or is this only a random coincidence of the location of burials from two separate, distant periods.

The studies presented were conducted with the financial support of the National Science Centre, Poland, research project No. 2017/25/B/HS3/01442.

7 MULTI-PHASE POLY-CULTURAL RITUAL SPACE IN EAST-CENTRAL EUROPE

Gašpar, Adam (Institute of Archaeology of the Slovak Academy of Sciences) - Olšav, Štefan (Institute of Archaeology of the Slovak Academy of Sciences) - Ruttkay, Matej (Institute of Archaeology of the Slovak Academy of Sciences) - Vojteček, Marek (Institute of Archaeology of the Slovak Academy of Sciences) - Cheben, Michal (Institute of Archaeology of the Slovak Academy of Sciences)

Last year's massive rescue excavation projects, related to the building of Valaliky Industrial Park near Košice (Slovakia), detected a ritual landscape. The village of Valaliky has been well known for its high density of archaeological finds. The cadaster is placed in a lowland of Pleistocene terraces of the Hornád River. An area larger than 2,500,000 m², revealed more archaeological sites dating from the Neolithic to the Middle Ages.

This contribution presents the ritual area unearthed by excavators at one of the sites (an area of about 40,000 m²). At least five phases of different archaeological cultures have been recognized here. The oldest evidence of human occupancy represents settlement features of the Baden culture. After, about ten barrows were built in the Late Neolithic. They had been making an irregular line with a natural terrain mound to the south. Nowadays, the barrows "are" preserved as shallow circular ditches in a subsoil, almost without the finds (except a small piece of obsidian and daub). We also investigated a cenotaph grave related to the Early Bronze Age (OFCC) between the barrows. North from burial mounds, thirty-eight Urnfield graves dated to the Middle Bronze Age have been discovered.

The last phase presents a settlement containing about twenty dwellings, features related to metallurgical activity, a grain pit, and several wells in the lowest part of the site dated back to the Middle Ages. The contribution will contextualize the ritual space in a broader context of nearby sites and landscapes.

8 UPS AND DOWNS: RECENT RESEARCH ON PREHISTORIC BURIAL MOUNDS IN THE LAKE NEUSIEDL AREA (HUNGARY)

Melis, Eszter (HUN-REN Research Centre for the Humanities Institute of Archaeology) - Berta, Adrián (HUN-REN Research Centre for the Humanities Institute of Archaeology) - Ekrik, Ákos (HUN-REN Research Centre for the Humanities Institute of Archaeology) - Mrenka, Attila (Museum of Sopron) - Kiss, Viktória (HUN-REN Research Centre for the Humanities Institute of Archaeology)

In several historical and prehistoric periods, communities buried their dead under a mound of earth and/or stones erected in their honour and remembrance. The landscape around Lake Neusiedl, one of the largest bodies of standing water in Central Europe belonging to modern-day Austria and Hungary, is dominated by these tumuli. The research so far suggests that nearly 1,000 barrows can be linked to prehistoric burials, frequently in the catchment areas of hilltop or fortified settlements. In addition to the majority of Early Iron Age mounds on the Austrian side of the lake, several ones from the Late Copper Age and Bronze Age are known, and a LiDAR survey of the entire area is open access. On the Hungarian part, it is mainly the Early Iron Age mounds that have been investigated.

More recently, with the support of the HUN-REN Research Centre for the Humanities, we have been able to carry out a high-resolution ALS survey of about 60 km² in the Hungarian territory west of the lake. We are focusing in this study area on Bronze Age features, involving literature and archive sources, as well as non-destructive methods on the field (systematic fieldwalking, metal detector survey, magnetometry, photogrammetry) in cooperation with the Museum of Sopron.

Our research has identified previously unknown mounds, and we intend to present the preliminary results of their study and possible dating. On the other hand, our presentation aims to summarize the construction traditions and patterns of the tumuli in the Lake Neusiedl region, highlighting in this context the period from the Late Copper Age to the Late Bronze Age (2800 - 800 BC), based on the available research data.

9 CONNECTING THE PAST WITH ITS PAST: THE OVERLAP OF MEDIEVAL STEĆCI AND PREHISTORIC MOUNDS

Milosavljevic, Monika (University of Belgrade) - Grahek, Lucija (Research Centre of the Slovenian Academy of Sciences and Arts, Institute of Archaeology) - Čaval, Saša (Research Centre of the Slovenian Academy of Sciences and Arts, Institute of Anthropological and Spatial Studies) - Škerjanec, Luka (Research Centre of the Slovenian Academy of Sciences and Arts, Institute of Anthropological and Spatial Studies)

Distinctive from the 12th to 16th centuries AD, stećci are enigmatic and understudied tombstones that scatter the Western Balkans. Medieval cemeteries, home to these remarkable monuments, are often found on the location of prehistoric burial sites - both Bronze- and Iron-age mounds. The reasons for this may have been practical, for example, environmentally based choices of burial; they may reflect the long-lived memory or could be an appropriation of places haunted by a mysterious past. Although this practice is well-known and studied in other regions across Europe, ancient funerary landscapes began to be reused in the Western Balkans only from the 12th century AD - roughly 400 years later than elsewhere in Medieval Europe. Our team will share the initial results of the pilot archaeological research on two distinct sites in Eastern Herzegovina (Bosnia and Herzegovina). The Hatelji and Baljci sites were studied to explore the intriguing relationship between prehistoric barrows and medieval burial locations. We shall present the identity and social structure of the people who had picked these locations for burying their dead. Moreover, through our analysis and comparison with similar cases in the region, we will address the significance of ritual landscapes in the medieval Balkans, the (dis)continuity of funerary ideologies, and the appropriation of old funerary places over time.

10 FOLLOWING THROUGH THE MOUND CEMETERIES LANDSCAPE. THE STORY OF BARROW TRADITION SUCCESSORS FROM THE PRE-CARPATHIAN AREA

Makarowicz, Przemyslaw (Faculty of Archaeology, Adam Mickiewicz University in Poznań, Poland) - Rud, Vitalii (Institute of Archaeology, National Academy of Sciences of Ukraine in Kyiv, Ukraine) - Romaniszyn, Jan (Faculty of Archaeology, Adam Mickiewicz University in Poznań, Poland) - Ilchyshyn, Vasyl (Kremenetsko-Pochaivskii Derzhavnyi Istoriko-arkhitekturnyi Zapovidnik, 47003 Kremenets, Kozubskogo 6, Ukraine) - Kochkin, Igor (Faculty of History, Politology and International Relations, Vasyl Stefanyk Precarpathian National University in Ivano-Frankiv'sk, Ukraine) - Kossakivski, Viktor (Vinnytsia State Pedagogical University, Vinnytsa, Ukraine) - Hildebrandt-Radke, Iwona (Department of Quaternary Geology and Palaeogeography, Faculty of Geographical and Geological Sciences, Adam Mickiewicz University in Poznań, Poland) - Niebieszczański, Jakub (Faculty of Archaeology, Adam Mickiewicz University in Poznań, Poland)

The selection of a space for a future burial place was one of the most fundamental acts that integrated prehistoric communities. The choice of the location of cemeteries had symbolic and practical significance. It flowed from past history and influenced the future activities of the founders and users of the necropolises.

The areas of the current Ukrainian Precarpathians were inhabited by communities that built mounds over graves in the Early and Middle Bronze Age (3rd and 2nd Millennium BC). These mounds formed long chains of cemeteries, sometimes stretching for many kilometers, and creating a kind of barrow landscape. The barrow necropolises were successively used by subsequent communities known in the archaeological record as the Corded Ware culture (2800-2200 BC) and the Komarów culture (1800-1400 BC).

The Precarpathian area has been archaeologically explored by the international Upper Dniester Expedition for nearly 15 years using multidisciplinary methods. Thanks to non-invasive prospections, excavations and multi-aspect specialist analyses, the rules of the funeral rites of the mentioned communities have been documented. Studies on funeral landscapes revealed the continuity of necropolis use for nearly 1,500 years, although with some interruptions and processes of adaptation and rearrangement of the funeral space.

The aim of this work is to present data and conclusions regarding the processes that took place during the adaptation of the funeral space. The authors present the specificity of the rituals, taking into account the chronological aspect, and answer questions about the main directions of the genesis of the barrow phenomenon. Thanks to a wide methodological spectrum, the characterized processes were placed within the broader socio-cultural context. The obtained results suggest that the Precarpathian area was an area with an original trajectory of socio-cultural development, in particular regarding the presence of unique and continuing forms of funeral rites.

11 THE DYNAMICS OF THE RITUAL LANDSCAPES CHANGES IN THE NORTH PONTIC STEPPE DURING ENEOLITHIC - BRONZE AGE

Androsov, Andriy (Independent researcher) - Teslenko, Dmytro (Independent researcher)

The onset of anthropogenic landscape changes in the North Pontic Steppe is associated with the architectural realization of the idea of a significantly sized kurgan in the late Eneolithic. The first monumental structures in the Steppe and equally served both burial and ritual functions. Comparative analysis and mapping of the early kurgans allow us to speak about the formation of unified ritual landscapes. For example, Monuments were located within direct visibility and were built according to unified technological and metric canons, using large stone slabs for cromlechs.

The Steppe is a territory where population turnover, along with ideology, was a common phenomenon. At the turn of 4th and 3rd millennia BC part of the obviously incoming tribes deliberately destroyed the architectural and symbolic integrity of the previous kurgan. They removed slabs from the cromlechs, which remained visible on the surface, but did not use them in burial practices. There was a kind of reloading of the ritual function of the kurgan, but the ritual landscape remained unchanged.

The time of Yamnaya culture is marked by mass construction of kurgans and, as a result, changes in the ritual landscape. All steppe space is covered with kurgans, located within direct visibility. Burial mounds from the previous period are included in this landscape.

The next changes in the ritual landscape are associated with the population of the Srubnaya culture. They built new kurgans, often of elongated forms and united the constructions of predecessors into unified "long" kurgans.

In the 12th-10th centuries BC, there were fundamental changes in the ideology of the Steppe inhabitants. Kurgans ceased to be used as burial sites, and settlements were often located at their foot.

Next landscape changes and the return of the kurgan to the functions of a ritual center occur in the Scythian period in EIA.

12 LONG-TERM SACRIFICIAL SITES OF THE DEER CULT IN EURASIA

Mykhailova, Nataliia (Institute of archaeology of National Academy of Sciences of Ukraine) - Kirkinen, Tuija (University of Helsinki)

In Northern Europe and Asia there are numerous sacrificial sites and sanctuaries of the deer cult, which origin from the Stone Age until the Middle Ages. As usual, they were associated with the most prominent places in the landscape, such as calving grounds, deer migration routes and hunting grounds. The inventory of the sacrificial sites included the attributes of the ritual offerings: deer/elk skulls, antlers and bones, weapons such as sacred tools for slaughtering deer, flints for making sacred fires, bowls for the sacred meal, and gifts to the Great Mother, e.g. deer figurines, jewellery, and coins.

The earliest known site is the Upper Palaeolithic Un'inskaya cave in the North Urals (northern Russia). At that site, accumulations of reindeer antlers were found that might be evidence of totemistic rituals. In the cave, there are layers that can be dated to the Bronze Age, Iron Age and Medieval period.

Several large sanctuaries were founded in the Neolithic period and functioned until the Middle Ages (Kanin Cave, Gliadenovskoe Bone Collection, Heibidia Pedar). Some sacrificial sites were associated with rock paintings (Pisany Kamen, Surukhtakh Kaya).

In the northernmost Europe, Sami offering sites emerged in ca 500-700 AD until the 17th century and even later. At these sites, people provided offerings, such as metal objects, reindeer antlers and heads, meat, or fish. The places selected for offering sites were often natural formations such as lakes and mountain tops.

In this presentation, we will give an overview of the sacrificial sites related to deer in Eurasia. Moreover, we will discuss the longevity and large areal coverage of this kind of sites.

13 THE PERSISTENCE OF MEMORY: USE, REUSE, AND COMMEMORATION OF THE ALTO DAS MADORRAS MEGALITHIC NECROPOLIS (MURÇA/ALIJÓ, PORTUGAL)

Sanches, Maria (Faculdade de Letras da Universidade do Porto; CITCEM, Centro de Investigação Transdisciplinar “Cultura, Espaço e Memória” (unidade de I&D 4059 da FCT)/FLUP.) - **Teixeira, Joana** (CITCEM, Centro de Investigação Transdisciplinar “Cultura, Espaço e Memória” (unidade de I&D 4059 da FCT)/FLUP; FCT (2020.06831. BD)) - **Ramos, Nuno** (Morph – Geociências, Lda. / Grupo Dryas. Rua Dr. José Augusto Saraiva de Aguiar, nº 18, 1º A, 5150-616 Vila Nova de Foz Côa, Guarda (Portugal).) - **Sá, Manuel** (Morph – Geociências, Lda. / Grupo Dryas. Rua Dr. José Augusto Saraiva de Aguiar, nº 18, 1º A, 5150-616 Vila Nova de Foz Côa, Guarda (Portugal).) - **Ferreira, André** (Morph – Geociências, Lda. / Grupo Dryas. Rua Dr. José Augusto Saraiva de Aguiar, nº 18, 1º A, 5150-616 Vila Nova de Foz Côa, Guarda (Portugal).) - **Almeida, Miguel** (Octopetala, Lda. / Grupo Dryas. Estrada de Coselhas, 107, 1300-125 Coimbra (Portugal).); **Uniarq** - Centro de Arqueologia da Universidade de Lisboa. Faculdade de Letras da Universidade de Lisboa, Alameda da Universidade, 1600-214 Lisboa (Portugal).)

Located on the biogeographical boundary of the Atlantic and Mediterranean regions in NW Iberian Peninsula, the Neolithic necropolis of Alto das Madorras is the region’s most extensive inland megalithic necropolis. Recognition of its heritage value resulted in its declaration of Public Interest site.

The topographic dominance of this monumental complex (which would have had around four dozen tumuli) over the surrounding territory emphasizes the value of funerary monuments as cultural landmarks, structuring the territory and settlement.

The subsequent creation of an adjacent sub-necropolis of lower tumuli proves the persistence of the Alto das Madorras sacredness in the Bronze Age.

If the impact of these landmarks in later communities’ imagination, if not ontologies, remains unknown to us, evidence shows that during Roman and medieval times the necropolis area was still crossed by important roads, eventually derived from Prehistoric pathways. We assume that travellers would not be indifferent to the Prehistoric monuments.

By the end of the 19th century, the necropolis was first extensively scavenged by systematic treasure hunting and then excavated archaeologically. Although the excavation methods are now outdated, their results served as a base for our present research, aiming to understand the necropolis’ long-term use throughout Late Prehistory.

Our present research further relies on the results of geophysical, pollinic, and petrographic analyses to set the global framework of the Madorras’ plateau funerary and secular long-term prehistoric occupation.

Finally, it should be stressed that the scientific approach isn’t the only consequent 20th/21st century focus on regional prehistoric sites. In a world driven by continuous tension between incompatible development strategies, where historical memory doesn’t always deserve adequate attention, the Buraco da Pala Prehistoric site was Christianised, while, paradoxically, the whole Serra de Passos seems to have been deprived of its relevant meaning to favour a new aeolian energy project.

14 CONTINUITY, CHANGE, USE AND REUSE: A CONCEPTUAL CONUNDRUM SEEN FROM PERDIGÕES ENCLOSURE

Valera, Antonio (Era-Arqueologia, SA)

In the approaches to the past, continuity, change, use, and reuse are concepts usually applied to features, monuments, and settlements, etc. They refer to biographies of those entities, or better, they traduced the perceptions of their biographers. Frequently, though, they sound more like boundless words. In fact, these are concepts that implicate a careful ponderation of the criteria used to organize and interpret what occurs within the fluidity of time.

Good contexts to reflect on these words as more bounded concepts, therefore more operative in the historical discourse, are those with a long-lasting life, following social trajectories in the long duration where these concepts can be tested and shaped.

Perdigões is one of these contexts. With a long biography in Late Prehistory (at least 1400 years, but certainly more), presents a complex set of scenarios spread over time that we may use to discuss these concepts used to organize the fluidity of life in time. So, for this presentation, I propose to question the dualities continuity/change and use/reuse through the ceremonial contexts of the central area of Perdigões, through its eastern funerary monuments, and through some other peripheral settlements.

15 THE CHALCOLITHIC ENCLOSURE OF CASTANHEIRO DO VENTO DURING THE BRONZE AGE: USE AND OBLIVION

Vale, Ana (University of Porto - FLUP/ CITCEM) - **Cardoso, João** (NOVA FCSH - CHAM)

Castanheiro do Vento (north-east Portugal) is a walled enclosure built and used during the 3rd millennium BC and was an integral part of the monumentalisation of the surrounding landscape. The site has been understood as a place of aggregation for both things and communities, with the formalisation of community structures, and the symbolic representation of everyday life.

At the turn of the 2nd millennium BC, the site changed. It shrank, accompanying shifts in how the landscape/territory was inhabited and the retraction of identifiable archaeological sites; and changes occurred in material culture, such as ceramics, with the emergence of new manufacturing techniques, shapes, and decoration, and with Cogeces pottery becoming identifiable at Castanheiro do Vento for the first time.

During the Middle Bronze Age (until circa 1300 BC) alterations to the landscape became more evident. Burial structures in pits appear, associated with Proto-Cogotas and Cogotas pottery (Medal) as well as stelae with anthropomorphic representations. Castanheiro do Vento seems to have been deactivated during this period, although it was revisited sporadically throughout the 1st millennium BC. This suggests shifts in identity dynamics, in the experience of the landscape, and a new understanding and materialization of symbolic practices.

Did the Castanheiro do Vento enclosure, built during the 3rd millennium BC, continue to be understood as a reference for identity during the 2nd millennium BC? Did its monumental, aggregating, and highly symbolic nature persist within Bronze Age communities? This presentation aims to explore these questions. Additionally, it considers that the site seemingly was forgotten after the 1st millennium BC, with no oral traditions or memories being preserved among current inhabitants of the landscape.

16 CONTINUITIES AND CHANGES IN RITUAL LANDSCAPES DYNAMICS: THE REUSE AND TRANSFORMATION OF MEGALITHIC MONUMENTS IN NORTHWESTERN PORTUGAL

Vilas Boas, Luciano (Minho University; Lab2PT) - **Bettencourt, Ana** (University of Minho; Lab2PT) - **Aluai Sampaio, Hugo** (University of Minho; Lab2PT) - **Almeida, Pedro** (University of Minho)

The construction of funerary megalithic monuments during the Neolithic pretended to immortalize the memory of the buried ancestors, but also contributed to model the Neolithic landscape. Creating artificial scenarios, this monuments assumed multiple meanings to the communities that coexisted and dealt with them within time and space.

This work intends to show how megalithic monuments maintained and maintain, until recent times, both a functional and a symbolic role linked to the different groups of people from the North of Portugal that interacted with them. Also, to demonstrate that the original role of these monuments was adulterated over time, originating a distinct relationship between people and megalithic monuments that culminated with the oblivion of some of those by local populations during the last 50 years.

Such a theoretical approach will focus both the archaeological evidence, placenames, and legends associated to several megalithic monuments and/or their surroundings, recurring to ancient cartography and documents. The collection of legends and oral traditions will be carried out by contacting with local elder and middle-aged populations that had any kind of knowledge about these monuments.

This approach will underline that multiple reutilizations, from regional Chalcolithic onwards, including during the Bronze and Iron Ages, apparently demonstrate that the original spiritual function of these architectures was changed and transformed, specially from Roman period, if not before, during Middle Ages. However, the persistence of place names (toponymy) and legends demonstrates their importance to the local traditional farmer and shepherd societies until the 1st half of the XX century. In fact, much of these monuments were actively used as special “landmarks” to effectuate physical boundaries of villages, councils, regions or countries.

17 BEYOND BIOGRAPHIES: A MULTI-STRANDED APPROACH TO UNDERSTANDING THE PAST IN THE PAST

Clements, Sheridan (Cardiff University)

Like an old farmhouse, we inhabit a planet of palimpsests in which we inherit, live within, and alter the material remains left behind by previous generations. These remains are encountered within each present context, and the ways in which we understand them depends upon individual experience as well as the collective memory (the shared understanding of the past, beliefs, and values) of the group.

The study of the palimpsest nature of the archaeological record, however, has been primarily confined to depth-studies – site biographies and changes in a place over time. While biographies may be incredibly useful, in order to fully

understand examples of 're-use' in prehistory and the cosmological understandings of time by various communities, we must also consider wider perspectives beyond the use and alteration of monuments in successive periods.

This project, as part of ongoing PhD research, aims to develop an approach to the palimpsest record from a different direction; a more breadth-focused study, concentrating on what interactions with the remnants of the past during the Iron Age may reveal about communities' concepts of the past, time, and identity. The project considers the ways memory practices may be materially visible in the archaeological record, using categories such as 1) landscape and placemaking, 2) settlement, structure, and organization, 3) material culture, status, and subsistence, and 4) treatment of the dead and investigates these in relation to the treatment of older sites, monuments, and material culture within three case study areas (Orkney and Caithness, Ireland, and the southwestern Fens).

395 OLD STORIES AND NEW DATA ON SLAVS. HOW TO INTERPRET THE GENETIC, LINGUISTIC AND SUBSISTENCE SHIFTS IN EARLY MEDIEVAL EUROPE?

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Machacek, Jiri (Masaryk University, Brno, Czech Republic) - Hofmanova, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

Session format: Regular session

Recently, new data from archaeogenetic research suggest a demographic shift at the beginning of the Early Middle Ages in Central, Southeastern and Eastern Europe. This is supported by new analyses of subsistence (via isotopes and lipids). Archaeologists have noted these changes much earlier, not only in specific parts of material culture (e.g. pottery) but more recently also in large archaeological datasets analysed by machine learning methods. Also, a linguistic change in this period is traditionally posited from linguistic research. All these developments are inevitably linked to a long-standing debate in anthropology, history and archaeology: the migration of the Slavs. According to some written sources (e.g. Procopius, Jordanes), the appearance of Slavic-speaking groups or people with specific habitus (housing, subsistence, social system, economy etc.) should have been the final dramatic act in the highly dynamic Migration Period. Indeed, at some point, a vast part of Europe became Slavic-speaking rather than Germanic-speaking. However, the question of how and when this change actually took place remains unresolved. Indeed, local indigenous communities may have 'become' Slavic not through migration but through language shift and acculturation.

While this debate has recently slowed down due to a lack of new data and the reinforcement of existing positions, new information from other methods is reopening it. In this session, we are looking for papers that bring new archaeological, historical, linguistic, genetic or bioarchaeological data to the discussion of the putative migration and ethnogenesis of the Slavs. We try to reflect the old stories in the light of new scientific data. The integration of results from all disciplines is necessary to grasp this complex question and also to guide further research in related fields.

ABSTRACTS

1 SHAPE SHIFTERS AND TWISTERS: MORPHOLOGICAL ANALYSIS OF CENTRAL EUROPEAN EARLY MEDIEVAL POTTERY

Nosek, Vojtech (Department of archaeology and Museology, Faculty of Arts, Masaryk University) - **Košťál, Martin** (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - **Macháček, Jiří** (Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

Morphological analysis of 3D scans of archaeological artifacts opens opportunity to harness possibilities in the fields of morphometrics and surface typology for the study of early medieval pottery in Central Europe. When applied to a statistically significant dataset with an adequate number of complete vessels, this approach allows for the comparison of similar artifact series from different locations and archaeological contexts. This leads to unveiling correlations within and between datasets. We propose new approach that allows combination of pottery spatial data and shape of high number of ceramic vessels. Early medieval ceramics from Moravia and the surrounding regions (Bohemia and Western Slovakia) does not primarily serve the purpose of identifying Slavic ethnicity of its creators, which can be problematic, but as an indicator of characteristic distribution networks, technological development and social change (both users and creators). Further on, we can discern the system, which linked together regional producers and the technological linkages among communities and the populations across Central Europe.

2 THE SUBSISTENCE SHIFT BETWEEN LATE ANTIQUITY AND MIDDLE AGES IN CENTRAL EUROPE: THE DATING AND EXPLAINING BY A TRANSDISCIPLINARY APPROACH

Machacek, Jiri (Masarykova univerzita, Filozofická fakulta) - **Dunne, Julie** (University of Bristol) - **Prichystalova, Renata** (Masarykova univerzita, Filozofická fakulta) - **Zeman, Tomas** (independent researcher)

At the end of Migration period, the last of the large ethnolinguistic groups that subsequently shaped the continent's history—the Slavs—appeared. Thus, a large part of Central Europe became Slavic-speaking instead of Germanic-speaking, which is thought to have been the result of Slavic migration into Central Europe from Eastern Europe sometime between 500 and 700 AD. However, the question of how and when this transformation really occurred remains unresolved, as pots and other material remains alone cannot serve as the main and only indicator of Slavic migration from elsewhere. Did these groups differ from the indigenous population in their lifeways? The fruitful way to explore the change by archaeological means is through practices involved in cuisine. The cooks can express identity through variability in the food served or through the preparation and presentation of dishes representing cuisine. The shift in the kitchen culture, could reflect not only the social transition, but also the migration. The reliable method for identifying food remains is the analysis of organic residue in pottery. Was the eventual change in subsistence related to the new "Slavic" social and cultural model that emerged in Central Europe? Can this change be precisely dated? To answer these questions, organic residue analysis was carried out on Late Antique ("Germanic") pottery from Zlechov (n=24), dating to the 4th/5th century AD and on Early Medieval ("Slavic") pottery from the sites of Pohansko and Láňy from the 6th-7th century AD (n=51). Lipid recovery was 56%. For the first time, we combined the Bayesian modelling of numerous radiocarbon measurements with the analysis of the organic residues in the cooking vessels. In this way, we were able to precisely date the turning point of the change in the habitus of the local population.

3 EARLY MEDIEVAL SLAVIC DIET: THE MILLET QUESTION

Drtikolová Kaupová, Sylva (National Museum, Prague, Czech Republic) - **Vytlačil, Zdeněk** (National Museum, Prague, Czech Republic; Department of Anthropology and Human Genetics, Faculty of Science, Prague, Czech Republic) - **Hofmanová, Zuzana** (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany; Institute of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - **Loskotová, Zuzana** (Institute of Archaeology of the Czech Academy of Sciences, Brno, Czech Republic) - **Macháček, Jiří** (Institute of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - **Poláček, Lumír** (Institute of Archaeology of the Czech Academy of Sciences, Brno, Czech Republic) - **Zlámalová, Denisa** (Institute of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - **Velemínský, Petr** (National Museum, Prague, Czech Republic)

As the beginning of the 9th century AD brought the gradual replacement of cremation burial sites by inhumations, the Great Moravian period (9th-10th century AD) is linked to the earliest Slavic skeletal series in Central Europe. Over the last decade, extensive isotopic analyses have enabled reconstruction of the Great Moravian diet, as well as descriptions of the agricultural practices applied.

This contribution considers new and previously published carbon and nitrogen isotopic data from Great Moravian sites (Mikulčice, Pohansko, Josefov, Prušánky), as well as from comparative Germanic datasets from the Migration Period (Kyjov, Mušov).

The clear difference in carbon isotopic values between the Germanic and Great Moravian samples confirms the hypothesis about millet being a "signature crop" of the Slavic populations. The subsistence shift must have occurred sometime between the 6th and 9th century AD. Further, intra-population differences in the proportion of animal products were found between proto-urban and rural sites, as well between distinct Great Moravian socio-economic groups. Finally, the isotopic values from Mikulčice and Pohansko are linked to genetic data describing the dietary characteristics of biological kinship groups.

This study was supported financially by the Czech Ministry of Culture (DKRVO 2024-2028/7.1.a, 00023272), Ministry of Education, Youth and Sports (OP JAK: Ready for the future: understanding long-term resilience of the human culture; RES-HUM; CZ.02.01.01/00/22_008/0004593) and the Czech Science Foundation (21-31765M; The Lombard population in Moravia. Interdisciplinary research into Migration Period necropolises).

4 THE "MEGASITE" OF ROZTOKY AS A SOCIAL PROJECT

Kuna, Martin (Institute of Archaeology CAS, Prague)

The early medieval "megasite" in Roztoky (Czechia, end of the 6th-7th century AD, estimated at about 1000 sunken houses) represents a unique archaeological phenomenon and a great challenge to research. Despite intensive analysis of ecofacts and environmental data, no conclusive evidence for specific economic activities, subsistence strategies, or unusual types of events has yet been identified. Moreover, some of the details of subsistence figures indicate the difficulties of living in such a large community rather than its advantages. A potential way out of the dead end of current interpretations can be sought in other levels of community life, namely in levels connected with social identity and ideology.

The finds from Roztoky demonstrate not only the variability of individual types of material items, but also their biographies and mutual relationships. They show that people's behaviour was subject to complex rules, determining, e.g., the internal structure of houses and the ways in which they were abandoned and rebuilt. The rules of conduct were clearly linked to ritual and cosmology and were generally so strong that they could hardly have been the result of mere passive imitation of cultural tradition. Instead, one can assume a conscious subscription to a social identity, created and reproduced in opposition to other social systems. This assumption could become a new starting point for the interpretation of the site, but it can also contribute to the understanding of its broader historical context. If the patterns of material culture can be acquired by conscious choice, the relationship between material culture and other levels of the human world (e.g., genetic patterns, language) is loosened. This does not necessarily contradict migration theories, but it could explain some of their weaknesses, e.g. the problem of rapid demographic growth during the expansion, the apparent absence of direct contact with previous populations, etc.

5 THE IMPACT OF LALIA ON THE "INVISIBLE" EMERGENCE OF THE WESTERN SLAVS

Schneeweiss, Jens (Kiel University; Centre for Baltic and Scandinavian Archaeology; Leibniz-Zentrum für Archäologie)

The Western Slavs, in the territories south of the Baltic Sea between the Elbe and the Vistula rivers, can be traced from the 7th–8th centuries at the latest. It is still unclear how and when they appeared here. In the centuries around the middle of the 1st millennium AD, fundamental changes took place in large parts of Europe. The Germanic population that had previously lived here had left this area by the 6th century. This was followed by the "Dark Ages" (6th–7th century), a period about which little is known in detail. The Late Antique Little Ice Age (LALIA), a global cooling phase due to volcanic eruptions, falls into this period. It had a negative impact on grain growth in the northern latitudes. Consequently, in northern Europe, lifestyle models were favoured that did not depend on yields from crop cultivation. In the woodlands of Eastern Europe, people lived with a complex economic system that was adapted to the forest and apparently included swidden agriculture. The habitat of these people naturally expanded with the recovery of forests in the territories largely abandoned by the Germanic settlers before. Swidden agriculture probably promoted their successive spread. An assimilation with a hypothetically remaining small Germanic population is conceivable. Such a process leaves hardly any archaeologically detectable and correctly interpretable evidence. Most simple and chronologically insensitive material culture as well as only a small-scale impact on the surrounding environment mean that this population is archaeologically almost "invisible". Only at the end of the third quarter of the 1st millennium did these people come into contact with neighbouring cultures, when the situation in Europe began to consolidate. A certain social differentiation started at this point. Only at this stage is it possible to speak of the ethnogenesis of the Western Slavs.

6 MIGRATION OF ALPINE SLAVS AND MACHINE LEARNING: SPACE-TIME PATTERN MINING OF AN ARCHAEOLOGICAL DATA SET, PART 2

Stular, Benjamin (Research center of Slovenian Academy of Sciences and Arts)

The session addresses new data from archaeogenetic research that suggest a demographic shift at the beginning of the Early Middle Ages in Central, Southeastern and Eastern Europe. Our own recent research noted these changes in examining an archaeological Deep Data set using a machine learning method termed time series clustering and geospatial analysis called multiscale emerging hot spot analysis. It confirmed two separate migrations into the Eastern Alps: The earlier one sometime after 500 CE upstream the Mura and Drava rivers, and the later one sometime before 700 CE upstream the Sava river. The envisaged number of immigrants was relatively small and this process was by no means a mass migration like, for example, that of Theodoric's Ostrogoths or Alboin's Lombards. Along the Mura and Drava rivers, it likely took the form of a series of near neighbourhood colonisation of mostly uninhabited landscape. Along the Sava it was more akin to a small group infiltration. The next step of the study employed the convergence of evidence from archaeology, linguistics, and population genetics. Linguistics and population genetics have, independently from archaeology and from each other, also deduced that there were two separate migrations to the South-eastern Alps (present day Slovenia). The study was therefore able to define the immigrants as Alpine Slavs (no inverted commas), people who spoke Slavic and shared specific common ancestry and who immigrated in Eastern Alps in sixth and seventh century.

In the study described above, only existing interpretations from linguistics and population genetics were used. In this presentation, we will build on the published results by analysing the linguistic data in more detail using spatial analysis methods in the context of archaeological data. The aim is to gain evidence about the migrating people independently of the archaeologically discovered material culture.

7 GENOMIC TRANSECT OF EARLY MEDIEVAL MORAVIA AND SLOVAKIA UNCOVERS POPULATION TURNOVER

Zlámalová, Denisa (Department of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - Macháček, Jiří (Department of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - Hladík, Marek (Institute of Archaeology, Czech Academy of Sciences, Brno, Czech Republic) - Mazuch, Marian (Institute of Archaeology, Czech Academy of Sciences, Brno, Czech Republic) - Poláček, Lumír (Institute of Archaeology, Czech Academy of Sciences, Brno, Czech Republic) - Krupičková, Šárka (Institute of Archaeology, Czech Academy of Sciences, Brno, Czech Republic) - Ruttkay, Matej (Institute of Archaeology, Slovak Academy of Sciences, Nitra, Slovak Republic) - Ingrová, Pavlína (Department of Archaeology and Museology, Masaryk University, Brno, Czech Republic) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany)

In the 6th century, a population labeled as "Slavs" appeared in Central Europe. According to historical records, a principality connected to these people later existed in Moravia and neighboring territories. However, the processes leading to the formation of this principality are still debated due to the limited number of written records in this region and period. This is connected to a general question concerning a possible demographic turnover in this and surrounding regions. The hypothesis is challenging to address due to the cremation burial rite in key periods of the turnover and an extremely low number of genetically studied Slavic-related inhumations predating 1000 CE.

To provide insights into a proposed population turnover between the 5th and early 8th centuries CE, we investigate Migration Period and Early Medieval genomic data from Czechia and Slovakia where such material is available. This chronological transect clearly identifies a genetic shift in the region. Our findings support the hypothesis that the observable change in the material culture in this period was propagated by a demographic turnover with a significant impact on the later genetic diversity of the region.

Importantly, we also present genetic data from the oldest known inhumation connected to the Prague material culture (in its earlier phases associated with Prague-type pottery) that already evidences this demographic shift and hence points at genetic continuity from the 7th to the 10th century CE, to the period clearly connected to the "Slavs". In the later period, we show tight genetic connectivity of the sites allowing us to study social structure of the newly formed society, though there are also influences of genetic components present already in the region previously.

8 GEOGRAPHY AND CHRONOLOGY OF SLAVIC DISPERSAL IN CENTRAL AND EASTERN EUROPE ACCORDING TO ARCHAEOGENETIC DATA

Vyazov, Leonid (University of Ostrava) - Flegontov, Pavel (University of Ostrava; Harvard University) - Flegontova, Olga (University of Ostrava) - Ringbauer, Harald (Max Planck Institute for Evolutionary Anthropology) - Reich, David (Harvard University)

Limited suitability of PCA, ADMIXTURE, and qpAdm methods of genetic analysis relying on allele frequencies for distinguishing many populations that were important historical actors in the Roman and Migration Period Europe can be overcome by the implementation of an approach based on autosomal haplotypes, "identity-by-descent" (IBD). Imputation of missing genotypes, phasing and IBD inference were performed for ancient Eurasians using the ancIBD method (Ringbauer et al. 2023). IBD links for subsets of these individuals are represented as graphs, visualized with a force-directed layout algorithm, and most clusters that were inferred in these graphs with the Leiden algorithm are in remarkable agreement with archaeological evidence, reflecting communities of distantly related individuals. Based on this approach, we identified a distinct population group that existed in Central and East Europe from the late 2nd century CE to the Medieval period. This group played a significant role in population processes and, from the 6th century onwards, was identified in written sources as the Slavs. Considering recent linguistic and archaeological advancements, it is plausible that this group included Slavic speakers from its early formation. Considering the results of other analyses based on allele frequencies (PCA, ADMIXTURE), a hypothesis for the origin and history of this population can be proposed: it was formed in close vicinity of the Eastern Baltic region and dispersed over Central, Eastern, and Central-South Europe in several waves of migrations. The earliest representatives of this population group were found along the wide arc from the Middle Danube to the Middle Volga that limits from the south the poorly sequenced area with the domination of the cremation ritual, in the context dated to the late 2nd–early 3rd century CE. The latest individuals of this IBD cluster were buried in the Medieval Slavic-associated context.

9 ANCIENT DNA CONNECTS LARGE-SCALE MIGRATION WITH THE SPREAD OF SLAVIC-ASSOCIATED CULTURE

Gretzinger, Joscha (Max Planck Institute for Evolutionary Anthropology) - Mager, Hellen (Max Planck Institute for Evolutionary Anthropology) - Schwarz, Ralf (Landesamt für Denkmalpflege und Archäologie in Sachsen-Anhalt) - Muhl, Arnold (Landesamt für Denkmalpflege und Archäologie in Sachsen-Anhalt) - Orschiedt, Jörg (Landesamt für Denkmalpflege und Archäologie in Sachsen-Anhalt) - Biermann, Felix (Institute of History, University of Szczecin) - Slaus, Mario (Croatian Academy of Sciences and Arts) - Meller, Harald (Landesamt für Denkmalpflege und Archäologie in Sachsen-Anhalt) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology)

Today, speakers of Slavic languages comprise around one-third of the European population and inhabit nearly a half of the European continent. Yet, there is no consensus among historians and archaeologists how this present-day distribution is connected to the spread of Slavic-associated material culture in the fifth to sixth centuries over major parts of Eastern and Central Europe, as the evidence from the written and archaeological record is characterised by both continent-wide similarities as well as region-specific trajectories. Consequently, the question of to what extent this cultural and linguistic transformation also affected the genetic composition of the continent has been a subject of enduring debate. Here we present an extensive dataset of genome-wide ancient DNA data from several sites in Central Europe, dating between 400 and 1200 CE and spanning the relevant phase of cultural and linguistic transition. We demonstrate that the arrival of Slavic-associated material culture in the studied regions is associated with a substantial influx of genetic ancestry from a region in present-day northern Ukraine and Belarus. Comparing archaeological and genetic evidence, we find that this change in ancestry coincided with a change in social organization, characterised by an intensification of inter- and intrasite genetic relatedness and strong signals of patrilocality and -lineality.

10 SLAVS ON THE ODER AND VISTULA RIVERS - ONE OF THE LONGEST DISPUTES OF POLISH ARCHAEOLOGISTS

Jedrzejska, Sylwia (University of Rzeszów)

Interest in the issues of the origin of the Slavs and the formation of their Early Medieval culture has a long tradition in Polish archaeology, dating back to the interwar period. The causes and the course of the processes that led to a pronounced cultural and settlement change in the Oder and Vistula river basins in the 5th to the 7th century are the subject of lively discussion. One of the key threads of the ongoing discussion is the 'eternal' presence of the ancestors of the historical Slavs in Central Europe north of the Carpathians or their arrival from the east in the 2nd half of the 5th or early 6th century at the earliest. As a result, it is possible to identify proponents among researchers of two main concepts – 'western' and 'eastern' (from the Polish point of view, autochthonistic and allochthonistic, respectively).

The paper will present the current state of research on the cultural-settlement situation of contemporary Polish lands at the beginning of the Early Middle Ages and how the available archaeological sources are interpreted. The main assumptions of the 'western' and 'eastern' hypotheses will be discussed, the arguments that have emerged with the development of the research, and the extent to which archaeologists reach for data outside their own discipline. In addition, the question will be raised – what impact on the development of the discussion have the recently published results of the study of ancient DNA of representatives of societies living in the Oder and Vistula river basins, buried in cemeteries dated from the 2nd century BC to the 4th century AD and from the late 10th(?) to the 13th century AD.

11 BECOMING SLAVIC - MIGRATION AND TRANSFORMATION

Brather, Sebastian (Albert-Ludwigs-Universität Freiburg)

What happened in East-Central Europe in the 6th and 7th centuries, is still quite unclear. Eventually, this region became Slavic. The name is first mentioned by Byzantine authors of the 6th century, who discovered the Slavs north of the Lower Danube. Archaeology cannot observe the changes directly, but can illustrate them by comparing the situation before and after. The spread of Slavic language(s) can only be seen in retrospect. How the migration of people and the transformation of culture were related to each other, can easily be transferred to the public sphere, and debated in terms of nation-states, "Urheimat", continuities, and priorities. Isotope analysis can identify non-locals and probable locals, but this refers to individuals and not to mass movements. The analysis of aDNA seems to offer new insights, but it is still quite unclear how geographical distinctions can be made and when the DNA characteristics developed – in the early Middle Ages or before? My paper will give a brief overview of this complex field which has to avoid mixing up the perspectives.

12 SLAVIC MIGRATION & ETHNOGENESIS - HISTORY & ARCHEOGENETICS

Heather, Peter (King's College London)

Our general understanding of the course of early Slavic History between the fifth century and c.700 AD has been hampered by an overall lack of data. Historical texts provide only a limited amount of information, with a strong bias in the available material towards Slavic expansion towards the west and particularly south of the Danube into the former Roman Balkans. The available stock of traditional archaeological material from this early period is also surprisingly sparse in some ways, with again a similar weighting towards the west and the south. This has left considerable room for reasonable disagreement among modern scholars, particularly when it comes to understanding Slavic origins, and the emergence of well-documented Slavic domination across large tracts of north-central Europe by the early Carolingian period. This paper will attempt briefly to analyse how the new insights emerging from the developing field archeogenetic investigation into early Slavic history compare with the models that might be supported by the available historical evidence.

396 EXPLORING EVERYDAY DOMESTIC LIFE: FROM THE NEOLITHIC TO THE EARLY MODERN PERIOD

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: van Gijn, Annelou (Leiden University) - Tagesson, Göran (University of Uppsala) - Craig, Oliver (York University) - Di Biase, Federica (University of Heidelberg)

Session format: Regular session

While the need for shelter could be said to be universal, most aspects of dwelling are not. How people live their lives in and around their dwellings is highly variable and is strongly connected to social practices and interactions. It is by asking the "small questions" of daily life, the simple and mundane, that we can start to address the extent and meaning of this variability and obtain a deeper understanding of the social aspects of dwelling.

Research into the domestic life of past peoples has recently been reinvigorated by the application of new methods of scientific analysis that shed light on craft activities, culinary practices, mobility patterns and social networks. Such detailed information obtained from seemingly mundane objects found at settlements are starting to paint an evocative picture of daily life in the past. Experimental archaeology can further highlight everyday tasks in the context of their environmental and social settings. With the ever-increasing trend to create 'big' datasets, there is a danger that these smaller-scale insights and the stories they reveal are overlooked. It is however, exactly in "Small things forgotten" (sensu James Deetz 1977) that we can start to obtain meaningful insights into how people lived in and around their houses. In trying to understand domestic buildings, we may ask questions about how houses and rooms were used and perceived, about spatial organization and the relation between the physical structures and their inhabitants.

In this session, we welcome contributions from a broad perspective - geographically and chronologically - on the themes of social practices of building (and rebuilding), living and dwelling. We are interested in papers dealing with house biographies and microhistory, households and habitation. Especially welcome are papers which address these issues from innovative methodological and theoretical perspectives that would elucidate the "small questions" of daily life.

ABSTRACTS

1 ECONOMIC BASIS OF THE EARLY NEOLITHIC SETTLEMENT IN GWOŹDZIEC, SOUTHERN POLAND: CONCLUSIONS FROM INTERDISCIPLINARY RESEARCH

Rauba-Bukowska, Anna (Institute of Archaeology and Ethnology, Polish Academy of Sciences (IAE PAS)) - Czekał-Zastawny, Agnieszka (Institute of Archaeology and Ethnology, Polish Academy of Sciences (IAE PAS)) - Kukułka, Agnieszka (Regional Museum Tarnów) - Craig, Oliver (BioArCh, Department of Archaeology, University of York) - Kufel-Diakowska, Bernadeta (Institute of Archaeology University of Wrocław) - Lityńska-Zajac, Maria (Institute of Archaeology and Ethnology, Polish Academy of Sciences (IAE PAS)) - Robson, Harry (BioArCh, Department of Archaeology, University of York) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences (ISEA PAS)) - England, Fiona (BioArCh, Department of Archaeology, University of York)

From the second half of the 6th millennium BC vast areas of Central Europe were settled by the first farmers associated with the Linear Pottery culture.

The Gwoździec 2 site is currently the oldest settlement of this culture in Poland. The site is located within the sub mountain zone, in the Carpathian Foothills, nearby mountain passes, which were migration routes for the first farmers from the south. In the years 2016-2018, we carried out extensive excavations there. As a result, the entire household consisting of a longhouse and an extensive farm zone, was examined in detail.

As a result of excavations and interdisciplinary research, the main economic foundations of the inhabitants of the settlement were established, while discovering many previously unknown facts. The following were performed, among others: archaeobotanical, and archaeozoological studies, micro use-wear analysis of stone tools, petrographic and organic residues analyses of clay vessels.

The basis of the settlement's existence was, of course, agriculture, but gathering and hunting were almost equally important. Domestic animals were bred and cereals, peas and flax were grown. In addition, natural environmental resources were intensively used, i.e. forests, wetlands and streams, catching mammals, fish, mollusks and aquatic crustaceans, collecting fruits, nuts and leafy plants, herbs, grain of certain grass species. Thanks to such diversity, the diet of that time was varied and rich in nutrients. A diet based on animal products seems to be preferred. This is visible throughout the entire period of the settlement's development.

2 EXPLORING THE ARCHITECTURE OF PRACTICE IN THE ABSENCE OF THE HOUSE: COMBINING USE-WEAR AND SPATIAL ANALYSES TO INVESTIGATE ARTEFACT SCATTERS

Chan, Ben (University of Bristol)

The architecture of daily practice, defined here as the spatial, temporal and social organisation of craft and subsistence activities, is fundamental to the construction and reproduction of social relationships and social identity. Therefore, determining the location of activity areas across settlements is a key objective in many settlement studies. Such analyses are normally conducted in relation to domestic architecture, contrasting public vs. private, and household vs. communal spaces. What can we do, however, in cases where we are not fortunate enough for structural architectural features to survive?

This paper explores this question in relation to an artefact scatter known as the West Kennet Avenue occupation site. The site, dating to the Middle Neolithic, lies in the heart of the Avebury landscape in Southern Britain, a landscape better known for its dense concentration of prehistoric monuments. Previous research on the distribution of micro-denticulates across the site showed that a combination of use-wear analysis and the spatial analysis of flint tools revealed different phases of occupation of the site within the unstratified scatter of artefacts. This paper further explores the spatial patterning of artefacts, by including a broader range of tool types, to explore the degree to which the analysis can further distinguish the spatial organisation of activities on the site. Ultimately, it aims to show that in the absence of structural remains, we can still explore the architecture of settlement practices.

3 HOUSE OF CRAFTS - DOMESTIC LIFE IN THE LATE NEOLITHIC WETLANDS OF THE WESTERN NETHERLANDS

van den Dikkenberg, Lasse (Leiden University) - van Gijn, Annelou (Leiden University)

Domestic life is highly variable across time and space. Even in a relatively confined area such as the western Netherlands domestic life varies greatly across different settlements. This paper presents some preliminary results of the Putting Life into Late Neolithic Houses: Investigating domestic craft and subsistence activities through experiments and material analysis (grant number: AIB.19.020). Through micro-wear analysis on lithic assemblages, we will explore domestic life and craft activities on several Late Neolithic Vlaardingen Culture sites (3400-2500 BC), notably zooming in on two houses found in two different environmental zones. One house, from Vlaardingen Arij Koplaan, is located on a levee in the delta. The other house, from Den Haag Steynhof, is located in the coastal dune area. Although the sites are dated in the same period the activities that took place on these sites are varied. In Vlaardingen Arij Koplaan a wide range of activities took place, both wild and domesticated resources were actively exploited at the site. In Den Haag Steynhof a clear focus on hide-working could be discerned. This paper aims to seek an explanation for these differences. It furthermore highlights that domestic life is highly varied, also in earlier periods. It demonstrates the importance of detailed analyses of materials, households and houses in order to fully understand the various modes of domestic life.

4 PUTTING FOOD INTO LATE NEOLITHIC HOUSES: REVEALING HOUSEHOLD CULINARY PRACTICES IN 3RD MBC NETHERLANDS THROUGH INTEGRATED ORGANIC RESIDUE ANALYSIS

Kubiak-Martens, Lucy (BIAX Consult, Biological Archaeology & Environmental Reconstruction, The Netherlands) - Kenney, Andrew (BioArCh, Department of Archaeology, University of York, UK) - Lucquin, Alexandre (BioArCh, Department of Archaeology, University of York, UK) - van Gijn, Annelou (Faculty of Archaeology, Leiden University, The Netherlands) - Craig, Oliver (BioArCh, Department of Archaeology, University of York, UK)

Food is at the heart of every household, and while our knowledge of the types of plants exploited by prehistoric communities is well established, we have far less understanding of how these were prepared, cooked, and consumed. Yet without this knowledge, our picture of life in the early domestic settings is rendered incomplete. Food residues either found encrusted on the surface of ceramic vessels (foodcrusts) or extracted from their walls, provide an exceptional

source of information about how people prepared their daily meals, the types of foods cooked, and the vessels used. Still, the study of charred and degraded residues derived from multiple cooking events is complex and requires a transdisciplinary approach, from microscopy and botany to chemistry and the biological sciences.

Here, we investigated organic residues associated with pottery from three Vlaardingen culture domestic settlements in the Netherlands (c. 2900-2450 BC). We applied a combination of Scanning Electron Microscopy (SEM) and lipid residue analysis of foodcrusts and absorbed residues to investigate their use. The former approach was employed to examine fragments of cereal and other plant tissues, as well as non-plant tissues, that remained after cooking. Lipid residue analysis was used to differentiate fats and oils from ruminant, non-ruminant, aquatic (marine and freshwater), and dairy foodstuffs. Using this combined approach we were able to reveal differences in the types of plant and animal foods used and the ways they were processed across the different sites providing new insights into the diverse daily activities of the Late Neolithic inhabitants of the Rhine/Meuse delta.

5 DOMESTIC MATERIALITY, SPATIAL DYNAMICS, AND SOCIAL ORGANIZATION IN THE BRONZE AGE SETTLEMENT OF CABEZO REDONDO (VILLENNA, SPAIN)

Martín de la Sierra Pareja, Paula (University of Alicante) - García Atiénzar, Gabriel (University of Alicante)

Our study focuses on the Bronze Age site of Cabezo Redondo (Villena, Alicante). It follows an interdisciplinary line of research, analysing the site from an integral vision that includes activities, living and productive spaces, and the settlement, understood as an interconnected and concatenated system.

More than 70 years of excavations at the site have made it possible to document a group of houses organised into different terraces. In many cases, they were affected by destructive events, leaving a large part of their materiality under the collapsed layers. These events have produced contexts with a high degree of preservation, which allow us to approach the internal organisation of the domestic spaces in greater detail.

At the methodological level, we begin by studying the physical structure, its materiality, the practices of building and rebuilding, the spatial relationships and the adaptation or continuity of the dwellings throughout the period of occupation of the settlement. From there, we identify the aspects that define a social unit. These are the elements that allow the proper development and maintenance of daily life (food, storage, rest, etc.). Once the social units have been identified, we will analyse economic patterns and social relations, the change and persistence of domestic practices and the interpretation of spaces.

The aim is to observe the intersection between everyday processes and the socio-cultural framework in which these groups are embedded. By approaching everyday practices, it is possible to deduce how Bronze Age communities shaped their domestic environments. In this way it is possible to understand economic, family, and social life through the study of the most basic form of organisation, the domestic unit.

6 TAKING A CLOSER LOOK AT IBERIAN CULTURE: EVERYDAY LIFE IN THE CONSTRUCTION OF FEMALE GENDER

Rosell Garrido, Patricia (INAPH (University of Alicante))

The Iberian Culture is one of the main Mediterranean Iron Age cultures that inhabited the Iberian Peninsula during the second half of the 1st Millennium BC. The lack of a translation of their direct written texts makes it necessary to use the movable and immovable material record as an essential source of information in order to reconstruct the life of these protohistoric groups. However, as was the case in most ancient Mediterranean cultures, the domestic sphere had not been the focus of study until recently. This change was brought about by the introduction of new perspectives and research paradigms, such as Gender and Feminist Archaeology and the line of Archaeology of Everyday Life, Households and Maintenance Activities.

Nowadays, we can recognise the daily life of the population thanks to the micro-spatial studies carried out inside the rooms and dwellings of the Iberian settlements. Thanks to the application of a detailed methodology (spatial distribution, statistics and understanding of the archaeological contexts) together with a gender perspective in some Iberian settlements in the southeast of the Iberian Peninsula, we have been able to recognise the daily reality of Iberian women and their daily tasks. In this way, the type of dwelling and the spaces occupied by the material culture show the value of maintenance activities and how they change and are distributed according to the type of dwelling over time and the type of settlement. In this way, we are able to recognise the social role and economic weight of women both within the family and in the village as a whole.

7 THE "HOUSE OF THE DOMESTIC SHRINE", A FIFTH CENTURY BC DWELLING IN WESTERN SICILY (MOTYA). DOMESTIC SPACE, ACTIVITIES, AND PEOPLE

Bonanno, Giuliana (Università di Roma La Sapienza)

The House of the domestic shrine is a wide and articulated building located on the slopes of the acropolis of the island of Motya, a Phoenician colony in Western Sicily. With its complex layout, a place for domestic cults inside, and its luxury goods, it is thought to be an aristocratic house, emblematic of the wellness that the island was living in the fifth century BC.

This paper aims at retracing the history of the house, trying to figure out how much and in what ways it reflects the cultural changes the island underwent during the fifth century BC, how it was involved in the social dynamics of the community, and for how long.

By matching the data provided by the renovations and additions to the house over time with the analysis of the artefacts, their nature, quantity and location, we are going to try to clarify a few questions about the people who lived in the house, their number and the relationships they had with each other, as well as other issues about the use of spaces, daily activities, and the connection of the household with the sacred sphere.

Answering to these questions could provide us with a way to understand the everyday life and composition of a wealthy family living in fifth century BC Punic Sicily, its structural changes over the course of time, by taking in or leaving new people, rooms, objects.

8 EXPLORING HEARTHES, HOUSES AND HOUSEHOLD ACTIVITIES: CASE STUDIES FROM CENTRAL AND EASTERN CRETE DURING THE CLASSICAL AND HELLENISTIC PERIODS

Di Biase, Federica (University of Cyprus)

When approaching the study of houses in Crete during the Classical and Hellenistic periods, hearths certainly constitute a special lens through which to investigate daily practices and household activities. Cross-referenced evidence from older and more recent excavations shows that several houses from the central and eastern regions of the island were equipped with fixed hearths, which were mostly located inside a roofed room. This piece of evidence is significant for two reasons: first, the use of fixed hearths seems to be rooted in the Cretan tradition as there is extensive evidence of their employment from the Neolithic age onwards; second, because the use of fixed hearths was quite uncommon in the majority of Greek regions during the Hellenistic period.

Starting from the morphological and functional analysis of fixed hearths, I will delve into architectural and functional study of fixed-hearth-equipped rooms, in order to explore the multipurpose aspect of these domestic spaces.

9 DIVERSITY IN DOMESTIC LIFE: INSIGHTS FROM HELLENISTIC FARMHOUSES IN MACEDONIA

Plika, Peli (International Hellenic University)

This study explores the rich tapestry of everyday domestic life through an examination of Hellenistic farmhouses unearthed in Macedonia. Despite the universal need for shelter, the nuances of dwelling practices varied greatly, reflecting diverse social interactions and lifestyles. Drawing from archaeological excavations revealing seventeen Hellenistic farmhouses in Macedonia, we uncover a spectrum of architectural layouts and functional adaptations. These structures, ranging from single buildings to complex compounds, reflect a lack of strict typology, with design tailored to the inhabitants' needs and occupations. Location played a pivotal role, integrating structures into the natural landscape, while also influencing usage patterns. Through analysis of artifacts and spatial organization, we discern a mosaic of activities encompassing domestic chores, agriculture, craftsmanship, fishing, pastoralism, and military endeavors. This investigation underscores the significance of attending to the "small questions" of daily life, illuminating the intricacies of past social practices and the dynamic interplay between inhabitants and their built environment. By delving into these microhistories, we deepen our understanding of the social dimensions of rural dwelling across diverse geographical contexts.

10 VANDALS IN PEACE. INVESTIGATING DOMESTIC ACTIVITIES IN ROMAN AGE BARBARIAN SETTLEMENTS IN NE HUNGARY

Soós, Eszter (HUN-REN Research Centre for the Humanities, Budapest)

An ordinary 2nd-4th century AD Barbarian settlement outside of the limes of Province Pannonia and Dacia is usually characterized by hundreds of different features and large amount of finds that can be considered as domestic waste. The extensive fieldworks carried out in the last decades in NE Hungary provided great opportunities for the study of the settlements intra-site activity, going beyond the research tradition that only focuses on the problem of chronology and cultural classification.

I examined and compared the patterns perceptible in the spread of domestic waste from two, partly contemporaneous settlements of the Inner-Carpathian Przeworsk culture to define household units and better understand their functioning, a topic that is completely left in the dark by the written sources of the period.

Most of the data derived from the find material likely represents production and distribution (including consumption). As the find assemblage mainly consists of ceramics and animal bones, I primarily investigated eating habits. I also dealt with the remains indicating other domestic production, for example iron- and boneworking, weaving, et cetera. The distribution of the pottery, bone and metal finds have been analysed with multivariate statistical methods. With the help of the model focusing on functionality and spatial arrangement, separate units within a site became distinguishable. Based on the patterns offered by the model, I examine various interpretation possibilities.

Can this units be corresponded as separated households? Could the semi-subterranean buildings (Grubenhäuser) have functioned as residential buildings at all? What are the phenomena that may point to social differences or differences in the traditions and customs?

11 STR 15.2: EXCAVATING THROUGH THE LAYERS OF A ROMAN HOUSE IN ANTIOCHIA AD CRAGUM IN WESTERN ROUGH CILICIA/ANTIOCHIA AD CRAGUM

Remon Alvarez, Sergio (Utrecht University)

This presentation delves into a new, comprehensive excavation project of a Roman house in Antiochia ad Cragum, Asia Minor, shedding light on the multifaceted layers of Roman domestic architecture and its socio-cultural implications. Through meticulous excavation, the project reveals the architectural evolution and spatial organization of the house, offering insights into the daily lives, social structures, and urban development of the region during the Roman period. By integrating archaeological findings with comparative analysis of late antique houses across Asia Minor, the study explores themes of public use, privacy, spatial control, and representation within domestic settings. The findings highlight the intricate balance between private and public spheres, as evidenced by the architectural layout and decorative elements, which reflect broader trends in late antique urban housing. This research contributes to our understanding of domestic architecture in Asia Minor, providing a nuanced understanding of social identity, cultural practices, and urban transformation in the late antique period. Through the lens of the Antiochia excavation, the study not only reconstructs physical spaces but also reimagines the lived experiences of its inhabitants, offering a window into the complexities of Roman domestic life and its enduring legacy in the architectural and urban landscapes of Asia Minor.

12 SEEKING PROTECTION IN THE DOMESTIC SPHERE AT KARANIS

Souto Castro, Iria (University of Vigo)

This study will illustrate the religious motifs related to fertility, childbirth, motherhood, and childcare found in houses at the Fayumic site of Karanis in Ptolemaic and Roman times.

The meaning of the relevant depictions in artefacts and wall paintings will be discussed in the context of the architectural structures with which they are associated, and it will be argued whether earlier objects and decorations suggest the perseverance of previous pharaonic attitudes in the household practice of religious actions to the same protective end, or if the Hellenisation and the Romanisation implied significant changes.

Firstly, a general overview of Karanis will be presented to introduce the site. Then, through different case studies from the houses at Karanis, examples of these compiled artefacts, decorations, and structures will be described and analysed, regarding how they can be interpreted as cultic within the domestic setting. Similarly, a brief discussion on related motifs in artefacts and wall paintings from other periods, namely the Middle and New Kingdoms, will be provided.

13 LIVING IN CIRCLES: DAILY LIFE IN MENORCA FROM PROTOHISTORIC TIMES TO THE MIDDLE AGES

Torres Gomariz, Octavio (Universitat d'Alacant) - Pérez-Juez, Amalia (Boston University) - Smith, Alexander (SUNY Brockport)

The so-called "Cercles" (same word in Catalan) are domestic structures from the Post-Talayotic period (550-123 BCE), unique to the island of Menorca (Balearic Islands). Due to their monumentality and complexity, they have been excavated, studied, and interpreted consistently since the beginning of the 19th century. Many of these works have dealt with general aspects of the architecture, ceramics, use of space or exploitation of the immediate landscape. These studies have enabled scholars to trace a series of characteristics of the peoples who inhabited the Cercles throughout time. The next interpretive step is to fit all the pieces together to glean an accurate social and historical interpretation of these structures, including both the macro and micro aspects of daily life.

In this paper we will focus on the results of the workshop and monograph that we produced gathering information from many teams working on Menorcan Cercles. We also draw information from our experience as members of the

Menorca Archaeological Project (MAP), where we examine these domestic spaces from a diachronic and holistic perspective with the goal of understanding their uses by different cultures over the past 2500 years. With the compilation of this information, we have the tools to better approach future studies of these unique and well-preserved Iron Age dwellings.

However, we don't want to focus on just the general features of these houses, but rather "the small stories" of daily life and use of space. We will show how modifications in the Cercles followed social practices that reflect interactions with the wider Mediterranean. In other words, we aim to study the Cercles through their own biography. We want to present an intersectional panorama of different moments in a single dwelling that can express phenomena of varying complexity, such as the articulation of gender, status, or cultural origin.

14 **BIG VILLAGE LIFE: AN IMAGE OF HOUSEHOLDS IN A MEDIEVAL FORTIFIED VILLAGE IN SOUTHERN MORAVIA**

Šimík, Jakub (MUNI - Ústav archeologie a muzeologie; ARCHAIA Brno z. ú.)

The contribution presents archaeological manifestation of life in a medieval fortified village in the specific environment of Southern Moravia (Czechia). The focus of the contribution are the results of extensive rescue excavations of a deserted medieval village called „Kapansko“ which was established in the 13th century. Several households with preserved above-ground parts of houses were captured by modern documentation methods (such as photogrammetry). Excavations have also uncovered a number of archaeological evidence showing the aspects of villagers' everyday life, which was set in the scenery of a strictly wood-and-clay fortified village. These include ways of using public space, using various storage spaces, dealing with waste disposal, how inhabitants obtained water and how they got rid of its excess, or even some folklore (non-Christian) habits shown in the archaeological record of the village. These factors, together with the still unanswered question of the village's demise, create the environment for the reconstruction of daily life in this medieval village.

15 **HOUSES AND EVERYDAY DOMESTIC LIFE IN EARLY MODERN SWEDISH TOWNS**

Tagesson, Göran (University of Uppsala) - Lindström, Dag (Uppsala university)

Apart from architecture and building traditions, houses are above all associated with social organization, ways of living and living together, organizing family life and production. The built structure is influenced and shaped by practical and functional factors, but also by traditions, norms and style. Conversely, the built structure affects life and how it is organized. Houses in general, but also the individual house, change and are affected by life and activities in the house.

Archaeological documentation of houses holds many possibilities; to study the design and change of the physical environment over long periods. But the possibilities of combining houses and change with detailed knowledge of social organization are limited before historic times. Around about 1980, the concept of household archeology was launched as a way to bridge the gap between large structures and stories on an aggregate level and the individual buildings. The possibilities of discussing the household (i.e. the group that lives, eats and works together) in relation to the physical house is a challenge.

The Houses and Social Practice AD1600-1850 (Uppsala university, Sweden) project combines archaeological documentation of standing buildings and buildings documented underground, with the historical household as it appears in contemporary written source material. The project focuses on issues around houses and households, during a period where both houses and the households are undergoing strong change. The interdisciplinary approach should be seen as a kind of laboratory, where we apply a clear micro-historical method to study agents and social structures. Gender is an important aspect, to study the relationship within the household and the home. Life course is also an important concept, where the changing relationships of the house, the household and the individuals over time are crucial to capturing the dynamics.

16 **HEAT AND LIGHT IN AN EARLY MODERN CONTEXT - WHAT DO THEY TELL US ABOUT DWELLING IN THE PAST?**

Eriksdotter, Gunhild (Uppsala university) - Qviström, Linda (Uppsala university; Upplandsmuseet)

The use of heat and light is closely entwined with the use of dwellings. In early modern houses, heat and light were facets that needed planning and maintenance. Their availability varied between different social contexts, but for everyone they in part formed the conditions for what could be done where and when.

Constellations of heat- and light sources, and distinctive room features, reflect conditions and strategies used to create indoor climates on different scales, and the use of light for various purposes.

Despite the importance of heat and light in early modern dwellings, this is a relatively unexplored field of research in archaeology as well as in architecture and history.

In this paper, we present a recently started research project, in which we address heat and light in relation to spatial structures of houses, and in relation to what different spaces may have been used for, and by whom. The aim is to include in our analysis a wide range of features that have affected indoor climate and lighting conditions, in order to broaden the understanding of dwelling and dwellings.

We will present examples where different sources of heat and light have been used for specific activities, and where a deliberate effort to take account of the indoor climate is noticeable in the design of different rooms.

An important question is, how the interaction between spatial design and the use of heat and light has transformed over time, and how this relates to other contemporary changes in the buildings.

Although we focus on early modern buildings in Sweden, we believe that the theme is relevant to anyone working with the concept of "dwelling", regardless of time and place.

17 **THE AGENCY OF EARLY MODERN CROFTERS - A MICROARCHAEOLOGICAL APPROACH TO DWELLING**

Williamsson, Sara (Lund university)

In the 1860's there were approximately 100 000 crofters in Sweden. None of them owned the land they lived on, and they paid dues in the form of day labour, cash, or kind to their landlord. This group of rural subalterns were often marginalized in the landscape and in society, as well as in the written records. Subsequently, qualitative research on crofters have sometimes been claimed to be difficult - in previous research they are often presented as a collective. Yet, when surveying the material remains of the crofts, it is obvious that they differ a lot in both location and appearance. Can these differences be connected to the agency of the crofters? How much influence did they have on the layout and organization of their croft? This presentation focuses on the theories and methods of an on-going PhD-project, where the agency of some individual crofters is explored through a microarchaeological approach. By focusing on the crofters' dwelling, and on their perception of their environment, a more nuanced understanding of this marginalized group might be possible.

398 **WHAT DO ANIMAL BONES HAVE TO OFFER? ZOOARCHAEOLOGY AND TAPHONOMY DURING THE MIDDLE TO UPPER PALAEOLITHIC TRANSITION IN SOUTHERN EUROPE**

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Real, Cristina (Departamento de Prehistoria, Arqueología e Historia Antigua, Universidad de Valencia) - Silvestrini, Sara (Department of Cultural Heritage, University of Bologna) - Vidas, Lia (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt am Main; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia)

Session format: Regular session

One of the most extensively researched Palaeolithic topics revolves around the disappearance of Neanderthals and the subsequent expansion of anatomically modern humans (AMH). This pivotal shift, known as 'Middle to Upper Palaeolithic Transition' was of particular significance in Southern Europe, where Neanderthal populations survived longer and, at some places, coexisted with the first AMH.

Much research has explored this key transition event, employing the study of archaeological sites occupied by Neanderthals and AMH, with the primary goal of defining and comparing the economic behaviors, technological advancements, and cultural traditions of each group.

Within the context of this discussion, faunal remains have proven to be a unique and ubiquitous window into lifeways of these hunter-gatherer groups. The zooarchaeological and taphonomic analysis plays a pivotal role in elucidating human behaviors and gaining insights into the subsistence and adaptation strategies used to exploit diverse ecological environments.

In this session, we aim to provide a podium for presenting works focused on faunal remains dating to the mentioned period. This encompasses remains of both macro and mesofauna, mammals categorized as "small game", as well as avian, fish, and mollusk remains. We welcome studies with a zooarchaeological and taphonomic approach, offering data on hunting, processing and consumption techniques, and diet composition, alongside experimental approaches. We also invite contributions based on biomolecular analytical techniques such as isotopic and proteomic studies e.g., ZooMS, and the analysis of amelogenin, which can provide fresh and new perspectives on different paleoenvironmental and economic aspects.

The ultimate objective is to foster discussions on the disparities and similarities in the daily economic activities of Neanderthals and AMH, as well as the environmental factors influencing their changes. Additionally, we aim to serve as a starting point for consolidating the latest research findings on animal remains and the future prospects offered by emerging analytical techniques.

ABSTRACTS

1 REVIEW OF THE FAUNAL ANALYSIS FROM MIDDLE TO UPPER PALAEOLITHIC TRANSITION IN SOUTHERN EUROPE

Silvestrini, Sara (Department of Cultural Heritage-Ravenna campus, University of Bologna, Italy) - Real, Cristina (Departamento de Prehistoria, Arqueología e Historia Antigua, Universitat de València, Spain) - Vidas, Lia (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb, Croatia) - Lugli, Federico (Institut für Geowissenschaften, Goethe-Universität Frankfurt am Main, Germany; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia)

The Middle Palaeolithic (Neanderthals) and Early Upper Palaeolithic (Anatomically Modern Humans) human groups occupied different habitats across southern Europe. Despite their distinct cultural characteristics, both groups demonstrated the ability to exploit all available animal resources and incorporate them into their diets based on availability and necessity. However, it is yet to be determined whether their subsistence patterns were consistent or varied, and the reasons for any discrepancies between them are still unknown.

Therefore, this work provides a critical evaluation of the results of archaeozoological analyses done in recent years in this region. This assessment covers the archaeozoological and taphonomic study of macro- and mesofauna assemblages, as well as other smaller prey. The review concentrates on hunting patterns, diet composition and processing techniques. Furthermore, it includes information obtained from biomolecular analysis techniques, such as (stable) isotope analyses, proteomics (e.g. ZooMS) and radiocarbon dating. These approaches aid in gaining a deeper understanding of the faunal assemblage and hunting strategies of the studied human groups (including the identification of hunted animals and the treatment of carcasses). Additionally, these techniques play a crucial role in precisely reconstructing the climate and environment. The analysis of amelogenin to determine the sex of animal samples, is still a relatively underdeveloped area that requires further exploration to unlock its full potential.

The aim of this work is to provide a broad overview of the economic and paleoenvironmental aspects related to the management of animal resources by both human groups. This will aid in establishing whether common patterns existed across southern Europe or if there were significant differences in the behaviour of Neanderthals and anatomically modern humans (AMH).

2 NEANDERTHAL SUBSISTENCE STRATEGIES WITHIN THEIR HUNTING GROUNDS AT TEIXONERES CAVE (SPAIN) AND PIÉ LOMBARD ROCK SHELTER (FRANCE)

Uzunidis, Antigone (Paris 1 Panthéon-Sorbonne university; Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) - Blasco, Ruth (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)); Departament d'Història i Història de l'Art, Universitat Rovirai Virgili) - Brugal, Jean-Philip (CNRS, Aix Marseille University, Minist. Culture, UMR 7269 LAMPEA) - Fourcade, Tiffanie (Archéosciences Bordeaux, UMR 6034, Université Bordeaux Montaigne - CNRS - EPHE; Environnements et Paléoenvironnements Océaniques et Continentaux (EPOC), UMR 5805, Université de Bordeaux) - Ochando, Juan (Department of Plant Biology (Botany Area), Faculty of Biology, University of Murcia; Sapienza University of Rome, Department of Environmental Biology) - Rosell, Jordi (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Departament d'Història i Història de l'Art, Universitat Rovirai Virgili) - Roussel, Audrey ('Archaeology of Environments and Resources', ASM laboratory, UMR 5140, 'Archaeology of Mediterranean Societies', Université Paul Valéry-Montpellier 3) - Rufa, Anna (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve; PACEA UMR 5199, Univ. Bordeaux) - Sanchez Goni, Maria (Environnements et Paléoenvironnements Océaniques et Continentaux (EPOC), UMR 5805, Université de Bordeaux; Ecole Pratiques des Hautes Etudes, PSL University) - Rivals, Florent (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA); Departament d'Història i Història de l'Art, Universitat Rovirai Virgili; ICREA)

Issues about Neanderthal subsistence behaviours are often disconnected from their complete environmental setting, especially when considering animal communities and vegetation structures. Their hunting strategies, however, are closely related to those factors. Our aim is to link the hunting grounds operated by Neanderthal to their prey acquisition patterns within three distinct habitats. Two middle Paleolithic sites have been analysed: Teixoneres Cave (TX; MIS 3, Spain) and Pié Lombard (PL; MIS 4, France). According to marine core pollen, dental mesowear and microfauna, TX-Unit IIIa corresponds to a mosaic landscape and TX-Unit IIIb was probably more forested, when PL 'ensemble II' biotope was divided between mountainous and forested areas. Dental microwear allows to reconstruct

within the regional environmental settings the habitats that were favoured by predators for prey selection. This aspect was discussed both in term of frequency (NISP/MNI) and in term of potential meat intake. At PL, Neanderthals relied on diverse taxa (mainly two ungulate species: red deer and ibex as well as rabbits and birds) exploited in semi-open hunting grounds. At TX, Neanderthals focused on large gregarious ungulates in open areas. Large herds of herbivores found in open spaces environments may have enabled Neanderthals to select only few species (here: red deer, aurochs and horse). However, they developed distinct hunting strategies. In Unit IIIa, they do not appear to have made any selection within the most abundant species while in Unit IIIb, they mostly focused on aurochs and opportunistically predated very young red deer. Thus, Neanderthal subsistence strategies are indeed diverse and partially related to the biome they lived in. Prey behaviour and habitat are decisive in Neanderthal strategies but other socio-economical factors are involved in determining specific procurement objectives for prey acquisition patterns.

3 NEANDERTHALS AND MODERN HUMANS IN COMPARISON: HUNTING STRATEGIES AND CARCASS EXPLOITATION BETWEEN THE MIDDLE AND UPPER PALAEOLITHIC IN CENTRAL-SOUTHERN ITALY

Boschin, Francesco (Università degli Studi di Siena, DSFTA; Accademia dei Fisiocritici, Siena, Italy; Centro Studi sul Quaternario ODV, Sansepolcro, Italy) - Paolo, Boscato (Università degli Studi di Siena, DSFTA; Accademia dei Fisiocritici, Siena, Italy) - Ronchitelli, Annamaria (Università degli Studi di Siena, DSFTA) - Moroni, Adriana (Università degli Studi di Siena, DSFTA; Centro Studi sul Quaternario ODV, Sansepolcro, Italy) - Spagnolo, Vincenzo (Università degli Studi di Siena, DSFTA) - Jacopo, Crezzini (Department of Biology, University of Florence; Università degli Studi di Siena, DSFTA; Accademia dei Fisiocritici, Siena, Italy)

This study compares the results of zooarchaeological analyses conducted on faunal assemblages from different sites in central-southern Italy: Grotta di Santa Croce, Riparo l'Oscurusciuto, Grotta del Cavallo, Grotta Paglicci (Apulia), Grotta di Castelcivita (Campania) and Grotta dei Santi (Tuscany). These contexts refer to both Mousterian and Upper Palaeolithic technocomplexes (MIS 4-3), giving us the possibility of identifying similarities or behavioral differences between Neanderthal and MH populations. Although both Middle and Upper Palaeolithic populations hunted roughly the same large mammal prey, substantial differences were found in the killing-age of the individuals, showing changes in the exploitation of ungulate herds. Hunting by Neanderthal groups was focused on adult and senile individuals, rather than juveniles and sub-adults. Furthermore, it was possible to highlight a specific treatment of carcasses during the Mousterian: some anatomical elements, such as basipodial and acropodial bones and epiphyses of long limb bones, were found to be very rare, as well as spongy bone fragments in the taxonomically unidentified sample. Taphonomic analysis of the bones exclude the alteration of the assemblages due to scavengers (large carnivores) or post-depositional phenomena. The selection of a restricted range of age-classes by Neanderthals, along with the methods followed in the treatment of the ungulate carcasses can be related to a peculiar exploitation of animal resources based on nutritional needs and/or specific adaptations to the environment.

4 HUMAN DIET AND ECOLOGY DURING THE MIDDLE TO UPPER PALEOLITHIC TRANSITION IN PORTUGUESE ESTREMADURA: THE CASE FROM LAPA DO PICAREIRO

Carvalho, Milena (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Ellis, Grace (Dept. of Anthropology and Geography, Colorado State University; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Benedetti, Michael (Department of Earth and Ocean Sciences, University of North Carolina Wilmington; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Friedl, Lukas (Department of Anthropology, University of West Bohemia; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Cascalheira, João (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Bicho, Nuno (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Haws, Jonathan (Department of Anthropology, University of Louisville; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour)

Identifying continuity or change in human behavior through time during the Middle to Upper Paleolithic transition is critical for understanding the processes which led to the disappearance of Neanderthals and dispersal of modern humans on both local and regional scales. Portuguese Estremadura (central Portugal), though typically an understudied region in Paleolithic research, has several key Middle and Upper Paleolithic sites, some of which have demonstrated the ecological plasticity of Neanderthals in their hunting strategies. However, little is known about the subsistence of the earliest Upper Paleolithic humans in Iberia, and this is in large part due to the small number of early Aurignacian sites on the Peninsula. Lapa do Picareiro is one such rare site on the Iberian Peninsula, a cave site with a deep stratified sequence of late Middle Paleolithic (~45-42ka cal BP) and Upper Paleolithic deposits containing evidence of early Aurignacian (~41-38ka cal BP) occupations. With large and well-preserved faunal assemblages, Picareiro offers the opportunity to assess Neanderthal and modern human diet and ecology in a stratified and well-dated site with a growing number of paleoenvironmental records. Here, we present new zooarchaeological, taphonomic, and spatial

data from terminal Mousterian and early Aurignacian deposits (Levels KK-GG) from Picareiro. When utilized with taphonomic and zooarchaeological data, spatial analyses, like hot spot analysis and density-based clustering, highlight important human and nonhuman activity patterns at the site, allowing us to draw comparisons between the Paleolithic occupations and their taphonomic histories. Using these data, we reconstruct human diet and ecology during the Middle to Upper Paleolithic Transition in Portuguese Estremadura and assess whether human behavior changed or continued during this important transitional time in human evolution.

5 HOW TO TAKE SEASONALITY ANALYSIS A STEP FURTHER? A COMBINED ZOOARCHAEOLOGICAL AND GEOARCHAEOLOGICAL APPROACH

Roussel, Audrey (Paul Valéry University of Montpellier 3; UMR 5140 ASM) - Vandeveld, Ségolène (University of Québec at Chicoutimi; CERM/LHASO) - Gourichon, Lionel (Côte d'Azur University; CNRS, UMR 7264 CE-PAM) - Brugal, Jean-Philip (Aix Marseille University; CNRS, UMR 7269 LAMPEA)

In this presentation, we propose a new methodological approach combining the study of archaeofauna with fuliginochronology, which allow to precise temporality of occupation events. These high-resolution approaches were successfully applied to two levels (E & D) of the Mandrin middle Palaeolithic site (Drôme, France, OIS 3).

The first approach combines classical ageing methods (based on tooth eruption and wear) with dental cementum analysis for providing biological age and slaughter season of the main ungulate animal preys. Data from the archaeofauna allow to determine the composition of the animal groups hunted and their season of acquisition.

The second, the fuliginochronology, is a method that uses microscopic observation of the soot deposits recorded in speleothems (broadly defined, including thin wall carbonate crusts). The speleothems of Mandrin Cave are annually laminated, similar to tree rings, with a micritic lamina formed during dry season and a sparitic lamina formed during wet season. By recording the position of soot deposits regarding there calcite annual doublets, we can determine the season of each occupation event. Each method complements the other and provides details that could not be attained using just one of these approaches. Indeed, archaeofauna provides information about 4 solar seasons and the seasonality information is much more precise than with fuliginochronology. Microtaphonomic analysis, especially on cementum also supplies information on the conservation of signals. On the other hand, fuliginochronology provides information about the hydric seasonality for each occupation event and offers a way to “decumulate” data. This presentation will show how, by cross-referencing the results obtained, we were able to determine the seasonality of occupation of the shelter (hydric & solar), to perceive the rhythmicity, continuity and/or changes in function of the site over time and, ultimately, approach the mobility of human groups in the late Middle Palaeolithic in the Rhône Valley.

6 AMELOGENIN ANALYSIS OF FAUNAL DENTAL SAMPLES IN EL SALT'S STRATIGRAPHIC UNIT XA (ALACANT, SPAIN): DECIPHERING NEANDERTHAL SUBSISTENCE APPROACHES

Egüez, Natalia (University of California Davis; Universidad de La Laguna) - Parker, Glendon (University of California Davis) - Pérez, Leopoldo (Universitat de Valencia; Institut Català de Paleoecologia Humana i Evolució Social IPHES) - Hernández, Cristo (Universidad de La Laguna) - Eerkens, Jelmer (University of California Davis) - Mallol, Carolina (Universidad de La Laguna)

Over the past decades, researchers have characterized neanderthal subsistence strategies as intricate processes encompassing controlled procurement of raw materials and extensive utilization of plant resources. This includes the use of fire and their adeptness in hunting prey of various sizes.

Distinguishing between males and females within zooarchaeological collections can yield insights into sex-specific animal exploitation strategies, offering vital information directly relevant to hominin planning depth, anticipatory skills, mobility, and land utilization. However, obtaining details about foraging efficiency and ungulate mortality patterns is often challenging, with a significant dearth of gender-specific data in many Middle Pleistocene bone assemblages. While aDNA sequencing is a viable approach, its limitations encompass elevated costs, time constraints, and the potential for failure owing to the compromised quality of residual DNA. Recent evidence underscores the indispensability of proteomics in estimating sex for osteological and shotgun-genomic analyses.

Situated in Alcoi (Alacant, Spain) at an elevation of 680 meters above sea level, the archaeological site of El Salt is an open-air rock-shelter characterized by a 38-meter-high travertine wall situated at the base of the excavated region. The site encompasses a stratified deposit divided into 13 stratigraphic units.

In recent years, the research emphasis at El Salt has centered on SU Xa, dating 52.3 ± 4.6 ky BP. This unit is distinguished by an abundant and varied archaeological assemblage featuring lithic artifacts, faunal remains, and well-preserved, flat, short-lived combustion structures. The faunal analysis suggests a focus on the utilization of medium-sized mammals: wild goats (*Capra pyrenaica*), deer (*Cervus elaphus*), and horses (*Equus ferus*).

Here, we report the results from enamel samples from the three main species present in SU Xa. Enamel samples were processed to identify AMELY and AMELX-specific peptides (i.e., the biomarkers of X and Y-chromosomes,

respectively), providing proteomic estimates of each individual's sex through nano-liquid chromatography-tandem mass spectrometry.

7 CUTMARKS AS KEYSTONE OF COMPREHENSION OF PAST BUTCHERING PRACTICES: THE CASE OF THE QUINA MOUSTERIAN BUTCHERING CAMP 'LES PRADELLES' (FRANCE)

Regis-Franzke, Enya (TRACES UMR 5608 - University of Toulouse (Jean-Jaurès)) - Soulier, Marie-Cécile (TRACES UMR 5608 - University of Toulouse (Jean-Jaurès)) - Costamagno, Sandrine (TRACES UMR 5608 - University of Toulouse (Jean-Jaurès))

Numerous ethnographic examples testify the importance of acquiring skin and fur for hunter-gatherer populations, especially those living in the northern areas. Skin removal and processing are valuable activities which are planned in advance on a seasonal basis to ensure sufficient stock for the manufacture of clothing, tent fabrics and other items. The use of the skin is widely codified both in terms of uses and sociology, and is intimately linked to the species and its anatomical origin. Indeed, depending on age and gender, people wear different types of skin or fur. The skin removal methods are also related to its final destination, as well as its quality.

In Palaeolithic contexts, the use of the skin is frequently documented through traceological analyses lead on lithic tools or more occasionally on bone tools, or through indirect evidence such as the spatial distribution of some archaeological remains usually associated with skinning activities. Even if these analyses can identify skin-related activities and sometimes specific steps in the skinning « chaîne opératoire », the cutting patterns (fully determined by the use of the skin) remain imperceptible.

Few years ago, a butchering reference-set providing data for identifying skin removal evidence on deer was published (Soulier and Costamagno, 2017; Costamagno et al., 2019). We applied this frame of reference on two Quina Mousterian bone assemblages of les Pradelles, Charente, France (layer 4a and 2b). Noticeable differences in skin removal have been perceived, and we explore the implications of these results in term of use, and also in term of site function. Finally, we discuss the importance of the skin for these Neanderthal populations.

8 A NEW EXPERIMENTAL PROGRAM TO UNDERSTAND THE EXPLOITATION OF RABBIT BY BOTH NEANDERTHALS AND ANATOMICALLY MODERN HUMANS

Real, Cristina (Departamento de Prehistoria, Arqueología e Historia Antigua, Universidad of Valencia, Spain) - Carvahlo, Milena (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve, Portugal) - Haws, Jonathan (University of Louisville, USA) - Rufà, Anna (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, Universidade do Algarve, Portugal; PACEA-UMR 5199, Université de Bordeaux, France) - Sanchis, Alfred (Museu de Prehistòria, Servei d'Investigació Prehistòrica, Diputació de Valencia, Spain) - Pérez, Leopoldo (Departamento de Prehistoria, Arqueología e Historia Antigua, Universidad of Valencia, Spain; Institut Català de Paleoecologia Humana i Evolució Social IPHES, Spain) - Martínez, Abel (Departamento de Prehistoria, Arqueología e Historia Antigua, Universidad of Valencia, Spain)

Palaeolithic human groups in the Mediterranean and Portugal regions of the Iberian Peninsula consumed several small prey species. Leporids are an abundant small game in the archaeological assemblages, representing between approximately 50% (Middle Palaeolithic) and over 80% (Upper Palaeolithic) of the faunal remains. Neanderthals demonstrate the same hunting capabilities as Anatomically Modern Humans for this prey, but with different resource management. What are the differences in processing and consuming patterns between hunter-gatherer groups, and why do they exist? To answer this question, we propose an experimental program that involves testing various rabbit processing methods.

Currently, the program includes three models: 1. evisceration, dismemberment, roasting, defleshing, and consumption; 2. evisceration, drying, defleshing, and consumption; and 3. evisceration, smoking, defleshing, and consumption. Each processing model was applied to eight rabbits. For the final consumption phase, we tried to extract marrow from four of the eight individuals.

Here, we present the description and results of the first model, which involves roasting for meat and marrow consumption. This data is compared to the results of archaeozoological analyses applied to rabbit assemblages from Middle Palaeolithic and Early Upper Palaeolithic sites in the Mediterranean and Portuguese regions of the Iberian Peninsula.

The aim of this work is to expand our understanding of how rabbit management affected the diets of Palaeolithic hunter-gatherers, Neanderthals, and Anatomically Modern Humans. This research is situated within the context of human evolution and the changes that occurred in subsistence activities during the transition from the Middle to Upper Palaeolithic.

406 DOING GOOD WITH ARCHAEOLOGY?: SOCIAL SUSTAINABILITY AND ACTIVISTIC PRACTICES TO TRANSFORM PEOPLE'S LIVES AND SUPPORT FLOURISHING COMMUNITIES

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Ripanti, Francesco (Trinity College Dublin) - Sayer, Faye (University of Birmingham) - Dobat, Andres (Aarhus University) - Monckton, Linda (Historic England)

Session format: Regular session

This session addresses archaeology's role in supporting social sustainability, addressing inequalities and promoting human rights and dignity. It presents evidence of how archaeology can shape and have positive and negative effects on wider social and human capital. It addresses the transformative role that archaeology and archaeologists can have, and how by coming together as a collective archaeologists can reposition their work to impact and address wider sustainable development goals and global challenges.

There is a growing body of evidence on the potential of archaeology as a path to positively impact social fabrics and people's lives. Archaeology is increasingly being recognized as a potent tool to be applied in countering the growing global mental health crisis, and tackling sustainable development goals, including wellbeing inequality. The session explores the role archaeology can play in addressing and countering social issues and challenges; considering how it can benefit social and human capital, and how activist practices can support human rights and dignity, inclusiveness, equality, connection and cohesion. Pushing beyond public benefit measures, the session explores how archaeology can contribute to shaping better societies, at local to global scale; considering how and why archaeology can reconcile collective trauma, contribute to conflict resolution and appeasement, and be a medium of empowerment.

The aim of the session is to provide a safe space for self-critical reflection, promoting an open discussion of uncertainties, unresolved issues and even failures, in order to move beyond the proof of concept stage and explore the underlying mechanisms of archaeology as a social force to positively improve people's lives, and support communities to flourish.

The session aims for diverse theoretically and practice based presentations, as well as explorative reflections on the wider perspectives of socially activist practices in archaeology. We encourage experienced scholars and early career researchers with bold ideas to contribute.

ABSTRACTS

1 A BEHAVIOURAL SCIENCE-BASED APPROACH TO HERITAGE: IMPROVING VISITOR DIVERSITY AND ADDRESSING WELLBEING INEQUALITY AT BILTMORE ESTATE

Sayer, Faye (The University of Birmingham)

The application of behaviour change models to shape strategy and develop interventions to achieve high-level outcomes is an emerging field for heritage-based research. Owing to this, the value and effectiveness of the science of behaviour change to the heritage sector has been underexplored; the behaviour change wheel approach has been utilised extensively in health care settings, this research adds to the small but growing body of its applicability in more multidisciplinary settings. The study uses data collected in partnership with the Biltmore Estate (USA) to address this gap and examine if COM-B/BCW could provide an alternative for understanding visitor behaviours. Previous research at Biltmore Estate indicated individuals who were young, old, and part of minority groups were amongst the most disengaged local community members and experienced the highest levels of mental distress during visits. As such, modelling focused on a core behavioural outcome to 'increase visits to the Biltmore estate by members of the local community', specifically visits by young, old, and minority groups. Using the COM-B/BCW this research created interventions to remove barriers and provide enablers to build the capabilities, opportunities and motivations for diverse community members to visit Biltmore. The research demonstrated the potential of a behavioural science approach to understand visitor behaviour and experiences, to support heritage places to improving visitor diversity and reducing mental distress of these groups.

2 ARCHAEOLOGY AS HEALING MAGIC

Dobat, Andres (Department of Archaeology, Aarhus University)

The beneficial role of archaeology as a pathway to wellbeing and happiness is well documented and widely acknowledged; be it for mental health, social cohesion, or personal empowerment. But what is it that makes archaeology such a powerful force? And how do we best make use of the healing potential of our discipline?

Moving beyond the discussion whether there can be established clinical evidence for the beneficial effect of archaeology or whether any mitigating effect is only perceived as such by the practitioner, I want to argue that archaeology is a sort of healing magic. As such it is not only the magical invention of personal and collective origin myths. It is also a practice resembling traditional approaches to both physical and spiritual healing and recovery. I will come across practices such as chanting, trance, herbalism, meditation, fetishism, prayer, etc. and investigate their significance (or possibly uselessness) as an explanatory framework for the healing magic of archaeology. My paper is not meant to be understood as a presentation of conclusive wisdom, but more as a fumbling quest for new avenues towards a deeper understanding of what makes archaeology such a powerful therapeutic force – and what we can use it for.

3 TRANSFORMATIVE JOURNEYS: UNDERSTANDING THE SOCIAL DYNAMICS OF ARCHAEOLOGY-BASED WELLBEING INTERVENTIONS

Ripanti, Francesco (Trinity College Dublin)

Archaeology can contribute to address societal issues by actively engaging communities through a range of programmes. Among these are Archaeology-Based Wellbeing Interventions (AWIs), which explore how engagement with the past can make a difference to wellbeing, producing outcomes such as socialisation, happiness and self-esteem. AWIs aim to achieve a wellbeing impact on the participants by engaging them with a variety of programmes based on archaeology, including excavations, walks in the historic landscape, photographic sessions and other craft workshops.

This contribution proposes an in-depth reflection on the different forms and dynamics of interaction in AWIs and how they can impact on inclusiveness, equality, connection and cohesion. The analysis is based on the quantitative and qualitative data collected during the programme 'ArcheologicaMente', delivered in Vignale (Italy) in September 2023, and the 'Αρχαιολογικά' programme, delivered in the Xeros Valley (Larnaca district) between October and December 2023. The two case studies have been carried out within the framework of research project 'Linking community archaeology and wellbeing in the Mediterranean' (LOGGIA). Funded by the European Union as Marie Skłodowska-Curie Postdoctoral Fellowship, LOGGIA has worked with local communities and vulnerable groups on programmes based on the historic landscape and assessed how archaeology practices can contribute to community wellbeing.

4 WELLBEING IN HERITAGE AND WELLBEING THROUGH HERITAGE

Monckton, Linda (HE - Historic England)

This paper will provide a strategic overview of the issues facing the heritage and archaeological world in relation to the wellbeing agenda. Wellbeing might usefully be thought about in two key ways, direct: that is the subjective wellbeing of how a person or community is doing, and indirect: that is working with the social determinants of health and wellbeing. Where has this agenda come from and how is it being approached? Expanding this further one might articulate Wellbeing as an individual issue (how does one feel things are going), a collective issue (how well is a community or area doing), and a population level issue (how well are policies affecting change for the country as a whole). Each is focussed on what difference we can make and all are relevant to how we approach wellbeing. Each is related to life satisfaction and how one is affected by the social, economic and environmental context of daily life. Wellbeing is therefore a complex issue seeking simple solutions for implementation. The two most common questions appear to be 'what works' and 'how to measure it'. With these questions in mind this paper will provide examples from the UK and consider how this can be applied within commercial archaeology. Through these examples it will highlight the kinds of opportunities that exist for improving local wellbeing and the challenges and evidence that exist for measuring this in a meaningful way.

5 DOWN AND DIRTY WITH ARCHEOLOGICAL ARTEFACTS

Smith, Aja (Department of Archeology and Heritage Studies, Aarhus University) - Dobat, Andres (Department of Archeology and Heritage Studies, Aarhus University)

While a still young but growing body of literature has begun mapping the positive effects on mental health and general wellbeing which engagement in archeological activities is proving to have (see e.g. Everill and Burnell 2022; Sayer 2023), the literature on the positive effects of metal detecting as archeological practice is yet scarce. This scarcity stands in stark contrast to the self-reported positive experiences of practitioners in e.g. Denmark (Dobat et al 2022; Dobat and Dobat 2020) and the UK (Dobat et al 2020; Dobat et al 2022; Winkley 2016).

In this paper, we contribute to this burgeoning field through an ethnographic exploration of the Danish VETEKTOR Buddy program. The program engages military veterans in archeological metal detecting activities by providing them with the necessary gear and an experienced mentor from the Danish hobby archeology community. The paper hones in on the veterans' own experience of engaging in archeological activities by specifically exploring the relationship between their embodied sense of engaging in the hobby and their past military training, identity and bodily and in-

tellectual proficiencies and aspirations. We also explore how the sense of meaning and purpose, the veterans derive from the hobby is connected to their experience of being engage in “the world biggest archeological citizen science projects”, as several of them refer to the registrations system, DIME.

6 IF HERITAGE IS GOOD FOR WELLBEING, WHY ARE PROFESSIONALS SO MISERABLE?

May, Sarah (Arup)

Wellbeing has risen as an important contribution of heritage to society, a reason for governments to support heritage and as target for volunteering programmes. Over the last decade impressive research has demonstrated measurable improvements in wellbeing for many groups through engaging with heritage. Yet wellbeing among heritage professionals is not better than societal averages, and in many professional contexts it is worse. There are many contributors to this circumstance, including precarious employment and poor working conditions. How can a profession which struggles with its own wellbeing be expected to improve well being for those that engage with it? Bearing in mind recent research demonstrating that most ‘workplace wellness programmes’ have no benefit, this paper will address these issues in two ways. Firstly, drawing on data from sources such as ‘profiling the profession’ it will explore the wellbeing pressures on different parts of the sector, and consider where current wellbeing programmes sit within that. Secondly, it will consider if there are any lessons from our understanding of how heritage improves wellbeing in other contexts which would help professionals within the sector.

7 EMBEDDING SOCIAL IMPACT AND VALUE INTO A CLIENT'S PROJECT: THE SUCCESS AND CHALLENGES

Latham, Alexandra (Arcadis Consulting (UK) Ltd) - Brooks, Poppy (Arcadis Consulting (UK) Ltd)

The commercial cultural heritage team within Arcadis Consulting (UK) Ltd was commissioned to create and implement a heritage trail around a small town in Wales (UK). The client had announced their intentions for the trail in their Town Regeneration Master Plan.

Arcadis and our client recognise the importance of the social impact and value of connecting communities and visitors to local heritage. The effective communication and display of an area’s heritage can create positive perceptions and pride in a local area. It can add knowledge and understanding about the past and is vital to destination marketing and contributing to local economies.

The trail created several challenges including deciding on which heritage assets would be incorporated into the trail. This was achieved by engaging with local stakeholders and then planning a logical and accessible route to connect assets. Not all assets could be included, and this caused some controversy amongst local groups. Those that were included consisted of assets representing the medieval history of the town, its civic life and its links to rugby and brewing.

The challenges for the implementation of the trail included raising awareness about the trail and how and where it would be advertised. Previously, the client had created a heritage app which was unsuccessful but there was still a possibility that something similar could be used for the trail. It would be important that the technology used be easily maintained, was future proofed and user friendly. If it was to succeed, planning permission, and listed building consent, would be required for new heritage boards, signs and QR codes for the route.

The client welcomed our proposal and is now taking the ideas and trail route out to additional stakeholder engagement.

8 TRANSFORMING COMMUNITIES THROUGH DEVELOPER-LED ARCHAEOLOGY IN SCOTLAND

Johnston, Emily (The University of Edinburgh)

Developments and construction works can transform, reshape and create new communities in both urban and rural settings. The archaeological works associated with developments can also contribute to this impact on communities, especially in instances of significant archaeological findings. On the one hand, development-led archaeology can impact communities through a loss of heritage, to which there is a sense of belonging or ownership. Place attachment should be considered in these instances as the archaeology and archaeological engagement can present opportunities to help mitigate the loss. On the other hand, new archaeological discoveries can create new narratives and ties to the past. Engagement with the archaeological works can therefore help to build a sense of community and shared heritage for locals.

Whilst development-led archaeology has an obligation to provide public benefit, what constitutes meaningful engagement, and appropriate / proportionate techniques are only just being examined in this setting.

This paper will synthesis my doctoral research into community engagement in the Scottish developer-led archaeology sector, and consider how community engagement can impact national, European and global sustainable development goals. This paper will be composed of a variety of case studies and examples to demonstrate a breadth of activities across Scotland. In doing so, it becomes possible to explore how different engagement techniques can impact indi-

viduals and communities, and generate values such as (and not limited to) educational, social, health and wellbeing, and cultural.

Ultimately, this paper will explore rationales behind developer-led archaeological sites delivering community engagement, showing awareness of key legislation and policies for communities building. By framing the discussion from the communities’ perspective, this paper will highlight the benefits of community engagement in developer-led archaeology that can be derived for individuals and the communities themselves.

9 EMPOWERING CHANGE: SOCIAL ACTIVISM ON STANTON MOOR

Bowyer-Kazadi, Emily (University of Liverpool)

How can engaging with the archaeological landscape of Stanton Moor in the Peak District can positively impact social sustainability, well-being, and our human rights in terms of access, whilst also ensuring that sustainable conservation of the cultural and natural resources of the moor? To answer this, this paper will reflect on and explore the complex, and multi-faceted landscape which has a number of sites located across the moor, most of which date to the Bronze Age, the most important of which for this paper is Nine Ladies Stone Circle. It is simultaneously an area of recreation, a working agricultural area, and a place of spiritual significance. This led to issues arising when a local quarrying company wanted to reopen their sites on the moor. There was lots of vocal opposition to this, and a protest camp was set up at Nine Ladies Stone Circle in 2000 and was on the moor till 2009 by followers of the old religions to protect the area. Although a good example of social activism, there were some issues involving antisocial behaviour, drugs, and alcohol, some of which still occur around the solstices. Stanton Moor has the potential to be an empowering and inclusive place for a diverse range of people can freely engage with its archaeological, spiritual, and natural aspects, ultimately leading to a positive sense of wellbeing. However, improvements are ultimately regarding accessibility, engagement and sustainability as well as updating the 2007 management plan. After providing background on its importance and the quarrying, managing the moor and its assets in a sustainable and inclusive manner to protect its valuable elements whilst also enabling a diverse range of people to enjoy it will be discussed and compared with other relevant case studies to provide a sustainable path for the future.

10 A STOP ON THE JOURNEY. WHERE WE WANT TO GO? ARCHAEOLOGY AND ITS CAPACITY FOR ACTION IN THE RURAL WORLD

Delgado, José (University of Oviedo) - López, Pablo (University of Leon)

The power of Archeology as a politically and socially active science is unquestionable. Far from descriptive/analytical studies, Archeology is a tool of great action capable of entering into the debates of the present world.

Continuous, non-stop “progress” - new techniques, new analytics, specialisation within specialisation, impact indices - dominate much of the discipline, but at some point along the way, do we put the brakes on all this and stop to think about what direction we are going in or how far we want to go? Reflections that go beyond mere academic transfers or the safeguarding of a common heritage.

We study people, communities, elites, minorities, marginalised..., or at least the materiality/non-materiality left by these groups throughout history. So, we have a great responsibility on our hands. But does all this really have an impact on the communities living in the territories we research?

In this paper we intend to do our bit to our possibilities as a science based on what we have been doing in the framework of Agrarian Archaeology in the study of local/rural mountain communities in the north and south of the Iberian Peninsula. In our research we have focused on these communities as the protagonists of their own history, active agents with a capacity for agency who have deployed various strategies to face up to different historical challenges. These diachronic approaches lead us to work or live in rural spaces that are still inhabited. This interaction makes us militant in the face of the problems that these territories are going through, seeking an agency that allows us to counteract the dominant discourses, to generate actions of co-construction of knowledge by integrating ourselves into the very communities in which we live and of which we form part as human capital and socialising agents of the territory.

11 UNCOVERING PAST TENDENCIES FOR FUTURE INSIGHT: THE IMPACT OF RESEARCH ON GREENLANDIC INUIT REMAINS FROM ARCHAEOLOGICAL CONTEXTS

Elleskov, Sara (ADBOU – Unit of Anthropology, University of Southern Denmark)

Archaeology and biological anthropology have been involved in taking human remains from colonized groups, contributing to the “colonial project”, and impacting Inuit tangible and intangible cultural heritage as research has been and still is predominantly presented through Western eyes. I argue that research has focused on aspects of Greenlandic Inuit societies that past and contemporary Greenlandic Inuit communities did and do not consider crucial to their self-perception and identity. This raises the question of whether we can truly refer to the research of archaeological Inuit remains as Greenlandic Inuit prehistory in its present state. I attempt to address these issues through the inves-

tigation of previous Danish archaeological, anthropological, and natural scientific research tendencies, as well as the perspective of Indigenous knowledge. On behalf of this, I argue for archaeological research to partake in a responsible and active role in the contemporary world, supporting ongoing efforts towards decolonization and cultural revitalization.

12 GROWING GOOD WITH ARCHAEOLOGY

Birkelund, Kristina (Museum of Cultural History University of Oslo)

In my free time from my work at the museum, I am passionate about educating non-native-speaking children and teenagers about archaeology and related subjects focused on their native cultures. The idea is simple - to socialize and cultivate kindness through learning. With narratives, games, and practices from archaeology, kids are able to see themselves as part of an ongoing human story that connects them to their culture, heritage, and the wider world. I believe that introducing kids to the benefits of archaeology at an early age can have a positive impact on their lives and contribute to building better societies.

With the rise of conflicts like the Russia-Ukraine war, educating ourselves and others about archaeology has become more crucial. In my group, there are kids from countries with ongoing conflicts, and yet they come together and stay united for the purpose of learning. I am confident that learning about archaeology can contribute to shaping better societies. Through learning about archaeology and its implications for cultural identity and social cohesion, we can build a better world for current and future generations.

13 ARCHAEOINFORMATICS: TOWARDS A PUBLIC ARCHAEOLOGY

Megalooikonomou, Pavlos-Stylianos (National Technical University of Athens) - Chroni, Athina (Hellenic Ministry of Education, Religious Affairs and Sports; National Technical University of Athens)

Archaeoinformatics, as is determined the study of computational and digital technologies under the perspective of achieving and proposing holistic models for analysing, archiving, and disseminating archaeological data, show the way both for supporting a holistic cultural resource management, whether in the public or the private sector, as well as for the community of people's active participation.

As a result, the growing dynamics of new practices and procedures, for the participation of the wider society in issues of integrated cultural heritage management, as is crowdsourcing, has now clearly made the concept of public archaeology visible and real, thus constituting a leading scientific trend of our days.

As innovation spurs the creation of value to communities through the development of new experiences, services and processes, the museum sector has already shown the way towards this direction. In the post-covid era, museological approaches are determined by the rapid innovations that have taken place and have been accelerated under the COVID-19 conditions as a catalyst and consist of rapid changes in accepting and implementing digital innovations, thus redefining the experience as well as the creative participation of the public, and are crystallized in the latest achievements and challenges.

Are these the future trends for safeguarding collective memory?

14 ADVENTURE TIME, CULTURAL AWARENESS, AND PUBLIC ENGAGEMENT IN UKRAINIAN ARCHAEOLOGY

Hemberzhavska, Daria (Petro Mohyla Black Sea National University) - Radchenko, Simon (University of Stavanger)

Ukraine appears to be a bright, illustrative case for many discussions on the social impact of archaeology and cultural heritage studies. This is mainly due to the relevance and strategic importance of Ukrainian cultural heritage, as revealed by the ongoing war. However, other features of archaeological practice are also worth noticing as they shape Ukrainian society in many ways. Here, archaeology appears to be a romanticized adventure and a resort for many social groups. It has the power to bring social and cultural awareness, shaping a positive attitude toward our country and history. Paradoxically, it frames archaeologists and rarely societally respected and acknowledged experts and widens the gap between scholars and governmental institutions.

Introduction to archaeology often occurs in school or university clubs, serving as the first exposure to cultural history for many young people. These clubs provide a tangible connection to the past and form a behavioral model for protecting and preserving national heritage. They shape the relationships between professional archaeologists and their environment in a very special way. Following the work of youth archaeological clubs, NGOs often emerge, acting as intermediaries between the local and global archaeological communities and between public engagement efforts and academic scholarships. These platforms create opportunities for dialogue and collaboration among diverse communities. In areas with relatively unstable cultural support (such as Mykolaiv, Zaporizhzhya, Kharkiv, and Odesa), the study of archaeology holds particular value and is a space of freedom and cultural responsibility.

The significant number of professional archaeologists or individuals involved in archaeology within the military underscores the interconnectedness of cultural consciousness, heritage preservation, and national security. This talk aims to expand on intertwined features of public engagement, cultural awareness, social responsibility, and the romanticized image of archaeologists in the modern Ukrainian cultural background.

15 NEOZOIK FOUNDATION: EMPOWERING YOUTH IN UNDERDEVELOPED AREAS OF SERBIA THROUGH HANDS-ON ARCHAEOLOGICAL LEARNING

Bogojevic, Maša (Faculty of Tourism Studies - Turistica, University of Primorska)

The Neozoik Foundation is a non-profit foundation established in 2021 in Pančevo, Serbia with the mission to raise awareness about archaeology and cultural heritage to address educational and media disparities within the public sphere. Comprised of enthusiastic young experts and students of archaeology and related disciplines, Neozoik focuses on providing youth with accessible and free online and in-person activities. One of the primary initiatives involves organizing free workshops for elementary and secondary school students in underdeveloped areas of Serbia. These workshops, conducted in rural with limited cultural resources and low quality of life, offer children hands-on experiences in archaeological research. Neozoik has conducted five workshops in rural places across Serbia, including Bela Palanka, Blace, Starčevo, Zvezdan, and Donji Milanovac. These projects introduce participants to archaeological methodologies by analyzing materials sourced from nearby sites. Students engage in discussions about the importance of their local heritage, issues related to illegal digging, and the societal significance of archaeology, further developing a sense of pride and ownership in them and empowering them to advocate for the preservation of their local heritage. Additionally, the Neozoik team maintains ongoing engagement with participants through several social media profiles, providing the children with continuous support in deepening their interest in archaeology and its popularization. The scope of this paper is to reflect on these workshops as a means to address and surpass inequalities in the educational system and development of different areas of Serbia, simultaneously supporting several social development goals. This paper aims to examine the impact of these grassroots initiatives as a further exploration of how can archaeology and cultural heritage be used to positively impact and inspire children from underdeveloped areas, as well as promote inclusiveness, quality education, and community engagement.

16 20 YEARS OF ARCHAEOLOGY IN VIGNALE. AN EVALUATION OF A RESEARCH PROJECT BEYOND THE ACADEMY

Luppino, Luca (La Sapienza Università di Roma) - Scoz, Jacopo (La Sapienza Università di Roma) - Ripanti, Francesco (Trinity College Dublin)

Since 2004, the Meta3Lab of the University of Siena has been carrying out archaeological excavations at the site of Vignale-Riotorto (LI). Over the course of two decades, the research initiative has become a dynamic training ground that has shaped the expertise of numerous students.

In addition, the community archaeology project 'Uomini e Cose a Vignale' (People and Things in Vignale), started in 2009, has tried to go beyond the usual public outreach activities by carrying out evaluations of the project's impact on the area and archaeology-based wellbeing interventions. Students have always been actively involved in the design, delivery and evaluation of these activities.

However, the long-term impact of archaeological excavation experiences on the education and attitudes of former students has never been assessed. Can a university excavation be evaluated not only in terms of its scientific publications, but also in terms of the impact it has on its alumni? And how deep is its influence on the working practices of students now working as archaeologists or in other fields? This paper uses a mixed-methods analysis to explore the perspectives and experiences at Vignale of more than 80 students who participated in the project for more than one season.

17 TEACHING THROUGH ARCHAEOLOGY: SCIENCE TEACHING, CULTURAL HERITAGE, AND DEMOCRATIC FORMATION

Toftdal, Mia (Museum of Copenhagen) - Andersson, Marie (Museum of Copenhagen)

In the project 'Archaeology and Natural Science: science teaching and cultural history', the Museum of Copenhagen collaborates with teachers and students in elementary school to develop new methods in science teaching. The purpose of the project is to explore the potential of working with archaeology and natural science in 7th and 8th grade in elementary school to strengthen the students' STEM competencies and their scientific, general, and democratic formation, by involving them in professional archaeological and scientific work at the museum. The students work hands-on with authentic archaeological material and use scientific archaeological methods alongside the museum's professional archaeologists.

The project work with an interdisciplinary approach and emphasize involvement and co-creation with participants in the development process. The aim is to develop a well proven and sustainable teaching format in a reliable teaching environment, all with the purpose to encourage students interested in an education and a career within the natural science subjects, as we provide the opportunity to interact with, get inspired from, and learn from the archaeological methods and role models. Together, the authenticity aspects and the pedagogical methods create different, yet secure learning situations, where students who are not normally interested or actively participating in learning activities, are fully focused and immersed, and express enthusiasm for succeeding.

408 CRAFTING IRON AGE SOCIETIES: CAN CREATIVITY, TECHNOLOGY, OR TYPOLOGY HIGHLIGHT HUMAN PAST TRANSFORMATIONS?

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Rolland, Joëlle (CNRS, UMR 8215 Trajectoires) - Cicolani, Veronica (AOROC UMR 8546 CNRS-PSL) - Canovaro, Caterina (Università di Padova, Dipartimento di Geoscienze)

Session format: Regular session

Breaking habits, innovating, changing a gesture or a material may be a matter of moments, but change comes from maintaining the decision and persevering in that change. When it comes to studying the production of Iron Age societies, change is the defining feature of typological and chronological studies. Archaeology was built on the classification and ordering of change; it marks the time or different cultures. But with the development of methods, it is now possible to perceive other changes, technological changes in the chaîne-opératoire or the specialisation of craftsmen, changes in materials and their origins. From style to creativity, from technology to typology, how do we recognise the changes that Iron Age craftsmen chose or went through? And if we detect a change in production, how can we identify its causes and its impact on past societies?

By looking at changes in the production of iron, bronze, precious metals, textiles, glass, amber, ceramics, bone, ivory, lithics, wood or black stone, this session will shed light on the choices made by the men and women who made and wore artefacts, creating their cultural and social identity. Creativity, technology and morphological variations reflect a range of choices resulting from changes at different levels: at the level of craftsmen, workshops, consumers and sometimes the whole society itself. By combining technological, morphological and contextual analysis and their variability within a broad socio-anthropological gender perspective, we can highlight the minimal or invisible changes behind common traditions and, through this approach, examine socio-cultural idiosyncrasies and ideological legitimization.

By bringing together researchers working on production process during the Protohistory, we hope to compare our views on the transformations that shaped cultures and societies.

ABSTRACTS

1 CAUSE AND EFFECT: CHANGES IN THE IRON AGE THROUGH A HOLISTIC STUDY OF SIGNIFICANT TRANSFORMATIONS (3RD TO 2ND CENTURY BCE)

Bursak, Daniel (Institute of Archaeology of the CAS, Prague) - Danielisová, Alžběta (Institute of Archaeology of the CAS, Prague) - Kyselý, René (Institute of Archaeology of the CAS, Prague) - Čížmář, Ivan (Institute for Archaeological Heritage Brno) - Kertés, Samuel (Institute of Archaeology of the CAS, Prague) - Volf, Jan (Institute of Archaeology of the CAS, Prague)

In the 3rd and 2nd centuries BCE, significant changes on various levels took place in the territory north of the Alps. Initial indicators of transformation were gathered through the study of historical sources, typological analyses, and settlement structure research dating back to the 20th century. Growing agglomerations, the dawn of a monetary economy, the emergence of oppida, new expressions of artistic styles and changes in ritual practices leading to archaeologically indistinguishable burial traces are just some of the numerous transformations to mention. In the past, efforts were made to understand the blanket causality of these changes – something that is increasingly challenging in contemporary research full of new partial data, revisions, and approaches.

In our contribution, we would like to introduce new probes into the Iron Age technologies, subsistence, and agricultural aspects of the observed period. We base our approach in a series of archaeometric analyses of materials mainly from Central Europe. The study of metals reveals a flow of new materials and the expansion of technological processes with a plethora of innovations. Similarly, research on ceramic production highlights the great complexity and diversity of production. The latest analyses of archaeozoological material bring surprising specific patterns of handling livestock. In our contribution, we aim to subject this evidence to critical review in connection with known transformations in sub-Alpine Europe during the Iron Age, as well as discuss their causality, correlations, or even randomness and their relevance to macro- or microhistories.

2 NOTES ON THE COMPLEX THE PRODUCTIVE STRUCTURE OF THE CONTESTANIAN COAST DURING THE IRON AGE. BETWEEN DOMESTIC AND WORKSHOP PRODUCTION

Perdiguero-Asensi, Pascual (Universitat d'Alacant)

The coast of the south-east of the Iberian Peninsula has always been an interesting case of study for the non-canonical ways of interaction between the Mediterranean and the local population. Several sites in this area show a consolidated productive network during the Second Iron Age, and a strong connection with the Mediterranean markets that finds its roots in the Phoenician colonies settled in this coast during the 7th century BC.

In this paper we intend to defend the importance of local crafting, technology, and production in the colonial processes of trade and exchange and how its study can reveal the social structures behind them. Through the analysis of archaeological data, we reflect on this productive network whose role as a link between economic systems contributes to generate asymmetric socioeconomic relations, of varying degrees of complexity. In this sense, the archaeological data shows a strong dichotomy between the coastal fringe that concentrates the workshop production, and the interior regions with a strong domestic crafting economy. The study of these differences and its evolution in time is proving essential to understand colonial situations in the Contestanian region.

The concentration of amphorae kilns in the coastal settlements shows an intensive productive network destined mostly to the shipment of products and craft goods towards the Western Mediterranean but with a strong distribution towards the interior. We have been able to identify the presence of this amphorae in most of the closest economic and productive nodes. The way this trade is organized shows a very specific model of colonial interaction and proves the high value of products such as wine, olive oil, salted fish, and crafts like esparto rope through the 6th to the 3rd centuries BC in the Western Mediterranean.

3 ARCHAOMETRIC INVESTIGATIONS ON BRONZE ARTEFACTS OF CHERICI COLLECTION: PRELIMINARY RESULTS ON METAL SUPPLY STRATEGIES

Lucarelli, Chiara (University of Padua) - Angelini, Ivana (University of Padua) - Artioli, Gilberto (University of Padua) - Canovaro, Caterina (University of Padua) - Cicolani, Veronica (Centre National de la Recherche Scientifique)

The Chierici collection consists of more than 400 finds in copper alloy and the 145 objects conserved in the Musée d'Archéologie nationale et domaine national of Saint-Germain-en-Laye. A selection of 15 finds (VI-V century BC) from the excavations conducted by Chierici at S. Polo-Campo Servirola, now preserved in the Civic Museums of Reggio Emilia, were studied in the framework of the ANRJCJC Itineris project (<https://itineris.huma-num.fr/>). The results will be compared with those obtained on coeval artefacts from archaeological settlements in Piedmont region. The aim is to highlight changes in the choice of mineral supply sources and the strategies adopted. Chemical and microstructural characterizations were achieved through a multi-analytical approach, including reflected-light optical microscopy, scanning electron microscopy coupled with an X-ray energy dispersive spectrometer, electron probe micro-analysis, and metallographic analyses. Lead isotope analysis (LIA) was employed to determine the provenance of the metal. The objects are mainly made of tin bronze (Sn 4.1-10.5 wt%) or lead-bronze (Pb 2.5-11.8 wt%). Segregations or inclusions are observed in the δ -phase, mainly mixed sulphides, δ -phase, and lead. The developed database containing chemical and isotopic data of copper mineralizations (Artioli et al., 2020) is used to interpret the LIA results. The finds exhibit various and complex signals of copper or lead sources, principally Iberian Peninsula and Aegean. These preliminary results suggest a complex metal supply strategy in terms of time and location of possible sources, with respect to the simple model of exploitation of regional resources (Cicolani et al., 2023).

Artioli G., Canovaro C., Nimis, P., Angelini I., 2020. LIA of prehistoric metals in the central mediterranean area: a review, *Archaeometry*, doi: 10.1111/arcm.12542

4 THE MAJOR IRON PRODUCTION SITE FROM THE LATE HALLSTATT AND EARLY LA TÈNE PÉRIOD OF DONNEMAIN-SAINT-MAMÈS (EURE-ET-LOIR, FRANCE)

Wassong, Rémy (Eveha; UMR7044 - Archimèdes) - Sarreste, Florian (Eveha; HeRMA) - Lacroix, Solène (Eveha; HeRMA)

The excavation of the site of Donnemain-Saint-Mamès took place from the 14th november 2022 to the 13th january 2023. The extensive investigations covered an area of 26000 square meters and revealed the presence of a significant iron production unit. Over fifty reduction furnaces were discovered, which is a remarkably high density for this period, spanning from the end of the Hallstatt and the beginning of the La Tène period. This finding emphasizes the importance of the settlement, potentially making it a prominent site in the region.

However, the origin of the iron ore used in the production process still needs clarification. The local rocks in the area contain insufficient concentrations of iron ore for effective reduction.

In the eastern part of the settlement, five heated stone pits were discovered. These pits measure between 1.3 and 2.5 meters in width and 5.2 to 6 meters in length. They were filled with a thick layer (40 to 50 cm) of various stones, including flint, sandstone, and limestone. At the bottom of the pits, a substantial layer of charcoal was found, containing carbonized wood elements such as logs, half-logs, wooden planks, and kindling. These pits may have been used for roasting the iron ore before initiating the reduction process. Alternatively, considering the limited amount of ore found in the local rocks, it is also possible that these pits served as communal cooking installations for shared meals.

The investigation of the Donnemain-Saint-Mamès settlement provides valuable insights into the creativity and technology of Iron Age societies. The study of slags and the organization of furnaces during this pivotal period sheds light on the iron production techniques employed at the time.

5 METALLURGY AS A NEW ECONOMICAL CHALLENGE? PARALLELS BETWEEN THE DEVELOPMENT OF AN ENCLOSED SETTLEMENT AND ITS METALLURGICAL ACTIVITY

David, Antoine (Eveha) - Lacroix, Solène (Eveha; UMR 7324 CITERES)

The excavation of a 3-hectare site carried out in 2021 in the commune of Saint-Varent (Deux-Sèvres, France) uncovered an enclosed settlement dating from late Iron Age. Each phase of occupation is associated with a metallurgical activity, the development of which is directly correlated with that of the settlement. Initially, in the 4th-3rd centuries BC, the site was mainly devoted to agriculture, but also show the existence of a smithy, meeting a specific local need. This activity took place on the outskirts of the enclosure, far from the dwellings. Around the end of the 3rd-beginning of the 2nd century BC, the settlement was transformed and enlarged, consisting of two nested enclosures whose occupation lasted until the middle of the 1st century BC. A smithy continued to operate, initially within the inner enclosure, opposite the dwellings, before being moved immediately outside the same enclosure when it was enlarged. At the same time, another metallurgical production area was established during this second phase, farther to the south-east, on the edge of the outer enclosure. A study of the metallurgical waste reveals a homogeneous production, of average size compared with other sites of the same period, and of good technical quality. This new forging activity undoubtedly played a major role in the economic strength of the settlement, and raises the question of the place of the craft - and the craftsman - in this change: did the occupants of the site see it, at a time when metallurgy was taking on an increasingly important role, as a genuine opportunity for development, or should it be seen as nothing more than a subsidiary factor in their power and wealth?

6 AMBER ROADS IN THE EARLY IRON AGE BETWEEN THE RHINE AND MORAVIA. METHODOLOGY, RESEARCH QUESTIONS AND FIRST RESULTS

Golec, Martin (Palacký University Olomouc) - Golec Mirová, Zuzana (Institute of Archaeology of the Czech Academy of Science Prague; Charles University Prague) - Chytráček, Miloslav (Institute of Archaeology of the Czech Academy of Science Prague) - Kučera, Lukáš (Palacký University Olomouc) - Mischka, Doris (Friedrich-Alexander University Erlangen-Nürnberg) - Hagemann, Katja (Friedrich-Alexander University Erlangen-Nürnberg) - Martínek, Jan (Palacký University Olomouc)

Amber Roads in the Early Iron Age between the Rhine and Moravia” is an international project of a Czech-German research team, supported by the GAČR and DFG for the years 2023–2026. The project is managed by the Czech Academy of Science in Prague, Palacký University Olomouc and Friedrich-Alexander Universität Erlangen-Nürnberg. The interdisciplinary research on amber studies amber as a strategic raw material for exchange in the Early Iron Age (800–370 BC). The project catalogues amber finds in Central and Southern Europe, identifies amber sources using natural science methods, reconstructs long-distance networks, and focuses on socio-economic and craft aspects. In 2023 and 2024, the team focuses on sampling (systematically Czech Republic and Germany). For questions on a broader spatial scale, selected sites are also sampled in Poland, Austria, France, Italy, Slovenia, Croatia, Serbia, Bosnia and Herzegovina, Bulgaria, or Greece. The current research direction in analytical chemistry is miniaturization and multi-instrumental approach. Both approaches have been applied in the current research. A 0.5 × 0.5 mm amber sample is placed on a modified microscope slide compatible with various analytical instruments. In this way, a single sample can be measured on different instruments. The most common method for determining the origin of amber is Fourier transform infrared spectroscopy (FTIR), but other instrumental techniques can also be used to identify the place of origin. One of these techniques is Raman spectroscopy, where the I1645/I1450 intensity ratio has been proposed as an indicator of the age of amber. The band intensity at 1645 cm⁻¹ belongs to C=C bond and the 1450 cm⁻¹ band belongs to simple C-H bond. In this process, the C=C bond disappears, so that the I1645/I1450 ratio decreases. This paper introduces the methodology, the main research questions and the first results of the analyses.

7 WOOL, LINEN, SALT - THE TEXTILE ARCHAEOLOGICAL ANALYSES OF THE IRON AGE TEXTILES FROM THE SALT MINE DÜRRNBERG, AUSTRIA

Lau, Ronja (Ruhr-University Bochum)

The organic preservation of archaeological artefacts in salt mines offer a basis for textile archaeological analyses. The rich variety of finds provide insight into craftsmanship, design concepts, as well as cultural and social status. The Iron Age salt mine at Dürrnberg near Hallein, Austria, offers these possibilities and is now part of a new research project.

In this presentation I would like to present an overview of the textile finds from the salt mine. The site itself now has more than 800 textiles, and a small selection is intended to show just how multifaceted Iron Age textiles can be. The main questions which I will address are: What is the quality of Iron Age textiles? What patterns and colours can we recognise? What differences do we see compared to earlier finds? And where did the resources come from?

With regard to the use of resources, the interdisciplinary approach of textile research will be demonstrated due to scientific analyses. With the help of chemical colour analyses and fibre determinations, we can track and compare textile technologies over the centuries.

Cultural differences are usually reflected in changes in the choice of colours and patterns in textiles. But also changes in the use of resources. After the overview, the main focus will be on direct comparisons between the Hallstatt salt mine and Dürrnberg. What has changed in the fabrics and how can this be recognised?

Not only the textiles themselves give an indication of the life of the people. Textile tools such as spindle whorls and weaving weights not only have a practical use, but often also a representative one. This is why these objects offer an insight into social structures.

Together with the textiles, the textile tools and the scientific analyses, we can create a socio-economic picture of the Dürrnberg.

8 HANDICRAFT ARCHAEOLOGY BASED ON INTELLIGENT TECHNOLOGY (HABIT)

Neiß, Michael (POSTDOC: Lund University (Department of Archaeology & Ancient History); GUEST RESEARCHER: Aarhus University (UrbNet - Centre for Urban Network Evolutions))

Thanks to new possibilities in natural and digital sciences, Viking Age scholarship is experiencing an unparalleled renaissance in material research. But when it comes to the question of cultural transformation, some important aspects of ancient metal crafting remain to be explored. The Viking Age saw many “tribal” societies transform into heterogeneous Christian realms with urban centres which sometimes would grow further on into medieval towns. This transformation can be likened to interlocking chains of events that involved a plenitude of agents with different incentives. But the key contributions of the craftspeople to this ideological transformation have long been bound to eschew our grasp – due to some outdated dichotomies that need to be overcome! Although, the scholarly debate on the Viking Era urbanisation process is gravitating towards the significance of different groups of craftspeople, it still remains to be connected with the similarly important debate on urban centres as meeting points for ideologies and religions. What sets Viking Age towns apart from antedating Iron Age central places is the ever increasing output in standardized utility goods that conveyed pictorial messages. Nowadays, artisans are envisioned as active creators of the cultural universe they inhabit. Many choices within the manufacturing process are culturally conditioned and express a mentality. Thus, an analysis of operational sequences might offer a key to the inner workings of Viking Period society. Certain changes in the artisan habitus that facilitated standardization were not likely caused by new selling opportunities alone, but also by the very gradual mental shifts that contributed to the emergence of a novel ideological superstructure that transformed Scandinavia into Christian realms. It is therefore imperative to analyze the interplay between this cultural change and the habitus of Viking Period artisans, their pictorial messages and how their output was received at different stages of the process.

9 TYPOLOGISTS MEET THE WORLD: AN EYE-TRACKING EXPERIMENT ON POTTERY STYLES FROM CENTRAL GERMANY, NORTHERN DENMARK AND NORTHERN SPAIN

Scholtus, Lizzie (XSCAPE Project on “Material Minds” (ERC 2020 Synergy Grant 951631); Christian Albrecht Universität zu Kiel) - Vindrola-Adrós, Bruno (XSCAPE Project on “Material Minds” (ERC 2020 Synergy Grant 951631); Christian Albrecht Universität zu Kiel)

Using typologies and the well-known love of archaeologists for classification systems, we are now able to determine the date of an object, how it was made and even where it comes from. Moreover, it is sometimes possible to link certain types to a specific part of the society or a specific cultural group.

However, it is still difficult to determine how different material culture types were perceived by past societies and what were the effects on the people using or seeing them, particularly at a time where the potter’s wheel was introduced. Are the social and economical changes (e. g. first agglomerations) or the innovations in production (e. g. potter’s wheel) that we see appearing as archaeologists during Iron Age affecting the way these objects are perceived or looked

at? And thus, does the material culture affect the way a given group would see and perceive the world? Until what point are our patterns of visual attention common to every human being and until what point are we influenced by our social and cultural background?

Through the novel use of eye-tracking techniques, in this paper we aim to characterise the stylistic changes in artefacts and the influence of those on people based on the visual behaviour of archaeologists and non-archaeologists. We conducted several experiments on around a hundred participants looking at 20 Iron Age pots (drawings, photographs and real objects) from central Germany, northern Denmark and northern Spain. We will particularly focus on how these people look at ceramic objects today, and how the task of free-viewing different types of European Iron Age ceramics have an effect on their patterns of visual attention (such as gaze positions, visual scan paths, fixations) and cognitive load.

409 OUT ACROSS THE SEA: BELL BEAKER MARITIME CONNECTIONS AND NETWORKS IN THE MEDITERRANEAN

Session theme: 6. The Mediterranean from Within

Session organisers: Derenne, Eve (Johannes Gutenberg University Mainz) - Ivanova-Bieg, Maria (Johannes Gutenberg University Mainz) - Sousa, Ana Catarina (University of Lisbon) - Câmara Serrano, Juan Antonio (University of Granada) - Giannitrapani, Enrico (Arkeos)

Session format: Session with keynote presentation and discussion

The late fourth and third millennium BCE saw the development of new long-distance maritime networks around the Mediterranean. During this late Chalcolithic phase, the 'mental mapping' of the Mediterranean as a maritime space reached a critical stage; the influx of new people and cultural traits, combined with a boom in seaborne exchange, meant that the western and central Mediterranean became integrated into a large maritime cultural area. Circulation routes seem to have expanded remarkably after 2500 cal BC, enabling large-scale cultural phenomena such as the Bell Beaker complex to spread across the Mediterranean and integrate a variety of local Chalcolithic groups, both on islands and in coastal or mainland areas. These large-scale networks of interaction foreshadowed the emergence of major Mediterranean civilizations in the next millennium. With this in mind, this session aims to examine the origins and dynamics of Bell Beaker connections across the Mediterranean, be it in terms of material culture, subsistence strategies, technology, human-environment relationships, absolute chronology, genomic ancestry, or isotopic provenance. We welcome presentations focused on mobility, cultural influence and exchange between islands and littoral areas during the fourth, third and early second millennia BCE. Discussions of Bell Beaker context integration in Chalcolithic societies and continued influence into the Bronze Age will be particularly appreciated.

ABSTRACTS

1 SEASCAPES: TRACING THE EMERGENCE AND SPREAD OF MARITIME NETWORKS IN THE MEDITERRANEAN DURING THE 3RD MILLENNIUM BCE

Ivanova-Bieg, Maria (University of Mainz) - Cramp, Lucy (University of Bristol) - Derenne, Eve (University of Mainz)

The 3rd millennium BCE witnessed a significant surge in maritime activity across the western and central Mediterranean, catalyzed by the dispersal of the so-called 'Bell Beaker complex.' The use of Bell Beaker pottery and associated archery gear, copper weapons, and distinctive personal ornaments, extended from the Iberian Peninsula in the west to the Tyrrhenian coast of Italy in the east, including the Balearic islands, the southern coast of France, Sardinia, Sicily, Morocco and coastal Algeria. Archaeological investigations seem to indicate a west-to-east spread of the Beaker complex by sea, related to seaborne mobility that expanded the geographic knowledge of prehistoric Mediterranean communities. However, our understanding of this early maritime world is impeded by the lack of precise temporal frameworks. To address this limitation, the SEASCAPES project conducts an extensive radiocarbon dating initiative for Mediterranean Bell Beakers and employs chrono-spatial modeling to uncover the origins, growth and decline of Bell Beaker maritime networks. This talk presents preliminary results, providing critical insights into the emergence and evolution of maritime connections during the 3rd millennium BCE.

2 EXCHANGE NETWORKS DURING THE CHALCOLITHIC PERIOD OF THE IBERIAN PENINSULA

Schuhmacher, Thomas (German Archaeological Institute - Madrid Department)

The studies on ivory objects from the Chalcolithic period of the Iberian Peninsula and Northwest Africa demonstrated that the consumption of ivory objects in the Iberian Peninsula began at the end of the 4th millennium BC, corresponding with the start of social complexity and a prestige-based elite. Especially in the biggest and more complex tombs of the end of the 4th and the 3rd millennium BC very sophisticated objects made in exotic raw materials such

as gold, ivory, ostrich egg-shells, rock crystal, variscite and amber, aside from ceramics and flint objects are coming together. Regional, inter-regional and even long-distance exchange over the Mediterranean of diversified raw materials and objects became a capital issue for the Chalcolithic societies. This implies also the movement of individuals. Several big settlements with an important agglomeration of people emerged as central places, production centers and gateways for the exchange of products and exotic goods.

By scientific analysis two different exchange networks of ivory during the Chalcolithic could be recognised, by which on one hand Asian elephant ivory, probably together with hippopotamus ivory and Sicilian amber, reached the South-east of the Iberian Peninsula and the Guadalquivir estuary. At the same time, from the Atlantic coast of what is today Morocco African elephant ivory reached the fortified settlements and/or ditched enclosures of the Atlantic coasts of Portugal and southwestern Spain by peer-polity interaction in exchange for painted pottery, metal objects and silex daggers during the Early Chalcolithic and for Bell Beaker vessels and other objects of the Bell Beaker complex during the Late Chalcolithic. Mainly raw material came to the Iberian Peninsula, where it was processed locally, redistributed and consumed in elite burials. We could also detect a complex network of regional and inter-regional exchange in the Iberian Peninsula related with the redistribution of ivory.

3 SARDINIA BETWEEN THE CHALCOLITHIC AND THE BRONZE AGE: THE RELATIONSHIP BETWEEN THE BELL BEAKER PHENOMENON AND INDIGENOUS CULTURES

Cicilloni, Riccardo (University of Cagliari)

In Sardinia, after the basic culture of San Michele di Ozieri, at the end of the Neolithic (4000-3300 BC), a series of cultural facies developed at the beginning of the Eneolithic, still strictly connected with the strong Ozieri heritage, at least until the appearance of a new cultural aspect, called the "Monte Claro culture" (2700-2200 BC), in which highly innovative elements appear, representing a clear break with the previous phases, so much so that some scholars see an arrival of populations from outside, linked to the broader phenomenon of the grooved ceramic cultures of the western Mediterranean. Although not everyone agrees with this hypothesis, there are surely strong elements of discontinuity, which still remain to be explained, as well as the origins of the phenomenon. The arrival on the island of the Bell Beaker culture, which chronologically joins the Monte Claro culture, would seem to be involved, in some way, with the evolution of the latter culture. Furthermore, understanding the relationship between the Monte Claro culture and the Bell Beaker culture could provide us with new data on the birth, during the middle Bronze Age (1900-1350 BC), of the subsequent Nuragic civilization, whose origins are still to be well defined, even if in a probable indigenous context.

4 ARCHAEOGENETICS ILLUMINATES BELL BEAKER FAMILY NETWORKS ACROSS WESTERN EUROPE

Olalde, Iñigo (Departamento de Zoología y Biología Celular Animal, Universidad del País Vasco; Ikerbasque - Basque Foundation for Science; Department of Human Evolutionary Biology, Harvard University, Cambridge, MA, USA) - Reich, David (Department of Human Evolutionary Biology, Harvard University, Cambridge, MA, USA; Department of Genetics, Harvard Medical School, Boston, MA, USA; Howard Hughes Medical Institute, Harvard Medical School, Boston, MA, USA; Broad Institute of MIT and Harvard, Cambridge, MA, USA) - Ringbauer, Harald (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, 04103 Leipzig, Germany)

The recovery of ancient genomes using Next-Generation Sequencing techniques is arguably the technological innovation with more impact on the study of the human past over the last decade. The crucial leap has been the move from single genetic markers such as mitochondrial DNA (mtDNA), that only informs about the strictly maternal ancestry lines and therefore about an extremely limited set of ancestors, to millions of genetic markers along the nuclear genome that inform about the whole set of ancestors an individual has at different points in the past.

The 3rd millennium BC in Western Europe is one of the most intensively sampled periods in the ancient DNA literature so far. These studies documented a clear demographic change linked to the arrival of groups from Eastern Europe and their admixture with local populations. In several regions within Western and Central Europe, the earliest attestation of this new ancestry strongly relates to Bell Beaker-associated individuals, pointing to the Bell Beaker Complex as a key actor for understanding mobility and interactions during the Chalcolithic.

Very recently, the development of novel analytical tools for detecting distant relatives in ancient DNA data makes it possible for the first time to draw direct genealogical links between individuals excavated across vast distances. These analyses are already revealing large-scale networks of interaction within Bell Beaker contexts and will substantially enrich our knowledge of the Bell Beaker expansion and integration into local societies.

5 HUMAN (ENVIRONMENT) INTERACTIONS IN THE MEDITERRANEAN DURING THE COPPER AGE: A FOCUS ON CENTRAL-SOUTHERN ITALY

Bernardini, Sara (Department of Cultural Heritage, University of Bologna, Italy; Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Italy; Aix Marseille Univ, CNRS, Minist Culture, LAMPEA, Aix-en-Provence, France) - Farese, Martina (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Italy) - Goude, Gwenaëlle (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA, Aix-en-Provence, France) - Tafuri, Mary Anne (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances (MAREA) Centre, Sapienza University of Rome, Italy)

During the 4th and 3rd millennia BCE in the Mediterranean, long-distance interactions are deducible from the archaeological record and in some communal cultural patterns. However, where present, the isotopic data show that displacements were more on an inter-regional or small scale. The study of isotopic analysis on human, animal and plant remains over a large area -the Mediterranean-, aimed at reconstructing dietary practices and mobility, is a complementary way to study group connections along with human-environment interactions on a large scale. Whereas, targeted multi-isotope analysis helps to better discriminate the area of exploitation. Here we present a case study on central-southern Italy during these millennia by integrating multi-isotope analysis and archaeological evidence. During the Copper Age, in the Italian Peninsula and islands, the material culture production and the funerary ritual show distinguishable regional traits parallel to a vast diffusion and reciprocal influence, hinting at a strong network of relations all along the Peninsula. This pattern is partly reflected by the results of this multidisciplinary study, with food choices seemingly mostly site-related and showing different strategies of land exploitation according to the funerary ritual, along with short-range mobility likely related to pastoralism and raw materials research. Profiting of this multidisciplinary session, we look forward to discuss to what extent cultural tradition -such as dietary practices- have influenced the Bell Beaker integration in Italy? Starting from the Italian case study, we investigated the available isotopic data from the Mediterranean through Bayesian modelling, trying to trace ecological and cultural tendencies in environmental exploitation and movement in these peculiar millennia. The use of the Bayesian model also permits to monitor data gaps present for these millennia in this large area, promoting future research in the perspective of understanding the puzzle of interactions emerging from the archaeological evidence.

6 ARCHER BRACELETS FROM THE LARGE ITALIAN ISLANDS, SARDINIA AND SICILY: DISTRIBUTION AND CIRCULATION

Spanedda, Liliana (University of Granada) - Pau, Claudia (University of Granada)

In the present work, typological and contextual data were collected on an important group of artefacts associated with the Beaker phenomenon, the so-called archer bracelets or brassards. The geographical distribution of these prehistoric objects in the two large islands of the western Mediterranean, Sardinia and Sicily, has been studied; creating a new, complete and updated inventory of this category of artefacts.

They were analysed morphologically and morphometrically, taking into account some fundamental parameters such as perforations, length, width and section. The artefacts were drawn, photographed and scanned, collected into groups and these, in turn, divided into subgroups, types and subtypes; highlighting the artefacts characterized by particular shapes, such as the brassard from Sbrivula cave (Noto, Syracuse, Sicily) that present perforations on the short sides and a wavy profile, or the example with a pseudo-lozenge shape from Cava Bernardina di Melilli (Syracuse, Sicily). Other specific cases of archer bracelets have been described, such as Anghelu Ruju (Alghero, Sassari, Sardinia) decorated with concentric circles around a central dot. Furthermore, though a careful analysis, information will be obtained on the raw materials used in the manufacturing of bracelets, mainly made in lithic materials but also in hard animal material (Gattolo brassard, Mazara del Vallo, Trapani, Sicily), ivory (Anghelu Ruju, Alghero, Sassari, Sardinia) and metal (Veneroso collection in Sicily). The main objective of this work is to research on the modalities of raw materials and objects circulation in the study area and the relationships with neighbouring regions of the Western Mediterranean.

7 THE MARITIME CONNECTIVITY OF MEDITERRANEAN AFRICA DURING THE 'LONG' THIRD MILLENNIUM BC

Broodbank, Cyprian (McDonald Institute, University of Cambridge) - Lucarini, Giulio (National Research Council of Italy, Institute of Heritage Science, Italy) - Bokbot, Youssef (Institut National des Sciences de l'Archéologie et du Patrimoine, Morocco)

The dramatic expansion of maritime interconnections within and between many regions of the Mediterranean during the 'long' third millennium BC (ca. 3500-2000 BC) is well-known. Recently, this has been given further impetus by aDNA results that, when interpreted in the framework of broader archaeological models of Mediterranean mobility,

can shed new light on the period's dynamics. To date, however, there has been one glaring absence. This concerns the people and communities of the Mediterranean's southern, African, shore. A surprising diminution in the data for this timespan within north Africa west of Egypt, even relative to the under-researched preceding millennia, has left this region's participation in wider networks only glimpsable through its raw materials (e.g. ivory and ostrich egg) abroad, and finds of European material in Africa (e.g. beaker sherds and metalwork in the northwest Maghreb). Three new sources of insight now enable Mediterranean African societies to take their proper place as active participants in these networks. First, configurational analysis of the coastal properties of the southern shore identifies likely areas for the emergence of indigenous African maritime activity, with striking archaeological correlates. Second, aDNA and other biological analyses have identified people of recent African ancestry in Iberia, Sardinia and Malta over this period. Third, and most vitally, new Anglo-Italian-Moroccan fieldwork at Oued Beht in northwest Morocco reveals a large-scale agricultural community of the later fourth to early third millennia BC, comparable in many ways to those of southern Iberia, with an abundant, locally made pattern-painted pottery hitherto best attested north of the Gibraltar strait. The Maghreb must now be acknowledged as a fully integral element of the complex inter-regional processes that created a Mediterranean world over these and succeeding millennia.

8 UNVEILING THE IVORY TRAIL: EXPLORING TRANS-REGIONAL CONNECTIVITY AND MOBILITY PATTERNS IN THE MEDITERRANEAN BELL BEAKERS THROUGH COMPUTATIONAL MODELLING

Morillo León, José Miguel (Christian Albrecht University of Kiel) - Kempf, Michael (Quaternary Geology, Department of Environmental Sciences, University of Basel) - Bilotti, Giacomo (Christian Albrecht University of Kiel)

Trans-regional connectivity between different groups is one of the most relevant aspects in the socio-cultural characterization of the Copper and Bronze Age. From a material culture perspective, the study of tracing raw material exchange has been a widely considered approach, especially after the normalization of archaeometric analysis.

During the Bell Beaker period, ivory appears to be one of the most important resources, at least for the Western Mediterranean communities, which required a relatively stable flow of this material, unavailable in the whole northern half of the Mediterranean Basin. However, tracing the flow of ivory has mostly been restricted to traditional theoretical models of raw material distributions deriving from socio-culturally centred considerations.

In this contribution, we focus on environmental and geographic conditions to explore the potential transportation networks and dissemination routes of ivory raw material from the African shores and the Eastern Mediterranean towards the Western Basin.

Implementing computational environmental and archaeological modelling, we present a fully reproducible quantitative approach to estimate potential communication and transportation networks based on environmental covariates. We deploy a Network Analysis model and a predictive model based on Least Cost Path density to propose a potential land- and sea-based movement corridor for the western Mediterranean Basin that could have enabled the cultural spread of ivory and other resources during the 3rd and 2nd millennia BC.

The results obtained show a significant parallelism with the expansion of the Maritime Bell Beakers, that characterizes the Mediterranean variant of this archaeological phenomenon. Particularly the model is shedding light on the physical patterns of transportation and mobility that contributed to the expansion of the Bell Beaker horizon, and establishes the probable paths of the expansion of this early global cultural phenomenon.

9 COPPER, GOLD, IVORY AND CINNABAR: POWER DISPLAY AND EXCHANGE NETWORKS IN THE BELL BEAKER TOMBS OF HUMANEJOS (PARLA, MADRID, SPAIN)

Garrido-Pena, Rafael (Universidad Autónoma de Madrid) - Paulos-Bravo, Rodrigo (Universidad Complutense de Madrid) - Flores-Fernández, Raúl (Independent Scholar (Madrid, Spain)) - Herrero-Corral, Ana (Austrian Archaeological Institute (Austrian Academy of Sciences))

The interior of Iberia shows one of the biggest concentrations of Bell Beaker finds in western Europe and has also seen the discovery of rich Bell Beaker cemeteries in the last decades, such as Humanejos, where just nine tombs display an extraordinary concentration of wealth. The grave goods documented are 56 complete vessels, 42% of them located in just two graves, both plain and decorated with Maritime and Late Beakers Ciempozuelos styles. There are also 4 stone wrist-guards, 34 metallic elements, both in copper (4 tanged daggers, 7 Palmela Points, 3 awls, a flat axe and an Atlantic halberd) and gold (18 small ornaments), concentrated in two tombs. The lead isotope analyses show different origins for the copper and this fact, together with the discovery of other grave goods made on exotic raw materials like ivory (8 V-perforated buttons and 44 necklace beads) or the presence of cinnabar, point to the connection of those individuals buried in the Beaker tombs of Humanejos with varied and widespread exchange and social networks. But even the genomic analyses made on 22 individuals, show wider connections. Amongst them three males had the steppe signal, as it has been widely documented in Bell Beaker male tombs in Iberia, but another man lacks this genomic trait. This contrasts with the general pattern, opening interesting lines of research for future samplings in

the site. Moreover, the strontium isotopes did not show female exogamy and patrilocality patterns, but a possible bilocal system, with the exception of a woman, probably the richest female Beaker burial in Iberia, who is a clear outlier.

10 THE COPPER'S SHINE. AN APPROACH TO PALMELA ARROWHEADS BASED ON THE COLLECTION FROM THE ALCOBAÇA CAVES (ALCOBAÇA, PORTUGAL)

Santos, Michelle (Independent research) - Delicado, Cátia (Faculdade de Letras da Universidade de Lisboa)

Among the metallic artefacts collected by Vieira Natividade in the interventions carried out in the caves of Carvalhal de Aljubarrota valley, the results of which were pioneered in a monograph of the same name (Natividade, 1901), several copper arrowheads «Palmela type» stand out. The morphological differences seem to be the best explanation for the typological variety and functionality of the tips, which seem to be a type of very standardized metallic artifact, which circulated widely and in a vast geographical area, with great expression in the Iberian Peninsula. The emergence of different typologies in different contexts (domestic, funerary, cultural and commercial routes), which coexisted at a given time, reaching an expressive geographical dispersion throughout Europe, constitute unavoidable references of the Bell Beaker phenomenon.

In this presentation, we seek to systematize the information produced about these artifacts and to better understand the impact of their geographical distribution on Western Iberia and the primitive metallurgical practices, their evolution and their influence on the daily lives of the communities of the 3rd millennium BCE.

The collection of V. Natividade, now part of the Museum of Alcobaça, demonstrates the importance of revisiting old collections. The careful observation of this collection allowed us to identify a new typology. Can we hypothetically point to a local/regional typological variant? Many other known specimens from the contexts of Portuguese Estremadura did not present this particularity. Are these two ends the result of an accident of production or of the will of the craftsman who produced them? Does the prismatic peduncle recorded in the two specimens with a rhomboidal leaf, a flat and elongated peduncle, means some technological evolution or later chronological phasing? These Palmela arrowheads collected by M. Vieira Natividade came from caves used as funerary spaces, possibly between the 6th and the 2nd millennium BCE.

11 PRODUCTION AND CIRCULATION: THE POTTERY FROM THE SITE OF EL CERRO DE LA VIRGEN (ORCE, GRANADA SPAIN) (2600/2500-2150/1900 BC)

Pinillos de la Granja, Paula (Universidad de Granada) - Dorado Alejos, Alberto (Departament of Prehistory and Archaeology (University of Granada)) - Cámara Serrano, Juan Antonio (Departament of Prehistory and Archaeology (University of Granada)) - Molina González, Fernando (Departament of Prehistory and Archaeology (University of Granada))

Technology is a social phenomenon identified by values and attitudes that condition the search for and extraction of raw materials, the obtaining and use of the finished product. Cerro de la Virgen (Orce, Granada) is an exceptional archaeological site serving to characterise southeastern Iberia's Chalcolithic pottery production as well as to delve into the role played by the Bell Beaker phenomenon in the cultural development of these human communities.

This proposal presents the results of the technological and typological analysis of ceramics (smooth and decorated Bell Beaker) from the middle of the Chalcolithic (2600/2500-2150 BC), to the transition to the local Early Bronze Age (2150-1900 BC). The main objective is to approach the origin, the degree of adoption and the meaning acquired by Bell Beaker pottery in the societies of the Iberian Southeast, focusing on a domestic context at a time when these societies were immersed in a process of growing social complexity.

The study will serve as a reference for the study of local integration and will allow us to approach the influence of the Bell Beaker phenomenon in the southeast of Iberia. It will also show that the symbolic value of this ware was not limited exclusively to the funerary context and will provide points of comparison with other archaeological contexts for future results of ceramic assemblages linked to the Recent Chalcolithic and Early Bronze Age.

12 THE ORANGE AND GREY VS. BELL BEAKER CERAMIC PRODUCTIONS AT LOS MILLARES (ALMERÍA, SPAIN). NEW BASES FOR THEIR SEQUENTIAL AND TECHNOLOGICAL INTERPRETATION

Castillo Gallego, Francisco (University of Granada) - Dorado Alejos, Alberto (Lab. of Archaeometry, Department of Prehistory and Archaeology, University of Granada) - Cámara Serrano, Juan (Department of Prehistory and Archaeology, University of Granada)

As is known, the studies of ceramic productions include a wide range of approaches from which we try to determine aspects related to their manufacture, function, meaning, etc. From this base, we are going to try to make a first approach to the so-called "orange", "grey" and Bell Beaker ceramic productions at the Los Millares site (Santa Fe de

Mondújar, Almería, Spain). On the one hand, the appearance of Bell Beaker vessels is a complex cultural phenomenon that implies profound relationships between Chalcolithic communities throughout the European continent. However, their integration into the preceding sets of material culture, which must have occurred around 2600/2500 BC, as well as the local evolution that developed in each community, is of great interest for understanding these societies in the process of hierarchisation. On the other hand, we consider that Los Millares, the occupation of which extends between 3200 and 2200 cal BC approximately, can be of great relevance, as it shows throughout its sequence different ceramic productions (common and fine) with formal and technological changes. Amongst the "fine" ceramics, we should highlight the "orange", "grey" and Bell Beaker productions. This proposal, therefore, aims to trace the formal and technical changes in these productions over time, to determine their distribution in the site and to investigate the role that all these ceramic classes may have had for these communities, paying special attention to the relationship of these fine ceramics with the rest of the ceramic production of the site.

13 THE BELL BEAKER LEVELS OF CAL CONDE (CABRERA DE MAR, SPAIN): PRELIMINARY RESULTS AND ARTIFACT ANALYSIS OF A MEDITERRANEAN SITE

Marín González, Lara (Universitat Autònoma de Barcelona) - Sanmiguel de la Fuente, Ana (Universitat Autònoma de Barcelona) - Monforte-Barberan, Andreu (Universitat Autònoma de Barcelona) - Molist Montaña, Miquel (Universitat Autònoma de Barcelona) - Bach Gómez, Anna (Universitat Autònoma de Barcelona)

The execution of preventive excavation in an open area, motivated by the development of public infrastructures or private promotions, often leads to unpublished results and unstudied collections. This is the case of Cal Conde, located in Cabrera de Mar (Spain), a site dug by the company ABANS Serveis Culturals S.L. between the years 2018 and 2020. This site presents a large stratigraphic sequence, including several Bell Beaker levels with evidence of metallurgical activities. In this context, we present a preliminary review of the site and the materials, that encompasses ceramic, metallurgical, lithic and macrolithic artifacts as well as a single ivory button. The ceramic collection stands out for its decoration, which includes international Bell Beaker, as well as common ware. These levels are characterized by numerous shards of pottery which have been highly taphonomically altered. Applying formal analysis on these materials, we aim to tackle the stylistic and technological development of all the aforementioned productions; as well as presenting this unpublished site and information that may contribute to the study of the Bell Beaker phenomenon in the Catalan coastal area and its Mediterranean connections.

411 WHAT ARE THE NEXT CHALLENGES FOR THE PROFESSIONAL ETHICS OF HUMAN REMAINS?

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Nilsson Stutz, Liv (Linnaeus University) - Tarlow, Sarah (University of Leicester) - Törv, Mari (University of Tartu)

Session format: Round table (without formal abstracts)

Over the past several decades, archaeologists, biological anthropologists, medical historians, and museum professionals have discussed the ethics of curating, exhibiting, and carrying out research on human remains. As part of these debates – often drawing on postcolonial critique and decolonization tropes, we have seen the formulation and implementation of new best practices, ethical guidelines, and sometimes even laws to regulate the field, but despite these changes, many fundamental ethical challenges remain unsolved. Ethics are multidimensional and not static. Many proposed solutions carry their own problems, and at the same time, the debates inside and beyond the field are creating pressures that may lead us to identify "quick fixes" rather than thought through processes. Adding to the persistence of fundamental ethical challenges, the debate is currently moving into new areas of concern. New categories of human remains emerge as problematic, new methods and new tools and practices (from DNA analyses to Open Access and Open Data), present entirely new challenges. The culture in which our work is situated has also changed, and we now need to carefully consider dimensions such as privacy and dignity of our subjects, in the new and often unregulated spaces of social media. In this roundtable we will move beyond the dominating debates about the ethics of human remains and explore these new and emerging challenges, and how they relate to fundamental dilemmas concerning human remains.

417 HISPANIA AND THE MEDITERRANEAN: NEW APPROACHES TO THE ANALYSIS OF SEA-AND-INLAND NETWORKS (3RD C. BC-7TH C. AD)

Session theme: 6. The Mediterranean from Within

Session organisers: Pina Buron, Maria Rosa (Universidad Nacional de Educación a Distancia) - Colom Mendoza, Enric (Universidad Nacional de Educación a Distancia) - Quaresma, José Carlos (Universidade Nova de Lisboa)

Session format: Regular session

From the 3rd c. BC onwards, especially after the end of the Second Punic War, the Iberian Peninsula became a growing pole of attraction for people, goods, and money, thus beginning a long period of intense commercial and cultural exchanges based on sea borne communications that lasted until the Late Antiquity. Accordingly, the center-periphery relations between Hispania and other regions of western Europe, as well as its major contribution to the economic growth of the Roman Empire, have capitalized on a large part of the research since the 1970s. The goal of this session is to offer an up-to-date and multidisciplinary overview to the mobility and connectivity between Hispania and overseas regions (including the Mediterranean basin and the Atlantic façade) from the 3rd c. BC to the 7th c. AD. We also aim to broaden the discussion to its methods of research, with special regard to the rigorous analysis of material culture.

The past decades research on fine wares, amphorae and other typologies has produced a watershed in our knowledge related to the main periods: Late Republic, High and Middle Empire and Late Antiquity. In addition to the geo-economic role of Mediterranean Hispania, with special emphasis on the Baetican olive oil and the Dressel 20 amphora, wine from the Mediterranean coast of Tarraconensis and fish sauces from the bay of Gades and Lusitania, a complex import-export network has linked the Mediterranean and the Atlantic, making Hispania a crucial pivot for our understanding of a globalising structure such as the Roman Economy.

General contributions and study cases on the following topics are welcome:

- Circulation of people, goods and ideas.
- Roman transport network analysis.
- Quantitative and big data analysis applied to distribution patterns.
- Stratigraphic approaches
- Interconnection between sea and land routes.
- Archaeometric studies.

ABSTRACTS

1 LATE REPUBLICAN LOCAL MONETARY NETWORKS IN THE SOUTHWEST OF THE IBERIAN PENINSULA

baeta, Alice (UNIRQ; University of Lisbon)

During the Late Republic, several cities on the Iberian Peninsula produced their own currency for local circulation to sustain their economies in everyday trade. Some with larger or smaller productions since based on the archaeological evidence, it was possible to have just one issue as the city of Ipses, or multiple series as Myrtilis. Being in the periphery of Rome's domain, this happened due to the lack of official Roman coins in circulation to supply the local demand, which was already adapted to a monetary economy.

We will therefore analyze the cities of Baesuris, Balsa, Cilpes, Ipses, Myrtilis and Ossonoba, which were all mentioned in the classical sources, meaning they had some structure and were known by the capital. The aim is to address the reasons these places needed to make their own coinage to maintain their trades, the size of these productions based on a dies study, and to create maps from finds with provenance to analyze the dispersion and therefore the reach of these local currencies. In this way, it will be possible to understand which cities were more important to the region, and to recreate the trade networks, and human and material flows.

2 TRACING THE FIRST ROMAN PRESENCE IN THE MINING DISTRICT OF SISAPO (2ND-1ST BC): ROAD AXES AND MATERIAL EVIDENCE

Nieto, Miriam (UNED) - Burón, M^a Rosa (UNED) - Prieto, Mar (UNED)

The mineral wealth of Spain was one of the incentives for Italian migration during the Republican period, as highlighted by ancient authors, and became a major catalyst for the early Romanization of its mining districts. In recent decades, archaeological research conducted in the mines and surrounding areas of both slopes of the Sierra Morena has revealed a significant presence of Italian people following the conquest of this space -the former land of the Oretani-,

as well as intense commercial traffic facilitated by land routes, resulting both in the proliferation of new settlements and a high dispersion of Italic imports between the 2nd and 1st centuries BC. The aim of this work is to provide a state-of-the-art overview of the connectivity of the mining district of Sisapo (La Bienvenida, Ciudad Real, Spain) with the Mediterranean basin through the analysis of two main sources of evidence: imported pottery assemblages coming from different sites related to mining activities (especially amphorae and tablewares) and the remains of Roman roads leading from this area to the main ports in the southern Iberian Peninsula (Corduba, Hispalis, Gades).

3 CERAMICS AND TRADE IN POLLENTIA (ALCÚDIA, MALLORCA, SPAIN): STUDY OF LATE REPUBLICAN AND HIGH IMPERIAL PHASES OF THE NORTHWEST HOUSE

Plaza Conesa, Paula (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona (ERAAUB), Barcelona, Spain.; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), Barcelona, Spain.; Universitat de Barcelona (UB), Barcelona, Spain.) - Guimarães, Raquel (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona (ERAAUB), Barcelona, Spain.; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), Barcelona, Spain.; Universitat de Barcelona (UB), Barcelona, Spain.; Fundação para a Ciência e Tecnologia (FCT), Lisboa, Portugal.) - Siclari, Patrizia (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona (ERAAUB), Barcelona, Spain.; Departamento de Prehistoria y Arqueología, Facultad de Geografía e Historia, Universidad de Sevilla, Sevilla, Spain.) - Mas Florit, Catalina (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona (ERAAUB), Barcelona, Spain.; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), Barcelona, Spain.; Universitat de Barcelona (UB), Barcelona, Spain.) - Chávez-Álvarez, Esther (Grupo de investigación ARQHISPA, Tenerife, Spain.; Departamento de Geografía e Historia, Universidad de La Laguna (ULL), Tenerife, Spain.) - Cau-Ontiveros, Miguel Ángel (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona (ERAAUB), Barcelona, Spain.; Institut d'Arqueologia de la Universitat de Barcelona (IAUB), Barcelona, Spain.; Universitat de Barcelona (UB), Barcelona, Spain.; Institució Catalana de Recerca i Estudis Avançats (ICREA), Barcelona, Spain.; Chercheur Associé, Aix Marseille Univ, CNRS, CCJ, Aix-en-Provence, France.)

The Roman city of Pollentia is situated on the northern coast of the island of Mallorca in the Balearics and holds a privileged position for controlling both the land and sea territory of the area. According to classical authors, it was conquered in 123 BC by the consul Quintus Caecilius Metellus along with the rest of the island. The military intervention of this insular territory is justified by its strategic significance in the maritime routes of the western Mediterranean. This importance is reflected in the diachronic evolution present in the ceramic contexts, which are fundamental for understanding the commercial dynamics of the region during the Roman period.

The current research project has rekindled the excavations of the Northwest House, a building traditionally identified as a domus in the residential area of Sa Portella, in the northern part of the city. There, three buildings are known to be distributed axially around the Porticoed Street and the North-South Street. The best-known phases are the High Imperial ones, but it also presents a Late Republican phase and occupation prior to the Roman period, as demonstrated by the remains of possible indigenous structures found beneath the Northwest House and the Porticoed Street.

The stratigraphy of this building has yielded several ceramic assemblages from indigenous, Late Republican, and High Imperial layers. This contribution aims to present the results of the study of the ceramic materials, with special attention to the Late Republican to the Early Imperial phases up to the 1st century AD. The goal is to provide new data on the commercialization and consumption of ceramic products during this transitional period in this insular city.

4 CONNECTIVITY ANALYSIS BETWEEN TARRACO (TARRAGONA, SPAIN) AND ITS HINTERLAND DURING THE LATE REPUBLICAN AND EARLY EMPIRE PERIODS

Mateo Corredor, Daniel (University of Alicante)

This presentation explores the connectivity and integration between the Roman provincial capital, Tarraco, and its hinterland from the onset of Roman presence until the end of the Early Empire, with amphorae as a primary indicator. It analyses the information from archaeological contexts with quantitative amphorae data from ancient Tarraco, along with amphorae records from the rural surroundings, particularly the Camp de Tarragona area, mostly gathered through various survey campaigns since the 1980s. Two complementary levels of analysis are employed: a proportion analysis of quantitative amphorae assemblages and a distribution pattern analysis based on the presence/absence of specific containers. The results reveal significant shifts in the distribution of amphorae reaching the port area of Tarraco during the Early Empire compared to the Late Republican phase. The aim is to discuss the possible causes that explain the uneven penetration of foodstuffs in the ager Tarraconensis and, ultimately, the potential and methodological limits of this approach.

5 NEW EVIDENCES OF TRADE NETWORKS BETWEEN HISPANIA AND ROME

Colom-Mendoza, Enric (UNED-ICAC) - Járrega-Domínguez, Ramon (ICAC)

Since 2016 we have initiated a collaboration agreement between Institut Català d'Arqueologia Clàssica (ICAC) and Sovrintendenza Capitolina ai beni culturali di Roma, in order to analyze all the amphorae from Hispania stored in the Musei dei Fori Imperiali (Mercati di Traiano). This project, called "Les àmfors hispàniques del Castro Pretorio conservades als Mercats de Trajà. Aportació a l'estudi del comerç entre Hispania i Roma durant l'Alt Imperi", allowed us to study the important archaeological context of fossa aggeris ad castra praetoria, among another ones. During this years, we have been analyzed more than 200 amphorae found in Rome and stored at the Mercati di Traiano, all documented by photogrammetric techniques. All this amphorae and the enormous amount of data recollected allow us to draw a new approach to the economic relation between Rome and Hispania, specially oil and fish sauces from Provincia Hispania Baetica and wine from Provincia Hispania Tarraconensis. In this communication we want to present a short briefing to our study, wich will be published in a book at the end of 2024.

6 SPANISH IMPORTS TO THE PORT OF OLBIA (NORTH-EAST SARDINIA)

Nervi, Cristina (MIM)

The Roman port of Olbia is located along the coast of Northeastern Sardinia, approximately where the Phoenician port was.

The geographical location of the city gave it great importance. It was situated right in front of Rome and became the location of the Annona warehouses.

Goods from all over the Mediterranean were stored in Olbia, awaiting distribution.

The Spanish amphorae (Tarraconensis and Baetic) found during the excavation of the port of Olbia span a chronological range from around 140 B.C. to 600 A.D.

The Spanish amphorae make up 6% of the total amphorae amount.

The contacts with Spain began in 140 B.C. with very few specimens. But they started to increase around the second half of the 1st century B.C. A real increase occurred between the second quarter and the middle of the 1st century A.D. In the second half of the 1st century A.D., there is the true peak in the importation of Spanish amphorae. Imports decrease and stabilize in the 2nd century A.D. From the 3rd century A.D. until the middle of the 5th century A.D. the regression in imports continues. From 450 onwards, specimens are rare and sporadic.

The arrival of the Vandals in Sardinia marked the definitive decline of trade in the port of Olbia.

The most imported type is the oil amphora Dressel 20, along with the Tarraconensis amphorae for salted products, Dressel 7-11. Another product was wine, carried in Dressel 2-4 Tarraconensis.

The port of Olbia, with its amphorae, outlines the shipping routes from the ports of Spain to Rome over a chronological span of about five centuries, allowing for the reconstruction of the passage of Spanish goods in the Tyrrhenian Sea from Sardinia and the Lazio coast and between Sardinia, the Balearic Islands and the eastern coast of Spain.

7 BEYOND THE SLIP SURFACE. AN ARCHAEOMETRIC APPROACH TO THE MICROSTRUCTURE AND CHEMICAL COMPOSITION OF BLACK GLOSS POTTERY FROM POMPEII

Ortega Palacios, Clàudia (Cultura Material i Arqueometria UB (ARQUB, GRACPE), Dept. Història i Arqueologia, Universitat de Barcelona, Barcelona, Spain) - Madrid i Fernández, Marisol (Cultura Material i Arqueometria UB (ARQUB, GRACPE), Dept. Història i Arqueologia, Universitat de Barcelona, Barcelona, Spain.) - G. Sinner, Alejandro (Department of Greek and Roman Studies, University of Victoria, Victoria, Canada)

Late Republican Black Gloss pottery, traditionally called Campanian pottery, was the first mass-produced tableware in the Roman world, arriving in large quantities throughout the western Mediterranean since the 2nd c. BCE. In this paper, we are pleased to present a comprehensive exploration into the microstructure and the chemical composition of the layer coating 56 sherds of Black Gloss pottery recovered from Pompeii (Campania, Italy).

Employing chemical analysis and microstructural examinations through scanning electron microscopy (SEM), this research aims to elucidate the composition, thickness, adherence to the matrix, and the vitrification stage of the slip. Not only do these characteristics serve an aesthetic purpose, but also contribute significantly to the impermeability and protection of the vessel. Additionally, this study assesses whether the raw materials employed in the manufacture of the barbotine correspond to the fine fraction of the same illitic clay used in the elaboration of the ceramic bodies, as several researchers have assumed for many years.

The research is founded on the chemical analysis previously obtained over the ceramic bodies through X-ray fluorescence (WD-XRF). This analysis has enabled the identification of up to four representative compositional groups, including a large group corresponding to a local Pompeian product, as well as two groups manufactured from an area

between Etruria and Latium, and that are frequently found in several north-eastern sites in Hispania (e.g.: Emporiae and Tarraco).

Only by examining the microstructure, as well as the connections between the slip surface and the ceramic body, we are able to observe significant differences between these Pompeian products and those with an Etrurian-Latial origin, a relevant point towards improving the archaeological classification and to attribute different technological solutions to the different workshops involved in the elaboration of this popular pottery.

8 NEW PERSPECTIVES ON LEVANTINE EASTERN SIGILLATA A REVEALED THROUGH ARCHAEOMETRY

Madrid i Fernández, Marisol (University of Barcelona) - Regev, Dalit (Israel Antiquities Authority) - Ortega Palacios, Clàudia (University of Barcelona)

Eastern Sigillata A (ESA) is the first red gloss fine ware distributed throughout the Mediterranean from the 2nd century BCE onwards. Their abundance documented in various Mediterranean sites from the east to the west (from the Levant to the Iberian Peninsula) allows us to hypothesise that multiple ceramists and workshops would have been involved in its production to supply all these markets. The intention to manufacture the same product with similar characteristics poses great difficulty for archaeologists to visually differentiate the products of those possible different workshops. However, this poses no problem at the archaeometric level.

Considering those issues, a first archaeometric approach to ESA in the Levant, supposed to be the origin of this pottery, has been carried out. Despite the lack of workshops at the archaeological level, the relationship between Eastern Sigillata A and Phoenician pottery made it worthwhile to propose the analysis of three sites dated to the 2nd century BCE: Akko Ptolemais, located along the northern coast of the southern Levant, Marisa, an inland administrative and trade centre, and Beit-Shean, which is in the northern Jordan valley.

The analytical study includes items characterised chemically and mineralogically using X-ray fluorescence and X-ray diffraction and microstructurally using Scanning Electron Microscopy. Provenance aside, archaeometric studies enabled us to identify technical characteristics related to the application of gloss and its features, as well as firing processes related to the temperature, atmosphere and the type of kiln used by the potters. All of this provides a complete insight into the level of knowledge of the ceramists involved in the production of this pottery and the flow of knowledge that circulated along with the materials themselves.

9 TWO CONTEXTS BETWEEN THE 4TH AND 6TH CENTURIES AD FROM MÉRIDA: STUDY OF THE CERAMIC AND GLASS TAXONOMIES IN STRATIGRAPHY

Lopes, Martim (University Rovira i Virgili; CHAM - Centro de Humanidades)

This work presents the full assemblage from two previously partially published contexts from Mérida, namely the stratigraphical units of waste dump from the excavations of Calle Muza nº38 and Calle José Ramón Mérida nº 37, where worked from a quantitative and statistical point of view.

Mérida, then Augusta Emerita, as the capital of the roman province of Lusitania was a central point for the comercial networks of the province, although its location could favour intra-provincial commerce such as with the Hispanic sigillata in determent of the products commercialized in the Mediterranean/Atlantic circuits.

The assemblage here analysed is composed of diversified ceramics with a particular emphasis on the terra sigillata with African D, Late Roman C and Late Hispanic Sigillata and on the coarse wares.

For the last category, various typologies were identified alongside different modulations and fabrics with the presence of some slow wheel, a phenomenon that this paper intent on quantify and compare with other examples from the province, namely from the region of Olisipo, one of the main portuary cities of the Atlantic façade of Lusitania.

10 A NEW AMPHITHEATER DISCOVERED IN AMMAIA (PORTUGAL): A PROVINCIAL MODEL

Barrero Martín, Nova (Museo Nacional de Arte Romano) - Basarrate, Trinidad (Museo Nacional de Arte Romano) - Fabião, Carlos Jorge (Universidade de Lisboa) - Viiegas, Catarina (Universidade de Lisboa) - Carvalho, Joaquim (Fundação Cidade Ammaia) - Guerra, Amílcar (Universidade de Lisboa)

The ancient Roman city of Ammaia is located next to the small town of São Salvador da Aramenha (Marvão, Portalegre). It constitutes one of the landmarks the Roman Province of Lusitania.

Ammaia was founded in the time of Emperor Augustus, towards the end of the first century B.C. and the beginning of the first century A.D. It was named Civitas around 44/45 A.D., obtaining the title of Municipium during the first century A.D.

The urban planning of the city is generally known thanks to the Radio-Past Project which, through geophysical surveys, generated a model of the city. The layout of its wall delimits the urbs, which may have had a perimeter moat.

There were at least four large entrance gates to the city, following the cardinal axes. Similarly, the forensic area is known, with the podium of the Temple raised.

Since 2018 the Foundation of Roman Studies and the National Museum of Roman Art joined the integral project of the city together with the City of Ammaia Foundation itself and the University of Lisbon. The geophysical surveys carried out on the perimeter of the city, outside the wall, where there were already signs of an area dedicated to public spaces, has allowed to recognize the fifth amphitheater of Lusitania. It is a construction perfectly adapted to the topography of the site, since one of the minor axes takes advantage of the steep slope of the hillside, previously used as a quarry, to seat part of the cavea. On the opposite axis, the boundary wall (muro limítrofe) is made of masonry and the main door through which the gladiators entered the arena has been excavated. Two small rooms have also been identified, with access only from the amphitheater arena, which could have auxiliary or religious functions.

426 WHEN GEOPHYSICS MEETS ARCHAEOLOGY: EXAMPLES FROM CULTURAL HERITAGE TO RESCUE ARCHAEOLOGY

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Barone, Pier Matteo (American University of Rome; Forensic Geoscience Italy) - Petersson, Håkan (University of Gothenburg, Department of Historical Studies; Sydsvensk Arkeologi Ltd) - Capizzi, Patrizia (Università di Palermo; Associazione Italiana del Georadar) - Tencer, Tomáš (Masaryk University, Department of Archaeology and Museology) - Moëll Pedersen, Grethe (University of Stavanger; Museum of Archaeology Department of Cultural Heritage)

Session format: Regular session

The session wishes to discuss the precision of knowledge achievable through geophysical investigation, with a specific focus on GPR and Magnetometry. Two different sub-topics are addressed. The first sub-topic delves into what degree geophysics can be adopted within development-led investigations (rescue archaeology), which varies considerably between countries. There is no universal agreement on the usefulness of the method within our time and cost-driven sector where reliable results are crucial. We (want) to host a methodological discussion about geophysical archaeology and large-scale development-led excavations. Our goal is to attract both proponents and sceptics, encouraging everyone to exchange experiences and initiate a productive dialogue. Both critical and positive opinions are most welcome in dialogue within this sub-session. What expectations should we have? Could geophysics be complementary to other traditional methods to increase our knowledge and have a more comprehensive picture and better understanding in advance of our time-driven decision-making? Or has it proven to be too unreliable for being used within time-cost-driven rescue archaeology?

The second sub-topic delves into the significance of advanced studies in Ground Penetrating Radar (GPR) specifically, exploring its current applications, potential future outcomes, and inviting a diverse array of presenters to contribute their expertise to archaeology and cultural heritage preservation. To enrich the discourse on advanced GPR studies, this sub-session calls upon a diverse array of presenters, including archaeologists, geophysicists, engineers, and technology developers. Contributions may span from successful case studies applying GPR in different cultural contexts to presentations on cutting-edge technologies that push the boundaries of current capabilities. By fostering interdisciplinary collaboration, this session seeks to create a dynamic platform for knowledge exchange, encouraging a holistic approach to the challenges and opportunities presented by GPR in archaeology and cultural heritage.

ABSTRACTS

1 SEEING WITH OTHER(S) EYES. GEOPHYSICS AND DEVELOPMENT-LED ARCHAEOLOGY FOR SECTION 3 OF SIBIU - PITESTI (A1) MOTORWAY CONSTRUCTION IN ROMANIA

Asandulesei, Andrei ("Alexandru Iona Cuza" University of Iași, Romania) - Borș, Corina (National History Museum of Romania) - Florea, Mihai (National History Museum of Romania) - Ștefan, Maria-Magdalena (National History Museum of Romania) - Șuteu, Călin (Gigapixel Art S.R.L.)

The incorporation of a non-intrusive assessment phase into the methodological framework of archaeological research should no longer be viewed merely as an exotic or optional desire expressed by archaeologists. Such interventions are increasingly essential, particularly in the context of extensive preventative research projects where the excavation of archaeological sites must proceed efficiently, very often amidst time or budget constraints.

It is important to note that this does not entail abandoning established sequences integral to the archaeological assessment process in a given area (such as surface surveys and intrusive diagnostics), but rather emphasizes their complementary nature. This approach aims to develop the most accurate understanding of the archaeological landscape.

Non-destructive techniques, including aerial photography, photogrammetry, and geophysical surveys, represent proven methods for identifying archaeological structures and assessing their planimetric complexity. Using extensive, high-resolution magnetometer surveys constitutes an essential aspect of cultural heritage management, providing a complementary method to trial trenching surveys for the detection and precise delineation of archaeological sites.

The case studies under our investigation were initially identified during the commencement of construction activities for a significant stretch of highway-type road infrastructure, namely Section 3 of the A1 highway in Romania, which is part of the IV Pan-European Transport Corridor. A total of 8 archaeological sites and 9 areas of interest were distinctly delineated as a result.

In general, we observe a significant correlation between the anomalies detected and those documented during preventive research, supporting the recommendation to incorporate this prospecting sequence into similar methodologies. Furthermore, we plead for the use of a combination of intrusive and non-intrusive methods during the diagnostic phase, not only as a methodologically sound approach but also as a necessary one. This approach ensures the reliability of the resulting data with a high level of precision, including clear site boundaries, spatial distribution of features, typology.

2 HERITAGE ASSESSMENT AND GEOPHYSICS: CHALLENGING 'RESCUE ARCHAEOLOGY' IN CONSULTANCY

Brooks, Poppy (Arcadis) - Latham, Alexandra (Arcadis)

In our role as private sector Heritage Consultants, the use of geophysical survey to better understand the archaeological and heritage baseline of a client site is often suggested as the first step of further assessment beyond desk-based assessment. The aim of our heritage assessments is to categorise archaeological sites, as part of the consenting process, to know its character and significance and propose appropriate mitigation measures. Having an awareness of the below-ground baseline at the beginning of the project can benefit us as consultants - we can provide better advice when we know what is there - and our clients as they can use this knowledge to help their budgets, scope, and design.

In this paper, we'd like to challenge the concept of 'rescue archaeology' and propose that during developer-led projects geophysical survey plays a part in our understanding of any below ground archaeological remains that may be present. Geophysics, alongside other work such as trial trenching, supports the reduction of risk for identifying unknown archaeological remains at construction avoiding the need for rescue excavation. As part of this paper we would like to discuss an Arcadis project, Otterpool, to demonstrate our points. The project used a combination of geophysics techniques to support heritage assessment, build on understanding of individual sites whilst feeding into the master plan to de-risk construction activities and enhance the historic environment through design.

3 LARGE SCALE MAGNETOMETRY SURVEY FOR MAJOR TRANSPORT INFRASTRUCTURE DEVELOPMENT - THE UK HS2 CASE STUDY

Carver, Jay (4AD Consultants Ltd)

Reconnaissance and site detection for UK High Speed 2 Rail Project Phase 1 involved commissioning of magnetometry surveys for all suitable land within a linear development area of several thousand hectares, between the cities of London and Birmingham. This paper will address the results of these surveys with reference to the subsequent ground truthing via archaeological trial trench and then detailed excavation areas. This enables an analysis of the effectiveness of the surveys and opportunity to identify regional variations in geology, superficial soils, and the types of sites detected and not detected, to corroborate a detection model for the regions assessed. The model will compare survey interpretation and classification of anomalies with the actual features detected via physical site investigation during the trial trenching and area excavation to establish a quantitative report on the effectiveness of surveys. Local conditions, in particular geology, superficial soils and recent land use are indicated to be a significant factor in determining detection/non detection of sites and this data it is analysed to provide some basis for developing local predictive models for site detection.

4 EARLY MEDIEVAL HILLFORT PRAGUE-VINOŘ: GEOPHYSICAL SURVEY AS A PART OF THE ARCHAEOLOGICAL INVESTIGATION

Fajta, Martin (Department of Archaeology, Faculty of Arts, Charles University)

Prague-Vinoř is a polycultural hillfort mainly associated with the early medieval Přemyslid domain in central Bohemia, Czech Republic. The Department of Archaeology of the Faculty of Arts of Charles University has been systematically investigating the site since 2013 using a combination of non-destructive methods and archaeological excavations.

Geophysics has played a significant role in the research of the site, with a wide range of applied methods including magnetometry, GPR, DEMP and ERT. Many measurements have been made over the years with different objectives and with varying interpretative value. Geophysics is not only used as a preliminary method, but measurements are

often carried out during time-limited excavation season to supplement the picture of the specific situations under investigation. Different geophysical methods are applied in the verification of extension of archaeological situations and in decision-making processes related to the organisation of fieldwork.

This paper summarizes the results of various geophysical surveys that have been conducted over many seasons and uses them to present the potential of different methods to complement ongoing excavations. Although the excavations in Prague-Vinoř are systematic and planned, this comparison can be applied to a variety of situations and may also be useful in development-led investigations.

5 COVERING NEW GROUND: GPR AND DEVELOPMENT-LED ARCHAEOLOGICAL SURVEYS IN ROGALAND, SOUTHWEST NORWAY

Pedersen, Grethe (Museum of Archaeology, University of Stavanger) - Gil Bell, Theo (Museum of Archaeology, University of Stavanger)

This presentation will discuss the current use and future potential of geophysical prospection techniques (ie. GPR) in pre-development archaeological surveys within the culture resource sector in Rogaland County, southwest Norway. We present an overview of the results of work conducted by the Arkeological Museum, University of Stavanger to address key questions regarding survey design and the integration of results into the planning processes as well as research agendas.

An extensive GPR survey carried out within the corridor of the proposed E39 motorway improvement scheme will be used as a case study. An area of 37000 m² was investigated in Moi, January 2020. However, due to delays and complications, arising because of the global pandemic, the results of the GPR survey were unable to be integrated into the planning of invasive archaeological surveys (ie. test-trenching) within the corridor.

By analyzing the results of the test-trench surveys and comparing them with the GPR data, we will propose a strategy that could have been recommended to the county municipality if the GPR data had arrived on time.

6 ADVANCING ARCHAEOLOGICAL CONSERVATION PRACTICE: GEOPHYSICAL SURVEYS IN MANTUA

Strapazzon, Guglielmo (Independent Researcher) - Marastoni, Chiara (Soprintendenza Archeologia, Belle Arti e Paesaggio of Lodi and Mantova) - Kainz, Jakob (University of Vienna) - Betto, Andrea (ArcSAT snc di Valente Vincenzo e C.)

The archaeological landscape of Italy's Po Valley faces threats from industrial agriculture and modern infrastructure development. While traditional excavation methods have long prevailed in archaeological practice, recent years have seen a notable shift towards non-invasive techniques. However, the integration of geophysical surveys has been slow until recently.

To address this challenge, the Archaeological Soprintendenza of Cremona, Mantua, and Lodi initiated a project focused on the province of Mantua. The primary objective is to establish "best practice guidelines" tailored to the sub-regional area, aiding authorities and professionals in evaluating the effectiveness of geophysical techniques concerning specific geomorphology, pedology, and archaeological deposits.

This extensive undertaking encompasses 12 sites spanning from the Neolithic to the post-medieval era, identified through remote sensing analysis, field surveys, and metal detecting.

To better understand the archaeological potential of the sites, geophysical surveys have been conducted over 30 hectares, primarily utilizing magnetometry and ground-penetrating radar, supplemented by soil sample analysis. Geophysical data have been validated through targeted test trenches, enhancing understanding of the preservation levels of archaeological features.

The integration of surface surveys, aerial photography, and geophysical surveys with stratigraphic excavation strengthens archaeological heritage protection, enabling a comprehensive assessment of site extension and archaeological potential. Guided by legislative frameworks, this interdisciplinary initiative strives for sustainable conservation, preserving Mantua's archaeological legacy as a replicable model for neighboring provinces.

7 STRATEGIC USE OF GPR SURVEYS WITHIN CONTRACT-ARCHAEOLOGY. EXPECTATIONS AND EVALUATION OF POTENTIAL IN SWEDEN

Petersson, Håkan (Department of Historical Studies, University of Gothenburg; Sydsvensk arkeologi Ltd)

In Sweden geophysical surveys, mostly GPR, in connection with rescue-archaeology have mainly been small-scale endeavours targeting limited areas, often within an urban context. Such projects have typically resulted in difficult to interpret data-sets, or in other instances data used to precisely locate structures known from written sources, such as building remains, stone walls etc. The aim has been helping the rescue archaeologists predict when excavating, or

where exactly to dig to find specific target objects known in advance. Another aspect has been to contextualise results from an excavation site, which within cities often is rather limited in space, by analysing a larger area of interest around the excavation. In those cases, it has been a high success rate.

In my talk however, I will present some results from our trial of large-scale multi-channel GPR surveys on arable land in rural areas. The aim of our approach has been to investigate the potential of geophysical methods in areas designated for archaeological excavations. Our approach is to collect GPR data, study and analyse it and then compare the result of the GPR surveys, along with our interpretations, to the findings from the excavations. From this I will briefly discuss the potential of the method within Swedish contract archaeology in the outset of the demands from our legislative system, from early planning, pre-investigations and test-trenching to the final rescue-excavation before the site is removed.

8 INTEGRATING GEOPHYSICAL AND GEOCHEMICAL DATA IN ARCHAEOLOGY - EXPERIENCE AND PRELIMINARY RESULTS FROM SEVERAL PROJECTS

Horak, Jan (University of Hradec Králové, Department of Archaeology) - Fišer, Jan (University of Hradec Králové, Department of Archaeology) - Milo, Peter (Masaryk University, Department of Archaeology and Museology) - Tencer, Tomáš (Masaryk University, Department of Archaeology and Museology) - Goláňová, Petra (Masaryk University, Department of Archaeology and Museology) - Parma, David (Institute for Archaeological Heritage, Brno) - Tichá Bambasová, Sylva (University of Hradec Králové, Department of Archaeology) - Soltészová, Kitty (University of Hradec Králové, Department of Archaeology) - Holas, Matouš (Museum of Eastern Bohemia in Hradec Králové) - Kindelmann, Petr (Osina Archo)

The data integration in archaeology and especially in archaeological prospection is a very often used term. However, it is not defined absolutely. We define the integration as a method where the input data from various methods are manipulated and influenced mathematically among datasets. We focused in our research to find methodological approach and workflow how to integrate geophysical and geochemical data. We use XRF spectrometrical geochemical data (elemental content) and magnetometric data in our example, but the workflow can be applied on any point and raster datasets.

Our results show, that it is a useful approach for archaeology, although questions still dominate over the answers, as the approach is quite new. We present several examples from various researches in various conditions: Iron Age enclosure with sunken features, not excavated prehistoric hillfort, La Tène period oppidum Bibracte with stone architecture and big area highway excavation with datasets ranging from lower hundreds to thousands of soil cores and areas covering several hectares.

This research activity is a part of our research initiative called IMAP – Integrated Multi-Methodological Archaeological Prospection.

This research initiative originated in the activities of the COAST action CA 17131 SAGA: The Soil Science & Archaeo-Geophysics Alliance (www.saga-cost.eu). The geochemical datasets were obtained during the project "Geochemical insight into non-destructive archaeological research" (LTC19016) of subprogram INTER-COST (LTC19) of program INTEREXCELLENCE by Ministry of Education, Youth and Sport of the Czech Republic. It was also supported by the Czech Science Foundation [Project: Mobility of materials and life cycles of artefacts: archaeometry of metals and glass of the La Tène and early Roman period; project number: 18-20096S]. Some datasets were obtained by activities of the Archaeo-Environmental Laboratory (<https://uni.uhk.cz/archeologie/envilab>) during rescue excavations of Czech highway infrastructure due to willingness of the Centre for Fieldwork Archaeology, Department of Archaeology of University of Hradec Králové.

9 USE OF GROUND-PENETRATING RADAR FOR ARCHAEOLOGICAL EXCAVATIONS AND CULTURAL HERITAGE MANAGEMENT IN THE CZECH REPUBLIC

Tencer, Tomáš (MUNI - Ústav archeologie a muzeologie) - Vágner, Michal (MUNI - Ústav archeologie a muzeologie) - Milo, Peter (MUNI - Ústav archeologie a muzeologie) - Šálka, David (MUNI - Ústav archeologie a muzeologie) - Havelka, Jan-Apač (MUNI - Ústav archeologie a muzeologie) - Rekemová, Anna-Mária (MUNI - Ústav archeologie a muzeologie) - Dejmal, Miroslav (MUNI - Ústav archeologie a muzeologie)

In recent years, geophysical surveys have become a standardised methodological tool in modern archaeology, offering a rapid, efficient, and affordable way to map hidden subsurface features. The information thus obtained not only provides an essential basis for scientific research but is also becoming an important source of knowledge both in the preliminary stages of rescue archaeological excavations as well as in the field of cultural heritage preservation and during the restoration of various immovable monuments. The increasing trust in the method by field archaeologists, investors, and cultural heritage management institutes slowly leads to their wider use and the discovery of their benefits and disadvantages for heritage management and rescue archaeology.

Exploring the applications of the geophysical methods in monument care within the Czech Republic, this contribution examines instances of their practical use in cultural heritage, especially in planning rescue archaeological research and during the revitalisation of immovable cultural monuments. The spotlight of this contribution will be focused on several examples of the excavation and renewing of historical monuments such as churches, castles, and chateaux, where the ground-penetrating radar was used and where acquired information not only played a pivotal role in uncovering long-lost historical features but also significantly contributed to the delicate process of sensitive restoration of these cultural landmarks.

10 GEOPHYSICAL SURVEYS REVEAL THE HIDDEN CITYSCAPE OF VULCI

Ullrich, Burkart (Eastern Atlas) - Meyer, Jess (Eastern Atlas) - Franceschini, Mariachiara (Albert-Ludwigs-Universität Freiburg) - Pasieka, Paul (Johannes Gutenberg-Universität Mainz)

In our paper, we show how large-scale geophysical investigations at Vulci, a long-known and protected site, can lead to new, sensational discoveries. The decisive factor here is to apply the concept of preventive archaeology and operate on a broad spatial scale to cover the entire accessible area and to gain a comprehensive overview of the city.

The broader Vulci Cityscape project (<https://vulcityscape.hypotheses.org/>), based at the German Universities of Freiburg and Mainz, aims to achieve a new understanding of the Etruscan-Roman city of Vulci combining non-invasive geophysical prospections and stratigraphical excavations. In 2020, geophysical surveys using magnetometry and ground-penetrating radar (GPR) were carried out by Eastern Atlas in the area north of the so-called decumanus. Stratigraphical excavations, ongoing since 2021, have made it possible to verify and complement the data from the prospections. Further non-invasive investigations are planned from 2024 to 2027.

An interdisciplinary team of geophysicists and archaeologists collaborated on the geophysical investigations and their archaeological interpretation. The results led to a new and more complete plan of this part of the city, identifying different functional areas and street systems in order to reconstruct the complex historical palimpsest of the urban structure. Among the functional areas, a new sacred district to the west of the Tempio Grande stands out, including a hitherto unknown monumental, late Archaic Temple.

11 NECROPOLIS IN MOKRIN – A GEOPHYSICAL CASE STUDY

Pentic, Jugoslav (TTC TOP TRAVEL CENTAR)

This paper presents the results of several years of geophysical research conducted on a Early Bronze Age necropolis site of Mokrin (Lalina humka). We discuss the benefits received from the combined approach to site survey, using both GPR and magnetometry methods for the assessment of the necropolis's extent and complexity. Despite somewhat disheartening results in mapping archaeological structures, charting contemporary changes that made a – substantial – impact on the site integrity has proven to be a valuable support in providing legislative protection to the site (in terms of local heritage management practices). We briefly discuss the methodology used to maximize the detection of expected burial structures, pitfalls and successes of the approach, as well as the – unexpected – results that extended the site activity far past the EBA range. Further discussion is directed toward the impact that geophysical methods provided on the perception of the site, the extent of site intrusion, and the effect of geophysical surveys in local practices in Cultural Heritage Management.

12 GPR IN NORWEGIAN CULTURAL HERITAGE MANAGEMENT - RESEARCH PROJECTS AND MAPPING OF KNOWN ARCHAEOLOGICAL SITES

Hillesland, Kristoffer (University of Stavanger) - Sæther, Øyunn (University of Stavanger)

This paper connects with two other presentations from the Museum of Archaeology in Stavanger which explore the increasing importance of GPR in Norwegian cultural heritage management. The primary focus is to highlight the role GPR-based research projects can play in the management and protection of vulnerable cultural landscapes.

The utilization of GPR technology has significantly enhanced our ability to explore and interpret historical landscapes, shedding new light on known archaeological localities such as cemeteries, grave mounds, church sites, and other culturally significant areas. Many of these sites are at risk of damage and destruction due to a lack of care and maintenance. GPR has proven to be a valuable tool in managing these sites.

The presentation will showcase compelling case studies where GPR has been employed to unveil hidden dimensions of known or previously excavated archaeological sites, with examples including the medieval churches at Hylestad and Hundvåg, as well as grave mounds and other monuments from the Avaldsnes region in Norway. By conducting systematic surveys and generating detailed subsurface maps, we have gained renewed insights from archaeological sites that were previously thought lost or damaged. This approach not only refines our understanding of our cultural heritage but also offers a non-invasive methodology that preserves the integrity of these delicate historical environments.

Key topics to be covered include the methodology employed in the GPR surveys, data interpretation techniques, the integration of GPR findings with other archaeological evidence, and the results this approach has yielded for our cultural heritage management. The session aims to foster discussions on the challenges, successes, and future directions of using GPR for mapping known localities, providing a platform for collaboration and knowledge exchange among archaeologists, geophysicists, and technology specialists.

13 CHURCHES AND HISTORICAL BUILDINGS: A CULTURAL PATRIMONY HIDDEN AMONG US

Persico, Raffaele (University of Calabria)

In this contribution a summary of results and potentialities referred to the GPR prospecting in historical churches and ancient monuments will be proposed. The peculiarities of this kind of prospecting will be discussed and some specific possible future developments will be stressed too. The discussion will be back-upped with results coming from different case histories related to my past professional experience.

Indeed, we have a cultural patrimony hidden under the thousands historical churches (let say dating back to the beginning of the 19th century or before) spread all over Europe (does not matter whether Catholic, Orthodox, Protestant or Anglican), and of course another meaningful heritage is hidden under the Hebraic synagogues and the Muslim mosques. Such a patrimony might be easily explored and understood, at least partially, by means of noninvasive geophysical prospecting and in particular by means of GPR prospecting, but this has been done up to now sporadically rather than systematically.

Through some concrete examples, this contribution will propose a possible protocol, that might be worth considering for future works.

14 THE AVENTINUS MINOR PROJECT: REMOTE SENSING FOR ARCHAEOLOGICAL RESEARCH IN ROME (ITALY)

Wueste, Elizabeth (The American University of Rome) - Facchin, Giulia (The American University of Rome) - Barone, PierMatteo (The American University of Rome; Geoscienze Forensi Italia; ANCRIM (Associazione Nazionale Criminologi e Criminalisti).)

This paper presents preliminary results from a central urban area of Rome, Italy obtained from both desktop and remote sensing surveys and archaeological excavations within a community archaeological excavation project: the Aventinus Minor Project (AMP).

AMP designed a research plan to answer specific academic research questions in collaboration with multiple community partners, including The American University of Rome, St. Stephen's School (whose campus directly borders on the site), the Istituto Santa Margherita (the landowners of the field and a Catholic convalescent home), and the Archaeological Superintendency of Rome (Concessione DG-APAB, prot. 20027, 10/06/2021, Decreto 609).

The application of geophysical and remote sensing approaches (such as NDVI, VARI, and GPR) and the creation of a GIS platform lay the foundations for correct and georeferenced reporting of all collected data. This further provided a nuanced understanding of the urban archaeology in the dense topography of Rome, potentially correlated with visible ancient remains, including the Republican Servian Walls and the Christian Church of Santa Balbina.

Geophysics, and GPR specifically, was a very important resource in AMP's design, as it offered the possibility of assessing the archaeological potential of a central, though under investigated, area of Rome in a timely manner. The archaeological excavation, so-called "ground-truthing", was able to verify the results of the geophysical survey during excavations carried out in subsequent seasons (2022-24).

The combination of the scientific methodology employed and the potential and usability of the geophysical results positions AMP as a promising research project within both the larger region and the more immediate local community. However, beyond the quality and usability of the scientific results, AMP's further novelty lies in having been able to successfully carry out its multi-faceted work by including several community collaborators within the complex urban environment of Rome, one of the world's capital archaeological cities.

15 EXPERIENCING GPR AT THE CASTELLO SFORZESCO IN MILAN: BETWEEN HISTORY AND DIGITIZATION. MULTIDISCIPLINARY APPROACH FOR A CULTURAL HERITAGE

Biolo, Francesca (Politecnico di Milano, Department of Architecture, Built Environment and Construction Engineering) - Porcu, Maurizio (Codevintec Italiana s.r.l.) - Guzzetti, Franco (Politecnico di Milano, Department of Architecture, Built Environment and Construction Engineering)

The idea to develop a complete and comprehensive 3D information model of the Castello Sforzesco emerged with the collaboration between Politecnico di Milano and the Municipality of Milan, recovering and including information from historical sources as well as surveys performed with contemporary technologies.

To achieve this objective, underground spaces were meticulously surveyed using terrestrial laser scanner, and the acquired data have been integrated with digital photogrammetry. A 3D model was crafted leveraging this dataset and the available historical documents. The digital twin was stratified according to various levels of geometric information, based upon the intrinsic characteristics of the initial data and its degree of precision.

Such a digital model framework facilitates evaluations on the coherence of numerous historical hypotheses, thereby enabling conjectures regarding existent underground spaces and pathways. The collaboration between the working group at the Politecnico and Codevintec Italiana s.r.l. stemmed from these ideas, evolving into an extensive 3D survey campaign using high-resolution gpr, yielding remarkable discoveries.

The radargram vividly reveals and locates remnants of the Spanish bastions along with their corresponding buttresses. For sure, additional pathways exist beyond those currently explored. In fact, various closures and evidentiary indications substantiate the presence of connecting passages to these unknown subterranean environments.

Even though their depth is known, it would be intriguing to additionally validate their current condition, assessing whether they are still unobstructed or they are partially occluded.

Notably evident from the radargram is the drainage conduit of the water from the two moats that encircled the Castle during its military tenure. Furthermore, numerous other indications of subterranean elements emerge, some of which are reminiscent of Leonardo da Vinci's designs.

Experience has shown how the study of historical sources, traditional and modern surveys, integrated and supported by geophysical technologies, together contribute to developing knowledge of the built heritage.

16

GPR - IMPACT OF USE IN DEVELOPMENT LED ARCHAEOLOGICAL PROJECTS

Eilertsen, Krister (Museum of Archaeology, University of Stavanger)

The use of geophysical methods within archaeological projects in Norway has been increasing in recent years. The Archaeological museum - University of Stavanger, has been using GPR as a part of our projects in Rogaland county since 2018/2019 and it has provided vital information that has been incorporated into the planning phase of archaeological excavations.

The diversity of the landscape and differing sub-soil conditions in southwest Norway present challenges to the use of GPR in our region. By collecting data from across a variety of different landforms we have gathered valuable knowledge which has allowed us to incorporate the results of our GPR surveys into subsequent excavation projects. In this paper I will present two case studies representing substantially different conditions and landscapes which illustrate how GPR data has influenced our archaeological projects. The detailed knowledge of layers, features and other contexts from the two sites has guided project planning and excavation strategies providing an opportunity to investigate contexts that would normally be lost during topsoil removal. GPR data has also allowed us to tailor the size and location of excavation areas improving the overall efficiency of projects.

17

3D GPR MODEL OF A FLOOR MOSAIC OF THE LATOMIA DEI NICCOLINI (MARSALA, SICILY)

Carollo, Alessandra (Department of Earth and Marine Sciences, University of Palermo) - Capizzi, Patrizia (Department of Earth and Marine Sciences, University of Palermo) - Martorana, Raffaele (Department of Earth and Marine Sciences, University of Palermo) - Abrignani, Alessandro (Freelance Researcher) - Castiglia, Angelina (PROPER-ART Cooperative Company, Enna) - Griffo, Maria Grazia (Lilybaeum-Marsala Archaeological Park) - Lo Brutto, Mauro (Department of Engineering, University of Palermo) - Occhipinti, Anna Vincenza (Lilybaeum-Marsala Archaeological Park)

The Latomie dei Niccolini archaeological complex is situated on the side of the Punic and Roman necropolis of Lilibeo (Marsala, Sicily). As a result of quarrying activities in the area, the construction of the modern cemetery along the eastern side of the Latomia and a long period of neglect, the state of conservation of the tombs was seriously compromised and precious frescoes were destroyed.

An essential element of this funerary system is the floor that gives access to three arcosoli, consisting of precious polychrome mosaics. At the time of the discovery, this mosaic had a large lesion that extended diagonally to the length of the mosaic. High-frequency Ground Penetrating Radar (GPR) was used to improve understanding of the causes of the fracture and differential subsidence found throughout the floor mosaic structure. The georadar uses the physical phenomena that an electromagnetic wave can undergo when it encounters discontinuities within an investigated medium (such as reflection, diffraction, and refraction). These physical phenomena are determined by variations in the magnetic and electrical properties of the materials passed (such as cavities, lithological variations, and buried bodies) and, in particular, the variation in the permittivity.

A three-dimensional GPR model of the variation of the subsurface's electromagnetic reflectivity was constructed to define the primary fracture's geometric effect and map the geometry of the void area below the mosaic floor.

430 CURRENT TRENDS AND FUTURE DIRECTIONS IN QUARRIES AND ROCK-CUT SITES STUDIES: THEORY, METHOD AND DISSEMINATION

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Doperé, Frans (KU Leuven Research Group Archeology) - Whitaker, Katy (Historic England) - Sciuto, Claudia (University of Pisa) - Morleghem, Daniel (La Sapienza University) - Liboutet, Marion (État de Fribourg/ARTEHIS)

Session format: Regular session

Stone quarries and rock-cut sites are places of stone extraction which, although created for differing purposes, share numerous common features. These include, for example, varied techniques of stone removal and working, tools, embodied action and gestures and know-how. They may be co-located in rocky landscapes, they are found globally and they have a deep time history as significant features of human lives for thousands of years.

Building on successful sessions at previous EAA meetings, this session aims to discuss the material record of quarries and rock-cut sites in terms of theory, methods and dissemination. It is not limited to particular regions nor periods. We also welcome contributions from interdisciplinary work and environmental humanities encompassing all researchers working with extractive landscapes. We invite papers that consider the following themes:

Theory:

Theorising relations between human and non-human actors in rocky environments at different times in the past; Placing them into their landscape, environmental, technical and social contexts.

Methods:

Designing methodological approaches that enable the testing of theoretical frameworks; Understanding strengths and weaknesses of interdisciplinary research to create robust narratives.

Dissemination:

Identifying roles for digital methods that go beyond mere data collection and how to apply FAIR data principles; Communicating research results in engaging ways to a range of audiences, including to people making decisions about the future of such sites in their locality.

ABSTRACTS

1

QUARRYING, PROCESSING AND DISTRIBUTION OF THE JIZERA MOUNTAINS TYPE METABASITE (CZECH REPUBLIC). ARCHAEOLOGY OF MAIN LBK RAW MATERIAL SOURCE

Trampota, Frantisek (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Burgert, Pavel (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Kachlík, Václav (Department of Geology and Paleontology, Faculty of Science, Charles University) - Šída, Petr (Department of Archaeology, Philosophical Faculty, University of Hradec Králové) - Přichystal, Antonín (Department of Geological Sciences, Faculty of Science, Masaryk University)

Metabasite of the Jizera Mountains type is the main raw material source for the production of polished tools throughout Central Europe during the LBK period. Its outcrops are located on the edge of the Jizera Mountains (Northern Bohemia, Czech Republic). This rock was extensively quarried and processed into semi-finished products in the quarry during the Linear Pottery Culture (LBK; ca 5400–4900 BC). The excavated material was processed by knapping directly and cut or polished in secondary workshops on settlement sites.

In the Jistebsko quarry there was used both surface and deep pit quarrying, which is well preserved on an area of more than 25,000 m². Further, we will present the state of art of the site. Key questions include the extent of distribution of raw materials in the Neolithic. We focus at the current state of art showing the maximum known range of distribution of Jizera Mountains type metabasites in Europe.

2

THE QUARRYSCAPE OF ITANOS: MAPPING THE STONE ECONOMY OF A CRETAN CITY-STATE

Vanden Broeck-Parant, Jean (UCLouvain (Université catholique de Louvain)) - Viviers, Didier (ULB (Université libre de Bruxelles)) - Tsingarida, Athéna (ULB (Université libre de Bruxelles))

The ancient harbour town of Itanos likely developed from the 9th century BC onward near the northeastern tip of Crete, on a peninsula previously occupied during the Minoan period. A trade-oriented city, it mainly resorted, by contrast, to local resources of its close hinterland for stone construction. The geological substrate of the area is varied with, notably, schist, hard blueish limestone, sideropetra and ammoudopetra being the most widely used in buildings and monuments. The new research project at Itanos aims at mapping the main quarries exploited for construction

(both monumental and domestic), using legacy data of past surveys and new recording strategies, with the objective of establishing a typo-chronology of stone consumption in the city itself and its territory. The recording of the geometry of the deposits and the layouts of the quarries allow exploring the extraction strategies and the socio-economic organization of the craftsmen. Labour costs are also estimated for the extraction of various types of stone in accordance with the quarry layouts, while the most likely terrestrial and maritime routes for the transport of stone are identified using DEMs and least-cost path analysis. This in turn allows gauging the energetic and economic investment made by the Itanian communities at various levels of organization and at different times in the history of the city-state. Overall, a new aspect of the economy of Itanos is revealed, which resorted mainly on local manpower and skills. This paper will present the first results of this research project and its future objectives.

3 QUARRY SURVEY AND BUILDING ARCHAEOLOGY, HOW TO ESTABLISH A MEANINGFUL LINK IN CLASSICAL ARCHAEOLOGY?

Doperé, Frans (Research Group Archaeology KU Leuven)

Quarry Survey and Building Archaeology are usually practiced as separate disciplines, whereby the archaeological link between both often proves difficult to establish. This is due to the difficulty to provide appropriate chronologies to surveyed quarries, while buildings and masonries can easily be subject to archaeological excavations and soundings. This question was tackled as a case study during five campaigns, between 2018 and 2023, at Sagalassos, an Hellenistic/Roman city site in South-Western Anatolia, Pisidia, in the Taurus mountain chain. The monumental city center groups a total of forty buildings/masonries, erected in limestone quarried locally, as determined by archaeometry. Quarries and smaller extraction points were identified and analyzed in the necropolei, immediately surrounding the monumental center, others are situated at distances of maximum 5 km. The following questions formed the backbone of this research. How to define a chronology for the quarrying activities? Can the owner of a quarry be identified, even without epigraphy? How to establish a relationship between the extraction technology in the quarries and the stone-carving techniques as observed on the individual monuments? Was the quarrying activity, observed in the necropolei, intended for the production of stone blocks for the building sites or rather for funeral features only? Was regular stepwise quarrying using extraction trenches and wedging always practiced for the production of building stones? Were extracted stones carved up to finish in workshops near the quarry or rather near the building site? Which technological observations may shed some light on the activities of quarry workers and/or stonemasons? The preceding questions were generated during the research at Sagalassos. They will be presented in this lecture as a potential basis for broadening the research to other sites and other research groups.

4 CONTEXTUALIZATION OF LATE ANTIQUE AND EARLY MEDIEVAL SCULPTURE ON THE ISLAND OF KRK (CROATIA) BASED ON MINERALOGICAL-PETROGRAPHIC ANALYSIS OF STONE

Belošević, Nikolina (Faculty of Humanities and Social Sciences, University of Rijeka) - Šprem, Katarina (Independent researcher)

It is a common opinion of the profession that the island of Krk, unlike other Adriatic islands, lacks quality stone as raw material for making sculpture and liturgical furniture, and since a significant amount of sculpturally processed stone fragments were found on numerous localities of the island, it is assumed that the stone blocks or finished stone products in antiquity and the Middle Ages were procured in some other area. One of the goals of our project was to determine the exact provenance of the stone raw material, in order to determine the direction of material import, the exchange of cultural influences and artistic templates, and possibly the migration of stonemasons in Kvarner region. This presentation will show the results of mineralogical-petrographic analysis of samples of late antique and early medieval stone sculpture, which was made for the first time for the island of Krk. Most of the samples were Cretaceous in age, with one exception. The obtained results of the analysis of sampled material from the island of Krk were compared with previously known data on the geological composition and age of rocks in the surrounding area, in order to determine, in accordance with the geological maps, possible exploitation fields or quarries from which the limestone identified in the analysed samples originates. Considering the position of the source quarry, we tried to determine the nearest ports from which the stone could be transported to Krk. The corpus of sculptures from certain localities in island of Krk whose fragments were sampled were compared with contemporary sculpture from the area from which the stone originates using the historical-artistic methods. This was done in order to determine possible similarities in use of templates, choice of motifs and methods of carving.

5 ANCIENT QUARRYING AND PROCESSING OF SILICATE SOFTSTONE IN EASTERN MADAGASCAR

Nitsche, Christoph (University of Fribourg) - Serneels, Vincent (University of Fribourg)

Eastern Madagascar hosts several zones with spectacular softstone quarries that were active from the 9th to 15th century CE. They mainly served for the production of cylindrical blanks that were crafted into polished pots, bowls and incense burners. The vessels were finished using a lathe-turning technique - a processing method for stone that

is unique for sub-Saharan Africa - and were both used in Madagascar as well as exported to the Comoros and the East African coast. Since 2017, over 35 quarries were visited and documented, many of which previously unknown to science, and two of the largest sites were excavated for the first time. The results provide interesting new insights into the chaîne opératoire of this industry, such as the use of a weighted metal bar for both carving and extraction of blanks. Coupled with petrographic studies on the raw material, it also allows a first comparison of extraction techniques between the different zones and how they were adapted to the characteristics of the different rock types.

6 THE CASTLE TOWN OF ARCONCIEL (CANTON OF FRIBOURG, SWITZERLAND). USE AND INSERTION INTO THE ROCK: METHODOLOGY AND MULTIDISCIPLINARY APPROACH

Liboutet, Marion (Service Archéologique de l'Etat de Fribourg; UMR 6298 ARTEHIS) - Bizri, Mélinda (Université de Bourgogne; UMR 6298 ARTEHIS)

The castle town of Arconciel, first mentioned in the 11th century, stands on a promontory fort overlooking the River Sarine. Protected on all sides by 50m-high cliffs, a deep ditch dug runs along its eastern side. The castle and its village blend into the landscape while irrevocably changing it. Topography, the use of rock and man-made constructions are intimately linked and give meaning to this site, which was once a settlement. The rock was used and shaped to perform specific functions within the castle town: it was used as a floor, urban features were carved into it, and the fortification and urban topography were inscribed in the bedrock.

In the middle of the promontory, a 4-metre-high molasse piton topped by a building has been shaped and appears to act as a gateway to ensure control. There are features on all 4 sides that bear witness to the structures that once leaned against them. On either side of the rocky outcrop, the structure of the habitat is different.

The aim of this paper is to report on the methods used to approach the rock features at the castle town of Arconciel and the results obtained. The aim is to test the methods applied to other sites and verify their effectiveness. Comparisons with French and Swiss sites will be sought.

7 CARVING A FUTURE: HBIM FRAMEWORK FOR CAPPADOCIA'S ROCK-CARVED ENVIRONMENTS

Kurcenli Koyunlu, Sena (Carleton University) - Fai, Stephen (Carleton Immersive Media Studio (CIMS), Carleton University)

This study is a critique of existing heritage data management principles in Türkiye and their applicability to carved stone environments. Given the multi-layered and complex nature of the historical carved environments, it is crucial to develop heritage data management principles that work for them. I propose a Historic Building Information Modelling (HBIM) framework for rock-carved environments by focusing on Cappadocia, Türkiye.

Cappadocia is a superimposition of archeological, urban, and natural heritage assets that inform the unique characteristics of the region. The rock-cut structures in Cappadocia can either be carved separately or integrated into masonry structures that are part of people's everyday life experiences. Despite the rock-carved environments being the subject of diverse research groups, in general, the documentation of them was often limited to case-by-case workflows. These workflows are notable, but the main problem of heritage data management is the hierarchical structure of the conservation plans, which focuses on the parcel as the smallest unit, which poses a challenge to documenting these environments. The two-dimensional nature of the parcel boundaries is not suitable to represent the rock-cut structures, resulting in them not being represented on cadastral maps or base maps. Thus, this study aims to establish an as-found HBIM workflow for rock-carved environments to develop heritage data management principles responding to the three-dimensional nature of these environments. It highlights the importance of the data collections and their management and accessibility, rather than the mass digitization workflows.

432 RESIDENTIAL BUILDING TECHNIQUES WITH WOOD AND DAUB IN PREHISTORY: WHAT WE FIND AND WHAT WE RECONSTRUCT

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Pusztaine Fischl, Klara (HUN-REN Research Centre for the Humanities Institute of Archaeology; University of Miskolc Institute of Archaeology) - Kienlin, Tobias (Universität zu Köln Institut für Ur- und Frühgeschichte) - Lie, Marian (Institute of Archaeology Iași, Romanian Academy) - Anvari, Jana (Universität zu Köln Institut für Ur- und Frühgeschichte)

Session format: Regular session

Architecture, or the practice of building houses, encompasses a range of related activities, such as the consensus reached of where and what to build, preparing the building site by felling trees and levelling the ground, supplying construction timber for crafting various parts of the house, excavating foundation trenches or postholes, obtaining and refining clay for the home's walls and other elements. After the structure was completed, it may have required repairs

to its walls and roof. The hearths or ovens would have needed periodic renewal in their original position or occasional reposition to another room or location. In temperate European regions during prehistory, wood and daub were primary construction materials. Prehistoric house-building techniques share common aspects with traditional, vernacular architecture, and therefore can enhance our comprehension of prehistoric building techniques and the remains of prehistoric houses and structures unearthed in excavations. The session will focus on the construction techniques and raw materials used for building in prehistoric temperate Europe. The aspects covered will include the evidence we have for the types of wood used, the traces and techniques of woodworking, the choice of raw materials and their preparation for building in daub. While the focus remains on direct evidence recovered during excavations, additional insights from vernacular architecture, ethnoarchaeology or scientific analyses of the building materials retrieved can be gleaned. We welcome a diverse range of contributions spanning from the Neolithic to the Iron Age, encompassing various forms of settlements and architectural styles. These may include, but are not limited to, flatland sites, settlement mounds and wetland sites, with a specific focus on building processes and techniques, as well as materials that were used. We invite contributions that consider relevant features from archaeological excavations, based on the scientific analysis of building remains, as well as a broader perspective including ethnoarchaeological approaches.

ABSTRACTS

1 UNLOCKING HIDDEN POTENTIAL IN A CAREFULLY ADDRESSED FIELD: RECONSTRUCTING LINEARBANDKERAMIK LONGHOUSES

Oross, Krisztián (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Mészáros, Nóra (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Jakucs, János (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Marton, Tibor (Institute of Archaeology, HUN-REN Research Centre for the Humanities)

Large-scale excavations between the 1930s and late 1970s revealed a series of settlements established by the first food-producing communities across central Europe. Traces of timber-framed longhouses became the hallmark of the entity called Linearbandkeramik (LBK) in the cultural concept. Following emblematic field discoveries, countless investigations were carried out on house typology and building techniques. Calculations on structure and on required labour force shaped the processing, so that problems concerning the architecture of the first Neolithic groups in temperate Europe seemed to have been solved once and for all.

However, there was still little evidence of LBK architecture in western Hungary. Southern Transdanubia between Lake Balaton and the Drava river was a blank spot in terms of architectural traces, although the LBK settlement of the region was recognised long before. Thousands of features belonging to longhouses have been uncovered during development-led rescue excavations since the 1990s. Some settlements at Lake Balaton provided house plans particularly suitable for further evaluation. A precise comparative record became available from more southerly lying micro-regions like the Tolna Sárköz and the Southern Baranya Hills. It is now also obvious that the central European type of longhouse architecture largely exceeds the region dominated by LBK-style material culture.

Core source of our assessment is the architecture of the Balatonszárszó-Kis-erdei-dűlő settlement. The presented research includes structural calculations and reconstructions using architecture software programs. These are less focused on visual display while strictly follow the archaeological record. We are seeking answers whether the buildings were as regular in all details, as suggested in some of the earlier studies. If not, how can we cope with irregular features and asymmetric elements? Precise reconstructions highly impact the interpretation of house clusters and that of the social dynamics in the settlement.

2 SIMILARITIES AND DIFFERENCES IN THE LATE NEOLITHIC HOUSE BUILDING TECHNIQUES OF GREAT HUNGARIAN PLAIN

Bittner, Bettina (Hungarian National Museum National Institute of Archaeology)

Reconstruction of Late Neolithic houses has generally focused on the parameters of post holes and the ground plan of the buildings. However, if we study the burnt daub remains of the period, the imprints of structural elements preserved on them can provide us with detailed answers about the building techniques. In the presentation, daub fragments are studied from 5 Late Neolithic sites of the Great Hungarian Plain: Polgár-Csőszhalom, Polgár-Bosnyákdomb, Öcsöd-Kováshalom, Hódmezővásárhely-Kökénydomb and Szegvár-Tűzköves. These sites are tell or tell-like settlements that existed between 5000–4500 BC and their archaeological remains include several buildings that were destroyed by fire. The buildings of the 5 sites certainly showed both similarities and differences. All of them were erected by wattle-and-daub constructions but with different architectural solutions due to their different size and layout. Construction techniques may differ in the wattle and daub weaving, the placement of the bracing, the orientation of the wall bracing and the slab design.

3 IDENTIFYING CONSTRUCTION TIMBER WITH DIGITAL SCANNING TECHNIQUES - IDJOŠ GRADIŠTE EXAMPLE

Maric, Miroslav (Institute of Balkan Studies SASA) - Mirković Marić, Neda (Međupštinski zavod za zaštitu spomenika kulture Subotica) - Jončić, Nenad (Narodni muzej Srbije)

The site of Idjoš Gradište is a multiperiod prehistoric site located near the town of Kikinda in Banat region of north-eastern Serbia. First settled in the mid Neolithic period, around 5300 cal BC it remained in occupation until the beginning of the Iron Age, with a telloid Neolithic settlement on the southwest edge of the Tisza River Pleistocene terrace it occupied, overshadowed by a late Bronze Age and transition to Iron Age settlement of over 20 hectares to the northeast of it.

Archaeological research on the site was conducted on several occasions throughout the 20th century, with the first systematic excavations, preceded by a large scale magnetometric survey, took place in 2014 and lasted until 2023. In the course of the excavations, several wattle and daub structures were excavated, either partially or to the full extent, yielding a significant amount of intensively burnt daub in the process.

Photogrammetric and LIDAR scanning enabled the creation of detailed 3D models of individual fragments of daub, that enabled the analysis of wood bark imprints on the fragments. The same methods were also applied on the bark of trees domestic to the region that were also available in the Neolithic period to provide for direct comparison of imprints. Additional comparison was made possible by creation of silicon casts from the daub. We present preliminary results and conclusions of this pioneering technique in Serbian archaeology.

4 RECONSTRUCTION OPTIONS FOR BRONZE AGE HOUSES G AND H IN BORSODIVÁNKA-NAGYHALOM (HU)

Pusztaine Fischl, Klara (HUN-REN Research Centre for the Humanities Institute of Archaeology; University Miskolc) - Pusztai, Tamás (Hungarian National Museum, Castle Museum Esztergom) - Kienlin, Tobias L. (Universität zu Köln Institut für Ur- und Frühgeschichte) - Balázs, Ádám (University Miskolc) - Gucsi, László (HUN-REN Research Centre for the Humanities Institute of Archaeology)

During the excavation of the Bronze Age tell site in Borsodivánka-Nagyhalom (H) as part of the BORBAS (Borsod Region Bronze Age Settlements) project, we uncovered fascinating details about two houses within a 5x6 m trench. House G in the mid sequence of the tell, which was preserved due to a fire, provided insights into the unique interior structure and decorative elements of the walls. The decoration elements found here are similar to those known from the “Dealul Vida” (RO) site in Sălacea/Szalacs. On the other hand, House H, located across a narrow street from House G, also experienced a fire, but the Bronze Age community had cleared away the rubble. Both houses were constructed using a horizontal foundation beam, but different masonry techniques and building materials were employed in each case. This presentation will outline the architectural reconstruction of these two contemporaneously-standing buildings, as well as the alterations made following their demise.

5 BUILDING AND DECORATING: A CHAÎNE OPÉRATEIRE APPROACH FOR ANALYSING THE BURNT REMAINS OF A BRONZE AGE STRUCTURE AT BORSODIVÁNKA (HUNGARY)

Drunagel, Eva (University of Cologne) - Mancini, Nico (University of Cologne)

The building ‘house G’ from the Bronze Age tell site of Borsodivánka is an example for a complex wattle-and-daub structure of the Hungarian Bronze Age. The different architectural features show a careful selection of material and techniques regarding the construction of walls, the partition of space and the design of surfaces. Elaborate wall decorations, including spirals and undulating lines, have been unearthed in various positions. Their condition varies from fragmentary to in situ conserved remains of adjoining ornaments on plastered wall-surfaces. The exceptional preservation of the burnt daub permits the analysis of strategies and choices in the process of building and decorating house G. This chaîne opératoire approach investigates the selection and preparing of building material and the process of constructing walls and subsequently preparing and decorating their surfaces. Macroscopic observations as well as analyses on microscopic level have been used for this purpose. Our results emphasize the considerable potential of analysing decorated walls to provide information on the intentional design of social space and the role of creativity in Bronze Age households.

6 SO MANY HOUSES, SO MANY CUSTOMS. HOUSE CONSTRUCTION PRACTICES DURING THE LATE EARLY BRONZE AGE IN THE CENTRAL CARPATHIAN BASIN

Bodnár, Csaba (Museum of Fine Arts (Budapest))

The material culture of a community incorporates not only the tangible artefacts they produce and use, but also structures and monuments they create through the manipulation and transformation of their physical environment.

The practices followed when erecting a building are affected by a number of factors. The choice of location, the raw materials (timber, stone, etc.) and building techniques applied can depend to a large extent on environmental and economic conditions and the intended function of the building. However, the decisions made during the construction process may also be heavily shaped by cultural customs and norms of the building community.

In this paper I will examine the house-building practices of people living in the central part of the Carpathian Basin, along the middle reaches of the Danube and Tisza rivers, at the end of the Early Bronze Age (2300-1900 BC). These communities showed many similarities in terms of their material culture, particularly in their pottery traditions, which once led archaeological research to classify their remains as part of a distinct archaeological culture (Nagyrév culture). After critically reviewing the archaeological evidence available on house construction techniques and methods from this region and period, various sites (mainly settlement mounds, e.g. Tószeg-Laposhalom) associated with the „Nagyrév” archaeological unit will be compared in terms of a number of architectural aspects (e.g. site selection, plan, orientation, internal layout, raw materials, wall structure, floor, roof, installations, renewal, etc.). The paper seeks to answer the question of how much variation can be observed among these „Nagyrév” communities in their house-building practices, and, eventually, to what extent their choices during the various phases of the building process may have been determined by cultural and social norms as well as environmental conditions, practical needs and other factors.

7 ARCHITECTURAL TECHNIQUES IN THE BRONZE AGE TELL SETTLEMENT OF BAKONSZEG-KÁDÁRDOMB

Balázs, Ádám (University of Miskolc)

In the Bronze Age Ottományi/Otomani tell-type settlements, we can examine the building solutions of several centuries. In my presentation, I would like to review the buildings excavated in the Bronze Age tell-type settlement of Bakonszeg-Kádárdomb, based on the different solutions used in their construction. My work is based on the drawings and diaries of an excavation carried out by Márta Máthé Sz. in 1974. Despite the small size of the 5x5 m trench, it provides a lot of valuable information about the different construction techniques. The walls, structures and floors of the buildings were constructed using several different methods. My aim is to evaluate the data within a coherent framework in order to obtain a more complete picture of the interior of Bronze Age settlements. In my presentation, I would like to try reconstructing the buildings excavated at different levels of the tell settlement on the basis of ethnographic examples and archaeological data.

8 MODELLING HOUSES AND HOUSEHOLD STRUCTURES. MIDDLE BRONZE AGE BUILDING MATERIAL AND CONSTRUCTION TECHNIQUES FROM NORTH-WESTERN ROMANIA

Gyurka, Orsolya (Babeş-Bolyai University, Cluj-Napoca) - Molnár, Zsolt (Babeş-Bolyai University, Cluj-Napoca)

The study of Middle Bronze Age settlement structure and buildings offers new levels of understanding and interpreting the evolution of communities. Heterogeneity, observed also in buildings, is a general feature of self-organizing sociocultural systems. There are no universal explanatory models, because of the different territorial, group structural and organizational levels of societies, which are defined by a number of specific principles. Therefore, we need to refer to the internal logic of the latter groups in order to better understand their settlements, the use of material culture or the construction of social space.

The prehistoric house-building and other wood and daub constructions reflect several aspects of the analyzed communities: the technological knowledge possessed, the use of natural resources and the sociocultural choices taken. The role and value attributed to a household or a building depends on the community's sociocultural and economic characteristics. The design, size and complexity of the constructions reflect how socioeconomic preferences and practices have been adapted.

Past tendencies have focused predominantly on the evolution of central sites, neglecting research of single-layer settlements, although these sites can still provide significant information to build up a comprehensive picture. Our presentation focuses on the construction processes and techniques of building types revealed at the tell settlement from Carei-Bobald (Carei Plain, Satu Mare County), in the context of the surrounding landscape. The results of the investigations are compared with new data from the undertaken archaeological excavation of the single-layer settlement from Biharea (Eriu Valley, Bihor County) and the existing macro-regional paleoenvironmental data.

9 MATERIAL CHOICES AND BUILDING TECHNIQUES IN THE OUTER SETTLEMENT OF THE BRONZE AGE TELL IN TOBOLIU (ROMANIA)

Gavan, Alexandra (Institut für Ur- und Frühgeschichte Universität zu Köln) - Lie, Marian (Institute of Archaeology Iași, Romanian Academy) - Kienlin, Tobias (Universität zu Köln Institut für Ur- und Frühgeschichte)

Toboliu is a multicomponent Bronze Age settlement located in the Eastern Hungarian Plain, in present-day western Romania. The site consists of a tell enclosed by two concentric ditches and an extensive outer settlement. Through geophysical and surface surveys conducted between 2015 and 2019, we were able to determine that the outer settlement covered an area of about 84 ha. In order to gain insights into the domestic architecture of the outer settlement of the Toboliu tell, we carried out targeted excavations of two off-tell households between 2021 and 2023. The aim was to gather data on their chronology, construction techniques, diet, and subsistence practices. This presentation will discuss the results of the above-mentioned excavations and provide an overview of the off-tell domestic architecture at Toboliu, focusing on building materials and construction techniques. A comparison of on-tell and off-tell houses will also be made in order to explore the different household configurations at this complex site. All the houses excavated at Toboliu to date have been rectangular wattle-and-daub buildings with at least one hearth. While there are similarities in house inventories and construction techniques, there are also some differences in construction details, individual design or choice of raw materials for flooring. Nevertheless, there seems to have been a common notion of what materials and techniques should be used to build the walls of a house or to construct hearths, although there are variations in individual designs.

10 REVISITING THE BRONZE AGE “TEMPLE” FROM SĂLACEA AFTER MORE THAN HALF A CENTURY

Lie, Marian (Iasi Institute of Archaeology) - Fazecaş, Gruia (Criş County Museum)

Between 1964 and 1969, within six campaigns, systematic archaeological excavations were conducted at the Bronze Age tell settlement at Sălăcea Dealul Vida (Bihor County, Romania). From the start, the leading archaeologists, Ivan Ordentlich and Nicolae Chidioşan, planned an exhaustive excavation of the entire mound. Some information that resulted from these campaigns was published in a few articles at the time, but a more comprehensive analysis of the site was only made in Ivan Ordentlich's PhD thesis, defended in 1973 but never published. Throughout the text, several domestic architectural remains are mentioned, but none benefited from a proper description or any archaeological documentation available to us. However, a single architectural find caught the excavators' attention as it presented some unique particularities. This layout benefited from proper documentation and description at the time and was interpreted by Ivan Ordentlich as a megaron temple (sanctuary). The find and the publication of the so-called temple caught the attention of several European archaeologists in the second half of the 20th century, but the megaron interpretation didn't hold for too long.

The current presentation of this Bronze Age structure at Sălăcea tries to focus on architectural patterns and offer new insights based on the current knowledge of domestic architecture of the Otomani-Füzesabony communities. Also, new information will be analyzed that was acquired from Ivan Ordentlich's PhD manuscript and from the collection of the Oradea Museum. In light of these new insights, we are trying to emphasize the importance of this architectural structure within the Bronze Age communities of the Carpathian Basin and finally offer the European archaeological community an English-written article about this important archaeological feature.

11 HOUSES OF THE LATE BRONZE AGE GÁVA CERAMIC STYLE: A CASE STUDY FROM POROSZLÓ-APONHÁT

Kósa, Polett (Szent István Király Museum)

When thinking about the classical Gáva culture (1100-900 BC), little concrete information about the houses of the period comes to mind. Since the early 2000's, there have been few publications on the settlements of the Gáva (HaA2-HaB1) period and almost none on the excavated houses. However, after the complete evaluation of the find material and the excavation documentation of Poroszló-Aponhát (Heves County, Hungary), a new and much more detailed picture of the houses can be drawn.

The communities of the period lived in complex and well-designed settlements, where houses could line up in a certain direction and order. These houses were made of wood and clay, the construction features of which can be reconstructed, including the scattered post-holes and the impressions of the daub material.

The buildings were equipped with several types of outdoor and indoor fireplaces and other built structures. Further presumed arrangement of the house equipment can be drafted by the scattering of loom weights and grinding stones. And last but not least, we have more information about the decoration of the houses than previously thought. In addition to structural information, we also have data on renewals.

Besides Poroszló-Aponhát, it is also important to examine and compare the material from other settlements of the period. Only by using all these data together can we form an almost complete picture of the houses of the period.

12 **DUST TO DUST: ON THE PROBLEM OF DETECTION AND INTERPRETATION OF BRONZE AGE SOLID CLAY BUILDINGS IN EUROPE**

Wehrheim, Ruben (Freie Universität Berlin)

Solid clay buildings are among the most neglected feature types in the Bronze Age archaeology of Europe. The reasons for this are diverse, but the primary is the assumption that this was an unsuitable and unstable type of building for the climatic conditions in Europe. At the same time, clay is an omnipresent substance which is easy to process. In particular in the poorly forested (forest-steppe) and loess-rich regions of the Pannonian Plain, such as the Banat. In addition, both the traditional massive clay buildings, still in use today, recent publications and the results of the excavations in Cornești-Iarcuri outline that such building types were probably more widespread in Central and Eastern European Bronze Age than supposed. These latest insights do show that the reason for the mentioned neglect is primarily the status of conservation.

Unlike the climate conditions in southwestern Asia, where whole palaces made of clay have been preserved, erosion by humidity, wind and rain in Europe can destroy abandoned buildings of this type within a few months.

The result is a pile of Dust that is nearly impossible to find or analyse using traditional archaeological methods.

In this study, I will discuss the problems, preconditions and conditions necessary for the investigation of massive clay buildings and further the most suitable methods for their detection.

For this purpose, soil types, recent palynological results, the excavation from Cornești-Iarcuri and building records of traditional types of construction in the Banat, moreover the specific properties of the possible building material will be presented.

These evaluations will show that, even if this building type seems lost to European archaeology, there are fast, effective and significant methods for examining such buildings. In addition, another approach has been developed based on the previous information acquired, which increases the knowledge gained many times over.

13 **LATE BRONZE AGE BRESTO (SOUTH-WESTERN BULGARIA) - EXCITING SITE, EXCITING DAUB**

Fries-Knoblach, Janine (LMU München) - Leppek, Maleen (LMU München)

Burnt daub is a thrilling building material, in the best case reflecting both the resources used and the architecture behind it, and thereby also temporal and spatial patterns and changes. A multi-disciplinary research project by Bogdan Athanassov (New Bulgarian University, Sofia), Iliia Kulov (Museum Blagoevgrad) and Philipp W. Stockhammer (LMU Munich, Germany) recovered tons of well-preserved daub with architectural imprints from the LBA settlement of Bresto near Bansko in south-western Bulgaria (two phases, ca. 13th and 12th c. BCE). In our presentation, we will give an overview of the site, its stratigraphy, architecture, and main evidence and then focus on the rich evidence for daub from several stone-timber houses with daub-clad features. The daub contained virtually none of the organic tempering so typical of this material in most contexts, but natural mineral tempering that made it extremely hard and heavy. Also, we discovered a technological shift in time as to the wooden components, while the mineral matrix stayed unaltered. A previously undescribed feature of phase 1 was daub pieces resembling small fluted half-columns. They are interpreted as remains of wattle woven across two stakes each in a twill-like fashion possibly paralleling the surge of this weave in Bronze Age textiles. It allowed for more wall stability without increasing flexion on rods, and thus perhaps for the use of tree species less prone to basketry. For phase 2, there is evidence for walls partly ornamented with stamps, some of which were covered by plain daub later. We will present the rich corpus from a qualitative and quantitative perspective and tentatively reconstruct part of the architecture of Late Bronze Age Bresto. This is highly relevant, since few sites have such well-preserved evidence, and Bresto is situated in a blind spot between the mud-brick-focused architecture of the Aegean and further north.

14 **HOUSES OF THE LATE BRONZE AGE IN NORTHERN GERMANY. WOOD, DAUB AND STONES BETWEEN TYPOLOGY, STRUCTURE AND CONSTRUCTION DETAILS**

Heske, Immo (University of Göttingen) - Schopper, Franz (Brandenburg State Authorities for Heritage Management and State Museum of Archaeology)

Northern Germany reaches from the coasts of the seas to the Harz Mountains. Various excavations in the area during the last 25 years brought up an assembly of new house plans. Different regional building styles are detectable. There are in discussion about the construction details as well as the possible usage as livestock stables. Constructions with postholes are widespread distributed, but some areas present in the same timeframe wall ditches. Mostly, the sandy soils are not useful for preservation of wooden remains. Some excavations nevertheless open up the possibility to take a deeper look at building details, like using a range of building material: timber in the context of local forest use, daub

and grass for thermal insulation and the usage of stones as element of construction. A special feature is the recently excavated "King Hinz Meeting Hall" (30.5 m x 10 m) in directly connection to the richly equipped monumental burial mound near Seddin. The talk has to discuss the possibility of wooden floors in the context of a ground level stone hearth. Also, the use of stone structures within wooden or wattle and daub walls has to be addressed.

Late Bronze Age houses in Lower Saxony open-air museums reconstructed on the basis of actual excavated house plans, as well as recent digital models, reflect construction methods influenced by knowhow of late 19th and early 20th century building techniques.

15 **TRESTLES AND WALL POSTS - ARCHITECTURAL DIVERSIFICATION IN BRONZE AGE SOUTHWESTERN SWEDEN**

Nordvall, Linn (Göteborgs universitet)

Empirical studies of longhouses and settlement structure in Scandinavia show local irregularities in longhouse construction and typological variabilities, yet a general longhouse tradition is discernable in the Nordic Bronze Age. Three-aisled longhouses are introduced around 1600 BCE in Scandinavia, creating an architectural diversification encompassing size differences, variabilities in trestle placements, presence of hearths, stalls, and other construction features. Differences in building techniques and materials used for constructing longhouses have been discussed by scholars and explored through reconstructions of prehistoric buildings. An overall tendency in settlement archaeology in Scandinavia is the implication of the use of wattle-and-daub or bole-walls. However, evidence of building materials is scarce although some evidence of charred remains of posts or burnt clay from wall constructions do occur. Interpretations of building techniques is therefore based on the placement of the trestles, entrances, and the placement and distance between the postholes. By studying the existing evidence of wattle-and-daub, placements of wall posts and other construction elements from Bronze Age house remains in the province of Halland, Southwestern Sweden, this paper aims at presenting problems and challenges in connection to architectural building techniques in the Nordic Bronze Age.

16 **RURAL SETTLEMENTS FROM THE BRONZE AGE AND IRON AGE IN FLANDERS (BELGIUM)**

Heirbaut, Elly (LAREs) - Vandenbussche, Vanessa (LAREs)

What can we learn from post-built houses when all that is left are discolorations in the soil?

The basis of our contribution is an extensive study into post-built houses dating from the Neolithic to the Middle Ages in rural settlements in Flanders (Belgium). The aim of this study was to understand typology, regional and chronological variation, as well as building techniques and more.

In this paper, we will focus on these timber houses dating to the Bronze Age and Iron Age. Over 300 (nearly) complete house plans were analyzed. Most of them were excavated during commercial fieldwork, leading to a non-consistent quality of data. Therefore, we decided to re-examine and interpret all data from scratch. This has resulted in an extensive, and unprecedented dataset for the southern Low Countries.

Although organic building material (wood, loam, straw) is not preserved in the sandy soils of Flanders, the study has provided many new insights into timber constructions. Conclusions can be drawn about typology, dimensions, internal layout, construction techniques, dating and location within the landscape. Regional and chronological differences can be distinguished in vernacular architecture. Construction types are singular for particular regions and show some evolution throughout time. There is hardly any evidence for general characteristics between different regions. Different choices regarding site topographies, locations, and farm in site organization (internal layout) can be recognized. Construction features (such as entrances, internal layout, structure of the walls, possible presence of an attic, extensions to the building etc.) can be derived from post positions and a thorough analysis of the depths of the postholes. Renovation, reparation, and deconstruction phases show in postholes and the remainder/removal of posts.

17 **HOUSES ON THE MOUNTAINSIDE: HOUSE ARCHITECTURE IN THE EARLY AND MIDDLE IRON AGE FORTIFIED SETTLEMENT OF DÉDESTAPOLCSÁNY-VEREBCE-BÉRC**

Barcsi, Marcell (Eötvös Loránd University, Institute of Archaeological Sciences)

During the Late Bronze Age and Early Iron Age, high-altitude fortified settlements of various sizes and topographic features appeared in the mountainous areas of Northern Hungary. The difficult accessibility and the forest environment make research on the sites a complex task, therefore little is known about the internal layout of the settlements, and the structure, quantity and location of the buildings on their territory.

In 2022 and 2023 – within the framework of the research project on Early Iron Age crises – the staff of the Institute of Archaeology of Eötvös Loránd University carried out excavations at Dédestapolcsány-Verebce-bérc (Borsod-Abaúj-Zemplén county), a high-altitude fortified settlement, which was besieged and destroyed in the 7th–6th centuries BC. The research was undertaken at the south-western part of the 140-hectare site, known as the „Pados”,

which is covered by an artificial terracing system. On two of the investigated terraces, remains of buildings of different structures were observed: one had stone foundation and the other had a wooden construction and clay plastered walls. The excavated houses provide new information about the architectural methods of the period and the region.

The aim of this presentation is to provide a more accurate theoretical reconstruction of the Early and Middle Iron Age houses and their building process by examining the objects and artefacts excavated at Dédestapolcsány-Verébce-bérc. This will be aided by the remains of charred beams and planks, as well as daub fragments bearing the impressions of structural elements.

433 ENCLOSED SOCIETIES: PREHISTORIC DITCHES OF SOUTHEAST EUROPE AND THE ADJACENT AREAS

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Naumov, Goce (Einstein Center - Chronoi) - Nikolova, Nikolina (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences)

Session format: Regular session

Ditches are common feature in the European prehistory, widely spread from the British Isles to Southeast Europe. Initially recognized more than a century ago in Central and West Europe they became eponymous for the enclosure phenomenon. Named as rondels, kreisgrabenanlagen, causewayed enclosures, enceintes à fossés, they are comprehensively studied with the established methodology and terminology. The enclosures have been thoroughly explored in the western parts of the continent, but they are a recent frequent fieldwork feature in the Southeast European archaeology (although ditches were detected and excavated many decades ago). The number of recorded ditches in the Balkans increased sharply in the past decade due to the application of current technology and methods in the archaeological detecting such as remote sensing analysis, geophysical and LiDAR surveys. As a result of these methods and excavations, it is now evident that many Neolithic and Chalcolithic sites were surrounded by a single or multiple ditches, or by more than one set of ditches.

Ditched enclosures arouse a vivid debate in the Balkans and correlates with the ongoing one in the Central and West Europe in regard to their interpretation. There is a variety of perspectives proposed for the motives of the prehistoric societies to construct ditches, as well as the theories about their purpose concerning their defensive, social, economic, symbolic or ritual character.

We welcome contributions dealing with the prehistory of Southeast Europe and the adjacent areas to discuss ditched enclosures within a palette of perspectives ranging from research strategies to theoretical approaches:

- Social, economic and ritual aspects of the enclosures;
- Depositional practices and funeral activities within ditches;
- Regional features and the chronology of enclosures;
- Territoriality and boundaries as a spatial concept;
- Ditches layout evidenced by digging and backfilling processes;
- Particular case studies from the Southeast Europe.

ABSTRACTS

1 THE EARLY NEOLITHIC DITCHES IN THE BALKANS: WHAT DO WE KNOW SO FAR?

Nikolova, Nikolina (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences)

The beginning of the new century came with the wide recognition of ditch enclosures throughout the Balkans. We are now aware of nearly 100 Early Neolithic ditches at about 40 sites, which cover the timespan roughly between the last quarter of the seventh and the mid-sixth millennium BC. And although ditches are detected many decades ago – mostly in the southern part of the peninsula – they are still a relatively new aspect of the Southeast European prehistory. The rapid accumulation of data raises numerous questions, hinted in brief dig reports. The early Neolithic ditches – their plans, dimensions, materials and mechanics of infill, labor and time invested in their excavation, maintenance, reuse, and etc., provide an extensive field for studies. The research history of the enclosures, however, indicates gaps both in the publishing state and the analyzing strategies.

In this presentation, I will try to summarize the available data so far regarding ditch enclosures from the beginning of the Neolithic in the Balkans. The time and space distribution of the ditches allows the distinguishing of some regional patterns and/or interregional similarities. It appears that the ditch-digging is widely practiced, although the various societies used their ditches in different ways. Moreover, the appearance and function of a ditch changed over the course of its 'life'.

2 EARLY NEOLITHIC DITCHES IN SOUTH-WESTERN BULGARIA THEIR CONCEPT AND PECULIARITIES

Kulow, Malgorzata (Regional Museum of History-Blagoevgrad)

A small number of Early Neolithic settlements have been recorded in the Middle Struma River valley, South-western Bulgaria, but almost all contain evidence of the surrounding concentric enclosures. In Early Neolithic settlements Kovachevo and Ilindentsi they have been investigated very detailed, but on the other two settlements Brezhani and Drenkovo II the concentric structures have been attested only through geomagnetic measurements, though the excavations undertaken in Brezhani in 2023 starts to give interesting data.

The ditches from Ilindentsi and Kovachevo have a very similar construction, which can be explained by the proximity of the two settlements and consequently close contacts between them. On the other hand, both constructions differ significantly from contemporaneous ditches unearthed on the sites Yabalkovo, Nova Nadezhda and Aşağı Pınar in the Thracian Plain. They have a wide flat bottom, a stone wall in the middle of the ditch and an additional wooden construction (a kind of palisade) along the inner border. These elements convincingly point towards their interpretation as sophisticated protective/defensive constructions.

3 ENCLOSING EARLY FARMING VILLAGES IN THE EASTERN BALKANS: DETERMINANTS, STRATEGIC CHOICES, AND SOCIAL IMPLICATIONS

Bacvarov, Krum (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences)

It seems that most Early Neolithic villages in the Eastern Balkans were enclosed by walls and/or ditches whose construction, upkeep and reconstruction required the investment of substantial amounts of time and labor. The enclosures varied in terms of type, size, and layout, and were obviously paid much attention to throughout the early farming settlements' lifecycles.

Based on evidence from extensively investigated early sixth millennium BC sites in Thrace and the Struma River valley, this presentation will compare the enclosure types identified at different Early Neolithic settlements in their environmental contexts focusing on what determinants could have affected the choices that early farmers made when deciding to build – or to rebuild – certain enclosure types and how these choices, in turn, might have predetermined the social implications for these communities. The accent will be placed on longer-lived sites as they better demonstrate the conservative aspects of the enclosures as well as the changes that occurred in their reconstructions and use.

4 THE PREHISTORIC ENCLOSURES OF PELAGONIA

Naumov, Goce (Einstein Center - Chronoi)

The tell sites have been highlighted as the most common settlement feature of the prehistoric Pelagonia. Most of them were established in the Neolithic and some were continuously occupied until the Bronze Age, while few were inhabited only in one of these three prehistoric periods. Approximately 15 of tell sites were excavated with research predominantly focused on the stratigraphy, buildings and material culture that gave the substantial information about their chronology, architecture and cultural features. It was not until the first implementation of the geophysical scanning performed on the Pelagonian tells when the research interest was more broadly concentrated on the spatial organization of these prehistoric sites. Initiated in the beginning of 2010's by the Center for Prehistoric Research these noninvasive surveys on dozens of tells gave entirely new perspective of their architectural features. It was for the first time detected that majority of them were enclosed by one or several ditches which was not recorded before during their excavation. Since then, they are thoroughly studied and their variations along with the spatial disposition of buildings have been systematized. In this occasion the major focus will be on the Neolithic and Chalcolithic tells sites in Pelagonia and the variety of enclosures recorded on them. The Early Neolithic site of Vlaho will be particularly highlighted as it disposes a remarkable setting of dozens of ditches throughout the entire settlement. They were recently excavated and therefore an updated knowledge on its ditches and their relationship will be elaborated in this presentation.

5 RONDELS GO SOUTH: EXPLORING TYPES AND CHRONOLOGY ON THE EDGE OF THE CARPATHIAN BASIN

Kalafatic, Hrvoje (Institute of Archaeology) - Šiljeg, Bartul (Institute of Archaeology) - Šošić, Rajna (Faculty of Humanities and Social Sciences Zagreb)

In the rich archaeological landscape of Eastern Slavonia, an array of Middle and Late Neolithic sites has been uncovered through aerial reconnaissance and satellite image analysis. Leveraging aerial reconnaissance and satellite image analysis, the majority of Middle and Late Neolithic sites in Eastern Slavonia were identified, with subsequent field surveys confirming their attribution through surface finds. In the vicinity of Đakovo, Croatia, magnetic surveys have

been conducted on five confirmed sites, revealing extensive Middle and Late Neolithic settlements characterized by complex spatial organization and enclosures. Through a multidisciplinary approach incorporating archaeological methods, the research aims to unravel the types and chronology of rondels found on the southern periphery of the Carpathian Basin. This investigation extends beyond typological analysis, employing advanced dating techniques to elucidate the temporal dynamics of rondel formation and usage in this region. The findings not only contribute to regional archaeological understanding but also offer broader insights into the diffusion of material culture and cultural exchanges, enriching our comprehension of prehistoric communities in this transitional zone. The spatial complexities and cultural implications of these extensive settlements challenge conventional notions of settlement patterns, emphasizing the need for comprehensive study and protection.

6 DITCH FEATURES AT THE LATE NEOLITHIC – EARLY CHALCOLITHIC SETTLEMENT NEAR BATA, PANAGYURISHTA MUNICIPALITY, SOUTHERN BULGARIA

Boyadzhiev, Kamen (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences) - Boyadzhiev, Yavor (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences)

The presentation focuses on a specific case study: the Late Neolithic and Early Chalcolithic (5150 – 4700 cal. BC) settlement in the “Varbishi dol” area, Bata village, in the southern part of the Sredna Gora Mountains. It is situated on a slope above small river, on a total area of around 180 000 sq. meters. Rescue excavations covered an area of 220x20 m in its eastern periphery.

Three parallel ditches, running NW to SE, mark the northern border of the settlement, on the higher part of the slope. To the south of them, a stone base of a wall was found. All of these features are linear and probably did not enclose the whole site. The width of the ditches varies between 2 and 4.5 m and their depth between 0.20 and 1.50 m. The depth of the ditches is not regular. Their most shallow part is in the middle of the excavated area, their depth increases both to the NW, and to SE. The fill is uniform, with no evidence of deliberate deposits. The specific shape, position and direction of the ditches suggest that they were mainly designed to protect the settlement from water and earth sliding down the slope after heavy rains. However, they may have served other defensive functions, as well.

In the southern part of the settlement, down the slope, two other ditches were attested, next to each other and parallel to the northern ones. Parts of these ditches were covered with piles of stones, animal bones and fragmented pottery. The archaeological situation suggests that they possibly had different purpose than the northern ones.

The features from Bata show that despite common characteristics that prehistoric ditches from the region share, they may have also served different, site-specific functions.

7 ALTERING LANDSCAPES, SHAPING COMMUNITIES: ARCHAEOLOGICAL INVESTIGATIONS AT THE LATE NEOLITHIC SITE OF CSÖKMŐ-KÁPOSZTÁS-DOMB

Riebe, Danielle (University of Georgia) - Dani, János (University of Szeged / Déri Museum)

Late Neolithic tells on the Great Hungarian Plain are well-known for being enclosed by single or multiple ditches, but the purpose and meaning behind these ditches have been widely interpreted. Scale, both geographic and temporal, has played a factor when interpreting the role that ditches played, with most archaeological attention given to the tell itself with little to no contextualization with the rest of the site or how the role of the tell may have changed for the community over time. In the Berettyó valley there are many contemporaneous Late Neolithic sites fortified with ditches (e.g., Berettyóújfalú-Herpály; Berettyóújfalú-Szilhalom; Berettyóújfalú, Berta-domb), but for the past 5 years, the Prehistoric Interactions on the Plain Project (PIPP) has conducted surface collections, magnetometric surveys, and excavations the Herpály tell site of Csökmő-Káposztás-domb. Taken together, the data collected from fieldwork endeavors illustrates the complex and evolving interactions between prehistoric people and their landscape. Radiocarbon dates illustrate that the site developed between c. 5000-4300 BC and over the course of that time, the construction and use of ditches changed in both form and function. These transformations to the broader environment reflect the life-history of the site through monumental community building efforts and human-induced landscape changes.

8 THE COPPER AGE ENCLOSURES AT STAMBOLIYSKI IN BULGARIAN THRACE: FROM DITCH DIGGING TO DEPOSITION AND INFILLING

Katsarov, Georgi (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences) - Nikolova, Nikolina (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences) - Tsurev, Atanas (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences) - Bacvarov, Krum (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences)

In advance of a gas pipeline construction in 2019, large-scale rescue excavations were carried out at the early Copper Age site of Stamboliyski in Bulgarian Thrace (early fifth mill. cal. BC). Three successive enclosure ditches were uncov-

ered as well as the remains of several palisades that are closely comparable – both chronologically and typologically – to the Central European rondels. Nearly 50 pits of various shape, size, and deposits were uncovered in the area enclosed by the ditches.

This presentation will focus on the construction, maintenance, and infilling of the ditches. Throughout the ditches' life cycles, their maintenance included multiple cleaning, repair, and recut. As a result, they went through at least two major phases of use that are clearly visible as distinct backfills or new cuts. Moreover, various depositional practices were associated with the use of the enclosure features. Structured deposits were identified mostly around the enclosures' entrances but also in different places on the ditches' bottoms. Deposits usually consisted of burnt house debris, disarticulated human remains, animal skulls and horn/antler cores, whole and fragmented pots and grindstones. Based on the deposits' position, it seems possible to identify events that mark the beginning or the end of the enclosure's use.

9 CUCUTENI-TRIPOLYE ENCLOSED SETTLEMENTS IN THE MOLDAVIAN SUBCARPATHIANS (ROMANIA). SOCIAL AND ECONOMIC IMPACT, PRACTICAL AND SYMBOLIC ROLE OF THE DITCHES

Preoteasa, Constantin (Neamț National Museum Complex) - Mischka, Carsten („Friedrich-Alexander” University of Erlangen-Nurnberg)

As a result of the scientific cooperation between Neamț National Museum Complex - Cucuteni Culture International Research Centre - Cucuteni Eneolithic Art Museum „Gheorghe Dumitroaia” in Piatra-Neamț (Romania) and „Friedrich-Alexander” University of Erlangen-Nurnberg - Faculty of Philosophy and Department of Theology - Institute of Pre- and Protohistory (Germany), in 2017-2024 interdisciplinary non-invasive archaeological research has been made on the Cucuteni-Tripolye sites (from Chalcolithic - ca. 5000-3500 BC) in the Neamț Depression (Ozana-Topolița Depression) of the Moldavian Subcarpathians (Northeastern Romania).

The results of the geophysical surveys and archaeological excavations confirm the presence of ditches (single or multiple, of different shapes and sizes) in most of the investigated settlements. Some settlements have developed over time and the inhabited area has expanded beyond the ditches.

From our point of view, the role of the ditches, whose creation involved a considerable socio-economic effort, was both practical (protective / defensive) and symbolic (delimiting the inhabited space, implicitly the sacred from the profane, such as the famous sacred furrow by which Romulus delimited the city of Rome).

As a result of our recent investigations, the Neamț Depression (Ozana-Topolița Depression) of the Moldavian Subcarpathians (Northeastern Romania) is currently the only fully investigated geographical area in Europe from a non-invasive interdisciplinary archaeological point of view (geophysics, UAV, DTM) for an entire epoch (Chalcolithic) and civilization (Cucuteni-Tripolye).

10 DIGGING DEEP INTO PREHISTORIC PERSONHOOD: DITCHES AND HOUSES ON TRYPILLIA MEGASITES

Chapman, John (Durham University) - Gaydarska, Biserka (Historic England)

In the last 15 years, we have seen major investigations of Trypillia megasites – the largest sites in 4th millennium cal BC Europe and claimed to be the world's first urban congregation centres. These programmes have been complemented by studies of the frequent smaller Trypillia and Cucuteni sites. Although ditches have been found by geophysical prospection in roughly half the sites, little attention has been paid to these significant features. Three familiar explanations have been posited for such enclosures – defensive, a planning guide to settlement layout and a materialisation of the conceptual division between inside and outside. Yet it is hard to relate the ditches to the other parts of a settlement without a detailed consideration of time/space relationships between the ditch, its segments and causeways, household neighbourhoods and those public buildings dubbed Assembly Houses. It is also vital to insert the ditch-diggers into the analysis and to consider the impact of ditch-digging on their personhood.

In our presentation, we report on such a detailed analysis of the Trypillia megasite of Nebelivka. The ditch is placed in three different contexts according to the Distributed Governance Model, the Assembly Model and the Pilgrimage Model. In our analysis, we seek to explain the number of causeways and their spacing, the labour force required to dig the ditch and to which neighbourhoods ditch segments were related. We also consider the ways in which ditch-digging was used to construct 'local' identities proper to those outside communities whose residence or visits built the megasite itself. It turns out that, just as with Trypillia persons, ditches, their segments and causeways embodied the tension between their dividual and individual identities.

11 "ROLLING IN THE DEEP": SMALL CLAY ARTIFACTS FROM EARLY AND MIDDLE BRONZE AGE DITCHES IN BULGARIA

Minkov, Petar (NAIM-BAS)

The aim of this study is to discuss the known so-far small clay artefacts originating from the Early and Middle Bronze Age ditches in the present-day Bulgarian lands. The locations represent both rondels and ditches surrounding settlement mounds and open-air sites. Amongst the finds discovered in ditches are clay anthropomorphic and zoomorphic figurines, clay models of wheels, and clay models of axes. The main question related to the research is whether the presence of these ceramic objects within ditches a consequence of accidental circumstances is, or it can be associated with use activities, ritual practices and infilling of the enclosures. The primary context in which such objects were usually found is in dwellings, rather than of pits and ditches. Thus, it can be assumed that some of the mentioned clay artefacts found themselves within the fill of ditches as the result of various ritual activities that have taken place there.

438 IN SPE RESURRECTIONIS. THE MULTIDISCIPLINARY APPROACH TO CRYPT BURIALS IN EARLY MODERN EUROPE

Session theme: 2. Archaeological Sciences, Humanities and the Digital era: Bridging the Gaps

Session organisers: Slusarska, Katarzyna (University of Szczecin) - Majewski, Marcin (University of Szczecin) - Rennwanz, Joanna (Joanna Rennwanz Institute of Archaeology and Ethnology of the Polish Academy of Sciences) - Grupa, Małgorzata (Nicolaus Copernicus University) - Ströbl, Regina (Forschungsstelle Gruft)

Session format: Regular session

Deeply rooted in Christianity, crypt burial in early Modern Europe became a status marker and a way to ensure a regular income for parishes and churches. Burial in the church was perceived as a right entitled to those of noble birth or have achieved high economic status. However, it was also a way of manifesting their/their families' remarkable role and place within society, especially crucial for all aspiring to a higher status.

A sumptuous funeral needed many complex and time-consuming preparations. And so, the deceased awaited a substantial amount of time for the burial ceremony. And thus, the dead also needed special treatment to be preserved in decent condition until the right time.

As a complex phenomenon, crypt burials need multidisciplinary approaches. We would like to suggest an in-depth and open discussion on the various aspects, approaches and research problems, with emphasis of social practice associated with crypt burial. We believe that the international platform, facilitated by EAA, will support developing the best practices within crypt burial researches.

We encourage contributions which address general questions and a case studies presenting multidisciplinary research on crypt burials.

ABSTRACTS

1 IT CAN ONLY BE DONE TOGETHER - THE NECESSITY OF INTERDISCIPLINARY COLLABORATION IN CRYPT RESEARCH

Ströbl, Regina (Forschungsstelle Gruft, Lübeck) - Ströbl, Andreas (Forschungsstelle Gruft, Lübeck)

The complete understanding of the complex of crypt burials requires many different scientific disciplines. In the time between the death of a nobleman and his final burial in the crypt, many different processes are necessary. On the one hand, the dead person must be washed, possibly preserved, clothed and placed in the coffin. On the other hand, the funeral service is planned with the entire process from the announcement, the invitations of the guests, the funeral procession, the decoration of the church and the service. To reconstruct all this, archaeologists, folklorists, anthropologists, botanists, chemists, theologians and historians have to work together.

The situation is very special for nobleman who die far away from their homeland and have to be preserved for transport back to the family crypt.

For example, the first evidence of a method for preserving corpses from the 16th century was made on to princes from Schleswig-Holstein-Gottorf, who died on their cavalier's tour. In the lecture, some examples of interdisciplinary cooperation will be presented.

2 WOODEN COFFINS FROM CRYPTS - EXEMPLIFICATION OF RESEARCH METHODS IN POLAND FROM WORLD WAR II TO THE PRESENT

Majorek-Lipowicz, Magdalena (University of Lodz; Institute of Archaeology)

It would seem that with the post-war dynamic development of Polish archaeology, when the number of researched sites of a sacral nature increases, and research work within churches with crypts provide huge amounts of data, the descriptions of discovered coffins containing human remains will find their place in the literature on the subject. This happened to some extent, but the data were often cattered, incomplete, limited to information regarding the presence or absence of a coffin, its shape in horizontal projection, possibly metric features, occasionally containing additional data.

The preliminary search of archaeological publications published until the end of the 20th century shows that fragments of post-medieval coffins were found only at a few sites. A breakthrough in research occurred in the second decade of the 21st century with better financing of investments in sacral buildings, new challenges and research questions emerging in relation to post-medieval archeology and, consequently, the implementation of interdisciplinary projects. The archaeological and anthropological teams were joined by, among others: costume specialists, archaeobotanists, microbiologists, conservators. The combination of knowledge and skills of representatives of many disciplines resulted in the publication of many monographs and articles dealing with the researched sacral sites, in which - more than in previous years - focus was placed on coffin finds. Attention was drawn to the informative, identification and functional potential of coffins. The coffin was somehow separated from the collection of grave goods, and for the first time chapters were devoted to it in monographs.

There has been a change - from the 20th century's poor descriptive narrative (metric data of the coffin, raw material) --> to a more complete form (+ decorations, inscriptions, reconstructions).

In my speech, I will present the changes that have occurred in the research methods used over several decades in relation to coffins from crypts.

3 INTERDISCIPLINARY RESEARCH OF CRYPT BURIALS IN SOUTHWEST FINLAND

Paasikivi, Sofia (University of Turku) - Moilanen, Ulla (University of Turku)

Burial crypts are unique archaeological contexts. In addition to their enormous cultural and religious significance, they are enclosed spaces, surrounded by physical walls. Fieldwork conditions inside crypts may be challenging, from the sensitivities involved in working with dead individuals to conditions ranging from cramped spaces and possibly low oxygen levels, the difficulty of working with collapsed coffins and limited access to human remains. This paper explores the challenges, methods, and ethical considerations associated with the archaeological study of crypts in Finland. Our ongoing research of the crypt at Seili Church in southwestern Finland is an interdisciplinary project combining archaeology and scientific methods, like proteomics, archaeobotany, entomology, ancient DNA and isotope analysis. In this paper, we discuss the challenges encountered in our work, the lessons learnt, and how our experiences can be applied to similar studies in larger churches, such as the prestigious Turku Cathedral, which is the burial place of several prominent historical figures, not least the Swedish Renaissance queen Catherine Månsdotter (1550–1612) and her daughter princess Sigrid Vasa (1566–1633).

4 SACRED BURIAL STRUCTURES DURING THE EARLY CHRISTIAN PERIOD IN THE TERRITORY OF KOSOVO

Hoxha, Zana (Institute of Albanology)

This paper focuses on the complex landscape of early Christian burial structures in the Territory of Kosovo, encompassing: crypts within churches, standalone crypt buildings, and martyriums. These sacred buildings offer valuable insights into the religious beliefs, social practices, and architectural design of the early Christian period in Kosovo.

Through an interdisciplinary approach drawing on archaeological evidence, historical records, and architectural analysis, this study examines the distinct characteristics and roles of each type of burial structure. Crypts within churches served as intimate spaces for interring the faithful, while standalone crypt buildings often confused with martyriums provided dedicated sanctuaries for burial rites and commemoration. Martyriums, while holding the remains of martyrs also held special significance within the early Christian landscape of Kosovo.

By exploring these diverse forms of early Christian burial structures, this paper aims to deepen our understanding of the architectural characteristics, and spiritual, social, and cultural dimensions of death and commemoration in Kosovo during the early Christian period. Through critical analysis and comparative study, it seeks to illuminate the rich tapestry of religious practice and belief that shaped the sacred landscape of the region.

5 THE FAMILY BURIAL VAULTS AT ST PATRICK'S ROMAN CATHOLIC CHURCH, LIVERPOOL IN THE CONTEXT OF THE 19TH-CENTURY URBAN BURIAL CRISIS

Fairley, Anna (University of Liverpool) - Mytum, Harold (University of Liverpool)

To date, only Protestant vaults have been archaeologically studied in England, so the investigation of the contents of family vaults within the crypt of St Patrick's Roman Catholic Church, Toxteth, Liverpool, offers new opportunities. St Patrick's Church opened on the outskirts of Liverpool in 1827 and included a small burial ground, but also a large crypt beneath the church with room for four private vaults as well as large charnel pits. Utilising the limited documentary sources contextualised the families able to commission a vault, but archaeological survey combined with the burial registers indicate how this was a tiny minority option. This paper describes the contents of the vaults and their distinctive features and discusses whether these reflect regional or religious traditions as most vaults. The use of vault burial is also compared with the alternative interment options at St Patrick's, and how other churches in Liverpool also used a combination of vaults and crypts alongside earth burial. The paper concludes with a review of similarities and differences in mortuary behaviour according to denomination.

6 BURIAL OF BISHOP STEFAN WIERZBOWSKI AND THREE SETS OF LITURGICAL VESTMENTS, GÓRA KALWARIA, MASOVIAN VOIVODSHIP, POLAND

Grupa, Małgorzata (Nicolaus Copernicus University) - Grupa, Dawid (Archaeologist)

In 2019, the metal sarcophagus of Stefan Wierzbowski in the crypt under the presbytery of the Church of the Exaltation of the Holy Cross in Góra Kalwaria was examined. Visible defects on the surface of the metal led to the decision to preserve it. Consequently, archaeologists were called in to preserve the mummified remains of the priest. It seemed that all these activities could be carried out quickly and without surprises but it became clear that there were more layers of clothing than there were arrangements for the burial of priests. It was clear from the first inspection that it was mainly the elements of the silk robes that had been preserved. Three sets of robes were discovered, which came as surprise to the archaeologists. They were looking for an answer to the question: under what circumstances were more robes worn? Before the layers of robes were removed, a CT scan was taken.

7 FUNERAL DRESSES FROM THE CRYPT OF THE WEJHER FAMILY IN THE PARISH CHURCH IN PUCK

Grupa, Dawid (Archaeologist) - Blusiewicz, Karolina (University of Warsaw) - Grupa, Małgorzata (Nicolaus Copernicus University in Toruń)

During the refurbishment of the floor in the parish church of Sts. Peter and Paul in Puck, access to the Wejher family tomb was uncovered. This family was among the most prominent in the Gdańsk Pomerania region in the late 16th and early 17th centuries. The tomb was founded as the burial place of the patriarch of the Wejher family, Ernest, and served as the family tomb in the early 17th century. Intervention surveys were undertaken to secure the remains of burials, which showed signs of previous openings of the crypt and various interventions. Interdisciplinary research methods, including bioarchaeological, archaeobotanical, dendrochronological, and costumeological analyses, were employed to gather information about the individuals interred in the crypt and the circumstances of their burial.

During the excavations, numerous silk textile fragments were found and identified as remains of funeral attire and other grave goods, such as pillows and padding of coffins. It was possible to identify a female dress, a child's dress resembling of a doublet, a żupan, a delia, and a sacklike funeral dress of an adult person. The remaining textiles were scattered and seriously damaged. The majority were disposable funeral dresses for children. The archaeological funeral attire from Puck provided new insights on the clothing worn in the Polish-Lithuanian Commonwealth. These clothes exhibited formal characteristics of both Western and Polish origin, reflecting the situation of families in which the West encountered the East.

8 18TH-CENTURY CHILDREN'S FUNERAL FASHION - ANALYSIS OF RESEARCH POSSIBILITIES BASED ON OBJECTS FROM THE CRYPTS IN THE CHURCH IN SZCZUCZYN

Grening, Danuta (Nicolaus Copernicus University in Toruń, Institute of Cultural Studies) - Dobek, Mikołaj (Nicolaus Copernicus University in Toruń, Institute of Archaeology)

Research of the crypts in the church of The Name of Blessed Virgin Mary in Szczuczyn turned out to be very important for the history of funeral fashion in the modern period. The unique conditions in the crypt contributed to the preservation of the full spectrum of grave clothing. A particularly unusual find is the collection of linen and woolen clothing. Analyzes of materials discovered in Szczuczyn made it possible to expand knowledge about grave clothes made of these fabrics, as well as to verify their role. It was established that less durable materials were also present in the rich burials of the local elite. The analysis of artefacts during fieldwork also allowed us to check to what extent the

secular community in 18th-century Poland complied with the rules imposed by the church regarding the use of grave clothes.

During works in the crypts under the presbytery, 96 burials were inventoried. This number also included children's burials, which were subjected to detailed in situ analysis. As a result of these works, the burials of two children of Stanisław Antoni Szczuka, the founder of the church and the owner of Szczuczyn, were identified. Children were usually buried in linen dresses decorated with silk ribbons, but there were also some unique and richer forms of grave clothes among them. The first archaeological discovery of a linen Czechman was made in the Szczuczyn crypts, in addition to a dress with a printed floral pattern, which can also be considered an extremely unique burial. In some cases, analysis of clothing made it possible to determine gender of the child who died very young. Research on children's grave clothes from Szczuczyn allows us to present a reliable picture of the funeral fashion of the youngest children in 18th-century Poland.

9 NOT NECESSARILY LACE AND RUFFLES: ANALYSIS OF CLOTHES FROM BURIAL NO.2 FROM THE WESTERN CRYPT OF THE CHURCH IN SZCZUCZYN

Dobek, Mikołaj (Nicolaus Copernicus University in Toruń, Institute of Archaeology) - Grening, Danuta (Nicolaus Copernicus University in Toruń, Institute of Cultural Studies)

Grave clothes are elements of burial equipment with very diverse characteristics. Their form was influenced not only by local funeral customs, but also by social status and fashion trends prevailing in a given region. Research on grave clothing clearly translates into the general development of knowledge about the evolution of fashion. This issue is no longer only the domain of fashion history researchers, but also something concerning archeologists. This is clearly visible in the examples of analyzes of artifacts found during archaeological research conducted in the crypts of the church of The Name of Blessed Virgin Mary. Clothing items were discovered among the equipment of over a hundred burials, the collection of which constitutes the largest collection of modern burial clothing from the areas of the former Polish-Lithuanian Commonwealth.

This collection is characterized primarily by the excellent condition of individual elements of the costume. This is evidenced by, among others, clothing discovered in burial no. 2 from the western crypt A. The woman buried there was dressed in a green dress, which in itself may seem very simple. However, it is enriched by numerous accessories, such as: a scarf, gloves, bows, a cap and decorative footwear. The analysis of her outfit allows us to redefine what could indicate the wealth and luxury of clothing in the 18th-century.

10 FAMILY IN THE VAULT. THE WEST POMERANIAN NOBLES' CRYPT BURIAL STUDY PROGRAM - CASE STUDIES

Slusarska, Katarzyna (University of Szczecin) - Majewski, Marcin (University of Szczecin) - Rennwanz, Joanna (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Poland) - Ogiewa-Sejnota, Monika (Archaeological and Historical Museum in Stargard)

Since 2020, an inter-institutional and interdisciplinary team has researched the crypts of the West Pomeranian nobility. So far, three sites dating to the mid-17th to mid-19th century have been investigated. These are crypts of three noble families: von Glasenapp in Białowąż (Balfanz), von Oesterling in Koszewo (Groß Küssow) and von Wedel in Bród (Braunsforth).

There are two main goals of such research. The first is to build a comprehensive knowledge of the funerary culture of modern times nobilities in Pomerania. The second goal is restoring the deceased dignity and order to their final resting places. We want to present the developed protocol we apply to this research, which comprises a thorough historical query, followed by an artistic and epigraphic analysis of the sarcophagi, osteological analyses of human remains and an inventory of the remaining material. Undisturbed human remains are sampled for DNA and stable isotopes. Well-preserved coffins are also tested for organic remains, such as mattress and pillow infill or herbs used for embalming, etc. Another element of the work is an attempt to reconstruct the layout of the burials and identify a programme for creating ancestral memory. Historical sources, epigraphical and art programs of sarcophagi compared with osteological analyses help to reconstruct family relations between the deceased. The West Pomeranian noble crypt, together with a commemorative complex in the form of tombstones, gravestones, and epitaphs in the churches, constituted a peculiar memorial which fitted perfectly into the narrative of the story of the family's 'ancient' history, its social position (including as owners of estates and patrons of the church) and the role it played. Plant remains analyses allow us to determine the meaning and symbolism of plants in the Protestant funerary rite.

After the work, each crypt is closed and protected from random entry and further degradation.

11 XYLOLOGICAL ANALYSIS OF STICKS FOUND IN COFFINS FROM CRYPTS IN KAZIMIERZ BISKUPI AND BYSZEWO (POLAND)

Michalik, Jakub (Nicolaus Copernicus University in Torun)

An inherent element of the funeral ceremony of the early modern period was a scrupulous observance of customs so that the deceased person could, in the opinion of their loved ones, pass away in peace. Archaeological and archaeobotanical research makes it possible to identify elements that may have been the aftermath of certain customs and to verify to what extent they agreed with information that was written down by ethnographers. One such item may be the simple, straight, and long wooden sticks that are occasionally found in coffins during archaeological investigations. Such items were found, among others, during archaeological research in 2017–2018 in Byszewo and in 2022 in Kazimierz Biskupi. According to the information gathered by ethnographers, the use of sticks, especially from elderberry (*Sambucus nigra* L.), was thought to be related to taking measures off the dead to prepare planks for the coffin. Finds from Kazimierz Biskupi and Byszewo show that every element placed in the coffin may be important, including small, inconspicuous sticks. Xylological analysis will allow for at least partial verification of ethnographic translations concerning customs that are largely difficult to observe during archaeological research.

12 "ANTI-PLAGUE AMULET FROM ARCHAEOLOGICAL RESEARCH OF THE PARISH CHURCH IN KOŃSKOWOLA (LUBLIN VOIVODESHIP, POLAND).

Openkowski, Rafal (Nicolaus Copernicus University in Torun) - Michalik, Jakub (Nicolaus Copernicus University in Torun)

Epidemics have accompanied humanity since ancient times, and the events that have taken place in recent years allow us to bring at least a little closer to the situation faced by societies of past eras. The biggest difference is the state of advancement of medicine, the lower level of which in the early modern period meant that the mortality rate during disease epidemics was much higher. This caused society to lose confidence in treatment methods then considered scientific. At that time, people turned to spiritual and magical methods of health protection. The consequence of this was the great popularity of devotional items and amulets, which were intended to protect their owner. One of such items is a small rhombus-shaped pendant, found during the examination of the crypts of the 18th-century parish church of "Discovery of the Holy Cross and Saint Andrew the Apostle in Końskowola". The paper will present an anti-plague amulet from the study of the crypts in Końskowola, as well as examples of items worn in the early modern period, which were perceived at that time to protect the health of the owner.

13 THE CANON'S GRAVE IN THE PARISH CHURCH IN BYDGOSZCZ (POLAND). IDENTIFICATION ATTEMPT

Nowosad, Wieslaw (Nicolaus Copernicus University in Toruń)

In 2017–2018, excavations were carried out in the Cathedral of St. Martin and Nicholas in Bydgoszcz within the presbytery. Several small crypts were discovered in this place in which remains were found, containing remains tentatively dated to the 17th and 18th centuries. Among them, archaeologists found a wooden chalice and fragments of a cassock, which suggested that one of the buried could be a canon associated with one of the several chapters existing in the area. This speech is devoted to an attempt to identify a buried figure based on historical sources. The source base that will be used in the identification attempt will be the own files of the parish church in Bydgoszcz, the files of the episcopal curia of the Włocławek bishops (record books, episcopal visitations) and the files of the courts operating in Bydgoszcz in the 17th and 18th centuries. Therefore, it is not an archaeological text, but a historical one and a look at material culture through the eyes of a historian and archivist.

439 INTERDISCIPLINARY AND MULTISCALAR APPROACHES TO BIOARCHAEOLOGY IN THE DANUBE PROVINCES OF THE ROMAN EMPIRE

Session theme: 5. All Roads Lead to Rome: Multiscalar Interactions

Session organisers: Szecsenyi-Nagy, Anna (Institute of Archaeogenomics, HUN-REN Research Centre for the Humanities) - Vulović, Dragana (Institute of Archaeology, Belgrade) - Miladinović-Radmilović, Nataša (Institute of Archaeology, Belgrade) - Bollók, Ádám (Institute of Archaeology, HUN-REN Research Centre for the Humanities)

Session format: Regular session

The Roman provinces along the Danube, renowned for being exceptionally well-explored, are pivotal to bioarchaeological studies. These regions underwent significant transitions during the Imperial and Late Antique periods in several areas, ranging from political shifts and military strategies to diverse cultural and economic interactions, largely driven by the Danube's strategic role in the Empire's policy.

This session seeks to enable and encourage a multiscale exploration of the civilian and military populations inhabiting these territories during these transformative times. We eagerly invite contributions from archaeology, anthropology, archaeogenetics, and isotope sciences to foster a multidisciplinary dialogue, synergizing archaeological and scientific perspectives.

In a synoptic approach, mortuary archaeology illuminates societal norms, beliefs, and the nuanced rituals surrounding death. Complementing this, anthropological data sketches a detailed portrayal of health status, diet, and daily challenges faced by these populations. Isotope analyses offer further granularity on dietary habits, mobility, and interaction with the landscape. Meanwhile, ancient DNA deciphers intricate tales of migrations, interactions, and ancestral lineages, often providing insights elusive to other methodologies.

Embracing these multifaceted strands of evidence, this session aims to delve into the life and death of the Danube provinces' inhabitants. Concurrently, it hopes to spotlight evolving methodologies and theoretical approaches in bioarchaeology. We welcome submissions spanning from meticulous case studies to overarching discussions on bioarchaeological practices within Roman archaeology.

ABSTRACTS

1 TWO LATE ROMAN CEMETERIES AT NAGYKANIZSA (HUNGARY) - ARCHAEOLOGICAL AND PHYSICAL ANTHROPOLOGICAL PERSPECTIVES

Bollók, Ádám (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Horváth, Friderika (Institute of Archaeology, HUN-REN Research Centre for the Humanities) - Szederkényi, Róbert (Institute of Archaeology, HUN-REN Research Centre for the Humanities)

The two late Roman cemeteries excavated at the Inkey-kápolna site in the northern outskirts of present-day Nagykanizsa (Hungary) are remarkable on several counts and thus require closer scrutiny. These burial sites constituted the necropolis areas of a Roman villa settlement located on the territorium of the Roman city of Salla (present-day Zalalövő). Since both cemetery sites have been excavated almost in their entirety alongside the material remains of the villa itself, we can not only carry out a comprehensive analysis of the burials and thereby reconstruct the mortuary behavior of the burial community who interred their dead in the two necropolises, but it is also possible to establish their standing in contemporaneous society and relate their mortuary habitus to their lifestyle and social position within third- to fourth-century CE Pannonia Prima. The results of the physical anthropological studies carried out on both burial sites further contribute to our reconstruction of the burial population's lifestyle, health conditions, and mortuary behavior. After presenting our conclusions based on insights of these two disciplines, our paper will point out a set of research questions to be addressed in the coming years by applying further bioarchaeological means.

2 „LIVIN' ON THE EDGE" - LIFESTYLE RECONSTRUCTION OF PANNONIAN POPULATIONS OF THE ROMAN EMPIRE BASED ON PALEOPATHOLOGICAL ANALYSIS

Kiss, Krisztián (MTA-BTK Lendület Momentum Bioarchaeology Research Group; HUN-REN Research Centre for the Humanities; University of Miskolc; Eötvös Loránd University; Hungarian Natural History Museum) - Mateovics-László, Orsolya (Archäologischer Dienst GesmbH) - Madai, Ágota (Hungarian Natural History Museum; University of Szeged) - Köhler, Kitty (Hungarian Natural History Museum) - Merczi, Mónika (Bálint Balassa Museum, Hungarian National Museum) - Láng, Orsolya (BHM Aquincum Museum and Archaeological Park) - Bernert, Zsolt (Hungarian Natural History Museum) - Mende, Balázs (MTA-BTK Lendület Momentum Bioarchaeology Research Group; HUN-REN Research Centre for the Humanities) - Vámos, Péter (BHM Aquincum Museum and Archaeological Park) - Szécsényi-Nagy, Anna (MTA-BTK Lendület Momentum Bioarchaeology Research Group; HUN-REN Research Centre for the Humanities)

The biological reconstruction of historical human populations is one of the main goals of bioarchaeology, for which the methods of paleopathology are powerful tools. With macromorphological analysis of oral pathologies, activity-related joint alterations and identification of skeletal signs of traumatic events we are able to draw conclusions on lifestyle differences between populations/groups distinguished by variables such like age, sex, spatial and temporal distribution, furthermore groups defined by archaeological and historical questions. Our presentation introduces an anthropological project related to a newly established HAS-RCH Momentum Bioarchaeology Research Group (Title: Life and death at the edge of the Roman civilisation: complex bioarchaeological analysis of Pannonian communities; PI: Anna Szécsényi-Nagy). The team of anthropologists is about to contribute to the reconstruction of the way of life of past populations' from the region of Aquincum (northeastern part of the former province of Pannonia). A classical anthropological and paleopathological analysis is carried out on osteological collections representing villa areas, civil and military towns deriving from the 2-5th centuries AD. The research plans and questions for the next years, altogether with the utilized methods and planned cooperations with another disciplines, as well as the preliminary results of the

current state of anthropological analysis will also be presented. This research was supported by the Hungarian Academy of Sciences through the MTA-BTK Lendület Momentum Bioarchaeology Research Group (LP2023-20/2023).

3 **BROKEN BONES: A CASE STUDY OF A MALE ADULT WITH A HEALED FRACTURE OF TIBIA AND FIBULA FROM NAISSUS, SERBIA**

Vulovic, Dragana (Institute of Archaeology, Belgrade, Serbia) - Miladinović-Radmilović, Nataša (Institute of Archaeology, Belgrade, Serbia) - Jeremić, Gordana (Institute of Archaeology, Belgrade, Serbia) - Manojlović, Nikolina (Homeland Museum Župa, Aleksandrovac, Serbia)

The necropolis in Naissus (Niš, SRB) in the city quarter of Jagodin Mala is one of the best-researched Late Antique necropolises in the territory of Serbia. From 2006 to 2022, more than 200 graves of various forms, with almost 300 skeletal remains, were excavated. In the Late Antiquity, Naissus was a multi-layered and multi-ethnic society with a population of different backgrounds. The city was the birthplace of two emperors (Constantine I and Constantius III), occasional residence of several 4th-century rulers, episcopal see, and the seat of important state military and imperial factories.

During archaeological excavations in 2012 on the site of Jagodin Mala – Benetton Factory, more than 70 graves were discovered. The anthropological analysis of skeletal remains from this site showed that fractures are uncommon in this population, but one skeleton drew our attention. In one of the brick-built graves (no. 46), the skeletal remains of an adult male individual were discovered with an estimated stature of about 171,2±5 cm. Numerous changes, such as caries, linear enamel hypoplasia, osteoarthritis, and osteophytes on vertebrae, were observed during the analysis. The most notable pathology were well-healed spiral fractures on the distal third of the left tibia diaphysis and the middle third of the left fibula diaphysis, followed by osteomyelitis on both bones. In this presentation, we will focus on this antemortem fracture and what this person's life might have been like after the fracture.

4 **CHILDHOOD SCURVY IN ANTIQUE BURIALS FROM SIRMIIUM, SINGIDUNUM, TIMACUM MINUS AND NAISSUS, SERBIA**

Miladinovic-Radmilovic, Nataša (Institute of Archaeology, Belgrade) - Vulović, Dragana (Institute of Archaeology, Belgrade)

Scurvy is a metabolic disease caused by insufficient intake of vitamin C (ascorbic acid), which can be the consequence of a wide range of different factors. Vitamin C is essential for the production of collagen in connective tissue, osteoid and the cement substance binding the endothelial cells of the blood vessels. It is a disease that is almost unique to the human species because most animals that require vitamin C synthesise their own. Causes of scurvy can be broadly grouped into four variables: reduced intake of vitamin C (e.g., resulting from socio-economic factors, natural or social disasters, such as long-term droughts or sieges, or caused by specific, culturally conditioned taboos against the consumption of certain foods or due to a longstanding diet with limitations regarding the number of ingredients, food storage and preparation), increased requirement for vitamin C (e.g., during infections), malabsorption of vitamin C (e.g., in some gastrointestinal diseases) and genetic predisposition to lowered vitamin C levels. The body can obtain the required amount of vitamin C from almost all types of diets, however, if it is not consumed in adequate amounts, humans of any age can develop scurvy. Humans are unable to store vitamins, hence, they require regular and continual sources from fresh fruits and vegetables.

In this regard, we conducted investigation on the presence of scurvy on children's skeletal remains from four Antique cities (Sirmium, Singidunum, Timacum Minus and Naissus), from three different Roman provinces (Pannonia Secunda, Moesia Prima and Dacia Mediterranea), in the hope that the results will shed light on some additional segments regarding the health condition and socio-historical circumstances in the Antique period.

5 **SEEKING FOR THE DACIAN DREAM. EXPLORING ANCIENT MOBILITY IN ROMAN DACIA**

Buzic, Ileana (Doctoral School of History, 1 Decembrie 1918 University, Alba Iulia, Romania; PhD Program in Evolutionary Biology and Ecology, Department of Biology, University of Rome Tor Vergata, Italy) - De Angelis, Flavio (Department of Biology, California State University, Northridge, USA; Department of Mental, Physical Health and Preventive Medicine; University of Campania, Italy) - Gligor, Mihai (History, Archaeology and Museology Department, 1 Decembrie 1918 University, Alba Iulia, Romania) - Bolog, Adrian (Archaeology-Research Department, National Museum of Unification Alba Iulia, Alba Iulia, Romania) - Timofan, Anca (Archaeology-Research Department, National Museum of Unification Alba Iulia, Alba Iulia, Romania) - Amorim, C. Eduardo (Department of Biology, California State University, Northridge, USA)

The province of Dacia, now part of modern-day Romania, was annexed into the Roman Empire by Trajan in 106 AD, drawing people from ancient Italy and other areas, attracted by the prospect of enhancing their livelihoods. Apulum was strategically selected by the Romans as the site for a legionary fort where the Legio XIII Gemina was stationed until the withdrawal of the Roman administration around 270 AD. Initially, a civilian settlement emerged near the cas-

trum. The transformation into one of the most prominent Romano-Dacian settlements featuring two urban centres, still requires in-depth examination in terms of social and demographic change from a bioarchaeological perspective. This interdisciplinary research examines a sample of individuals buried in the Pitchforks Hill (Dealul Furcilor, ADF) biritual necropolis of the Roman Apulum, which is the largest identified in Dacia so far with its over 1000 burials, being utilised throughout the Roman rule. Teeth samples from 34 Roman-era individuals from ADF necropolis were collected for Whole Genome Sequencing (WGS) analysis. After applying rigorous quality controls, 21 samples were chosen for the downstream analyses, with their genetic variants being filtered using the 1240K SNP panel. PCA, F statistics, and Admixture modeling were utilised to assess the genome-wide variation of the ADF group in relation to coeval and current-day populations. The genetic diversity within the ADF group aligns with the broader European genetic landscape. However, it is possible to distinguish two primary clusters: the majority of the samples share genetic similarities with Mediterranean populations, while a minority shows closer ties to Eastern European groups. These findings significantly enhance our understanding of the Romanisation in the region, revealing the genetic imprints left by legionaries and other Italic peoples who settled in Apulum compared to those who migrated from nearby regions, whose genomic makeup is anticipated to be markedly distinct.

6 **BIOARCHAEOLOGICAL INVESTIGATION OF COMPLEX POPULATION DYNAMICS IN THE ROMANIZED EASTERN ADRIATIC AND HINTERLAND**

Loewen, Tisa (SUNY Cortland)

Applying a multidisciplinary inclusion of scholarship from archaeology and classical studies, in conjunction with bioarchaeological research, I examined population continuity in the Eastern Adriatic and hinterland during the transition between the end of the Iron Age and Roman Empire. Biological distance analyses using dental morphology demonstrate regional population continuity, but also admixture between Pannonians, Eastern Adriatic groups, and Italic Romans. Considering the historically established clashes between these populations, the regional transformations, interpreted here as biological imperialism, highlight the complex interplay of local and Roman influences.

Scholarship has increasingly recognized the complexities of population interactions and group social construction in the past. However, Roman studies still deliberate over two-dimensional perspectives, as if discussing power and conflict preclude focus on local agents. By integrating bioarchaeological data with classical perspectives, we gain a richer understanding of the multifaceted dynamics Adriatic and hinterland descendants navigated. These individuals embodied the negotiation of local and Roman during this transformative period, affording us insights into scholarly dissonance around imperialism.

446 **THE GRAND TOUR BETWEEN TRADITION AND TRANSFORMATION: NARRATIVES, PRESENTATIONS, AND REPRESENTATIONS**

Session theme: 3. The Life of Archaeological Heritage in Society

Session organisers: Martins, Ana Cristina (IHC - Polo Universidade de Évora / IN2PAST) - Dross-Krüpe, Kerstin (Ruhr-Universität Bochum – Alte Geschichte) - Mora, Gloria (Universidad Autonoma de Madrid) - Manzetti, Maria Cristina (University of Cyprus)

Session format: Regular session

From the middle of the 17th to the 19th century, European (mainly male) elites embarked on the Grand Tour: a transformative journey complementing their classical education. This expedition led them through diverse landscapes, rich in heritage, ultimately culminating in their much-anticipated destination: Rome, and for some, even South Italy and Greece. During the Grand Tour travelers not only experienced antiquity through the explorations of ruins, museums, and collections but also by attending opera and theatre performances, featuring ancient themes. These spectacles brought the ruins visited by the European elites to life on stage, establishing vivid images and concepts of the past in their minds.

Guided by tutors, the Grand Tour travelers documented their experiences in letters, diaries, and illustrated notebooks, which sometimes evolved into travel literature. The travelers ignited their passions, encompassing the beauty of landscapes, architecture, ruins, cultural traditions, socio-political structures, social gatherings, collecting, museums, the art market, and reproductions. They also bought artifacts to decorate their homes, both scientifically and artistically. This phenomenon thrived as transportation and accommodations improved, resulting in the social proliferation of the Grand Tour. Furthermore, it laid the foundation for a unified European culture with a strong scientific underpinning, notably through antiquarianism and archaeology.

The Grand Tour's lasting influence is evident in how we study, preserve, and present history today. This impact is seen in narratives, collections, education, aesthetics, and tourist options. However, ongoing efforts aim to diversify and modernize this tradition by expanding geographic focus, amplifying marginalized voices, and utilizing new technologies for more inclusive cultural practices.

We welcome contributions exploring various facets of the Grand Tour, comprising collecting, museums, art markets, archaeology, the fusion of Arts and Letters, itinerary design, identity formation, local development, and its contemporary relevance in both tangible and intangible realms. We also encourage submissions using digital technologies.

ABSTRACTS

1 A WORLD MADE BY TRAVEL: INTRODUCING THE GRAND TOUR EXPLORER FOR A DIGITAL STUDY OF THE GRAND TOUR

Ceserani, Giovanna (Stanford University)

What can digital humanities do for the study of the Grand Tour? What can we learn from looking at thousands of travelers at once about this voyage of cultural and symbolic capita, that contributed to a massive reimagining of politics and the arts, of the market for culture, of ideas about leisure, and of professional practices for archaeologists, artists and architects? This talk will introduce *A World Made by Travel: the Digital Grand Tour* - a new online and open access publication from Stanford University Press Digital - which synthesizes multidimensional data about the lives and journeys of 6,007 travelers with original research in a dynamic and interactive online format.

Through the datafication of *A Dictionary of British and Irish Travellers in Italy, 1701-1800* (compiled from the Brinsley Ford Archive by John Ingamells), *A World Made by Travel* introduces more than a thousand new figures, including hundreds of women, servants, workers, and Italians not previously represented among the Dictionary's primary headings. This digital Grand Tour is more representative, addressing and inviting vital questions about a historical phenomenon whose study has tended to focus on the most elite and well-known of travelers.

Through its Grand Tour Explorer, an interactive database with raw downloadable data, visualizations, and documentation; chapters on the project's history, rationale, and meaning; a collection of original essays produced by scholars working with the Explorer; and resources to bring this material to the classroom, *A World Made by Travel* shows the historical and continuing significance of eighteenth-century travel to Italy in a new light and with unprecedented granularity. And it showcases the possibilities of digital-history approaches for producing original research that is equally accessible to researchers, students, and the general public.

2 THE TRANSFORMATIONS OF THE GRAND TOUR: FROM CULTURAL TRAVEL TO MASS TOURISM

Mora, Gloria (Universidad Autónoma de Madrid)

The Grand Tour, as a journey of intellectual training and immersion in the classical world, aimed at the young members of the European aristocracy, developed from its beginnings at the end of the 17th century, when the Grand Tour became an exclusive form of travel, to the 19th century when advances in communications facilitated access for the emerging bourgeoisie to the representative destinations of Western civilisation. An exclusive form of travel was opened up to new pilgrims who, in many cases, did not have the classical training necessary to appreciate, value and enjoy the ancient landscapes and productions of Greece and Rome, but who wished to imitate the customs of the aristocratic class. This opening was accompanied by a transformation of the traditional antiques market: the collection of original antiquities or copies by prestigious sculptors such as Piranesi, Cavaceppi or Thorwaldsen, something reserved for an elite that could afford to display these pieces in their residences as true museums, gradually gave way to the acquisition of copies and reproductions of the most famous statues of antiquity made on a smaller scale, souvenirs easily accessible to bourgeois travellers who could thus display such ornaments in their homes as a testimony to their social advancement. This proposal will also address the impact of this transformation on the conservation of the archaeological heritage, a problem that is very relevant today.

3 GRAND TOURS AND ANTIQUARIANISM IN 18TH CENTURY FINLAND

Kunnas, Liisa (University of Helsinki)

The first university in the area of Finland was founded in 1640 by Queen Christina of Sweden, while Finland was under Swedish rule. This university, the Royal Academy of Turku was the center of Finnish cultural and scientific life, especially in the latter part of the 18th century and the beginning of the 19th century. Classical archaeology, history, art and literature was studied and taught in the Academy and some scholars also traveled and studied abroad. Nevertheless, Finland was a northern periphery in Europe with only few scholars and aristocrats who were able to take actual Grand Tours. In my presentation I will discuss these travelers and their interests in Roman and Greek Antiquity, especially in relation to artefacts brought from these travels to the collections of the Academy of Turku. Since most of the collections of the Academy were destroyed in a great city fire in 1827, it is remarkable that some of these artefacts still exist in the collections of the National Museum of Finland.

4 J.-P. HOUËL: ENGRAVINGS AND TRAVEL NOTES FOR THE RECONSTRUCTION OF THE ANCIENT LANDSCAPE OF THE AEOLIAN ISLANDS

Giuliano, Francesco (Scuola Superiore Meridionale)

Between the 17th and 19th centuries, the need to complete their classical education led numerous scions of the European aristocracies to investigate little-known or partially unexplored lands. Among the European intellectuals eager to satisfy their desire for discovery through direct observation of landscapes and monuments was Jean-Pierre Houël who, having reached Sicily in 1776, stayed there for approximately four years. During his stay, he spent a short period on the Aeolian Islands. He kept a diary to note down his itineraries and his impressions of the archipelago, as for the rest of his journey. Back in France, he engraved his pictures and published *Voyage pittoresque des îles de Sicile, de Malte et de Lipari*. The twelve plates dedicated to the Aeolian archipelago frame his work in the artistic current defined by Giuliano Briganti as "vedutismo dei pittori viaggianti", in which the study of landscapes and natural phenomena is combined with that of surviving antiquities. Houël repeatedly depicted the craters of Vulcano, Vulcanello, and Stromboli, surrounded by bucolic scenes or the rough sea. In Salina and Lipari, it represents some monuments of considerable historical value that are no longer visible, enriching them with vivid textual descriptions. The engravings depicting archaeological remains not only help to preserve memories of structures that have almost completely disappeared but also to reconstruct portions of the surrounding ancient landscape when cross-referenced with archaeological data and topographical reconnaissance. This reconstruction is also supported by the artist's travel notes, which, as evidence of the 18th century, provide information now lost.

5 TOUR À TOUR. THE CHANGING IMAGE OF RAVENNA THROUGH THE DRAWINGS OF CULTURED TRAVELLERS

Emaldi, Elisa (Museo Nazionale di Ravenna - Ministero della Cultura) - Novara, Paola (Museo Nazionale di Ravenna - Ministero della Cultura)

Ravenna represents an anomaly in the panorama of Italian Grand Tour cities. Over the centuries the perception and importance attributed to its heritage changed: some recurring elements in the descriptions of Romantic tourists, notably the mosaics decorating the interiors of late antique monuments, were almost ignored by visitors of the century of the Grand Tour. During the 18th century and part of following century, the primary interest was in the Roman architectural and sculptural heritage, understood as classical, in historical and epigraphic evidence, or "whatever appeared curious and worth drawing", i.e. the most spectacular features of late antique buildings, such as the monolith covering the mausoleum of Theodoric or the dome of the church of St. Vitale, made of clay pipes. With the growing interest in post-classical monuments and works of art, fuelled by factors such as the take-off of academic Byzantine studies and the 'train revolution', the traveller's eye is drawn deeply towards mosaic art, in a trend that still influences modern tourists' perceptions.

The selection of sketches offers the possibility of analysing the travel drawing as a means of approaching knowledge: an essential action not to fix memory or experience, but to complete the study and provide first-hand documentation.

Thus, to give a few examples, in the 18th century Robert Adam and Charles Louis Clérissseau sketched the monuments of Theodoric, while John Talman recorded 'liturgical treasures' that would be lost with the suppression of the monasteries, while in the 19th century Johann Anton Ramboux reproduced mosaics from life to augment his *Museum* and John Ruskin wished to draw "every bit of St. Mark's and Ravenna". Antiquarians, connoisseurs, pensionnaires or art enthusiasts, over a period of almost two centuries, confirm the written sources and reveal interesting aspects of the changing perception of Ravenna's millenary heritage.

6 UNDER THE GUIDANCE OF GEROG ZOEGA. THE EXPERIENCE OF RUINS AT THE DAWN OF ARCHAEOLOGICAL SCIENCE

Cabula, Gianluca (Tor Vergata University of Rome)

A number of manuscripts preserved in the National Library in Copenhagen, together with many letters from his public and private correspondence, enlighten us about George Zoega's role as a special guide for grandtourists and scholars visiting Rome and its surroundings in the late 18th and early 19th century. These people were not only his Danish compatriots, towards whom Zoega had duties of protection and assistance due to a public office, but a vast social and intellectual network that gravitated around the famous antiquarian and for whom the knowledge of Roman monuments was formed under his suggestive guidance. Particularly intense were the exchanges between Zoega and Wilhelm von Humboldt, who was involved in the archaeologist's habitual surveys around Rome. In particular, one of Zoega's rare manuscripts in German, informs us of the accuracy of a tentative mapping of the territory on the slopes of the Alban hills. While this was certainly a sign of an increasingly scientific approach to the study of topography, the experience of ruins remained ambiguous, in the fear that erudition could be at the expense of imagination.

7 FRANZ I. OF AUSTRIA AND HIS JOURNEY THROUGH ITALY 1819 – AN IMPERIAL GRAND TOUR?

Ertl, Claudia (Universalmuseum Joanneum) - Modl, Daniel (Universalmuseum Joanneum)

Looking back over a long tradition of imperial family members traveling to Italy incognito and visiting the traditional sites of the Grand Tour, it was undoubtedly more difficult for the ruling Austrian Emperor Franz I. (1768-1835) to leave his government business behind and spend almost six months doing something considered mandatory for a young nobleman since the 17th century. So, some official duties and bilateral talks with the Pope in Rome were scheduled into the travel itinerary, together with pleasures such as listening to several operas and being present at archaeological excavations, e.g. in Cumae and Pompeii. Next to official court records, this journey is exceptionally well documented by the emperor himself in his personal diaries from 1819. Day by day one can follow Franz I. and his intense sightseeing program in cities like Venice, Florence, Rome or Naples. The emperor was well prepared, having read numerous guidebooks ahead of the journey, but he also had his own personal tour guide, the director of the coin and antiquity cabinet in Vienna, Anton Steinbüchel von Rheinwall (1790-1883). The journey as well as ancient monuments were illustrated in several sketchbooks by the Austrian artist Thomas Benedetti (1797-1863), who accompanied the travel party. In combination, text and illustration do not only display an extraordinary look at the beginnings of archaeology as a science, but also show Franz's personal interest in ancient monuments and antiquities and are therefore unique records.

8 POMPEIAN NARCISSUS IN CENTRAL EUROPEAN COLLECTIONS: COPIES OF ANCIENT ANTIQUITIES AND ARCHAEOLOGICAL AUTHENTICITY IN THE 19TH CENTURY COLLECTORS' MARKET

Petreková, Eliška (Masaryk university)

When the bronze statue of Narcissus was discovered in Pompeii in 1862, excavations near Naples were no longer a novelty. Nevertheless, copies of this specific statue are found in many noble residences in Central Europe. The interest in Southern Italy had never completely waned, the tradition of the Grand Tour persisted and with the expansion of the railway, it became easily accessible. Moreover, during this time, the antiquity market opened up to numerous tourists and collectors. Previously, antiquities were restricted to the chosen few; the King claimed ownership of finds and was reluctant to share discoveries and knowledge. The strict rules and prohibitions, however, gradually loosened over time. In the 1840s, the king allowed selected workshops to create precise copies for wealthy patrons. Prestigious Fonderia Chiurazzi, in collaboration with the Royal Museum, produced over 1000 plaster casts, which were later used to create archaeologically accurate and precise copies, including surface treatment to imitate ancient patina.

The discovery of the Pompeian Narcissus itself occurred at a very opportune time. In the 1860s the Royal Bourbon Museum transformed into the National Archaeological Museum, and the exclusive right to produce copies shifted to unrestricted permission for any artist interested in creating their reproductions. This resulted in a massive boom in foundries and workshops, offering affordable copies of discovered antiquities. However, not all artists aimed for archaeologically accurate reproductions; they altered size, and surface, and added embellishments to appeal to a new type of customer. These often sought not an archaeologically precise citation of the ancient original but an idealized and affordable replica.

Several versions of the Narcissus statue found in Central European noble collections will be presented, showcasing the diverse practices of Neapolitan workshops in the second half of the 19th century, considering the level of authenticity and the pursuit of archaeological precision.

9 "I DON'T UNDERSTAND HOW THE GENTLEMEN OF MY COUNTRY DON'T COME TO ROME..." THE GRAND TOUR TRADITION IN SPAIN

Sánchez, Jorge (Universidad Complutense)

The aim of this conference is to question the cliché concerning the lack of interest of the Spanish aristocracy in carrying out formative European travel, especially in Italy, between the 18th and 19th centuries. The paper will explain the reasons why the literature has traditionally ruled out the existence of a Spanish Grand Tour of Europe, including: the diversity of the fields of research to which the specialists who have undertaken these studies belong; the lack of research in Spanish archives, which has meant that many of these journeys are still in manuscript form; the confusion between the different variants of travel to Italy (artistic trips, scholarly trips, etc.); in quantitative terms, the evident lack of a collecting tradition similar to that of other European contemporaries (of Roman artefacts preserved in Italy); and the very late edition or publication of diaries, correspondence and travellers' accounts, as well as the poor publishing success of some of these writings.

This conference will not, of course, provide a detailed analysis of any specific Grand Tour of Spanish nobles. But we will try to provide a "catalogue" (also still non-existent in the Spanish bibliography) of some of the individuals who started their European Grand Tour; we will take a look at this cosmopolitan custom from a gender perspective; and

we will also provide some useful sources for the further research, in order to encourage the interested public to delve deeper into this field.

10 THE GRAND TOUR, THE FRENCH WRITER FERDINAND DENIS (1798-1890) AND THE DEFINITION OF A PORTUGUESE ARTISTIC IDENTITY

Rodrigues, Paulo (University of Evora; CHAIA - Centre For Art History and Artistic Research)

Between the end of the 18th century and the beginning of the following century, Portugal was one of the frequent destinations of the Grand Tour. Consequently, it was also the protagonist of the literary descriptions of these journeys, in which the authors emphasised the aspects that had been worthy of their attention and that they considered to be of interest to their readers. These aspects consisted of the most distinctive and original features of the territory described, those that were the most picturesque and exotic in relation to the places of origin of the authors, usually those associated with landscape, climate, ways of life, social and cultural practices, the past and the arts. The arts and, in particular, architectural monuments, were seen as having the ability to demonstrate how local populations had related, over time, to the space they inhabited. The uniqueness of their history and the specificities of their geography found plastic expression in artistic and architectural forms. With regard to Portugal, the travelling writers focused mainly on medieval art, especially Gothic and late Gothic art (14th-16th centuries), to demonstrate how the configuration of objects and buildings created in these artistic periods manifested the particularities of the country's history, namely the Muslim presence on the Iberian Peninsula (8th-15th centuries) and the contacts with non-European cultures resulting from the overseas expansion of the 15th and 16th centuries, endowing it with a marked artistic identity. Focusing on the figure of the French literary scholar, writer and historian Ferdinand Denis (1798-1890), the trip he made to Portugal around 1820-1823 and the book that resulted from it (*Le Portugal Pictoresque*, 1846), we intend to demonstrate how the impressions of the Grand Tour travellers contributed to the definition of a Portuguese artistic identity, anticipating factors and characteristics later formalised theoretically by historians and archaeologists.

11 JOURNEYS OF ENLIGHTENMENT: EXPLORING ARCHAEOLOGICAL PERSPECTIVES THROUGH THE 19TH-CENTURY DIARIES OF MARIA CONSTANÇA DA CÂMARA, MARCHIONESS OF FRONTEIRA

Urbano, Pedro (IHC - NOVA FCSH / IN2PAST) - Martins, Ana Cristina (IHC - UÉ / IN2PAST)

Maria Constança da Câmara (1801-1860), Marchioness of Fronteira by marriage, was a Portuguese aristocrat who left us one of the few known examples of Portuguese nineteenth-century diaries written by women. Written between 1826 and 1842, it covers the Portuguese and European revolutionary periods. The couple's attachment to constitutional ideas led to their forced exile between 1823-1826 and 1829-1833, during which time they travelled around Europe, in territories now belonging to the United Kingdom, France, Switzerland, Austria, Germany and Italy.

Although these journeys did not formally constitute a Grand Tour, as they were usually undertaken by unmarried men up to the age of 21, they nevertheless have some similarities. In addition to the social origins of those involved, the trips of the marquises of Fronteira, apart from the usual socialising with other members of the international aristocracy - dinners, soirées, attending the opera houses - included various visits to places of heritage, artistic, scientific, and archaeological interest, such as palaces, churches, museums, and factories. The contact with new realities and the visits to these places are, like other forms of sociability, a characteristic element of the European aristocracy, as a social group, regardless of their geographical origin, especially at a time when there was an intense migratory flow caused by political instability in many of the southern European kingdoms. Analysing these visits to museums and other places of heritage interest, allows us to deepen our knowledge of various subjects in non-formal educational contexts and permitting us to see the existence of the production and reproduction of a transnational aesthetic and shared cultural and artistic consumption.

12 GRAND TOURS IN REVERSE: ANTIQUITIES TOURISM IN GREEK SATIRICAL FICTION OF THE 1840S

Jotischky, Christopher (Brown University)

Discussion of the Grand Tour has focused on Western Europeans travelling south and east to Italy and Greece. But what of the inhabitants of these so-called ancient lands themselves? The unfinished novel *Xouth the Ape* (Ο πίθηκος Ξουθ, 1848) by Iakovos Pitsipios (c.1800-1869) turns this situation on its head. Although the novel's treatment of the attempts of Greek high society to adopt a Western European habitus (Yagou 2009) and the resulting instability of Greek identity this creates (O'Neill 2003) have been documented, its attitudes towards the museumification of Greek antiquity within Greece inspired by the activities of Grand Tourists collecting ancient artefacts have yet to be examined in full.

Pitsipios satirizes nouveau riche Greek society in the early years of independence, with one character travelling to Egypt and desecrating its ancient monuments, just as Grand Tourists had treated the physical remnants of Greek antiquity. The central figure, Kallistratos, stoops to the point of collecting forged Greek antiquities such as 'Homer's eyeglasses' or 'Perikles' tobacco pouch' purchased in Paris, fashioning a private museum Pitsipios implicitly contrasts with the Western-style public museums which were being created throughout Greece for the scientific display of antiquities. This aping of Western Grand Tourism is contrasted with the fate of the real-life Prussian travel writer JLS Bartholdy, who has in the novel been transformed into the eponymous ape several years after penning a mendacious account of his journey to Greece.

Pitsipios cautions that homegrown Greek understandings of antiquity are being effaced through an over-reliance on the greater scientific standards reached in Western philology, with Modern Greeks losing their national identity by attempting to perform a Western ideal of Ancient Greece. He thus asks vital questions provoked by Grand Tourist activities about the ownership of classical antiquity and how Greeks can best embody their heritage.

452 COASTAL TECHNOLOGY AMONG STONE AGE HUNTER-GATHERERS AND EARLY AGROPASTORAL COMMUNITIES

Session theme: 1. The Material Record: Current Trends and Future Directions

Session organisers: Calvo-Gómez, Jorge (CNRS - University of Rennes) - Schülke, Almut (Museum of Cultural History - University of Oslo) - Berg-Hansen, Inger (Museum of Cultural History - University of Oslo) - Macane, Aija (Latvian History Institute - University of Latvia)

Session format: Regular session

During the Early Holocene period, coastal environments were occupied and exploited by human groups, both hunter-fisher-gatherers as well as the first agropastoral communities. Much of the previous research in these contexts has been based on a theoretical perspective from which human technology and tools would have been fundamental actors in the exploitation of coastal and marine resources. For example, fishing, collecting seafood, hunting marine mammals, or navigating along the seashore are some of the activities developed by coastal human groups that would have required specific techniques and knowledge. However, to understand the lifeways of the coastal prehistoric groups, many technological perspectives still need to be explored. Can we identify technological features specific to the coast and the exploitation of coastal and marine resources in the archaeological record? Are the tools produced or used differently in the coastal areas compared to those in inland environments? To what extent can we consider these technological features as a socialized perception of the coastal environment? We invite contributors to present theoretical and methodological perspectives to the study of the coastal techniques, as well as new study cases, including contributions comprising technological, functional, or raw material studies of Mesolithic and Neolithic coastal groups.

ABSTRACTS

1 THE CHAÎNE OPÉRAIRE OF THE SOAPSTONE 'COFFEE BEAN' SINKERS OF STONE AGE NORWAY

Adegeest, Mette (University of Stavanger) - Radchenko, Symon (University of Stavanger)

In the Norwegian Late Mesolithic and (pre-agriculture) Early Neolithic, the stable and abundant supplies of fish were a vital food source and probably played a role in the development of semi-sedentary settlements. Fishing equipment must have played an important role in the hunter-fisher-gatherer societies of this time, but not all fishing technology has received much archaeological attention. Soapstone 'coffee bean' sinkers in particular have gone underappreciated. These small, sometimes decorated, soapstone sinkers are a common find along the West-Norwegian coast and are presumed to have been used in line fishing during the Late Mesolithic and Early Neolithic. Previous studies have investigated their distribution and forms, but little attention has been paid so far to the technology of their manufacture or use. This paper will focus on the chaîne opératoire of making these sinkers. I will present the preliminary results of actualistic experiments with crafting and ornamenting sinkers and of provenance studies to gain insights into raw material acquisition. I will further discuss the traceology study we are currently carrying out to build on the experiment results. This study utilizes Structure from Motion photogrammetry as a flexible and controllable technological solution for the highly detailed image-based 3D-modeling of the experimental replicas as well as original sinkers with submillimetre accuracy, to document and compare the traces left by different tools and to reveal techniques and peculiarities of the manufacturing process.

2 TRACKING MESOLITHIC MOBILITY IN SOUTH SCANDINAVIA: LITHIC TECHNOLOGY AND ISOTOPIC PROVENANCING OF FAUNAL REMAINS FROM NORJE SUNNANSUND AND LJUNGAVIKEN, SWEDEN

Kjallquist, Mathilda (Lund University)

The extent of regional and local mobility among hunter-fisher-gatherers during the Mesolithic period in Scandinavia has long been a source of scientific discussion. In recent years, methods like $^{87}\text{Sr}/^{86}\text{Sr}$ isotope analysis have widened the knowledge of mobility in the past. However, only a few studies have been able to elucidate details, and few studies have been done on faunal remains to explore the provenance of prey and thereby draw more precise conclusions about human mobility patterns. In this multidisciplinary study, two different approaches were combined to investigate local and regional mobility and social contact networks. We analyzed strontium isotopes in animal teeth as well as lithic technological traits and regional lithic raw material use from two coastal Swedish Mesolithic sites, Norje Sunnansund (7000 cal. BC) and Ljungaviken (6500 cal. BC). The detailed strontium isotope analyses were performed using laser ablation-multi-collector-inductively coupled plasma mass spectrometry. In combination with an extended baseline for the region, probable areas of origin for a range of terrestrial and marine fauna were identified. The lithic raw material choices and technological traditions from the sites had many similarities, but with some interesting variations that may further contribute to a more nuanced picture of local and regional Mesolithic mobility during the period. The study contributes to the understanding of Mesolithic mobility and emphasizes the dynamics between technological choices, social networks and resource utilization among hunter-fisher-gatherers.

3 IS THE TECHNOLOGICAL (AND SOCIAL) ORGANIZATION IN EARLY MESOLITHIC NORWAY REALLY UNIFORM, IF WE BREAK IT DOWN, LITTLE BY LITTLE?

Dugstad, Sigrid (Museum of Archaeology, University of Stavanger) - Eigeland, Lotte (Museum of Archaeology, University of Stavanger)

It is generally agreed that the archaeological record from the Early Mesolithic period in Norway is rather uniform, and it is securely placed on the microscale level. The settlement pattern is highly mobile, and each site reflects single core families or task groups. The proposed uniformity is especially visible when comparing lithic assemblages and distribution patterns from different sites. They often have a similar size and composition, but the similarities between the sites are first of all reflected in a selected set of artefacts: blades, cores and tools. Other artefacts, such as flakes and fragments, are rarely studied in any detail, only sorted and counted. However, how similar are activities at different sites when inspected through a meticulously detailed technological analysis? Can we also get a glimpse of demographic diversity by identifying individual knappers? If we dig deep, will uniformity prevail?

The Early Mesolithic people were predominantly coastal hunter-gatherers-fishers. However, settlement sites in the mountains also provide evidence of seasonal exploitation of other ecozones. In this paper the results from a study of lithic assemblages from three mountain and two coastal sites in southwestern Norway will be presented. The selection of sites provide ground to detect differences in strategies when it comes to technology, group composition and demography. An important aim is to demonstrate the potential in assessing the entire lithic material - what do this really consist of and why, and are there differences between coastal and mountain sites?

4 TO THE QUESTION OF THE GENESIS OF THE NEOLITHIC COMPLEXES OF THE NORTHERN ARAL SEA REGION

Rakhimzhanova, Saule (Margulan Institute of Archaeology, Kazakhstan) - Aminova, Rimma (Margulan Institute of Archaeology, Kazakhstan)

The archaeological sites of the Northern Aral Sea had an episodic researches and the question of the cultural and chronological affiliation of the materials remains open to this day.

In 2021-2022, the Aral Expedition, led by A. Ongar, conducted archaeological reconnaissance, during which the settlements of Akespe 4, Kosaman, Kulandy 1-2, and Saksaulskaya 1, located in the Aral District of the Kyzylorda Region, were re-surveyed. A total of 185 artifacts were studied.

In collections attributed to the Neolithic era, two groups distinguished by raw materials have been identified: one is made of flint of various colors, rarely chalcedony and translucent quartzite, while the other consists entirely of products made from transparent quartzite. Dating markers in the collection among tools include horned and symmetrical trapezoids, symmetrical and asymmetrical points on blades, chisels, and serrated tools, which correspond to the Daryasay stage of the Kelteminar archaeological culture of the Akchadaryin Delta (6th millennium BC) (Brunet, 2014, pp. 39-40). Leaf-shaped arrowheads with notches at the bases and willow-leaf arrowheads with straight bases, inserts, asymmetrical points on medial blades, processed with abrupt retouch, find their analogies in the Oyukly archaeological culture of the Mangyshlak Peninsula (Astafyev, 2014). Thus, the genesis of this artifact complex is linked to components of two cultures - Kelteminar and Oyukly - which coexisted synchronously at these sites.

Another complex from the Neolithic era, represented by artifacts made of translucent coarse-grained quartzite, differs in size and the character of retouching on blade-like flakes. Because of this, we hypothesize that it is either an indigenous local population group (since sources of this raw material are present in the region), or an adaptation of incoming populations to new local resources. The tool assemblage of these two population groups is similar. The functionality of the tools was confirmed through traceological analysis.

5 FUNCTIONAL ANALYSIS OF THE MACRO-TOOLS OF THE LATE MESOLITHIC SHELL MIDDEN SITES IN MORBIHAN (BRITTANY)

Dehurtevent, Alexanne (CReAAH)

The macro-tools discovered in a coastal context provide an insight into raw material supply strategies and the activities carried out, helping to interpret the type and duration of occupation of a site. A technological study integrating a first level of functional analysis was carried out on the macro-lithic corpus of the three Second Mesolithic sites of Beg-er-Vil (Quiberon), Port-Neuf (Hoedic) and Téviéc (Saint-Pierre-de-Quiberon), all three located on the Morbihan coast (France). Our goal was to understand the functionality of these tools through the analysis of use-wear traces and to be able to integrate them into fields of activity. The sites established on the seashore, in comparison with continental sites, have a greater diversity of raw materials, particularly on the Armorican coast, and a diversity of pebble morphologies allowing a reduction in the technical investment to obtain blanks for the purpose of its use.

We have twelve types of tools, the majority of which were used in thrusting percussion, such as the different sub-types of percussion tools, cutting tools and bevelled pebbles. We also have resting percussion with abraders and smoothers, indirect percussion with intermediate pieces, thrusting and resting percussion with pestles and tools that function without percussion such as weights and discs. These tools were used in various activities, the traces of which are imperceptible to us today, such as food preparation activities or the working of animal materials. From the different activities recorded at each site, a dichotomy emerged between the macro-tool assemblages, showing a certain divergence in the mode of occupation of the sites, whereas the results provided by other fields of expertise would rather indicate a similarity in their mode of occupation.

6 TECHNICAL SYSTEMS OF MESOLITHIC COASTAL GROUPS AROUND THE BAY OF BISCAY: A FUNCTIONAL APPROACH THROUGH USE-WEAR ANALYSIS ON KNAPPED TOOLS

Calvo-Gómez, Jorge (University of Rennes - CNRS) - Cuenca-Solana, David (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - Universidad de Cantabria) - Gutiérrez-Zugasti, Igor (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - Universidad de Cantabria) - Marchand, Grégor (University of Rennes - CNRS)

The occupation and exploitation of the coastal environments by human populations has been long time discussed by the archaeologist as a process in which the technology would have played a major role. While many Holocene contexts along the Atlantic European seashores have delivered data related to the exploitation of marine resources, the functioning of the technological system remains rather poorly understood. Around the Bay of Biscay, in the shell middens of Brittany (France) and Asturias (Spain) the production of knapped tools is part of the technical standards of the Mesolithic. While these traditions in lithic knapping are not restricted exclusively to marine environments, the function and functioning of tools could reflect technical traditions specific to these coastal contexts. In this work we have sought to deepen the characterisation of the technical system of coastal populations through the functional study of the knapped tools from three shell middens from Brittany (Beg-er-Vil, Téviéc and Port-Neuf) and two from Asturias (El Mazo and El Toral III). The final objective is to address the question of a potential specificity of techniques in the coastal sphere. The study of the use-wears revealed that there is a certain functional consistency in both study regions. However, the functioning of the identified tools cannot be undeniably associated to specifically coastal techniques. In some cases, the functioning of the tools arises from technical traditions known at a supra-regional scale, transversal to various geographical areas, both terrestrial and coastal. On the other hand, the use of certain tools could respond to specific technical choices, but which seem to respond to essentially cultural realities.

7 TECHNOLOGICAL DEVELOPMENTS IN THE LATE MESOLITHIC AND NEOLITHIC WETLANDS OF THE RHINE MEUSE DELTA: A VIEW FROM THE MICROSCOPE

van Gijn, Annelou (Faculty of Archaeology, Leiden University) - van den Dikkenberg, Lasse (Faculty of Archaeology, Leiden University) - Verbaas, Annemieke (Faculty of Archaeology, Leiden University)

In the last decades a number of sites have been excavated that provide a glimpse of daily life in the Rhine/Meuse delta of the coastal western Netherlands. People lived on river levees and coastal dunes, but were always, to various extent, within the influence of the sea. These sites date from the Late Mesolithic (the Hardinxveld-Giessendam sites) to the Late Neolithic Vlaardingen culture (e.g. Hekelingen, Den Haag-Steynhof), encompassing a period of c. 3000 years

of intermittent occupation of this wetland area. Usewear studies were done for many of these sites, including not only the flint implements, but also tools made of bone, antler, and non-flakeable stone, enabling us to reconstruct the toolkits for various activities. In all of these sites a variety of craft activities was carried out, from woodworking, hide working, making bone and antler tools, to making ornaments. We also have found evidence for various subsistence activities, such as fishing. Which activities were carried out, and which kind of tools were selected for these tasks, varies somewhat between the various sites. We will discuss these differences, and relate them to other lines of evidence as well as to their specific landscape setting. Last, we will address the issue of a possible continuation of Mesolithic lifeways into the Neolithic of the coastal Netherlands, especially in the light of recent evidence from the analysis of Late Neolithic Vlaardingen tools (www.puttinglife.com).

8 TEETH AS TECHNICAL TOOLS? ANALYSING DENTAL WEAR AS AN INDICATOR OF SUBSISTENCE-RELATED ACTIVITIES IN ISLAND INHABITANTS FROM NEOLITHIC NORTHERN GERMANY

Boensch, Victoria-Luise (Kiel University) - Jantzen, Detlef (State Agency for Heritage Service of Mecklenburg-Vorpommern, Schwerin, Germany) - Fuchs, Katharina (Institute of Clinical Molecular Biology, Kiel University, Germany)

The use of one's own teeth as tools in performing daily tasks is a well-documented practice in ethnological and osteoarchaeological studies. It can be recognised both macroscopically and microscopically by microfractures and dental modifications that are indicative of certain activities, such as chipping, interproximal grooves, or occlusal notches. Chipping and occlusal notches have been observed to be a possible indication for fishing-related activities due to their increased occurrence in coastal communities and their potential role in processing fibres e.g., for net-making.

The excellently preserved flat grave cemetery on the island of Ostorf-Tannenwerder in Lake Ostorf near the north-eastern German coast has been subject to one of the first tooth-tool use case studies in Germany. The cemetery had its main period of use in the Middle Neolithic from c. 3200 to 2900 BC but exhibits grave goods and anthropological findings that hint to a lifestyle more akin to that of Mesolithic hunter-fisher-gatherers than that of early agriculturalists. Isotope studies have shown that the Ostorf people consumed a high proportion of fish, but tools that could have been used for fishing are significantly underrepresented among the cemetery's grave goods.

Following a macro- and microscopic assessment for identifying and recording dental modifications related to the habitual use of teeth, we could gain important insight into this population's activities and social organisation against the background of their aquatic environment. Furthermore, we offer an alternative approach to detect the possible presence and use of technologies related to fishing activities in the archaeological record of Ostorf-Tannenwerder.

460 ALTERNATIVE PATHS TO COMPLEXITY: NEW PERSPECTIVES ON LATE BRONZE AGE AND IRON AGE CENTRALISATION IN THE MEDITERRANEAN

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: de Vos, Marcello (Sapienza University of Rome; University of Groningen) - Zamboni, Lorenzo (University of Milan) - Attema, Peter (University of Groningen) - Monti, Dario (Université catholique de Louvain) - Scarsella, Elena (University of Cambridge)

Session format: Regular session

The Late Bronze Age and Iron Age Mediterranean (ca.1300-500BCE) saw the transformation of society from small, loose communities into complex and organised polities. When it comes to the study of this transformation, much emphasis has been placed on concepts such as 'state' and 'urbanism'. These terms have proven difficult to define and can only be measured in relative terms. Recent research has shown that in many cases the trajectory toward more complex societies is not linear and that many variations occur in different landscapes. A universal definition of the term "urbanisation" is therefore difficult to formulate and misses the opportunity to explore intermediate and alternative phenomena, such as the emergence of other nucleated centres and the challenges posed by fragmented landscapes, such as mountainous areas or wetlands. This session aims to step away from state and urbanism as fixed concepts and ultimate societal models. It rather approaches society's pathway to complexity as a multi-linear process, the diverse character whereof reflects an adaptive strategy to environmental and historical necessities.

This session welcomes papers that take a different approach to increasing complexity in the Late Bronze Age and Iron Age Mediterranean, including non-linear perspectives, such as deurbanisation, and alternative forms of nucleated agglomerations.

1 THE ARCHAEOLOGY FROM THE BIRD'S EYE VIEW. THE TRANSITIONS IN SETTLEMENT PATTERNS BETWEEN BRONZE AGE, IRON AGE IN CENTRAL ANATOLIA

Hordecki, Jędrzej (Polish Academy of Science)

The history of the Bronze Age, Iron Age Anatolia is often seen from a historical viewpoint. The main narrative is based on historical sources and excavations conducted in the major administrative centers. This presents an intriguing but fairly one-dimensional perspective with well-defined political actors. However, archaeological research offers more insights than excavation alone.

Hundreds of sites in Central Anatolia have been identified as a result of archaeological investigations done over the previous forty years. They provide a major opportunity for the study of the Bronze Age and Iron Age transitions. The emergence and decay of settlements can be observed using an archaeological technique rather than a historical one.

The transitions encompassing the emergence and decline of archaeological sites will be examined through the prism of two primary perspectives: the decline of Bronze Age states and the advent of the inaugural Iron Age states within the region, both of which have significantly influenced these changes. This paper will explore the natural factors that have impacted settlement configurations during this period. Nonetheless, while the people responsible for these settlements remain elusive, their decisions resonate through the shape of the settlement.

The research outlined in this paper aims to redirect focus towards the analysis of settlement patterns during the Iron Age and Late Bronze Age. The principal objective is to delineate the evolving dynamics of settlements, which served as catalysts for the emergence of embryonic states.

As a result, we may track changes in settlement localization, geographical differentiation, and the level of organization and grouping rather than the political entities standing behind them. This perspective reveals an unknown picture of Central Anatolia's relatively undiscovered archaeological region.

2 COLONIAL ENCOUNTERS: GREEK ARCHAIC SETTLEMENTS AND ECO-CULTURAL ADAPTATION IN THE WESTERN BLACK SEA

Bivolaru, Alexandra (Ca'Foscari University)

This paper focuses on Greek colonization (7th-5th c. BC) along the western Black Sea coast, examining the interaction between colonists and the colonised environments. The newly founded settlements adapted to local conditions, which differed significantly in climate and environment from Anatolia, where the mother-city was located, leading to the development of distinct landscapes through land management practices. In the construction of these settlements, both agrarian territory (chora) and harbors played pivotal roles, influencing land use patterns, the movement of goods and people, and the distribution of terrestrial infrastructure. However, efforts to comprehensively integrate traditionally separately studied contexts (such as paleo-environment, harbors, roads, and hinterland) for examining the occupation and structuring of ancient colonial territories in the Black Sea region have been limited. This study seeks to address questions such as the dimensions of the chorai and how settlement structures adjusted to local environmental conditions and ergonomic limitations. Furthermore, it investigates whether the distinctive steppe-wetland landscape of the western Black Sea, coupled with the impact of land cadasters and the influence of export trade, led to the development of a distinct communication system and settlement pattern. Lastly, we shall ask the question of interactions with autochthonous communities. These Greek settlements played a pivotal role as centres of commerce and connectivity, fostering trade networks and facilitating interactions between the Greek settlers and local Getae communities. This brings to fore the question of Greek colonies of the western Black sea shore undergoing a process of assimilation between local environments, Getae customs and Greek traditions in the construction of their communities.

3 ANOTHER LOOK AT MYCENAEAN DIMINI: ALTERNATIVE CENTRALISATION IN LATE BRONZE AGE COASTAL THESSALY

Zeman, Piotr (Institute of Archaeology and Ethnology of the Polish Academy of Sciences) - Lis, Bartłomiej (Institute of Archaeology and Ethnology of the Polish Academy of Sciences)

The paper focuses on the site of Dimini, located in coastal part of Thessaly. During the Late Bronze Age (LBA), this region was subject to a process of Mycenaeanisation, so the gradual adoption and adaptation of various Mycenaean cultural markers. Dimini started to show presence of Mycenaean characteristics already during 15th c. BC, together with two other important local centers – sites of Kastro/Palaia (Volos) and Pefkakia, which testify to the contacts of the local communities with the elites of central and southern Greece. However, the historical trajectory of the development of LBA Thessaly did not follow that of the inherently Mycenaean regions, where during the 14th c. BC the

emergence of palatial centers led to the formation of urbanized and strictly hierarchical settlement networks. Instead, all the main settlements of the region co-existed during this period, experiencing recognizable phases of development and decline which may suggest shifts of power. Both a heterarchical model of cooperation and competition, and a model of a nucleated agglomeration were proposed in the literature as interpretations of this regional network not fitting the patterns recognized elsewhere. Moreover, even though it seems that there was a proper Mycenaean palace at the site of Kastro/Palaia, it is clear that Dimini, located only 3 km away and clearly a center of major regional importance, developed differently. During this period Dimini formed a large open settlement, organized along a central road and centered on an administrative and ritual complex of quasi-palatial nature, separated from the rest of the settlement only by a formal propylon. The paper gathers data from the excavated parts of the site, in an attempt to reinterpret it as a unique example of an alternative, local form of a Mycenaean urbanized settlement and seeks to understand its position in the regional settlement network.

4 INTEGRATING EVIDENCE: AN HOLISTIC SYSTEMS APPROACH TO CENTRALIZATION IN CENTRAL ITALY

de Vos, Marcello (Sapienza University of Rome; University of Groningen)

The process of centralization in Central Italy is a rapid transformation that must have greatly impacted society. In the past, many studies have been dedicated to this subject, mostly from economic and regional perspectives that focus on the long term development of urban centers. Although we gained great insights from such approaches, it is susceptible to teleological biases and tends to overemphasize the role of the economy. When considering centralization as the turning point that leads up to urbanism, the complex and multifaceted nature of the process is overlooked. Furthermore, the focus on economic development, often inspired on Marxist theory, tends to neglect that such crucial transformations involve and impact all domains of society including the social and cultural. To gain a better understanding of this phenomenon, therefore, it is necessary to take centralization as the focal point without the evolutionary connotation of urbanization and to incorporate all aspects of society. In this paper, a new conceptual social systems framework will be presented that will serve to do so. This framework is based on the action systems approach developed by sociologist Talcott Parsons. Contrary to conventional archaeological applications of systems theory, this framework does not consist of a top-down differentiation model, but rather of a bidirectional cybernetic order of subsystems that encompass the different environments of social action and their relations. This framework allows to integrate archaeological evidence relating to various domains of society and takes into account the influence of the landscape. Finally, the cybernetic orders provide directions that help to understand how change, in this case centralization in Central Italy, impacts society in a non-linear way.

5 THE PIEDILUCO BASIN IN THE CONTEXT OF THE GENESIS OF PROTOHISTORIC COMMUNITIES IN CENTRAL ITALY.

Zanini, Alessandro (Independent researcher) - Virili, Carlo (Department of Science of Antiquities, Sapienza University in Rome) - Jaia, Alessandro M. (Department of Science of Antiquities, Sapienza University in Rome)

The data from the research still underway on the proto-historic site of the Paduli wetland area constitute a useful starting point for a re-reading of the evidence in southern Umbria. It is difficult to perceive a unitary overview of this territory on the threshold of the first millennium B.C., the time of general definition of the structures of future historical communities, both Etruscan and Central Italic.

The central-northern part of the present region is better defined in late protohistory, both from the point of view of archaeological aspects and territorial arrangements. Further south, different dynamics must be identified and clarified that cannot yet be traced back to a unitary cultural model that seems to be innervated by Tyrrhenian models. The reading of the emergencies that have been accumulating in the Piediluco lake basin, mainly around the multi-layered site of Paduli, through researches conducted by the Sapienza University of Rome, could provide one of the possible keys to interpreting the evolution of the peopling between the Final Bronze Age and the beginning of the Iron Age. Is this the time of maximum development of the settlement lake related-system of the Velino area, capable, in a socio-economic and political framework of village communities with a tribal structure, of bringing out elites included in a network of continental and indirectly Mediterranean trade and of managing a large metallurgical production such as that represented by the Piediluco deposits with notable Tyrrhenian affinities. After the ancient phase of the Iron Age the Velino lake-related system collapsed, showing the inability to transform this cluster into proto-urban outcomes, perhaps more potentially activatable in the nearby Terni basin, which sees in PF1 the crystallisation of the great funerary area of the Acciaierie.

6 A MOUNTAIN PATH TO COMPLEXITY: THE CASE STUDY OF INNER SABINA BETWEEN THE IRON AGE AND THE ROMAN CONQUEST

Monti, Dario (Université catholique de Louvain)

Even though mountainous areas represent around 35% of Italy's national territory, they have been archaeologically under-studied over time. Although there has been a trend reversal in recent decades, especially in the Apennines this gap is still far from being bridged. Moreover, there is also a lack of recognition of the particularity of this environment, which is often evaluated based on criteria that are alien to it. This is particularly evident in relation to the phenomenon of (proto-)urbanisation. Scholars attribute a fundamental role to this process in the complexification of society on the peninsula. This perspective relies on the great complexity achieved for example by Etruscan cities as well as the pivotal role played by the city (the Urbs) par excellence, Rome, in subsequent Italian and European history. This led too often to defining the process of complexification of societies on a teleological evolutionary basis, in which the urban phenomenon is a necessary step. Because of its absence, the mountainous communities have for long time been considered as isolated, marginal, and backward. An increasing number of studies in the last decades, on the contrary, is showing instead the adaptability to local geographical contexts, the dynamism and cultural elaboration of mountain communities. In other words, their own path to complexity.

The paper wants to highlight these latter characteristics through the case study of Nursia territory (south-eastern Umbria) between the Iron Age and the Roman conquest (290 BC). The first aim is to show the vitality of the area in pre-Roman times, through the analysis of the new data from survey research, as well as the study of unpublished material from local deposits. The second is to underline how this settlement pattern did not change even following the Roman conquest and colonisation of the territory, demonstrating its adaptation to the local context.

7 ALTERNATIVE PATHS TO EARLY CENTRALISATION IN NORTHERN ITALY

Zamboni, Lorenzo (University of Milan)

For several years, early urbanism in northern Italy has been an underrated phenomenon, often viewed through antiquated cultural-historical mechanisms of colonisation and acculturation from supposedly more advanced Mediterranean civilisations. However, recent fieldwork and polythetic studies have revealed evidence for early and potentially independent nucleation processes in the regions south of the Alps. This led to a significant expansion of our understanding of site agglomerations in the study area, including potential cases of instability, ephemerality, low-density population, and seasonality.

Yet, I argue in this paper that previous archaeological studies have placed excessive emphasis on the elites and the exchange of prestige goods, overemphasizing the role of coercive authorities who alone promoted and ruled the urbanisation process. A comparative perspective could help disentangle the simplistic equation between urbanism and pyramidal social hierarchy. By examining collective forms of cooperation, egalitarianism, and alternative strategies of wealth-sharing, a more nuanced understanding of urbanisation can be achieved.

463 METHODS OF ANALYSING SUBSISTENCE RESOURCES, LANDSCAPE MANAGEMENT AND EXPLOITATION PRACTICES BETWEEN THE BRONZE AGE AND IRON AGE

Session theme: 4. Persisting with Change: Theory and Archaeological Scrutiny

Session organisers: Sotgia, Agostino (RUG - University of Groningen) - Debandi, Florencia Ines (Alma Mater Studiorum - University of Bologna) - Cattani, Maurizio (Alma Mater Studiorum - University of Bologna)

Session format: Regular session

The significant demographic growth and extensive land occupation that greatly increased in Europe during the Bronze Age can be explained by a different approach to resource exploitation and, more importantly, a different organization of agricultural and animal production methods. Agriculture is one of the most comprehensive and rational forms of resource utilization within communities' landscapes. Together with pastoralism, it has always held a prominent place in historical reconstructions and archaeological analyses, both in terms of landscapes and the ancient societies that inhabited them. This is particularly true for the period between 2200 BC and 800 BC, where agro-pastoral systems played a pivotal role in the development of communities, affecting their internal socio-political dynamics and inter-community relations on a large scale. Traces of ploughing, field partitioning, possible fertilization or manuring interventions, along with crop rotation, suggest meticulous planning of agricultural production. Furthermore, effective livestock management, involving the selection of animals, the choice of grazing areas, and precise breeding strategies, should not be underestimated.

Numerous interdisciplinary studies have addressed these topics, establishing reference criteria, explaining analytical methods, and providing general reconstructions of subsistence forms. However, there have been limited opportunities for scholars to come together to clarify various hypotheses and propose common guidelines. This session is aimed

at archaeo-zoologists, archaeo-botanists, geo-archaeologists, as well as archaeologists studying the productive and subsistence processes of ancient communities. The goal is to understand how to approach the analysis of archaeological data related to agricultural and livestock resources, stay updated on archaeological contexts where traces of agricultural landscapes are discernible, and delve into the scientific aspects related to the results of micro-archaeological analyses of ancient agro-pastoral contexts. In this way, we can develop a common "toolbox" necessary to address this important and fascinating theme.

ABSTRACTS

1 "A PLACE IS ALWAYS THE PLACE OF SOMETHING": EXPLORING HUMAN-ENVIRONMENT INTERACTIONS THROUGH MAXENT-BASED MODELLING

Lucci, Enrico (University of Bari - DIRIUM; Istituto Italiano di Preistoria e Protostoria)

The mutual influence between the physical components of the environment and human activities was the core of the process that led to the emergence of places within the landscape for prehistoric communities. On this matter, agricultural and pastoral practices stand out as key components of the socio-economic sphere of late prehistoric societies, shaping social organisation as well as the physical landscape of their surroundings.

An integrated approach based on the combination of archaeological, palaeoeconomic, and paleoenvironmental data represents the key way to explore the places to which prehistoric communities were tied, what type of activities they performed there, and how much such practices physically impacted on those places. Within this interdisciplinary framework, the application of state-of-the-art machine learning methods significantly enhances our capacity to integrate and explore diverse datasets, characterised by varying nature and quality.

The ModLand project, funded by the Next-Generation-EU program, aims at reconstructing the ties between people and places, unveiling their diversity across space and time, through the use of the ecoinformatic MaxEnt modelling technique. The project focuses on communities from the 3rd and 2nd millennia BCE in Southeastern Italy, where a progressive emergence of differentiated settlement patterns occurred across diverse ecological niches. This process ranged from the development of long-lasting settlements, primarily along the coast, to the persistence of small and dispersed settlements in the inland and the occurrence of seasonal sites in the uplands.
